Clause 6 of Mr. Carleton's report alludes to perhaps the most important features of the whole inquiry. It is one which presents a most gigantic stumbling block for your Committee to overcome in dealing with Port Kembla as the harbour for the south coast. It is a vast question. It is one in which the rights of the Colony have been alienated to private individuals without any value received. To abolish this private monopoly and to regain the public rights, a large amount will have to be paid. The clause states that "Two jetties have been erected at Bellambi, and two at Kembla. The jetties at Port Kembla have been constructed under special Acts of Parliament, and are the properties of the Southern Coal Mining Co. and the Mount Kembla Coal and Oil Co. respectively, and the Acts of Parliament give the companies power to construct such other piers or jetties as they may think necessary, so that before anything is done at Port Kembla some arrangement should be come to with these companies whereby they would be placed upon the same plane as all other shippers at the port, and pay the same shipping rates, harbour dues, &c., &c." This much of clause 6 virtually tells us in plain English that we, the people, by our Government, have no right to land in Port Kembla. That we cannot improve the port because we are trespassers. Then it seeks to deprive these individuals of their rights to use and to monopolise the port, and to compel these people to pay shipping rates, harbour dues, taxes, &c., for what they now hold free. Do not we wish we may get it? So much for Kembla. Let us now see how this point affects Bellambi. Mr. Carleton's report states that "Those

Mr.  
C. Morton.  
18 Jan., 1897.

Mr. C. Morton.  
18 Jan., 1897.

"Those (the two jetties) at Bellambi are constructed under a lease for the Crown, terminable in October, 1899. Therefore Bellambi is free and the Government can enter upon its work of improvement there with a free hand, unfettered by monopoly, and with any liability to costly actions at law or to expensive never terminating arbitration. This is a most all important point in favour of Bellambi, and had all other points been equal this one and this only would cause you to accept Bellambi as the site for the deep water harbour of the South Coast."

Clause 7 states, "From an engineering point of view Wollongong does not work out economically, as no shallow site can be selected to place a breakwater on. I fully agree with this, and I with the people of Wollongong lament over this melancholy fact. If the want of a shallow site for a breakwater at Wollongong prevented its economical construction, why should the shallow site at Bellambi be ignored. What became of the engineering eyes which could perceive the want of the shallow site at Wollongong and could overlook the shallow site at Bellambi. It must have been a shallow site of the eye, not only has the shallow site at Bellambi been overlooked, but the most useful water in the whole harbour has been monopolised by the site of the proposed breakwater as planned by the Government officials. Thus a grievous mistake has occurred and one which should not have happened, had inquiries been made of local people whose daily calling keeps them in constant knowledge of all these important facts regarding the requirements of the harbour at Bellambi."

I will now compare the depth of water as shown by the soundings given at the site of the Government breakwater, and that at the site which I propose.

It shows thus, the Government breakwaters would for—

	400 feet in 15 feet of water and under		
then	400	"	20
"	200	"	35
"	1,600	"	48

Against this the site chosen by me gives—

	for 1,000 feet 20 feet and under		
then	600	"	25
"	400	"	35
"	200	"	42

Showing nearly 60 per cent. in favour of the latter. So much for an oversight.

Clause 8 propounds a question which to my taste seems rather unsavoury. It reads thus, "Which of the three ports is situated nearest to the centre of the whole of the remaining marketable coal in the southern district?" I am very glad to see that Mr. Carleton places this question within inverted commas, showing that someone has lent it to him. I thought this question was too deep for an engineer who generally simplifies matters so that they can be understood by all. This cute and designing question has emanated from a deep and plodding mind, and is characteristic of the man who lent it out. Mr. Carleton fairly admits that this is one of those questions upon which he is unable to express an opinion. Then why place it in the report? Let me revise this question, so that it may have a practical bearing upon this inquiry. It will then read thus,—which of the three ports is situated nearest to the centre of the whole of the collieries that have been opened and are now working in the Illawarra district? The answer to this would have been quite easy to arrive at, and would have been one upon which Mr. Carleton would have been an authority. It would read thus—taking the distance along the main South Coast Railway, and thence either by existing line or proposed new line to each port. Thus, Mount Keira and all northern mines would go by new line over Tom Thumb to Port Kembla. Showing that:—

From	To Bellambi Jetty.	To Kembla Jetty.	To Lake Illawarra.
Kembla .....	8 miles.	4½ miles.	13½ miles.
Keira .....	5 "	5 "	14 "
Pleasant .....	4½ "	5½ "	14½ "
Corrimal.....	2½ "	7½ "	10½ "
South Balli .....	1 "	9½ "	18½ "
Bellambi.....	1 "	10 "	19 "
Bulli .....	3 "	12 "	21 "
North Illawarra .....	5 "	14 "	23 "
South Clifton .....	8½ "	17 "	26 "
Coalcliff .....	10 "	18½ "	27½ "
Helensburgh .....	18 "	26 "	35 "
	67 miles.	129 miles.	228 miles.

Leaving out Helensburgh, the average mileage to Bellambi new jetty would be 4.9 miles,—to Kembla, by way of Tom Thumb, 10.3 miles, and to Lake Illawarra shipping place, 19.3 miles. This table of railway distances to the ports demonstrates that to Bellambi seven collieries would come within the 5 mile zone system and the ten within the 10 mile zone. Applied to Kembla port two collieries come within the 5 mile zone, three within the 10 mile zone, four are excluded, but would come within a 20 mile zone. To the lake three are within 15 miles, three within 20 miles, and four within 30 miles. Helensburgh would save 10 miles by shipping at Bellambi, with grades in its favour, 43 feet to the mile for 4 miles, as against 85 to the mile for 3 miles, and 55 feet to the mile also for 3 miles. Therefore coal from Helensburgh could be more economically shipped at Bellambi than at Darling Harbour. Helensburgh could ship more cheaply at Darling Harbour than at Kembla, because, although it would save one mile its headquarters are in Sydney and the difference would not pay supervision at Kembla.

Clause 9 of Mr. Carleton's report informs us that Dr. Robertson is a recognised authority on the southern coalfield, but for all that Mr. Carleton doubts the doctor's statement and says it will require fuller consideration. I agree with Mr. Carleton.

Clause 10 instructs us that the total cost of any scheme for the South Coast Harbour must not exceed £234,375 or say in round figures £235,000.

Clause 11 I will allude to when I explain my scheme for improvements at Bellambi harbour.

Clause 12 gives a comparative statement of cost but, "as the details have not been carefully considered", it should not have been written.

Clause 13 mentions the question of land resumption for harbour purposes which are necessary at either Bellambi or Kembla.

At Bellambi I recommend the resumption of about 370 acres for which I allow £7 10s. per acre. This I believe to be full value. Your Committee will see that this land or rather a great portion of it was at one time laid out as a village, three allotments were sold or given away; this sale binds the survey and the several roads, therefore in all probability £5 per acre might buy the land at Bellambi.

Of the land at Kembla I cannot speak. But I am informed that on this item also the resumption will favour Bellambi.

I will now in the simplest manner possible explain what I think is necessary by way of improvements to make Bellambi a harbour in every way suitable to the coal trade of the south coast. At the same time I will give my reasons for what I advocate. I can assure you that I have spent much time and thought over the matter, every item has been carefully considered, and I place this my statement before you with all integrity of purpose and I can now assure you that my statements are the result of full conviction arrived at after careful thought and full investigation. They are not the result of prejudice, nor are they promoted with any idea of ulterior gain. This work has been a laborious one, which has entailed a great loss of time to me, and more than that I know full well that to a certain extent my professional reputation is at stake, therefore I have all to lose and nothing to gain. In the first place I wish to point out to your Committee that for a coaling station Bellambi requires no artificial shelter from the north-east; this has been the experience of all those who have watched the effect of the wind and sea and who have day by day been at their post of work shipping coal at the jetties. Such being the case no attempt has been made by me in designing work which my own experience and my honest convictions tell me would be a useless and wasteful expenditure.

I advise and provide for, in the first place, the filling in of the channel that divides the main or Bellambi reef. This channel is 700 feet wide about 100 feet of which is about 16 feet deep. It has been contended by some people who have examined this place that the completion of this work alone will have a very beneficial effect on the shipping at the present jetties. I am of that opinion, but that is not the work which I expect it to do. The object of constructing this breakwater, which we will now call breakwater No. 1, is to complete this big reef, which will then form a solid break to the sea, extending 2,500 feet due east. By means of this breakwater which will be constructed with heavy rugged masses of blue metal or basalt to a height of 8 feet above low water, the great destructive force of the heavy southerly seas will be broken and the wave force, which is greatest at low water, will be nearly exhausted when it reaches the deep water on the northern side of this breakwater and reef. The estimated cost of this structure is £16,000.

Mr.  
C. Morton.  
18 Jan., 1897

#### Breakwater No. 2.

To the north of the main reef and distant about 1,300 feet I propose to construct what may be termed the harbour breakwater which can be called breakwater No. 2. It will start from a hole in the rock on the east of Bellambi Point, and will follow thence along the shallow water, for a distance of 2,200 feet, in a semi-circular form, what is generally known as part of the inner reef. This structure will be constructed as specified by the Engineer-in-Chief for Harbours and Rivers, and will cost at Government schedule prices £116,880. This breakwater will not be called upon to resist the heavy sea that the proposed Government breakwater would have to contend with. It will, as it were, meet the broken sea from No. 1 breakwater and guide it harmlessly well to the east and north of Bellambi Point, leaving the water within the harbour comparatively free from range or swell. This desired effect would and could not be accomplished by one breakwater alone. This can be easily understood by anyone who has studied the action and movements of the storm waves on this coast. They rush up, as it were, in successive threes, or one, two, and three, the third being the heaviest and most destructive of the three, this is always followed by an extended period of time before the next series, and these waves, unless their form, order, or force is broken before they reach a point on the coast or a breakwater, they, as it were, expend their violence against the point or breakwater; but the bodies of accumulated water run still separated inside of the breakwater or point and take the form of long rollers or a deep heavy swell, which would cause great trouble at times. Hence, the great service expected from breakwater No. 1. It would be the means of ensuring comparatively smooth water inside and to the north-west of breakwater No. 2. The next work would be the erection of No. 1 jetty, 1,050 feet long, and fitted up so as to land a vessel on each side in from 28 to 32 feet of water at low spring tides. It would be a low level top structure from which the coal would be shipped by means of steam or hydraulic cranes two on each side. Waggons on jetty to be worked by endless rope. Estimated cost of jetty has been fixed by that given by the Government for coal shipping jetty at Kempl, would be £24,465; cost of cranes, &c., £4,000; fixing same, £2,000; with roads on jetty, £1,000.

I would advise that 2 miles of siding accommodation be provided at £2,500 per mile. One mile would do for the one jetty at first. A wharfinger's house and light, £1,000; resumption of 370 acres of land, £2,775; resuming South Bulli railway lines, £5,000. I propose the construction of a railway line from the north end of Corral railway station to Bellambi Point, and the resumption of land for same. Also the construction of a loop line from off the main south coast line north of the South Bulli line to join that line, and land for same. These, with due allowance for engineer and supervision, conclude the whole expenditure that would be required for some years. When necessary the No. 2 or outer jetty could be constructed with all appliances. This jetty would be 1,400 feet long and would be able to accommodate four vessels at one time. It would cost £32,620; this, with the second mile of siding, would complete the coal harbour.

#### The Dock.

Should it at any time be found necessary, and the trade of the district required it, a splendid inner dock could be constructed at Bellambi Creek. I would recommend that a 10-acre dock should be constructed, there is room for one 20 acres, the length of channel from high-water mark would be 1,000 feet. This dock would provide wharf accommodation to the extent of 2,400 feet at its sides, which would have to be timbered, with ballast wall at back.

I will now lay before the Sectional Committee the following estimates of the proposed works:—

#### BELLAMBI HARBOUR—Breakwater No. 1.

Construction—1st class blue metal or basalt rubble blocks, placed at a batter of  $1\frac{1}{2}$  to 1 on the outer slope, and  $1\frac{1}{2}$  to 1 on the inner slope; width on top, 30 feet; height of top, 8 feet above low-water mark.

Calculation—2 tons to cubic yard, less  $\frac{1}{2}$  for voids; price, 6s. per ton.

Section.	Length.	Depth water low spring tide.	Contents in cubic feet.
1	600 feet	2 feet	270,000
2	500 "	6 "	502,500
3	100 "	16 "	171,000
4	100 "	10 "	129,000
			1,072,500

1,072,500 cubic feet = 40,000 cubic yards @ 2 tons per cubic yard = 80,000 tons -  $\frac{1}{2}$  voids = 64,000 @ 5s. £16,000.

CHARLES MORTON, C. & M.E.

#### BELLAMBI HARBOUR—Breakwater No. 2.

Construction—1st class rubble sandstone, placed at a batter of  $1\frac{1}{2}$  to 1 on the outer slope, and  $1\frac{1}{2}$  to 1 on the inner slope; width on top, 16 feet; height of top, 20 feet above low-water mark.

Calculation—1.75 tons to cubic yard, less  $\frac{1}{2}$  voids.

Section.	Length.	Depth water low spring tide.	Contents in cubic feet.
1	200 feet	7 feet	286,200
2	700 "	18 "	1,808,800
3	400 "	15 "	896,000
4	300 "	21 "	825,600
5	200 "	22 $\frac{1}{2}$ "	638,400
6	200 "	27 "	760,400
7	200 "	33 "	943,400
8	100 "	42 "	682,000
9	100 "	42 "	731,600
[10	Slope at end	42 "	416,710
			7,889,100

7,889,100 cubic feet = 292,200 cubic yards @ 1.75 tons per cubic yard = 511,350 tons -  $\frac{1}{2}$  voids = 408,675 tons @ 5s. = £102,169.

If calculated @ 2 tons per cubic yard would equal 467,520 tons @ 5s. = £116,880.

Note.—Section 8 averages 24 feet on top, section 9 averages 32 feet on top.

New Zealand prices from 2s. 2d. to 4s. 8d.

CHARLES MORTON, C. & M.E.

BELLAMBI

## BELLAMBI HARBOUR.

Mr.  
C. Morton.  
18 Jan., 1897.

Estimated cost of complete harbour affording loading accommodation for four of the largest cargo vessels in from 28 to 45 feet of water at low-water spring tides, and also for vessels of smaller draught at the same time.

<i>First expenditure.</i>		£
Breakwater No. 1 .....		16,000
"    No. 2 .....		116,880
Jetty No. 1, 1,050 feet .....		24,465
Four 20-ton steam cranes .....		4,000
Fixing .....		2,000
Roads on jetty .....		1,000
Wharfinger's house and light .....		1,000
1 mile siding .....		2,500
Resumming 370 acres .....		2,775
"    South Bulli railway lines .....		5,000
"    land for loop north side of South Bulli .....		100
"    land for line, Corrimal to Bellambi .....		100
Construction of loop-line .....		750
"    Corrimal line .....		2,500
Engineer and supervision .....		2,000

To which must be added—

<i>Second expenditure.</i>		
Jetty No. 2, 1,400 feet .....		32,620
Four 20-ton steam cranes .....		4,000
Fixing steam cranes .....		2,000
Roads on jetty .....		1,000
1 mile siding .....		2,500
		£223,190

Construction of Inner Dock, to be formed 30 feet deep at low-water spring tides; area, 10 acres; channel, from high-water mark, 1,000 feet by 200 feet:—

<i>Cost of excavation.</i>		
10 acres, at £1,452 per acre .....		14,520
Channel .....		726
2,400-feet timber wharf .....		20,016
Entrance, from 30 feet soundings to high water .....		14,738
Ballast wall .....		5,000
		55,000
Total cost of dock .....		55,000
"    coal harbour .....		223,190
		£278,190

207. Your plan shows that you intend to connect the outlying reef at Bellambi with the mainland by means of breakwater No. 1? Yes.

208. You believe that that is necessary for the protection of the Bellambi jetty which lies north-west of it? I believe it will be beneficial to the shipping.

209. Would it be beneficial in easterly weather? There is no easterly weather of any importance. We have north-easterly winds and south-easterly winds; but we have no easterly weather that interferes with our shipping.

210. You say that the northern end of your proposed main breakwater lies approximately east of the seaward end of the Bellambi jetty? Yes.

211. Do you consider that sufficient protection from easterly weather? Yes, for the whole bay.

212. Although the entrance of your proposed dock is north-west of the end of your breakwater, you consider that the breakwater is sufficient protection for easterly weather? I do.

213. In the event of the construction of the breakwater in a position different from that shown by the Department, will there be sufficient shelter for large vessels coming there to load coal? It would not be safe for a great number; it would be for a few such as we expect the trade of the district to bring.

214. How many? Half a dozen sailing vessels could lie safely within the breakwater as proposed by us.

215. But no sailing vessel could lie safely behind an eastern breakwater at Port Kembla? I do not say that at all. I believe Kembla to have a better holding ground, and it will no doubt be a good port; but it will cost a great deal, and one breakwater will not make still water. It will not be perfectly still water even with both breakwaters, but it will be better than it would be with only one breakwater.

216. Would Bellambi be a better port than Kembla? Yes; my reason for saying so is that the water will be broken up by the southern breakwater.

217. What experience have you had in coal-mining? None until I came into this district.

218. What experience have you had since? I have had experience in several mines.

219. Have you been in charge of the mines? No; I have been visiting engineer and surveyor.

220. What evidence have you about coal-mines? There is a prospect of the Kiera, the Mount Pleasant, and the Kembla Companies amalgamating to work their properties as one mine, coming out near the mouth of the Mount Pleasant pit.

221. Where did you hear that? I have had papers through my hands in connection with it. If it is carried out that will bring them nearer to Bellambi.

Mr. Michael O'Brien, Wollongong, sworn, and examined:—

Mr.  
M. O'Brien.  
18 Jan., 1897.

222. *Chairman.*] Are you a resident of Wollongong? Yes; I have been here about nineteen years.

223. *Mr. Hassall.*] Have you any knowledge of this proposal now under consideration? Yes. My interest lies in Wollongong, but I cannot get away from the fact that Kembla is the place for a harbour. It is well protected. It is protected from the northerly winds, and it is equally protected from the south-westerly winds. It is protected from the southerly winds. The south-easterly wind interferes with it, but if a harbour were formed it would be broken water. Outside there is a reef which runs from the big island—it is called the Bomborah. It runs north to the little island, and is between 700 and 800 yards long. Then there is another island outside that—one is north and the other north-east from Port Kembla. A little island runs about north and south-east, and all the north-east wind is broken by it.

224. That is what you call the little island? Yes; the big reef runs from the south-east point of that which is under water.

225. Does that run across to the big island? It runs to the outer island, then from that island outside there is another reef which runs west-north-west. But the sea that comes down from the north-east expends itself pretty well upon Tom Thumb Creek, and that is a mile away from Kemplā. The actual sea which they have to put up with at Kemplā from the south-east is not a heavy sea at the jetties; it is broken when it comes in. I suppose there is no better anchorage than they have at Port Kemplā: the bottom is composed of clay, black sand, and gravel. Of course it is a very good place for ships which go there now for protection. Some years ago a steamer called the "Hunter" came to the islands for refuge, and she lay there until the gale was over. It is a great drawback to the Illawarra district not having a good harbour, because under the existing state of things the insurance companies will not allow shipowners to send their vessels here.

226. Have any of the residents in this district taken shares in the Illawarra company's venture? I could not say.

227. Do you think there is any prospect of that work being carried out? It is doubtful.

228. Do you think it will necessitate a very large expenditure? Yes; no doubt it would. I think it would be a great mistake to lease an inch of water frontage at Kemplā: it will be very valuable by-and-bye. A breakwater could be carried from the Flat Rock to the reef, and from the reef to the island in an average of about 4 fathoms of water.

229. What is the distance from the shore to the reef? To the Flat Rock it is about half a mile.

230. Then from the Flat Rock, when you get on to the reef, how far is it from the island? About a mile, with 4 fathoms of water.

231. Have you any knowledge of Bellambi Harbour? Not much.

232. Do you know how many days in twelve months it would be impossible to load coal at Port Kemplā jetties under present conditions? Very few days. I have seen them loading there in very heavy weather.

233. Practically, they can load there all the year round? Yes; except when the weather is very bad.

234. I suppose on the average they would be able to load there 350 days out of the 365? They load pretty regularly. It is very seldom that they are unable to load there.

235. So that a little additional protection would be sufficient to enable them to load there in any weather? Yes.

236. Judging from your remarks you think there is no necessity for the northern breakwater? It is not required.

237. Is the land about there private or Government land? There is some Government land.

238. If the Government propose to spend money there to make a harbour, will it not be advisable to resume the land before commencing operations? I think they should. It will become very valuable there, because as soon as the breakwater is built foreign companies will come in and bring smelting works there.

239. Alongside of Port Kemplā? Yes; they have the coal there.

240. Do you think, in view of the smelting works already erected at Lake Illawarra, that others will be erected at Port Kemplā? Decidedly.

241. Supposing that the supply of ore ran out? There are millions of tons at Noumea.

242. In the event of land being resumed at Port Kemplā, do you think the Government could recoup themselves by the sale of that land for any large portion of the outlay incurred in constructing a harbour? It would be a good investment no doubt.

243. Do you think the Government would be justified under present circumstances in spending £300,000 or £400,000 in this work? I do.

244. Do you think that the trade of the district warrants it? I do, because there is a great demand here for coal for coking and smelting works.

245. But in the event of the colliery proprietors using their own jetties to save shipping charges or harbour dues, do you think that the money expended in constructing a harbour at Port Kemplā would return interest on the amount? I think so.

246. You think that the colliery proprietors would use the harbour instead of their present jetty? Yes.

247. In any weather? In all weathers. It is very expensive to keep those jetties going.

248. Do you expect an increase in the over-sea trade if the harbour is constructed? Yes. Vessels would come here if there were sufficient protection for them.

249. *Chairman.*] Did you ever see any easterly seas here? Yes; the easterly seas are our heavy seas.

250. Will an easterly sea go into Bellambi Bay? It must go in there; there is nothing to keep it out.

251. *Mr. Lee.*] Do you know Kemplā Point and Bellambi Point? Yes.

252. Does Kemplā Point lie east or west of Bellambi Point, or which projects furthest towards the east? I think Bellambi Point does, but there is very little difference.

253. Then if an easterly sea would run in and come round the proposed Kemplā breakwater, would it not do exactly the same with a breakwater made at Bellambi? Decidedly it would.

Mr. Samuel Kemish, Wollongong, sworn, and examined:—

254. *Chairman.*] What are you? A retired teacher, resident at Wollongong.

255. What information have you to give the Committee? What I have seen from Berkely Heights during thirteen years' residence there.

256. *Mr. Farnell.*] Will you explain what you refer to? I lived there from November, 1878, to April, 1892, as a teacher. The position of Berkely Public School is about the most favourable for viewing Port Kemplā Harbour of any point in the whole district of Illawarra. It is within 2 miles of the coast and affords a full view of the bay.

257. You have had an opportunity of judging of the effects of the weather on the coast? Yes. I was there in some severe storms. I saw six steamers come to Port Kemplā through stress of weather. They dropped anchor and were there for many hours.

258. From what weather does that point afford protection? From south-east weather chiefly, but also from easterly weather. It is only exposed to the north-east wind, but I have never seen the north-east winds really dangerous.

259. You have had an opportunity of investigating the proposal to construct a harbour at Port Kemplā as well as the rival proposals? Yes.

Mr.  
M. O'Brien.

18 Jan., 1897.

Mr.  
S. Kemish.

18 Jan., 1897.

Mr.  
S. Kemish.  
18 Jan., 1897.

260. What is the conclusion you have come to? That the Port Kembla scheme is by far the best. I think it would be best to confine the expenditure to the eastern breakwater and not to resume any more land than would be absolutely necessary for the railway.
261. Do you think that by the establishment of a new harbour at Port Kembla the trade of the Port of Wollongong would be interfered with? Yes. In my opinion Wollongong could not be a port for large steamers.
262. Do you think that the trade which is done at Wollongong will be diverted? Not the present trade.
263. Do you think it is likely that the output of coal will be increased and that some of the collieries that are at present using Wollongong harbour will use Port Kembla? I do. When going to England on the "Ormuz" I asked the officers why they did not come to Port Kembla and load there where there is 46 feet of water at the end of the jetty. The answer was that they would be only too glad to do so but that there were no appliances there to do the work. They said that by loading there they would save ten days. I became acquainted with the Japanese Commissioners to the Exhibition of 1878, and they said, "You come from Wollongong; we are told that there are two sorts of coal in New South Wales—the Newcastle coal and the Wollongong coal; which is the best?" I said for household purposes Newcastle coal is the best, but for steam purposes Wollongong coal is the best. They said, "That is what we want. We want to bring out a cargo of our goods, and take back your coal." That was before the Japanese had learnt to work their own mines scientifically.
264. Supposing that the harbour was constructed at Lake Illawarra by private enterprise which would afford the same facilities as could be afforded at Port Kembla, would you be prepared to support a scheme like that instead of the expenditure of £400,000 at Port Kembla? Certainly not. I do not think that that scheme can be carried out. What is wanted is a harbour for large steamers, one which they could come into in any weather. Such a harbour could be made at Port Kembla, but not at Lake Illawarra. I have been all over the district many times, and I do not see how they could make an entrance to that lake which would admit large steamers.
265. Do you think there is any probability of the Illawarra company proceeding with the work at an early date? I do not.
266. Is that the general impression of the district? It is. When I first heard of that scheme I put it down to a desire to sell a certain amount of land. If that land had been sold they would not have cared for anything else.
267. You think their idea was a speculative one? I do.
268. Considering the whole question from a national standpoint, do you think that the country would be justified in constructing a harbour at Port Kembla? I do.

Mr. William Osborne, auctioneer, Wollongong, sworn, and examined:—

Mr.  
W. Osborne.  
18 Jan., 1897.

269. *Mr. Roberts.*] How long have you resided at Wollongong? All my life.
270. Have you any interest in the coal trade? None.
271. Are you familiar with the different schemes that have been put forward for providing harbour accommodation? No.
272. Do you feel qualified to give an opinion upon the scheme now under consideration? I believe Port Kembla to be the best site for a harbour on this coast. Over forty years ago an English sailing vessel lay for over a week in Port Kembla in a south-east storm, and I have seen other vessels lie under the lee at one of the islands for days in bad weather. I think there is no other place between Sydney and Jervis Bay where a vessel could lie during a south-easterly storm.
273. Even in its present state you regard it as a safe harbour of refuge which could be greatly improved by the construction of that eastern breakwater? Yes.
274. Have you ever visited Kembla? Yes.
275. Are you acquainted with Bellambi Bay? Yes.
276. Having a knowledge of those places you think that Port Kembla would be the best for a harbour? I do.

Mr. David John Stewart, journalist, Wollongong, sworn, and examined:—

Mr. D. J.  
Stewart.  
18 Jan., 1897.

277. *Mr. Fegan.*] What do you wish to tell the Committee? Only that while following my vocation I have frequently visited Port Kembla on the occasions of the visits of unusually large vessels, such as the "Indrani," the "Ormidale," and the "Sonnesbergh," vessels of from 5,000 to 8,000 tons burden. I have interviewed the captains and officers of those vessels, and in every instance I have been assured of their entire satisfaction with Port Kembla as far as the depth of the water and the anchorage are concerned. They stated that the natural features of Port Kembla were excellent, and they believe that by the construction of breakwaters the harbour could be made into a first-class port of refuge.
278. Easy of access? Yes. It is believed that the construction of a suitable harbour there would lead to a great increase in the export trade, and in support of that statement I may mention that about two years ago I received from Egypt a letter, which came addressed to the *Mercury* Office from a firm of shipping merchants named Souter & Co., who stated that they had seen some reference to Illawarra coal in an extract from the *Illawarra Mercury*, and that they believed there was a splendid market for coal of that quality in Egypt if it could be landed at Suez.
279. Did they know anything about the port? They asked if we would lay that letter before some of the coal-shipping authorities here. I handed it to the Southern Coal-owners' Association. Two of the members of that association thought that the freight would be too great a handicap to allow them to take advantage of that market. The construction of a harbour at Port Kembla, however, will enable them to place the coal in the markets of the world at a substantial reduction.
280. It is believed that the cost of shipping and transshipping amounts to something like 3s. 6d. a ton at present, besides heavy insurance? Yes.
281. Do you think that the construction of the northern breakwater would be an impediment to vessels leaving the port? I would rather not express an opinion on that.
282. Do you know anything about Bellambi? Yes.
283. Have you heard any remarks made by captains of ships in reference to that harbour? Yes; I have heard some of the captains say that Port Kembla was infinitely superior to Bellambi.

284. I understand that you have taken notes of the expressions of those officers? I went to Port Kembla when vessels arrived of unusually large size. I never went to Bellambi to interview captains.

285. But if there were vessels there you would have a chat with the officers? Not at Bellambi, but I have met some of them at Kembla. Mr. D. J. Stewart.  
18 Jan., 1897.

286. You would hear their opinion of the place whether favourable or otherwise? I have never heard any of the captains express the opinion that Bellambi was as good a harbour as Port Kembla.

287. But you have heard them say that Port Kembla was a superior harbour to Bellambi? Yes.

WEDNESDAY, 20 JANUARY, 1897.

[The Sectional Committee met at Lake Illawarra.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. DANIEL O'CONNOR.  
HENRY CLARKE, Esq.  
CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.  
FRANCIS AUGUSTUS WRIGHT, Esq.  
FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Mr. Austin Joseph O'Grady, commission agent and auctioneer, Dapto, sworn, and examined:—

288. *Chairman.*] You have a statement to make? Yes. North of Dapto certain people held a meeting, and those people professed to represent the whole of the Illawarra district. I desire, as representing Dapto, to emphasise the fact that the people at that meeting did not represent the whole of the Illawarra district. I am informed that there is not the name of one person who resides south of Unanderra on the committee which was formed. The names of certain persons at Unanderra were placed on the list by accident because they happened to be at Wollongong when the deputation was going to Sydney. Furthermore, it was thought by a majority of those present at the meeting that Lake Illawarra was the natural and the best site for a harbour for the southern coast. Resolutions were carried confirming that a number of witnesses were appointed to give evidence before the Public Works Committee in favour of the construction of a harbour at Lake Illawarra instead of at Port Kembla, and claiming that this is the most central port on the south coast. I will not detain the Committee by trying to describe the advantages which the lake possesses. You have seen them all to-day. Anybody who has ever seen the lake will consider that nature has intended it for a harbour. Mr. A. J. O'Grady.  
20 Jan., 1897.

Mr. William R. Atkinson, Dapto, sworn, and examined:—

289. *Chairman.*] What are you? I am a resident of Dapto.

290. Have you been long a resident of Dapto? Yes; ever since I was a boy.

291. What information do you desire to lay before the Committee? I desire to describe Lake Illawarra as it really is, not as it is represented by some of the witnesses. I happened to be employed by the first surveyor that took sections of Lake Illawarra seven or eight years ago. I was employed with Mr. Baber who, I think, was working for Harper and Harper. We took soundings from Tallawera Point down to the entrance to the channel, and we found the average depth of the water to be from 10 feet 6 inches to 11 feet 6 inches. For about 3 miles in the centre it hardly varied at all. We also took soundings from Tallawera Point to Kanahooka Point and found the soundings to be the same. From Kanahooka Point to the eastern entrance it was the same. Afterwards, we sounded the mud, and immediately off the point, I suppose half a dozen boat lengths, we sounded with a pole, but we could not find the bottom of the mud. I cannot say exactly the depth which we went on that side. We crossed to the western entrance to the channel, near Codgerie Island, and we found the depth there to be 30 feet and we put a bar down 30 feet in the mud. Mr. W. R. Atkinson.  
20 Jan., 1897.

292. There are a few feet of water and then mud? Yes. The depth that we went down through water and mud opposite Tallawera Point was certainly not less than 20 feet. I desire also to emphasise the evidence given by the previous witness to the effect that the agitation in favour of Port Kembla was not an agitation from the whole of the Illawarra district. The people to the south of Unanderra still believe that Lake Illawarra is the proper place at which to make a harbour. Speaking as a non-professional man, I do not feel qualified to give an opinion in reference to the coal south of Kembla; but it is quite clear that if coal is discovered south of Kembla, Lake Illawarra will be the most central situation for a harbour for the coal trade.

293. Is there any other point to which you wish to refer? I desire to inform the Committee that I have seen the coal got south of Kembla burning satisfactorily in various places. It is used in local factories for generating steam. They use it at the creameries.

Mr. George Henry Blakemore, Manager, Smelting Company of Australia (Limited), sworn, and examined:—

293½. *Chairman.*] What has been your expenditure here up to date? About £70,000.

294. What do you anticipate expending before completing your plant? About £120,000.

295. How long will it be before the scheme is completed? About four months longer.

296. We will say from four to six months? Yes.

297. What amount of coal is it reasonable to suppose you would use when the works are in full swing? Between 50,000 and 60,000 tons a year. With our present smelting plant about 65,000 tons of ore.

298. Then it appears probable that these works, in the near future, will bring 120,000 tons of freight in ore and coal per annum? Yes.

- Mr. G. H. Blakemore.  
10 Jan., 1897.
299. You say that you have expended £70,000 up to the present time;—within what period has that amount been expended? We commenced in November, 1895.
300. Then your expenditure has been within the last twelve months? Yes.
301. Your railway freight from here to Sydney will be how much? 2s. 4½d. per ton on ore.
302. Approximately, from the estimate, the cost of all—coal and ore—is at ½d. per ton per mile? Yes, for ore.
303. Well, what is it for coal? The coal costs 1s. 4½d. per ton to Dapto station from Corrimal. We deal with the Southern Coal-owners' Association; but I believe it is from Corrimal that the coal comes.
304. What is the distance? About 10 miles. If we carry up to 200,000 tons of coal a year the Railway Commissioners will give us a reduction of 25 per cent. Our present rate is 1½d. per ton per mile for coal.
305. If it is possible to have your ore delivered in one instance from vessels close to your works, and in another instance at a distance more remote, it would cost you ½d. a ton for every extra mile of haulage? Yes.
306. What portion of that ore will come by sea, and what portion will come by rail? About 50 per cent. of it will come by sea.
307. And 30,000 tons would come by land? Yes.
308. Therefore any error in the location of your work means 30,000 half-pennies per ton per mile on the ore? Yes.
309. Mr. Lee.] Do you intend to treat ore for the public? Yes; ours are public smelting works.
310. It is a question for the producer as to how he will send the ore. He can send it by any route he thinks proper? Yes, if he pays the rates.
311. Mr. Wright.] I suppose that ore coming from the north or from the west the journey would not be broken? No; I do not think it would pay us to load it into ships at Sydney. It would be quicker for us to get it by rail.
312. Mr. Roberts.] Do you get your coal from Dapto Creek? I think it comes from Corrimal. We deal with the Southern Coalowners' Association.
313. Mr. Wright.] Have you any contract with them? Only a verbal agreement with Mr. Evans.
314. Chairman.] You get your coal where it pays you the best? Yes.
315. Mr. Lee.] Then you have no coal mines of your own? We hold a lease of the Ocean colliery which belongs to the Illawarra Harbour and Land Corporation.
316. Mr. Wright.] How far is that from your works? By rail it is 6 miles from here.
317. Mr. Roberts.] Would not the Dapto Creek coal be nearer for you? The Ocean colliery is closest to us.
318. Have you formed any opinion of the quality of the Ocean colliery coal for smelting purposes? We have not opened up the colliery in the way in which a colliery ought to be opened up. From what we have seen of the coal up to the present it is not satisfactory. We want to get further into the coal before we open it up to any great extent.
319. Do you consider that the coal north of the Ocean colliery is better adapted for smelting purposes? The coal of this district resolves itself into a question of ash. If we had a coal here which carried as low a percentage of ash as the coal in the northern part of the district it would be satisfactory. It depends upon the amount of fixed carbon as against the quantity of ash. This coal averages about 16 per cent. of ash.
320. Chairman.] Unless the quality of the coal improves you will not use it? Not if it cost the same as the northern coal.
321. Mr. Wright.] It must have 50 per cent. of fixed carbon, and not more than 12 per cent. of ash to be suitable? It is a matter of price against ash.
322. But the prices being equal, would you use coal having more than 12 per cent. of ash and less than a certain percentage of fixed carbon to save a shilling a ton? No.

THURSDAY, 21 JANUARY, 1897.

[The Sectional Committee met at the Council Chambers, Nowra, at 1 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. DANIEL O'CONNOR.	THOMAS HENRY HASSALL, Esq.
HENRY CLARKE, Esq.	GEORGE BLACK, Esq.
CHARLES ALFRED LEE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.
	FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Mr. James Wilson, storekeeper and grazier, Bellawangarah, sworn, and examined:—

- Mr. J. Wilson.  
21 Jan., 1897.
323. Chairman.] What are you? Storekeeper and grazier.
324. Where do you live? At Bellawangarah.
325. You are virtually a Berry man? Yes.
326. What have you to tell us that you believe would induce the Committee to come to the conclusion that we ought to make a port at Jervis Bay? First, there is a quantity of coal up Broger's Creek.
327. There is a quantity of coal that lies on the other side of the mountain from Berry? Yes; there is a seam 8 feet thick. Then there is a band of ironstone or sandstone, and another seam about 7 feet thick. The place is called "Madman's Gully." I went to view this coal. Unfortunately heavy rain came on, and it got dark, and we were unable to get from the gully that night. On the occasion to which I refer there were out about 7 tons of coal. We put 2 or 3 tons of it on the fire, and in the morning we found that the coal had burnt to a beautiful white ash, which made it clear to me that the coal was suitable for commercial purposes.

purposes. Professor Taylor, and Mr. Scott, an expert, were with me. I am of opinion that probably shale will be found in that vicinity. On one occasion I visited the site in company with an expert, and found a seam some 6 feet thick, which unfortunately, on being tested, did not prove quite good enough for commercial purposes. I also visited Broughton Vale and Wood Hill with Mr. Wilkinson, Geological Surveyor, and Mr. Martin, and we found seams of coal 7 feet or 8 feet thick, which appeared to have bands in them. The experts expressed the opinion that a couple of hundred feet back the seams to which I have referred would probably contain good coal. There is also in that vicinity a kind of clay suitable for making pottery. A sample of this clay has obtained Departmental approval. I am also of opinion that lime would be found in quantities at Wood Hill. In Broger's Creek there are large quantities of ironstone which must have come from the higher level. But I have not been able to locate the place of their origin. Professor Taylor told me that the seams to which I have referred in Broger's Creek cropped up also in Kangaroo Valley, from which I infer that the seam is continuous. There is in existence some igneous rock and also some intrusion of porphyry. The coal shows again on the south side of Kangaroo Valley, right under the sandstone cap; then it shows again in the Cambewarra Mountains and west from Jervis Bay towards Braidwood.

Mr.  
J. Wilson.  
21 Jan., 1897.

328. *Mr. Wright.*] How far away is Madman's Gully? I suppose it will be about 18 miles.

329. That is where the coal outcrop is? Yes.

330. Due west? North-west.

331. *Chairman.*] In general terms west from the bay and approximately between there and Braidwood? Yes. Some of this last information is to some extent hearsay. Some of the outcrops I have never seen myself but I have seen some coal which I have no reason to doubt comes from them.

332. You desire to inform the Committee there that the presence of coal, shale, clay, limestone, and iron, contiguous to Berry and westward of the bay gives it importance, and it would be a valuable thing to have these deposits worked, and you think that if a port were made up the bay there is a probability of this being done? Yes.

333. Have you anything further to say? I think further that with opportunities of access the attractions of Jervis Bay and St. George's Basin would bring many tourists to those places.

334. You say that you regard St. George's Basin and Jervis Bay as being unrivalled as pleasure resorts? Yes. If I had £20,000 and a railway was made to Jervis Bay I would speculate at St. George's Basin.

335. *Mr. Lee.*] How long have you been residing in the district? Forty years.

336. On which side of the river is Broger's Creek? On the northern side.

337. And Madman's Gully? On the northern side.

338. Is Madman's Gully any distance from the creek? It is one and the same.

339. Have you any assays of the coal that you obtained? I think that Mr. Wilkinson gives them in his report.

340. Are you aware that within the last month samples of coal have been obtained in these localities and analysed, and that the coal has been found quite unfit for commercial purposes? I am not.

341. Are you aware that the coal out of the 2-ft. 9-in. seam in Broger's Creek contains nearly 43½ per cent. of ash? I am not aware of it.

342. You know only of the existence of coal there? And professional men have reported to that effect.

343. You have no technical information to give to the Committee as to the quality of the coal? Nothing but the white ash.

344. Supposing that the coal beds did continue so far south, and there was a large quantity for exportation, why are you so desirous of having it exported from Jervis Bay? I have no interests whatever in Jervis Bay.

345. I want to know why you are so anxious to have Jervis Bay improved to make it a port of exportation? It is closer to the Melbourne market for one thing.

346. Is not Jervis Bay a good harbour at present? Yes, a good natural harbour.

347. Does it not admit the men-o-war? Yes.

348. And would it not admit steam and sailing vessels? Yes.

348½. What would support it unless something were done to make it a commercial port? The general trade of the district.

349. Is there not sufficient water and a good entrance in all weathers? Yes; it is a harbour of refuge.

350. And the only one on the southern coast after leaving Sydney? Yes.

351. Could Jervis Bay in its natural state be used as a port for the export of coal? Yes.

352. What improvements are required there? The railway should be extended to Jervis Bay.

353. You do not suggest that anything should be done to the entrance? I think not. What you would require would be a jetty to ship coal from.

354. If there were jetties at Jervis Bay vessels of ordinary size could lie there in any weather? Yes.

355. What you wish to impress upon the Committee is that no improvement is required at the port of Jervis Bay? Nothing more than jetties.

356. If the coal were conveyed to Jervis Bay it could be shipped from there? Yes.

357. Before you could get the coal there a railway would have to be made from those alleged coalfields to the bay? If the main line were continued to the bay then the coal companies would make feeders to join the main line.

358. Is not the bay south of Bomaderry? Yes.

359. Would it not require a railway then? We should want a bridge across the river first.

360. You mean that it would require a connection between any coalfields with the main line, and that that must be extended to Jervis Bay? Yes.

361. The line must of necessity cross the Shoalhaven River. I believe that money has been granted to make a line to Jervis Bay.

362. When you say that money was voted for the construction of a line to the bay you mean that it was included in a general scheme passed by Parliament some years ago? Yes.

363. Are you of opinion that the coal-beds in the localities you have alluded to are of sufficient importance to justify the country in going to the great cost of extending the railway to Jervis Bay? I should think so, but I am not an expert.

364. But not one of those coal-beds has been worked? No; it would be impossible to work them without a line of railways. There is no road to get the stuff away.

365. How far is Broger's Creek from the main line? About 3½ miles.

366.

- Mr. J. Wilson.  
21 Jan., 1897.
366. If these coal-beds were of any commercial value, do you not think that they would be of sufficient local demand to keep one pit going? We have too much firewood at present.
367. But do not steamers come here? They get their coal in Sydney.
368. Would they not get the bulk of the coal for steaming purposes from a pit near the line? It would take a lot of money to get it. No doubt if a line were made to Jervis Bay mails would be landed there, and ships would get coal there.
369. Do you think it would be wise on the part of the State to make a railway to Jervis Bay before those coal beds had been proved? I should not like to see the State lose by it.
370. Would you do it? I would to a certain extent.
371. Would you make a railway to Jervis Bay? I should say the State should make all these railways.
372. Do you think it would be wise on the part of the State to construct a railway to Jervis Bay and carry out improvements there before those coal measures have been proved? They will not be worked until there is a line to the bay.
373. But it must be proved? Professor Taylor believes in the coal.
374. You think that a railway should be made to Jervis Bay, and that certain improvements should be carried out there to facilitate shipping; but you are not prepared to say that there would be anything to carry if the line was made? Nothing except from the development of the mines.
375. Would it not be wiser to see whether the coal really exists there? The thing is quite feasible.
376. Would you be surprised to hear that the Government Geologist differs entirely from you? I should not wonder.
377. Are you of the opinion that coal of a commercial value does not exist south of Kembla? There are some fine seams between Kembla and Jamberoo.
378. But it is of such inferior quality that it would not find a market? I do not think that the Kangaroo Valley coal has been submitted to analysis.
379. If a railway were made to Jervis Bay, and coal of commercial value were proved not to exist there, what would be the position of that extension? There is a good deal of splendid timber-ironbark, which would be useful for piles, &c.
380. Is there anything else that would tend to make it a paying line? There is a kind of sandstone. You can cut pillars out of it 10 or 15 feet long. You can get as much out of a round boulder as would build a house.
381. Do you think that the whole of the local trade would go by Jervis Bay? I think it would.
382. What does the local trade consist of? At present butter is the principal thing.
383. How many tons a week would be exported from this district? About 35 tons from one of the creameries, and from some of the others, 10 or 15 tons.
384. How many tons of butter a week do you think would be sent from the creamery? I do not know which way they would send it.
385. Would there be 100 tons? No, there would be 50 or 60 tons.
386. What else would go? If improvements were carried out, there is no doubt many people from Sydney would visit St. George's Basin.
387. You are not prepared to say what would be the traffic from the district to the bay? No.
388. You do not know whether a railway would pay anything on the outlay? No.
389. The question is whether there should be a port on the southern coast, principally for the transport of coal? Yes.
390. If Jervis Bay were adopted, do you think it would be practicable for the coal-owners, between Kembla and Clifton, to send their coal to Jervis Bay to be shipped? That would depend upon the cost of haulage.
391. Your view is purely a local one? Yes.
392. You think that if the work were carried out, it would be a good thing to look for the coal afterwards? Yes.
393. *Mr. Roberts.*] What is the distance from Sydney to Nowra? I think it would be about 92 miles by railway.
394. What is the distance from the present terminus to Jervis Bay? I think about 12 miles.
395. The distance from Wollongong to Sydney is 48 miles by railway, and the distance from Wollongong to Jervis Bay would therefore be 56 miles, would it not? Yes.
396. Do you think it likely that the coal-owners at Wollongong will send their coal to Jervis Bay for shipment to Sydney when they are within 48 miles of the metropolis? If the coal was going to Melbourne it would save a considerable distance;—it would save seamen's wages and the time of the ship.
397. What advantage would accrue to the general community by the construction of a railway to Jervis Bay to make that a port of shipment for coal? We have timber, fishing, oyster-gathering, and a great many other things. It is a splendid harbour for fish and oysters.
398. You know the country well between here and Sydney? Yes.
399. What are the wants of the coal-trading community? They want a better harbour.
400. Do you approve of a harbour being made at Port Kembla? Yes.
401. You do not appear here as an opponent to that scheme? No; I am not opposed to it.
402. You do not appear here to prove to the Committee that instead of spending money at Port Kembla, it would be better to spend money in making a railway from the present terminus to Jervis Bay? That is a necessity, and as the money has been voted the Government are breaking their word with the public in not carrying out the work; they ought to extend the line to Jervis Bay.
403. *Mr. Black.*] You do not think that if the railway were extended to Jervis Bay and coal staiths were erected there, the coal-owners north of Wollongong would bring their coal to Jervis Bay for shipment? I think they would if they were sending it to Melbourne. They would probably send their coal to Sydney.
404. If Jervis Bay is to have any coal trade it must be from the development of coal as yet unworked in its vicinity? Yes. And the coal from Mount Kembla now going to Melbourne would go to Jervis Bay.
405. Do not you think that knowing of the existence of such a splendid natural port as Jervis Bay, men who have developed the coal in the north, where the harbours are dangerous in rough weather would lay out their capital in the vicinity of Jervis Bay if the coal there was as good as the coal further north? Yes; but these seams further south have been found out lately.
406. You still adhere to the idea that the coal recently discovered here is equal to that further north? Yes; but I am not an expert.

407. The question is one as to providing a port which will be easy of access for minerals which will not bear long land carriage? Well, how is it in Canada; there they ship coal thousands of miles and across lakes for 10s. a ton.
408. A charge of 10s. a ton would be prohibitory;—I gather from your answers to Mr. Roberts that there is no desire to prevent the improvement of other harbours elsewhere? Not as far as I am concerned.
409. But you desire to bring Jervis Bay into notice? Decidedly.
410. It would be essential, before the Committee could report favourably on Jervis Bay, to be in possession of such definite evidence that we should be sure that the money spent at Jervis Bay would not be thrown away? I do not think it would be.
411. *Mr. Fegan.*] I think your great object in giving evidence here is to get a railway to Jervis Bay? Yes.
412. If you got the railway you would not trouble about wharfs or jetties? No.
413. Therefore the great point in your evidence to-day is that if you were to make a harbour at Jervis Bay you must get a railway there? Yes.
414. How many years is it since you and Professor Taylor went to examine that coalfield? Ten or twelve years.
415. At that time some of the mines had been opened up, had they not? Yes.
416. What is the thickness of the seams at Broger's Creek? 8 feet and 7 feet. There is a band between them. One is steam coal and the other is household coal.
417. What is the thickness of the band? About 15 inches.
418. Is there only one band dividing those two seams? There are some very small bands.
419. Who owns that property? It is Crown land.
420. Have you heard of anyone trying to get hold of that property? No; but I heard that Sir Henry Parkes intended to secure it. I believe he had some explorers out.
421. Have you any property there? No.
422. Therefore you came here as a witness, believing that certain facilities can be given at Jervis Bay at a small cost? Yes.
423. The chief object of your evidence is to get a railway made from the terminus to Jervis Bay? Yes.
424. *Mr. Clarke.*] Independent of any probability of coal being shipped, do you consider that any other produce in the district would go to Jervis Bay? Yes; if maize was a good price in Melbourne it would go there, and Ulladulla people would come and ship there. There is a district north of Milton which would send live stock and other perishable goods for shipment.
425. You think that some 60 tons of butter a week would be exported? I said that about that quantity was manufactured in that district, but I do not know where it would be sent to.
426. Do you think it probable that produce would go from the Shoalhaven district to Jervis Bay when you have a railway at your door and two steamers on the river? I do not think it would.
427. Is it not a fact that all the heavy goods going to Sydney go by steamer? A great deal of heavy stuff goes by train. There is very little maize grown in the district; it is a dairying district.
428. Do goods from Sydney come by rail or by steamer? A good deal comes by rail as well as by steamer.
429. You state that about half of the heavy goods come by steamer? Yes.
430. Then what inducement is there to extend the railway to Jervis Bay? Only the Melbourne market.
431. What kind of country is it between Nowra and the bay? Timber country and grazing country.
432. You have stated that there is not likely to be much freight besides the dairy produce, and that it is not likely to increase much? The district grows good fruit, and the production of fruit will increase.

Mr. Louis M'Intyre, farmer, Nowra, sworn, and examined:—

433. *Chairman.*] What are you? A farmer.
434. *Mr. Lee.*] How long have you been living in the district? Forty-two years.
435. How far from Nowra do you reside? About 8 miles.
436. Have you got a general knowledge of the whole country round? I have seen a very large portion of it.
437. What reasons would you like to give in support of the adoption of Jervis Bay as a port for the southern district? The reasons which I would give have been well stated by Mr. Wilson. We want a shipping-port for coal and other produce.
438. For what coal? The coal from the mountains; there are large deposits of coal here, which I believe are a continuation of the Bulli seam.
439. But if scientific men say that it is not so? They have a better knowledge of it than I have.
440. It is generally known that coal does exist? We can see it.
441. In the event of payable coal being found in this locality it could be shipped from Jervis Bay if a short railway were made to the bay? That would hardly be complete unless it was connected with the present main line at Bomaderry.
442. Supposing that coal were found on the southern side of the river, what necessity would there be to continue the main line? No coal is found on the southern side of the river. A seam has been found at Jervis Bay.
443. If coal is found here, and it has to be shipped, that can be done by extending the main line to Jervis Bay? I could not favour anything but the extension of the present line; nothing else would be satisfactory. The land between here and Jervis Bay is well suited for growing fruit.
444. Does Jervis Bay require any improvement upon it? I am not prepared to say what improvement Jervis Bay would require. It does require improvement, but it is one of the best harbours in the Colony.
445. Would it require a breakwater? I believe it would.
446. For what purpose? I could not go into that.
447. Cannot the shipping enter at any time? Yes.
448. Then why would it require a breakwater? It might require one to improve it. I have seen vessels come in there during a great storm in perfect safety and anchor there. My reason for advocating Jervis Bay is that it is one of the best natural harbours you could find, and it would open up a large trade with the other colonies.

Mr.  
J. Wilson.  
21 Jan., 1897.

Mr.  
L. M'Intyre.  
21 Jan., 1897.

- Mr. L. McIntyre.  
21 Jan., 1897.
449. Your evidence is that if a railway were made to Jervis Bay, and wharfs and jetties were erected, it would be used as a harbour? Yes.
450. You do not mean to say that coal from Illawarra would be taken to Jervis Bay? I do not know whether it would be. I believe that some coal from Illawarra would be taken to Jervis Bay.
451. Do not you see that the distance from Illawarra to Sydney is shorter by rail? In sending the coal to Sydney they have to deal with a much steeper grade than they would have from Illawarra to Jervis Bay.
452. Do you think it probable that they would send the coal a longer distance by rail to Jervis Bay, tranship it to steamers, and then send it round to Sydney? Sydney does not consume the whole of the coal. Jervis Bay would be nearer to Sydney than Melbourne.
453. The greater portion of the southern coal trade appears to be done by colliers, the coal being transhipped at Sydney, where there are conveniences which we could not have at Jervis Bay;—under those circumstances do you consider that the coal would be brought to Jervis Bay to be sent to Sydney? I do not.
454. You are aware that the great ocean-going steamers make Sydney their port of destination, and whilst they are taking in cargo they are being coaled by colliers alongside? Yes.
455. I suppose that the extension of the railway across the river would be a very expensive matter? Of course getting across the river would be an expensive item, but it would not be a very expensive line to make between the river and Jervis Bay.
456. If the railway were extended to Jervis Bay I suppose the residents of this district would feel pretty well satisfied? Yes. I am well aware that they are very dissatisfied with the present state of things.
457. Under these conditions they have no objection to offer to Port Kembla being made their harbour? I do not think they have.
458. Have you any thing else to say? I believe that if a harbour were made at Jervis Bay, and the railway extended to it, it would open up a large trade with the other colonies, and it would become a very important port. If the seams of coal in the vicinity of Jervis Bay prove as valuable as we hope they are we may make it a second Newcastle.
459. Do you not think it would be as well to test those coal-seams first of all? Yes; I was not aware that the coal was of an inferior quality.
460. I suppose it is the general wish here to see the railway extended to the bay? Yes; I think that all the people in the district believe that we ought to open a harbour at the bay.

---

Mr. John Maclean, newspaper proprietor, Nowra, sworn, and examined:—

- Mr. J. Maclean.  
21 Jan., 1897.
461. *Chairman.*] What are you? Newspaper proprietor.
462. How long have you been resident in the district? Eighteen years.
463. You are conversant with the resources of the district? Yes.
464. Have you any knowledge of the proposal to construct a deep-water harbour at Port Kembla? Only from what I have seen in the newspapers.
465. Are you of opinion that Jervis Bay would be a more suitable place for a harbour than Port Kembla? I am of opinion that Jervis Bay would be the most economical for us as taxpayers.
466. Will you give the reasons for your opinion? I have read that the complete scheme for a deep-water harbour at Port Kembla will cost £440,000. I am under the impression however that a complete scheme would exceed a cost of £1,000,000.
467. The scheme under the consideration at present is not to cost more than £440,000? I put it in this way. The distance from the present terminus of the railway at Bomaderry, as sworn to by engineers of Departments before your Committee, is 1 mile and 70 chains, and that it would cost to make the line, including the bridge across the Shoalhaven River, £75,000. Then there is a distance of 14 miles from Nowra to Jervis Bay at £3,000 per mile; that makes £117,000, not speaking of the piers or anything of that kind which would possibly be the work of the company that would get the foreshore from the Government. I put that against the £400,000, and I say that, in round numbers, there is a saving to the taxpayers of £200,000. Then I look at this fact—that the line from Sydney to Nowra is already £52,000 a year in debit, as regards interest. I disavow any personal interest whatever in the matter. I have no land at Jervis Bay. Looking at the relative cost of the two schemes, and especially at the loss of £52,000 a year on the existing railways, I ask whether the construction of parallel competing lines of traffic, by making ports in the Illawarra district, will not involve the taxpayers in further loss, instead of helping to reduce the deficit. Will not creating greater facilities for shipping between Jervis Bay and Sydney decrease the traffic on the railway between here and Sydney, and increase that debit instead of reducing it;—is it the business of the State to spend money to increase the value of private property while decreasing the value of the State property. I say, although I am not an expert, that the increase of harbour accommodation between here and Sydney must decrease the traffic upon the railway. Ships come down here loaded below their Plimsoll mark now owing to our having the river. If it was not for the river the railway would have the whole of the traffic. I am told that the same thing occurs at Wollongong. The railway gets only the up freight. I see that there would be an area of about 260 acres in the harbour of Port Kembla for an expenditure of £400,000, but in Jervis Bay, the natural inheritance not only of this district but of the State, there is an area of 26,000 acres. At Jervis Bay there is that area of absolutely safe harbour, which has been testified to by Admiralty officers. I say further it is a statutory obligation on the part of the Crown both to the taxpayers here and to our bond-holders in London to complete the railway to Jervis Bay. The very first petition for this came from Wollongong, at the very inception of the movement in favour of the south coast railway in 1876. There was a great deal of contention about the matter in the Assembly when the first Bill was brought in by the late S. W. Gray to provide for the connection of the "deep waters of Port Jackson with the deep waters of Jervis Bay". The proposed line as first submitted to the Assembly in Sydney and to the stockholders was to be a line from Sydney to Jervis Bay. When a few of us from here asked for some deviation which it was thought necessary, when the people of Wollongong asked that the line might be deviated into Wollongong, they were informed that this was not a line of railway for Wollongong, Kiama, or Nowra, but a line from Sydney to Jervis Bay. I have no doubt that if the Appropriation Act was looked into it would

would be found that the line provided for was a line from Kiama to Jervis Bay, and there is a further instalment of £800,000 put on the estimates of 1891 for this line. I believe that on that occasion the phraseology used in the Appropriation Act was Sydney to Jervis Bay. The Sydney to Kiama line was passed in March, 1879, and it was in 1891 that the subsequent portion was agreed to. I pointed out that there is an obligation on the part of the Government to complete the line to Jervis Bay. Not long ago the proposed extension across the river was submitted to the Public Works Committee, who recommended the extension of the line into Nowra. It is the bogie of the bridge that has scared the Commissioners into leaving the line 2 miles out of town and putting an additional charge of 5 per cent. on freights from Bomaderry to the township. The construction of this extension has been submitted to four Committees and approved, and when money was borrowed it was contemplated that a connection would be made between Port Jackson and Jervis Bay. That is the scheme as originally submitted. Some of the coal-owners have stated that if the line were extended to Jervis Bay the coal-owners about Wollongong would decline to ship their coal at Jervis Bay. I take it that the objection to Jervis Bay is a freight objection, the Commissioners charges being 2d. per ton per mile for loads of not less than 150 tons. 468. The charge for minerals is  $\frac{3}{4}$ d. per ton per mile? I have here a copy of the *Sydney Morning Herald*, dated 4th June, 1894, which gives several particulars of an interview with Sir Thomas M'Ilwraith after his visit to America. According to Sir Thomas M'Ilwraith there has been a revolution in railway management in America, and if his statement is correct they manage to make mineral traffic pay at very much lower rates than are charged in this country. Under the heading of "Canadian Railway Management," Sir Thomas M'Ilwraith says:—

Mr.  
J. Maclean  
21 Jan., 1897

On being informed that a recent cable message had conveyed the news that he had been able to do nothing with respect to land-grant railways, and also that there was some divergence of opinion in the Ministerial party, and even among Ministers themselves, as to the railway policy of the future, Sir Thomas said that it was true that he had declined to give his London interviewers information on the subject, but he had nevertheless been actively engaged in prosecuting inquiries in both America and London. His conferences with the leading Canadian railway men had been a revelation even to him. He found that on one line goods were profitably carried long distances at the rate of a farthing, and a profit of one-eighth of a penny per ton per mile; while on another the accounts showed a profit of 25 per cent. with a rate of a farthing per ton per mile. The secret he found to be the avoidance of steep gradients. On the Great Trunk line the ruling gradient even across the Rocky Mountains was 1 in 120, while the curves were not by any means sharp. Level roads meant big loads with a minimum expenditure of power, while low rates meant a big business. In one case mineral ore was moved in large quantities over 1,000 miles of railway, then transhipped into steamers and carried across the lake, and finally sold at its destination for 10s. 6d. per ton.

Sir Thomas M'Ilwraith makes this significant remark:—

The railway managers never doubt the possibility of so developing the traffic as to make a line pay, for every district or section of the country possesses the potentialities of profitable traffic, and only needs development by skilful management, influenced by enlightened self-interest

There is a probability of Jervis Bay being a more suitable coal harbour in the end than Wollongong. Then they have Crenorne, Moorfield, and other places where coal exists. Moorbank, which is the property of the Church of England, has a 6-ft. seam. These properties are going to be developed, so that the northern districts will fairly supply the metropolis, and Wollongong will have to look southwards for a market. In the race for the Melbourne market by the utilisation of Jervis Bay there would be a saving of 360 miles at sea, comparing the distances between Newcastle and Wollongong. I say that there is a probability that Sydney will cease to be a market for Illawarra coal, considering the possibilities of the metropolitan district. The gradient on the railway from Wollongong to Sydney is 1 in 40, and on that grade the hauling power of a locomotive would be from 360 to 80 tons. A number of people who have discussed the matter in the *Sydney Morning Herald* have shown that freights similar to those mentioned by Sir Thomas M'Ilwraith are common in the United States, and that the lines are paying.

469. Do you think it probable that ocean-going ships would come and load coal at Jervis Bay when they can bring out a cargo to this country and take in coal at Newcastle? I have given that slight consideration. The distance from Point Perpendicular to Sydney Heads is 60 miles, and I think it is the same distance from Sydney to Nobbys. It would therefore become a question of the quality of the coal. If a ship came from Frisco with wheat or flour she would discharge at Sydney, and in returning to Frisco she would be on her way back on going to Jervis Bay, and she could be sailed into the bay, where she could take her coal if there is not a preference to Newcastle coal. If I were a skipper and could get my cargo 60 miles nearer my destination in a safe harbour, I should give that harbour the preference.

470. You are aware that the colliers load at the various jetties and take their coal south? Yes.

471. The question arises whether the colliery proprietors of the Illawarra district would make use of a railway and port so far distant from their present scene of operations, when they possess facilities for shipping which can always be availed of in fairly good weather? That involves the question whether any expenditure at all is necessary in providing further harbour accommodation. I admit that if there is not the contemplation of a large extra traffic there would be no necessity for further accommodation. I would not say that a profit would result immediately from the construction of a harbour at Jervis Bay. I only take it as the lesser of two evils—the spending of £440,000 at Port Kembla or the spending of a certain sum in railway extension—which has become a statutory obligation. Some years ago I went to Melbourne, entrusted by certain trustees with the sale of the Coalcliff property. I met leading Victorian coal-owners and I found that there was a very serious objection to purchasing a coal property at Wollongong, owing to the want of a harbour. Owing to that I did not succeed in disposing of the Coalcliff property at the time. From what I understand from the boring which has taken place and the prospectuses which have gone out, developments of the coal supply must take place which will shut out the southern coal trade from the Sydney market. I say that they must go southward. It is to a great extent a question of grades. To-morrow there will be a gentleman here who will show that between here and Jervis Bay the gradients will be such that they will not be so expensive in haulage as the grades on other portions of the railway. Therefore the question of cost of traction to the Wollongong coal-owners ought not to be so serious a matter after all.

472. With regard to the collieries in the southern district, do you think that the distance from those collieries will prevent a very large trade from being done? I do not think that the Wollongong coal-owners could send their coal at the existing rates. The existing trade is an intermittent one, and I would not contend that it would be transferred to Jervis Bay.

Mr.  
J. Maclean.  
21 Jan., 1897.

473. The Bellambi people want a harbour, and they say that if the harbour is constructed at Kembla they will not use it. The Port Kembla people might say that they would not use a harbour at Jervis Bay; therefore, any attempt to concentrate the coal trade to Jervis Bay might not be a very profitable undertaking? I do not think that the present trade can be got away from where it is. The steamers suit the trade, and they are Wollongong people who are carrying on the business. If large vessels are coming in, the answer of the taxpayer ought to be that we have a harbour ready, and that we can freight the coal at a rate that will pay, and that instead of spending £440,000 in making a harbour in the Illawarra district we will spend £150,000 in making a line to Jervis Bay.

474. Then your opinion is that if the Government intend to spend a large sum of money in the construction of a harbour on the south coast, the requirements of the trade can be met by the extension of the railway to Jervis Bay? That is it.

475. At a less cost to the taxpayer, and at a reasonable profit? Yes; and with a reasonable probability of decreasing the enormous loss upon the existing south coast railway. I should like to emphasise the fact that the more harbours we make parallel with the railway, the more we shall increase the debit in connection with the existing lines. We ought to look to that, especially in the face of the fact that it is said that private enterprise will open up Lake Illawarra.

476. Would your knowledge of Jervis Bay enable you to say that it will not be necessary to spend money on it to make a harbour? There is an average depth of 10 fathoms of water. I have been there in all weathers, and I think you can get the officers in charge of the naval station to give their opinion upon it. I believe that they will report favourably with regard to Jervis Bay as a harbour. It is looked upon as a harbour of refuge, and vessels are constantly going there in bad weather.

477. Is there any difficulty in getting out? There is an opening of 2 miles in width. There is no fear of missing stays.

478. The only expenditure necessary to make it a valuable harbour would be in the construction of the proposed railway? Yes.

479. *Mr. Black.*] One of your arguments was that all the coal-owners north of Kembla might send their coal as cheaply by rail or by small steamers to Jervis Bay as to Sydney to coal ocean-going steamers? I said that if the line was extended to Jervis Bay, vessels could come in light ballast to the bay and take in coal there instead of going to Newcastle. I referred to the grain boats which are now carrying corn to Sydney from San Francisco and elsewhere.

480. You say that if these ocean-going steamers go to Jervis Bay for coal, they would have the advantage of being further on their way; but would they not have the expenses of double pilotage and double harbour dues? It costs 3s. 6d. a ton to lighter coal to Sydney. I have not said I would lighter it, but it would be preferable to carry it by rail if we could get the freights which Sir Thomas M'Ilwraith spoke of.

481. Do you think they could carry the coal cheaper to Jervis Bay than to Sydney? In the case to which I have referred they have to go into decimal fractions to find out the freight. If we have got to an irreducible minimum in freight there is no more to be said.

482. The southern coal trade is not now done with large ocean steamers, and the desire of the coal-owners is to provide a harbour which would not be objected to by the insurance companies? I undertake to say that not one of those vessels would leave their berths in Sydney if you had any number of harbours.

483. Do you think that those boats would come and coal at Jervis Bay or that the coal-owners north of Port Kembla would send their coal to Jervis Bay to load the vessels? At one hatch they are discharging and at another they are taking in coal at the same time. Time is money, and they cannot go to two harbours.

484. Do you not see that if the improvement of Port Kembla or Jervis Bay will not attract those boats any expenditure by Government would be thrown away? If those boats did the whole of the coal-carrying that theory would be correct, but there is a large number of ships carrying merchandise from all parts of the world which do not go back in ballast, but, in preference, go back in coal. There is plenty of coal on the south coast, and we often see that the collieries are only working half-time, or even less.

485. If the colliery proprietors declared that they could not use Port Kembla as a harbour, and preferred to continue to use their present jetties, is it not obvious that such a harbour as you desire at Jervis Bay would not supply the wants of the coal-owners? I have only contended for Jervis Bay line as part of a contemplated scheme. We could not expect 120 miles of railway to carry more cheaply to Sydney than a harbour alongside of it.

486. We are considering whether Jervis Bay would be a better harbour than Port Kembla? I have never contended that the Orient boats should not go to Port Kembla.

487. Your argument is that the grades being better between Port Kembla and Jervis Bay the coal-owners would prefer to send their coal to Jervis Bay than to lighter it to Sydney? The Orient boats and all the large ships cannot afford, on account of the great cost, to go anywhere for coal except where they are discharging and receiving cargo.

488. You say that the grades on the railway between Sydney and Kembla being very steep coal-owners would prefer to send their coal to Jervis Bay rather than send it to Sydney? I did not say that. Wollongong people say we want a deep-water harbour for the shipping. I say that as taxpayers we cannot entertain that. I say that if we are going to have a traffic which is not at present in existence we ought to complete the 17 miles of railway to Jervis Bay at a cost of £117,000 instead of spending £440,000 to make a fresh harbour at Port Kembla.

489. I want you to show that those people will use the harbour at Jervis Bay? I do not say that they will use it; we have their evidence that they will not because their harbours already are sufficient for their present shipping.

490. If they will not use it, why should the Government spend money in connection with Jervis Bay? We do not desire that the Government should spend money at Jervis Bay. Wollongong says we cannot let our coal trade expand for want of a deep-water harbour, and the Government say it will cost £410,000 to make such a harbour. Then the Public Works Committee is asked to say whether it is desirable to spend that amount of money, and whether a harbour could be provided at a less cost, and we are here to say that if it is true that a deep-water harbour is required such a harbour can be provided at Jervis Bay for half the proposed cost of Port Kembla.

491. *Mr. Farnell.*] You think that the Government would be as much justified in spending money at Jervis Bay as at Wollongong? Yes.

492. Until that development which they speak about takes place, you say that there is no justification for the expenditure of the great amount of money which the proposed new harbour will cost? That is it in a nutshell.

Mr.  
J. Maclean.  
21 Jan., 1897.

493. As regards Jervis Bay, can you tell us during what portion of the year Jervis Bay would be available for shipping coal? It is available at all seasons and in all weathers. There is no sea there that would cause inconvenience to a ship of large tonnage, but there might be sufficient to give you a wetting in a small boat.

494. During three-quarters of the year you think that Jervis Bay would be available for shipping? Oh, yes; right through the year. There is a distance of 9 miles from the offing, which is sheltered by Bowen Island, to the west side of the bay. It contains from 8 to 10 fathoms of water, and has good holding-ground.

Mr. O. J. Beckett, orchardist, Falls Creek, sworn, and examined:—

495. *Chairman.*] What are you? Fruitgrower. I live at Falls Creek, 7 miles from here, on the road to Jervis Bay.

Mr.  
O. J. Beckett.  
21 Jan., 1897.

496. How long have you been there? Ten years.

497. *Mr. Clarke.*] Can you give any statement as to how the public would benefit by the construction of a railway from Bomaderry to Jervis Bay? I wish to corroborate what has been said by Mr. Maclean; and I wish to add that there are thousands of acres of land in the Jervis Bay district suitable for growing fruit and for vineyards. It is some of the best land in the Colony for that purpose. The Government in 1882 sent Mr. Bernard to the Bordeaux Wine Exhibition, and his advice was that no large vineyards should be planted in the Colony outside the sea air. There are thousands of acres of land there that will produce as fine a fruit as I now produce here. That fruit has been grown on land which ten years ago was standing forests. The Minister for Agriculture is trying to develop an export trade. Why should not the Government encourage the occupation of all these thousands of acres of land. You can grow very fine fruit out there, but it is impossible to send it to market. According to Mr. Bernard, large vineyards should not be planted outside the influence of the sea air, and to give a light wine the vines should be planted in a soil containing 60 per cent. of sand, and you need never fear the phylloxera. There are thousands of acres of Crown lands of that kind in the Jervis Bay district for anybody to occupy. They ought to make a railway down there, reserve the Crown lands, and then gradually sell them out, taking care not to let syndicates get the best of it. It would not take a great amount of money to clear the land, and in a few years' time we should have hundreds and hundreds of people employed there. That would make Jervis Bay go ahead as a shipping-port.

498. Is the land between here and Jervis Bay suitable for any other purpose than fruit-growing? Principally for fruit-growing and vineyards.

499. What sort of a grazing country is it? It is a fair grazing country, but I look forward to seeing it an immense fruit and wine-growing district.

500. You say that you are only about 7 miles from Nowra? Yes; 7 miles from Nowra, and 5 miles from Jervis Bay.

501. Could you not avail yourself of the present modes of communication with Sydney? If fruit is carried 7 or 8 miles over a rough road it would be destroyed.

Mr. George Underwood Alley, farmer and grazier, Sassafras, sworn, and examined:—

502. *Chairman.*] What are you? Farmer and grazier.

503. Where do you live? Thirty miles south-west of Nowra.

504. *Mr. Farnell.*] Have you considered the proposal placed before the Committee to construct a harbour on the south coast? Yes, I have given it some consideration.

505. Have you a knowledge of Jervis Bay? Yes.

506. How have you gained that knowledge? I have been at the bay several times, and I can see it from my own door. From my own place I can see war-vessels there at practice.

507. Did you hear the evidence of Mr. Maclean? Yes.

508. Do you agree with that in the main? Yes; I quite agree that Jervis Bay is a good harbour, and could be made a great help to the district.

509. Is there any additional information which you would care to give the Committee in reference to the construction of a harbour on the south coast? I cannot give any evidence as to the necessity for a harbour on the south coast, but I can say that if Jervis Bay was a harbour for ocean-going vessels it is very likely that the coal-measures in our district would be developed. There are large coal-seams about 3 miles from my house.

510. Do you not think that the best course would be to ascertain the permanence of those deposits before constructing a railway and forming a harbour? They have been tested. Shafts have been put down, and the coal has been analysed, and I understand that it is a very good coal. There is a large deposit of shale as well. I have not tested it all the way down, but I have tested it over half-a-mile.

511. Your contention is then that a natural harbour exists at Jervis Bay, and that there is no necessity to spend a large amount of money in making a harbour at Port Kembla? Yes.

512. *Mr. Lee.*] How far would that coal be from Jervis Bay in a direct line? About 20 miles.

513. Will you explain how the expense of the railway from Nowra to Jervis Bay would develop the coal properties you have spoken of? If there was wharfage accommodation, and vessels came into Jervis Bay, there is no doubt that the parties owning the coal-land would make a railway from the coal-field to the bay, so as to ship the coal there.

514. Could it not be done at present? There is no wharfage accommodation where vessels could be loaded. You have Jervis Bay, the finest harbour on the coast.

515. Is it not the custom for all colliery proprietors, when they have payable seams of coal, to construct their own railways and erect their own jetties? Possibly.

516. Have they not done so in many cases? I dare say they have where the mines were very close to the water's edge, but these coal-seams were some distance away.

517. If there was a payable seam of coal at Jervis Bay, do you not think that private enterprise would make a railway for shipping purposes? I can hardly say whether it would or not.

Mr.  
G. U. Alley.  
21 Jan., 1897.

Mr. Jacob Elmoose, fisherman, Sussex Inlet, sworn, and examined:—

- Mr. J. Elmoose.  
21 Jan., 1897.
518. *Chairman.*] What are you? I am a fisherman, residing at Sussex Inlet, about 25 miles from here, and south of Jervis Bay about 10 miles.
519. *Mr. Wright.*] Can you point out any benefits that would result from the construction of a railway to Jervis Bay? It would benefit the fishing industry, which it is impossible to carry on in the summer time. That would go a long way towards paying the interest on the outlay.
520. How many tons of fish would you send to Sydney in a day? I could not send many; but the railway coming there would develop the industry. Jervis Bay has the best fishing-grounds about there.
521. Do you think that if a railway was made more fish would be caught? Yes; they cannot get their fish to market in the summer time.
522. Can you give us any idea how many tons of fish would be sent away in a year? During the last six months I have sent away 700 boxes.
523. What is the weight of a box? Three-quarters of a hundredweight.
524. Where do you catch them? I catch them in St. George's Basin.
525. Can you tell us of any other benefit that is likely to accrue from the construction of a railway to Jervis Bay? No.
526. Do you think the country would be taken up by settlers? Yes, it would. It is all Government land at the back of where I live.
527. You think that a railway would induce a large population to settle there? Yes.

Mr. James Thomas Jones, cattle-dealer, Nowra, sworn, and examined:—

- Mr. J. T. Jones.  
21 Jan., 1897.
528. *Chairman.*] What are you? A cattle-dealer.
529. Where do you live? At Nowra. I desire to inform the Committee why Nowra people ask them to come here. Their motive is a patriotic one. It was thought that if a large sum of money was to be spent in the construction of a harbour we ought to advocate the making of a railway between Bomaderry and Jervis Bay. That would be a better thing than to make a harbour at Port Kembla.
530. *Mr. Roberts.*] Have you any further statement to make? Yes; I consider that if a south-coast harbour is required, nature has provided one at Jervis Bay already. The cost of making a harbour at Port Kembla would be very great, and the thing might ultimately prove to be a white elephant. The harbour at Port Kembla will be constructed for the coal proprietors—one class of the community. I consider that it is wrong to spend money on a class. We want a harbour at Jervis Bay for the export of coal and for many other purposes as well. We want it to open up the country for miles around Jervis Bay. A gentleman has stated in his evidence that the district in the vicinity of Jervis Bay is a fruit-growing district. I have been living in the Jervis Bay district for nine years. I took up land there on the understanding that the Government were going to construct a railway right through to Jervis Bay; but they deceived me. I tried fruit-growing, and I proved that the land is very suitable, especially for grapes. There is a large tract of country south of Jervis Bay—between there and Berryherrie River. It is on a short neck between the lake and the sea. That country would more than pay the Government for all the cost of constructing a railway from Bomaderry to Jervis Bay. I think there are over 40,000 acres there of the best land to be found in Australia for growing fruit, especially grapes. If a railway was constructed I do not mean to say that the trade would go by the railway; there is no doubt that the produce would be shipped away, but the railway would have the effect of settling people on the land, and the Government would gain by that. The Crown would be able to sell the land at a good price and it would bring in more money than it would cost to construct the railway from the present terminus to Jervis Bay. As you have already been told we have coal-measures in the district all the way from Jamberoo to the Sassafras Mountain. The Jamberoo coal has been tested and according to reports it is one of the best seams in the Colony. I heard a gentleman remark that there was no coal of any commercial value south of Port Kembla. I spent nearly eighteen years of my life in coal-mines. I have prospected a good deal in New South Wales, and I was proprietor of the Singleton coal-mine at one time. I prospected that coal, and I sent a truck to the Government to try, the result being that it was 5 per cent. better than any other coal in New South Wales. I got a contract to supply the railways, and since then I have come and settled in this district. I find that there is an exactly corresponding seam of coal, as regards quality, close to Jervis Bay. A seam of coal, the like of which they have not got at Wollongong and Kembla. They have nothing that could stand alongside of it. I have a knowledge of coal, and I say that that coal is better than the Wollongong coal. I do not want you to make the railway line because we have got coal, if you have not the money to spend; but you should not go and build an artificial harbour on the coast when we have such a magnificent natural harbour at Jervis Bay, close at hand. We have in the neighbourhood of Jervis Bay a tract of land which has been crying out for a railway from Nerriga to Braidwood. The people of that district have long been wanting a railway for the carriage of their produce. It is 132 miles from Sydney to Goulburn. It is 51 miles from Goulburn into the town of Braidwood. That makes 183 miles. By taking a railway from Jervis Bay to Braidwood, you reach Braidwood by going a distance of 67 miles, therefore you save 116 miles in reaching a shipping port. You save 116 miles of a haulage by railway, which should be a great consideration for both the Government and the people of this country. That country is offering the Government a very fair thing for making a line. The principal part of that country, right through from Nerriga to Braidwood, is Crown lands. That land would all be taken up by settlers if they had a railway connecting Jervis Bay with the deep-waters of Port Jackson.
531. *Chairman.*] Are you aware that the coal-owners will have to pay so much a ton at Port Kembla in shipping coal? They can ship the coal at their own jetties, and if you make a harbour at Port Kembla, I do not know that there is any guarantee that they would give you the whole of the coal trade. From a national point of view we want a railway connection with Jervis Bay. It is required for defence purposes. It is important to New South Wales, and to Australia at large, to have Jervis Bay connected with Sydney by railway. Another reason is this, that we know that Jervis Bay will be a permanent harbour. Science is going ahead by leaps and bounds, and at present there are ships building that would not be able, with safety, to enter Sydney Harbour. A railway to Jervis Bay would improve the fishing business. We would urge you, whether you build a railway to Jervis Bay or not, not to make a harbour at Port Kembla.

SATURDAY, 23 JANUARY, 1897.

[The Sectional Committee met at the Council Chambers, Nowra, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).	
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. DANIEL O'CONNOR.	THOMAS HENRY HASSALL, Esq.
HENRY CLARKE, Esq.	GEORGE BLACK, Esq.
CHARLES ALFRED LEE, Esq.	FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Mr. Christopher Graham, Mayor of Nowra, sworn, and examined:—

532. *Chairman.*] What are you? Mayor of Nowra.

533. Do you desire to make a statement? Yes. Having heard that the Government had been requested to construct a deep-water harbour at Port Kembla, and that the matter had been referred to this Committee for report, it occurred to certain taxpayers of this town, myself amongst the number, that it would be well to direct your attention to the fact that we have a good harbour at Jervis Bay, and that the Government had already constructed a railway for the purpose of promoting the coal trade at an enormous cost to the taxpayers of the Colony, and I believe at a loss, too. Such being the case, it is my opinion that the better way to promote the coal trade, and the safest way for the taxpayers, would be to complete the railway from the deep-water at Port Jackson to Jervis Bay; that it would be better in the interests of all concerned for the Government to carry the coal at a low freight to Jervis Bay or Port Jackson than to go to the great cost of constructing a harbour at Port Kembla, with the off-chance of being able to collect sufficient harbour dues to pay the interest on the outlay. It is my opinion that coal delivered at Port Jackson would command a much higher price than at Port Kembla,—that in point of fact coal delivered either at Jervis Bay or Port Jackson would command a higher price and would pay the producer and the Government better than it would be likely to do at Port Kembla. The Government would have no guarantee from the mine-owners at Port Kembla that they would receive sufficient in harbour dues to pay the interest on the expenditure. Although you may tell me that the harbour will cost, to start with, £200,000 or £300,000, my opinion is that if you spend that amount you will end by spending half a million, or perhaps more, before the scheme is complete. I cannot see that you have any guarantee that that scheme will pay better than the one already started, that is the railway scheme which was commenced at the instigation of those coalmine-owners on the understanding that they would support it and that it would pay. Now they want to drop the railway, and they want the Government to construct a harbour at Port Kembla to promote the coal trade. I do not know what they will want next; but I say that I think it will be an injury to the country to undertake the construction of that harbour. I do not think it will ever be a safe harbour, even if you go to an expenditure upon it of £440,000. I do not think it will ever be equal to Port Jackson or Jervis Bay. If the railway is extended to Jervis Bay there is a prospect of increased freight from the line. At the present time the people of this town are bringing metal from Kiama, but we have to pay more for carting it from Bomaderry than we have to pay for getting it from Kiama to Bomaderry. If the railway were constructed the whole of the distance there would be a better chance for the line to pay than there is at present.

534. *Mr. Roberts.*] Have you an intimate knowledge of the coal trade? Not beyond this, that large steamers, such as the mail steamers, would not be likely to put into Port Kembla for coal if they could get it at Port Jackson.

535. Are you not aware that large steamers up to 7,000 tons burden occasionally call in at Port Kembla? I am not aware of that. I think it would have to be very calm weather.

536. You will admit that if a breakwater were constructed to protect Port Kembla visits of large ships from foreign ports would be more frequent? Such a thing might be; but I cannot see why those large seagoing vessels which bring cargo to Sydney should not prefer to coal in Sydney harbour even if they had to pay a higher price for the coal.

537. Would it not be a great advantage for these steamers to be able to get the coal almost at the pit's mouth instead of having it put into colliers and taken to Sydney to be transhipped? The better way would be to have it delivered from the railway on to the vessel—to have it carried to Sydney in a collier and then transhipped is an expensive process.

538. Will not the construction of a harbour at Port Kembla facilitate the shipment of coal and tend to still further develop the resources of the district? I have very great doubt about it. I have no great confidence in the progress of the coal-mines in that direction. The coal-owners are divided amongst themselves as to where they will ship the coal. Some advocate Bellambi, and others Port Kembla.

539. Do you think the best place to bring the coal to would be to Jervis Bay? I think it would be as good for the company to deliver the coal at either Jervis Bay or Port Jackson. If the Port Kembla scheme is carried out it will cost the Government about £17,000 a year, and that money would be better spent in conveying the coal by railway to Sydney. I am not an interested person except as a taxpayer.

540. You will admit that it would be better to take the coal to Port Jackson than to Jervis Bay? Yes; and I think it could be taken by railway, and that that would be better than incurring this large outlay at Port Kembla.

541. Have you ever been to Newcastle? No.

542. Do you not think that similar assistance ought to be given to the coal-owners in the south to that which has been given to the coal-owners in the north? I think that when they have got the railways they have got a very large item in the way of assistance; they have not been neglected.

543. You have heard of the great improvements which have been made at Newcastle? I am aware that a great deal has been spent there, and I would not mind if the Government spent a little here too, to promote trade; but I do not want them to do anything that will not pay.

544. Are you aware that the coal that is obtained from the southern collieries is different from that got from the Newcastle collieries;—the southern coal being steam coal, and the northern coal household coal? I have heard so.

545.

Mr.  
C. Graham.  
23 Jan., 1897.

Mr.  
C. Graham.  
23 Jan., 1897.

545. And there will be a considerable demand for southern coal if it can be delivered at a lower price, which the Committee are told can be done if a breakwater is constructed at Port Kembla. In view of that do you think it would be a wise thing to provide a harbour there? I will admit that there should be a harbour on the south coast if the harbour dues would not make the coal almost as dear as it would be at Port Jackson. I think I am safe in saying that the coal commands a higher price at Port Jackson than it would at Port Kembla and it could be delivered there more cheaply.

546. If you are shown that the probable revenue from the shipping at Port Kembla would pay the interest on the expenditure would you take a more favourable view of the proposal? If it would pay the interest on the outlay and at the same time the coal could be delivered as cheaply as it can be delivered now there would be something in your contention. In an undertaking of this kind I think everyone must see that the coal-mines depend a great deal upon the whims of the men employed in working them. The men may strike at any time and leave the mines idle for six months; how would your harbour pay then.

547. We expect that there would be an increase in the trade, but as a taxpayer you seem to regard the proposed expenditure as a waste of public money? I look upon it as a very risky undertaking. The Government have been constructing harbour works at Wollongong and other places on the coast during the last thirty years and the whole of the outlay has been to a great extent a failure.

548. Do you urge upon the Committee the desirableness of constructing a railway to Jervis Bay? I do.

549. Upon what grounds? Because it will give the proprietors of the coal-mines along the coast further south than Kembla a chance to ship their coal. I believe that there is good coal to be found south of Kembla.

550. In view of the possibility of the discovery of coal in this district, do you think the railway should be extended to Jervis Bay? The Government should complete their railway scheme before they enter on any new undertaking.

551. Would it be a great advantage if the railway came into the town of Nowra? It would give a better return.

552. Do you think that the Government lose a large amount of revenue through the terminus remaining where it is? I do think so; it costs a great deal to carry goods by water, which, if the railway came into the town, would probably be carried by rail.

553. Can you send your goods to Sydney at a lower rate by steamer than you can by rail? I am not sure that I can. I am paying in many cases on goods coming from Sydney 5 per cent. on the amount of the invoice. That is very high, and I think the railway should be able to carry the goods for that figure.

554. You would, of course, send your goods by the cheaper route? If we had a railway into the town, I do not think that the steamers would continue to come here.

555. Would they not lower their freight? I do not think so.

556. Do you think that no time ought to be lost in bringing the railway into the centre of the town? Yes, if the railway is to pay.

557. *Mr. Black.*] You said the Government have no guarantee that sufficient harbour dues will be received at Port Kembla to pay interest on the outlay in the construction of the harbour? That is my opinion.

558. What guarantee would the Government have, if they went to the expense of constructing a harbour at Jervis Bay and connecting it with the railway, that the returns would compensate for that expenditure? The extension of the railway to Jervis Bay would involve a cost to the Government of £3,000 or £3,500 a year.

559. Interest on the money expended? Yes. I think I am safe in saying that the Government would probably receive half that amount from the business people of this town, and that they would get still more revenue from Tomerong and other places further south.

560. Do you think that the construction of a harbour at Jervis Bay would meet the requirements of the coal owners north of Nowra? I think that coal would be opened up in the vicinity of Berry.

561. Do you think that the work we desire to have done at Jervis Bay would meet the alleged necessities of the coal owners north of Nowra who are asking for a harbour on the south coast? I think it is what they are justly entitled to.

562. Would they use it? I think they would.

563. Do you tell me that anyone who could send coal from Wollongong to Sydney, 42 miles, having it then alongside of the vessel, would prefer to send it to Jervis Bay where it would have to be transhipped to go to Sydney? I do not think that.

564. Then you cannot contend that the mine owners on the southern coast would use Jervis Bay as a harbour at all? No, except in some cases. There would be no certainty that they would.

565. If they wanted to get coal sent to Sydney they would not send it to Jervis Bay to be transhipped to Sydney and have the cost of double handling? I cannot say that mine-owners at Port Kembla would send coal to Jervis Bay. It is my opinion that vessels coming from Melbourne would be likely to get their coal at Jervis Bay at the same price as in Sydney.

566. Are there any such vessels? I should say there would be, if the Government wished to increase the coal trade with the colony of Victoria.

567. To what vessels do you refer? I refer to vessels that come specially from Victoria.

568. Are they colliers? Yes.

569. Then your claim is, that if there should be a coal trade between Melbourne and the southern coast,—Jervis Bay being nearer than Kembla to Melbourne,—that port would be more advantageous to the coal trade than Port Kembla? Yes.

Phillip Henry Morton, Esq., M.P., sworn, and examined:—

P. H. Morton,  
Esq., M.P.  
23 Jan., 1897.

570. *Chairman.*] You represent the Electorate of Shoalhaven in Parliament? Yes.

571. And you have an intimate knowledge of the district? Yes.

572. Are you acquainted with the schemes which have been submitted to the Committee? Yes; it is proposed to make a deep-water harbour at Port Kembla at a considerable cost.

573. The eastern breakwater is to cost £160,000? Is that the complete scheme.

574. That is for the eastern breakwater? But there is a proposal to spend £450,000.

575. It is proposed to expend £270,000 in the construction of two breakwaters? The proposal is to spend £270,000 in making a port.

576. Yes. Is it reasonable to suppose that the eastern breakwater could be made for about £133,000? That expenditure would be to give accommodation to the people who take coal from that port.
577. Yes? That alters the thing very considerably as compared with the first idea that I had. Speaking generally the first objection that I have is not confined to Port Kembla, but applies generally to harbours that are made in the open sea. From my experience, and I have had to go closely into such matters in New Zealand, such harbours have cost an enormous amount of money beyond what the engineers thought they would cost, and they have not been a success, owing to the great difficulties with which the engineers have to contend in the open sea. That is why I have objected to a harbour being constructed in an open roadstead. Having for business purposes to investigate the cost, the returns, and the prospects of most of the New Zealand open harbours, such as those of Oamaru, New Plymouth, and Napier, I find that the amount of money that has been expended in excess of the engineer's estimate was very large, and when the works were partially complete they were broken down by the sea. At Napier when the harbour was completed a big sea washed through the breakwater, and the same thing will have to be contended with in this case. If it were a question of getting some accommodation at the port already made at Jervis Bay as against the other, I would favour connecting the coal-fields with the port already made if the people will use it. The other question whether the Illawarra people will use it is for the Committee to go into. If a harbour is made at Port Kembla, and the Government charge reasonable harbour dues to get some return, will the people who already have private jetties use the harbour at Port Kembla except when there is some urgent necessity for them to do so. Except during heavy seas when they cannot use the private jetties, or when they have a greater demand for coal and have shipping which they have not accommodation for. Will they not use their own jetties when they can, and only go to the Government jetties (where they will have to pay heavy dues) when they are forced to go there. Unless there is some guarantee from the coal-mine owners that they will use Port Kembla harbour I cannot see that there will be any reasonable return on the outlay. These are the only two objections that I have to the Government spending money at Port Kembla. There is great danger in constructing breakwaters in an open sea. It is difficult to find out what will be their cost and also the cost of keeping them up after they have been made.
578. What do you say to justify the proposed extension of the railway to Jervis Bay? The Illawarra coal-fields can be connected with Jervis Bay at a cost of £120,000; but the question is, would the coal-owners use that line. I am not prepared to say that they would. The distance I believe from Wollongong to Jervis Bay is not very much different from the distance to Sydney. Another question is, is there coal to be opened up north of Jervis Bay, and is there any likelihood of its being opened up.
579. These are your main points? Yes.
580. Do you express an opinion with regard to the coal-fields? I can give no certain information as to where the coal is; there are rumours that it is everywhere, and I know that there is coal within a reasonable distance north of Shoalhaven River, in the Jamberoo Ranges.
581. Whether it has any commercial value you do not know? No; I am not an expert.
582. You desire to advertise the superiority of Jervis Bay over Port Kembla? Yes; over Port Kembla or any other port south of Port Jackson. Coal could be carried more cheaply to the southern ports of Australia from Jervis Bay than from any other port. I believe that wharfs could be provided much more cheaply in a smooth water port than in the open sea. The cost of wharfs at Jervis Bay would be as nothing compared with the cost of wharfs at Kembla or any other open sea port.
583. Another thing in favour of Port Kembla is that to reach Jervis Bay you have 50 miles of land carriage? Yes, from the mines that are now opened; but there may be coal much nearer.
584. Therefore it is in one instance interest upon the cost of construction and maintenance as against the charge for freight? Exactly. The line which one would advocate to be built at Jervis Bay to carry coal could be used from Bomaderry and there would be an increased traffic. There would be a small increased passenger traffic and a large increased goods traffic into Nowra.
585. Would there be any traffic in timber? No; if any timber is sent from Jervis Bay it will go to other parts of the world. There is a proposal to construct a light line of railway to Jervis Bay from the ranges far back, where there is magnificent timber. The timber is to be shipped to London. That is to be an accomplished fact—the shipping of hardwood timber. That would not do anything for the railway line; it would only assist to repay the Government any expense in constructing wharfs there. The extension of the railway would not benefit by the timber trade, because timber from Jervis Bay would not come this way.
586. Is there no timber between here and Jervis Bay? Yes, and that would go down by the extension of the line, which would only be a matter of 10 miles.
587. *Mr. Black.*] You base your assumption that Jervis Bay would be a cheaper harbour than Port Kembla on your opinion that it is more secure in rough weather? It is more secure in rough weather than the proposed harbour in Port Kembla will be after this expenditure.
588. Do you consider that all that would be required for the shipping trade in Jervis Bay will be wharfs? I think so.
589. You do not think it will be necessary to construct a harbour within the harbour? I do not think so.
590. Have you been there in rough weather? I have been there in all sorts of weathers and I have never been kept on shore.
591. Have you been there when a south-easterly was blowing? Yes. The bay is so large that you can get safe anchorage in some part of the bay in any gale. Behind the Hole in the Wall it is as safe as Sydney Harbour and there are portions of the bay that are always smooth.
592. And are there portions where it would be possible to construct a wharf alongside of which vessels of large tonnage could lie? Certainly.
593. And you think they could lie there in the roughest weather? Yes; there are places where in any weather at all the largest vessels in the world could lie.
594. Supposing there was a number of vessels waiting their turn at the wharf, would there be good anchorage for them? Yes, on both sides. The worst place is in the open mouth.
595. There would be no danger of their anchors dragging? I do not think there is the slightest danger.
596. What is the bottom composed of? I cannot say.
597. Then you only assume that there is good anchorage? I know from warships going there continually and making no complaints, and other ships going in for shelter.
598. Your argument is that coal could be carried more cheaply from Jervis Bay to any southern port than from any other port? I believe so. Cheaper because the distance is shorter, and cheaper because the vessels could wait there with more safety.

P. H. Morton,  
Esq., M.P.  
23 Jan., 1897.

P. H. Morton, Esq., M.P.  
23 Jan., 1897.

599. *Mr. Hassall.*] Do you think that if there were shipping facilities at Jervis Bay there would be any prospect of wool coming there from Braidwood? I would not like to say that—wool used to come there for many years. It is as good a route and shorter than that from the New England district to Grafton and the Clarence where wool does go.

600. There is a possibility of wool going to Jervis Bay? I do not think there is. I am of opinion that less wool every year will go to other places than Sydney. The tendency is to get the whole of the wool to Sydney. There is a desire to have the sale of wool in Sydney instead of sending it home. New South Wales people want to keep Sydney a market for wool, and try to stop the wool from being sent anywhere else. I believe that if once wool was carried down to Jervis Bay the Railway Commissioners would reduce freights and equalise cost to get it to Sydney.

601. *Mr. Farnell.*] Do you know the depth of the water in and near the Hole in the Wall? No.

602. Would it be shallow water as far as a jetty would extend (say) 200 or 300 feet? No; I do not think it is very shallow.

603. Would it be any shallower than the water in the proposed harbour at Port Kembla? I should say that Port Kembla would be the deepest.

604. *Mr. Lee.*] Your contention is that to admit of the southern coal trade being carried on by large sailing vessels it would be cheaper to continue the railway to Jervis Bay than to construct costly breakwaters at Port Kembla? Yes; it depends on the cost.

605. You have already said that the coal trade would go on at Port Kembla and Bellambi even if a harbour was made at Port Kembla or Jervis Bay? I believe so.

606. Therefore your remarks are confined more to the sailing trade? Yes; the coal that goes out to the world.

607. What the colliery owners say it is necessary to compete for? Yes.

608. If the railway were extended to Jervis Bay do you think the coal business would go up there? I am positive that mines would be opened up. Melbourne is the chief place at present to look to. If coal can be got within a reasonable distance of Jervis Bay, say 20 miles, they would open up mines.

609. You are assuming that the mines would be on the northern side of the Shoalhaven River? Yes; I do not know enough about any other place to say whether coal could be got elsewhere.

610. To get to the bay a bridge would have to be constructed over the Shoalhaven River? Yes; and the cost of that would certainly be over £60,000.

611. If those mines were on the southern side of the river it would be easier? The coal would be more expensive to get at because it must be at a lower level. It is a different seam. I believe what is on the northern side is the Bulli seam, and on the southern side it is the Greta seam at a lower level altogether.

612. During your term of the representation of this district have the Public Works Committee reported in favour of the extension of the line from Bomaderry into Nowra? Yes.

613. If that recommendation were carried out, do you not think it would very largely meet the difficulty of getting to Jervis Bay? Certainly it would, because the extension to Jervis Bay would be a very small matter. The distance is only 14 miles, and it is easy country to get over. There are not many hills, and there is no low land. Therefore the cost of the expense of the line from Nowra once the railway was across the river would be comparatively small.

614. As a matter of fact it would then be within the reach of companies to construct coal lines to the bay if they had the advantage of a Government line into Nowra? Certainly. When you consider that the Government has an enormous area of Crown lands around Jervis bay which is now useless because it cannot be used to any advantage, it will be seen that the increased value given to that land by the extension of the line would afford the Government large returns.

615. Do you think those lands would be settled upon? I believe that a large area of them would be used to advantage, and there would be a good deal of settlement around the bay.

616. You are of opinion that it is advisable to extend the railway to Nowra, with the ultimate idea of taking it to Jervis Bay? Yes.

617. *Mr. Fegan.*] Have the owners of the land power to construct a line from their coal-measures? If it is private land they have.

618. Is the land fronting the shores of the bay private land? Much of the frontage is Crown land, and the matter of getting wharfs would have to be arranged with the Government.

619. Will legislation be needed? No; the matter will have to be dealt with by the Land Board.

620. Will there have to be legislation before they can construct a railway? Not unless they propose to cross land which does not belong to them. The Government would be asked for their consent to the erection of the wharf.

621. What about the passenger traffic? They cannot carry passengers.

622. So that if they are to utilise that line for passenger traffic, or if they have to ask the Government for land, legislation will be necessary? Yes; but I have never heard of any private proposal to construct a line from Nowra to Jervis Bay.

623. Was it not once intended to construct the railway from Bomaderry to Nowra? I do not know whether it was ever intended. I know that the Government submitted the matter to the Public Works Committee, but I am always doubtful of what a Government intend to do in such a case.

624. Do you remember when the present line was before Parliament and a certain sum of money was voted? Yes.

625. Was there any talk then of bringing the railway into the town of Nowra? Some people objected to it leaving Kiama unless it came into Nowra. My idea was to take as much as we could get if we could not get the whole.

626. I suppose you thought that if you asked for a line to Nowra you would get nothing? I believed so, because the Commissioners did not favour it.

627. Have many petitions been presented to Parliament in reference to the extension of the railway to Nowra or Jervis Bay? A great many petitions have been presented asking that the line should be extended to Nowra.

628. Have you made any representations on the subject? Yes; I have made representations to every Minister for Works.

629. What was the answer? The answer—that the matter would be considered and sent on to the Public Works Committee.

Mr. T. R. Peak, Secretary, Jervis Bay Railway Extension Committee, sworn, and examined:—

630. *Chairman.*] What are you? I am Secretary to the Jervis Bay Railway Extension Committee.

631. *Mr. Fegan.*] Have you any statement to make to the Committee that has not already been given? I will state my view of the Port Kembla scheme, but I would say that if we here are asked to provide a deepwater harbour to suit the colliery proprietors at Port Kembla our case is knocked on the head. The Government is asked to commit itself to the expenditure of £443,000 on the construction of an artificial harbour at Port Kembla for the convenience of eleven colliery proprietors, practically creating a monopoly for these people. There is no guarantee that the estimated amount will not be largely exceeded—indeed, the history of this class of artificial work shows that it nearly always is, that it is costly to maintain, and that it is liable at any time to be damaged or destroyed by coastal hurricanes or tidal waves. There is no evidence that the colliery proprietors interested will guarantee interest on capital expended; the strongest statement in this direction having been made to this Committee within the past week, to the effect that although the owners of private jetties would continue to use those jetties as long as practicable, they would eventually become too costly to maintain, and thereafter the port of Kembla only would be used. There are no unalienated Crown lands that this costly work would bring into the market, and instead of bringing extra freights to the Government railway, it would detract from that already non-paying line the very freights it was constructed to catch and cater for. The development of Jervis Bay, by continuing the line from Bomaderry to the deep waters of the Bay, would give the country an all time valuable national asset; would develop fishing, shipbuilding, timber, mining and other industries; would rapidly bring into the market over 400,000 acres of Crown lands that have hitherto gone begging at nominal prices, nearly the whole being offered at £1 per acre; would develop the good coal-seams known to exist at Jamberoo, Broger's Creek, Cambewarra, Sassafras, and Conjola; would rapidly sell thousands of acres of land between Nowra and Jervis Bay for fruit-growing purposes, for which it is eminently suitable, provided there was a quick get-away to market. The fact of the line crossing the river into the town of Nowra would immediately increase the returns, as the fact of the present terminus being over a mile and a half from the town, and the river wharfs being three quarters of a mile nearer, loses to the railway many hundred tons of freight annually, which it would otherwise carry. The fact that iron ore, limestone and coal are all to be found in close proximity to the Bay, makes it pre-eminently the natural home for iron and smelting works, and the fact that it is the most southern suitable port gives it an advantage over all other ports for ores coming from Adelaide, Port Pirie, &c. These briefly are our views in support of the Jervis Bay scheme. I have left a good many matters out because they have already been spoken of by other witnesses. There are 423,000 acres of unalienated Crown lands in the Jervis Bay district, exclusive of 22,000 acres reserved for timber, and 50,000 acres for other purposes. There are half a million acres of land which would rapidly come into the market if the railway were made. That would more than recoup the Government for any expenditure on the railway.

632. Would you mind telling the Committee why you make the assertion that the proposed harbour at Port Kembla is simply to suit the coal trade. On Thursday, Mr. Maclean was urging that the railway to Jervis Bay would develop the coal-fields when Mr. Black said, "Do you think that in the event of Jervis Bay being opened up the people of Kembla will send their coal there?" We do not know, and we do not care.

633. On what do you found the assertion that the harbour at Port Kembla is to suit the convenience of all colliery proprietors down there? I said, if you have come to the conclusion that a deep-sea harbour is to be provided for those colliery owners, my case is done.

634. *Mr. Black.*] Do you think the Committee would be justified in disregarding existing interests because of some prospective interest which might afterwards pay? Certainly not. Mr. Maclean spoke of the very low freights on easy grades in Canada, and so on, and in working the question out as to what it would cost the Port Kembla people to ship at Jervis Bay. I find that a freight of one sixth of a penny per ton per mile might induce people even at Port Kembla to ship at Jervis Bay.

635. Do you not know that the Railway Commissioners will not carry coal at less than  $\frac{1}{2}$ d. per ton per mile? I do not know why they should not; it is done in other places.

636. Do you know that the Commissioners were offered a million tons if they carried at a lower rate, and they refused? I do not know anything about that. That might be on a line where the grades were too heavy.

637. Mr. Maclean forgot to tell us that they have a larger population in Canada than we have here; a great deal depends upon that? Where there is a greater population there must be a greater traffic. But we should be shipping coal for the trade of the world, and there would be a great increase in smelting, and it is very likely that Jervis Bay will be a natural home for these works and that there will be a great demand there.

638. You say that there are extensive coal-fields at Jamberoo and other places? Yes.

639. And you quote Professor Taylor and others, coupling with those men the name of Mr. Jones? Yes; he is a practical man and has seen the coal.

640. Will you give us any idea of the seams of coal there? I cannot from my own knowledge.

641. As far as the coal measures are concerned, we must look upon your evidence as second-hand? Yes.

642. In reference to the price of land in this district, will you give us the ruling price per acre about Jervis Bay? The price varies very little. Some of the land on the banks of the creek is arable land, and fetches £14 or £15 an acre. The Government land which has been taken up brings from £1 to £4 per acre. People want £4 an acre for it.

643. Have there been any recent sales? About 100 acres have been taken up during the last two years at £1 an acre.

644. Has there been notice of auction sales, but no buyers? Yes; I have seen advertisements of sales which did not come off.

645. Have you been on the bay in all kinds of weather? I have been on it in fairly rough weather.

646. You have taken care when a storm was brewing to get away? I cannot say there is any danger in that bay.

647. The first question of importance to you is the extension of the railway from Bomaderry to Nowra? No; I cannot say that it is. The objection to the proposed harbour that struck us was this wanton waste of £440,000 in the construction of an artificial harbour when we know that there is a perfect harbour at Jervis Bay. We should not have agitated for this railway but for that.

648. The terminus is of very little importance as against the great object in pointing out Jervis Bay? Very little.

Mr.  
T. R. Peak.  
23 Jan., 1897.

- Mr. T. R. Peak.  
23 Jan., 1897.
649. *Mr. Lee.*] What return would there be to the Commissioners to pay interest on the capital expended in extending the line to Jervis Bay? Nothing much but the coal until the bay develops a general trade. Then there will be the whole produce of the district.
650. Do you think the Government Geologist should know whether the coal to be found here is a marketable commodity? Certainly.
651. If he told you that the coal south of Port Kembla was much inferior to the coal at Bulli or Kembla, what would you think of that? I should believe it if I knew nothing about it; but knowing what I do I doubt it.
652. Perhaps you will give us what knowledge you possess on the subject? Other experts have given a contrary opinion. I have lived amongst coal for many years. I have seen the coal here, and I agree with Professor Taylor and others in saying that it is a good commercial coal.
653. What is the thickness of the seam? At Conjola and Sassafras there are seams about 4 feet thick, and those referred to by Mr. Mackenzie, late Examiner of Coal-fields, range from 39 feet downwards.
654. Would you take his opinion before that of Professor David and Mr. Pittman? I should take the opinion of an expert, and I suppose that Mr. Mackenzie is one.
655. What would it cost to make a railway to Jervis Bay? £120,000.
656. Would you expend that on the authority of Mr. Mackenzie when Mr. Pittman is against his opinion? I would take Mr. Mackenzie's opinion. There is a prospectus before the country of a scheme to raise £250,000 to proceed with works including the building of a railway.
657. Have you ever been in any company for buying or selling minerals? I have not.
658. Have you read the prospectus? Yes.
659. Have you found that to be correct? They give a glowing account of things.
660. What are you referring to? I am referring to the prospectus of the Proprietary Land and Smelting Company for whom a report was written by Mr. John Mackenzie, late Examiner of Coal-fields.
661. And you produce it here? Yes; I also quote from Mr. Norman Taylor's report.
662. I suppose you are acquainted with the coal-fields at Kembla? Yes.
663. On account of the quality of the coal, a number of companies have opened up collieries there? Yes.
664. You say that Jervis Bay is a first-class harbour? Yes.
665. Without any improvements? Yes.
666. If the coal that goes to Jervis Bay is of such a good quality, and shipping facilities will be so favourable there, do you not think that companies would open up those properties? I do not think it is difficult to understand why they have not. They have to get over 20 miles of rough country with a railway.
667. I understand that the construction of a line to Jervis Bay would not cost much;—where is the rough country? From Broger's Creek, Sassafras, and Jamberoo.
668. It would not cost much to open a main-trunk railway from Jamberoo? No.
669. Have you any idea how much coal has been got from there? No.
670. Do you not think that if there are such valuable seams of coal there a greater development would have taken place before now? No; I consider that the 10 miles carriage on the railway and the 5 or 6 miles from the mouth of the pit kills it.
671. At Kembla they had a number of obstacles to contend with, yet they built their own piers and railway lines, and could not the same thing be done at these other places? In the other cases it is the freight. The position at present without facilities for shipping has prevented the development of those seams.
672. Or in other words those seams will never be developed until there is a railway to Jervis Bay? No.
673. How far is it from Jervis Bay to those seams? I should say from 25 to 28 miles to Jamberoo and Broger's Creek.
674. And to the next? The next to Nowra is in the Cambewarra Ranges.
675. And it is equal to any coal that you can get in the southern district? Yes, as far as I can find from the reports.
676. What about the timber? I am told that there is an immense field for timber; huge contracts have been let and arrangements have been made with the Government for the shipment of vast quantities of timber from Jervis Bay. This is all going to the European markets.
677. This is by a private company and the Government is going to give them facilities? Yes, at Jervis Bay. We are told that they intend to ship 1,000,000 feet per month.
678. They are constructing their own jetties and railway to carry out the work? Yes.
679. Have the people made any representations to the Government? No; they have no objection to it.
680. If it is decided to construct a harbour at Port Kembla, do you think it would be of any benefit to the people at Jervis Bay? Not the slightest.
681. Do you not think it would be a harbour for discharging cargo? I do not think so.
682. A vessel will not come empty and it will decrease the distance of carriage for the people here if cargo is landed at Port Kembla? I do not see what class of goods they would bring in.
683. You take stores here, and if goods were landed at Port Kembla you would have only half the distance to Sydney to carry them? We should still have to go to Sydney for all that we want here.
684. Do you not think that if goods are landed at Port Kembla it will induce people to open up a trade which they have not been able to open up yet? I do not think that these goods will ever be landed at Port Kembla; it is not a suitable place for a harbour.
685. Your patriotism will not let you go to Sydney if you can get goods cheaper from there? Port Kembla can never compete with Sydney, and merchants will not go to Kembla and establish warehouses.
686. But it divides the distance between here and Sydney? Yes.
687. Therefore, that will make it much better for the people here? I cannot see how it would benefit people here at all.
688. Should a railway be made from here to Jervis Bay, what shipping would you expect there;—would you expect goods to be landed there? Not in the first place; but we should afterwards, because I think it would compete with Newcastle, and to some extent with Sydney. The trade will be initiated by vessels from Adelaide bringing vast quantities of ore.
689. You expect a goods trade to develop ultimately? Yes; and merchants would erect warehouses here.
690. But they would not at Port Kembla? No.

691. You think the cost of constructing a line to Jervis Bay small compared with the amount of money that would be required to make a harbour at Port Kembla? Yes. Then there is the other great fact; that whereas Port Kembla would bring in no more revenue than would be required to pay the interest on the outlay, a railway to Jervis Bay would cause the sale of 400,000 acres of Crown land. It would pay the Government to make the railway for that, if for nothing else.

Mr.  
T. R. Peak.  
23 Jan., 1897.

692. *Mr. Black.*] Do you think that the land at Jervis Bay is of any value at all? Not on the foreshore, except for smelting works, and so on.

693. What can the bulk of the land between here and Jervis Bay be used for? Fruit-growing; it will grow excellent oranges and grapes.

694. Do you anticipate that if a harbour were constructed there there would be a sufficient quantity of fruit-growing to provide any large amount of freight? I think that within the next fifteen or twenty years there will be 100,000 acres under fruit.

695. Do you not think that there is land equally good for fruit-growing nearer to the market? Not of the same quality; that land is specially adapted for fruit-growing.

696. Do you think it is good for fruit-growing because it is bad for other purposes? No. It contains ingredients which enables us to raise good oranges and grapes.

Mr. John Maclean, newspaper proprietor, Nowra, sworn, and further examined:—

697. *Chairman*] Have you anything further to say? I produce two exhibits of coal taken from a coal-seam west of Jervis Bay in some 20,000 acres of Government land. I also produce a photograph of the personal extract of the coal, and showing the depth of the seam. The coal comes from the vicinity of Wandandian Creek. This, on the evidence of Professor David and Mr. C. S. Wilkinson, is one of the lower beds of the coal systems of New South Wales—the Greta coal. If necessary, I can lay before the Committee an analysis of that coal by Professor Taylor, late Government Geologist in Melbourne, in which he remarked that it is better than Newcastle coal for general purposes. A bore was made in 1891 by the Government, 7 miles north-west of Jervis Bay and 13 miles south of Nowra, at a spot called Tianjera Creek. This coal was struck at a depth of 1,300 feet. There are 10 feet of coal in bands, the thickest seam being 2 ft. 8 in. Mr. David, who examined the core, said the drill had not struck upon the true thickness of the coal. We had the misfortune of cutting the coal at a place which did not represent the true section of the seam.

Mr.  
J. Maclean.  
23 Jan., 1897.

Mr. James Thomas Jones, cattle dealer, Nowra, sworn, and further examined:—

698. *Chairman.*] Have you something further to say? As regards the extension of the railway to Jervis Bay, I wish to mention that I believe it would be one of the finest undertakings that the Government of New South Wales could enter upon in the way of bringing in value for the work done. If the Government would adopt a scheme of leasing the land near Jervis Bay for a term of years, there is no doubt it would be a grand paying speculation.

Mr.  
J. T. Jones.  
23 Jan., 1897.

699. *Mr. Farnell.*] What would you consider a reasonable rate at which to lease these lands? From 1s. to 5s. an acre.

700. *Mr. Black.*] Would you like to lease it at that? If you make a railway through it, I will lease a few thousand acres.

701. *Chairman.*] The utilisation of the Crown lands is your first point? Yes. And to show that it is well adapted for a site for a city, I may mention that the quantity of fresh water about Jervis Bay surpasses anything that we have in Australia. Lake Windermere, which is a fresh water lake, has an area of 640 acres, and a depth of from 80 to 90 feet in the centre.

702. Your second point is that there is abundance of fresh water naturally stored? Yes; and it could be brought in without the use of machinery, because it stands about 80 feet above the level of the bay.

703. It would come in by gravitation? Yes. There are four or five creeks of good water emptying into the bay—permanent streams. A question has been asked as to what the Crown lands had been sold at. At the last sale Crown land was sold at the rate of £40 an acre.

704. *Mr. Farnell.*] Was it water frontage? No; it was back from the Public School.

705. *Mr. Hassall.*] I suppose that the man who bought it would take less for it to-day? No; he would not sell it for that money.

706. *Mr. Farnell.*] Was it bought for grazing purposes? No, for a building site. The best part the Government have cut up in lots of half an acre each at £10 an acre.

707. Is that within the limits of a surveyed township? Yes, close on the road to the terminus of the proposed railway line. Another great thing to my mind is that federation is fast approaching, and if there is a port in Australia suitable for a federal city it is Jervis Bay. It would be ridiculous to expect that the federal city would be either Melbourne or Sydney. Jervis Bay is the very spot for it. I have brought a sample of iron ore from Jervis Bay.

708. *Mr. Fegan.*] Can you tell the Committee where these pieces of coal came from? I have an idea: I know the locality. I have no doubt that Mr. Maclean told you the truth about it.

709. Has any of this coal been analysed? Yes; you will find a report in some of the Government offices on Rix's Creek seam.

710. Then that is Rix's Creek coal? Rix's Creek seam.

711. What seam is Rix's Creek coal? It is the bottom seam.

712. Similar to the Greta seam? Yes, it is similar.

713. Is it not the Greta seam then? I believe it is.

714. What is the seam like? I take it to be exactly the same coal as Rix's Creek: There is a little over 30 feet of coal in bands.

715. Can you give the Committee an idea of how many bands are found there? I could not from memory.

716. Is Rix's seam coal as good as the Greta coal? Yes; I think it is a little better.

717. What is the difference in the price? They never met in the market in my days.

718. Do you not know that Greta coal was from 7s. to 10s. a ton whilst Rix's seam was selling at 4s. or 5s.? I do not.

- Mr. J. T. Jones.  
23 Jan., 1897.
719. Was it not always looked upon as inferior to the Greta coal? The tests of my coal showed it to be so superior to the Greta coal that I took the contract from them.
720. At the same charge? No; I think we were a few pence under.
721. You took the contract on account of making the lowest tender? No; we took it on account of the quality.
722. When was that tender? About 1876.
723. Do you know any other coal seams about here? There are outcrops of seams. There is one cropping out near Berrewherri River.
724. What seam is that? It is the lowest seam. It has never been examined.
725. Do you know of any iron ore in the district? I got the sample which I have here about 8 miles from Jervis Bay.
726. How far from the coal? Close to it.
727. Do you know of any deposits of limestone? No.

---

Mr. Thomas Charles Kennedy, newspaper proprietor, Nowra, sworn, and examined:—

- Mr. T. C. Kennedy.  
23 Jan., 1897.
728. *Chairman*] What are you? Newspaper proprietor, residing in Nowra.
729. Do you desire to make a statement? I am aware that the Public Works Committee are inquiring into the question of the establishment of a deep-water harbour at Port Kembla. I am satisfied that to meet the requirements of the Illawarra district it is necessary to have a harbour in the vicinity. The amount which it is proposed to expend in the construction of the harbour is large, and I do not think in the face of what has already occurred in harbour experiments in Illawarra the expenditure of such a large sum of money is just now warranted for a harbour at Port Kembla. Jervis Bay is a harbour requiring practically no works to make it a port of refuge, and the money spent on the construction of a line of railway would give advantages to Jervis Bay that would meet the requirements of the coal deposits that are admitted, according to expert opinions, to exist further south. I say nothing of the commercial value of the coal, as I am not an expert in the matter. The danger of expending such a large sum of money at Port Kembla at present is that in the event of the discovery and working of good commercial coal in the vicinity of Jervis Bay it must detract from the usefulness of Illawarra, because the principal coal-trade with the southern provinces of Australia will be carried on at Jervis Bay. According to the information supplied by the Railway Commissioners 2s. 3d. a ton would be the cost of hauling coal from Woodhill in the event of the coal there proving commercial coal; then the less amount that it would be necessary to charge for harbour dues at Jervis Bay would compensate for the extra charge of haulage from Woodhill to Jervis Bay. I have not any more to say, except that as a taxpayer I consider that it would not be wise to spend such a large sum of money at Port Kembla, because of the probability of competition opening up further south, and of shipping being done on more advantageous terms at Jervis Bay.
730. *Mr. Fegan.*] What is the land being leased for about there? Private land is as high as 20s. per acre per annum.
731. Is some as high as £2? Not that I am aware of.
732. Do you think that Crown land should be leased at from 1s. to 5s. an acre? I do not.
733. What do you think the Crown should get for the leasing of land here? Crown land has been leased between here and Pillara north of Jervis Bay—some 2,000 acres—at £2 yearly for the lot.
734. Is it very inferior land? Yes.
735. Is there any Crown land equal to that which is being leased by private owners at 30s. an acre? Not that I am aware of.
736. You would not like to lease from the Crown 1,000 acres of land at 5s. an acre between here and Jervis Bay? Not for grazing.
737. Would you for fruit-growing? No, not for fruit-growing.
738. Under what circumstances would you lease it at 5s. an acre? I might give that for land that would carry stock, but if Jervis Bay were opened up and an export trade were carried on from there, and coal-measures were developed within the vicinity I would buy or lease the land.
739. You would rather buy it to sell again under those circumstances? Those are the circumstances which make the value of land.
740. Under present circumstances you would not lease the land at 1s. an acre? I would not say that. There are certain portions of the land which you might rent at 1s. 6d. or 2s. an acre, but they would be small pieces.

## A.

[To Evidence of Mr. W. Evans.]

## PROPOSED LOOP-LINE TO MOUNT PLEASANT RAILWAY.

Southern Coal Company of New South Wales (Limited),

Colliery Office, Unanderra, 21 January, 1897.

Dear Sir,

As stated verbally, my proposal for a loop-line coming on to the Mount Pleasant railway, instead of the present one at Mount Keira, is to avoid the heavy grade now existing between Mount Pleasant, Mount Keira, and Wollongong, whereby a locomotive could deliver 100 per cent. heavier a load at Wollongong wharf than by the present route. In my opinion it is impossible to attain satisfactory results by attempting to alter the present grade, and it would be far more costly than the proposed new loop, including cost of resumption, &c.

My experience in working coal traffic is that the less mileage over the Government railway, contending with passenger and other traffic, the more satisfactory are the results.

If Port Kembla should be decided upon I think the above suggestion would be worthy of consideration, and, if adopted, I am confident would facilitate the traffic to a very large extent.

Yours, &amp;c.,

WALTER EVANS.

## CONSTRUCTION OF DEEP-WATER HARBOUR AT PORT KEMBLA.

(PETITION FROM THE ILLAWARRA HARBOUR AND LAND CORPORATION (LIMITED), PRAYING TO BE HEARD BY COUNSEL AT THE BAR OF THE HOUSE, IN REFERENCE TO.)

*Received by the Legislative Assembly, 7 July, 1897.*

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the Illawarra Harbour and Land Corporation (Limited),—

SHOWETH, AS FOLLOWS:—

1. Among the business to be brought before your Honorable House on Wednesday, 7th instant, is the following:—

Government Business.—Orders of the Day.

1. Mr. Young to move,—That it is expedient that the construction of a Deep-water Harbour for Port Kembla, as referred by the Legislative Assembly to a Parliamentary Standing Committee on Public Works, be carried out by constructing the eastern breakwater only, as recommended by the said Committee.

2. By a Private Act assented to on December 20th, 1890, the Illawarra Harbour and Land Corporation (Limited) were empowered to form and maintain an entrance and passage between the South Pacific Ocean and the waters of Lake Illawarra, in the county of Camden, and to construct, use, maintain, and, in certain respects, control and regulate, a Harbour within the waters of the said Lake and of Windang Bay in the county of Camden; and to make, establish, maintain, and control wharfage and shipping accommodation in connection therewith; and to construct, work, use, and maintain a line or lines of railway to connect with the said Harbour, all or any coal-bearing lands situate between the South Coast Colliery on the north and the Macquarie River on the south; and to reclaim, purchase, take, occupy, and otherwise acquire land on certain terms. Provided that the said Harbour and entrance thereto and channel should be commenced within two years, and be made and completed in accordance with the provisions of the Act, and opened throughout for the admission of vessels of a draught of 15 feet, within the term of seven years from the passing of the Act, failing which all rights and privileges acquired under the Act should be null and void, and all reclaimed lands should revert to the Crown, excepting certain lands in the said Act mentioned.

3. By the Illawarra Harbour and Land Corporation Act Amendment Act of 1895 the time mentioned in the Principal Act for the completion of the Harbour and entrance thereto and channel was extended for a further period of one year from the 20th day of December, 1897.

4. Your Petitioners have already expended a sum of £12,032 Gs. under the provisions of the Statute upon surveys, plans, and works at the entrance to the said Lake Illawarra, and in constructing a line of railway connecting the said Lake with the South Coast Colliery, and also connecting same with the smelting works and the State line of railways.

5. That, in view of the construction of the said Harbour, a large commercial undertaking for the smelting and reduction of ores has been established on the shores of Lake Illawarra.

6. That, upon the question of the construction by the State of a Harbour at Port Kembla being submitted to the consideration and report of the Parliamentary Standing Committee on Public Works, your Petitioners applied to the said Committee for leave to appear by counsel, with the object of explaining the effect which the construction of a rival Harbour by the State would have upon the scheme of works then in progress by your Petitioners.

7. That this request was refused by the Committee on Public Works, and the whole question of constructing a Harbour which could not fail to be a rival of that of Lake Illawarra was dealt with, entirely ignoring the then existing statutory rights and powers of your Petitioners.

8. That the Committee on Public Works having recommended the construction of a Harbour at Port Kembla, the authority of your Honorable House for the commencement of such Harbour is now about to be asked.

9. That your Petitioners fear that the Bill for the introduction of which authority is sought, if passed, will greatly increase the difficulty which they have hitherto experienced in the completion of the work of Harbour construction which they have in view.

Your Petitioners, therefore, most humbly pray that, in order that your Honorable House may be fully informed of the details of the objects which they have in view, previous to the adoption of any resolution affirming the desirability of commencing the construction of a Harbour at Port Kembla, your Petitioners may be heard by counsel at the Bar of your Honorable House in explanation of the objects and position of your Petitioners.

In witness whereof the common seal of the Illawarra Harbour and Land Corporation (Limited) has been affixed hereto this 7th day of July, 1897.

The common seal of the Illawarra Harbour and Land Corporation (Limited) was affixed hereto by the authority of the Directors, previously given in the presence of the undersigned, two of the Directors, and countersigned by the undersigned.

J. ARMSTRONG, }  
A. G. FRIEND, } Directors.

FRANK JARVIS, Secretary of the said Corporation.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

FLOOD-PREVENTION IN THE HUNTER RIVER.  
(DEPARTMENTAL REPORTS RESPECTING).

*Printed under No. 7 Report from Printing Committee, 10 June, 1897.*

Copies of Reports by the Engineer-in-Chief for Public Works, and Mr. Price, Assistant Engineer, Public Works, in regard to flood-prevention in the Hunter River, presented in fulfilment of a promise made on the 27th ultimo by the Secretary for Public Works in answer to a question by the Honorable Member for West Maitland.

The Engineer-in-Chief for Public Works to The Under Secretary.

HUNTER RIVER FLOOD-PREVENTION.

Department of Public Works, Sydney, 29th April, 1897.

I FORWARD herewith Mr. E. B. Price's report on prevention of floods in the Hunter River.

I have perused it carefully, and am of the opinion that it is worthy of serious consideration.

There is no doubt that the height of floods in the lower river can be reduced and, to a considerable extent, regulated, by impounding water in the upper part of the valley, but, at the same time, as pointed out by Mr. Gordon in his report, great care must be exercised in releasing impounded water not to do more harm by maintaining the water for a much longer time at a harmful level, for if the flood water should be kept up to a level exceeding a banker for a considerable time, it may do much more injury to property than by letting a big wave pass quickly down the valley.

For instance, in 1870 there were five big floods during the months of February, March, and April, following in such quick succession that the impounding reservoir, which will really only hold about half a large flood, would have been practically useless unless one long continual flood-level, higher than a banker, had been maintained, and it is possible that this continuous high water might do more harm than the five waves did in passing down the valley.

Mr. Price has, I think, taken too sanguine a view as to the probable cost of the dam. The prices are cut altogether too fine, and I doubt if any competent contractor would be ready to tender at the figures quoted, seeing that none but contractors with a large command of capital could undertake this vast work, for a very large amount of money must be sunk first in providing sufficient suitable plant for carrying on with expedition. Also, taking into account the great risk a contractor must run from floods during the progress of the work, it is necessary to make a liberal allowance over the bare cost of excavating material in a dry cutting. It must further be borne in mind that the excavation for the foundation goes to a depth of from 50 to 60 feet below the surface, and a great portion is some 25 to 30 feet below river-level in water-bearing strata, for which contractors will certainly require a very high price. Should a flood occur at any time while this excavation is being taken out, many months work may be wholly lost.

Taking this and the probable cost of the masonry into consideration, I am of the opinion that the very lowest cost at which this undertaking could be completed for would be £900,000, instead of £550,000 as estimated.

I have also some doubts as to whether such a great dam could be safely built on a shale and coal bed formation. This would require most careful investigation before entering upon the work. As a rule the shales and pipe-clays found adjacent to coal seams are most unreliable, and not calculated to form a safe foundation.

I quite agree with Mr. Price as to the injudiciousness of expending large sums of money in making flood-cuttings in the lower river to reduce the flood-height at certain places. This might be beneficial to certain places, but would mean destruction to other places lower down.

With these few remarks, I submit Mr. Price's report for the Minister's consideration.

C. W. DARLEY,  
Engineer-in-Chief for Public Works.

The Engineer-in-Chief for Public Works.

Sydney, 24 March, 1897.

Sir,

Having received instructions from the Minister to investigate and, if possible, devise some means for the prevention of floods in the Hunter, I have, during the past eighteen months, devoted all the time it was possible for me to spare from my other duties to the study of the question.

I regret the delay which has occurred in the furnishing of my report, but for a long time I found it impossible to give the time necessary to complete my personal examination of the river and its tributaries, and afterwards to work out a scheme for the information thereby acquired.

The question of floods in the Hunter has been so often reported upon that I have had at my disposal a number of documents, amongst which are the following complete reports, viz.:—

1. By the late Mr. Moriarty, Engineer-in-Chief for Harbours and Rivers, dated 1868,
2. By the Flood Commissioners, dated 1870,
3. By Mr. W. Clark, dated 1877,
4. By Mr. G. Gordon, dated 1890,

all of which contain valuable information for the guidance of anyone who may be investigating the subject anew. Indeed the information collected in the first report must always form the ground-work on which calculations of discharges are based.

It is not my intention to discuss these reports which have been public property for many years; I must, however, point out that the circumstances of the country have altered very much since the first two were written, but since the last was composed the highest flood since 1820 has occurred. It is impossible, therefore, to say what conclusions would be arrived at by the authors if they were reporting at the present date. Neither have I the time available to give a full description of the Hunter River and its floods, all information of this character will be found in the above-mentioned reports.

The flood with which I have more especially to deal is that of 1893, of which, unfortunately, we have not very complete data. It is, however, acknowledged to have been the highest ever known, with the exception of that of 1820, of which we have little information.

I must, however, point out that the floods vary greatly in character and in the amounts of rainfall which produced them. Also that the rainfall on the lower river cannot be taken as a guide to what has fallen on the mountains at the source; for which reason the rainfall returns in connection with the early floods are of little use.

Early in my investigation I came to the conclusion that so little was known of the Upper Hunter and its great tributary, the Goulburn, as well as of the minor tributaries, Williams, Paterson, Wollombi (or Cockfighter), and Pal Brook, Page's River, &c., that it was imperative that I should examine them all, as without the personal knowledge gained thereby it would be impossible for me to select the best.

I therefore commenced at the sea and worked upwards, examining the main river and each important tributary far into the mountains. I afterwards came down the river, from Denman to Maitland, in a light boat, to satisfy myself that no possible site for a dam had escaped my notice on this important section of the river.

This examination has convinced me,—

- 1st. That the increasing importance of Maitland and its surrounding district warrants the expenditure of a large sum to minimise the loss of property and the danger to life which arises with each recurring flood.
- 2nd. Of the practical impossibility of conferring any real protection on the whole flooded area by embanking, deepening, widening, or altering the channel of the lower river, or by cutting a new outlet to the ocean.
- 3rd. That the only practical manner in which the floods can be dealt with is by the creation of a large lake or "regulating reservoir" below the junction of the Goulburn with the Hunter.

With regard to the first, it will be sufficient to point out that West Maitland alone has a population of between six and seven thousand, and a capital value of over a million sterling. That the town is built on the worst possible site there is no gainsaying, yet there it is and will remain till some day a disaster occurs resulting in great loss of life. The fact of the town being embanked, though affording protection against small floods, adds considerably to the danger during great floods. If, during the 1893 flood, the dam above the town, and the embankments on the far side of the river, had not burst and so afforded an escape for the pent up waters, there is no doubt the high embankment round the town would have been cut through, and many houses swept away, with great loss of life. As these flood-escapes have since been closed and made more secure the danger to the town is now greater than ever. I have never seen a flood in the Hunter, but have in several of our other large rivers, so can realise what such a flood as that of 1893 means, and am surprised that the loss of life was so small. The protection of life and property is considered the first duty of a Government, and for this reason alone I think the regulation of the flood on the Hunter should be looked upon as a State work.

With regard to possible remedies. Increasing the strength and height of the embankments round West Maitland, though affording protection to that town, would, by closing the natural regulator of Wallis Creek, tend to augment the height of the flood at other places. To counteract this, the embankment on the far side of the river would probably be raised, with the result of still further confining, and, consequently, increasing the height of the flood to the danger of West Maitland. It would also be possible to reduce the level of ordinary floods at Maitland, by carrying out one of the proposed schemes for shortening the river between there and Morpeth. The result would, however, be disastrous to the lower river, unless other more expensive cuttings were carried out lower down. These remedies have been so fully discussed in previous reports that it would only be a waste of time to further consider them here; moreover, channels which would have been large enough to carry the floods on which these reports were based, would have proved quite inadequate for such a wave of water as came down in 1820 or 1893. A careful study of the matter has convinced me that no system of channels could save Maitland when such extraordinary rainfalls occur, and when conditions are favourable for the quick discharge of the watershed.

watershed. In this connection, I may mention that if the rain which fell in the 1833 flood on the Goulburn River had also fallen on the Upper Hunter, the result would have been a more appalling flood than that of 1820, which was many feet higher than that of 1893. I cannot, therefore, agree with those who think the extreme height of the 1820 flood was owing to the banks of the river not having been cleared. This would have retarded the flood-wave in the upper river, and thus tended to lower it to just as great an extent as the obstructions in the lower river would have raised it. The experience of other rivers is, that the more the rivers are settled upon and cleared the greater will be the height of the floods, consequently, at any time we may expect even higher floods than those recorded.

Any scheme for straightening and deepening the lower river must start from the ocean. The works now in progress at Newcastle will be most beneficial, and when the entire scheme for training the lower river through the flats is carried out a much better flood-discharge will be obtained, to the benefit of Hexham, Raymond Terrace, and the lower Williams. The effect, however, will hardly be felt at Morpeth except during small floods.

In this connection must be considered the proposed canal from Raymond Terrace to Port Stephens, which has been brought prominently under my notice, and to which I have given rather more than its share of attention. This canal, in length about 12 miles, would join one tidal water with another. There could, therefore, be no flow through it except the level at Raymond Terrace was raised by a flood. The rise during the 1893 flood was 15 feet, while an ordinary flood will rise from 5 to 10 feet. All, therefore, this canal could be expected to do would be to prevent a flood rising above a certain arranged maximum, say 8 feet at Raymond Terrace, with a corresponding decrease in the flood-level for some miles up the Williams and Hunter and down the river to Newcastle. To have this effect the canal would have to be very large. For instance, a cutting 300 feet wide, with slopes of 3 to 1, excavated to a depth of 12 feet below low water, would discharge only about 35,000 cubic feet per second, which would not have reduced the 1893 flood by 7 feet. When it is considered that such a canal would average 43 feet for 7 miles and about 20 feet for the remaining 5, and would consequently cost over a million, it must at once be rejected. This money, or portion of it, spent on the lower river in training walls would have a much better effect, and would improve navigation, whereas the suggested canal would ruin it unless carefully maintained and regulated. I cannot help thinking that the promoters of this scheme brought it forward under the belief that the swamps between Raymond Terrace and Port Stephens were very little above high water-level, whereas our surveys show them to be for miles from 10 to 28 feet higher. I need not refer to the other suggested cuttings from the lower river to the ocean further than to say I have given them all due consideration, but cannot recommend any of them.

A flood outlet from some point on the upper river would be a complete remedy for all great floods, but from an examination of the intervening mountains I am convinced of the practical impossibility of carrying out such a scheme.

Having, therefore, been convinced from my examination of the lower river that it would be a costly if not an impossible task to so reduce the level of great floods by any series of cuttings as to remove all danger, I turned my attention to the upper river and tributaries in the hope that some suitable sites for regulating reservoirs could be found either large enough to control a whole flood or half a one as suggested by Mr. Gordon.

It appears strange that this examination was not made previously, as it might have influenced the finding of the Royal Commission and the recommendations of different engineers. For all that was known to the contrary, a most economical site for a regulating reservoir might have been available. I should here mention that I received every assistance and valuable information from the residents in each locality, and thereby was saved much loss of time. It was Mr. E. R. White, of Merton, who directed me to the site at Woodlands. It was rather a difficult matter to follow the Hunter and Goulburn Rivers, as in few districts do tracks follow near the river banks, while the country along the upper tributaries is wild and inaccessible.

During my examination I found many possible sites for reservoirs, but none so favourable as that at Woodlands, on the Hunter, about 10 miles below the Goulburn Junction. In order to regulate a flood it was necessary either to find a suitable site on the main river above Singleton and below the Goulburn Junction, or to obtain a number of sites for smaller reservoirs on the tributaries. All things being equal, one large reservoir was to be desired, as giving more complete control, since, with a number of small reservoirs, even with the most complete telephonic communication, it would be a difficult matter to regulate the discharge of a flood; though, of course, if very economical sites were available on the tributaries, this disadvantage would be counterbalanced.

In selecting a site for a dam it was necessary to find—

- 1st. A place where high land approaches the river on both sides, with a rocky foundation at a reasonable depth.
- 2nd. That the site should occur not far below a large extent of plain which could be submerged.
- 3rd. That good building stone and sand should be available close at hand.

Amongst the various sites discovered or examined by me the following are worth mentioning:—  
On the Hunter (1) above Hudson's Bridge, about 8 miles from West Maitland. This complies with the first and third condition above specified, but, unfortunately, not with the second, as otherwise the site is favourable in many ways. Should it be thought desirable at any future time to hold back the flood-wave from the Cockfighter and the lower tributaries, this position might be selected for an additional regulator. (2) Below Jerry's Plains. This site is inferior in nearly all points to that at Woodlands. (3) The Woodlands site, though complying with all the above conditions, is not so economical with regard to the first as some others. This is, however, compensated for by the enormous holding capacity of the reservoir and the magnificent quarry of freestone (locally known as "the Battery") which overhangs the right bank of the river. These three sites being below the junction of the Goulburn—which is in reality the main river, as it carries far more water than the Upper Hunter—are geographically suitable for the construction of single regulating reservoirs. The first is, however, too low down, as it would not benefit, but rather injure, Singleton and a large number of cultivated farms, while the others would preferably be below the junction of the important Wollombi Brook or "Cockfighter." With regard to the tributaries, I found sites for reservoirs on the Williams, above Clarence Town; on the Paterson, and its tributary the Allyn, near Gresford; on Wollombi Brook, about 5 miles above Broke township, and again above the town

town of Wollombi; on Fal Brook, about 5 miles above the railway crossing; on the Goulburn, near Baerami Creek, and again above Kerrabee and at Bylong Creek, the last being the best I saw on the Goulburn, but too high up to be of service, except in conjunction with other reservoirs. On the Hunter, above Aberdeen; and on its branches, Page and Isis, near Gundy, I found several sites suitable for small auxiliary reservoirs.

Not one of the aforementioned sites are free from some objection; in fact, the Hunter is a very difficult river on which to form storage reservoirs.

After thoroughly examining the upper tributaries, I formed the opinion that it would be far more economical to create one great lake, by constructing a high masonry dam at Woodlands, below Denman, than to form a great number of smaller reservoirs on the tributaries. I therefore obtained permission to have a preliminary survey made, and sent Mr. Surveyor Fleming with boring-gear to thoroughly prospect the site and run contour levels. The result of his work will be seen in the plans which accompany this report, and on which my estimate is based. The borings revealed the fact that the foundation of the dam would be on hard blue shale, with certainly two coal-seams.

This shale, which crops out in many places on the Hunter, is of a hard dry nature, and appears to resist the action of water and weather in a wonderful way. Though some of our bores were carried to a depth of 40 feet into the shale, they were always free from water. Overlying the hard shale on the south bank are softer shales and sandstone. On the north bank the hard shale has, at one time, been washed bare, and is now covered with gravel, boulders, and clay to a depth of from 30 to 50 feet. This extends back for nearly 1,000 feet, till the hill at Woodlands House is met. This hill, from our trial shafts, appears to consist of a kind of cemented basalt, overlying sandstone, while further back a freestone escarpment appears. Looking at the site from the plains higher up the river, one would form the opinion that this escarpment was at one time continuous across the valley, and that the whole of the plains at the junction of the Goulburn were at one time under water. To reconstruct this lake, though on a smaller scale, is, to my mind, the only feasible solution of the problem of the Hunter River floods.

Raising the water level at Woodlands 130 feet above summer level would submerge over 33 square miles of plain, and would back up the Hunter and Goulburn Rivers for 10 and 8 miles respectively above their junction near Denman. It would, unfortunately, flood the township of Denman, which would have to be removed to higher ground on the adjoining village reserve. This, however, except for the expense entailed, would be rather an advantage, as the township, which is situated on a rich alluvial flat, intercepted with depressions and waterways, is now completely submerged during high floods, which at times sweep houses away with loss of life.

The village itself is of little importance, consisting of two hotels, a couple of small stores, a Court House, Police Station, Post Office, two or three places of worship, a few fair sized residences, and a number of small cottages and huts. Many of the buildings could be taken down and rebuilt.

After the town is removed to the adjoining high ground, the rich flat would be available for agricultural purposes, and would benefit from the fact of the high floods being held long enough to deposit silt instead of as at present sweeping rapidly over the surface and doing more harm than good. This applies also to the whole of the plain which it is intended to submerge during great floods. At present, with the exception of one small farm near the dam which would require resumption, the land is held in large estates, and utilised for cattle-grazing alone. The principal owners are the Messrs. White, of Martindale and Merton, and E. Vickery, of Woodlands. About 2 square miles is reserved, some being leased under the "Prickly Pear" Act. The best land lies about Merton, where rich black soil occurs. Much of the land is covered with "wiry" grass, which must take considerably from its value for grazing, and which a good deposit of silt might kill. At present, when a flood is expected, the cattle are removed from the plains. Prior to the 1893 flood this was not always done, but in that year the river rose with such rapidity that it overflowed its banks and swept across the plains before the cattle could be removed, and consequently many were drowned. It can never be foretold to what height the flood will rise, or what course the overflow will take, as both depend on the times of the arrival of the flood-waves from the Hunter and Goulburn. The river also frequently alters its channel, as can be seen from the old floodways and anabranches; even within the past few years large areas have changed hands through this cause. It will therefore be seen that though much of the land is very valuable for grazing, the liability to flooding considerably depreciates it for agricultural purposes, for which, as previously pointed out, it is used to a very small extent.

So far as grazing is concerned, the value of the land will be enhanced rather than depreciated by the proposed work. At present the flood rushes across the land with great velocity, and does not deposit much silt; whereas, in future, it would be retained long enough to thoroughly soak the ground, and deposit almost the whole of the silt, which is of the greatest value in renewing pastures. The loss, therefore, of the grazing for a few weeks longer than usual would be more than compensated for by the enrichment of the land.

It is not proposed to resume any large area of land, except in the immediate vicinity of the dam, together with the alienated portions of the township of Denman. The land at the dam will be necessary in order to form a permanent shallow lake, in which all flood *debris* would be checked before reaching the dam, where it might choke the sluice-guards. By lowering the level of this lake in dry seasons, when it was desirable to flush out the lower river, the fringe of drift could be dried and burnt.

As the land surrounding the lake would be covered more frequently and for longer periods than that higher up towards Denman, where the existing state of things would not be altered except by very high floods, it would be more advantageous to resume than to compensate the owners. This would also allow of water being stored for irrigation and the production of power, if so desired. It must here, however, be clearly pointed out that it would not do to retain a very large quantity, as, by so doing, the flood-holding capacity of the reservoir would be proportionally reduced. Nor would it, in my opinion, be worth while doing so, as irrigation on the east coast can never be carried out to a large extent. For irrigation to be successful there must be either very little rain or it must fall at regular periods, whereas on the Hunter Valley heavy soaking rain may fall at any time of the year.

With regard to power, the proposed dam, if kept at about the 40-foot level, will create one of the greatest water powers in the colonies; by using the lake as a compensating reservoir, anything from 1,000 horse-power to 100 horse-power would be available, according to the dryness of the season. There are many ways in which this cheap power could be turned to advantage, such as the electric production of aluminum.

The

The maximum capacity of the reservoir formed by the proposed dam will be, as near as can be estimated, 40,000,000,000 cubic feet. The following table gives approximately the capacity for different depths. The bottom, 40 feet, though covering nearly a square mile, does not contain much, as the river banks are high, and will be retained as a permanent lake, and utilised as previously pointed out:—

*Table showing holding capacity of reservoir.*

Depth at dam in feet.	Area covered in square miles.	Cubic feet.
40	0.97	200,000,000
60	.....	2,200,000,000
70	7.22	3,100,000,000
90	.....	10,000,000,000
100	21.07	15,500,000,000
120	.....	31,000,000,000
130	35.02	40,000,000,000

It is hard to realise such an immense body of water as 40,000 million cubic feet. No artificial reservoir in the world at all approaches it. The Bear Valley reservoir, which I believe is the largest in America, contained 4,161 million cubic feet, while the new Croton reservoir in course of construction for New York Water Supply is estimated to hold nearly 5,000 million cubic feet. In the United Kingdom the largest is the Vyrnwy Reservoir for Liverpool Water Supply, which contains 2,080 million cubic feet. India at present has the largest reservoirs in the world. The Mutha reservoir—called Lake Fife after its originator—in the Bombay residency, contains 5,000 million cubic feet—but this is being surpassed by the Periyar reservoir in Madras, now being constructed, which will contain 13,300 million cubic feet. Our own Prospect reservoir holds about 1,730 million cubic feet, and it will give some idea of the proposed reservoir on the Hunter to consider it as equal to 23½ Prospects.

In the proposed dam there will be a series of sluices sufficiently large to control the flow of the river. The larger sluices, which would be situated about 40 feet over the bed of the river, would be on the "stoney" principle moving on live rollers and actuated by "turbine" wheels as well as hand power. I can speak from personal experience of the excellence of these sluices. In the works for the regulation of floods on Lough Erne in Ireland, carried out by my father, four of these sluices, each 30 feet wide by 14 deep, were erected across the Erne River, and have during the last fourteen years given complete satisfaction. Since then they have been adopted on the Thames above London. A few smaller sluices sufficient to carry the ordinary flow of the river would be placed nearer the bottom.

A spill-way will also be provided sufficiently wide to pass, with assistance from the sluices, the heaviest known flood without injury to the dam. In the design of the dam, which accompanies this report, the spill-way is shown on top; it would, however, be preferable to have an additional spill-way cut through the solid rock at one end, as thereby the depth of water falling over the dam would be reduced.

I am in hopes that when the quarry on the south end is opened up hard freestone will be found at a level low enough for a by-wash. It will then only be necessary to work the quarry in the form of a wide channel to obtain a by-wash in the natural rock. The dam is, however, designed to allow a flood 10 feet deep to pass over the top. Owing to the depth of the "water cushion" on the lower side—varying from 20 to 60 feet according to the volume of the flood being passed—there would be no danger of erosion from the falling mass of water. It is obvious that when a large body of water is passing through the sluices or over the dam, there must be a current down the reservoir, especially at the narrow place, about 3 miles above the dam. To produce this current the water surface at the upper end of the reservoir will have to be considerably higher than what the contour levels show, and consequently the quantity held back by the dam when a flood is being passed will be greater than that shown for each level. During the 1893 flood the fall in the surface from Denman to the dam as near as can be estimated was 4.6 feet per mile; this of course was exceptional, and was caused by the great flood-wave which came down the Goulburn. When the reservoir is full and discharging 100,000 cubic feet per second, the fall on the surface would average about 3 inches per mile. The water level at the upper end of the reservoir would consequently be raised about 5 feet, and the capacity increasing about 3,000 million cubic feet. The reservoir would, therefore, to a certain extent act as an automatic regulator, as no sudden overflow could take place. In fact, if it were not for the lower tributaries, it would not be necessary to have many sluices in the dam, but simply an open arch, which would check back the flood to the fixed maximum. As, however, the lower tributaries are of themselves capable of causing a considerable flood, it becomes necessary to provide sluices whereby the flow of the upper river can be stopped completely, if desired, in order to give the lower river time to empty.

During my investigation I found, as was to be expected, that the residents of each particular locality considered that the tributary next above them was the immediate cause of the flood. For instance, at Raymond Terrace the Williams and Paterson are blamed, at Maitland the Cockfighter, and so on. They overlook the fact, however, that although their tributary may add considerably to a flood, after all its contribution bears a very small ratio to the discharge of the whole river. Take the Cockfighter, for instance; one has only to compare its narrow, tortuous channel below Wollombi with the channel of the Goulburn to be convinced that the Cockfighter alone could never produce a flood of any consequence in the Lower Hunter.

If it were not for the obstructions caused by bends, narrows, and *debris*, not only in the tributaries but in the main river, especially above Singleton, the effects of a flood would be much more serious. These obstructions check the velocity and cause the water, as it were, to remain in the river a much longer period, and to overflow the banks, thereby forming a storage reservoir. For instance, I calculate that during the 1893 flood the maximum discharge at the site selected for the regulating dam amounted to 234,000 cubic feet per second, while at Singleton, after receiving Doyle's Creek, Foy Brook, Fal Brook, and the Cockfighter, it amounted only to about 150,000 cubic feet per second. If this quantity, which passed Singleton in one second, produced the disaster of 1893 at Maitland, what would have been the result of 234,000 cubic feet per second passing down? This

This instance will show the objection to cutting a large channel between Maitland and Morpeth, which has already been pointed out in various reports.

The effect which could be produced by the proposed regulating reservoir must now be considered, and here I must state that it is utterly impossible to determine this with any degree of accuracy. All formulas for the flow of large rivers are at any time difficult things to apply correctly, but still more so when there are few and faulty data to go upon. In the case of a steadily flowing canal or river, fairly accurate results can be arrived at after careful observations, but in a river like the Hunter, when discharging a flood, the surface inclination must alter from hour to hour as the flood-waves arrive from the different tributaries, or as the lower river overflows its banks. Again, it is impossible to foretell what rise will be produced in a river from a given rainfall. Too much depends on the condition of the ground, nature of watershed, comparative size of tributaries to main river, and character and distribution of rainfall, to allow of anything more than a guess being made.

If we take the 1857 and 1870 floods, of which we have more reliable information with regard to levels and discharges than of any others, we are met by the difficulty of want of rain-gauge returns to show the quantity and distribution of the rainfall. It is, however, clear to me from a study of the tables of discharges and such information as to rainfall as we possess, that the rainfall which caused these floods, though more prolonged, was much less violent in character than that which caused the flood of 1893.

With regard to the 1893 flood, which was the highest on record, if we exclude that of 1820, though we have little reliable data from which to calculate the discharge, yet the Government Astronomer's admirable rain-gauge records supply fairly full information as to the rainfall, I find that although there had been heavy rain in different parts of the watershed during the previous days, sufficient, indeed, to soak the ground and start the river, yet the flood was caused almost entirely by the rain which fell in the twenty-four hours ending 9 a.m. on the 9th March. This was heaviest over the Lower Hunter, Cockfighter, and Goulburn rivers. Some of the rain-gauge returns are extraordinary; for instance, Newcastle 11.14, Maitland 14.79, while Morpeth, only three miles away and between the two, had 21.52. I can hardly believe that the Morpeth record is correct, and that three miles would make a difference of 7 inches in two gauges both nearly at sea level, especially when Newcastle, on the coast, had less than either. If the Morpeth return is correct, it must have been very local; nevertheless, I have taken it when calculating the mean fall for the lower river. If we divide the whole watershed of the Hunter into three parts: "Upper," or that above the proposed dam; "Central," between the dam and East Maitland; "Lower," between East Maitland and the sea, and distribute the rainfall of the 9th March, 1893, the following results are obtained.

*Table showing Distribution of Rainfall which caused the 1893 Flood.*

Watershed.	Area in square miles.	Average Rainfall for 24 hours ending on 9th March, 1893.	Amount produced in cubic feet.	
			Per 24 hours.	Per second.
Upper ... ..	5,230	4 inches.	48,601,344,000	562,511
Central ... ..	1,944	9 "	36,130,406,400	418,176
Lower ... ..	1,095	13 "	33,070,752,000	382,763
Totals ... ..	8,269	.....	117,802,502,400	1,363,450

It must not be imagined that the whole of this water, though falling in one day, could flow off the land in one day, or, in fact, ever flow off. In small rocky watersheds, under favourable conditions, 90 per cent. of the total rainfall will at times flow off, but the larger the watershed the less will be the percentage.

Various formulas have been devised to determine the total flow off a watershed and the proportion which the maximum flood discharge can bear to the rainfall in a given period. All of these, however, depend on a knowledge of local conditions, and must be taken as very approximate.

I have no reliable data as to the total amount which flowed off during the 1893 flood. If the river had not burst its banks at Maitland, the record of the heights at Belmore Bridge would be an approximate guide; as it is, however, they are of very little use. In the flood of 1857, which occurred at the end of winter, when all conditions are favourable to a large discharge, the total flow off the watershed is estimated at 88,000,000,000 cubic feet, equal to about 5 inches spread over the whole watershed. We have, unfortunately, no rain-gauge returns of any use for this period from which a percentage could be calculated. The flood seems to have been caused by continuous rains, and took a month to flow off. I have made a careful study of this question, and, from a comparison of the Hunter with other watersheds from which the flow off has been observed, I have come to the conclusion that under the most favourable circumstances 70 per cent. of the total rainfall is the maximum amount which could flow off the Hunter watershed. Rather more might flow off the Goulburn and upper tributaries, but much less off the lower river. This maximum would only be reached when tropical rain fell as in 1893. Even in India on smaller watersheds it is very seldom that more than 60 per cent. of the monsoon rain flows off.

If we allow even 70 per cent. of 1893 rainfall to have flowed off, the proposed reservoir would have been capable of stopping the entire discharge of the upper river for a month if desired.

Referring to the previous table, it will be seen that the average fall per second on the watershed above the dam amounted to 562,511 cubic feet. The maximum flood, however, which passed the dam site was only 234,000 cubic feet per second, or about 42 per cent., and, as far as I can learn, this maximum was not maintained for twenty-four hours. As the rainfall was exceptionally heavy we may safely take 42 per cent. of the daily rainfall as the maximum quantity which could reach the regulating reservoir in one day.

If

If we take the maximum flood at Maitland as equal to that which passed Singleton, and compare it with the rain falling on the combined upper and central watersheds, we will find it amounted to about 15 per cent., showing how much faster the drainage reaches the upper than the central river, and how the long river-channel and decreased fall of the country tends to reduce the height of the flood-wave.

Granting that the proposed reservoir will be large enough to completely stop the flow of the upper river, we must now see, if possible, what effect that would have produced on such a flood as the 1893. During that flood the maximum quantity of water which reached Maitland in one second was about 150,000 cubic feet. This was produced by about 85,000,000,000 cubic feet of rain falling in one day above Maitland. If, therefore, we deduct the 49,000,000,000, approximated, which will be cut off by the dam, the remaining 36,000,000,000 cubic feet should have produced a maximum flood-wave less in the ratio of 85 to 36, or 64,000 cubic feet per second, corresponding to a rise of from 20 to 24 feet at Maitland Bridge, according to the state of the Paterson and Williams Rivers. Or, if we take the future maximum flood at Maitland, which could be produced by the central river, as bearing the same ratio to the rainfall on its watershed as the present maximum flood at Maitland bears to its rainfall, viz., 15 per cent., the result would be a flood of 63,000 cubic feet per second.

These modes of reasoning are, of course, open to objection; but they are the only means whereby an approximate result can be arrived at.

Reducing the volume of a flood would also reduce the velocity with which the flood-wave would pace down the river, thus allowing the Paterson and Williams to discharge before the water from the central watershed reached Morpeth. In this connection I must quote from the late Mr. Moriarity's valuable report as bearing out the conclusions I have arrived at:—"On reading over the accounts \* \* \*

\* \* \* of the great floods of 1857, 1861, 1864, and 1867 it will be seen that in every instance the flood consisted of two distinct waves, the first being due to the lower tributaries—the Wollombi Creek, Black Creek, Cockfighter's Creek, etc.—which, rising nearer the coast, get the rains sooner than the upper heads, and having shorter sources to run send down their water with greater rapidity. They produce the first flood-waves which, though rising sometimes very quickly, rarely attain a dangerous height, and soon commence to subside, but before they have had time to flow away through the contracted and tortuous channel below Maitland they are overtaken by the second waves coming down from the main heads of the river—the Goulburn, the Hunter, and the Dart. The result is that the already gorged channel is utterly inadequate to carry off their united waters, and hence the second rapid and great rise which is observed, by which the banks are everywhere overflowed and the river channel rendered less capable of performing its duty."

The above is the opinion of one who was better acquainted with the Hunter floods than probably any one else. So far, therefore, as Maitland is concerned it must be conceded that the proposed reservoir will be capable of reducing a flood of even the magnitude of 1893 to harmless limits. I find it, however, quite impossible to estimate the effect that would be produced on the flood-level at Morpeth and lower down. Here so much depends on the state of the Paterson and Williams and on whether a strong easterly gale is blowing, that it would be useless to attempt any calculation.

As a rule the Williams and Paterson discharge their floods with great velocity and before the flood-wave comes down the Hunter. By retaining the greater portion of the Hunter flood-wave the velocity of the remainder will be decreased, giving more time for the lower river to clear its channel. With the lower river fallen, a much better discharge will be obtained at Morpeth for the flood-wave from the Cockfighter and the central tributaries which consequently should not rise so high. No doubt the farms about Morpeth would be flooded for a short time should we have another flood such as 1893. This would occur so seldom that it is doubtful whether it would do more harm than good.

In order to save the lower farms from all flood it would be necessary to increase the carrying capacity of the lower river to a minimum of, say, 60,000 cubic feet per second either by making new cuts and by embanking or by enlarging the existing channel. I am, however, inclined to believe with the regulator once constructed the land would not be flooded oftener than is necessary to keep it enriched. Certainly these cuttings should wait till the regulating reservoir is constructed and experiments conducted as to the discharging capacity of narrow portions of the lower river.

In this connection it should be pointed out that if at any time it is desired to submerge the farms on the lower river it can be done by opening the sluices in the dam.

With regard to the low land on Wallis Creek, this will be protected from all future floods by the existing sluice-gates.

The creek is now sufficiently embanked to allow the local drainage to discharge without overflowing the adjoining low land except when a high flood occurs in the river. The outside floods will now be reduced low enough for the creek to discharge almost at all times. Should, however, the Cockfighter produce a flood so high as to prevent the gates opening, it will last for such a short time that Wallis Creek will not have time to rise high enough to do any damage. Then by keeping the regulator closed for even twenty-four hours the river would fall so rapidly that Wallis Creek would completely empty itself before it was necessary to cause a fresh in the river by commencing to empty the regulating reservoir.

A regulating reservoir, therefore, will have a beneficial effect on the whole river, whereas any other scheme will benefit one locality at the expense of another. There will also be no interference with the natural channel of the river which it is dangerous at any time to touch; as the fact of cutting off one bend will cause the river to encroach somewhere else unless expensive protective works are undertaken.

It must now be considered how the vast body of water retained in the reservoir is to be got rid of without doing any injury. Taking the case of the 1893 flood, I have pointed out that the reservoir would not have been filled even if the sluices had been kept closed for a month, while long ere that the lower river would have emptied itself. Not having the upper water to sustain it the fall should be nearly as rapid as the rise. Once, therefore, the lower river has fallen sufficiently for Wallis Creek to empty itself, there is no reason why the sluices at Woodlands should not be allowed to discharge at the rate of from, say, 30,000 to 50,000 cubic feet per second, according to the state of the weather and the probability as to another flood coming, which would empty the reservoir in from ten to fourteen days. This discharge would first have to fill the channel of the river from the dam to Maitland—approximately, 100 miles long, and containing for a 15-foot rise about 3,000,000,000 cubic feet, and therefore the fresh caused would rise very gradually at Maitland and be less in volume than the discharge of the sluices. The safe rate of discharge

discharge would, however, have to be determined experimentally, as the faster the stored-up water can be got rid of the better. Different floods would have to be treated in different ways. The rainfall returns will always, in conjunction with a knowledge of the state of the ground, allow of the character of a flood being foretold. With a sudden fall as in 1893, a great wave of water is to be expected and the sluices closed entirely until the lower river clears its channel. With long continuous rain as in 1857 and 1870, it would be advisable to keep the sluices partly open so as to maintain the flood at Maitland up to a safe limit. In the case of these floods the amount to be retained in the reservoir would not be nearly so great as in 1893. A really intelligent man who was willing to make a study of the question should, after the experience of a year or so, be able to foretell the character of a flood and work the sluices accordingly. It would also be possible without waiting for a great flood to test the discharging capacity of the river; this could be done by storing up the ordinary flow of the river for a short time and then letting it out at different rates. By this means it can be accurately determined whether it is necessary to interfere with the narrower parts of the channel below Maitland.

There is one other point yet to be considered, namely, the effect of the reservoir on navigation.

Reducing the height of a flood will cause it to remain within its banks, and form fewer cross currents, therefore less silt should be deposited. A large quantity of silt and *debris* will also be deposited above the dam on the submerged plains, where the timber will be burnt off, and the silt go to enrich the grass. Again letting out a strong stream from the dam when the lower river has fallen should tend to scour out the bed, especially where training walls have been constructed, while with the reduced flood it should be possible for vessels to enter Newcastle Harbour at all times. In no way, therefore, would navigation suffer, but rather the reverse.

The mode of construction and cost of the proposed dam must now be considered. Owing to the magnificent and easily worked stone at the site, I would propose to build the dam of massive squared rubble masonry, set in three to one cement mortar, and the interstices filled with concrete, formed by ramming broken stone into the mortar. Where good easily squared freestone is available very large blocks can be used, and fairly close joints made without much trouble or expense. Specially large blocks would be selected for the front and back faces. Those on the water face would be dressed on the beds and joints, the joints being afterwards raked out and calked with stiff mortar for a depth of a few inches, so as to form a water-tight wall. The face stones should also be left as rough as possible under the spill-way, so as to break into spray the descending mass of water. All face stones would be bedded at right angles to the batter of the faces of the dam. I would also leave weep-holes in the back, with drains leading into the centre to allow any water which may find its way through the front face to escape without producing internal pressure. In designing the profile of the dam, I have followed the now well established rule of keeping the lines of pressure inside the middle third, and have taken the mass as weighing 150 lb. per cubic foot, which, with stone weighing 165 lb. per foot, as that in the Battery Hill averages, should be easily attained. If care is taken to drive small stones into the mortar-filing of all internal joints the mass weight should reach 155 lb. per cubic foot.

To regulate the discharge a series of arches would be formed through the dam. The larger ones would be about 40 feet above the bed of the river, and fitted with "Stoney's" patent sluices, already described. These would be about 10 feet wide and 15 high, while to give complete control about twelve would be required. In addition there would be smaller sluices at a lower level. Since the discharge of such an enormous body of water through sluices might give rise to vibration, I would propose to build into the dam over and around the arches about 1,000 tons of old rails and tram cables, which can be purchased cheaply from the Railway Commissioners.

A fender of old rails would also be constructed in front of the sluices to stop any *debris* which might drift across the permanent lake above the dam. The plans and sections of the proposed dam which accompany this report are, of course, tentative, as more complete information should be obtained by sinking numerous shafts or bores before the design is finally adopted. I have curved the dam slightly in plan as this form allows of a certain amount of expansion and contraction to take place without vertical cracks appearing. Not that such cracks are any real defect in a gravity dam, as each section will stand by itself; they are, however, unsightly, and cause slight leakage which, however, in this case would be of no consequence. The curved form also offers additional resistance to the over-turning pressure, and as it adds little to the cost should, I think, be adopted. I may mention that the huge Quaker Bridge dam now being built in connection with the Croton water supply scheme for New York is curved in places on the recommendation of the Committee of Experts who were appointed to examine the preliminary design.

The depths to which the foundations are shown are of course only approximate; when the shale is laid bare it may appear that certain portions are softer than others, and, consequently, it will be necessary to sink deeper, or widen out the base at these places. My intention is that the foundations should be set 5 feet into solid rock. The coal seams will also have to be followed until hard compact coal is found and a water-tight joint made. These coal seams, though not any improvement to the foundations, will be valuable as providing an unlimited supply of cheap fuel to drive the machinery during construction; a short distance below the dam the coal can be struck about 30 feet below the surface.

It is doubtful how far the south end of the dam will have to be extended into the "Battery Hill" before sound shale or sandstone is found. At the north end I propose to construct an embankment with the best of the material excavated from the foundation.

As the embankment would be subject to pressure for very short periods, and only during high floods, it will not be necessary to obtain such good material as would be required for a dam for water supply purposes. If, however, sufficient good material is not obtainable from the foundations it might be necessary to construct a masonry core. I am, however, of opinion that from the enormous amount to be excavated all that is required will be obtained, though possibly the puddle wall would have to be brought from elsewhere.

It is impossible, without going to much greater expense than is desirable at this stage, to give more than an approximate estimate of cost. The quantities to be dealt with are so enormous that it may be assumed that the best labour-saving appliances and plant will be used. For the purchase of this I have allowed a lump sum of £20,000. The cement would, of course, be specially imported into Newcastle, unless indeed it could be manufactured on the ground. As, however, the nearest line is 15 miles away, it is doubtful, even with coal on the spot, whether this could be done cheaply enough to compete with cement imported in large quantities, and I have no doubt the Railway Commissioners would grant the usual reduction in freight on large quantities carried by rail to Muswellbrook.

Carting

Carting out will be a considerable item, as the distance is about 17 miles; this, however, might be shortened by opening a road through private land for a few miles. I have taken the cement as costing 8s. 6d. per cask on trucks at Newcastle, and adding railway freight and cartage, the cost per cask at the work would be about 13s., so that, as excellent sand in inexhaustible quantities is obtainable from the river on the site, the cost of 3 to 1 mortar would be about 30s. per cubic yard.

All stone would be obtained from the "Battery Hill" which overhangs the site and rises to several hundred feet above it. The stone is very similar to the best Pyrmont stone, and should be quarried by machinery into square blocks, and delivered on the dam at 5s. or less per cubic yard, the waste stone being used to ram into the mortar so as to form concrete. If we allow  $\frac{1}{4}$  of the whole mass to consist of mortar and  $\frac{3}{4}$  stone the raw material would cost 11s. 3d. per cubic yard; adding 3s. 9d. per yard for placing in position and ramming it will bring the mass work out at 15s. per cubic yard.

This sounds low, and could only be attained where large quantities have to be dealt with and modern appliances are used; yet, taking into consideration the fact of all materials, except cement, being on the ground it is in my opinion, if anything, rather high.

Since designing and working out the estimates for this dam, details of the construction of the Vrynwy dam have been published. I find that the method adopted there, after trials of other methods, was very similar to that adopted by me; and although the builders had a much more difficult stone to deal with they succeeded in getting the average mass to weigh 90 per cent. of the weight of the stone used. Although the profile of the Vrynwy dam is a most extravagant one and has been greatly criticised, no fault can be found with the way in which it was built.

The excavation for the foundations will be through black soil, yellow clay, basalt, boulder, clay, gravel, sand boulders, sandstone, yellow and blue shales. As the quantity will be very large and all in one place it should be done very cheaply. I have added considerably to the quantities to allow for sloping or timbering and for the expense of coffer dams when constructing the dam in sections across the river, and have put the whole down at 1s. 6d. per cubic yard, which is to cover the cost of forming portion of the excavated material into an embankment at the north end. As I have already provided a lump sum for plant, this amount should be sufficient. If advantage is taken of a dry season there should be very little trouble about getting in the foundations.

For sluices, gearing, old rails, cables, and grids I allow a lump sum, which should be more than sufficient, while for engineering and contingencies I allow the usual 10 per cent.

In estimating the quantities of masonry I have made no deduction for the space left by the arches, but have allowed that to go against the extra expense of dressing and selecting stones and other contingent works.

The following is the estimated cost of the dam:—

	£
Excavation and embankment, 410,000 cubic yards at 1s. 6d....	30,750
Rubble masonry, 510,000 cubic yards at 15s. ...	382,500
Sluices and ironwork ...	18,750
Plant ...	20,000
	£452,000
Engineering and contingencies, 10 per cent. ...	45,200
	Total £497,200

It is hardly my province to give an estimate of the cost of land and compensation, nor would it be wise to give details, so the estimate which follows must be taken as very approximate.

It will be necessary to resume in all about 2,000 acres, and to remove the buildings in Denman to the new town, to be laid out on the adjoining reserve, or else to supply new ones in place of old. A certain number of new roads must also be opened up to give access during high floods, or when the reservoir is full.

Telegraph lines would also have to be altered and new ones established. Then there is the difficult question of compensation to owners of grass lands for occasional flooding to be considered, taking into account the increased value owing to the deposit of silt.

Taking all these matters into consideration, I would allow £52,800, bringing the total cost of the Regulating Reservoir up to £550,000.

This is, no doubt, a large sum, but yet not so great as the estimated cost of some previous proposals, which would not have been so effective. If hereafter it should be found necessary, in order to save the farms below Maitland from all flooding, to shorten the channel to Morpeth, this could be done, *via* Howes' Lagoon, for under £20,000. A small cutting at Green Rocks would be a useful work in any case, and could be done for about £6,000.

Since before anything could be done the whole question will have to be considered by the Minister, and submitted by Parliament to the Public Works Committee to be thoroughly thrashed out, it is hardly necessary for me to go further into the matter. For the same reason I refrain from bringing forward any scheme for the payment of the whole or part of the interest by the levy of a tax on the betterment principle, besides the information necessary to frame an equitable scheme of taxation could only be obtained by some such body as the Public Works Committee.

I must, however, express it as my opinion that since the whole country will benefit by the protection afforded to our railways, and by the saving which I am confident will result in the cost of maintenance of Newcastle Harbour, a large proportion of the cost of the work should be borne by the country at large.

I have, &c.,

EDWD. PRICE,  
Assistant Engineer, Public Works Department.

1897.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

CLOSING OF WHALING-ROAD, NORTH SYDNEY.

(RETURN RESPECTING.)

*Printed under No. 20 Report from Printing Committee, 21st October, 1897.*

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 1st July, 1897, That there be laid upon the Table of this House,—

“ A *précis* of papers in connection with the closing of Whaling-road, North Sydney.”

(Mr. E. M. Clark.)

Part of the Whaling-road, Borough of East St. Leonards.

PRÉCIS.

In March, 1868, application was made by the Borough Council of East St. Leonards for proclamation of alignment of roads and streets in their Municipality.

In compliance with this request, the late Licensed Surveyor Armstrong was instructed to make the necessary survey for the purpose. To carry out the work he was compelled to resurvey certain land known as the Whaling allotments, situate between Careening Cove and Neutral Bay, in order to determine the position of the Central road, now called the Whaling-road.

Mr. Licensed-Surveyor Armstrong reported, when transmitting his plan, that his survey on the south-west of the Whaling-road agreed very well throughout with the original survey, which proved that the road was correctly placed by him. He further stated that to give Mr. Loxton (who owns part of Mitchell and How's grant) his boundaries as conveyed to him by deed it would be necessary to extend the measurements across the road laid out by him; and the opposite allotment (No. 2, Barker's, now Parbury's) would be deprived of its road frontage—in other words, the grant would overlap the road.

Further on in his report he speaks of the buildings erected by Messrs. Loxton and Younger as intrusions on the road.

Mr. Surveyor Deering, who was instructed to report on Mr. Armstrong's survey, in consequence of the protests of Mr. Loxton, takes exception to the term “ intrusion,” as applied by Mr. Licensed-Surveyor Armstrong, and states that the buildings are within the boundaries granted by the Crown, and that the facts are:—That the Government, on one hand, reserved the Whaling-road on the designs for subdivision in the descriptions of all surrounding grants, and in the survey of the allotments on the south-western side of the road; but, on the other hand, the Government included the road in the survey and measurements of the north-eastern allotments; and further, that the dimensions of these allotments, as furnished by Mr. Assistant-Surveyor Larmer (the original survey), embraced the road beyond all doubt.

Proclamation of the streets, as surveyed by Mr. Armstrong, was made in August, 1870, and confirmation in May, 1873, with the exception of that part of the Whaling-road between the western boundary of the Whaling lots and the waters of Port Jackson (the part in question), and this omission was in consequence of protests made by Mr. Loxton, on the grounds that the road, as marked by Mr. Armstrong, ran within a few feet of his residence (which was erected at great cost), and cut off about 2 acres of his land. Whereas he alleged the road ought to be without his boundaries, as granted by deed (*vide* accompanying plan).

When authority was obtained of the Executive Council for alignment of the streets under 2nd Victoria No. 2, the part of the Whaling-road referred to, viz., from the western boundary of the Whaling allotments to the waters of Port Jackson, was carefully excluded, as it had been from the confirmation notice, and consequently did not receive Executive authority for alignment, yet, by a mistake, it was included in the alignment notice with the other streets.

On

352—A

[580 copies—Approximate Cost of Printing (labour and material), £7 7s. 5d.]

On a memo. from the Clerk of the Executive Council asking how this error can be cured, the question was referred to the Crown Solicitor, who returned the papers at the request of this Department, with a statement to the effect that the Attorney-General had not advised in the case yet.

Mr. Lamb, on behalf of Mr. Parbury, applied for the Government to take immediate steps for the removal of serious obstructions that have been placed on the Whaling-road by private persons (meaning Mr. Loxton and Mr. Younger), and for the opening such road for the use of surrounding residents.

Investigation showed that a design for the subdivision of the point of land on which the Whaling allotments are situate was approved by Governor Darling in July, 1830.

A survey in accordance with this design was made of portions Nos. 3, 4, 5, 6, and 7 in May, 1831. These portions lie on both sides of the Whaling-road.

It was stated by Mr. Lamb that the grants of the allotments on the northern side of the road are many years subsequent to the date of those under which his client (Mr. Parbury) claimed. This is not the case, for the respective dates of some of these grants are as follows:—

Barker's, lots 1 and 2, south side; date, July, 1834.  
 Donnison's, lot 3, south side; date, February, 1837.  
 Brown's, lot 6, north side; date, May, 1840.  
 J. Lamb, lot 4, south side; date, June, 1841.  
 Mitchell and How, lot 7, north side; date, September, 1846.

There is no doubt that Barker and Donnison's grants, all on the south-west of road, were the first issued, and it is in right of these that Mr. Lamb claimed to have the road opened.

It was submitted to the Honorable the Minister for Lands that the Crown Law Officer's opinion be obtained, not only on the subject of the letter from the Clerk of the Executive Council, but also as to the legality of carrying the Whaling-road, as surveyed, to the waters of Port Jackson, having in view all the circumstances of the case, and also section 15 of 4 William IV. No. 11.

On 25th May, 1876, the Minister for Lands (Mr. Garrett) approved of the papers being forwarded for the Crown Law Officer's opinion on the subjects mentioned in the foregoing paragraph, and, in accordance with that approval, the papers were so forwarded.

On the 4th June, 1877, the Crown Solicitor returned the case, with a statement that the Attorney-General was unable to advise thereon until furnished with further information respecting it. Such further information was supplied to the Attorney-General (Mr. Windeyer) by an officer of the Surveyor-General's Department, in the course of a personal interview, but the Attorney-General does not appear to have advised on the case at that stage, and on the 7th January, 1878, the papers were obtained from the Crown Solicitor, for the information of the Minister for Lands (Mr. Farnell), who had consented to receive a deputation of property-holders interested in the opening of the road.

No notes of what transpired at the interview granted by the Minister to the deputation can be found with the case, but on the 15th January, 1878, the Minister wrote:—"This road may now go on to completion."

Several communications were next received from persons interested, urging the opening of the road, and on the 17th April, 1878, in the Legislative Assembly, Mr. Greenwood, M.P., asked the Secretary for Lands, pursuant to notice,—

- (1.) Have any steps been taken towards removing the obstructions which prevent the public from using the Government Road at St. Leonards, called the Whaling-road?
- (2.) Do the Government intend to open the said road; and, if so, when?

Mr. Farnell answered,—

- (1.) No steps have been taken, for though it was the intention of the Government to reserve a road, no allowance was made for it in the measurement of adjoining grants.
- (2.) No decision has been arrived at, and the case will probably require the introduction of a special Bill before Parliament.

On a communication from Mr. R. P. Abbott, who, on behalf of Mr. P. Hayes, urged that in the settlement of any question as to the opening or closing of the road, the latter's claim to have such road as the eastern boundary of his land should not be overlooked. The Minister (Mr. Farnell), on 10th May, 1878, wrote, "A Bill will be required to deal with the matter of the Whaling-road. All claims will be considered."

Mr. Surveyor Maitland was then, on the 23rd May, 1878, requested "to make himself acquainted with the requirements of the persons interested in the road herein referred to as the Whaling-road, and to suggest a way in which a road may be taken through the peninsula to the waters of the harbour that will meet the requirements of a majority of the people interested, and that will not entail the necessity of paying an excessive amount of compensation."

In reply, Mr. Surveyor Maitland, on 29th June, 1878, transmitted a plan and field-notes of a survey of proposed road through the Whaling allotments from Alfred-street to the waters of Port Jackson, and reported in connection therewith that after a close inspection of the locality he had laid out a road that he would suggest as the most suitable to meet the views of a very large majority of those interested in the matter, and which would entail the necessity of the Crown paying a smaller amount of compensation than any other line that could be adopted.

In his report, Mr. Maitland stated that it appeared to him that there were but three possible lines, one of which would have to be adopted—

1. A continuation of the Whaling-road, as surveyed by Mr. Armstrong, passing through land claimed by Thomas Loxton, Watt and Fell, Wood and Younger, Edward Lord and Mrs. Younger.
2. A road passing through lands owned by G. von Meyer, J. E. Loxton, H. Simpson, W. Cope, J. J. Slade, W. Henderson, and Edward Lord.
3. A continuation of High-street (already dedicated to the public as far as the west boundary of E. Lord's 1 acre 1 rood by Mr. Lamb's private subdivision) through Edward Lord's land to the water's edge.

To the first-mentioned line—that proposed by Mr. Armstrong—Mr. Maitland took very strong objection, sharing the opinion expressed by Mr. Surveyor Deering that the fact of Thomas Loxton's land embracing

embracing the road is an error wholly attributable to the surveyor (Mr. Larmer) who originally surveyed the land, and apprehending consequently that the Government would be called upon to pay a very serious amount as compensation to Loxton, as the damage done to the latter's property would be very material.

In the case of line No. 2, Mr. Maitland reported that compensation would have to be paid to each of the proprietors, not only for the area taken from their properties for the road, but also for damage effected by the fact of the road passing in close proximity to buildings, &c.

The exceedingly rough, precipitous nature of the country formed a further objection, in Mr. Maitland's opinion, to the adoption of either of lines 1 or 2.

With regard to line No. 3, Mr. Maitland reported that though some compensation would be demanded, that line would cost the Government less than either of the other lines mentioned, met with the approval of a large majority of the persons interested, presented no engineering difficulties, and was, in consequence, the one which he could confidently recommend for adoption, suggesting, for economic reasons, that High-street should be retained at its original width (83 feet) as far as Edward Lord's 1 acre 1 rood, through which it should be widened to 50 feet.

In a further communication, dated 23rd July, 1878, Mr. Maitland, at the request of the Surveyor-General, reported having shown upon the plan transmitted with his previous letter (of 29th June, 1878) "a means of access to every proprietor of land having frontage to the Whaling-road"; that the roads shown thereon by dotted lines through Watt and Fell's portion were, he was informed by Mr. Fell, secured by deed and afforded access to the portion owned by Messrs. Wood and Younger; and that the road proposed by him afforded "good means of access to Edward Lord, Mrs. Younger and P. Hayes' portions."

The papers were then (on 25th September, 1878) forwarded by the Surveyor-General to "Lands" for the purpose of the preparation of the special Act.

At the meantime, the Minister was again approached by a deputation in the matter, and on the 22nd October, 1878, in the Legislative Assembly, Mr. Greenwood, M.P., asked the Secretary for Lands,—

- (1.) Is it the intention of the Government to open the Whaling-road at North Shore?
- (2.) Is it deemed necessary to deal with the matter by Bill; and, if so, when will such Bill be brought in?
- (3.) Failing the opening of the said road, what other provision do the Government intend making to remedy the great inconvenience now suffered by property-owners in its vicinity?

Mr. Farnell answered,—

- (1.) Yes.
- (2.) By Bill, which will shortly be placed in the hands of the Parliamentary Draftsman.
- (3.) Answered by previous answers.

NOTE.—In October, 1878, the business of dealing with road matters was transferred from the authority of the Minister for Lands to that of the Minister for Mines.

The papers were then, on the 11th November, 1878, forwarded to the Parliamentary Draftsman to prepare a Bill.

In response to a request of the Parliamentary Draftsman certain further particulars were supplied to him, and on 19th March, 1879, he forwarded for the perusal of the Honorable the Secretary for Mines a proof copy of a "Bill to authorise the prolongation of High-street, in the Borough of East St. Leonards, in the county of Cumberland, to the waters of Port Jackson."

Further communications from interested parties were received, and deputations waited upon the Minister for Mines in the matter.

In a lengthy letter, dated 23rd April, 1879, Mr. Donnelly Fisher, a petitioner for the opening of the Whaling-road, advanced arguments, such as the fact of the Government having granted land with a frontage to Whaling-road, thereby practically dedicating that road to the public, and also on the score of economy to the Government to support the contention that the Whaling-road should be opened instead of the proposed prolongation of High-street, but upon that letter the Minister for Mines (Mr. Baker) wrote:—"It is thought that High-street should be proclaimed and opened to the water's edge.—Approved.—E.A.B., 7/6/79."

On a further communication being received from Mr. Donnelly Fisher, that gentleman was informed that "the Minister for Mines has directed the extension of High-street to the waters of Port Jackson, through Mr. Lord's property. Proclamation of the same is now about to be made."

On 15th July, 1879, the authority of His Excellency the Lieutenant-Governor (Sir Alfred Stephen) and the Executive Council was obtained for the "preliminary notification" of High-street from Alfred-street to the waters of Port Jackson, parish of Willoughby, county of Cumberland, and notice was duly published in the *Government Gazette* of 8th August, 1879, folio 3513.

After waiting the customary time for the receipt of objections to the proposed road the Clerk of the Executive Council returned the case, with a statement that no objections had been lodged with him.

On 20th November, 1879, the Deputy Surveyor-General wrote the following minute:—"I am of opinion that the case of the Whaling-road, and claims in connection with it, can be dealt with only by a special Bill, as previously determined (see Ministerial 78-5502 herein); but should it be considered that this part of High-street can be established under 4th William IV No. 11, which I believe cannot legally be done, and that its establishment meets the necessities of the case, confirmation is the action remaining to be taken."

Further public demand for the opening of the prolongation of High-street was made, and on the 11th May, 1880, in the Legislative Assembly, Mr. Greenwood, M.P., asked the Secretary for Lands,—

- (1.) Is the Government aware that Whaling-road, St. Leonards East, has been stopped at one end by a land-owner, who claims that he has purchased it?
- (2.) Will the Government inquire into his right; and, if such exists, give him compensation, so that the street or road will be opened as promised?

Mr. Baker answered,—

- (1.) Yes; it is understood that a portion of the road in question has been obstructed.
- (2.) The matter is now under the consideration of the Government.

The

The Minister for Mines, after going into the matter, and according an interview to Mr. Lord (through whose land it was proposed to take the road—the extension of High-street) intimated through the Under Secretary for Mines that he wished the extension to High-street to be “shown in such a position as to take as little as possible of Mr. Lord’s land between Mrs. Younger’s land and the water frontage even though it involved a bend in the street.” The case was then, on the 21st July, 1880, referred to Mr. District-Surveyor Woolrych, who was requested to report upon the proposed alteration of High-street in accordance with the direction of the Minister for Mines, and who was informed that it was understood that the street should be 33 feet wide and not 50 feet, as laid out by Mr. Maitland. Mr. Woolrych transferred the instruction to Mr. Surveyor Bullock, who, on the 2nd September, 1880, reported that after carefully examining into the relative merits (as regarded gradients, cost of formation, and convenience to the public) of the road as laid out by Mr. Maitland, and the suggested alteration thereof, he was of opinion that the road as laid out by Mr. Maitland was by far the better one, and added that he failed to see a single reason why the deviation should have been thought of. Mr. Bullock further stated, “It would appear, on inspecting tracing, that Mrs. Younger would have no access to the road—should the road as laid out by Mr. Surveyor Maitland be adopted. This, however, would not be the case, for Mr. Lord informs me that she is entitled to a right-of-way through his land to the present street.”

The Deputy Surveyor-General then wrote the following minute: “Under this report the suggested deviation is inferior to the road laid out by Mr. Surveyor Maitland, and cannot be recommended as affording any solution to the difficulties of the case.”

Further communications from the public urging the speedy settlement of the road question were received.

On 15th December, 1880, a tracing illustrative of the course of the proposed road through his land was forwarded to Mr. Edward Lord, and that gentleman was requested to say what sum he would claim as compensation in the event of the road being carried through his land in the position shown thereon.

On 21st December, 1880, Mr. Lord replied that he would require compensation to the amount of £500.

The Surveyor-General then minuted, “*The acceptance of Mr. Lord’s offer cannot be recommended, as the amount of compensation asked for by Mr. Lord is so great, and even though it be granted and High-street carried out, it would still leave the question of the Whaling-road unsettled.* Attention is drawn to the course proposed in my minute of 20th November, 1879, upon Roads 79–3,291.”

The Minister for Mines then directed that a valuation should be obtained of the land proposed to be taken from Mr. Lord, and Mr. District-Surveyor Woolrych was instructed to cause such valuation to be made. Mr. Woolrych transferred the instructions to Mr. Surveyor Bullock, who, on the 16th July, 1881, reported that the proposed extension of High-street would take from Mr. Lord’s property an area of 1 rood and 2 perches, which he (Mr. Bullock) valued at £250, and from an adjoining property, an area 29 perches, valued at £190. Total value of land taken, £440.

The Minister for Mines (Mr. Suttor) then asked whether the reservation of 100 feet from high-water mark, which existed in the deeds of grant of the land that would be effected should High-street be carried to the water’s edge, had been alienated; and upon being informed that, although application for permission to purchase the rescission of that reserve had been lodged, it had not been alienated, directed that all applications for permission to purchase the rescission of the reserve referred to should be refused pending the settlement of the question of compensation for land required for road.

Meanwhile, on the 7th July, 1881, in the Legislative Assembly, Mr. Farnell had asked the Secretary for Mines,—

Has any action been taken; and, if so, what action, relative to the opening of Whaling-road, at North Shore, to the waters of Port Jackson, or has any action been taken for the opening of a road or street in lieu of the said Whaling-road?—and Mr. Baker had answered,—No action has recently been taken in relation to the opening of the Whaling-road, at North Shore, to the waters of Port Jackson. An extension of High-street, at North Shore, to the waters of Port Jackson has been proclaimed, but such extension has not yet been confirmed pending receipt of a report by the District Surveyor upon claim for compensation for land required for such extension.

Further communications urging the opening of High-street to the water’s edge were received, and on the 27th September, 1881, in the Legislative Assembly, Mr. Farnell asked the Secretary for Mines,—“What progress has been made towards opening High-street at St. Leonards, and when is it probable that the said street will be opened?” to which Mr. Suttor answered,—“The question of compensation for land required for the extension of High-street to the waters of Port Jackson is at present under consideration. As soon as that has been decided, High-street to the water’s edge, will be confirmed.”

“On 22nd November, 1881, the Minister for Mines (Mr. Renwick) wrote:—“With reference to the opening of High-street, St. Leonards, to deep water, and Mr. Lord’s claim for compensation in connection therewith, I am of opinion, considering that Mr. Lord is now an applicant for certain reserved Crown land (100 feet above high-water mark in front of his property), which it has been recommended by the proper officers, he should have at a nominal price; and, further, that in original tracings the quantity of land to be taken for this street from Mr. Lord was represented as being about half an acre (as it was supposed to include land contained in the reserve already referred to), and the valuation fixed by Mr. Lord for such quantity was £500, but as it is now known that the land to be taken from Mr. Lord’s property is only quarter of an acre, Mr. Lord should be content to take £300 compensation, and that he be informed accordingly.” Mr. Lord was informed in terms of Mr. Secretary Renwick’s minute, and on 30th November, 1881, he gave a written agreement to accept £300 in satisfaction of his claim. The Minister then directed that steps should at once be taken to establish the road by confirmation, and upon the Surveyor-General pointing out that the road as proposed included another strip of land 29 perches in area, and which Surveyor Bullock had valued at £190, and for which, although no application for compensation had at that time been received, compensation would ultimately have to be paid, said that any claim, if made in respect of that piece of land could be dealt with at the proper time; and, further, drew attention to the fact that 27 perches out of the area quoted came within the 100-foot reservation, and that, consequently, the landowner could claim only in respect of the remainder, viz., 2 perches.

The road, “High-street from Alfred-street to the waters of Port Jackson,” was then confirmed by notice in *Government Gazette* of 20th January, 1882, folio 330; claims for compensation in respect of land

land taken for the confirmed road were received from Mr. J. J. Slade (£100), and from Mrs. Thomasine Fisher (*per* Donnelly Fisher). These claims were referred to Mr. District-Surveyor Woolrych—and by him transferred to Mr. Surveyor Maitland—for report.

Mr. Maitland reported that Mr. J. J. Slade's claim was excessive, and that a sum of £55 would be fair compensation. Mr. Slade was informed of the surveyor's report, and on 20th July, 1882, wrote expressing his willingness to accept the amount mentioned, £55, as full compensation, and Treasury was authorised to pay him that sum.

In the case of Mrs. Fisher, Mr. Maitland recommended that a slight deviation in the road should be made to avoid encroachment upon the properties of Mrs. Fisher and others. This recommendation was given effect to. An objection on the score of encroachment to High-street, as originally surveyed, was at a later date received from Mr. J. F. Loxton, but the encroachment complained of was avoided in the deviation recommended by Surveyor Maitland and approved by the Minister.

The agitation for the opening of the Whaling-road was renewed by property-holders interested therein, and deputations waited upon the Minister for Mines with the object of urging the adoption by the Government of one of two courses, namely—to open the road and compensate owners of land on northern side of such road for loss of land and improvements, and deterioration in value of property, or to close the road and compensate land-owners on both sides of it for the loss of such road.

On 31st March, 1882, Mr. Stopps (for the Surveyor-General) wrote the following explanatory minute:—"Could any definite position be assigned to, or agreed upon, for Whaling-road valuable property and improvements would be interfered with, and it is doubtful that the Borough Council of East St. Leonards would ever make the road, as the land is described to be remarkably broken and precipitous; these facts, together with other circumstances of the case, fully dealt with in previous papers, led to the determination which was arrived at in 1878, namely, that Whaling-road should be annulled by Act of Parliament, and any claims arising out of such action should be dealt with under the Bill, which was also to provide for the resumption of land to extend High-street (a private street) to the waters of Port Jackson, and such extension of High-street was to be in lieu of Whaling-road, which road virtually never had any existence. The Bill referred to was prepared, and a survey was made of the proposed extension of High-street, which was to be established under the Bill in connection with the settlement of claims for loss or deprivation of frontage to Whaling-road through its cancellation. The Bill, however, never became law, but High-street was carried down to the water's edge under 4th William 4th, No. XI, thus leaving undone the intended abolition of Whaling-road and settlement of claims consequent thereon, which were the objects for which the survey of the extension of High-street was made."

In response to a verbal request made by the Minister for Mines that those land-owners who, in the event of the Whaling-road being closed, would consider that they had claims against the Government for compensation for loss of frontage, &c., would furnish estimates of the amount of compensation they would require, the following forwarded claims:—T. J. Loxton, £5,000; Mr. G. von Meyer, £3,000; Mr. J. J. Slade (for self and Mrs. Thomasine Fisher), £2,708; T. H. Simpson, £450. J. F. Loxton also wrote in on the subject, complaining that his property was very injuriously affected by the non-opening of Whaling-road, but without specifying the amount of compensation he would claim in the event of the road being closed. Mr. Henry Levien, solicitor for Mr. George von Meyer, wrote in, stating that he had been instructed by his client to demand £4,000 as compensation for damage to property by the closing of the road.

In connection with his application for permission to purchase the rescission of the 100-foot reservation in front of his property, Mr. E. Lord relinquished any claim he might have in respect of the Whaling-road.

On the 9th January, 1883, the Principal Under Secretary (Mr. Critchett Walker) addressed a communication to the Under Secretary for Lands, stating that, by notification in the *Government Gazette* of that day's date, the Honorable Sir John Robertson, K.C.M.G., Secretary for Lands, had been appointed nominal defendant in "the matter of the petition presented by Mr. R. H. Levien, solicitor, to His Excellency, on behalf of Mr. George von Meyer, as to a certain claim or demand which he deems himself to have against the Government."

On the 7th February, 1883, Mr. R. H. Levien wrote to the Minister for Lands asking for an interview, with the object of seeing if a settlement could be arrived at with regard to the claim of G. von Meyer. The matter was referred to the Under Secretary for Mines, and the Minister for Mines was supplied with copies of the deeds of grant of the land through which the Whaling-road is supposed to pass.

On the 15th March, 1883, the Minister for Mines (Mr. J. P. Abbott) wrote: "The question at issue in reference to this matter is really not one of roads, but, as I take it, rather a claim for an error made in the Department of Lands by issuing a grant which included a road. If the claimant is entitled to any compensation it is for the loss he has suffered through this mistake, and the late Government named Sir John Robertson (as the head of the Department which is charged with making the mistake) as the nominal defendant. If the plaintiff is entitled to compensation, a jury alone, it appears to me, can safely assess that compensation."

Several of the land-owners interested renewed the agitation for a speedy settlement of the road question, and the Minister for Mines (Mr. J. P. Abbott), in referring the matter to the Crown Solicitor for Attorney-General's opinion thereon, wrote the following minute:—"In February, 1837, the Crown made a grant to Henry Donnison of 8 acres 2 roods 5 perches. This land is described as starting at a rock in Careening Cove, and bounded by a road (*see* copy of the grant at page 5 hereto annexed, and also copy of a plan herewith). In 1840 the Crown made another grant to William Brown of 3 acres 2 roods 36 perches. This land is described as starting from the waters of Neutral Bay (*see* copy of grant at page 17, and also the plans). This grant is described as extending from the water to a road, but the length of the lines given has the effect of including within the description of that grant whatever road was referred to in the grant of 1837 (*see* plan). I shall be glad to be advised whether by the first grant there was not an actual dedication of a road?

"(2.) Whether the second grant was not inoperative, so far as it had the effect of granting that road?

"(3.) What rights have the present owners of the second grant for a deficient area within their boundaries, assuming that the Crown had no power to include the road?

"I shall be glad if the Attorney-General will favour me with his opinion upon the points submitted as soon as possible.

"Mr.

"Mr. Attorney-General Dalley inquired whether, at the time of grant being made to Donnison (February, 1837), there was any road in user on the boundary-line of this piece of land between Neutral Bay and Careening Cove, or whether any such road is shown on the old maps? Also whether, if no road were either actually in user or marked on any plan at the time of Donnison's grant, it was in existence at the time of Brown's, three years afterwards"; and was informed by Mr. Stopps, for Surveyor-General, that there was nothing whatever to show that a road or track was in use along the boundary in question of Donnison's grant, that, on the contrary, there appeared to be presumptive proof that a road could not have been in use, inasmuch that the land along that boundary formed the crest of a steep, rocky, and broken hill, which had been described as almost impracticable in its natural condition, as at present—that, probably, the only access to the Whaling allotments that was required or used at the time was by the waters of the harbour, and that a sketch (which was forwarded to the Attorney-General with this minute) showed "that the design for the subdivision of the promontory proposed to provide land for a road which should run along the middle of the promontory, and separate the allotments on one side from those on the other side; but the lengths of lines and areas given under the deeds of the allotments embraced the land proposed to be set apart as a road."

Mr. Attorney-General Dalley then advised as follows:—"I have now seen the Surveyor-General's report, confirmed by an explanatory plan. It appears clear from the papers that there was no road in use along the boundary of Denison's (this should be 'Donnison's') grant. The design for the subdivision of the promontory proposed to provide land for a road running along the middle of the promontory, but the lines and areas of the allotments given in the deeds embrace the proposed road, and, therefore, show that this design for the road was never carried out. I think, therefore, it must be assumed that there was no road either by dedication or user."

In the meantime, in the Legislative Assembly, Mr. Holterman moved, pursuant to Notice, "That there be laid upon the Table of this House copies of all papers, correspondence, minutes, reports, plans, and any and all other documents in connection with the dedication, resumption, closing, or sale of Whaling-road, Milson's Point, North Shore, or the resumption, closing, or sale of any portion of such road."

The question was put and passed. In obedience to the order of the Legislative Assembly, a return was prepared, and laid upon the Table of the Legislative Assembly on 6th February, 1884, with tracings.

On 7th February, 1884, the Honorable John McIntosh, M.L.C., forwarded a letter received by him from Mr. Georgo von Meyer, in which the latter urged his claim for compensation in respect of the closing of the Whaling-road. No action was taken upon the letter, pending the settlement of the question.

On 6th May, 1884, the Legislative Assembly appointed a Select Committee, consisting of Messrs. Abigail, Withers, Chapman, Sydney Smith, George Campbell, Levien, A. G. Taylor, Abbott, Harris, and Holtermann (Chairman), "to inquire into and report upon the opening of Whaling-road, at North Shore, from Alfred-street to the waters of Port Jackson." On 1st November, 1884, that Committee issued the following report:—

1. Your Committee, having examined the witnesses named in the list (whose names will be found appended hereto) find as follows:—

1. That, in about the year 1830, Mr. James Larmer, licensed surveyor, acting under instructions from Mr. Surveyor-General Mitchell, surveyed and marked out at North Shore a road 1 chain wide, which road divided two sets of allotments granted for the purpose of encouraging the whaling industry, and was known as the Whaling-road.
2. That the allotments referred to have since been sold by the original grantees to various purchasers, and have been subdivided by different surveyors and resold. In some of these measurements the road has been absorbed, and is now held by the purchasers of the allotments under the subdivisions.
3. That the original allotments are now shown to exceed in area the quantity of land granted by more than would suffice to restore the road.

2. Your Committee, in view of the foregoing facts, are of opinion that the road known as the Whaling-road should be at once dedicated and proclaimed by the Government as a public thoroughfare.

On 20th January, 1886, Sir Henry Parkes, K.C.M.G., on behalf of G. von Meyer, wrote *re* the Whaling-road, and the Minister for Mines (Mr. R. M. Vaughn) replied:—"Sir Henry Parkes may be informed that nothing more can be done in the matter."

NOTE.—In May, 1887, the business of dealing with road matters was retransferred from the authority of the Minister for Mines to that of the Minister for Lands.

On 17th August, 1887, the Borough Council of East St. Leonards requested that alignment posts should be fixed in position on the Whaling-road, and stated "the Whaling-road has already been aligned."

On the 31st August, 1887, the Borough Council was informed that there is no alignment of the road in question to mark with posts, consequently their request could not be complied with. The Borough Council then applied to have the Whaling-road aligned, and on 23rd September, 1887, wrote requesting an interview with the Minister for Lands in connection with the matter. The Minister (Mr. Garrett) appointed a day to see the deputation, and wrote, "The position of the Crown can only be satisfactorily ascertained by referring the case to the Crown Law officers for their opinion, which is set out on papers herewith."

The papers were accordingly forwarded to the Crown Solicitor on 4th October, 1887.

On 27th September, 1887, a Mr. Henry Deane, on behalf of land and property owners in the neighbourhood of an alleged road called the Whaling-road, wrote to the Minister for Lands requesting him to fix a day to receive a deputation in opposition to the opening of the said road.

The writer was informed that Mr. Secretary Garrett had already decided to grant an interview at 2.30 p.m. on 30th September, 1887, to a deputation from the Borough Council (presumably in advocacy of the opening of the Whaling-road), and would receive the deputation in opposition to the opening of that road at the same hour. Mr. Deane then wrote expressing regret at the inability of his deputation to attend at the hour named, and asked the Minister to defer arriving at any definite determination with regard to the road in question until his deputation expressed their views in writing.

In January, 1888, Mr. G. von Meyer wrote to Mr. Burns (Acting Minister for Lands), urging the matter of the Whaling-road, and on 25th February, 1888, Mr. Secretary Garrett, referring to delay by  
Crown

Crown Solicitor in furnishing the opinion of the Attorney-General on the matter, wrote: "It is of the greatest importance that the opinion sought for should be given without delay, as there are cases before the lower Courts and a Committee of the Legislative Assembly sitting on the matter at present." The Crown Solicitor was accordingly requested to expedite action on the matter.

On 6th March, 1888, the Crown Solicitor returned the paper with a request preferred by Mr. Attorney-General Simpson for further information in the case. In making the request, the Attorney-General remarked: "These papers appear to have been before the late Attorney-General since October, 1887, and he has evidently not advised on the case for some reason which he considered a good one. I believe it was because proceedings are going on in a Court of Equity, and he did not think the Crown should interfere pending such proceedings. I find in a letter written by the late Attorney-General on 23rd January last to Mr. von Meyer, Whaling-road, the following:—'The Attorney-General desires me (the Secretary to Attorney-General) to inform you that as the matter is pending in the Supreme Court he has deferred giving his opinion upon the point of law involved. You are under a misapprehension in thinking that any opinion of the Attorney-General would settle the matter in dispute. The point is a legal one, and seeing that legal proceedings have been taken it can only be settled in a Court of law.'

"I have had a conversation with the late Attorney-General, and I am very much inclined to agree with him.

"As, however, my hon. colleague the Minister for Lands wishes for the opinion of the Crown Law Officers—meaning thereby, I assume, the Attorney-General—I will be very happy to give an opinion, without any delay, upon a proper *précis* of the case being prepared and submitted."

Mr. Stopps, of the Surveyor-General's Department, waited upon the Attorney-General with required information, and explained the case to him. The question submitted for opinion was as follows:—"Assuming that there is no land, or insufficient land to afford a roadway in the position described in the deeds of the allotments of land alienated by the Crown, is the Crown legally responsible; and, if so, what steps would the Attorney-General advise to be taken in the matter?"

On the 9th April, 1888, Mr. Attorney-General Simpson advised as follows:—"I am of opinion that the Crown is not legally responsible, at all events to the present owners of the lands in question. I advise that no steps be taken by the Crown, and that the parties interested be left to have their rights determined by the legal tribunals of the Colony. I understand that equity proceedings are now pending."

The Minister for Lands (Mr. Garrett), on 23rd April, 1888, wrote: "Seen. Attorney-General's advice to be acted upon."

On 22nd August, 1888, the Cumberland Ranger (Mr. J. McKeown) forwarded a letter which he had received from Mr. G. von Meyer, in which the latter complained that the Great Northern Coal Company had fenced in a piece of Crown land which formed part of the Whaling-road. Mr. von Meyer was informed that if any Crown land existed at the point in question forming part of a road, and was illegally enclosed and occupied, it came within the scope of the authority of the Municipal Council to protect the rights of the ratepayers from infringement.

On 23rd October, 1888, Mr. G. von Meyer interviewed the Minister for Lands (Mr. Bruncker), and left a letter (setting forth at length the injury which he claimed had been done him by the non-opening of the Whaling-road), together with some other documents and newspaper clippings.

In the meantime the case of the Whaling-road had come before the Police Court at St. Leonards, Mr. von Meyer and five other persons having pulled down a wall that had been erected by J. F. Loxton, across what was claimed to be part of the Whaling-road, were proceeded against on an information laid by the latter on a charge of "forcible entry." Mr. Stopps attended on behalf of the Department of Lands, and produced certain evidence that had been called for. The defendants were discharged.

On 22nd November, 1889, Mr. G. von Meyer wrote asking for an interview with the Minister for Lands. The Minister (Mr. Bruncker) appointed Thursday, 19th December, 1889. On that day a deputation consisting of Mr. Cullen, M.P., Mr. von Meyer, Alderman Clark, and others attended. Mr. von Meyer reiterated the statements set forth in his letter of 23rd October, 1888, to the Minister of Lands, as to the injury done him by the non-opening of the Whaling-road. Alderman Clark said the Municipal Council of which he was a member, were being continually pestered by people to do something in the matter of the Whaling-road, and he contended that the road having been gazetted, and also recommended for establishment by the Select Committee of the Legislative Assembly, should be opened up by the Department.

The Minister (Mr. Bruncker) said "he could do nothing in regard to the case. The Crown has a legal adviser—the Attorney-General—who has advised that the Crown was not responsible, and that the parties interested should be left to have their right determined by the legal tribunals of the Colony. The survey of these Whaling grants appeared to have been first made on paper, and when they came to be made on the land, it was found that there was not sufficient ground available for both grants and road." With regard to the statement that the road had been confirmed by *Gazette* notification, the Minister said that "the road had not been confirmed, but, through an error, it had been included in the alignment notice. It was only a notice, and not one binding on the Government. In any case he could not go against the 'Attorney-General's opinion.'"

On 28th July, 1890, the Municipal Council of East St. Leonards requested the Minister for Lands to "proceed against Mr. Loxton for an intrusion upon Crown lands, and to cause such lands to be properly laid out and dedicated as a road;" the lands referred to being described as the Whaling-road.

The Council was informed as follows:—"The Department is not satisfied that there has been encroachment upon Crown land by Mr. Loxton, or that there are grounds sufficient to take action against him for intrusion, and declines to comply with the request of the Borough Council of East St. Leonards.

On 26th and 27th October, 1890, Mr. D. M. Maitland attended, on behalf of the Department of Lands, at the Supreme Court (in Equity), with evidence in the case of Loxton *versus* von Meyer.

On 8th November, 1890, the Borough Council of North Sydney solicited an interview with the Minister for Lands, with the object of urging upon him that the Government lodge a caveat against the application of Lucinda Jane Loxton (No. 8,189) to bring certain lands (including part of the alleged Whaling-road), and which lands were described in *Government Gazette* of 17th October, 1890, folio 8070, under the provisions of the Real Property Act.

On the 14th November, 1890, the Minister (Mr. Bruncker) received the deputation, which consisted of Mr. Cullen, M.P., the Mayor, Aldermen Clark and Mosely, &c., &c.

The deputation said that the Borough Council, in the interests of the ratepayers, had decided to lodge a caveat against the application of Mrs. Loxton, and asked the Minister to strengthen their hands by lodging another. Mrs. Loxton would get 4 acres 3 perches if her application were granted, whereas she was only entitled under her grant to 3 acres 22 perches.

The Minister said that he could not do what they desired. He had the opinion of the Attorney-General that he was not justified in so doing. He thought that if the Council lodged a caveat the better course would be to have the matter threshed out in the Supreme Court. The Department would look very foolish going into Court when they had documentary evidence to show that the Whaling-road had been carefully omitted from the alignment. In regard to the area, not one of these old grants but had more than its proper area. Their surveyors did not say there was Government land there—quite the opposite, and they would soon have this pointed out to them if they went into Court.

On 17th November, 1890, the Borough Council of North Sydney addressed a communication to Sir Henry Parkes, K.C.M.G., further urging that the Government should lodge a caveat against Mrs. Loxton's application. The letter was referred to the Minister for Lands (Mr. Brunker), who decided that, in view of the answer given to the deputation on 14th November, 1890, no further action was necessary thereon.

On 20th July, 1891, in answer to a request made by Messrs. Ellis, Makinson, and Plunkett to be allowed to file an information and statement of claim in the name of the Attorney-General, and of their clients (Tierney and others, trustees of St. Joseph's Investment and Building Society) to assert a right to the Whaling-road as a highway, Mr. Attorney-General Simpson wrote, "Inform Messrs. Ellis, Makinson, and Plunkett that, after due consideration, I have come to the conclusion that it is my duty to refuse compliance with the request contained in their letter of the 20th instant."

On 21st December, 1891, the Legislative Assembly appointed a Select Committee, consisting of Messrs. Copeland, McGowen, Haynes, Cook, Want, Crick, Levien, Hutchinson, Hassall, and E. M. Clark (which Committee was subsequently altered to include Messrs. Rose, Donald, and Dr. Hollis in lieu of Messrs. Want, Crick, and Hassall), to inquire into and report upon the opening of the Whaling-road, North Shore. On the 17th March, 1892, the Special Committee reported that they were of opinion that the road as shown on plans referred to and known as the Whaling Road, was a public thoroughfare, and recommended that the road "as gazetted on 18th July, 1893," should be at once opened by the Government for public use.

On the 29th November, 1891, judgment was delivered in the case of Tierney *versus* Loxton. Tierney had lodged a caveat against Mrs. Loxton's Real Property application, and an order of Court had been made settling the issue at highway or no highway. The judgment of 29th November, 1891, rescinded the order of Court directing trial of issues, and the Registrar-General was directed to take the caveat off the file.

On 3rd December, 1891, in the Legislative Assembly, Mr. E. M. Clark drew attention to the question of the Whaling-road. He understood that from the decision of the Court in Tierney *versus* Loxton the caveators would have to withdraw their caveat on the following Saturday. He wished to know whether the Attorney-General would join issue with the caveators in the case. Mr. Barton (Attorney-General) said that he could not see that there was any question that could not be as well fought out without the intervention of the Attorney-General.

On 13th December, 1892, in the Legislative Assembly, Mr. E. M. Clark asked the Secretary for Lands,—

(1.) Has he yet considered the advisability of giving effect to the resolution of this House, adopted as a formal motion, and therefore unanimously, "That the Report of the Select Committee on the Whaling-road be adopted"?

(2.) Is it a fact that the North Shore Gas Company has erected a gasometer on the said road, and that one J. F. Loxton has also lately erected a stone wall across same?

(3.) As the recommendation of the Select Committee was that the road should be at once opened, has he any objection to state why he declines to give effect to the unanimously expressed resolution of this House which adopted such recommendation?

Mr. Copeland answered,—

(1 and 3.) The resolution of the House was a formal motion, which slipped through inadvertently, and should not have been dealt with without full consideration, seeing that a Select Committee cannot be appointed on a formal motion. The recommendation embodied in the Committee's Report is the reverse of that recommended by the ex-Attorney-General (Mr. Simpson). I will, however, endeavour to obtain the opinion of the present Attorney-General on the vexed question, and in the meantime no action will be taken.

(2.) It is understood that a gasometer and other buildings are on the land, which might be locally spoken of as the Whaling Road.

On 19th December, 1892, the case was forwarded to the Attorney-General, the Minister (Mr. Copeland), having written: "Forwarded to Attorney-General. I should be obliged if my honorable colleague would favor me with his opinion as to whether the Crown should be held responsible for opening this road."

On 5th April, 1893, Mr. Clark, M.P., wrote drawing attention to the fact that the North Shore Gas Company had made a Real Property application in respect of land known as the Whaling-road, and urging that the Department of Lands should lodge a caveat against such application.

At various times during April, 1893, in the Legislative Assembly, Mr. Clark asked questions of the Secretary for Lands relative to the Whaling-road, and was informed that the case had been referred to the Crown Law Officers for the opinion of the Attorney-General thereon, and that this Department will take such action as might be recommended by the legal adviser of the Crown.

On 16th May, 1893, Mr. Clark wrote to the Minister for Lands, pointing out that the period within which caveats might be lodged in the matter referred to expired on the 26th May, 1893, and that in the case of Tierney *versus* Loxton, it was held in the Supreme Court that no property owner could caveat in respect to a right of road. The letter was referred to the Crown Solicitor for the information of the Attorney-General.

On 22nd May, 1893, the Crown Solicitor forwarded Mr. Attorney-General Barton's opinion on the matter, referred to him on the 19th December, 1892. It was as follows:—"This matter gives rise to a number of complex and difficult questions, but the subject more immediately demanding an opinion from me is whether the Crown ought to lodge a caveat against the application of the North Shore Gas Company."

"I have come to the conclusion that this course is not advisable. The evidence as to what has been called the 'Whaling-road,' whether in respect of its location or in respect of the question of dedication and user, is, in my opinion, so vague and unsatisfactory that I am unable to say that the caveat could be supported with reasonable hope of success, assuming that there still existed the means of proving everything which seems to favour the claim of a road. But the great lapse of time makes even this most doubtful, and on the whole I am of opinion that it would be a waste of money on the part of the Crown to litigate the matter.

"The Municipal Council of North Sydney are, I understand, anxious to contest the claim of road if they could acquire any footing to enable them to do so. If they are willing, in view of the limited prospects of success, to take the risks attaching to litigation, it may be a question for my honorable colleague whether he will contest the matter on the Municipal Council giving a satisfactory indemnity to the Crown against all the costs. But it must be remembered, as pointed out by the Court in its judgment in *Tierney v. Loxton*, 'that there is nothing to be found in any section of the Act (*i.e.*, the Real Property Act of 1862) which points to the conclusion that the Legislature ever intended that questions as to the existence of a highway or right of public user of land should be contested under its provisions.' In a later part of the judgment it is hinted that the Minister might think it right to take the necessary steps to enter a caveat, but the Court does not clearly intimate its opinion that a caveat is any more open to the Minister than to anyone else for the purpose of contesting questions as to the existence of a highway.

"On the other hand, it may be that a writ of intrusion would be the best means of settling the question if the Municipal Council will take the risk by giving an indemnity. But unless or until they intimate a desire to do so it is not necessary to inquire minutely into this branch of the subject. It is enough for me to say now that I do not think there is sufficient evidence to warrant the Crown in contesting the question as asked.

"The Under Secretary for Lands (Mr. Houston) then submitted that, 'in view of the advising of the Attorney-General, no steps be taken to lodge a caveat against the application of the Gas Company.' This is the matter requiring immediate settlement. The Minister (Mr. Copeland), on the 23rd May, 1893, wrote. 'In view of the Attorney-General's opinion, I should not feel justified in taking any action in the matter. Inform.'

"Mr. Stopps then queried, 'The question of whether a caveat shall or shall not be lodged having been settled in the negative, it is now submitted whether it is considered that the subject of the Minister's reference to the Attorney-General of 19th December, 1892, on paper 86 herein, has been dealt with in Mr. Barton's opinion, and whether in view of the tenor of it *no further action be taken* to survey or to attempt to locate and open the so-called road.'

The Under Secretary (Mr. Houston) submitted that the question really was whether litigation was to be entered upon with a view to opening the supposed road; if so, he ventured to think, it should only be undertaken on the conditions indicated in the concluding paragraph of the Honorable the Attorney-General's advising.

The Minister (Mr. Copeland), on 6th June, 1893, wrote: "Approved." On 13th June, 1893, Mr. E. M. Clark, M.P., was informed in terms of the foregoing.

On 3rd August, 1893, Mr. G. von Meyer submitted a lengthy letter relative to the Whaling-road to the President of the Executive Council, and stated that in 1882 "Dr. Renwick, M.P., the then Minister for Mines, was requested to assess the damage done to my wife's estate (*i.e.*, by the closing of the Whaling-road), and the said Minister assessed the damage at £3,000, but my said wife has not received one single penny on the said assessment."

Mr. von Meyer's letter was referred to this Department, and in answer the Principal Under Secretary was, on 9th October, 1893, informed that the Honorable the Attorney-General having expressed his opinion that the evidence as to what has been called the Whaling-road is so vague and unsatisfactory that it has been decided not to take any action towards opening the said road unless the Borough Council of North Sydney will take the risks of litigation which might issue thereon by giving the Crown an indemnity.

In answer to a communication from Mr. G. von Meyer, that gentleman was, on 16th October, 1893, informed that his letter to His Excellency the Governor and the Executive Council, having been referred to this Department, was reported upon on 11th October, 1893.

On 18th November, 1893, Mr. G. von Meyer addressed a communication to the Principal Under Secretary, stating that he relied mainly upon "the authority of the Crown given to Dr. Renwick (late Minister for Mines) to assess the value of the property," the subject of his claim for damages in respect of the Whaling-road, and further stating that he awaited the return of Dr. Renwick to Sydney for the purpose of prosecuting his claim.

On 25th September, 1894, in the Legislative Assembly, Mr. William Morgan asked the Secretary for Lands,—

- (1.) Has any sum been awarded to George von Meyer as compensation for losses sustained in consequence of the closing of the Whaling-road, North Sydney?
- (2.) If so, what amount?
- (3.) Did Dr. Renwick, when Minister for Mines, assess the damage sustained at £3,000?
- (4.) Has this sum been paid; if not, why not?

Mr. Young answered,—

(1 and 2.) No.

(3.) The papers do not disclose that Dr. Renwick, as Minister for Mines, assessed the damage alleged to have been sustained by Mr. von Meyer, who, however, made a claim for the sum of £3,000 for compensation for such alleged damage, which was refused, on the opinion of the Attorney-General that the Crown was not legally responsible.

1897.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## CLOSING OF BRANCH ROAD, DOUBLE BAY.

(RETURN RESPECTING.)

*Printed under No. 20 Report from Printing Committee, 21 October, 1897.*

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 1st July, 1897, That there be laid upon the Table of this House,—

“A *précis* of papers in connection with the closing of Branch Road, “Double Bay.”

(Mr. E. M. Clark.)

*Précis in re* Branch Road, Double Bay.

In 1833 grants were issued of 13a. 3r. to William McDonald, and 11a. 2r. to Elizabeth Pike, the land therein granted being described as follows:—

*William McDonald*, 13a. 3r. County of Cumberland, parish of Alexandria, allotment No. 10. Bounded on the north by a line dividing it from No. 9 allotment, bearing east  $13\frac{1}{2}$  chains; on the east by the shore of Double Bay and a stream to a marked tree thereon 3 chains north of the bridge on the old road to Point Piper; on the south by a branch road from the marked tree to the upper road; and on the west by the upper road,—being the allotment sold as lot 18 in pursuance of the advertisement of 11th September, 1833, and therein stated as 13 acres.

*Elizabeth Pike*, 11a. 2r. County of Cumberland, parish of Alexandria, allotment No. 11. Bounded on the west by the upper road; on the north by the branch road leading to the bridge; on the east by the old road leading to Point Piper; and on the south by a line dividing it from No. 12 allotment, bearing west 15 chains,—being the allotment sold as lot 9 in pursuance of the advertisement of 11th September, 1833, and therein stated as 13 acres.

The boundaries of branch road, which divided these two allotments, do not seem to have been definitely marked on the ground. The plan shows it as being of variable width, *vide* copy herewith marked P 1.

In 1867 Mr. Licensed Surveyor John Armstrong made a survey of this road and transmitted a plan, a copy of which (marked P 2) is attached. He reported that there was then a slight encroachment by Mr. W. Smart in the position indicated by green edging.

On 28th November, 1867, Mr. Armstrong reported that, in accordance with instructions given to him, he had pointed out to an officer of the Municipal Council the position of the road.

On the 5th August, 1886, R. Hellings applied to be allowed to purchase, under section 66 of the Crown Lands Act of 1884, an area of  $6\frac{1}{2}$  perches of land, described as being the land between Spring-road and his freehold land. This land is shown by red tint on tracing marked P 3 (attached).

On the 27th September, 1886, the application was refused, as the land was reported to form part of a road, the alignment of which had been asked for by the Woollahra Municipal Council.

On the 5th August, 1886, Elizabeth Hunt made an application under the same clause for the land shown by red tint on the attached tracing marked P 4, which was refused for the same reason.

On the 29th June, 1886, William Bell drew the attention of the Department to an alleged encroachment upon this road which, he alleged, obstructed approach to his land, and he asked that the Cumberland Ranger be requested to cause such alleged encroachment to be removed; he was, however, advised to apply to the Borough Council.

On the 28th August, 1886, the Borough Council of Woollahra asked that this road might be aligned, and instructions were issued to Mr. Surveyor Woolrych for the alignment accordingly.

On the 16th December, 1886, Messrs. Want, Johnson, & Co. advised the Department that certain fences erected upon Miss Hunt's land had been removed by officers of the Crown, and they requested that such fences be replaced. Further particulars were asked for regarding the matter.

On the 4th January, 1887, Surveyor Mills transmitted a tracing showing the position of branch road from Darling Point Road to Ocean-street, and suggested, before finally marking the alignment, that the matter of encroachments (shown by him on the tracing accompanying his report, *vide* attached tracing P 5) be referred to the Woollahra Council as to whether it was probable that the road would be constructed for vehicular traffic, and, if not, whether the road as fenced with a lane between the properties of Hunt and Morgan, giving access to the properties claiming frontage to the road, would sufficiently meet the public requirements.

On the 11th February, 1887, the Council was referred to as to what would be the best course to adopt in connection with the public and ratepayers' interests in view of the report of Surveyor Mills.

On the 17th February, 1887, the Council replied that the best course to adopt would be alignment in accordance with the original application; instructions were issued to the surveyor accordingly, and Messrs. Want, Johnson, & Co. were informed of the intended action.

Several letters were then received from solicitors acting for Miss Hunt and Mr. Morgan, objecting to the alignment of the street in such a way as to deprive them of any land occupied by them.

On the 2nd May, 1887, Mr. Hellings lodged another application under section 66 of the Crown Lands Act of 1884, for the land previously applied for, which was refused on the same grounds as his first one.

On the 29th June, 1887, a number of the residents of Double Bay and Darling Point petitioned against the alleged creation of a proposed new road; in reply to which they were informed that no attempt at creating a new road was being made in the position referred to by them, that action was being taken to define the position of a road left in the subdivision of the Crown Estate in compliance with a request of the Woollahra Council, and that in doing so it was found that a number of encroachments on the road existed.

On the 29th January, 1888, Surveyor Mills transmitted the plan of survey for alignment (*see* attached tracing, marked P 6).

As however the road, as thus aligned, embraced a considerable portion of land included in Mr. Morgan's certificate of title, No. 4,296, which he had improved in good faith and at considerable expense, the Registrar-General was asked to say if the error in the certificate could, and would, be dealt with under section 40, or any other section, of the Real Property Act. The preliminary notification of the road appeared in the *Government Gazette* of the 20th April, 1888.

On the 4th May, 1888, J. F. Morgan lodged an objection to the opening of the road, and similar objections were lodged on the 7th May, 1888, by J. W. Johnston; on 12th May, 1888, by Elizabeth Hunt; on 14th May, 1888, by W. S. Coulter; and on the 15th May, 1888, by R. Hellings,—all of whom stated that the road was not required.

The Registrar-General (after some correspondence) made an attempt to recall Morgan's certificate with a view to amendment, but Mrs. Morgan refused to deliver up the document.

The Crown Solicitor, having been instructed to take proceedings with a view to causing surrender of the certificate for amendment, on the 14th January, 1891, advised that the Department had a serious task before it in undertaking to prove before the Supreme Court that the certificate issued on the application of Mr. Morgan was so issued partly in error, and contained by misdescription certain Crown land, and that success seemed doubtful, and even if the action were successful the expense would be very heavy; he therefore suggested that the Council should be asked to say if they were still prepared to take over and form the road if aligned, having regard to the costs of such formation, and, if not, they might approve of a proposal to permit the adjoining owners to purchase the land encroached on by them up to the new alignment.

It was approved on 2nd March, 1891, that the Registrar-General and Crown Solicitor be advised to abandon the intended proceedings in the matter of recalling the certificate, and on the 24th March, 1891, in reply to a letter from the Woollahra Council, they were informed of the above decision.

On the 17th September, 1892, the Council advised the Department that they had received a petition, signed by over 100 residents, requesting immediate removal of all encroachments on this road, and the Council was informed in reply thereto that, in view of the advice of the Crown Solicitor, the Department declined to proceed further with the alignment as surveyed by Mr. Mills.

On the 20th October, 1892, W. Bell—per T. H. Hassall, M.P.—complained of certain encroachments on the road, as a result of which the value of his property was depreciated, and he requested alignment of the road, or that the ranger be instructed to cause removal of the encroachments (fences).

On the 3rd November, 1892, the matters mentioned by Mr. Bell were referred to the Borough Council, and an illustrative tracing was at the same time sent.

On the 13th December, 1892, the Council asked that the branch road be proclaimed and dedicated, and in reply were referred to previous correspondence, in which it was stated that the Department refused to proceed further with the matter.

On the 29th May, 1893, Bell again requested that the portion of the road alleged to be accurately defined by the descriptions in the deeds, and not covered by Morgan's deed, be dedicated to the Council, or that the ranger be instructed to cause removal of the encroaching fences.

On the 8th June, 1893, Mr. Hassall, M.P., asked that something be done either to cause alignment to be completed or removal of the encroachments.

After careful reconsideration of the circumstances surrounding the matter, it was decided, on the 2nd July, 1893, that in view of the advice of the Crown Solicitor the circumstances of the case did not warrant the Department undertaking expensive legal proceedings in which success was very doubtful, and that no modification of the decision previously given could therefore be made.

On the 6th October 1893, W. S. Coulter advised the Department that Mr. Bell had cut down a portion of the fence around his property in assertion of an alleged claim to a road.

In reply to a request by the Council for an interview, Mr. Secretary Copeland, on the 4th December, 1893, declined to reopen the question.

In consequence of Bell cutting down a fence belonging to Hellings, in order to assert a right to use the land as part of this road, an action for trespass was brought by G. Hellings against W. Bell, and he obtained a verdict with £100 damages.

On the case coming before the Full Court, on a motion for a new trial, a settlement was arrived at between the parties, Hellings agreeing to move his fence back so as to give Bell access to his land, and Bell agreeing not to oppose an application by Hellings to purchase the remainder of the land in dispute; the verdict for Hellings to be set aside and each party to pay his own costs.

On the 6th December, 1894, Hellings again applied to be allowed to purchase the area referred to in this agreement, being the area shown by pink tint on attached tracing marked P 7.

On the 22nd February, 1895, the case was referred to the Crown Solicitor to obtain copies of the notes taken at the hearing of the case "Hellings v. Bell," and for advice as to whether this Department would be warranted in proceeding to act in the way desired by Hellings, by providing a road of less width than that aligned by Mr. Mills, and entertaining applications for pre-emption of land between such road and the watercourse.

On the 3rd January, 1896, the Crown Solicitor advised that in his opinion the best course of procedure would be to formally revoke the dedication of branch road by action under section 105 of the Crown Lands Act of 1884, then to rededicate the land desired to be appropriated as a road, and the balance could then be sold to Mr. Hellings and others.

On the 2nd June, 1896, the District Surveyor reported that he had caused to be defined the limits of branch road as proposed to be laid out (*vide helio*. P 8 attached), and advised that the dedication of this road be formally revoked in the manner suggested by the Crown Solicitor, with a view to dedication of the road as now defined, and also alienation of certain portions of land not now required by the public.

On the 19th June, 1896, Mr. Hassall, M.P., requested that certain encroachments on this road be removed, and he stated that neither the residents nor the Council would consent to any alteration being made in the original road.

On the 8th August, 1896, Mr. E. M. Clark, M.P., requested that this matter be further looked into, in order that no individual rights might be interfered with.

On the 10th August, 1896, it was approved that the course suggested by the District Surveyor, under the report of the Crown Solicitor, should be followed.

On the 2nd September, 1896, Messrs. Clark and Hassall were informed that due consideration had been given the case, and the course proposed seemed the only method of settling a long disputed matter, except by embarking in expensive litigation.

The papers were then sent to the Crown Solicitor for preparation of the Executive minute in connection with the proposed action under section 105 of the Crown Lands Act of 1884, and on the 3rd December, 1896, he returned the case with the necessary draft of the Executive minute.

On the 14th May, 1897, Mr. Clark, M.P., wrote asking for a careful reconsideration of the whole matter, with a view to protection of the rights of the property-owners and the public.

On the 3rd June, 1897, Mr. Clark, M.P., was informed that the action being taken by the Department was decided upon after a very full consideration of the case, and after seeking legal advice, and, as it seemed the only solution of a very difficult case, it must be proceeded with, and that the decision must be considered as final.

On the 7th June, 1897, Mr. Clark advised the Department that he intended moving an adjournment of the House; he was asked, on the 11th of same month, to see the Minister.

On the 8th June, 1897, the Governor and Executive Council approved of the publication of a preliminary notice of the revocation of the dedication of branch road and rededication, in lieu thereof, of certain other roads forming portion of such road.

On the 30th June, 1897, Mr. Clark, M.P., advised the Department that he had given notice of motion with regard to the papers in the case, as suggested in a conversation with the Minister, and he requested suspension of further action in the case for the time being. He was informed that pending the preparation of the *précis* asked for action had been suspended.

The attached tracing, marked P 9, is a copy of the original plan of allotments 27, 28, and 30.

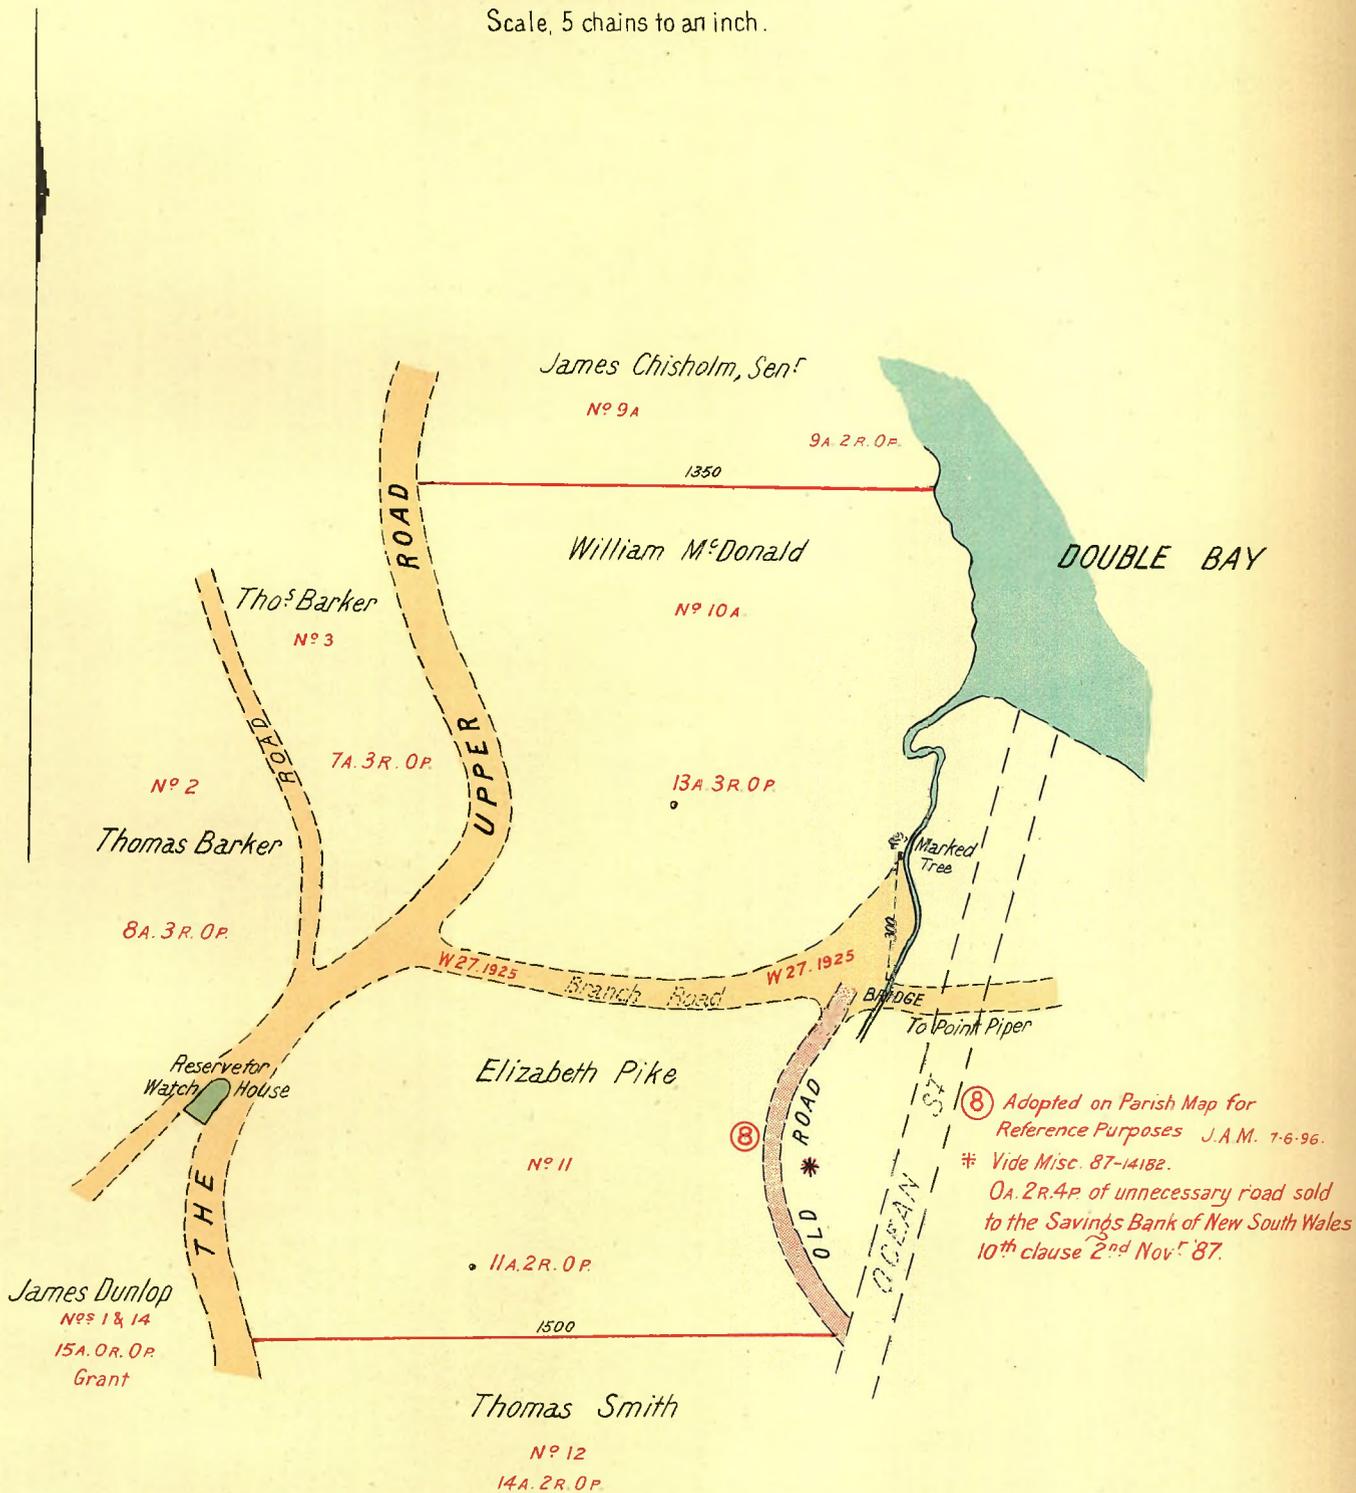

[Nine plans.]

## PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

### NEW BRIDGE AT GLEBE ISLAND.

## REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a New Bridge at Glebe Island, to replace the existing structure," have, after due inquiry, resolved that it is not expedient the proposed bridge should be constructed; but they recommend that there be substituted for the present bridge a stone causeway, having a steel swing-span in the centre, as proposed by the Engineer-in-Chief for Public Works; and, in accordance with the provision of sub-section (iv), of clause 13, of the Public Works Act, report their recommendation to the Legislative Assembly:—

#### QUESTION OF ERECTING A NEW BRIDGE.

1. The question of erecting a new bridge at Glebe Island was before this Committee in 1894. On 25th January of that year it was referred to the Committee for inquiry, and on 21st June, 1894, they decided "That when the renewal of Glebe Island Bridge becomes necessary it should be replaced by a timber structure of improved design, having openings by a swing-span of 60 feet, and a clear headway of not less than 20 feet"; but, in consequence of a sudden dissolution of Parliament, time did not permit of the resolution being embodied in a report and presented to the Legislative Assembly. It thus became necessary to again refer the question to the Committee, and this was done by the Legislative Assembly on 27th September, 1894, with the result, after further inquiry, that the Committee resolved it was "not expedient that the Glebe Island Bridge be replaced at present by a new structure." The bridge had recently been strengthened, and it was considered to be in a condition sufficiently satisfactory to serve the traffic passing over it for a considerable length of time.

Nothing further was done until April, 1896, when a report upon the state of the bridge being called for by the Honorable the Minister for Public Works, it was found that, though the condition of the structure was not very satisfactory, the matter might be allowed to stand over for another year. In May, 1897, a further report was obtained, and on that occasion it was stated that the bridge was rapidly becoming more insecure, and at that date "had barely a sufficient factor of safety to justify the traffic over it." Upon this the Engineer-in-Chief for Public Works recommended that a sum of money be placed on the Estimates at the earliest date for the reconstruction of the bridge, and £110,000 was noted for the Loan Estimates, that amount being the estimated cost of a new iron bridge as submitted to the Committee in 1894. At the same time arrangements were made for again referring the proposed work to the Committee, and on the 9th June, 1897, the present Committee were authorised by the Legislative Assembly to consider and report upon the expediency of erecting a new bridge, to replace the existing structure.

THE

## THE PRESENT INQUIRY.

2. In carrying out their inquiry it was necessary for the Committee to ascertain clearly the condition of the present bridge as compared with what it was in 1894, and whether the period contemplated in the decision of that year, as that during which the structure might be expected to accommodate its traffic without risk, had now expired. With this object they made personal inspections of the bridge, as well as examined witnesses. Considerable delay occurred on the part of the Department of Public Works in placing before the Committee the design for the structure it was proposed should take the place of the bridge; but, to some extent, this was due to the Engineer-in-Chief for Public Works being out of the Colony, and it was remedied immediately he returned. The witnesses examined consisted of Government officers and persons interested in the question of the bridge, most of the latter having specially requested to be heard in the inquiry.

## DESCRIPTION OF THE PROPOSED STRUCTURE.

3. The design submitted to the Committee, in the present inquiry, is not one of a bridge, but of a causeway constructed in the form of a solid bank of rubble from the shore at either end, hand-pitched on the slopes from low-water upwards, with a steel swing-span in the middle covering two openings of 60 feet in the clear, and two side spans each 80 feet long, the side spans being provided to keep the toe of the banks clear of the fairway through the swing-span. The mechanism of the swing will be similar to what it would be in a steel bridge; but instead of having a timber deck, trough plates filled with concrete carrying wood-blocking will be used, thus ensuring a practically permanent roadway.

The proposal to construct a new bridge, it is explained by the Engineer-in-Chief for Public Works, was abandoned by the Department, and a design for a causeway adopted, because fuller consideration showed the latter to be preferable.

The situation of the new structure will be about 90 feet from the southern side of, and parallel to, the present bridge, and it will carry a roadway of 40 feet and two 5-foot pathways. Part of the existing curve on the road from the present bridge across Glebe Island will be done away with, and a better gradient and wider roadway will be obtained from the causeway to the Abattoirs. On the Pymont side also the approach to the causeway will be widened considerably.

The material required for the causeway will be easily obtainable, a circumstance that will probably cheapen the work. Sufficient stone can be excavated on Glebe Island, but it may be obtained elsewhere and at a much reduced cost. There will, for instance, be a considerable amount of excavation in connection with the construction of the large power-house near Harris-street for the George-street electric tramway, and the site of the causeway will be very convenient as a place where the earth and stone so excavated can be deposited. The site will be equally convenient for the reception of the material excavated from Hyde Park, should the proposed railway extension into the city be carried out, or obtained from other excavations in or around the city. By using the material from such sources in this manner, it is the opinion of the Engineer-in-Chief for Public Works that the cost of the causeway will be reduced, probably to the extent of £25,750.

Both the causeway and the swing-span are to be so constructed as to admit of their carrying a tramway.

The time likely to be occupied in completing the work will be about three years.

## ESTIMATED COST.

4. The estimated total cost of the causeway and swing is £84,500, but, with the widening and regrading of the Abattoir-road (an improvement necessary in any scheme for replacing the present bridge), £89,100, the total amount being made up as follows:—

Causeway	£32,130
Swing-span, including pivot piers and two rest piers	35,050
Side-spans, with piers, abutments, and superstructure	10,740
Approaches	3,250
Tram-track and protecting platform	3,330
	£84,500
Widening and regrading the Abattoir-road (including land resumption)	4,600
	£89,100

Of this amount, as previously indicated, possibly £25,750, and certainly a very considerable portion of that sum, may be saved by much of the material for the causeway being obtained either free of cost or at a very low price.

COST

### COST OF A CAUSEWAY AND OF A BRIDGE COMPARED.

5. In an appendix to the evidence of the Engineer-in-Chief for Public Works will be found a comparison of the estimated cost, annual charge, and capital value of the annual charge of the proposed causeway, with those of a timber bridge and of a steel bridge, which gives the following results:—

	Prime cost.	Annual charge.	Capital value of annual charge at 4 per cent. interest.
Causeway with steel swing-span:—			
Bridge and causeway ... ..	£81,500		
Protecting platforms ... ..	3,000		
	£84,500	£5,040	£126,000
Timber bridge:—			
Bridge and approaches ... ..	£56,500		
Protecting platforms ... ..	3,000		
	£59,500	£5,270	£131,750
Steel bridge—Tarred metal deck:—			
Bridge and approaches ... ..	£89,400		
Protecting platforms ... ..	3,000		
	£92,400	£5,840	£146,000

If £25,750 be saved, as previously explained, the prime cost of the causeway and swing will be less than £60,000, and the annual charge and its capital value proportionately reduced.

### CONDITION OF THE PRESENT BRIDGE.

6. The condition of the present bridge which is thirty-five years old, appears to be such as to justify the erection of a new structure. The piles, as a whole, are fairly sound, though some of them are hollow and show indications of decay or of the ravages of the white ant, as do the girders. The piers are very light, and the superstructure is not strong enough for the traffic which the bridge carries; the vibration is much in excess of what it ought to be. The bridge is defective also in its swing, which is small and obsolete, inconveniently worked, and badly situated. Only constant supervision and repair since the inquiry by the Committee in 1894 have kept the structure in a condition fit to accommodate the traffic passing over it without undue risk of accident, and it has now reached the stage when it is considered to be no longer economical to expend money upon the bridge in repairs beyond what may be necessary to keep it open for traffic until a new bridge or causeway can be provided. Up to the present £21,800, in addition to its original cost, has been expended upon it.

### THE BRIDGE TRAFFIC.

7. The bridge was designed to provide for only light traffic, and consequently cannot satisfactorily meet the requirements of the present traffic, which is largely in excess of what was the case at the time the bridge was erected, a great increase having taken place in recent years. In 1889, for instance, the daily average number of vehicles crossing the bridge was 196; in 1894 it was 1,792; and now, according to a count made in the week 19th to 29th June last, omitting Sundays, it is over 2,000, in addition to which there is a daily average traffic of 51 horsemen, 215 driven animals, and 1,295 pedestrians.

One-fifth of the present vehicular traffic is connected with the Abbatoirs; the remainder consists of vehicles passing to and from districts to the north and west of the bridge.

### NECESSITY FOR A BRIDGE OR CAUSEWAY.

8. A bridge, or causeway, from Pymont to Glebe Island is absolutely necessary for the traffic between those places. While the Abattoirs remain on the island there must be some means of communication with them such as the present bridge affords, and they may remain there permanently, for there is plenty of room to permit of their enlargement and of their being connected with the railway at Homebush. But, if sooner or later, they should be removed, there is sufficient traffic across the bridge unconnected with the Abattoirs to justify its existence, as most of that which comes over the Lane Cove, Parramatta, and Iron Cove bridges uses the Glebe Island Bridge.

REASONS

## REASONS FAVOURABLE TO A CAUSEWAY.

9. If it is proved that the present bridge—or something to take its place—is necessary to preserve the means of communication with the Abattoirs and the districts to which the bridge affords access, and that the one now in existence is in such a state of decay that a new structure is required, the only question that arises is the kind of new structure it is advisable to adopt. A comparison between the cost of a bridge and of a causeway shows that the latter is cheaper in annual cost and is the more permanent. One other point for consideration is whether the causeway will prove to be, in any way, an obstruction to water traffic to and from Blackwattle and Roselle Bays, or lead to the silting up of any portion of those bays. A statement published with the evidence describes the businesses carried on in the bays, and from this it will be seen that, though most of what is done there is in connection with the timber trade, there are one or two firms engaged in other business undertakings which, with due facilities, may grow to considerable dimensions.

The average depth of water to be found in Blackwattle and Roselle Bays is about 13 feet, the depth at the head of the bays being about 9 feet. In Johnstone's Bay there is alongside Glebe Island a depth of 12 feet, which increases to 18 feet at Glebe Point. Dredging might increase the depth above the bridge at low water to 18 feet over an area of 160 acres, 22 feet over 120 acres, and 26 feet over 100 acres; or a channel 300 or 400 feet wide and of sufficient depth could be dredged around the shore, the cost of dredging by adopting this plan being considerably lessened.

This possible improvement of these bays indicates an important future to the area of water above the bridge in connection with the shipping trade of the port, and, in view of this, it is necessary that the approach to this part of the harbour should not be unduly obstructed. The swing in the centre of the proposed causeway will afford ample facilities for the movements of shipping to and from the bays, and the passage through the swing will be of so considerable a size in proportion to the area of water above the causeway that there can be no danger of any diminution of water within the bays by an interception of its flow or an accumulation of silt.

The only source from which deposits of silt reach that part of the harbour are, the Engineer-in-Chief points out, storm-water drains and local sewers which discharge into the heads of the bays, and there is no current in the locality which would have the effect of causing this silt to be precipitated near the causeway. After the construction of the causeway the silt would be, as now, a deposit near the drain or sewer openings, and would be removed by dredging.

## BASCULE, OR SWING.

10. During the inquiry the question of having the opening in the centre of the causeway fitted with a bascule instead of a swing was considered. Each method has its advantages, but the swing appears to be the more desirable. With the bascule a central pier is not necessary, but the side piers upon which it would rest would have to be proportionately strengthened. The matter was referred to the Engineer-in-Chief, and he adheres to the swing in preference to a bascule, on the grounds that there could be no economy in adopting the latter, and that with the swing there could be provided a more permanent and satisfactory roadway.

## A NEW ROAD ACROSS GLEBE ISLAND.

11. Some complaint has been made of the road across Glebe Island leading from the bridge, and which will lead from the causeway, passing through the Abattoirs. There is ground for this complaint; but the Engineer-in-Chief, to whose attention the matter was drawn, explains that in view of the uncertainty as to the use to which Glebe Island may be put in the future, it is not wise, at present, to construct a new road. If, for instance, the island should be used for shipping purposes, which is possible, a new road might interfere with the usefulness of the place for railway traffic. It is, however, easy to make, in connection with the causeway, a new road across the island, if such a step should be found necessary, and that road could be used for general traffic, the present one being devoted exclusively to the traffic connected with the Abattoirs.

DECISION

## DECISION OF THE COMMITTEE.

12. Taking everything into consideration—the age of the bridge, the unsuitableness of it for the traffic passing over it, the large expenditure upon it in repairs, and its increasing weakness through natural decay—the Committee have no difficulty in deciding to recommend that the bridge be replaced, as soon as possible, by another structure. This recommendation is justified by what the Committee have personally seen of the bridge, and by what the evidence discloses; and it is not inconsistent, it may be pointed out, with the decision of the Committee who considered the proposal for the construction of a new bridge in 1894. At that date, as already mentioned, the bridge had recently been strengthened, and from personal inspection and from the evidence of witnesses examined it was regarded as in a condition to sufficiently serve the traffic over it for a considerable length of time. The swing opening, it was stated, is badly situated, causing inconvenience to vessels passing through it, and exposing the bridge itself to risk of injury; but the extensive repairs, carried out by the Department of Public Works, had made the bridge sufficiently strong to meet requirements until a new structure should become an absolute necessity. That time, in the opinion of the present Committee, has now arrived.

## THE RESOLUTION PASSED.

13. The following extract from the Committee's Minutes of Proceedings of 10th September, 1897, will show the resolution passed:—

“Mr. Black moved—

‘That, in the opinion of the Committee, it is not expedient that a new bridge should be constructed at Glebe Island to replace the existing structure, as referred to the Committee by the Legislative Assembly; but they recommend that there be substituted for the present bridge a stone causeway, having a steel swing-span in the centre, as proposed by the Engineer-in-Chief for Public Works.’

“Mr. Farnell seconded the motion.

“Mr. Wright moved—

‘That the motion be amended by the omission of the word ‘not’ and of all the words after the word ‘Assembly.’

“The amendment was negatived, and the motion was then passed.”

THOS. EWING,

Chairman.

Office of the Parliamentary Standing Committee on Public Works,  
Sydney, 15th September, 1897.

# PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## MINUTES OF EVIDENCE.

### NEW BRIDGE AT GLEBE ISLAND.

WEDNESDAY, 16 JUNE, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHRY.  
The Hon. JAMES HOSKINS.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
The Hon. DANIEL O'CONNOR.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.  
FRANCIS AUGUSTUS WRIGHT, Esq.  
FRANK FARNELL, Esq.

The Committee proceeded to consider the expediency of constructing a New Bridge at Glebe Island, to replace the existing structure.

Robert R. P. Hickson, Under Secretary for Public Works, sworn, and examined:—

1. *Chairman.*] I understand that, in Mr. Darley's temporary absence from town, you do not propose to deal with the design of the proposed bridge, but merely with the necessity for the substitution of a bridge for the existing structure? Yes.
2. You have prepared a statement for the Committee? Yes. It is as follows:—

R. R. P.  
Hickson.

16 June, 1897.

#### GLEBE ISLAND BRIDGE.

On the 25th January, 1894, on the motion of Mr. Secretary Lyne, the following resolution was passed by the Legislative Assembly:—

That it be referred to the Parliamentary Standing Committee on Public Works, to consider and report on the expediency of removing the present Pyrmont and Glebe Island Bridges; the construction in lieu thereof of certain other means of communication between Sydney, Pyrmont, Balmain, and the northern suburbs; and the carrying out of incidental works in connection therewith.

The work was a subject of inquiry by that Committee from the 11th April to the 21st June, 1894, when the following decision, as far as Glebe Island Bridge is concerned, was arrived at:—

That when the renewal of Glebe Island Bridge becomes necessary it should be replaced by a timber structure of improved design, having openings by a swing span of 60 feet, and a clear headway of not less than 20 feet.

The dissolution of Parliament occurring somewhat suddenly, time did not permit of the resolution being embodied in a report and presented to the Legislative Assembly; it was consequently necessary to refer the proposed work to the next Committee, and this was done by the Assembly on the 27th September, 1894, with the result that the Committee reported, "It is not expedient that the Glebe Island Bridge be replaced at present by a new structure."

As the evidence given before the Committee was to the effect that the bridge had only a very short life, by direction of the Minister, I wrote a memorandum on the 1st April, 1896, as follows:—

The Minister would like a report on the present state of the Pyrmont and Glebe Island Bridges as soon as possible, to enable him to decide if it be necessary to take any action this Session with regard to the erection of new structures. He would like the examination made by the same officers as inspected last year, as they would be in a better position to judge of the changes (if any) which may have taken place.

In reply Mr. De Burgh furnished the following report:—

In accordance with instructions on 96/40-54 herewith, I have made an examination of the Pyrmont and Glebe Island Bridges, with a view to ascertaining what changes (if any) have taken place in the structures since 1894, when the question of replacing them was before the Public Works Committee. In 1894, extensive repairs were in hand with a view to strengthening the most decayed portion of the structures, and rendering them comparatively safe for traffic. Since then the bridges have been carefully watched, attention being paid to stopping the destructive work of the white ants, and also to keeping the decks in such order as to enable them to distribute the loads to the best effect over the girders. The precautions, however, could not and do not affect the general condition of the structures, the repairs being carried out "to make the structure safe till a new one can be erected."

It is not possible to define the alteration which has taken place in the bridges in the two years that have elapsed since these repairs were carried out. They have passed the life which could be expected from them, and the heavy traffic causing the old timbers to work upon each other makes them more and more shaky with each year. There is one point which I must draw special attention to, and that is the condition of the opening span of the Pyrmont Bridge. I pointed out in 1894 that, owing to the extensive decay in the pier carrying the swing, it was unsafe, and special attention was paid to strengthening it; but both pier and swing are so light that the traffic across the bridge is in danger of being stopped every time a vessel of any size passes through the opening. As an example of this, the "Fifeshire" in passing through touched the pier (2/12/95), and threw the span over about 2 inches, so that it could not be closed. This was at 4 o'clock in the afternoon, a time when an enormous stream

R. R. P.  
Hickson.  
16 June, 1897.

of traffic is crossing the bridge to the railway yards, and the whole of this traffic was stopped for an hour and a half while the span was closed. Fortunately, I had a gang of men with gear working at Glebe, and so was able to start repairs a few minutes after the accident, or the stoppage of traffic would have been for a much longer period. Such an accident may occur at any moment, and may be of such a character as to suspend traffic altogether for weeks. In a word, the bridges are not only unsuitable, but they are quite worn out. If it is not intended to build new ones, the present structures should be gradually rebuilt and strengthened, to do which would, in my opinion, be to throw money away.

Although the report as to the state of the bridge was not very satisfactory, the Minister thought the matter might stand over for another year, and in May of this year, in accordance with his instructions, I wrote as follows to Mr. Darley:—  
The Minister would like a report on the state of the Pymont and Glebe Island Bridges, with a view of deciding what steps should be taken, either as regards repair or re-erection, or, if safe, postponing any action for a time.

In reply, Mr. De Burgh, on the 21st May, again reported:—

In accordance with the instructions herewith, I have to report that, as we are constantly working at the Pymont and Glebe Island Bridges, no special examination is required to enable me to report on the necessity for renewal, but it is perhaps better to touch briefly upon the recent history of the bridges before expressing an opinion on their present state.

In September, 1893, Pymont Bridge was reported to be in an absolutely dangerous state. In 1894, upwards of £7,000 was spent in patching it up. In January, 1894, Glebe Island Bridge was reported dangerous, and £4,000 was spent in patching it. I wrote then *re* Pymont Bridge, and it applies to Glebe Island Bridge also, "That there may be no misunderstanding as to the state of the bridge, I may state that these repairs, and some minor repairs from time to time, should enable the bridge to carry traffic safely for (say) two and a half or three years, when the portion not now renewed will be unsafe."

When I completed the repairs I stated that the close inspection which was possible during the repairs confirmed my opinion of the bad condition of the bridges.

I made a further examination of the bridges in 1896, which showed that the decay in the old timbers was advancing rapidly through perishing, as well as from white ants and rot.

Now as to present state. The bridges are becoming more shaky as month after month passes. The timbers, weakened by age, work upon each other, and the piers are so weak that they cannot afford the support required to stop the vibration. At the time the bridges were built they were not up to the strength necessary for the traffic they now carry, and they now have barely a sufficient factor of safety to justify us in allowing the traffic over them. The size and number of vessels passing through the swing openings is increasing daily, and interruptions to the road traffic, which occur through the bridge being damaged by the slightest touch of a vessel, are numerous. If the work of replacing the bridges is put in hand at once, I shall consider that we have been extremely fortunate if we are able to carry the traffic on the old bridges until the new ones are built, and I may state that, had I thought the work would have been postponed so long in 1893, I should have recommended a very much larger expenditure than £11,000 on repairs; but, considering the unanimous opinion of all the officers who have had to do with the bridges that they should be replaced at once, I never doubted that steps would be taken not later than 1894. I cannot, of course, ask to be released of responsibility in connection with these bridges, but I must point out that I occupy a very difficult position with regard to them, as I cannot possibly recommend sufficient repairs to make them safe on account of the sum required being large enough to go a long way towards building new bridges. If, however, it is not intended to take such steps as will relieve the present bridges of the traffic in (say) three years (which is the shortest time in which the new structures would be likely to be ready) I shall have to ask for a heavy vote to strengthen the present bridges.

Upon this report, Mr. Darley minutes:—

I recommend that sums of money be placed on the Estimates at the earliest date to enable these bridges to be reconstructed. It is alike unwise and unsafe to attempt to keep them much longer in use. It is for the Minister to decide which class of the numerous designs estimated for should be adopted.

In submitting the matter for the Minister's information, I drew his attention to the fact that the Public Works Committee recommended the construction of a bridge at Darling Harbour, at a cost not exceeding £82,500, and that an iron bridge at Glebe Island, estimated to cost £110,000, was rejected, and on this the Minister minuted that—

The two sums of money named may be noted for Loan Estimates, a resolution prepared for submitting the Glebe Island Bridge for the consideration of the Public Works Committee, and one for the carrying out of the renewal of the Pymont Bridge in accordance with the recommendation of that body.

So far as Glebe Island Bridge is concerned, the result of this was that, on the motion of Mr. Secretary Young, the Legislative Assembly passed the following resolution on the 9th instant:—

That it be referred to the Parliamentary Standing Committee on Public Works to consider and report upon the expediency of constructing a new bridge at Glebe Island.

It would appear from the various reports that the present bridge, which is 35 years old, was constructed by the Government at a cost of £20,186 15s. 11d., and has cost for alterations and repairs since it was erected the sum of £21,800. In 1894, £4,000 was spent, and it was reported that further expensive repairs will have to be undertaken.

The bridge (irrespective of its probable life) is much below present requirements.

According to a return tabled in 1894, the average daily traffic for twelve hours, from 6 a.m. to 6 p.m. was as follows:—

Vehicular traffic (cabs, omnibuses, carts, vans, &c.)	1,792
Horsemen	60
Animals	357
Pedestrians	1,406

The average number of vessels passing through per day, according to a return recently made, is 17.5.

As the whole of the traffic has to filter through two tracks 8 ft. 6 in. wide at the centre of the bridge, and one track over the swing span, it is not surprising that the traffic becomes congested in the busy portions of the day.

The swing span with its 34 feet opening is too narrow, and being awkwardly placed at the Pymont end of the bridge accidents to vessels frequently occur.

The piers of this bridge are in a very weak state. They were never designed to carry the immense traffic, which now uses the structure, and, notwithstanding that they were patched up in 1894, the vibration is so great as to be dangerous.

The corbels and girders have perished through age, and the ravages of white ant, and are no longer to be relied upon.

The decking has to be totally renewed every two years, so need not be taken into consideration—its present state is fairly good, having only been down about twelve months.

The swing span of the bridge is totally inadequate for the traffic using the bridge—both road and water. It is so narrow that only one vehicle can cross at a time, often causing serious delays, and at the same time the water is so shallow that many vessels have a difficulty in getting through the bridge at all.

Mr. De Burgh is in attendance to give you particulars as to the state of the bridge from his own personal examination, and I would suggest that you should examine him upon that point.

3. Approximately six years have elapsed since the report made by a previous Public Works Committee, with reference to this bridge? Very nearly six years.

4. You made reference just now to a paragraph in the report of a former Committee, in which it was suggested that a new bridge was not at that time necessary? Yes.

5. *Mr. Hoskins.*] If the repairs executed in the bridge at the request of the Committee in 1894 are about worn out, and if the bridge as it stands is no longer serviceable, does it not serve to show that the timber put in was not good? No; the timber put in is as good as on the day on which it was put in, but it has been the old timber and the new timber working together which has caused the defect. That will be explained to you minutely by Mr. De Burgh. I have not examined the bridge personally.

Ernest

Ernest Macartney de Burgh, M.Inst.C.E., Assistant Engineer for Bridges, Department of Public Works,  
sworn, and examined:—

6. *Mr. Humphery.*] You are in a position to give the Committee information as to the state of the bridge at Glebe Island? Yes.

E. M. de  
Burgh,  
M.I.C.E.

7. Have you prepared a written statement? No; but I can make a brief statement as to the condition of the bridge.

16 June, 1897.

8. Will you in the first place refer to the condition of the bridge in 1894, at a time when a considerable expenditure took place upon it for the purpose of strengthening it, and will you briefly tell us the condition of the bridge after that expenditure? At the time the previous inquiry was held by the Committee in reference to this bridge I was expending about £4,000 upon what were considered absolutely necessary repairs, to prevent an accident occurring. There was no attempt made at that time to strengthen the bridge throughout. The repairs were simply made with a view to make the roadway good enough to carry the traffic, and to replace any of the timbers which were so completely decayed as to be likely to collapse. When these repairs were completed, which was early in 1895, the bridge looked very much better than it had looked before; but as regards the unsuitable character of the piers, and the vibration when traffic passed over it, it was very little better. Since then we have had to re-deck it once, but that was simply due to the ordinary wear and tear resulting from the traffic. We have done nothing of an important character to stiffen up, or improve the bridge, because we were under the impression that a new structure would be built there.

9. What is the present condition of the bridge? In my opinion it is worn out. The piles, as I have previously stated, are fairly sound, but the piers are very light, and the traffic which goes over the bridge now is so much heavier than that for which the bridge was built that the vibration is much in excess of what it ought to be in such a structure. The superstructure was never strong enough for the traffic which the bridge carries now.

10. You have not a design of the bridge which you propose shall be substituted for the existing bridge? No.

11. The resolution passed by the Public Works Committee in 1894 was to this effect:—"That when the renewal of Glebe Island Bridge becomes necessary it should be replaced by a timber structure of improved design, having openings by a swing-span of 60 feet, and a clear headway of not less than 20 feet." In your opinion, will that meet all requirements? I hardly care to express an opinion as to any new structure until the Department has submitted its design to the Committee. I am merely a constructing officer.

12. When you were before the Committee in 1894, you expressed the opinion that when the improvements which you were making had been effected the bridge would last from three to five years;—have you any reason to doubt that the bridge will last long enough to enable you to erect a new structure? I think it will last long enough to enable us to do that.

13. What do you consider is now the probable life of the bridge? We cannot let the bridge fall down. If we were to let it fall down there would be trouble. We are bound to keep it up.

14. Do you say that the bridge has collapsed, or that it will collapse if you do not repair it frequently? It has not collapsed, and I do not propose to let it. But it would be a serious thing if we were to wait until we found out that a bridge was so worn out that it would be likely to fall down before substituting another structure. The bridge, in my opinion, has got into such a state that it is no longer economical to repair it. I should regard any expenditure in strengthening it as waste of money.

15. I gather from what you say that the principal expenditure ceased in 1895? Yes, about two years ago. I have re-decked the bridge once since then.

16. Last year? Yes.

17. When you re-decked the bridge did you make an examination of its state? I made no further examination. I am familiar with it all through.

18. You found it necessary to re-deck the bridge, although you are of opinion that a new bridge should be placed there? It was absolutely necessary to re-deck it. It is a matter of wear and tear. The horses' feet would wear out the decking in about two years.

19. Would the re-decking be an unimportant expenditure? I daresay it would run to about £400.

20. Is it your opinion that you would be able, without much difficulty, to maintain the bridge a few years longer, allowing time for the erection of a new structure? Yes; we can keep it in order until a new structure is erected.

21. Where is the principal defect in the present bridge? The girders carrying the superstructure when the bridge was originally built were very much too light. They are now about thirty-five years old, and in regard to the bulk of them, the timber is not, of course, nearly as strong as when they were put in. Even although they may not be actually decayed in the centre, the life has gone out of the timber. They were weak enough when they were put in for light traffic, and now that they are not so good as when they were put in, they have to carry very much heavier traffic.

22. What is the difference in the traffic as between 1894 and the present time? I have no record, except as regards the shipping. The vehicular and pedestrian traffic has not been counted.

23. Will you give the Committee the figures you have in reference to the shipping? In March, 1894, we opened the swing-span an average of eleven times daily to allow vessels to go through. Taking the average of the whole of 1896, and up to May, 1897, we have opened the bridge on an average twelve and a half times a day.

24. Over what period did you spread the average in March, 1894? I took the average of a week.

25. Did you take the average in the corresponding weeks in 1896 and 1897? No; I have given you the average from March, 1894, up to last month. A record has been made of the number of openings every day during the intervening period.

26. When did the increase in traffic become apparent? It has been pretty uniform right through.

27. *Mr. Hoskins.*] Is the class of vessels which go through now larger than it used to be? They always take as large ones through as they can, but the water is limited. Even small vessels can only go through at high tide.

28. *Mr. Humphery.*] Prior to March, 1894, what was the average number of vessels passing through daily? I have no record of that.

29. According to the figures you have given there has been an increase of something like 9 per cent. between March, 1894, and the present time? Yes. 30.

E. M.  
de Burgh,  
M.I.C.E.

16 June, 1897.

30. You are not prepared to speak as to the tonnage? No; we keep no record as to the tonnage.
31. Have you any recent figures showing the number of vehicles and of pedestrians who have crossed the bridge? I have no record since 1894.
32. What was the state of the traffic in March, 1894? The daily average was 1,792 vehicles, 60 horse-men, 357 driven animals, and 1,406 pedestrians.
33. Have you no statistics showing the traffic since the time when the expenditure of £4,000 for the strengthening of the bridge took place? We have no statistics as to the traffic since the period I have just given you. It would involve putting on a special man to count the traffic.
34. What has led you to the conclusion, then, that the bridge is used to a larger extent now than it was previously to 1894? I do not think I made that statement.
35. Then in speaking of the traffic being greater now than in 1894, you referred to the opening of the swing only? Yes; I am not in a position to speak as to the other traffic. I should think it would be considerably greater, but I have no figures to go upon.
36. Do you think the increase of traffic has tended to weaken the bridge? It would not weaken the bridge. There would be more wear and tear of the decking; but as regards the strength of the bridge, that would depend upon the question of how many persons and vehicles were on it at the one time.
37. Do you think it likely that the opening of the swing has tended to weaken the bridge? The opening of the swing has not weakened the bridge; but if a vessel in passing through touched either the bridge or the swing itself ever so lightly, it would cause damage.
38. Why have you arrived at the conclusion that the increased traffic has to a large extent caused an earlier necessity for a bridge than you anticipated after the expenditure of £4,000 in 1894? I think there is some misapprehension. The statement I made was that the superstructure of the bridge was built for light traffic originally, and that the traffic in recent years had so greatly increased, and that the loads passing over the bridge were so much heavier, that it was not, in my opinion, strong enough to carry them in safety.
39. Are you referring to the traffic prior to or since 1894? There has been a gradual increase of traffic from the time the bridge was put up until the present day. The bridge is unsuitable for the traffic it is now called upon to carry.
40. Then, I presume, it was equally unsuitable in 1894? Yes.
41. There has been no change, so far as you are aware, between the conditions that then existed and those that now exist? So far as I am aware there has been no change. It might be of interest to the Committee if I gave you the number of vehicles which passed over the bridge in 1889. That will show you what an enormously increased traffic the bridge is called upon to carry. In 1889 there was a daily average of only 196 vehicles, 102 horsemen, 456 driven animals, and 1,011 passengers. That would be during a day of twelve hours. The number of vehicles, which, of course, constitutes the heaviest of the traffic, has increased from 196 in 1889 to 1,792 in 1894.
42. *Chairman.*] I suppose there would be no difficulty in getting the present traffic counted? No; I can obtain it.
43. We are sure to require it before the Committee report? Yes; but it would be scarcely well to take it this week, on account of the holidays coming on. I will see, however, that it is taken. It is only a question of putting a man on the bridge to count the traffic.
44. *Mr. Humphery.*] Can you explain the large increase of traffic as between 1889 and 1894;—was the bridge improved in the meantime? No, the bridge was not improved. I take the increase to be due to the increase in the suburbs and the larger volume of traffic to Balmain.
45. You think places of business have come into existence which have led to this increased vehicular traffic? Yes.
46. Can you so divide the traffic so as to show what portion might fairly be attributed to the Abattoirs and what might fairly be attributed to the suburbs? No attempt has yet been made to divide it, but I daresay it could be done.
47. Which suburb, in your opinion, has caused the greatest increase in the traffic? It would be very difficult to say.
48. Of course a large quantity of the traffic would be in connection with the Abattoirs? At certain periods of the day.
49. What is the annual cost of maintenance at the present time? It costs about £30 a month in ordinary wages apart from repairs, such as the putting down of a new deck. But the wages of the men would cover the cost of keeping the bridge clean and the opening of it.
50. It would come to about £360 a year? Yes.
51. What additional expenditure do you contemplate in connection with the maintenance of the bridge? If it be decided not to construct a new bridge, I should advise that the superstructure be renewed and the piers strengthened; but that would run into a large sum of money.
52. Have you made any examination to ascertain how many of the piers require removal? The piles of the piers are fairly sound, but the piers are too light. There is too much vibration.
53. That objection was mentioned when the matter was last before the Committee? Yes.
54. Although the piers are sound you think that they are too light? Yes; the whole structure is too light.
55. But, notwithstanding, it has carried the traffic safely up to the present time? Yes; there has been no accident, no collapse.
56. It is rather difficult to understand, if the piers are quite sound, and if the traffic has not increased, why it has become suddenly necessary to proceed with a new bridge? It has not become suddenly necessary. It became necessary some time ago, in my opinion. When I took charge of the bridge, in 1893, I expressed the opinion that steps should be taken to replace it. I repeated that opinion in 1894, and I still hold the same view.
57. Which means that the conditions of 1894 and those of the present time remain unaltered, but you think that the time has now arrived when a new bridge should be started? That is the case.
58. The bridge is as good as in 1894, because you then expended £4,000 upon it, but in your opinion before long the life of the structure will practically have ceased, and you therefore think that we ought now to commence the erection of a new bridge? In one respect you are in error; the bridge is not as good as it was in 1894. When girders are over 30 years old they get a certain amount of decay into them, and they get worse every year. The bridge will be in a worse condition next year than it is in now.

E. M.  
de Burgh,  
M.I.C.E.  
16 June, 1897.

59. You say the girders are not as sound as they were? They are not. Every year tells upon girders which are thirty years old.
60. Have you made an examination, with a view to ascertain the number of girders which are at present unsound? I have examined the structure from end to end many times.
61. When did you make the last examination? I think in 1896 I last went over the bridge in detail.
62. Have you the result before you? There is no detailed result. The whole of the timber, in my opinion, was perishing to such an extent as to lose a great portion of its strength. If we found any girder with a considerable defect in it we should have taken it out and put in a new one.
63. Will you be prepared, when the Committee make their visit of inspection to the bridge, to point out to them how many girders there are which, in your opinion, are wholly unsound. I hope there are none which are wholly unsound. If there are any which are wholly unsound they have escaped my attention and the attention of my officers. Under those circumstances, we should take out the girder and put in a new one. I hope you do not misapprehend the position. I shall not be able to show the Committee girders with great holes in them, and point to the probability of their breaking down the next day. If I could have done that the traffic would be in the harbour at the present time.
64. But you will be able to point out to the Committee girders which, in your opinion, have perished? Yes.
65. You are not prepared to say at this moment how many are perished? I am prepared to say that with the exception of new ones, which have been put in from time to time, they are all sufficiently perished to render their renewal very desirable.
66. Are they in a much worse condition than they were in in 1894? I should not like to say exactly what would be the effect of the three years upon old timber, but from a large experience among other bridges in the Colony—I am constantly reconstructing old ones, and so forth—I can say that when I pull down a bridge of that age I can seldom get any timber out of it which will be of any use for culverts or anything of that kind.
67. Are the girders now in the bridge the original girders? A great number of them are.
68. Can you say how many have been replaced within the last ten years? No; I could not say exactly how many have been replaced.
69. Over how long a period has your experience of this bridge extended? I have had personal charge of it only since 1893.
70. Therefore you can only speak of the expenditure upon the bridge since 1893? Yes.
71. Did you make an examination of the bridge when you took over its charge? Yes.
72. Did you then make a report upon it? Yes.
73. Can you produce your report? I think the first report I made was just before the matter was brought under the notice of the Committee in 1894. It would be at the latter end of 1893, or at the beginning of 1894. The date of the report is not given, but you will find it on the first page of the evidence appended to the Committee's previous report.
74. In that report you called attention to what you thought absolutely essential for the traffic at that time? Yes. You will find upon page 2 a paragraph dealing specially with the Glebe Island Bridge. The first portion of the report is more general, dealing with both the Glebe Island and Pymont Bridges. But further on you will find this paragraph:—
- As the result of a very careful inspection of this bridge, extensive repairs were found to be necessary. To place this structure in the same condition as the Pymont Bridge—that is to say, safe for three to four years—will cost £4,060, which will be the cost of renewing walings, defective girders, flooring, hand-rail, &c., and also strengthening the cross girders of the iron swing span. If authorised, work can be started immediately the timber is obtained.
75. That is preceded by a minute by Mr. Hickson to the effect that with repairs, at a cost of £4,500, the bridge will practically be in a safe condition for the three years which would be occupied in the construction of a new bridge? Quite so.
76. Are we to understand that the bridge would take traffic equal to that of the present time for a period of three years during the construction of a new bridge? Yes. I think that unless an unforeseen accident happens, such as a ship touching the bridge, it would carry the traffic for that period.
77. You think we may safely estimate the life of the bridge at three years? Yes.
78. You would not care to express an opinion as to anything beyond that? No. But I particularly wish it to be understood that the bridge, even during those three years, will be too weak and too light for the traffic it carries. I do not anticipate that it will fall down, but it is too light and too old for any engineer to care to carry upon it the present heavy volume of traffic for any longer period than he can help.
79. You do not say that the traffic is greater now than it was a few years ago? No.
80. But you think that during past years the traffic has been too heavy for the bridge, although it has carried it safely? That is my opinion.
81. Have you any statement as to the class of vessels which have passed through the bridge? No, we do not keep any particulars as to the vessels. We keep the number of openings more as a check on the men doing the work than anything else.
82. Are you prepared to express an opinion as to what should be the maximum size of the openings in any new structure that may be erected? I certainly think the openings should not be less than 60 feet.
83. How do you arrive at that opinion? I arrive at that opinion chiefly from my experience at the Pymont Bridge, which is also under my control, and through which large vessels pass.
84. Do you think that vessels of the same class would pass through the Glebe Island Bridge? I do not think such large ones are likely to pass through it. It is used now chiefly for timber vessels.
85. What depth of water have you under the Glebe Island Bridge at the deepest part? In about the middle of the bridge there is approximately 22 feet of water at low water.
86. Do you think that vessels of a larger tonnage than those now passing through the bridge would pass through it if the depth of water were greater than it is where the swing is at the present time? I think so. I think that if improved facilities were afforded a great many more, as well as larger, vessels would use the bridge.
87. What depth of water have you near the swing? At the swing there are only 9 feet at low water. There is more water directly under the swing, but a vessel to get to it has to pass over some rocks with a depth of 9 feet at low water. At the present time we have to let a number of vessels through at night to catch the high tide.

E. M.  
de Burgh,  
M.I.C.E.  
16 June, 1897.

88. What is the depth of water at the Blackwattle Bay wharf? I cannot say.
89. What is the width of the present opening of the bridge? 34 feet.
90. Do you think that the opening should be 26 feet wider than the present opening, assuming a new bridge to be necessary? Yes; I think it ought to be about 60 feet.
91. Do you arrive at that conclusion upon the character of the traffic passing through the Pymont Bridge, or from what you think will be the character of the future traffic passing through the Glebe Island Bridge? There is one thing which guides me to some extent in the formation of that opinion. We recently had occasion, even as the bridge is at present, to bring through some of the large dredges, and in order to get them through we had to widen the opening in the bridge to 58 feet.
92. Have you had dredges of the same class passing through the Pymont Bridge? No.
93. I suppose you could not get one through? No. We should have to do as we did at the Glebe Island Bridge—that is, remove a portion of the structure.
94. That is your reason for fixing 60 feet as the necessary width of the opening? I merely mention that as an instance; but I am of opinion that any opening of less than 60 feet is inadequate even for small vessels. They cannot always hit the opening exactly, and accidents are very likely to arise if you have a narrow opening.
95. *Mr. Wright.*] Would the difference in the cost as between a 40-foot and a 60-foot opening be very great? It would depend entirely on the width of the decking, and what kind of bridge you had.
96. *Mr. Humphery.*] Have you formed any opinion as to where the new structure should start from? There is a line shown on the plan placing the bridge alongside the existing one—to the south of it. That appears to me to be a very suitable position.
97. Is that the same design as the one which was placed before the Committee in 1894? That was the scheme I think which was placed before the Committee at that time.
98. Has it been altered in any way? I do not think the plan has been touched since. The site to which I refer is that which was proposed at the time you mention.
99. The place where the swing is shown under that scheme would be the deepest part of Johnstone's Bay? Yes. There would be as good water there as in any part of the bridge.
100. Do you know how far up above the bridge that depth is continued? I am not aware.
101. Have you the soundings of Blackwattle Bay? I fancy soundings were taken at the time designs were prepared for a bridge over the harbour, but I do not remember what they were.
102. There would be no difficulty in getting them? No. If they have been taken they can be easily obtained.
103. What would be the area of available water to a depth of over 20 feet in Rozelle Bay and Blackwattle Bay? I do not know the borings sufficiently to say.
104. Who could furnish the Committee with information upon that point? I should think the Public Works Department would be able to do so. Mr. Halligan, the marine surveyor, would probably have the information.
105. As far as you know, there would be, with good dredging, a considerable area of deep water? That is my impression.
106. *Mr. Lee.*] Supposing the question arose as to the advisableness of prolonging the life of this bridge by repairing it:—what would it be necessary to expend upon it to extend its life for a further period of ten years? I should recommend a practically new structure throughout. I should recommend bracing the piers below the present water-level, so as to stiffen them, and I should think that if you were going to extend the life of the bridge for so long a time as ten years, it would be very necessary to widen the roadway of the existing swing span—practically to put a new swing span in.
107. I named ten years, as I thought that would be a fairly proportionate period, having regard to the life of a new bridge, which I take it would be thirty years. If you expend £4,000 every two or three years in repairs, that would amount in ten years' time to £13,000 or £14,000. It might become a question whether it would be better to put the bridge in substantial repair for ten years, or to build a new bridge. I should, therefore, like to know the probable cost of giving the bridge a further life of ten years? Besides the condition of the bridge, you must take into consideration its limited capacity, the congestion of traffic at the swing, and the consequent delay.
108. In the first place, the swing is in the wrong place? Yes.
109. The condition of the present structure is such that in order to obviate danger, you have to put gates at a certain distance from each side of the swing? Yes.
110. To prevent traffic from getting too close to the swing when it is open? Yes; I am sometimes afraid of one of the little vessels touching the bridge, while persons are standing on it near the swing.
111. The bridge is shaky, not so much on account of the decay of the woodwork as from the slender nature and great length of the piles? That is it.
112. Looking at the question from the two points of view I have laid before you, you think it would be cheaper to erect a new and more commodious structure than to patch up the present structure, with a view to giving it a further life of ten years? Yes; I am very strongly of that opinion.
113. If the piles were long, strong, and sound enough to last for another twenty years, there would be some reason in recommending a new superstructure, would there not? Yes; there might be some reason in such a recommendation then.
114. But you could not recommend the putting of a new superstructure on piles which you have already condemned on account of their unfitness—not from their rottenness, but from their being too light? It would be of no use to put in a new superstructure without going to great expense in strengthening the piers.
115. Would you, as an engineer, recommend that that should be done? No; I would not recommend that anything more should be done to the old bridge.
116. If the piles had to be braced below water, and strengthened in other respects, and if a new superstructure had to be put upon them, that would go a long way towards the cost of a new bridge? Yes.
117. After having incurred all that expense, you would have a structure which would last for ten years; whereas, if you put up a new structure it would last for at least thirty years? Yes; providing a timber structure were contemplated.
118. You contemplate that, with a new timber structure, you will be able to give the necessary accommodation for the increasing traffic, placing the swing in a position in which it would afford greater convenience

16 June, 1897.

convenience to vessels plying to the upper portions of the harbour? Yes; but I do not express any opinion as to a timber structure. I am in favour of a new structure, but I express no opinion as to what kind of structure it should be.

119. It may be better to put in an iron one, but as between putting in a new wooden structure and repairing the existing structure, the difference in life would be represented by the difference between thirty years and ten years? Yes.

120. Have you any reason to suppose that the large volume of traffic passing over Pymont and Glebe Island Bridges is likely to be diverted by railway or tramway construction? I should not think so. I think there would always be a certain amount of traffic from the city to Balmain along that route. Knowing the district as I do, I should say that the traffic would be more likely to increase than to decrease.

121. No matter what action may be taken in the future in railway or tramway construction, you think that it would always be necessary to keep open bridge communication between these two points? I think so.

122. *Mr. Clarke.*] Are the piles in the present structure coppered below high-water mark? Yes.

123. In that case no injury would be done to the piling by the cobra? I do not think much injury would be done by the cobra. But even piles covered with copper are likely to get the copper rubbed off at places; and at those places the teredo may get in.

124. The danger of injury from the teredo lies chiefly between wind and water, or, in other words, between high and low water mark, does it not? So some persons say, but in my opinion they will work at any depth. I know that some persons say that they will only work between wind and water; but there is ample proof that they will do damage lower than that.

125. You think they will work anywhere where the timber is not covered with copper? Yes.

126. Although, in this case, the piles are slight, I suppose they are strong enough for the ordinary traffic which existed when the bridge was first erected? Yes. It was supposed to be a light-traffic bridge.

127. *Mr. Wright.*] Both the Glebe Island and Pymont Bridges have been in existence for some years? Yes. The Glebe Island Bridge is now 35 years old.

128. I suppose that, with ordinary care and good piles, a wooden bridge will last from twenty-five to thirty years? Yes; longer than that.

129. Therefore, the superstructure without the decking would last for a considerable time? No; because the girders which carry the decking are more exposed to influences which would cause them to decay than are the piles.

130. Will not the trusses last for a great number of years if they are built of hardwood? We estimate the life of these wooden bridges at from twenty-five to thirty years. That is a long life.

131. For a wooden structure? Yes.

132. But with proper care and occasional repair, and a coat of paint or tar, how long would such a bridge last? From twenty-five to thirty years.

133. How long have you had charge of the Construction Branch? I have been connected with it since 1887.

134. And during that time you have had occasion to superintend the repair of a great number of wooden bridges? A great number. There are about 2,800 bridges in the Colony which are under my care.

135. And your experience points to the fact that well-constructed wooden bridges will last from twenty-five to thirty years? Yes; not any more.

136. *Mr. Hassall.*] A good deal of delay at present takes place in getting the traffic across the bridge, does it not? The average daily delay would be one hour forty-five minutes—that would be from 6 o'clock in the morning until 6 o'clock in the evening.

137. Is not that principally caused by the narrow entrance to the bridge on the city side? The time I have given you is merely the time between the opening and shutting of the swing. Of course, when the swing is shut again, there is a long string of vehicles waiting to come over from Balmain, and another long string of vehicles waiting to cross over from the city. They are a long time battling through. The delay I have given you would not include the time thus occupied.

138. Then there would be considerable delay in addition to that which you have already mentioned? Yes.

139. In consequence of the narrowness of the bridge only one line of vehicles can pass over at a time? Yes; only one line can cross the swing at a time. The city-bound traffic crosses first, and the Balmain-bound traffic must wait until the city-bound traffic is over before it can get across.

140. That necessitates considerable delay? Yes; there is no room on the bridge for two lines of vehicles to pass over at one and the same time.

141. Is it not a fact that the traffic is largely increasing? As I have already said, I have no record of the increase in the vehicular traffic since 1894, but between 1889 and 1894 it increased to an enormous extent.

142. From your knowledge of the traffic, the bridge being under your supervision, do you not think it is necessary to make better provision for the traffic than exists at the present time? I am strongly of opinion that that should be done.

143. You think that any plan which is submitted should provide better facilities for traffic than those which now exist? Yes.

144. *Mr. Roberts.*] When did the expenditure of the £4,000, with which you were entrusted for the repair of the bridge, cease? It would be near the end of 1895 before the expenditure was quite completed.

145. About eighteen months ago? Yes.

146. Was it not contemplated that the expenditure of that £4,000 would preserve the bridge for another three or four years? It was expected that it would keep it safe, that there would be no accident.

147. Has the bridge become worn out sooner than was anticipated, or would it be safe for another two and a half years with the £4,000 of expenditure to which I have referred? In my opinion, it is not safe now from an engineering point of view. An engineer is not simply satisfied with the fact that a structure will hold up. He wants a certain margin of safety, especially in timber bridges, because there may be defects in the timber of which we know nothing. We have not that margin in the case of this particular bridge. Therefore, I say it should be entirely rebuilt. I have no reason to suppose that there will be an accident within the next three years with reasonable care.

148. You think that with reasonable care the bridge might last another three years? Yes; but it would not be right to carry traffic over it for a longer time than is absolutely necessary.

E. M.  
de Burgh,  
M.I.C.E.  
16 June, 1897.

149. Will you give the Committee the details of the expenditure of the £4,000? I took all the walings—that is, the cross-pieces on the piers—off, and put on new ones of a kind which were not very good, because I did not think they would be long required. I took the whole deck off, and patched the skin underneath. Here and there I took pieces out of it. I also put in a few new girders, and endeavoured to destroy some white ants in the bridge. I put a new hand-rail on it, and I also put new iron girders in the swing-span to strengthen it up a little. It was in dreadful condition. I also did some painting, which might lead persons to suppose that the bridge was stronger than it really is.
150. Do you regard the bridge as being safer now than it was at the time you commenced the expenditure of that money? Yes; it is in a better condition now than it was in at the commencement of 1894.
151. It is stronger? Yes, the deck is stronger.
152. Is the deck very much cut about by the large traffic now passing over the bridge;—it has now had about eighteen months' wear? The present deck will last for about nine months or a year. I shall then have to put in a new deck.
153. What would be the cost of the new deck? It would vary from £200 to £400.
154. Would the life of a deck be about three years? It generally runs from two to two and a-half years. There are a number of considerations affecting the life of a deck.
155. *Mr. Farnell.*] Do you think that in the construction of the new bridge it would be possible to ease the approach to the bridge on the Balmain side? Yes, quite possible.
156. Do you know it to be a fact that vessels are sometimes moored to the bridge? I have occasionally allowed a vessel to make a line fast to it; but it is not done without special permission and my knowledge of the vessel to be moored.
157. There is at the present time a considerable congestion of traffic on the bridge? Yes.
158. Have you ever noticed the bridge swaying backwards and forwards with the congested traffic? Yes.
159. As a matter of fact, when the bridge was constructed years ago, it was intended to meet the requirements of traffic between only two points—Balmain and Sydney—whereas since its construction the traffic from Ryde, Pennant Hills, Dural, and the districts to the north of the Parramatta River has come over the bridge? Yes; that is the case.
160. *Mr. Hoskins.*] You said just now, in reply to Mr. Farnell, that vessels are sometimes moored to the bridge;—is that a fact? I recollect two occasions within the last three or four years in which I have allowed a vessel to make a line fast to the bridge.
161. It is not the general practice is it? No; it is not done without permission.
162. Is permission frequently given? I can recollect giving it only twice.
163. Would not the making fast to the bridge of a laden vessel injure it if there were a heavy gale of wind blowing? In such a case the men in charge of the bridge would cut the line. They would not allow the line to remain if there were any wind or sea. In the cases to which I have referred the vessels were running out two or three mooring lines, and they wanted to make a light line fast to the bridge.
164. Is there not a regulation against such a practice? Yes. It is never done without permission.
165. Was the whole of the timber used in the repair of the bridge in 1894 seasoned timber? It was not what you would call seasoned timber. We seldom get seasoned timber for bridge repair. In this case the repair had to be done in a hurry, and we had to take the timber as we got it.
166. I understood you to say just now, in reply to Mr. Roberts, that you made certain repairs to the bridge which you did not consider were very good? It was not expected that the repairs of which I spoke were to last very long. I referred to the walings.
167. Why were those repairs not made good? If I had intended them to last for a long time, I would have coppered them, because the water comes over them at high tide; but, under the circumstances, I did not go to that expense.
168. Then I am entitled to infer that the repairs you made were intended to be only of a temporary character—they were to last only a short time? Yes. I should have regarded any more serious repairs as a waste of money.
169. Has any of the timber used in the repair of the bridge at the time the £4,000 was expended rotted away or decayed? No; none of it.
170. It is all in good condition? Yes. The ants may have got into particular pieces, but I do not think it likely.
171. Are we to infer that the portion of the bridge which has become so deteriorated as to make the structure almost unsafe is the old timber, and not the new timber which was put in in 1894? That is so.
172. You could not give us an estimate of what it would cost to replace the timber which is not in good order, so as to make the whole of it equal in condition to the timber which was last put in? No; I could not give you such an estimate, but I have already endeavoured to point out that if I were to renew the bridge by replacing each piece of timber now laid the structure would not be sufficiently strong to carry the traffic which passes over it.
173. You say that the piles are in good order, but that they are not sufficiently strong for the traffic? The girders in the superstructure are not strong enough to carry the traffic over such long spans as there are in this bridge.
174. I suppose the replacement of the girders would not be a very formidable matter? It would run into a good deal of money. If the bridge were all in new timber now, just as it stands, it would be about one-quarter as strong as one of our ordinary up-country bridges—one of the standard bridges of the Colony—that is, if you were to make every stick in it brand new.
175. You have had great experience in bridge-building, I take it, and you say that the vibration of the bridge is excessive;—is it not a fact that timber bridges generally vibrate when loads are passing over them? Yes.
176. Is the vibration of the Glebe Island Bridge greater than is usually the case in such bridges? Yes.

FRIDAY, 18 JUNE, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
 The Hon. JAMES HOSKINS.  
 The Hon. CHARLES JAMES ROBERTS, C.M.G.  
 The Hon. WILLIAM JOSEPH TRICKETT.  
 The Hon. DANIEL O'CONNOR.  
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
 JOHN LIONEL FEGAN, Esq.  
 THOMAS HENRY HASSALL, Esq.  
 GEORGE BLACK, Esq.  
 FRANCIS AUGUSTUS WRIGHT, Esq.  
 FRANK FARNELL, Esq.

The Committee further considered the expediency of constructing a New Bridge at Glebe Island.

Ernest Macartney de Burgh, M. Inst. C.E., Assistant Engineer for Bridges, Department of Public Works, sworn, and further examined:—

177. *Mr. Lee.*] Since you were last here you have made a further inspection of the Glebe Island Bridge? Yes. I went over yesterday morning before the Committee visited the bridge, to see what portions of the work showing its defective condition, I could point out to you. I found that, in addition to the very rotten piece of timber I showed to the Committee, the white ants had extended their operations from the Glebe Island end of the bridge to a point past the centre. I found them to be a good deal worse in the bridge than I anticipated they would be, because I have been at some pains in endeavouring to keep them out of it. Apart from that, however, I found nothing but what I quite expected to find—that is, decayed girders, and some of the piles hollow.

178. You are prepared now to reiterate your recommendation that no new superstructure should be placed upon the present under-structure? Certainly.

179. The reasons you have formerly given hold good to-day, first, from the lightness of the piles, and the partially-decomposed state of some of them? Exactly.

180. Apart from that feature in the structure, is there not one which should receive consideration at the hands of the Committee;—I refer to the circumstance that the bridge as it now stands is far too narrow to carry the increasing traffic? Yes. In my opinion, the swing portion of the bridge, especially, having only one roadway in it, is utterly unsuitable for the traffic, quite apart from the narrowness of the main structure.

181. Your under-structure, being of a certain width, you could not very well increase the width of the superstructure? No; not without making things worse than they are now.

182. As a matter of fact, the bridge is so narrow as to be altogether insufficient to carry the traffic? In my opinion that is the case.

183. Your recommendation, therefore, is that the bridge be built on a larger scale? Yes.

184. You think that all idea of patching up the old bridge should be abandoned? Yes; I think that would be useless.

185. How do you propose to conduct the traffic while the new bridge is in course of erection? If the Engineer-in-Chief proposes a new bridge on the site shown on the plan before you, no matter what kind of a bridge it may be, the traffic will be carried on over the old bridge during the construction of the new one.

186. Would the width of the approaches on either side of the bridge determine the amount of traffic that would pass over it? Unless the road were so narrow that two vehicles could not pass on it, I do not think the width would have any effect on the amount of traffic.

187. The road at present will admit of two or three vehicles passing one another? Yes.

188. On the other hand there are portions near the rock excavation which are very narrow? Yes; as you go up hill towards the Abattoirs there is a narrow portion.

189. If you provide for a double traffic bridge, you must also provide for double traffic approaches? In that case, you will have to increase the width of the roadway. No doubt in building such a large bridge as would be required at this place, they would increase the width of the road. That would be done as a matter of economy to get the material for the necessary filling.

190. Would there be much additional cost involved in that? No; the cost would be very trifling.

191. The erection of the larger bridge will not lead the country into a still heavier expenditure in connection with the widening of the roadway? The widening of the road on the far side would be a trifling matter.

192. If it became necessary to widen it the work could be done at a small cost? Yes.

193. You are quite clear about that? Yes; it would be a mere bagatelle compared with the cost of the bridge.

194. Is there any other point you desire to mention to the Committee? I might mention that yesterday morning while I was at the bridge, I counted sixty-four vehicles waiting to get across, the swing being at the time open to let a vessel through.

195. How long were the vehicles detained? I did not time the detention. Some would be detained a long time, others a minute or two. I do not know what the maximum time would be, as I was not there when the swing was opened.

196. *Mr. Roberts.*] Do you think that if you were to remove the swing to the centre of the bridge, the structure could be so strengthened as to last for another three or four years? Some time ago the ship-owners and persons who trade at the wharfs in Blackwattle Bay wrote to the Public Works Department and pointed out the great inconvenience to which they were subjected from the present position of the swing. They asked the Secretary for Public Works to cause the swing to be put in the centre of the bridge pending the erection of a new structure. We then looked into the matter very carefully to see if the matter were practicable; but the old iron swing which is there at present is such a poor affair, it is such an old-fashioned, ramshackle thing, and the cost of getting foundations for it in the deeper water in the centre would be so great as compared with the advantages to be gained for only a few years—you might say for only three years—that we thought the proposal out of the question. We went very carefully into the matter at the time, because we were anxious to improve the shipping facilities,

E. M.  
de Burgh,  
M.I.C.E.  
18 June, 1897.

197. The Minister came to the conclusion that the present bridge was in such disrepair that he would not be warranted in expending the large sum required to put a new swing span in? That is so.
198. *Mr. Trickett.*] What regulations are there with regard to the traffic over the Glebe Island Bridge at the present time? There is no limit to load, if that is what you are referring to.
199. But is there any limit to the pace at which the loads can be conveyed across? No.
200. If the bridge is in such a shaky condition, would not some regulations seem to be advisable? Our experience is that it is very difficult to enforce such a regulation; in fact you might almost say that it is impossible to do so. The advantage gained, therefore, would be inconsiderable.
201. I ask you this question, because when you were examined before the Committee in 1894, you said you thought it inadvisable to allow swift traffic over the bridge? I recollect that at that time I limited the traffic for a certain period. Some portion of the bridge was being altered, and I was particularly concerned at that time as to the speed of the traffic. We were altering the portion in the middle, which you may have noticed yesterday. We cut some piers out of the arched portions, and put in two new iron girders at each end. This work having been done, and finding, as we did, that the police were not very successful in their efforts to keep vehicles at a walk, we allowed the traffic to proceed as before.
202. Do you think that in the interests of the safety of the structure you should still allow the drivers of vehicles to go as they please over the bridge? I think we could get through safely, if we had not to keep the bridge open for more than another three years.
203. In reply to Question 120 in 1894 you said that you had limited the pace but that you had not limited the load. Does it not strike you that if it was necessary in 1894 to limit the pace it would be quite as necessary to do so in 1897. If it be necessary, surely the Government can enforce the regulation as to pace, in the interests of the safety of the bridge and of the public who use it? I did limit the traffic for a time, but since the beginning of 1896 we have so strengthened the centre spans, where there is the greatest vibration, as to alter the circumstances to a certain extent. I presume we could insist upon the pace being lessened, but it would be very difficult to do so, and it would at the same time be very inconvenient to the public.
204. If I am rightly informed there are a good many swing bridges in use where the traffic has to be limited in pace. In many of the American bridges that is found to be very necessary? In America they regulate the pace on many railway bridges also. Traffic is made to go very slowly over bridges there, the bridges being of light construction, and their life very short.
205. This bridge has always been looked upon as designed weak, to use your own words? Yes.
206. In the interests of safety, do you think the traffic should be allowed to go over the bridge without any regulation? I think it might be allowed now until we put up a new bridge. I say so on account of the alterations which have been made to the centre of the structure since I gave my evidence in 1894.
207. The alterations cause the bridge to vibrate less than it did before? Yes.
208. Yesterday we saw the effect of the ravages of white ant at one end of the bridge;—can you tell us whether the piers of the bridge are suffering to any great extent from cobra? As far as I can ascertain from the examination made by the divers the last time I had them examined there is not much cobra in the piers. But I might say that cobra is very difficult to detect. We have frequently drawn the piles of an old bridge which have been coppered, and upon which we have thought there was sufficient protection, and have found them very badly eaten. We had bored the piles in two or three places, but we had missed the worse places by accident.
209. The cobra do not go in any regular line? No; and they leave no mark on the outside worth speaking of.
210. In the case of a bridge built over salt-water, is it not a very necessary part of the examination to ascertain whether the structure is affected by cobra? Yes; but the examination is not altogether satisfactory. It is rather difficult to be quite certain about cobra.
211. What steps do you take to ascertain the existence of cobra? Sometimes when they are very bad in the piles we discover them with the auger, in other cases we get a broken pile from a snag coming across it and smashing it. A glance at the place at which it has been broken will sometimes disclose the fact that the pile is full of cobra.
212. Have any of the piles which you have had to replace in the Glebe Island bridge been weakened by cobra, or by reason of the ravages of the white ant above water level? I have not taken any out of the main bridge. Where we touched any at all we cut them off above the covering and spliced on a new piece of timber to stiffen them.
213. You have not examined them below water-level? I had them bored by the divers.
214. The diver's examination did not disclose any danger? No, they were not in peril of collapsing.
215. You are sure of that? Quite sure.
216. Have the white ant run along the bridge to any great extent? They went right through the particular girder I showed you from end to end. They have followed along in a straight line from the point at which you were standing to a point past the centre opening. I got large quantities of them alive yesterday.
217. You were using a chisel, and were actually sweeping them out? Yes.
218. Underneath the bridge there is a lot of iron tie-rods;—I suppose their efficacy would be much impaired if the white ant were to get into the wood into which they are screwed? They would be weakened very much. They were not put into the bridge originally.
219. They were put in to stiffen it up? Yes. I presume that, as traffic increased, the Department began to be anxious about the bridge.
220. But as long as the timber remained solid, I suppose these tie-rods would be a great factor in the stability of the bridge? Not much so. They are very light; they are quite small rods. From time to time I have had the tie-rods collapse with the girders.
221. Would that be with the weight of the girder? The traffic would come altogether on to the tie-rods, and they would break.
222. They are of wrought-iron? Yes.
223. During the last three years the bridge has been under your watchful care? It has been under constant observation.
224. You have patched up the weak points and made the best job you could of it? Yes.
225. You now consider that the bridge has arrived at such a stage that it is absolutely necessary, in the interests of the safety of the public, that a new structure should be put up? I am of that opinion.

226. *Chairman.*] The effect of your evidence is this;—first of all, you say that the bridge, by reason of its construction, is not suitable to carry the traffic which it has to carry; secondly, that if you were building a new bridge to carry such traffic, it would be two or three times as strong as the existing bridge;—then, as to the steamer traffic, you say that the swing is so situated that it presents a serious difficulty both to the road traffic, on account of its construction, and to vessels, which find it difficult to approach its entrance;—you further say that the bridge is defective, not only on account of its weak construction, but on account of the piles and girders having seen their day;—that is the effect of your evidence? Yes.

E. M.  
de Burgh,  
M.I.C.E.  
18 June, 1897.

Stephen Edward Perdriau, Surveyor, Department of Lands, sworn, and examined:—

227. *Chairman.*] You are a surveyor in the Lands Department? Yes.

228. *Mr. Fegan.*] Do you produce plans? Yes. I have two sheets of the map of Sydney and its environs, covering the district under consideration.

229. You are well acquainted with the approaches of the proposed bridge? Yes.

230. Are they both through Government land? There is Government land on the Glebe Island side but not on the other side.

231. Then resumption would be necessary? A portion on this side would have to be resumed.

232. I understand that you have prepared a statement for the Committee? Yes. I have a description of Blackwattle Cove and Rozelle Bay, comprising part of Port Jackson lying southward of Glebe Island Bridge. It is as follows:—

S. E.  
Perdriau.  
18 June, 1897.

This sheet of water is in shape an irregular oblong, longest in an east and west direction, the bridge being about in the middle on the northern side. The water is about  $1\frac{1}{2}$  mile in length with an average width of about 15 chains. The area is about one-third of a square mile, and the shore-line about 3 miles, measured along the limit for reclamations where the same has been determined, and without following the sinuosities of high-water line.

The eastern portion is called Blackwattle Cove, and the western portion Rozelle Bay, Glebe Point, located about midway on the southern shore forming the division.

The various municipalities delimited by this waterway are, on the north side Sydney (Pymont) and Balmain (including Glebe Island), and on the south The Glebe and Annandale. Within about a mile are Sydney proper, Redfern, Camperdown, Petersham, and Leichhardt. The interests of all these municipalities are of course considerably affected by the facilities for trade afforded by water-carriage to this part of the harbour.

The above-mentioned municipalities, already populous, are still rapidly increasing, and they comprise immense areas at present unused, which, owing to their proximity to the city, must in the near future be required for business and residential occupation. In view of these facts, I conclude that, with the exception of Circular Quay and Darling Harbour, there is no more important inlet in Port Jackson than that now under description.

This opinion is strengthened by my intimate knowledge of the development here. During the last fifteen years this foreshore has been continuously under my observation. In that period I have surveyed nearly the whole of it in connection with reclamations made by the Crown and by private individuals. With the exception of the frontage of Glebe Island reclamations, extending as far out as Government would allow here, have been effected on nearly the whole of the foreshore. The principal business carried on is in timber and road metal. The exceptionally large areas of flat land reclaimed from the harbour render it superior even to Darling Harbour for the timber trade, and the trend of that business has been in this direction for some time, and now timber-yards are located at intervals all along the foreshore. My work for the Department of Lands is largely in connection with water frontages, and I am constantly visiting all parts of the harbour, and during recent years on no other equal length of foreshore, except in the city proper, has there been as much money expended for reclamation and wharf building, nor as many new and important businesses established, and the conditions indicate inevitable further development if due facilities are afforded for access from the main harbour.

#### BLACKWATTLE COVE.

Blackwattle Cove lies between Pymont and the Glebe; it is within  $1\frac{1}{2}$  mile of Redfern Railway Station, and  $\frac{3}{4}$  mile of the nearest point on the railway at Darling Harbour.

The water-frontage land on the northern shore of the cove is nearly level, being reclaimed land. It forms part of the Harris estate, and access to the water is very convenient from Bank-street and Cippis Crescent, which bound the water-frontage allotments. About half the total length of the foreshore, which is about 2,500 feet long, is leased to various persons, and used principally as timber yards. The freehold value of these allotments varies with their position and depth from about £30 per foot near the bridge to about £70 per foot at Pymont Bridge Road.

The southern foreshore of the cove is about the same length as the northern, but is much steeper, the gradients of the roads leading to the water being very severe. The southern shore is inferior to the northern shore for business, and the design of subdivision of the locality is inconvenient for access to the water, consequently land values are much lower than on the northern side. There is one large timber yard on this side of the bay at the Pymont Bridge Road, and about half the remainder of the water-frontage is occupied for businesses of less importance, and the rest for residential purposes.

The Government wharf at the head of the bay lies between the Pymont Bridge Road and the cove. It is 1,075 feet long, all in one straight line, and forms the head of the cove. The wharf is used for discharging road metal from vessels carrying up to about 320 tons, and was built when the natural head of the cove was reclaimed from the harbour and formed into the recreation reserve called Wentworth Park.

Direct access from Blackwattle Cove to the city is provided through Pymont, and thence by the bridge to Market-street; but the gradients of the roads traversed and which cross the backbone of the Pymont Peninsula are somewhat steep.

The gradient is easy from Blackwattle Cove, *via* Wattle-street, to Redfern Railway Station.

The Glebe Island bridge connects that Island with Pymont, and obstructs the natural access to the cove. The bridge opening is situated at the Pymont end, and is sufficient to allow of vessels up to 34 feet beam passing through. In the opening there is a depth of 12 ft. 6 in. of water at low tide. I was informed that a new pile recently driven at the western side of the opening required to be 50 feet long to reach the rock.

On the 21st November, 1894, the Public Works Committee, after inquiry, reported against the replacement of the bridge by a new structure.

#### DEPTH OF WATER AND BORINGS TO ROCK.

The depth of water in the cove is from 7 feet to 13 feet at low tide; in a few places it reaches 20 feet. This is sufficient for the present requirements, *viz.*, for vessels up to about 400 tons burden, laden with the timber and road metal referred to above.

The dredge is now at work in the cove lifting mud which is taken to the large reclamation work in progress about half a mile away, at Johnstone's Creek, Rozelle Bay.

Soundings north of the bridge show a depth of from 18 to 19 feet. Seventeen borings upon two longitudinal sections extending across the bay show a depth varying from 21 feet to  $86\frac{3}{4}$  feet in the middle of the bay. At one place there were only  $8\frac{1}{2}$  feet to rock. These sections were located respectively north and south of the bridge and distant therefrom about 100 feet. Borings have been taken to test the depth to rock throughout the bay.

#### GLEBE POINT.

Glebe Point is so well known as a first-class residential locality that little need be said of it here, except that the building of expensive residences has continued even during the depression. Communication with the city by tram and bus is so frequent that for this purpose water access is not of great importance, but the wharf at the end of Glebe Point Road is a place of call for ferry steamers.

#### ROZELLE

## ROZELLE BAY.

S. E.  
Perdriau.  
18 June, 1897.

Between Glebe Point and Annandale, and between Annandale and Balmain, the flat foreshores of Rozelle Bay at the mouths of Johnstone and White Creeks have recently been reclaimed from the harbour.

These areas, which were formerly objectionable and foul-smelling mud flats, are to be formed into public parks, but the water frontage portions for a width of about 200 feet from the sea-wall will be retained by the Crown for wharfage; the lengths of same are about 1,700 feet and 500 feet respectively.

No doubt these places will soon be used, and consequently the Government possessing these two large wharf frontages, as well as that at the head of Blackwattle Cove above referred to, will be studying its own interest by providing uninterrupted water access thereto.

The remainder of the foreshore of this bay, except that of Glebe Island, has now all been reclaimed by the owners of the various freeholds adjoining.

With one or two exceptions they are in actual use for business purposes, mostly in connection with the timber trade, as before described.

I have not been able to procure a plan showing soundings and borings in Rozelle Bay, but judging by the size of the vessels I have seen there, I should say that the depth is equal to that in Blackwattle Cove.

The following is a description of Glebe Island:—

Glebe Island comprises an area of about 34½ acres, being about 34½ chains long and about 10 chains wide. It extends into the harbour north-easterly from Balmain at a point near the south-western end of the borough, and was, as the name implies, an island. It is now a promontory, the greatest height being towards the north-east. Many years ago a causeway about 1 chain wide was built, connecting it with the mainland. Within the last few years an area of about 12 acres, lying to the north-west of the island, and joining it with Balmain for a length of about 12 chains, was reclaimed from the harbour by the Crown. The reclamation was effected to abate the nuisance caused by the stench from the mud flat. The land is not used, except a small piece railed off for a cricket ground. The two areas combined are about 46½ acres. The island is bounded on the north by White Bay, dividing it from Balmain; east by Johnstone's Bay and Blackwattle Cove, dividing it from Pyrmont; and south by Rozelle Bay, dividing it from the Glebe and Annandale.

The total length of the water frontage of the island, including that of the reclamation, is about a mile. The reclamation is, of course, level; but the whole of the island has a bold, rocky foreshore—in fact, the solid rock shows freely all over the surface, and at a few yards back from the shore line a height of 15 feet above high-water level is reached, the height rapidly increasing by rugged, rocky slopes until the highest point is reached, which is 90 feet above high-water level.

The central portion is a plateau from 70 feet to 90 feet above high-water level. Stone for Government works elsewhere is now being quarried at the northern end near the water.

The island occupies a peculiarly central position. It is within comparatively easy reach of the city and nearly all the populous suburbs.

From the city it is approached *via* Market-street, Pyrmont Bridge, Pyrmont, and Glebe Island Bridge, and is distant about 1½ mile by road from the General Post Office.

The nearest point on the Darling Harbour railway is within seven-eighths of a mile of the island, in a direct line, and Petersham railway station is within 2½ miles by road. The main Sydney road from the Ryde and Hunter's Hill districts, *via* the four bridges called Five Dock, Long Cove, Glebe Island, and Pyrmont Bridges, crosses the southern portion of the island, and forms the frontage road of the Abattoirs.

*The Abattoirs.*

The Abattoirs for the Sydney and Metropolitan District occupy the area of about 7 acres lying southward of the road, and the small space on which the mutton houses are erected, northward of the same.

The desiccating works situated at the southern extremity of the island are now disused, the blood and offal being conveyed to sea in punts.

There are six dwellings of various sizes and material scattered over the more northern section of the island, all occupied by officials connected with the Abattoirs.

The small Post and Telegraph Office located here was closed a few months ago owing to the insufficiency of business.

Upon the high land northward of the road, and immediately opposite the Abattoirs, there is a large tank or reservoir hewn out of the solid rock. It is about 240 feet x 35 feet, and 20 feet deep. Water for flushing the slaughter-houses is pumped from the harbour into this tank. The pumps are said to be capable of lifting 40,000 to 50,000 gallons per hour.

There is no permanent occupation of any part of the island excepting in connection with the Abattoirs. The Abattoirs are said to be thirty-six years old and antiquated, and it is held that nothing short of entirely new and much larger and higher buildings could bring them up to present requirements.

There is no railway to the island, and the cattle and sheep, &c., are driven here from the sale-yards at Homebush, a distance of from 7 to 8 miles; and as the total for the year is between 900,000 and 1,000,000, it is evident that the objections raised in the populous suburbs *en route* against the cattle-driving nuisance are not without foundation. It is considered by those competent to judge that no other site in the metropolitan district presents such advantages for abattoirs as Glebe Island. Its central position has already been referred to.

It is all high land, and being almost isolated by the surrounding broad stretches of salt water, objectionable odours are dissipated before they reach the surrounding residential districts. (Complaints have, however, been made from time to time with regard to the unpleasant smells, particularly at Glebe Point; but there does not appear to have been any sustained effort by the public for the removal of the Abattoirs.)

Such extensive deep-water frontage affords unequalled facilities for the shipment of meat for foreign countries.

An advantage of a very peculiar nature is that the island is entirely free from blow-flies. It is said that none have ever been seen there.

Cattle are sometimes brought by sea to the island, whence they have to be driven to the sale-yards at Homebush to be sold. They are then driven back and slaughtered.

A light line of railway leaving the main line at Stanmore station, *via* White Creek—a distance of a little more than 2 miles—has been suggested to overcome the nuisance arising from cattle-driving, and the reclaimed land might be used for sale-yards; but those engaged in the trade state that if the Abattoirs were removed any considerable distance from the city the result would be an increase in the price of meat.

For many years no blood nor offal have been allowed to go into the harbour, but no doubt pollution occurs to some extent from the surface drainage.

*Soundings and Borings.*

Commencing at the bridge on the east side and thence northerly and round the eastern end of the island, the depth of water at 100 feet out from high-water mark is from 7 to 15 feet at low tide, deepening to 19 feet in the middle of the bay between the island and Pyrmont; but that depth is not reached within 600 feet from the northern portion of the island towards Balmain. Along the north-western foreshore the water is shallow. At 200 feet out from high-water mark it varies from 5 feet to 12 feet in depth at low tide.

Borings to rock were taken in 1881 on the foreshore extending from the bridge north-easterly and round the eastern end of the island. These show that at 200 feet out from high-water mark rock is reached at a depth of 20 feet, and less from low-water level.

The officer in charge of such work is, however, doubtful whether the plan affording the information *re* borings stated above is correct.

From about the middle of the sea-wall of the reclamation above referred to, a pile jetty about 240 feet long and 30 feet wide has been thrown out into the harbour.

The locality of the jetty had previously been dredged, as well as a channel to the same from the harbour, so that now vessels drawing up to 20 feet of water can be accommodated.

Apparently no soundings nor borings have been taken on the south side of the island from the bridge.

233. You have not seen a plan showing the depth to which various bores have been put down in Blackwattle Cove and Rozelle Bay? No; I understand that the borings are not yet complete in either Blackwattle Cove or Rozelle Bay.

234. And that is the reason the plans are not in hand? Yes.

235. Can you give us any information of the inconvenience resulting from the driving of cattle to the Abattoirs? I have ascertained that at the present time there are not so many coming down the Bullock Road on the southern side of Balmain as used to come down that way. There is only one paddock there now—the other paddocks are out towards Five Dock, and it is from that direction that the cattle come mostly.

236. Do you not think that some steps should be taken to minimise this nuisance to the public? I certainly think something should be done.

237. You do not think the reasons adduced by those interested in the Abattoirs are enough to justify any delay in protecting the public from this great inconvenience? I made some inquiries when I was over there. One man, an old resident of the locality, told me that if he saw a mob of bullocks coming he never remained in the road, or near it. The bullocks are made so wild by being harassed by men and horses, and by being driven, that they are really dangerous.

238. And you think the time has arrived when this danger should be lessened? Yes.

239. Can you give us a description of the stock route? Yes; I have not yet had time to go into that matter.

240. The resumption necessary in connection with the proposed bridge has not come under your notice? No.

241. *Mr. Humphery.*] Have you any means of ascertaining the area of available water to a depth of 20 feet which could be obtained by dredging in Blackwattle Cove and Rozelle Bay? That can only be ascertained by boring; but judging from such information as we have at hand, it appears highly probable that a great portion of Blackwattle Cove and Rozelle Bay can be dredged to a considerable depth, and be made available for shipping.

Gerald Harnett Halligan, Chief Surveyor, Department of Public Works, sworn, and examined:—

242. *Chairman.*] You are Chief Surveyor in the Department of Public Works? Yes.

243. *Mr. Hassall.*] You produce some plans showing the depth of water round about Glebe Island, and in the neighbourhood of the proposed bridge? Yes.

244. Will you explain it to the Committee? Yes. The plans submitted show the soundings in Blackwattle Cove, Rozelle Bay, and Johnstone's Bay. The depth varies from 2½ to 3 fathoms. If you take the average all over Blackwattle Cove and Rozelle Bay above the bridge you will get about 13 feet. The depth at the head of Rozelle Bay would be about 1½ fathom; at the head of Blackwattle Bay it runs to 1½ or 1¼ fathom. In Johnstone's Bay there is a depth of 2 fathoms alongside Glebe Island. That runs to 3 fathoms at Glebe Island Point. There is an average in the bay of about 3 fathoms.

245. Those soundings are to the mud? Yes.

246. Have any borings been taken? Only here and there. We have not gone over the whole area. We have taken borings at the head of Rozelle Bay, off the Abattoirs, over at Glebe Point, opposite Harris' property at Pymont, and at the head of Blackwattle Cove. If these places were dredged we could obtain 18 feet at low water on a hard clay bottom. You could excavate so as to give a depth of 18 feet at low water over an area of about 160 acres. That would include Rozelle Bay and Blackwattle Cove. Eighteen feet would be the average, but in regard to 100 acres, you could have a depth of 30 feet. That is only an approximate estimate, of course.

247. As to the clay, is it very stiff? It is Hawkesbury sandstone clay. It would be very difficult to remove, but it is a splendid holding bottom.

248. I suppose that below the bridge you would have a greater depth of water? Yes; and the further you get out towards the harbour the easier the excavation would be. The same thing applies to the whole harbour. At the heads of the various bays there is a stiff clay bottom, but as you get out further into the waters of the harbour there is more ooze and mud, which of course is not so difficult to remove.

249. *Chairman.*] What sort of approach is there to Johnstone's Bay? There is a depth of about 18 feet—it is a mud bottom.

250. *Mr. Hassall.*] There would be no difficulty in making a deep channel below the bridge? No; there is ample room, and it could be easily excavated.

251. You think that if a new bridge were constructed to Glebe Island it would be advisable to leave sufficient space to enable vessels of 600 or 700 tons to get through? I should think it would be wise to do so.

252. If such vessels could get through the swing of the bridge they could traverse the waters of Blackwattle Cove and Rozelle Bay, the depth being improved by excavation and dredging? Yes.

253. You think it is a very valuable sheet of water, considering the position it occupies? I think it is highly valuable.

254. There is a good deal of business in the timber trade carried on in that locality? A good deal is carried on at the head of Rozelle Bay, at the southern side of Pymont, fronting Blackwattle Cove, and also at the head of Blackwattle Cove.

255. Have you any knowledge of the extent of the traffic to Glebe Island? Only from casual observation.

256. The traffic is pretty extensive, is it not? Very extensive.

257. You think it is necessary to make better provision for it than now exists? I am sure it is.

258. The present mode of transit has outgrown its usefulness—it no longer meets growing wants and requirements? It is quite inadequate.

259. You think that a new structure is required to meet both present and future requirements? Yes.

260. What is the area of reclamation in White Bay? About 40 acres. All the western end of the bay has been reclaimed. There is a reclamation wall in front of the reclaimed area, and the bay has been excavated to an average depth of 18 feet at low water over the whole area. That was done with the object of giving access to the wharf at the head of the bay. There is a wharf running into the bay from the reclaimed portion, and it is largely used in connection with the wants and requirements of Balmain.

261. In view of the increasing population of Balmain, you think the wharf is very useful? Yes; we have only had it up for about six months, and it has scarcely ever been idle.

262. Leaving White Bay, the water gradually deepens as you get to Johnstone's Bay, Darling Harbour, and the Fair Way? Yes. I may mention that at the entrance to Johnstone's Bay and opposite the Sugar Company's works there is a depth at low-water of 18 feet, and in mid-channel you carry the same depth up to Glebe Island Bridge.

S. E.  
Perdrian.

18 June, 1897.

G. H.  
Halligan.

18 June, 1897.

THURSDAY, 24 JUNE, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERT.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the expediency of constructing a New Bridge at Glebe Island.

Captain John Jackson, Manager of Public Wharfs, made an affirmation, and was examined:—

Captain  
J. Jackson.  
24 June, 1897.

263. *Chairman.*] What position do you hold? I am Manager of Public Wharfs.
264. Have you seen a plan of the proposal to replace the bridge to Glebe Island? I have.
265. And you fairly well understand the nature of the proposal? I do.
266. *Mr. Lee.*] You are familiar with Glebe Island Bridge? Yes.
267. In 1894 you gave evidence before the Public Works Committee on the same question? Yes.
268. Have there been any developments in that part of the harbour since that year to cause you to change your opinions? None whatever.
269. What is your opinion to day—first, as to whether a necessity exists for constructing a new bridge; and, secondly, if a new bridge is to be constructed, how it should be constructed so that the water traffic could be carried on? I can only speak from the standpoint of the wharfs I am in charge of up there.
270. What is your knowledge of the working of the bridge? There has been always a very great difficulty for vessels to get through the bridge, owing to the opening being on one side of it. Vessels have to my knowledge frequently sustained considerable damage in going through it;—they object to go through it.
271. In any case I presume the class of vessels trading there would be of small tonnage? At present they are, because no large vessel could get through it.
272. If sufficient provision were made for the passing of large vessels, would there be sufficient water to enable them to get through? It could always be deepened.
273. It would have to be deepened? Yes.
274. To what extent? To 24 feet, to allow large vessels to go up there.
275. But would there be a fairway from (say) the centre of the bridge with sufficient water to enable large vessels to go there? Do you mean where the bridge stands.
276. Suppose that a proper entrance were given about the centre of the present bridge, is there sufficient water now at that point to enable large vessels to go through? No.
277. In any case the passage would have to be dredged? Yes.
278. The inner portion of that part of Darling Harbour would have to be dredged? Yes.
279. In fact the whole of it would have to be dredged to enable vessels to get in and out, and to go to the various wharfs? The whole of the bay would require to be dredged.
280. Would that be a costly matter? I do not think so. I think they are dredging a great portion of it now for reclamation purposes.
281. Which is also answering a double purpose—reclaiming the land and giving deeper water? Yes.
282. Are you of opinion that a new structure is required for the convenience of passengers there? I do not know about a new structure, but I am strongly of opinion that the swing should be in the centre of the bridge. Whether they could put the swing in the centre of the present bridge or not, I am not prepared to say.
283. Has it been reported to you, or do you know of your own knowledge, that there is a certain danger to the present bridge if a vessel strikes the piers at the swing? I do not know it from my own knowledge, but I know that the bridge has on several occasions been slightly damaged there, and that vessels have been damaged in going through it.
284. In consequence of that difficulty being likely to arise has not the Department placed gates on either side of the swing, so as to regulate the traffic? I do not know.
285. Were the gates put there simply to cut off the traffic while the span is open? I do not know.
286. You cannot tell us very much about the bridge itself, or the traffic over the bridge? No.
287. All you wish to tell us is what will be required to admit of proper navigation in that part of the harbour? Yes.
288. You were suggesting that if a new bridge is to be erected the swing should be put in the centre? Yes.
289. What would you consider a fair opening for that swing? For many years, perhaps, 40 feet would be sufficient; but I would suggest that it should be made 60 feet.
290. Inasmuch as the life of a wooden bridge will practically be 50 years, and the traffic is likely to increase very largely, what would you consider a fair width to adopt in the new bridge? I think 60 feet.
291. That will be 60 feet from the centre? From side to side.
292. That is 30 feet on either side of the central point? Sixty feet for the swing.
293. Suppose it is swung from the centre, the opening on either side would be 30 feet, less the space taken up by the pier? Yes.
294. What would be the width of the passage required? Sixty feet in the clear.
295. No matter how the opening is provided for? No. I strongly recommend that it should be 60 feet. Some vessels are about 54 feet beam, and they could not go through Pyrmont Bridge.
296. What class of vessels and trade passes through the bridge to Blackwattle Bay? Stone vessels and timber. That is all that go through at present.
297. For what purpose are these vessels taken into that inner portion of the harbour—what trade is it to supply? The trade of different boroughs. There are, I think, five municipalities nearer to Blackwattle Bay than to the city.
298. And consequently it is made their depôt for metal, timber, &c.? Yes.

299.

299. Are there any timber merchants there who receive large consignments of timber? Yes.
300. But a good deal of it is foreign timber? I do not think that much foreign timber goes up there, because a large vessel laden with foreign timber could not go through the bridge.
301. The class of timber which would come in from foreign countries would be sawn timber? Yes; and it would come through there by lighters.
302. Owing to the insufficiency of water and the pier of the bridge, only lighter vessels can go through, and which are chiefly employed in the colonial trade bringing long timber? Yes.
303. But if this opening were given, and Blackwattle Bay were dredged, you are of opinion that the vessels which discharge timber at Woolloomooloo Bay would discharge at the other bay? Vessels discharge timber at the wharfs at Pyrmont; no timber is discharged at Woolloomooloo Bay at present.
304. It used to be? Yes.
305. That could be taken into Blackwattle Bay? No doubt it could.
306. Is all the foreshore of Blackwattle Bay in the hands of the Government? No.
307. How is it held? It is held by private people. Only the head of the bay is held by the Government—about 1,400 feet.
308. What scope is there for the erection of Government wharfs and the receipt of an income from them if the proposed improvements are made? The income from Blackwattle Wharf itself would be very much greater if larger vessels could go up there. I have always had an idea, and I think I am right, that if vessels could go up there it would become a large produce depôt.
309. What is the frontage to the present Government wharf there? 1,400 feet.
310. The annual revenue from that wharf is how much? Last year it was over £600.
311. Do you remember the cost of that wharf? I think it was £7,000.
312. What is the cost for maintenance and supervision? £135.
313. It is rather a profitable expenditure? Yes.
314. Will you state exactly where that wharf is situated? It runs right across the mouth of the old bay.
315. Does it abut on to Wentworth Park? It is separated from that park by Pyrmont Road.
316. Do the Government own any other portion of that foreshore? Not that I am aware of.
317. Is it all let to private owners under reclamation schemes? I could not say that.
318. There is nothing, or very little, to reclaim there? It is bold water up to the rocks on each side.
319. If there are only 1,400 feet of Government wharfage there, and that cannot be extended, how are you going to provide accommodation for a large increase of shipping? It is not only for an increase of shipping at the Government wharf, but there are private wharfs there too.
320. If all this work is done by the Government, how are they going to obtain a revenue? They would not get very much revenue from the present Government wharf there; but there is also Rozelle Bay to be considered.
321. You draw a distinction between Rozelle Bay and Blackwattle Bay? There is no wharf in Rozelle Bay at present.
322. Is there any Government land there? They are reclaiming a large portion.
323. It is all Government land in that bay? Yes, a large portion is.
324. And a portion of it is now being reclaimed? Yes.
325. Would it be possible to dredge Rozelle Bay, and make it suitable? I have no doubt of that.
326. Of course the reclamation would have to be dredged out a longer distance into the stream? Yes.
327. Still it is possible to reclaim that, deepen it, and make it available? Yes; they have reclaimed a large portion of it now.
328. If a new bridge is erected with a proper span-opening in it, and the traffic is allowed to pass free of cost, and Blackwattle Bay and Rozelle Bay are deepened, to admit of ships going to the wharfs, are there any means by which the Government could impose a toll, in order to recoup themselves? Only the wharfage. Of course they could charge so much for going through the bridge.
329. But they could not impose a wharfage rate on private wharfs? No; private owners would have to do that.
330. Nor could they impose a tonnage rate without its being inconsistent with the practice of the port generally? They could only charge that at their own wharf.
331. Do you know of any reason why a rate should not be charged for the passage of ships through the bridge? If you were to charge for the passage of ships through the bridge they certainly would never go up there. They would go and land their cargo where they would be free of that charge.
332. It would appear that if some provision is made for the admission of shipping to Blackwattle Bay, in the course of time considerable trade would spring up there, and it would be a very great convenience to the people in those five boroughs, and would be of very great advantage to the boroughs themselves? I have no doubt of it.
333. But towards the expense of which they would not contribute anything? Nothing directly.
334. Do you think it would be to the interests of the community generally that these facilities should be given? I do think that there should be a new bridge or that some improvement should be made to the present structure.
335. Do you think it is wiser for the country to deepen that water and increase the wharfage accommodation than to fill up that extreme portion of the bay? I do.
336. Which is the wiser course to pursue? I think it would be sacrilege to fill up these beautiful bays.
337. If you hold the opinion that the water should be held for wharfage purposes, it follows, as a matter of course, that there must be sufficient accommodation given there for the shipping? Yes.
338. Are there any other reasons which might debar ships from going there, or which might prevent that locality from becoming thickly populated—such as the discharge of sewage into the water? Of course that is very objectionable at the present time, but I think it will be remedied shortly when the sewerage scheme is complete.
339. At present the discharge of sewage into that part of the harbour is very offensive to people? Yes.
340. Is it not a fact that when the western suburbs sewerage scheme is completed this practice of discharging sewage into the harbour will be discontinued? I think so.
341. Is not that the system which has been worked out? I am not in a position to say.
342. Now, in view of the possible removal of the Abattoirs from Glebe Island, and the possible reclamation of Blackwattle Bay and Rozelle Bay all round to the island, and not only a good road, but possibly a railroad,—

Captain  
J. Jackson.  
24 June, 1897.

Captain  
J. Jackson.  
24 June, 1897.

railroad,—under conditions of that character do you not think it is possible that a time may come when the Glebe Island Bridge can be dispensed with altogether? That would put things in a different light. I believe a time will come when Glebe Island will be used for shipping coal. Of course a railway will be running there then, and if the Abattoirs were removed it is possible that Glebe Island Bridge could be dispensed with.

343. Do the Abattoirs contribute much towards the pollution of the harbour? I do not know.

344. Have you any Government wharfs in that direction? No.

345. Is it all held privately? I have a Government wharf up in White Bay, which is on the other side of Glebe Island.

346. Has your experience among timber wharfs in Port Jackson enabled you to form an opinion as to what will be the best class of bridge to put there? I would rather not say.

347. What is the effect of the cobra on the timber which you use in the piles? The timber which is used in Government wharfs is all coppered.

348. But how long does the copper last? Down at Circular Quay I have seen piles pulled up which had been down for about forty years, and the copper was still on them.

349. Were the piles sound? The piles were sound, but the copper was worn off.

350. Even with a thin layer of copper the piles were perfectly sound? Yes.

351. That portion of a pile which is between high-water mark and low-water mark is the worst place for the ravages of the cobra;—is not that the vulnerable point? Yes.

352. Do not the borers enter the pile at that point? Not at Government wharfs, because the piles are coppered.

353. Take any timber which is wholly or partially exposed to sea-water in Sydney Harbour, does it not, in course of time, become infested with the borer? Yes.

354. Therefore, if the piles are coppered only partially, it is only a matter of time when the cobra will get into the wood? Yes.

355. At what age do you estimate the life of a pile under these conditions, not being coppered? It would not last long.

356. If timber piles are used in the new bridge they must be securely coppered for a considerable distance above high water? Yes.

357. I presume that that copper must be carefully watched and kept intact, and that wherever it is bruised or broken it must be instantly repaired? It must be repaired within a month or so.

358. It is a fact that nearly every colonial timber we have is more or less infested by some kind of sea-borer? Yes.

359. No amount of tarring or preserving by other means will keep the borers out of the wood? No.

360. A covering of copper or muntz metal is the only thing which will keep them out? Yes.

361. Therefore, if a bridge is to be erected on wooden piles, to last a period of fifty years, extra precautions would have to be taken to ensure that it should last for that time? Yes.

362. *Mr. Fegan.*] What water frontage have the Government to Rozelle Bay? I could not say.

363. Could you not say approximately? No; I know there is a large frontage which they have reclaimed lately, and which they are still reclaiming.

364. And which they will continue for some time to reclaim? I think so.

365. A large frontage to Rozelle Bay will belong ultimately to the Crown? Yes.

366. By dredging Blackwattle Bay and Rozelle Bay, and erecting a strong bridge there, it will induce trade to go in that direction? I have no doubt about that.

367. The Government wharf in Blackwattle Bay has a frontage of 1,400 feet;—how many vessels will it accommodate? It will accommodate seven vessels of 200 feet each.

368. I suppose one may say that it will accommodate six or seven vessels? About six.

369. What rent do you get for berthing a ship? We charge a schedule rate. In the case of metal we charge 6d. a ton.

370. It is not according to the length of the ship or her carrying capacity? We do not charge the ship anything; we charge it on the cargo.

371. The larger the vessel is the bigger the payment is? It depends on what cargo she has.

372. Will you furnish the Committee with a copy of your scale of rates? Yes.

373. And also give the approximate frontage to Rozelle Bay belonging to the Crown? The Works Department will be able to give that information. I am not in a position to give it to the Committee; I am only in charge of completed wharfs.

374. Do you find a great inconvenience from the swing being at one end of the bridge? Very great inconvenience.

375. Did you hold your present position when the bridge was constructed with the swing at one end? No.

376. Several piers have been carried out recently? Yes.

377. Have you at any time previous to being examined by a Parliamentary Committee recommended that the swing should be placed in the centre of the bridge? Yes.

378. And your recommendations have not been given effect to? I have not made a special report on the matter, but on several occasions I have recommended that the swing should be in the centre.

379. You think that no bridge should be constructed without making provision for the swing to be in the centre? Yes.

380. And that it would be useless to have less than 60 feet, seeing that a large number of the vessels are only 50 feet wide? Yes; I am looking ahead thirty or forty years.

381. You are looking to the life of the bridge? Yes.

382. As traffic has increased, and as the size of vessels has increased within the last twenty years, you are looking forward to even greater progress being made in the next twenty years? Yes.

383. Therefore, to give facilities to shipping in the future, the swing in this bridge should not be less than 60 feet? I think that is the right size for the swing.

384. *Mr. Roberts.*] Can you state the tonnage of the vessels which passed through the opening in the bridge during 1896? No; but I could furnish a return of all the vessels which have been berthed at the Government wharf. The Auckland Timber Company berthed more vessels than were berthed at the Government wharf.

Captain  
J. Jackson.  
24 June, 1897.

385. Are you able to say whether the number of vessels passing through the bridge in Blackwattle Bay has increased or not;—has the trade there increased or not? The trade as far as the Government wharf is concerned has increased during the last two years.
386. As compared with previous years? I know that from the revenue I have received.
387. Has it increased to a marked extent? I think the revenue last year was about £200 more than it was two years previously.
388. Do you look upon that as a substantial increase? Yes.
389. Can you recollect what the annual revenue is? Two years ago it was about £450, and last year it was £612.
390. I suppose from observation you can say that there has been a substantial increase in the trade to the private wharfs? Yes; I have no doubt about that.
391. And that as the trade has increased so much you experience great inconvenience in getting so many vessels through the present opening? No. They object to go through the bridge because they sustain so much damage to themselves.
392. Notwithstanding that objection on their part the trade is going there more than ever it has done? Yes; but it is all done by small vessels. I do not believe that a vessel over 400 tons register goes up there.
393. They are principally timber vessels? Yes.
394. Have you of late examined the bridge at all;—would you like to offer any opinion on the bridge? No; because that is no part of my duty.
395. From your experience in your vocation, I should think that your opinion would be of value to the Committee? I do not know much about bridges, but I do know a little about ships.
396. *Mr. Hoskins.*] Are vessels allowed to be tied up or moored to Pymont Bridge or to Glebe Island Bridge? I do not know.
397. *Mr. Clarke.*] Is there any charge made at present for passengers or goods going over Glebe Island Bridge, or is it entirely free? I am not sure, but I think it is free to the public. I do not charge anything.
398. You do know what traffic goes over the bridge? No.
399. Are you aware whether the approaches on each side are Government property or private property? I could not say.
400. *Chairman.*] Can you tell the Committee the different kinds of private enterprise located on the foreshores of Blackwattle Bay and Rozelle Bay? I cannot.
401. And you have no record of the trade? No.
402. *Mr. Wright.*] At what height should the bridge to Glebe Island be erected? I think it should be between 20 feet and 30 feet.
403. Do you think that a height of 26 feet would give sufficient headway for ordinary purposes? I think a height of 30 feet would be better, because it would admit of the passage of lighters with a derrick without opening the swing in the bridge.
404. In the case of the bulk of the lighters, I suppose the derrick head is not more than 30 feet high? It is about that height.
405. Do you think that any large trade would spring up there if there were a better or wider opening in the bridge? I think so.
406. What class of vessels other than the present vessels are likely to go up there? Grain ships, I think.
407. Grain ships from other colonies and from America? I think so.
408. What is your reason for fancying that grain ships would go up there? I think that grain and produce would go there; I think the produce which would be consumed in four or five municipalities would be landed there, because it is the centre of five municipalities. My reason for thinking that is that cartage is a large item, and that they would pay about 3d. less for cartage from Blackwattle Bay than from Sussex-street.
409. You think that Newtown, the Glebe, and all those places would be likely to land their produce there? Forest Lodge, Leichhardt, and all those places.
410. All the suburbs lying nearer to the waters of Blackwattle Bay than to the waters of Darling Harbour? Yes.
411. Do you think that any other trade would be likely to be developed? I have no doubt the timber trade would go up there.
412. The timber trade to a large extent is there now? Yes; but it is not foreign timber; it is Colonial timber.
413. Do not the Kauri Company deal in Oregon? They do; but it is brought there by lighters from large vessels discharging at other wharfs.
414. Ships from Puget Sound go up there? They could not get up there; nor could they get through the bridge.
415. I think you said that even if the opening in the bridge were made 60 feet, no larger vessels could go up there than those which now go up there unless the bay was dredged? Exactly.
416. Do you know anything about the mud soundings in the bay? No; but it is very shallow—it is caused principally by the sewers.
417. But there is a considerable amount of mud overlying the bottom? Yes.
418. From your knowledge of the harbour, do you think that that bay could be dredged out sufficiently deep to accommodate ships drawing 24 or 25 feet of water? Yes.
419. Therefore it might become eventually a very important shipping centre? Yes.
420. Do you know what the water frontage of Glebe Island is? I do not know how much it is; but it is all deep water at the island.
421. A considerable amount of wharfage room could be provided round that island? Yes; a very large amount.

FRIDAY, 25 JUNE, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
 The Hon. JAMES HOSKINS.  
 The Hon. CHARLES JAMES ROBERTS, C.M.G.  
 The Hon. WILLIAM JOSEPH TRICKETT.  
 The Hon. DANIEL O'CONNOR.  
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
 JOHN LIONEL FEGAN, Esq.  
 THOMAS HENRY HASSALL, Esq.  
 GEORGE BLACK, Esq.  
 FRANCIS AUGUSTUS WRIGHT, Esq.  
 FRANK FARNELL, Esq.

The Committee further considered the expediency of constructing a New Bridge at Glebe Island.

Gilbert Curtis Murdoch, Mayor of Balmain, sworn, and examined:—

- G. C. 422. *Chairman.*] You are Mayor of Balmain? Yes.  
 Murdoch. 423. Have you had an opportunity to see the plan of the proposed bridge to Glebe Island? I have just  
 seen the plan.  
 25 June, 1897. 424. You have a fair idea of what it is? Yes.  
 425. *Mr. Hassall.*] Have you any statement to make with reference to the bridge? I have known the  
 bridge for thirty-one years. I have resided in Balmain for that period, and as a youth I used to go there  
 to fish sometimes. The traffic in those times was comparatively small compared to what it is now.  
 Taking the figures which were arrived at in 1889, there was a decided increase in the traffic from 1889 to  
 1894, and there has been a decided increase since that year. The reason I assign for there being so much  
 increase in the traffic lately is the establishment of new industries at Balmain. For instance, Lever Brothers  
 oil works is one of them. Phippard Bros. have been making there the whole of the iron and wood work in  
 connection with the George-street markets. Of late years a box factory has been established. A bottle  
 factory and a paint factory have also been established there. Large timber merchants, who do a lot of  
 business with the town, have established themselves there. The traffic has largely increased as far as  
 Balmain is concerned for those reasons, but the traffic has also increased largely from the western suburbs.  
 Drummoyne, for instance, has gone very much ahead of late years, and from Five Dock, Gladesville, Ryde,  
 the Field of Mars, and right on to North Sydney, the traffic has increased greatly from those districts.  
 The people go across Balmain with their fruit and produce to the markets, and that has added to the  
 traffic. It is a natural outlet by road for the whole of the western suburbs, and the traffic seems to con-  
 gester at that particular spot.  
 426. The whole of the traffic from Balmain, and of all the suburbs to the westward of it, which are  
 increasing in population, has to go across the bridge? It congests there, because that is the shortest road  
 to the city. A good many of the Leichhardt people go by that way as well.  
 427. In addition to the Balmain traffic, you have a considerable portion of the Leichhardt traffic? Yes.  
 428. And Forest Lodge? No; that goes through the other way. When the draw-bridge—which is the  
 great bone of contention—is open I have known some people, sooner than wait on the bridge—that is,  
 those who could get off—to turn round and go through Forest Lodge to do their business in town.  
 429. Has the traffic by the present bridge to and from Glebe Island Abattoirs increased very largely?  
 It has.  
 430. Has it increased almost in the same ratio as the other traffic? I think even more so. Comparing  
 the traffic in the early days to what it is now there is no comparison at all.  
 431. Do you think the bridge is suitable for present requirements? Certainly not.  
 432. What strong objections can you name against the bridge? In the first place, it is too narrow. The  
 draw-bridge is antediluvian. It is a great nuisance there, considering that in olden times perhaps only  
 two vessels would go up the harbour in a week, whereas now sometimes as many as twelve or thirteen  
 vessels a day go up there. The bridge is open sometimes twelve or thirteen times in a day. I know that  
 timber merchants—the Kauri Timber Company, on the Glebe side, and Swan Brothers, one on our side,  
 and the box factory—send some of their wares away by water. The Federal Timber Company are  
 established at the head of Rozelle Bay, and that is where we get all our blue-metal landed by our  
 contractor.  
 433. The whole of that shipping has to go through the present narrow opening in the bridge? Yes.  
 434. The opening might be placed in a more convenient position? In order to do any good it should be  
 in the centre of the bridge, I think.  
 435. What is the width of the bridge? I cannot say. The carriage-ways are divided in the middle.  
 There is barely sufficient room to allow a horse and cart to go along on each side of the bridge.  
 436. Is it not a fact that after the bridge has been opened to allow the traffic to go through, the traffic for  
 Sydney takes precedence of the traffic going the other way? I cannot say that; but I know that if ever  
 an accident happens on the bridge through a restive horse, it will be very serious with that congested  
 traffic, especially in the early hours of the morning.  
 437. Do you know of your own knowledge that considerable delays to the traffic do take place? Yes;  
 and so much so that some people have had to go, *via* Gordon-street, to Annandale, and through Forest  
 Lodge to Sydney, to get their business done.  
 438. You think it would be advisable to erect a wider and more convenient bridge, with a swing in the  
 centre, rather than at one end? Yes.  
 439. And that the bridge should be of such width that the traffic could proceed to and fro without having  
 to wait until one line of traffic had got over before the opposite stream of traffic could get started?  
 Yes; the approach on the Glebe Island side is very much too narrow. The roadway to the Abattoirs  
 ought to be widened. The bridge itself, I think, is much too low; there is not sufficient headway for the  
 punts and small steamers to go through.  
 440. The new bridge should be provided with a greater headway? Yes; there is a good deal of traffic up  
 there with timber barges.

G. C.  
Murdoch.

25 June, 1897.

441. What is the largest one that you have seen there? I have no idea of tonnage, but perhaps Mr. Alderman Chidgey, who will follow me, will be able to give you the tonnage of the vessels that go up there. The "Resolute" that brings out metal is 500 or 600 tons.
442. Do you look upon Rozelle Bay and Blackwattle Bay as pretty valuable adjuncts to the trade of that locality? There is no doubt about that.
443. Do you think it will be desirable to deepen the water in these bays in course of time, in the event of a more convenient bridge being built so as to allow larger vessels to go up? Yes.
444. You think that larger vessels would take advantage of it? Yes. A good many vessels lie below the bridge, and discharge their cargo into punts which are towed up to the bay.
445. Do you think there is any prospect of businesses similar to those you mentioned increasing in the locality? I am certain that the businesses will increase up there.
446. The population is increasing there, and as it increases you think that the business is bound to increase also? Certainly.
447. Therefore, it will be only reasonable to provide better facilities to discharge cargo in this large area of water? Yes; so as to let the vessels go up.
448. Is there any objection on the part of the Balmain people to the presence of the Abattoirs at Glebe Island? None whatever.
449. Where does the objection to their presence come from? The objection has come mainly from, not the whole, but a small section of the people at Glebe Point, and from some of the Annandale people.
450. From people on the opposite side of the water, and not from the residents of Balmain proper? Yes.
451. The residents of Balmain do not look on the Abattoirs as a nuisance? No.
452. In fact, they think it is rather advantageous to have them there than otherwise? Certainly.
453. Is there any great objection to the cattle-driving nuisance on the part of the Balmain people? That is the only objection.
454. They would like better provision to be made for conveying cattle to Glebe Island? Yes. There was an accident to a child there only two mornings ago.
455. Do you know if the Abattoirs are equal to requirements;—have you any knowledge of them at all? Yes. I have been over the Abattoirs which, I think, could be much improved, although at present there is no offensive smell from them. I have passed the Abattoirs at night when it was most likely if there were any odours at all that they would arise, but I could never smell offal, blood, decayed meat, or anything of that description. The only smell you ever got was the smell of the animals, more particularly the sheep.
456. They are not unhealthy? No.
457. The offal and everything of that kind are discharged into punts, and taken away in order that no nuisance shall be created? Yes.
458. Your idea, I presume, is that, in any scheme to improve the Abattoirs, provision should be made to convey the cattle by rail? Yes.
459. Do you know if there is a fair depth of water in Johnstone's Bay, Roselle Bay, and Blackwattle Bay? There is plenty of water round the island and near the bridge, and it is only when you get close to the foreshore of Balmain that you get natural flats.
460. Is it pretty shallow? Only in patches.
461. I suppose you have practically to represent the borough of Balmain? Yes.
462. The evidence which you give to-day will be corroborated, I presume, by every alderman in the borough? Yes.
463. And by most of the residents of Balmain? Yes.
464. Do you think that steps should be taken to erect a new bridge in place of the old structure, and thus provide better accommodation for the traffic? Certainly; I do not look at it only from a Balmain point of view; I look upon it as an adjunct to all the western suburbs.
465. In fact, the business between the city and Balmain and the western suburbs has assumed such proportions that it is absolutely necessary that better provision should be made for its transaction? Certainly.
466. *Mr. Roberts.*] Are you of opinion that the time has arrived for the existing bridge to be replaced with a new one? Certainly.
467. Is it on account of the decayed nature of the timbers in the bridge that you have formed that opinion? That is one reason why I think a new bridge should be erected. Another reason is the inconvenience of the present bridge to carry on the traffic.
468. In what way is it inconvenient? For one thing it is too narrow, and for another thing the draw-bridge is a drawback. The new bridge should be built with more headway, so as to allow small steamers and barges to pass underneath.
469. Is not the bridge sufficiently wide to allow two vehicles to pass each other? The fairway is so narrow that there is barely room for them to pass now, and the foot-passengers have a very small space at their command.
470. Do you frequently travel over the bridge? Not of late years; but in the old days I used, as a boy, to go there a good deal. I have been over the bridge a good many times, and seen the state of the traffic.
471. Your great objection appears to be that the opening of the bridge is too near the eastern shore? It is not nearly wide enough for another thing. Only very small boats can get through the opening.
472. Are there larger craft going through now than used to go through in former years? Certainly; and many more of them, too. In old times perhaps two vessels would not go up there in a week.
473. Has the trade considerably increased? Yes.
474. What is the nature of the traffic? It is mostly timber ships.
475. I understand you to say that the traffic has increased to a very large extent during the last few years? Yes; the Kauri Timber Company, Swan Brothers, the box factory, and the Federal Timber Company all require vessels to bring their timber up there; in fact, some of the larger vessels have to stop below the bridge and discharge their cargoes into punts.
476. Is the vehicular and pedestrian traffic largely inconvenienced by the opening of the bridge;—does it take a longer period than you think it might take if more modern appliances were used to open the bridge? Much longer.
477. Is there a very large vehicular traffic from Balmain to Sydney over the bridge? Most of it are the butchers' carts, but of late years the traffic has got very great from the western suburbs, from Drummoyne,

G. C.  
Murdoch.  
25 June, 1897.

Five Dock, and right out to the Field of Mars. The fruit carters and even Leichhardt people use the bridge as a short cut into the city.

478. Is any toll collected on the bridge? No; but there used to be.

479. How long has it been a free bridge? Fully ten years.

480. You think that a bridge which gave greater facilities to the traffic, and was fitted with more modern appliances in regard to an opening in the centre, would prove a very great convenience to the people of Balmain? Not only to them, but also to the people of the various adjacent suburbs. A line of 'buses runs from Sydney through Balmain up to Gladesville; they go over the bridge.

481. The road leading from the bridge past the Abattoirs towards Balmain is very steep? Yes.

482. Is that considered objectionable by the people in any way? I have never heard any complaint made that it was objectionable in any way. The only objection that I can see is that you just smell the animals, not the blood, offal, or hides, but only the natural smell of the animals, more particularly of the sheep.

483. Has any suggestion been made by your Council that a new road should be made closer to White Bay, with a view to avoid the Abattoirs? There was some talk at one time of asking the Government to cut down the island and to take the road round it so as to avoid the Abattoirs, but I have never heard it said that it was suggested through any objection to the smell of the Abattoirs. I have been over the Abattoirs at night, when you would naturally suppose that if there was anything objectionable about them it would be smelt, but I did not smell anything which was objectionable.

484. Would you get a better grade for a road to Balmain by way of White Bay? There is no doubt that you could make a winding road of it.

485. Would it be any nearer for people to travel by? No.

486. Would you, as Mayor, recommend any improvement in the approach from the Glebe Island end into Balmain? What I should recommend is, if a new bridge is to be built, that the approach on the Glebe Island side should be widened.

487. Do you suggest the altering of the grade of the road? If the bridge were built with a higher headway for the boats you would not have such objectionable grades. The grade of the road would be lessened materially.

488. You recollect the site where it was proposed to erect a new bridge some years ago? Yes; on the Rozelle side of the existing bridge.

489. Assuming that that site should be selected, do you regard it as one of the best? I do not think you could have a better site than that.

490. You strongly approve of the opening being placed in the centre of the bridge? Yes.

491. Is not the grade of the present bridge objectionable? There is a rise in the centre to admit of the passage of small ferry steamers, but even now, from what I have seen, it seems to be a bit of a squeeze sometimes for the steamers at high water.

492. *Mr. Trickett.*] When the former Mayor of Balmain was examined before a previous Committee he suggested that the road should be lowered 12 feet in front of the Abattoirs, so as to separate the traffic to the Abattoirs from the ordinary traffic to Balmain, and also to avoid that steep grade there;—do you think that would be a good thing to do? I do not think that if we were to take 12 feet off the road there it would do.

493. The evidence I refer to is as follows: "You favour the Departmental proposal to put a good bridge across there with two swings? Yes; and to ease the grade of the road. We think it might be lowered about 12 feet in front of the Abattoirs. The bridge could then be put over the roadway, giving an independent road to the Abattoirs traffic. If that were done the traffic to Balmain would not encounter that traffic at all?" I cannot see that it would be practicable, for this reason: that the cattle are driven from Mr. Swan's place, just at the foot of the hill, and driven in at the side of the Abattoirs. The cattle are never driven in by the front gate.

494. How far is that place from the bridge? It is on the western side of the island. The meat traffic is taken out through the main gate of the Abattoirs, and that is where, I take it, the ex-Mayor thought of lowering the road.

495. That, I suppose, is not objectionable at all—the meat is all taken out in covered carts? Yes.

496. You do not see anything advantageous in that proposal? I cannot see the advantage of it.

497. If you took 12 feet off the road it would not make a very great reduction in the grade? I do not think it would, but it would interfere with traffic into the Abattoirs.

498. It would necessitate a separate entrance into the Abattoirs? Yes.

499. You, as Mayor, would not advocate that that should be carried out? I cannot say that I would.

500. Would it not be a great improvement to the through traffic if the grade of the road were lowered? There is no doubt that it would.

501. But if the bridge is going to be raised, and it can be carried a little further inland, that will be a means of reducing the grade of the road? Yes.

502. I suppose this road over the bridge is the only road to your borough unless you make a very long detour? Yes; there is no other access to the borough.

503. There are no transit boats to carry vehicles to Balmain? No.

504. So that carts, carriages, and waggons that go to Balmain have to go over the bridge? Yes.

505. And that is likely to continue to be done for a very long time? Yes; I am told that the Water and Sewerage Board would not allow the heavy pipes for the low-level service—pipes weighing 6 tons each—to be taken across the bridge to Balmain, and that they insisted upon the pipes being carted all round by the Parramatta Road.

506. They were frightened of this bridge? Yes.

507. Have you thought out the question whether, in constructing the new bridge, provision should be made for carrying a tramway? I had that idea in my mind when I said that the present bridge was very much too small for the traffic; I thought that some day we might get either a cable tram or an electric tram across that road, because the present tram service goes by such a roundabout way that it takes a very long time for a person to get there.

508. How many miles is it to Balmain by tram? A tram is supposed to take forty minutes.

509. I suppose it is 6 or 7 miles? Yes.

510. If it were taken *viz* Glebe Island, the distance would be very much shorter? Yes; especially when you consider that the Government are about to construct an electric tramway to Harris-street.

511. Could that be extended to Balmain? Yes.

512.

G. C.  
Murdoch.  
25 June, 1897.

512. The shortest way would be to cross Pyrmont and Glebe Island Bridges? Exactly.
513. Of course you prefer that the bridge should have a swing in the centre, and that it should be worked by hydraulic power? Yes; it would not take up so much time then.
514. Do the ferry boats run to Balmain all night now? There is not a night service; but they run up to 12 o'clock.
515. After midnight, the only means of getting to Balmain is by a vehicle? Yes; the trams run up to 11:30 p.m., I think.
516. There was a proposal made some time ago to connect the bridge with Glebe Point;—how do you favour that idea? I do not favour it at all.
517. It would be a very roundabout means of communication with the city? Yes; it would be almost as bad as having to go along Gordon-street and up through Annandale, as some people do now. It would be very inconvenient indeed.
518. *Mr. Lee.*] In the event of the Abattoirs being removed in the future, do you think that the traffic would then be sufficiently large to justify the maintenance of a superior bridge? Independent of the Abattoirs, the traffic is very large; but you can form no estimate of it.
519. Even if the Abattoirs were removed at any time, the traffic would be very large between Balmain and Sydney, and the suburbs west of Balmain? Yes.
520. Certain industries have been established about the foreshores of Balmain, and I presume they have to make use of the railways for the distribution of their articles? Yes.
521. Is it not a fact that all goods sent to the railway by dray from Balmain have to go by the Glebe Island Bridge to get to the railway station at Darling Harbour? Yes.
522. Suppose there was no bridge to Glebe Island, how would the people in your borough, and to the westward of Balmain, be able to get their goods to and from the railway station at Darling Harbour? They would have to go along Gordon-street and up through Annandale.
523. That would be a considerable detour? Yes.
524. It would be a very serious inconvenience to the people? Yes.
525. For the purpose of commerce alone, you appear to think that it is a necessity to keep up a direct line of communication with an important suburb like Balmain? Certainly.
526. Has your experience enabled you to say whether, in any new bridge, side-paths should be provided for pedestrian traffic? Certainly. The present ones are very narrow, and when the vehicular traffic is great, any vehicle more than a butcher's cart, or a little bit wider, interferes with pedestrian traffic, because it is too close to the people.
527. There must be side-paths to keep the pedestrian traffic clear from the vehicular traffic? That is a necessity.
528. Is Glebe Island in your municipality? No.
529. Do you think there will be any strong objection on the part of your borough, and of the adjoining borough, to undertake the maintenance of the new bridge if it is built? That I cannot say. We have no power under the Municipalities Act to spend any money outside the borough, and, as Glebe Island is not within the borough, we could not legally spend a penny there as you suggest.
530. I suppose all these boroughs have power to issue licenses? Yes. They have the power to make by-laws to do so.
531. Are the carriers licensed by the suburban boroughs or the city? By the city.
532. You derive no revenue from the carriers? No.
533. And inasmuch as no tolls are collected on any bridge now, you think it would be unwise to ask the municipalities to contribute towards the maintenance of the new bridge, because they have no source from which they could derive revenue other than the ordinary rates? I do.
534. Are you of opinion that a direct and important thoroughfare of that character should be kept open and maintained by the Government in the same way as they maintain other bridges in other parts of the Colony? I certainly do.
535. And you protest against anything in the shape of a toll or direct charge for the maintenance of the bridge? Yes.
536. You say that the interests of the people, and the increasing interests of the people, demand that superior accommodation should be given? Certainly.
537. And that it should be given in the same way as the Government gives it to other places? Certainly.
538. *Mr. Farnell.*] Have you ever thought of the question whether it would be desirable to have a wooden or an iron structure? No; that is a matter I would leave entirely to the Government. I would not ask them to do either one thing or the other, so long as they gave us the accommodation we want.
539. You do not care as long as you get something to relieve what you may term the disgraceful state of affairs which exists there? No.
540. Have you ever looked to the probability of a railway being constructed to Glebe Island? Certainly.
541. If it were constructed, would the necessity to erect a bridge still exist? Yes.
542. *Chairman.*] Have you any way in which you can divide the traffic over the bridge into the ordinary road traffic, and the traffic which is dependent on the Abattoirs alone? I have no figures.
543. Can you venture an opinion in regard to the proportions? I think it is about equally proportioned as far as I can gauge it. We have to take into consideration, not only the Balmain traffic, but also the traffic from the western suburbs, and this traffic I think equals what I call the butchers' traffic. This opinion is based upon my own observation of the traffic.
544. Do you know the number of cattle, or sheep, or pigs which go to Glebe Island? No.
545. Do you know the road by which they go? Yes; most of them go down the Western Road.
546. But there are three roads? I believe the majority of them go through Five Dock, and across the Iron Cove Bridge.
547. What are the other two roads by which some of them come? Some come by the Callan Park Road, and some come by the Bullock Road, which runs through Lillyfield.
548. *Mr. Wright.*] The balance come through Leichhardt? Yes.
549. *Chairman.*] Have you any idea of the proportion which comes by the Iron Cove Bridge;—does it represent three-fourths of the traffic? I would not go quite as far as that.
550. Does it represent between a half and three-fourths? Yes.
551. Do not the pigs come by the coastal boats? Yes; they go through Pyrmont.

- G. C. Murdoch.  
25 June, 1897.
552. Then there is a fourth way by which some of the traffic goes? I was only taking the sheep and cattle.
553. Does only the pig traffic go through Pymont? Pigs and calves principally.
554. *Mr. Fegan.*] Have any representations been made to the Minister for Works or to the Railway Commissioners in reference to a shorter tram route to Balmain? Not that I am aware of.
555. So that it is first suggested to-day by Mr. Trickett's question to you? No, it has been talked about.
556. No suggestion has been made to the Government? It has been talked about.
557. It has been talked about, but no move has been made by your Council or other municipalities, and, therefore, nothing really has yet been done? No, not as far as Balmain is concerned.
558. What distance would it save? By taking the tram across the two bridges it would save 3 or 4 miles, half the distance.
559. That would be a great consideration to business people in a great centre like Balmain? Yes.
560. You have large iron-works there, and naturally you have heavy traffic, both pedestrian and vehicular? Yes.
561. Do you find on holidays any inconvenience to the traffic? I had an experience of that kind on Tuesday night. I got into a tram at Bent-street at 9.5 p.m., and I was landed at my place, which is close to the Town Hall, at 10.20 p.m., so that you can imagine what kind of delays we had in going across there. A cab, if it is taken here at Bridge-street, will land you at the Balmain Town Hall in twenty-five minutes at the outside. I have done it myself.
562. That is by the nearer route? Yes.
563. But a tram travels faster than a cab? The usual time for a tram from Bent-street to Gladstone Park is forty minutes.
564. That will really be a point for consideration in determining the width and strength of the new bridge? Yes.
565. What is the population of your borough? 30,000.
566. What was the population ten years ago? I suppose it was 23,000 or 24,000.
567. Have you had any new works put up there lately? Yes; Lever Brothers' oil works is a big industry there.
568. Which means an increase in the population as well as in the traffic? Yes. The coal-mine which is being sunk now means another increase in the traffic.
569. The opening of new works, the deepening of the frontage to the harbour, and the dredging of the harbour there, means the giving of great facilities to the people of Balmain? Certainly.
570. And you want a more permanent and a better bridge in order that greater facilities may be given to the shipping? Yes.
571. And a much nearer route to Balmain than you have? Yes.
572. Seeing that you have not such a very good tram service? Yes. Another thing is that on one grade if we have three carriages on we are almost bound to be stuck up, and have to go back.
573. What is the grade? It is the grade from Gordon-street to the Western Road. At one time I was run back to Mr. John Young's place in Annandale, where they detached one car, and took the other two up the curved grade.
574. What profession do you follow? I am a solicitor.
575. From your long residence in the borough you can speak with some confidence as to the requirements of the people of Balmain? Yes.
576. You state that the facilities which now exist are not ample enough for the convenience of the people of Balmain? I do.
577. You think that in considering the question of erecting a new bridge to Glebe Island the possibility of adopting a shorter route by tram ought to be considered? Yes.

Osborne Hickey Chidgey, Alderman of Balmain, sworn, and examined:—

- O. H. Chidgey.  
25 June, 1897.
578. *Chairman.*] You are an Alderman of the Borough of Balmain? Yes.
579. Are you engaged in business there? I carry on the business of a timber merchant alongside the Iron Cove Bridge.
580. *Mr. Roberts.*] Do you travel over the Glebe Island Bridge frequently? On almost every business day, I do.
581. Does your business take you into its vicinity frequently? The main part of our business is over the bridge—it is vehicular traffic, and therefore I can speak very feelingly of the bridge.
582. In what way are you affected as a timber merchant? Our business lies across the bridge principally—to the railway station, to the city, and to the suburbs out in this direction. Our carters and vehicles are delayed very much indeed through the insufficiency of the accommodation of the bridge, and the difficulty of the swing, and the long delay when it is opened. We have eight drays in use.
583. Where do they come from? From our business place in Balmain over the bridge, and from the various business places in the city to our business place.
584. You are put to great inconvenience through the delay in the opening of the bridge? Yes; I reckon that every dray of ours in crossing the bridge loses on an average half an hour a day.
585. How many of your drays go over the bridge on an average during the day? I should think our drays would cross there on an average eight times a day.
586. So that there is a direct loss to you of four hours a day? Yes.
587. Is that owing to the swing being of such an ancient description? Principally owing to the swing. It is only a few years since a notice was posted prohibiting any loads over 2 tons from crossing the bridge. I do not know whether the notice is withdrawn. I know that when we have a load heavier than 2 tons I instruct the carter not to cross the bridge, but to go round by the Parramatta Road.
588. What difference in time does it represent to go by that way? With a heavy vehicle it represents one hour. With a lighter vehicle it would be very much less than an hour.
589. From the nature of your business you are probably a good judge as to the state in which the timber of the bridge is;—what is your opinion of its state? I never inspected it. I simply took the word of the Department that it was unsafe a few years ago, when they posted a notice at each end that you were not to go over with a load of more than 2 tons, and that you were not to go at other than a walking pace. I take it that a bridge which was defective five years ago could not be remedied to that extent that it would be safe now it was simply patched up.

O. H.  
Chidgey.  
25 June, 1897.

590. Was it not remedied two years ago? Within the last five years it has been remedied once or twice.
591. Does it appear to you to be stronger than it was? I have only had a superficial view of the bridge. I have never been underneath it. I have never examined any of its timbers.
592. I think that when you were examined on a previous occasion you suggested that the road ought to go nearer to White Bay? Yes.
593. Do you still hold that opinion? I do, unless it would perhaps be more expedient and cheaper to widen the present roadway to almost double its present width.
594. You think the traffic is such as to necessitate the road being considerably widened? I do; and in spite of what our Mayor has said, there is an objection to the traffic passing the Abattoirs. My idea always was to get a road away from the Abattoirs.
595. Have you heard people complain bitterly of any offensive smell when passing the Abattoirs? Certainly, and I make the same complaint myself.
596. That is the reason why you suggest that a new road might be opened nearer to the shores of White Bay? Yes.
597. Would the road you suggest go through Crown lands? Yes, all the way.
598. Have you ever taken any steps, as an alderman, to have that idea carried out? Yes; a deputation from the Balmain Council, of which I was a member, waited on the Minister for Lands about three years ago.
599. Was the reply satisfactory from your point of view? The deputation wandered away from the subject. It wandered away to the question of constructing new bridges and of filling up bays, and consequently the Minister, as is usual in such cases, put it on one side. The little matter we went about was lost sight of in discussing works which would run into an expenditure of £200,000 or £300,000.
600. Have you, as an alderman, moved in the matter since that time? On every occasion I had a chance I suggested that it be done.
601. Do the majority of your fellow aldermen agree with you as to the desirability of altering the road? Either that or having the present road very much wider. I suppose the roadway is 30 feet wide at the Abattoirs, and there is no pathway; therefore, you can quite understand that the traffic is very much congested there.
602. Do you regard a footway as being absolutely necessary for the comfort and safety of pedestrians? Certainly, on the bridge.
603. Is there not any footway alongside the road leading from the bridge towards Balmain? There has been one cut out by Government day labour within the last three or four years. I should think it is about 3 feet wide.
604. In going towards Glebe Island, where is the boundary of your municipality? The "White Bay Hotel."
605. How far is it from the island? We run on to what was at one time the shores of the island. The island is not within the municipality; it is within the Balmain electorate.
606. By which way, as a rule, are the cattle which arrive by train taken to the Abattoirs? From the sale-yards at Homebush they are driven into paddocks as convenient to the Abattoirs as they can be got—at Five Dock in one case, and at Leichhardt in the other—and they are brought in the early morning through Balmain. One lot comes by what is called the Abattoir Road, and the other comes over the Iron Cove Bridge and by the Western Road, both being Government roads.
607. Is a mob of cattle ever driven during the busy portion of the day so that the safety of people travelling is in danger? It is hard to define what is the busy portion of the day. A busy time to some people would be a quiet one to others. I take it that any time in daylight is a busy time in Balmain, and the cattle are driven to the Abattoirs up to 8 a.m., which is the regulation hour.
608. Is that one of the reasons why you advocate a much wider road? The proposal for a new bridge does not affect the driving of the cattle. It will not have the slightest effect, because the cattle driving is actually done before you get near that point. The road which I reckon would come under the head of the bridge proposal is the road from the Glebe Island approach to the end of the gates, and from that to Balmain we have a very fair road.
609. Do you think that that road ought to be widened? Yes.
610. Is it as wide as George-street? There would be about 30 feet of driving room in it at the most.
611. How wide do you think it ought to be made? Sixty-six feet, at least.
612. If the proposed bridge were erected, have you any suggestions to make which would add to the comfort of vehicular or pedestrian traffic over the bridge? No; I did not study out the details of the proposal—I thought the Department would do that. It has been very often before the public in Balmain;—I suppose I have attended at least twelve public meetings, and four or five deputations on the subject. It has been before the people of Balmain for the last ten or twelve years.
613. You are prepared to leave the details of its construction to the Department? Yes.
614. You strongly favour the providing of a footpath for pedestrian traffic over the bridge, and for its continuation right up to the Abattoirs gates? Yes.
615. You think that there ought to be more head-way left for the shipping traffic to pass under the bridge? Yes; the shipping traffic has grown very materially during the last ten or twelve years.
616. Can you furnish any figures showing the increase of the shipping traffic through the bridge? No. I cannot give you the tonnage, but in round figures I may say there is a business done round Blackwattle Bay of half a million a year, and the whole of it is interested in shipping. In fact, the whole of their products must be fetched in the first instance in vessels. At present, they have to discharge their cargoes outside the bridge, and the punts are towed through to the bay.
617. Is that owing to the great delay which takes place? It is not sufficiently wide to allow the vessels to go through. There is not the depth of water for the vessels. There is a ledge of rock which bigger vessels have to cross, and captains will not take their vessels through there.
618. Do larger tonnage vessels go through now than did a few years ago? Much larger vessels have occasion to go through, but cannot. There are businesses up there which have oversea vessels fetching cargoes of 1,000 tons, and these cannot go through the openings. They have to lie in Johnstone's Bay. They lie out in the centre of the stream, and discharge their cargoes in lighters, which are then towed through the bridge.
619. Have you any figures showing the increase of trade there? No. I may mention that when the bridge was first constructed there was no bridge at Gladesville, Iron Cove, or Lane Cove, and consequently when

O. H.  
Cbidgey.  
25 June, 1897.

when those three bridges were constructed the whole of the traffic to and from those districts which used to go by the Parramatta Road was diverted through Balmain over Glebe Island Bridge to and from the city.

620. That is one of the reasons why the traffic over Glebe Island Bridge is very much larger now than it was some years ago? Yes.

621. A large number of omnibuses go over the bridge? No; only the omnibuses to Ryde. When the bridge was first constructed the population of Balmain, I should think, was about 5,000 or 6,000 whereas now it is 30,000.

622. How far back are you going? About thirty-five years.

623. Is that the population of the Municipality or of the electorate of Balmain? Of the Municipality, which is divided into two electorates, namely, Balmain North and Balmain South. I take it that there are 50,000 people who are directly interested in the vehicular traffic across the bridge, and who have hardly any other means to go by land than over the bridge to and from the city.

624. Are a large number of people obliged to drive round by the Parramatta Road owing to the delay in getting across the bridge? It is a long drive round by that road. I have driven round by the road rather than wait when a vessel has been jammed at the bridge; but I cannot say that there are a great many who do. People will rather wait twenty or thirty minutes than drive round.

625. Are they called upon to wait that time frequently? Frequently.

626. You are perfectly clear that the time has arrived when a more modern and suitable bridge should be erected there? I am; and it is a wonder to me that the Government has let the present bridge remain there so long.

627. You think that the increased traffic undoubtedly warrants the erection of a new bridge? Yes.

628. And the convenience of 30,000 people, a large number of whom are constantly going to the metropolis? That is only taking Balmain; but you must also consider that the people of Ryde, Hunter's Hill, Gladesville, and all the other suburbs must go by that way.

629. Is there a very large traffic from Ryde and Gladesville through Balmain? Very large indeed. It all comes through Balmain. All the fruit-growers must use that direct road to the markets.

630. Do nearly all the fruit-growers come by that way? Yes.

631. There is a large buggy traffic, I suppose, from Ryde and Gladesville? It is the only way they can come, unless they go round by the Parramatta Road. It is now recognised to be the route.

632. Do you think that the traffic is of such a nature that the residents would be likely to ask for the erection of an electric tram to connect them more directly with the metropolis? That was talked of years ago in Balmain. At the time the present tram was constructed, our Members wanted a more direct route, which they reckoned would go across the bridge.

633. Do you think that, in the public interest, this Committee ought to consider the question that if a bridge should be constructed it should be built of such a size and such a strength as to carry an electric tram if it should be thought necessary in the future to construct one to Balmain? I do certainly. It has been agitated for for a long time, and as we have waited for so long a time, I think we might wait a little longer to have it constructed by that way.

634. Has the question been before your Council? On several occasions.

635. Has your Council ever approached the Government with a view to get it to connect Balmain with Sydney by a tramway over this bridge? Not since I have been in the Council.

636. Is it a question which is likely to come up for discussion in your Council;—have you heard it seriously talked of there? Our Council is in this position as representing Balmain and the views of Balmain: we want a bridge badly. The main thing with us is a bridge. We want increased accommodation. We reckon that Balmain is kept back through the present bridge.

637. Do you look upon the tram question as being somewhat out of your consideration? Yes; I would leave the tram question out of it. What we have asked for is increased accommodation in the bridge. We reckon that the present bridge is obsolete, and that it is time it was done away with.

638. Do you think if an electric tram were taken over the new bridge the traffic would be sufficiently great to cause the work to be remunerative to the Government? I do not, unless it did away with the other line. It is quite impossible for two trams to pay running to Balmain.

639. *Mr. Black.*] I understand you to say that the population of Balmain has grown from 5,000 to about 30,000 in the last thirty years—that is, at the rate of 1,000 people a year? Yes.

640. Then you said that Balmain has been kept back from the want of a bridge;—I presume you mean a proper bridge? I mean through this bridge, which I reckon is a great obstruction to the advancement of Balmain in a lot of ways.

641. In what way has it been kept back when it has grown so tremendously? In the way of factories. Now, if Mort's Dock have a casting or other piece of work which is over 2 tons weight they have to take it round 3 or 4 miles further than they could go by a direct route in consequence of this bridge.

642. I understand that it has not interfered with the growth of population so much as with the spread of industry? You can take it that way.

643. You do not know what the tram to Balmain cost? No.

644. I presume that if a more direct route were made the existing tram would be a loss to the Government? It is not possible to keep two tramways.

645. The present tram would have to be abandoned? That is my idea.

646. There would be no means of utilising it? I do not think so.

647. *Mr. Clarke.*] Do you think that if a better structure were erected than the present bridge it would be the means of increasing the trade and business in Rozelle Bay and Blackwattle Bay? I certainly do.

648. I suppose the present bridge is utterly unfit for the traffic? It is quite unfit. Everyone who uses the bridge or goes over in vehicles, particularly in my trade, is always grumbling about the state of it.

649. Would it be advantageous in the new bridge to have a wider opening for the passage of vessels? Certainly; that is one of the main points for which the new bridge is wanted.

650. And a much wider bridge? Yes.

651. Is it advisable if possible that the bridge should be higher than the present one, to permit of the passage of small vessels and punts without necessitating the opening of the swing in the centre? It would be very much better if it could be built sufficiently high to allow ordinary coasting vessels to pass underneath. It would save a lot to the Department, and it would be a great convenience.

652. The live stock go chiefly from Homebush to the Abattoirs? Yes; it is only the pigs which go through Pyrmont. You should have some other way of fetching the pigs to the Abattoirs. 653.

O. H.  
Chidgley.  
25 June, 1897

653. I notice from the reports in the Press that there is an agitation to have a railway from Homebush to Glebe Island? There is, and has been for some time past.

654. Will that be a benefit to the public? It will be a vast benefit, as far as the cattle-driving nuisance is concerned.

655. I suppose it would also prevent accidents happening from the driving of cattle through the streets? Yes. Only yesterday morning an accident was caused by the cattle rushing a child.

656. You have been asked whether you think it advisable that the new bridge should be made strong enough to carry a railway or a tramway? Perhaps it would be advisable; but I did not go into that aspect of the question. What Balmain is asking for is increased accommodation at the bridge.

657. You have very fair accommodation now to various parts of Balmain by tram and steamer? We have very fair accommodation. We do not grumble, only we would like a more direct route. As a business man, I would not say that the Government should put down two lines of tram to Balmain.

658. *Mr. Humphery.*] Are you aware that the width of the present bridge, exclusive of the footway, is 19 feet, and, I think, 14 feet on the swing, and that the proposal before the Committee is to have a roadway 40 feet wide with footways 5 feet wide;—in your opinion, would that provide for all ordinary traffic? I think it would.

659. The original proposal was to increase the height of the headway under the bridge from 12 feet to 15½ feet, and the recommendation by a former Committee was that it should be increased to 20 feet;—do you think that a clear headway of 20 feet under a fixed span would be sufficient for small crafts? No; it would make it much more convenient if it were possible to arrange it so that a small coaster could go underneath by lowering her topmast. It would be very much more convenient if it was possible to get sufficient elevation by keeping the approaches up a bit.

660. Can you say at the present moment what headway would be sufficient? Not off-hand. It would have to be much higher than that.

661. How many times daily is the present draw-bridge used? I cannot say; but, unfortunately, every time I want to go across it is open.

662. Do you think that with a clear headway of 20 feet it will considerably reduce the number of openings? It would reduce them, but not very considerably.

663. Do you think the majority of vessels require more headway? Yes. It would be very small craft that would go under a bridge 20 feet high.

664. You are not prepared to make any suggestion as to the necessary height to be adopted? No. I know that it should be considerably more than 20 feet.

665. You think the interests you represent will be fairly met by the construction of a bridge, as proposed by the Department now? Certainly.

666. You are familiar with the details? Not with the details. I have just looked at the rough sketch on the case.

667. With regard to the deviation of road you proposed by way of White Bay, are you prepared to make any suggestion by means of which that road, without increasing its length, could be substituted for the present road? It would not be substituted for it. We should take it that even that road would be outside this bridge proposal altogether. I would not think that the two proposals would meet, because that is a little departmental matter which might be carried out at a small cost to the Minister without touching this bridge proposal.

668. In connection with the bridge, you do not suggest it as practicable? No. I would have the existing road very much wider than it is; it is not half wide enough for the traffic. The whole of the traffic is congested in an ugly little turning there.

669. A sufficient widening of the road in your opinion would meet all requirements? Yes.

370. *Mr. Lassall.*] You stated that you have been in communication with the Minister in reference to getting a road nearer to White Bay? We wished him to cut down a portion of Glebe Island and round the shores of White Bay to give us another road, so that we should not have all the traffic congested on the Glebe Island Road.

671. Would the construction of that road necessitate the erection of another bridge over Johnstone's Bay? No; it is simply a detour, an alternative road, which we could use if we did not like to pass the Abattoirs.

672. It would bring the whole of the traffic on to the bridge? Yes.

673. Necessitating a much better bridge than you have, and giving increased facilities for the traffic? The present bridge is obsolete.

674. Do you corroborate what the Mayor said as to the urgent necessity for making better provision for the traffic across the bridge? I have said so for ten years.

675. You find that it is very inconvenient, and that the inconvenience is increasing year by year? Day by day.

676. *Mr. O'Connor.*] Has not the bridge been altogether inadequate for twenty years? I would not go back so far; but I know that it has been for the last ten years, and within the last five years the Department evidently thought it was inadequate when it posted the notices I mentioned.

677. Apart from its strength, the width of the bridge has been altogether inadequate for many years? Independent of the Abattoirs traffic, which never ought to enter into the consideration of the matter at all, there are such a lot of other places depending on this bridge, that if the Abattoirs were removed from the island to-morrow, it would not have the slightest effect upon the traffic.

678. *Chairman.*] You heard the estimate given by the Mayor of the amount of traffic which goes to the Abattoirs, and the amount of the ordinary road traffic;—do you agree with that estimate? No; I think that only one-fifth of the traffic at present goes to the Abattoirs. I think he said that one-half of it goes there, but I am in a much better position to judge than he is. I am on the bridge almost every day, and our traffic is all over the bridge.

679. Did you hear the proportion he gave with reference to the various classes of stock which reached Glebe Island? Yes.

680. Do you agree with his estimate? I should think that about half comes along the Abattoir Road, and half along the Western Road, both being Government roads through Balmain. I think the pigs should be taken in a punt to the Abattoirs.

681. You think there should be another way of taking the pigs to the Abattoirs? I do; I think the pigs are driven to the Abattoirs two or three days a week.

682. Do you think it is practicable to take them by water? I do; and I think if the traffic gets thicker on the road that will have to be done. The pig and calf traffic goes through the heart of the city, and on the Pymont Bridge it is an awful nuisance.

O. H.  
Chidgey.  
27 June, 1897.

683. *Mr. O'Connor.*] The pigs were punted to the island thirty years ago? —  
 684. *Chairman.*] Do you know the number of stock which go over the bridge to the Abattoirs? No.  
 685. Is there any other point on which you desire to inform the Committee? No. I think it must be quite apparent to anyone that a bridge which was constructed thirty-five years ago is not suitable for the requirements of the present day.  
 686. *Mr. O'Connor.*] You differ somewhat from the Mayor in your estimates;—do you think that your information is any better than his? I make my estimate from personal observation, for I am on the road almost every day.  
 687. How long have you been driving over the bridge? Twenty years.  
 688. Has it not struck you that the bridge was inadequate even at that time? I cannot say that I took much notice of it then. There used to be a toll on the bridge then, and that used to strike me as an obstruction.  
 689. The bridge is rendered inadequate for the purpose for which it was intended principally by the fact that your great hamlet has grown into such large proportions? I would not take it from the local point of view. The construction of the Gladesville, Iron Cove, and Lane Cove Bridges has made that the direct route to all the western suburbs.  
 690. Suppose that to-morrow the Abattoirs were abolished, do you not think that the communication between Balmain and all the surrounding suburbs would be entitled to have a better bridge? Yes; I do not think that the Abattoirs question should be considered at all.  
 691. If the Government was to receive revenue from the Abattoirs elsewhere the large population of Balmain and surrounding districts is entitled to a better mode of communication with the metropolis? Certainly; if the old bridge is left there much longer it will fall down.

TUESDAY, 29 JUNE, 1897.

Present:—

THOMAS THOMSON EWING, ESQ. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES MOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the expediency of constructing a New Bridge at Glebe Island.

Henry Brisbane Swan, Alderman of Balmain, sworn, and examined:—

- H. B. Swan  
29 June, 1897
692. *Chairman.*] You are an Alderman of Balmain? Yes.  
 693. *Mr. Farnell.*] How long have you been a member of the council? Nine years.  
 694. But you have been a resident of the borough for a long period? All my life.  
 695. You have had an opportunity to notice the increase of population in Balmain and surrounding districts? Yes.  
 696. Were you a resident of Balmain prior to the erection of the Iron Cove and Parramatta River bridges? Yes.  
 697. Do you remember which way the traffic, which naturally found its way to Sydney, went before those bridges were erected? From Ryde and Drummoyne districts it went by the Parramatta-road.  
 698. Very little of it went over the Glebe Island Bridge? Yes. It did not go that way at all.  
 699. We may conclude that the Glebe Island Bridge was built to meet the requirements of the people of Balmain? It was originally built for the accommodation of the Abattoirs. There was not much population in Balmain when it was built. Where I resided there was only three houses round the whole place.  
 700. Since that time the people of Balmain have availed themselves very largely of the convenience of the bridge? Certainly.  
 701. Added to that, since the bridges have been erected over Iron Cove and Parramatta River there has been an increased traffic from the districts lying to the north and north-east of the river? Undoubtedly.  
 702. You have had an opportunity to compare the traffic at the time I first mentioned with the traffic of the present time, and to notice the great increase which has taken place? No traffic can go to Sydney or come from Sydney without passing my door.  
 703. Have you noticed at any time the condition of Glebe Island bridge? I know that it is very inconvenient for the travelling public.  
 704. Have you noticed that it does not meet the demands of the people? Nothing like their demands.  
 705. Have you had an opportunity to examine the structure itself? Some few years ago when it wanted sheathing I put in a tender for re-decking it. It was in a bad condition at that time, which, I suppose, was 10 or 12 years ago.  
 706. Will you be good enough to describe its condition at that time? The girders were becoming decayed. They have been renewed since that time; they have put girders alongside many of them. The white ants are into it at the present moment. If the white ants extend from the crown of the bridge to the Glebe Island shore I think it is pretty seriously riddled.  
 707. Did you, twelve years ago, consider the bridge to be in an unsafe condition for the travelling public? It was unsafe then. They spent a good few hundred pounds on it then.  
 708. Do you consider that the patching up has sufficiently strengthened the bridge to make it trafficable and safe for the travelling public? On top of that sum they have spent £3,000 or £4,000 in taking out some of the timber which they renewed then. The bridge is not fit for the present traffic. There are only something like five piles in each bay—and these are 30 or 35 feet apart from one another—and only four 12 x 12 girders running from pile to pile with tie-rods, and the bolts of the tie-rods are through the girders. There are not even head-stocks running as there should be, 10 or 12 feet long. I understand that the bridge was only constructed to carry the traffic to Glebe Island. It was not constructed for the traffic which goes over it now.

709. If the girders became rotten, these tie-rods would be dependent on them and would be useless? Yes.
710. Do you consider that the bridge is really unsafe and does not meet the requirements of the public? Certainly, it is quite unsafe. The Government themselves realise that it is unsafe, because they will only allow you to go over in single file; they will not allow double traffic to go across the bridge at the same time.
711. Do you remember a notice being issued some time ago, allowing only loads of less than 2 tons weight to go over the bridge? Yes; we have had to go round by the road.
712. That notice was issued because the bridge was considered by the Department to be unsafe? Yes.
713. Is there much inconvenience experienced by people travelling to and fro with carts and horses, from the fact of their not being able to pass one another on the bridge? As business people we can speak very strongly on that point. We have to send a good deal of material by rail, and very often we get disappointed from the blocking of the bridge and do not get the number of loads to the railway that we should. Very often, right through the day, two hours are lost through the opening and shutting of the swing. It is not a proper swing—it is opened and closed very slowly, and if a southerly wind is blowing it must be on an average from two hours to two and a quarter hours through the year that that is blocked daily to the public. Furthermore, on the Balmain side the Government prohibit any vehicle from coming on to the bridge until it has been lightened of the traffic which is then on it, so that that causes further delay to people on the Sydney side. On the average you may say that it runs into three hours, which means a serious loss to us. It means that we have to pay a man for a whole day—for nine hours are lost in connection with the four or five drays we send to Sydney.
714. The bridge has to be cleared of traffic going towards Sydney before any vehicles will be allowed to cross from the opposite direction? Our men told us that when they were going to the railway yesterday the bridge was opened ten times during the time they were passing too and fro.
715. Is the approach to the bridge from Glebe Island a safe one? It is not a safe approach. It is very unsafe when the carts are racing, and they are pretty congested there on a busy day like Friday. It is not a straight run on to the bridge; there is a bend as you approach the bridge.
716. Would you suggest that a more direct approach should be made to any new bridge? Certainly; and of course a wider one.
717. How wide do you think it should be? It would have to be double the present width—treble if possible. The roadway should not be less than 60 ft.
718. And the footways? You should not have less than 10 ft., because there is a lot of foot-passengers now.
719. Do you think it desirable to have a footway on the bridge for the convenience of the passenger traffic like there is on the Iron Cove Bridge? No; but it would be all the better if they continued to drive small stock across the bridge.
720. You do not think there would be much danger to the public if the bridge were an open place? There is not much danger to the public. I have not heard of any serious accident taking place.
721. Where do you propose that the swing should be placed in the new bridge? In the centre of it.
722. At what height should the bridge be erected so as not to interfere with shipping going into Rozelle Bay or Blackwattle Bay? To save the swing from being opened too often I should say that the bridge should have a clear headway of 20 ft.
723. Do you think there is a possibility, if such provision is made, of Rozelle Bay and Blackwattle Bay being used for commercial purposes? Yes, very extensively. During the past two years Langdon and Hopkins have had 12,000,000 or 13,000,000 ft. of timber taken through that bridge. I think we have had about 7,000,000 ft. of timber taken through the bridge during that time, and during the past week we have had 200,000 ft. of timber delivered on to our wharf. The Kauri Company, I suppose, have had from 25,000,000 to 35,000,000 ft. of timber taken through the bridge during the last two years.
724. You think it would be a mistake to construct the bridge without giving due consideration to the future use of these two bays? Yes. The Government wharf at the head of Blackwattle Bay cannot be used. It would be used by several steam-boat proprietors now if they could get their boats through the bridge without carrying away the propellers.
725. Have you considered the question whether the bridge should be made of iron or timber? The question was raised in the Balmain Council at one time, and it was said that the bridge would cost over £100,000, which I thought was rather excessive. I suggested that two-thirds of the distance should be filled in from Glebe Island to the Pyrmont side, that we should quarry the rock from Glebe Island, and with it run out a causeway from each side.
726. Would that be less expensive than to construct a timber bridge right across from side to side? I should think so. You would make use of the island. The timber bond will be done away with at Pyrmont, and they will want a timber bond somewhere else. There is some talk about asking the Government to allow White Bay to be made a timber bond, but that would not be nearly large enough. You could raise the centre of the bridge and make an incline up to the centre. It would give you a good headway. It is better for a horse to travel on a macadamised road than on a bridge.
727. As regards the present bridge you have had some personal experience of being kept waiting while the swing was open? Yes.
728. How long have you been kept waiting on any occasion? On the average it is from thirteen to fourteen minutes, but I have had to wait there for half-an-hour, and I have seen the bridge blocked for three or four hours, sometimes half a day, when vessels have got stuck there.
729. Have you any idea of the number of vehicles which passes over the bridge each day? I know the number of vehicles which passed my business place on a day about two and a half years ago. When we were going to have a deputation to the Government, I put on a man to tally the vehicles for a day, and I think it was 1,900 vehicles which went to and fro on that day.
730. The traffic has considerably increased since that time? I should think it had.
731. You would not see all the traffic going over the bridge, because Glebe Island would take a good deal of it? I could not say whether all these vehicles went to the Abattoirs or direct into Sydney, but I know that they passed the place.
732. Still a good deal of traffic would go to the Abattoirs, which you would not see at all, because it would not go past your place? Yes.
733. *Mr. Clarke.* Are there many places of business in the neighbourhood of Rozelle Bay and Blackwattle Bay? Yes.

H. B. Swan.  
29 June, 1897.

- H. B. Swan.** 734. What particular trades are carried on there? Timber businesses principally, meat-works, glass-works, and iron foundries.
- 29 June, 1897. 735. Do you think that if the present bridge were replaced with a more suitable bridge, both in width and strength, it would be a convenience to those who trade in that locality? It would send more business there, and the population would increase. All the vacant places would be taken up, in fact, there are two sites there which would be let now only for the inconvenience of getting through the bridge.
736. Are you aware that the state of the present bridge, after being in use so many years, is positively dangerous to the traffic? Yes, it is for anything but light loads. About two months ago I happened to be under the bridge in my boat, and I noticed two trolley-loads of ironwork going from Phippard Brothers' place round to the new markets. They were bending the bridge, I daresay, to the extent of 2 inches, for the tie-rods seemed to sag down about 2 inches in the middle. It is quite dangerous for any heavy traffic. We have a new industry over there, and instead of loading in Sydney tallow, hides, and wool they go round with it to Balmain and load it there.
737. Does not a portion of the trade go across in punts? We have to use punts now.
738. If a suitable bridge were erected, you think that a greater portion of the traffic would go over the new bridge? Yes, it would be nearer to the city in every way.
739. Still a good deal of traffic will be carried on in punts and small vessels? Large vessels which cannot get through the opening have to lie outside. At this moment we have to lighten three large vessels which could not get through the swing. We have to lighten a vessel over 200 tons, before she can get through the bridge.
740. Would it not be a considerable advantage to the public if a larger swing were provided in the new bridge so as to enable larger vessels to get through to the bay? Undoubtedly. You want an opening of not less than 60 feet. When we have to punt we cannot put any long timber on the punts—some of the spars are 60 and 70 feet long—because the spans of the bridge are only 30 or 32 feet.
741. There is a considerable depth of water in the two bays? There used to be, but it has silted up.
742. Do you know what depth of water vessels draw which go through? Vessels drawing 14 or 15 feet cannot get through the opening. A vessel is not allowed to go through the opening which is drawing more than 12 feet 6 inches.
743. The water in both bays could be deepened by dredging? No; there is rock at the present site of the swing.
744. But that could be removed by blasting? Yes; but that would not remove the inconvenience to the travelling public. You can only go in single file over the swing at all times.
745. It is in the wrong place? Yes; it should be in the centre.
746. On the whole, you think that for the safety and convenience of the public, and the encouragement of trade in Rozelle Bay and Blackwattle Bay, a new bridge should be erected as soon as possible? Yes, and it should be constructed strong enough to carry a tramway.
747. *Mr. Hassall.*] You think it is absolutely necessary that better provision should be made for the present traffic and the large increase in traffic which must take place between Sydney, Balmain, and the western suburbs? Yes; and if you constructed the bridge strong enough for a tramway it would give a handsome return.
748. You think it is advisable to construct a bridge to carry a tramway, in addition to the road traffic? Yes; the population of Balmain has increased very much lately.
749. *Mr. O'Connor.*] How long have you lived in Balmain? Over thirty years.
750. Do you recollect when the present bridge was constructed? I do not recollect the bridge being built, but I remember that as a child I used to travel in the punts backwards and forwards.
751. I suppose there are very few men who know better than you do the great traffic there is from Balmain and outlying districts and Glebe Island into Sydney? Yes.
752. Do you not think that many years ago the traffic had increased so much that a new bridge was requisite there? Twelve or fifteen years ago it was requisite to have a new bridge there.
753. Do you know that with the enormous business which is done on Glebe Island, which is continually coming into Sydney, and with carts going back to the outlying districts—apart altogether from all Balmain—the traffic there is very great? Yes. What is lost sight of is the existence of Mort's Dock and several large industries in Balmain. The loads from these places are drawn on heavy trolleys, with six or eight horses, and after they get on the bridge it is almost impossible for one to get along. The trolleys are so wide that they take up the room on the bridge, and they go along so slowly that it is impossible for one to get along fast.
754. They take up nearly the whole of the bridge? Yes; I have had to follow at a slow place after a four-horse trolley for the whole length of the bridge.
755. When the bridge was built it was ample for all that was requisite at that time? Only for Glebe Island; Balmain was never considered when it was built. It was simply built for the Abattoirs, because the incline to the Abattoirs was very steep then. They improved the approaches to the bridge in years gone by. They cut all the hills down and made easy grades for heavy vehicular traffic to approach the bridge, but they never made the bridge itself any stronger.
756. The bridge was originally intended for Glebe Island only? Yes.
757. It was never contemplated to be of use to any other place? No.
758. Do you remember that about twenty-two years ago the site of what is now called West Balmain was absolutely uninhabited? It was bush.
759. The population of Balmain was located down towards Darling-street? Yes.
760. And their only mode of communication with Sydney was by steamer? Yes.
761. It was never intended that the bridge should carry the great traffic, which is every day increasing, from that most populous district, besides outlying places, independently of Glebe Island? The first steamer which ran to Bald Rock averaged twelve passengers a day—that is twenty years ago—whereas now a steamer can take 6,000 over. At that time the fare was 3d., but it is now reduced to 1d. We were told that it would not pay at 1d., but we are paying 10 per cent. on these steamers.
762. From the White Bay Hotel, for a distance of about a mile, there was not a single house all round that district when the bridge was built? There were only our house, Mr. Steele's, Mrs. Moore's and Mr. Roderick's in Balmain West at that time. Ours was the first house west of Glebe Island. There was only a little track for the cattle to get to the island. The water originally went round the Island. At the bottom of our land they made it high water. They built up the roadway, which has made the approach

approach better for the travelling public. Originally it was only meant for the cattle to go on to the island. They fetched no meat into Balmain in those days. There was little or no population to serve there with meat; it was all in the city. H. B. Swan.  
29 June, 1897.

763. Were you an officer at Glebe Island Abattoirs? Yes.

764. That bridge was intended wholly and solely for Glebe Island? Yes.

765. The traffic has been so increased by the surrounding populous districts that it must be altogether inadequate to meet the great wants of the present day? Yes. When they were taking night-soil from the surrounding boroughs it was pointed out that the bridge was originally built for the Abattoirs alone, not for the use of the municipalities, and we had to stop using the bridge for that purpose.

766. When the first public school was built in West Balmain it was thought that it would be useless, because it was so far away from Sydney? Some persons urged that the building of a bridge from Pyrmont to Glebe Island would increase traffic and encourage settlement, but it was considered even at that time that the bridge was only intended to carry the traffic to Glebe Island. I recollect that the Public School at West Balmain was considered by some a white elephant in those days, because there was no population, but now it is the largest school in the Colony.

767. That very portion of Balmain is now an electorate? Yes; it is South Balmain.

768. Have you considered the question whether the piles in the present bridge are safe? I suppose the piles, as far as they are in the mud, are perfectly safe. I daresay that if you pulled up the piles they would be found to be quite green where they were in the mud, but I should think that the upper portion is decayed. I noticed one or two of them were gone in the sap two or three years ago.

769. Do you imply that there is some element in the mud which would preserve the piles? There is something in the mud which preserves them.

770. Have they got a pretty solid foundation? I could not say. After you take off 8 ft. or 10 ft. of silt in the bay you get clay, so that the piles must have a good foundation. If any engineer or officer of the Government were going to construct a bridge at this moment, he would never hesitate for one moment to put down such a structure for the traffic.

771. Twenty years ago it was a common thing for men to fish along there, particularly on Sunday? Yes.

772. Have you noticed how the piles are holding up the bridge? About two years ago I did. They have put alongside the present girders another girder 12 in. x 12 in. There are only four 12 in. x 12 in. girders running longitudinally with the bridge. It is a very cheap temporary structure, which depends upon the iron tie-rods.

773. You have come to the conclusion that a new bridge is absolutely necessary? Yes. There will be a serious accident some day if the Government do not do something with the bridge. The Department is always painting up the bridge and making it look nice. I remarked to them one day: "Why don't you save the money and put it into a new bridge?" and they said, "We must make the bridge look nice, to keep the public from singing out."

774. *Mr. Wright.*] In the event of a new bridge being built, do you think that the grades to the island could be reduced? Yes.

775. The approach on the eastern side of the island is very narrow and very steep? Yes.

776. You think that either the approach should be raised, or that the island should be cut down so as to lessen the grade? When I was mayor of Balmain I suggested that a roadway should be cut half the width right from the bridge, past the Abattoirs, so that the public would not see the killing going on. It would be a roadway for the public.

777. Do you think that to make the traffic easy it is very necessary that the island should be cut down? Yes; and if you cut down the road you could use the material to make a causeway out towards the centre.

778. *Chairman.*] Do you think that the Abattoirs should be permanently located on Glebe Island? Yes; I believe that it is the best site in the world for abattoirs.

779. What area of vacant land is there on the island? I do not know.

780. The Abattoirs take up a very small portion of Glebe Island to the north of the road? Yes.

781. There are about 52 acres in Glebe Island. Are the desiccating works used now? No; the stuff is towed out to sea.

782. There is an ample area for wharfage round Glebe Island, provided that it did not interfere with the Abattoirs? There is plenty of room for wharfage. White Bay has been filled up, and there will be abundance of land reclaimed right round the island.

783. It will be a very large valuable water frontage? Yes.

784. If the island can be approached, there is room for wharfage, if abundant provision be made for the Abattoirs? Yes.

785. Is there anything else you desire to say? I was on the deputation which waited on the Minister recently in regard to constructing a railway to Glebe Island. I think the Abattoirs should be done away with if the Government cannot remedy the cattle nuisance.

786. *Mr. Wright.*] The cattle have to be driven through a populous district? That is the trouble.

787. It is a constant source of danger to the public? Yes; but the Abattoirs themselves are no nuisance to anybody.

788. *Chairman.*] Have you formed an opinion in regard to the best route to take for a railway to Glebe Island? Down White's Creek, they reckon, is the cheapest route to fetch it from Summer Hill. I had an idea that the railway ought to come from Darling Harbour on to Glebe Island by a tunnel through Pyrmont.

789. There is no third route which you could suggest? It must come either from Darling Harbour or from Summer Hill? From Petersham is, I think, the most expensive route. Another route I would suggest is down the canal in Iron Cove Bay, and through Callan Park which is Government land, and as far as the Iron Cove Bridge, and then tunnel from that bridge right on to Glebe Island. They would not need to resume any land in Balmain if they adopted that route.

790. Where would you leave the main line? You could leave the main line at Summer Hill, come down *via* Iron Cove Bridge, pass round the bottom of Callan Park, and tunnel through to the island.

791. You believe that these are the only three routes which are worth considering? That is a good route which is worth considering. You want to extend the electric tram across the two bridges, and it is a tram which would pay well too.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works,  
sworn, and examined:—

- H. Deane. 792. *Chairman.*] You are Engineer in-Chief in the Railway Construction Branch of the Department of Public Works? Yes.
- 9 June, 1897. 793. You have been asked to consider certain questions bearing on the construction of a bridge to Glebe Island? I have.
794. Have you prepared any statement for the Committee? No; I have brought a map of Sydney, drawn on an 8-chain scale, to show what connections could be made with Glebe Island. We have surveys and explorations on the western side for connecting with the railway, but nothing has been done on the eastern side, that is to connect it with Darling Harbour. It would be a very simple matter to make such a connection, for there are no engineering difficulties to encounter. A connection could be made with the Darling Harbour line, near the head of Darling Harbour, by tunnelling through the hill under Harris-street and coming out on the lower ground on the Blackwattle Cove side, or a connection could be made by tunnelling from Darling Island, or from the lines which will be constructed over the newly resumed area in Pyrmont Bay. There are no sections taken to test the practicability of it; they are not necessary, but a section would be required if an estimate were wanted. Before an estimate could be made, it would be necessary to decide how the connection should be made, because the cost of connection between the lines on Darling Island and Glebe Island, would be very different from that of the connection from the Darling Harbour line at the head of Darling Harbour. The distance in the latter case would be so very much greater, and that of course would affect the cost.
795. How many lines of railway is it proposed to extend over the resumed land in Pyrmont Bay and towards Darling Island? There will be two main lines of rail and there will be sidings in addition.
796. Supposing that the two lines were extended to Glebe Island;—by taking that basis you can tell us approximately what the tunnelling for the two lines would cost? I do not think I could tell you the limits of the tunnel with any attempt at accuracy.
797. How far is it? Making a connection with the line at the head of Pyrmont Bay across to Johnstone's Bay, there would be, speaking approximately, about 30 chains of tunnel.
798. In all probability it would be an easily-constructed tunnel? Yes, it is all sandstone.
799. Roughly speaking, what would two lines of railway in tunnel cost approximately? The cost of the tunnel—30 chains—would be about £50,000 approximately. That would bring you to the water. The bridge ought to be a separate structure from the road-bridge.
800. You have no doubt on that point? I think there is no doubt whatever about that. You could not make the two hang together. It would be a very awkward bridge if you made it wide enough for both. The approaches would be very awkward if you made it a double tier bridge with one on top of the other. I doubt very much whether any saving would be effected.
801. And it would be unsuitable for traffic purposes? Yes. I think that a separate bridge a little to the north of where it is proposed to put the road bridge should be built.
802. Have you any idea of the cost of carrying, say, two lines of rails? I can give you only a very rough idea of the cost.
803. We do not regard it as anything else? I think a bridge to carry a railway would cost about £130,000, with an opening in the centre. I should propose to adopt the bascule style, and have a suitable opening in the centre to allow vessels to pass through the bridge.
804. How long is the bridge? About 924 ft.
805. You have estimated roughly that the railway bridge would cost about £130,000? A little more than £130,000.
806. An expenditure of about £200,000, allowing £20,000 as a margin, would bring you pretty well across to the island? That would do.
807. In your opinion, would a railway bridge immediately north of the traffic bridge seriously impair the approach to Blackwattle Bay and Rozelle Bay? I do not think it would seriously impair the approach to the bays, but the two swings should be open at the same time.
808. We have now dealt with the salient points in a connection from the east to Glebe Island? Yes.
809. Will you now describe the route which goes pretty well due west from Glebe Island? Surveys have been made to connect with the main southern line at Stanmore and Petersham, and an examination of the country and a compiled section have been made of a line joining the main line at Summer Hill.
810. Any other? No, that is all.
811. Will you explain the Petersham connection first? The construction would be of a somewhat difficult character, as so many roads have to be dealt with; otherwise, there is no difficulty in it. That remark applies to both. It would mean, unless you went to considerably more expense, the adoption of stiffer grades than there are on the main line.
812. Would there be heavy land resumptions on the connection from Petersham? Yes.
813. Have you any idea of the cost of them? No.
814. Will you state the cost of construction? The cost of constructing the Stanmore-Petersham connection would be between £60,000 and £70,000. The cost of constructing the Summer Hill connection, which is longer than the other, would be about £130,000.
815. That does not include the cost of land resumptions? No; in neither case. Those surveys have been connected with the two fast lines. The matter has not been very much discussed—scarcely discussed at all—with the Railway Commissioners, because neither of these projects has arrived at a sufficiently forward stage. But I think it would be found necessary if a connection were made to pass under or over the fast line so as to join on to the other side. That would mean a little extra cost, perhaps another £10,000,\* which I would like to add to my estimate, making it in the one case from £70,000 to £80,000, and in the other £140,000.
816. But you can give us no idea of the cost of the land resumptions? No; I have not any idea of their cost.
817. You think it will be a heavy item? Yes.
818. What will be the grade on either of these lines? It would be about 1 in 60.
819. With a fall, of course, towards the water? In either direction, I think you may say.
820. What height is Petersham above Glebe Island? The rails at Petersham are about 100 feet above high water.

821.

\* NOTE (on revision): I find on going into the matter that the sum would not be sufficient. It would probably have to be doubled.

821. In your opinion, which is the better connection to make—from Petersham or from Summer Hill? I should say from Summer Hill, for the reason that it avoids a good portion of the main line. The sooner you get off the main line the better. H. Deane.  
29 June, 1897.
822. Presuming that the cost of land resumptions between Petersham and Glebe Island will be the same as the cost of the land resumptions between Summer Hill and Glebe Island, then the cost of the Petersham or Stanmore connection is roughly £60,000 more than the cost of the Summer Hill connection? £55,000 or £60,000 more.
823. Notwithstanding that, you think it would be better to turn off the main line at Summer Hill? I think so.
824. Of the Summer Hill connection, which you regard as the better one, and the Darling Harbour line, which do you think would be the better connection to make? The western connection would be the better.
825. Why? You would avoid going through the neck, and I think eventually it would possibly be a better thing for the Darling Harbour goods traffic. That might all be brought round in that way, if in addition to the western connection the eastern connection with the island were made.
826. Does it not appear that if anything were done with it at all it would be very much better to connect from Summer Hill or Petersham—that is, from the better of these two starting points—and make it a sort of loop-line into Darling Harbour? Yes.
827. That would be really the right scheme? Yes; it would be a way of getting the goods traffic away from the entrance to Redfern station, which has been looked upon as a desirable thing to do.
828. How long would be a direct tramway from Balmain to Sydney, taking it across Pyrmont and Glebe Island bridges? From George-street to the point where the present Balmain tram enters Weston-street, it would be, approximately, about 170 chains, which is virtually 2½ miles.
829. There is another route which would be possible by using Glebe Island Bridge for tramway purposes, and going along by the Harris-street electric tram route, and down by the George-street tram route, by which route you would reach the same point which you have scaled? Yes.
830. What would that length be? It would be 110 chains, or nearly 1½ mile longer than the other.
831. How much longer is the present tram route to Balmain than the direct route? About 120 chains, or a mile and a half.
832. The approach to Balmain, *via* George and Harris streets, and thence *via* Glebe Island Bridge, will be approximately the same length as the present tramway? Yes.
833. Therefore, it follows, unless there be some other reason as far as Balmain is concerned, a connection at the termination of Harris-street in the saving of time would not be very material? No; it would not be anything.
834. But if it be possible to bring a tram direct by the two bridges, then there is a very material saving of 1½ mile? Yes.
835. If it were constructed over the Pyrmont Bridge from the foot of Market-street, it would be a strong competitor with the Harris-street line? It would depend upon how much the Harris-street line picked up at this extreme end. It does not follow that all the traffic on that line would be between Sydney and Pyrmont. It might be between Redfern and Pyrmont.
836. The best approach to Balmain would be from Market-street across Pyrmont Bridge to Glebe Island Bridge, and to Weston-street? Yes.
837. In your opinion, must we consider the question from the basis of a trolley system of electric tramways? Yes.
838. Therefore, if an electric tramway be constructed by the route we have particularised, it will be on the trolley system? Yes.
839. Do you regard it as difficult to carry a tram run on the trolley system over bridges with swings in them such as it is proposed to construct? There will be no difficulty whatever.
840. Except that the tram would have to wait while the swing was open? That is all.
841. But you could establish your connection at once when the bridge was shut? You might make it absolutely automatic.
842. The connection would not be on the trolley wire overhead, but on the side of the bridge, and it could be made automatically;—you have considered that question? Yes; and there is no difficulty at all.
843. If the street be wide enough to carry the traffic and the tram, any bridge as wide as the street will be wide enough to carry the traffic and the tram? Yes; a 40-ft. roadway between the kerbs is a very good width for the bridge.
844. It would be a capital approach from Market-street to Balmain? Yes; it would compete with the present Balmain tramway.
845. There is a very large traffic growing on that tramway? Yes.
846. *Mr. Hoskins.*] There are two large lines of steamers running to Balmain? Yes.
847. If the bridge be made sufficiently strong to carry the ordinary road traffic, such as would go to the Abattoirs or Glebe Island, would it also be sufficiently strong to carry the cars? It could easily be made so. I think it is highly probable that it would be quite strong enough as designed.
848. Have you a copy of the joint report which was made in 1890 or 1891 in regard to a connection from Glebe Island *via* Pyrmont Bridge to Sydney? Yes; I will let you have a copy of the report.

WEDNESDAY, 30 JUNE, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the expediency of constructing a New Bridge at Glebe Island.

George Waddy Shelley, Inspector, Glebe Island Abattoirs, sworn, and examined:—

- G. W. Shelley.  
30 June, 1897.
849. *Chairman.*] You are an inspector at the Glebe Island Abattoirs? Yes.
850. *Mr. Black.*] Do you think the site of the Abattoirs is a suitable one for the public health and safety? No; it is too confined.
851. Your reason for holding that opinion is that there is not sufficient space? Yes.
852. Is that a fault which cannot be got over? Not in that position.
853. Is it not possible by resumption or other means to devote a larger space there to the purpose? In the first instance it was built just on the point without cutting down, and you cannot extend it in any way.
854. From the nature of the ground it is impossible to increase it? Yes.
855. That does not apply to the island generally, I suppose? No. I mean just in the position of the Abattoirs.
856. To one particular site? Yes.
857. Is there any objection on the ground of sanitation;—is it likely by pollution of water or atmosphere to affect the public health? I do not think so in its present condition.
858. Is there any interference with the public safety by driving animals through the streets to the Abattoirs? Not when they are confined to small animals, as they generally are. It is only once in three months that we have anything which is beyond three years old, and, when it comes to them it is not safe. I speak of animals coming from the Corporation yards, not from Homebush at all.
859. What do you kill at the Corporation yards? It all comes from the Corporation yards. The calves and pigs all go over the Glebe Island Bridge.
860. No large horned stock? Perhaps once in six months they may get one or two from that direction.
861. *Chairman.*] The big stock comes straight down from the saleyards at Homebush without crossing the Glebe Island Bridge, and only the pigs and calves go across the bridge? Yes.
862. *Mr. Black.*] But the cattle are a source of danger to the people? They are a source of danger in coming from Homebush to Glebe Island.
863. Under certain circumstances there is some danger to the public from the driving of horned cattle through confined streets? Yes.
864. Are the Abattoirs well situated as regards cattle breeders? That is a wide question which I cannot answer.
865. Speaking generally, do you think the position is a good one for them? I think not.
866. For what reason, speaking broadly? As regards the condition of the meat, the driving and the trucking and the knocking about the cattle receive from the time they are driven from the station until they are finally dealt with, more especially with the trucking and driving after they leave the saleyards.
867. Do you think that if Glebe Island were in direct communication with the railway the position would be improved in that respect? No; I have always maintained that the slaughtering should be done in the country.
868. Your objection would apply to any abattoirs, no matter where they might be situated? Yes, for large animals, but not for small ones.
869. Yours is an objection in general, not in particular; you simply say that it is preferable to the growers of meat that the animals should be killed in the country, and deported in a dead state to the city? Yes.
870. That does not apply to the Glebe Island Abattoirs, but simply to the method of conveying meat to market? I will give my reason for holding that opinion. From the time the cattle arrive at the trucks, say, at Bourke, until they are finally dealt with at Glebe Island, they are probably three weeks without ever getting anything to eat, and that is detrimental to the meat in every way.
871. And nothing to drink? They only get water.
872. There is not likely to be much fat on your sirloin under those conditions? No; there is a continual wasting, especially with cattle which are eight or nine months on the road before they get to the railway. It is not like cattle which may be loaded and slaughtered daily.
873. Practically, what you would require is the construction of country slaughter-houses in large centres of meat-producers? Yes.
874. And the conveyance of the meat in refrigerating cars? Yes; the difficulty to be met is at this end.
875. Is there anything in the air or situation of Glebe Island which is prejudicial to the meat industry— which is especially liable to taint or to anything of that sort? No, nothing in that direction.
876. Is it a fact that you are almost free from the visitation of the blowfly there;—that it is hardly known over there? I have not noticed a blowfly there. It is only in certain places that they do.
877. How is it situated in regard to the carcase butchers? It answers them very well. It is handy for them.
878. But dismissing altogether the idea of country slaughtering, would it be an improvement to the Glebe Island Abattoirs if they were directly connected with the railway? To sell the cattle at the Flemington saleyards and then to re-truck them to Glebe Island would not do at all.
879. You mean to have saleyards at Glebe Island? Yes; for the cattle get knocked about too much as it is.

G. W.  
Shelley.  
30 June, 1897.

880. Is there sufficient land available there for the construction of saleyards and new abattoirs? Not in the one piece, unless the arrivals by train were regulated so as to have so many cattle for each sale day.
881. That is to say, if you were to construct saleyards and abattoirs in close proximity, the saleyards would be only capable of accommodating a limited number of animals at any one time? Yes.
882. Do you think it would be advisable to have the live animals and the dead animals brought so near, with all the dust there would be? There is not sufficient space there for the live animals to be in close proximity to the abattoirs. They would have to be away in some of the reclaimed portions. There is not sufficient room for them together.
883. What do you mean by saying that there is not sufficient room for them together? I mean not sufficient room to take the cattle out of the saleyards into the slaughter-houses.
884. At the beginning of your evidence you said that they were not suitable for saleyards, because of the smallness of the area of the ground? That is in the present position. If they were extended to the northward then I do not think it would be sufficient. There are only about 25 acres there.
885. How much of that area would you require for the abattoirs? Ten acres at least.
886. You think that 15 acres would not be sufficient for drafting and saleyards? No.
887. I suppose the present position of the Abattoirs in relation to the bridge is a very unsuitable one;—you find some difficulty from travelling animals over there on account of the density of the traffic and the fact that the bridge is closed from time to time? Yes; it is a great drawback.
888. These delays, I suppose, at times are very dangerous? Yes.
889. Some of the disabilities under which you labour there can be got over, I suppose, by the erection of a wider bridge with a swing-span in the middle of it? I do not know about a wider bridge—there is quite sufficient room for one to pass; but a swing in the centre of the bridge would be a vast improvement.
890. Do you think the present bridge is wide enough? It is quite wide enough for two vehicles.
891. Suppose that two vehicles are going in one direction, and a herd of pigs is coming from the other direction, is it wide enough then? If the stock are regulated to arrive at certain hours, which can be done, instead of at all hours, it is.
892. Given a sufficient area, and the establishment of cattle-saleyards at Glebe Island, with direct railway communication, are you of opinion that Glebe Island is a suitable place for the maintenance of abattoirs? I have always maintained that the country is the place where the cattle should be killed; but putting that view on one side, then Glebe Island would be.
893. Do you know of any place more suitable than Glebe Island? No. If the northern portion were levelled down, and extended so as to deal with White Bay, I think there would be plenty of ground there.
894. What you require, then, are a better bridge, direct railway communication, and the construction of saleyards and new abattoirs on a larger type? Yes. The bridge is on this side of the island, and it is only small stock which would cross the bridge in any case. Last year we had 65,000 pigs and about 15,000 calves across the bridge.
895. You want an improvement on the bridge, not only for the bringing of stock, but for the taking of the meat away, for the convenience of those who carry the meat? Yes.
896. I suppose there is sometimes great delay there? They are delayed when the bridge is opened, because the opening and closing of the swing is a very slow process.
897. I suppose in the meat trade, in summer, time is of some value? Yes.
898. It does not improve the meat to stand there in the sun and dust? No. It has not been delayed to the extent that it would interfere in that way with the meat.
899. Do you think not? No; it has not been half a dozen times in the year when they have been delayed for more than twenty minutes, and that is on account of the water not being deep enough for a vessel heavily laden.
900. *Mr. Hoskins.*] I understood you to say that the Abattoirs are too small—that there is not sufficient room there for the work? No.
901. Would there not be plenty of land if the island were levelled down to extend the Abattoirs? There are over 20 acres of land on the northern portion of the island which have not been utilised, except for residences. If that portion were levelled down, the Abattoirs could be extended.
902. All that land belongs to the Crown? Yes.
903. Have the authorities at the Abattoirs reported to the Government that that land ought to be utilised for extending the Abattoirs, making them more adapted to modern systems—that is, by providing lofty, well-ventilated buildings? It has been reported to the Government, but I cannot remember how long ago it was done.
904. Has the Colonial Architect's Department ever inspected the place, with a view to building new abattoirs there, or to improve the existing Abattoirs, or to extend them? Not at present.
905. *Mr. Clarke.*] You approve of the cattle being killed in the country at various places, in preference to bringing them to the Abattoirs here to be killed? Yes; on account of the knocking about they receive in the trucking and driving.
906. Would that be as convenient to the public of Sydney as to slaughter the cattle on Glebe Island, which is so close at hand, and so easily approachable by those engaged in the butchering business? If it could be established it would be preferable.
907. It has been tried at Orange, Tenterfield, and other places in the Colony, and discontinued;—can you give any reason why it has been discontinued? I think it was discontinued because they are not unanimous in dealing with it at this end.
908. *Mr. Hoskins.*] It does not pay? No. There are no chill-rooms or markets to receive the meat. They are all trying to vie with one another. Instead of being unanimous, and trying to deal with it at this end and bring it in, each man tries to take advantage of the other.
909. Is there any danger or inconvenience to the public in small stock, such as pigs and calves, being taken across the two bridges to the Abattoirs? Only in cases where there may be some stock two or three years old, and it may be only once in four months that any stock of that age would go across the bridge. The larger ones go by the steamers.
910. Between what hours are the cattle from the Homebush sale-yards driven into Glebe Island? From 6 a.m. to 8 a.m. in the winter, and from 5 a.m. to 8 a.m. in summer.
911. Is there any considerable danger to the public in driving the cattle from Homebush, even at those early hours? There is danger to the public, especially on the Iron Cove Bridge.

G. W.  
Shelley.  
30 June, 1897.

912. Do you think it would be advisable to construct a railway from Homebush saleyards to Glebe Island in order to obviate that difficulty and danger to the public? No; I think it would be better to let the cattle come in in the night.
913. If a direct railway were constructed, and the cattle were trucked from Homebush, would it not be less dangerous than to drive them at any time? To re-truck them at Homebush would not do at all. The animals are knocked about sufficiently as it is.
914. The difficulty would then be that they would have to be sold as they are now at Homebush, and then re-trucked to the island? Yes.
915. And that you think it would not be advisable to do? No.
916. In the old times, when the slaughter-house was situated in Sussex-street, the cattle used to be driven down Sussex-street in the middle of the night? I believe so.
917. *Mr. Clarke.*] Would that get over the difficulty? If the cattle were driven in the night-time it would. I remember that in Melbourne we were not allowed to go in before midnight or after 3 a.m., and we never had any trouble.
918. Are there any offensive smells proceeding from the Abattoirs at Glebe Island? No.
919. Has that been obviated of late years? Yes, by abolishing the desiccating works, which originated the nuisance.
920. Have you desiccating works there now? No.
921. How are the blood and offal removed? Large quantities of offal are taken out now by market-gardeners and poultry-farmers, and the refuse is taken out to sea twice a week.
922. The desiccating works have not been a success, I presume? It costs about £5 a ton to manufacture the article, and the last surplus sale we had realised 7s. 9d. a ton.
923. From a financial point of view it has been a failure? Yes.
924. Is that the reason why it was abolished? Yes; as well as on account of the nuisance it created. Since the first day of July last year we have been taking everything to sea, and there has been no complaint made.
925. *Mr. Wright.*] Did I understand you to say in answer to a question by Mr. Black that you disapproved of the Abattoirs existing where they are? Taking a broad view of the question, yes. I believe the meat could be delivered in better condition if it were slaughtered in the country.
926. You think that all meat should be slaughtered nearer to the pastures? Yes.
927. Have you had a long experience in connection with the slaughtering of cattle? From my youth.
928. Consequently you have had a very large experience? Yes.
929. You think that the cattle are deteriorated by the trainage and the knocking about which they receive? By the trucking and knocking about on the railway. We get very many cattle, from Queensland which have never seen a white man from the time they were branded until mustered to be sent to market. These cattle are in a state of fever from the time they are handled until they are finally dealt with. When cattle which have never seen a yard in their lives come to be put in a truck, you can imagine what state of fever they will be in.
930. Under any circumstances the cattle will have to be driven for a considerable distance from the pastures to the various country slaughter-houses? Yes.
931. With careful droving the beasts are not knocked about, and they do not deteriorate? Not so much.
932. In an ordinary season, I suppose, they do not lose much in weight? Not much—just inside.
933. The serious aspect of the question to you is the present knocking about, and the half-starving which the beasts receive from the time they get to the railway? Yes. We have had cattle arrive in such a condition that the moment the knife has been taken from the tail it has dropped. We have had to condemn the carcasses in consequence of the trucking and trampling.
934. Provided that a modern system is adopted, you cannot improve on Glebe Island as a site? We have no better site.
935. You spoke about the non-desirability of providing railway communication from the saleyards to Glebe Island? I referred to the re-trucking of the cattle. They would have more difficulty to get the cattle into the trucks than they had in the first instance.
936. The cattle would have to be liberated from the trucks at Homebush for the purpose of being inspected and sold? Yes.
937. If a railway is constructed from the main line at Homebush to Glebe Island, is there sufficient space on Glebe Island for saleyards? If the northern portion of the island were levelled down to White Bay, I suppose there are 25 acres which have been reclaimed at White Bay.
938. You are aware, I suppose, that the island comprises an area of 34½ acres? About 7 acres are taken up by the Abattoirs, and there is the road between the Abattoirs and the northern portion, which, I suppose, measures about 20 acres. It is very shallow round the foreshores, and the northern portion could all be levelled down to meet White Bay.
939. If the island were properly prepared, do you think it would be a good plan to establish saleyards on the island, and let the cattle come right through to be slaughtered? It might be done, I believe, with advantage.
940. You think it advisable that it should be done? Yes, if all outside slaughter-houses within a certain area were compelled to go there.
941. If all the slaughtering within the metropolitan district were compelled to be done there? Then it would pay.
942. What branch slaughter-houses are there now? I think within a radius of 8 miles there must be seventeen or eighteen suburban slaughter-houses.
943. Have you any idea of the system of inspecting these outside slaughter-houses, or is there any inspection at all? It is very crude, and it is left to the sanitary inspectors or the police.
944. There is a danger, I suppose, of cattle infected with pleuro-pneumonia or cancer being killed in these outside places? I think they are taking advantage of them at present. I may safely say that advantage is taken of the opportunity to take inferior qualities of cattle to outside slaughtering-houses.
945. That may very seriously affect the health of a large number of people? Especially in the suburbs.
946. There would be considerable security to the public health if all the slaughtering were done at one place? Yes.
947. Do you make the inspection at Glebe Island yourself? I have half a dozen sub-inspectors under me.

G. W.  
Shelley.

30 June, 1897.

948. Each of them, I suppose, is competent enough to distinguish pleuro-pneumonia? Nothing is condemned unless I see it.
949. Do you think that the reason why so comparatively few beasts are condemned there is that diseased cattle are taken to other slaughtering-places? They are drafted at Homebush. You may get a draft at Glebe Island which are all right, and the same quality of cattle will go on elsewhere without any inspection.
950. I gather from your evidence that you think it will be more convenient for the trade, and will better ensure the health of the public, if the slaughtering business is concentrated at Glebe Island under the supervision of yourself and your staff? Decidedly. There are a good many leaving the Abattoirs; they say that they cannot put up with the inspection—that there are outside slaughter-houses with no inspection at all.
951. They cannot put up with the fact that you condemn diseased cattle? Yes; especially since they have got nothing for them.
952. What is done with the diseased cattle? Most of them are taken to the boiling-down places.
953. Are they allowed to be taken away? They are thoroughly scoured with kerosene, and then taken to the boiling-down places.
954. The condemned carcase is put into such a condition that it cannot go into human consumption? Yes.
955. As far as cattle and sheep condemned on the island are concerned, you are satisfied that there is no means by which the carcase butchers can palm them off on to the public? Yes.
956. *Mr. Hassall.*] How many cattle are slaughtered at the Abattoirs in a year? Last year 75,000 horned cattle and 1,159,000 sheep were slaughtered.
957. The whole of these carcasses, or practically the whole of them, are conveyed across in vehicles from the Abattoirs to the city of Sydney? Not all would go across to the city; they would be distributed—going to Balmain, Leichhardt, and out to Marrickville by the Abattoir Road.
958. What percentage of the carcasses would go across to Sydney? Quite 75 per cent.
959. And the whole of that traffic has to cross the present Glebe Island Bridge? Yes.
960. Do you know how many vehicles leave the Abattoirs daily with meat for Sydney? No; I have never taken any record of them.
961. Have you any idea of the approximate number? No; I tried to ascertain yesterday by asking some questions through the telephone. I telephoned to one man and he said, "Upon my word, I cannot tell you. I have two waggons. One has been over the bridge four times this morning, and it may not go over again, and one has been over the bridge once. Perhaps the two waggons will not go over the bridge half as many times to-morrow."
962. Is it all conveyed in waggons and carts? In both.
963. How many carcasses will a waggon carry? From four and a half to five carcasses of cattle, and from fifty to seventy carcasses of sheep.
964. What will a cart carry? A cart will carry up to forty sheep, or about two bodies of cattle; sometimes more if they have only a short distance to go, or if they are in a hurry.
965. I suppose you pass over the bridge pretty constantly? Yes.
966. What is your opinion of its capacity to meet the requirements of the traffic? The only delay is in the opening and closing of the swing, and the rise in the bridge is dangerous.
967. How long is a vehicle delayed when the swing is open? Twenty minutes is a long time. Occasionally very heavily-laden vessels may miss the tide and get stuck in the channel, and keep the bridge open for a number of hours. But since I have been there I do not think that has happened half a dozen times.
968. Generally the delay is about twenty minutes? That is a long time.
969. Does that occur often during the day? No; ten minutes is generally the time.
970. How many times would it happen during the day as a rule? I have known it to happen six or eight times. Twice this morning I was delayed ten minutes.
971. Is not the swing very narrow for the requirements of the traffic? Only one vehicle can pass at a time.
972. If it were made a double road it would lessen the delay materially? Yes.
973. If a more convenient bridge were constructed with a wider roadway, and with a swing double the width of the present one, it would do? If the swing were wider it would meet the requirements, I think. They could go backwards and forwards without delay.
974. Has that traffic increased very much while you have been Superintendent at the island? Yes.
975. Has it increased materially? Yes.
976. Does it still show signs of increasing? Yes.
977. Do you think it is necessary that another bridge should be built which will give greater facilities for the traffic? I think that if the bridge were altered and widened it would be quite sufficient at present.
978. There seems to be a deal of objection to the swing being at the end of the bridge. It is said that a swing in the centre would be far more convenient? A swing similar to that in the Pyrmont Bridge would be. The rise in the bridge is very dangerous.
979. In the event of the roadway over the swing being widened you think it would be necessary to move the swing to the centre of the bridge? It would be far preferable in my opinion.
980. Do you think the Abattoirs will have to be enlarged to carry on operations as time goes on? Yes.
981. You could not possibly carry on if they were all compelled to go there to slaughter? No.
982. You are getting crowded up there now? Yes.
983. Is the number of stock slaughtered increasing yearly? It has up to last year. It has decreased for the last eighteen months.
984. Consequent, practically, on the bad season we had? On the very bad season we had.
985. I suppose the killing in the country has also an effect on it? It affects us a little. Last year there was a decrease of 16,000 head of cattle and 21,000 pigs.
986. But the increase during the years you have been Superintendent has been gradual? Yes.
987. It is considerably more than it was eight or ten years ago? It was considered then a large number to kill—5,000 horned cattle in a month. It has been up to 9,000 since that time. But we have not been up to over 8,000 head during the last twelve months.
988. And the same increase, practically, in sheep? The sheep are increasing.
989. In your opinion it will be necessary, if Glebe Island is retained as a killing depôt, to make further provision for the stock that will have to be slaughtered? It must be made.

G. W.  
Shelley.  
30 June, 1897.

990. You say the ground is available on the northern side of the island? Yes.
991. In the event of increased accommodation being necessary, the land is there to enable larger accommodation to be given? Yes.
992. *Mr. Roberts.*] Do large numbers of cattle arrive over sea from Queensland? There used to be, but there has not been for the last two or three years. The last twelve months' return for wharf rates at 9d. was £19 for the number of stock which arrived by sea for the year.
993. Are they discharged from the steamer direct on to the island? Yes; there is a wharf at the Island.
994. Does the steamer go through the swing in the bridge? No; it unloads the cattle on the northern side of the island. In that very dry season we had in 1886 some yards were erected there for the purpose, and, I think, in eighteen months 15,000 head of cattle arriving by sea were landed there.
995. To what cause do you attribute the falling off in the shipment of cattle from Queensland to Sydney? To the cost.
996. Does the railway successfully compete with the steamer? They drive the cattle.
997. Are they driven down to Homebush or are they driven direct to the island? Most of them arrive at Bourke, whence they are trucked. Others are trucked from Dubbo and Nyngan.
998. Could cattle be landed more cheaply if brought in that way than they could if taken to Brisbane and shipped from that port, or in fact from any other port in Queensland? Yes; from Rockhampton I think it cost them £4 a head, and when the cattle came here, they did not realise as much as £6 a head.
999. What is the cost per head of bringing cattle from Bourke to Sydney? It is so much a truck, and the truck is limited to so many head.
1000. Would it be less than the cost of bringing the cattle by steamer from Rockhampton? I think so.
1001. As a rule the cattle are brought down by whichever is the cheaper way? Yes.
1002. From which district does the greatest number of cattle come to Sydney to be slaughtered? It must be from the northern district.
1003. Do you keep any record of where the cattle come from? No; that is all done by the agents at Homebush.
1004. You think they come from the north on account of its proximity to Queensland? Yes. They are all sheep stations in the west and north-west of this Colony.
- 1004-5. When you say that the cattle chiefly come from the northern district, you include the Queensland cattle? Yes.
1006. You think it would be an improvement if the Abattoirs were not located in Sydney? Yes.
1007. Can you make any suggestion to the Committee as to what steps should be taken to improve the cattle which are supplied to the people of Sydney? Until they do bring the supplies from the country I think there is a place near Belmore (where there is plenty of land available) which could easily be connected with the western sewerage system. It is quiet there. There are no buildings about.
1008. If new abattoirs at that place were connected with the sewer, would it be an improvement upon the existing state of things? Yes.
1009. Is there not a sewer at Glebe Island that you make use of? No; everything goes into the reservoir, from which it is run into the punt twice a week and taken 10 miles out to sea—I mean the refuse of the offal and blood.
1010. Do the waters of the bay suffer in any way from the presence of the Abattoirs? No; for nothing goes into the harbour. For the last six months, even the drainage which used to go into the harbour, goes into the punt.
1011. If the Abattoirs were removed to Belmore, or to that neighbourhood, you would be able to make use of the sewer? Yes; and it would do away with the driving of the cattle through a large population. It is no distance across from Flemington to Belmore.
1012. Could not the difficulty as regards the driving be got over by connecting Glebe Island with the railway system of the Colony? Not if they had to re-truck the cattle at Flemington.
1013. Would they not have to be re-trucked if they went to Belmore? No; they could be driven over at night. It is no distance; I do not think it is more than 3 or 4 miles from Rookwood.
1014. Have you ever made any report to the Government as to the desirability of removing the Abattoirs from Glebe Island? No; but I believe the Board of Health has.
1015. Do you report to the Board of Health on the state of the Abattoirs;—do you communicate with the Board in any way? The Abattoirs are under the control of the Board of Health.
1016. Have you ever reported to the Board that Belmore would be a suitable place for the abattoirs? Yes.
1017. How long ago? Within the last few months.
1018. Have you heard anything from the Board? I did not make an official report; I simply expressed an opinion to that effect in a conversation with the President.
1019. *Mr. Hoskins.*] How long is it since the authorities at Glebe Island discontinued the use of the desiccators? Since the 1st July of last year.
1020. How long had they been in use before they were discontinued? They were closed in 1887, and reopened in the middle of 1889, and continued up to last July.
1021. Why did you discontinue the use of them? Because we could not get any sale for the article. It was a financial failure. The last of our surplus stock brought 7s. 9d. a ton, although it cost from £5 to £6 a ton to manufacture it.
1022. *Mr. Lee.*] That is not the desiccated blood? Blood and offal.
1023. There is a great demand for that on the Richmond? It has been falling off. We could not get any sale for it. It was advertised for sale.
1024. *Mr. Hoskins.*] Do they not use desiccators at the Sydney Meat Preserving Company's establishment at Rookwood? I believe so, but I have not seen them. They are on an improved plan to those we have at Glebe Island.
1025. The desiccators you had at Glebe Island were of the original style, and therefore it was very expensive to work them? Yes.
1026. The modern desiccators produce an article of commerce at a cheaper rate? I have heard that they do.
1027. Is there not a graziers' meat company at Parramatta which is going to use extensive modern desiccators? I have heard so. I have not seen them.

1028. Do the Sydney Meat Preserving Company dispose of the article they produce with their desiccators from blood and offal to market-gardeners or to people in the neighbourhood, or is it exported? I could not say. I suppose a great deal of it is sold locally.

G. W.  
Shelley.

30 June, 1897.

1029. When the desiccators were in use at Glebe Island great complaints were made by the people in the neighbourhood of the smell arising from them? Yes; it was very offensive.

1030. *Chairman.*] Notwithstanding the fact that there may be slaughtering establishments in the country, and that the meat may come down to Sydney in chilled cars, still for any pigs or calves—in fact, for cattle coming by water—you would still require to slaughter close to Sydney or to send this stock away from the metropolis to slaughter-yards? We would require a small metropolitan slaughter-house.

1031. Notwithstanding the fact that you would have a large chilled meat trade with the country? Yes. All the small animals, especially pigs, would have to be slaughtered in the metropolitan slaughter-house, because they nearly all arrive by steamer from the rivers.

1032. If cattle were landed eventually on Glebe Island, or wharfs were erected there, they would still, under present arrangements, have to go out to Homebush to be sold, and then come back again? Yes; they do at present.

1033. Small stock are sold in Sydney? Yes; in the Corporation yards and at Inglis' yards. Cattle which land by steamer are taken at night to Flemington, and brought back again.

1034. If it is not possible to walk the cattle from the sale-yards to the slaughter-yards, they must be put again into the railway trucks? Yes.

1035. That is an expensive and a troublesome operation? Yes.

1036. Therefore, if it became necessary for the sake of the public health that stock were not permitted to walk from Homebush to the Abattoirs, you would require to build a railway to bring them down. If you have a train to the island, and still sell at Homebush, you have the re-loading? Yes, and it is very detrimental to the cattle.

1037. That seems rather to point to the fact that at some future time, and at no very great distance, when the population does become sufficiently great along the route of travelling, the Abattoirs will be an unsuitable place? They will have either to make sale-yards at the Abattoirs or to establish abattoirs at Belmore.

1038. Should the sale-yards and abattoirs be together, or as close together as possible? They could not be together, because there is not enough land available.

1039. Glebe Island comprises over 34½ acres? In that case they would have to limit the supplies by rail.

1040. Are not 34½ acres sufficient for sale-yards? Not for sale-yards and abattoirs.

1041. Therefore sale-yards and abattoirs cannot be together at Glebe Island? No.

1042. *Mr. Wright.*] What is the size of the sale-yards at Flemington? I do not know.

1043. Do you think they cover 7 acres? I think they must cover more than that area. I have not been up there for some considerable time. Unless the supplies are limited by train, what is sold to-day must be killed before next sale day.

1044. *Chairman.*] In your opinion what is the best thing to-day in regard to the abattoirs and the meat supply of Sydney—you say "kill the cattle in the country, and bring down the meat in refrigerating cars"? Yes.

1045. Are you aware that at one or two places—at Orange and Tenterfield—that operation has been tried? That was some time ago.

1046. Do you know why the operation was not continued? I think the failure was at this end.

1047. Perhaps it was owing to heavy railway rates? There was no place to receive the meat.

1048. *Mr. Lee.*] They are going on in winter? They go on in winter, but in summer the difficulty arises.

1049. *Chairman.*] In your opinion with all the horned stock, a great proportion of the meat supply for Sydney could be killed in the country and brought down in refrigerating cars? That is my opinion. We will never get any good meat until it is done.

1050. In your opinion calves and pigs will still be killed at the Abattoirs? Yes.

1051. Would you bring the sheep to the Abattoirs, or would you kill them in the country, too? I would kill them in the country.

1052. Have you watched the meat trade of the American States? No.

1053. Have you watched the comparative improvement of the dead and live meat trade, as they call it, there? No; I have not seen any reports.

1054. Your opinions are formed from your own experience, not from what has happened in other places? No, just from the quality.

1055. Have you any figures in regard of the gradual growth of the various trades? No.

1056. Have you brought any figures with you? No.

1057. Is there anything else you would like to say? I do not think there is anything more I can say.

Joseph Levy, Carcase Butcher, Glebe Island, sworn, and examined:—

1058. *Chairman.*] You are a carcase butcher, trading in the City of Sydney? Yes.

J. Levy.

1059. *Mr. Hoskins.*] Have you been engaged long in that business? For a great many years. Ever since the slaughter-house has been on Glebe Island I have been butchering there, and my father was butchering there before me.

30 June, 1897.

1060. Do you receive much live stock from Sydney by way of Glebe Island Bridge? Not of late years. Very little stock comes by that way now.

1061. Only small stock from the sale-yards in Sussex-street? Yes. We do not deal in small stock.

1062. You get all your live stock from Homebush? Yes.

1063. I suppose a good deal of the meat you send to Sydney and the suburbs is taken over the Glebe Island Bridge? All of it has to go over that bridge.

1064. What is the weight of the load you generally send in each van? In the waggons from 35 cwt. to 2 tons.

1065. Have you felt that the bridge has not been very secure to carry loads of that weight? It has not been what it should be, but it has been secure enough to carry that weight so far.

1066. Is there much vibration in the bridge when a load is taken over? Yes.

1067. Are the approaches to the bridge on either side at all cramped, or do they make the bridge inconvenient of access? Yes.

1068.

- J. Levy. 1068. Are the approaches so narrow and awkward as to make access to the bridge very inconvenient? They are both inconvenient and dangerous.
- 30 June, 1897. 1069. Why? If one cart is going this way, and one is going the other way, and you want to go between, there is hardly room. I consider it is dangerous on that ground.
1070. Is there not room for one vehicle to pass another? Yes; but if one is walking at a slow pace, and a person is in a hurry to get by, there is hardly room to pass.
1071. Is any inconvenience experienced from the bridge being too narrow? I think it is too narrow altogether. That is the great fault of it, I think.
1072. Have you observed whether the business at Glebe Island is increasing? I think the business is increasing and the traffic is increasing too.
1073. Is the traffic to the Abattoirs? Yes. There is other traffic, too, which is increasing.
1074. The greater portion of the traffic to the Abattoirs is over the bridge? It is all over the bridge.
1075. In addition to the Glebe Island traffic, there is also the traffic from Balmain, Ryde, and other suburbs? Yes.
1076. That traffic goes over the bridge too? Yes.
1077. Do you consider that, in order to afford proper facilities for the increasing traffic on the Glebe Island Bridge, a wider and more secure bridge should be erected on a modern design? I think it is quite necessary. These suburbs will expand, and there will be more traffic and more population. I think the present bridge is not fit for the traffic, even at the present time.
1078. Do you know whether there is frequently or otherwise a block in the traffic, occasioned by the approaches being inconvenient and the bridge being narrow? Yes. I have had to wait a quarter of an hour and sometimes half an hour when the swing was being turned. Perhaps a vessel will get jammed in the opening. The swing may have done for twenty or thirty years ago, but for the present time I think it is quite out of place.
1079. The block in the traffic has been occasioned by the swing being opened to let vessels go through? Yes; and vessels have been jammed in the opening. I have known the swing to be jammed for three or four hours—half a day at one time, and we had to go right round. It stopped the traffic altogether.
1080. Do you think that the traffic is stopped, not only because the swing is open, but also because it is not in the best place? I think it would be much better if it were in the middle of the bridge.
1081. Can you say of your own knowledge, or as the result of your observation, whether the number of vessels going through the bridge has been increasing during the last five years? Most undoubtedly they have increased.
1082. They are increasing now? Yes.
1083. Are they increasing in number and in size? Yes.
1084. Are there many places up that bay where a good many vessels unload and load? The timber vessels do the greatest trade in the top of the bay. Just lately a new timber merchant has commenced business on the corner, and they appear to be getting a lot of timber in there.
1085. Are not vessels discharging broken stone in that bay for municipal bodies? That has been going on for years.
1086. And it is increasing? Yes.
1087. Are there not coal yards up there, too? Yes.
1088. Are there any fresh factories in the neighbourhood at which a number of persons is employed, and which vessels frequent? Yes; there are meat-preserving factories up that way, and the glass factory. They have to take up their coal.
1089. What meat-preserving factories do you refer to? Mr. Barnes'; and I think a new company is about to be started, but I cannot tell you the names of the promoters.
1090. They get meat from Glebe Island? From Glebe Island, Riverstone, and the Government market. They get their meat in the cheapest market.
1091. Considering the large expenditure which would have to be incurred to erect a new bridge, do you think that in the present circumstances of the Colony the Government would be justified in erecting a bridge to Glebe Island with a view to afford additional facilities to the trade in the locality? The suburbs are growing, and I think Glebe Island is sure to grow with the suburbs. My idea is that it is necessary to have a more modern bridge, and it should be a great deal wider than the present bridge; it should be at least as wide as the Pymont Bridge.
1092. And a great deal wider in the opening? Yes.
1093. Are the present Abattoirs of sufficient capacity to do an enlarged trade if it should arise? If more abattoirs were erected.
1094. The existing Abattoirs are not sufficient to do any large extent of trade? They are over-taxed at times in a good season. Of course, the present season is bad, and the stuff is not coming in so freely as it does in a good season.
1095. The Government owns 30 acres of land on the island to the north of the Abattoirs;—do you think it will be advisable, if the Abattoirs are retained on the island, to extend them by taking in some of that area? I think it would be a very advisable plan.
1096. Are the present slaughter-houses at Glebe Island of a sufficiently commodious and modern type—are the buildings sufficiently lofty and ventilated to carry on the business in a healthy and modern way? The beef slaughter-houses are, but the mutton slaughter-houses are not. I am in the beef line myself. From what I can see, they are very much cramped at the mutton slaughter-houses, and it is sure to increase in a good season.
1097. The evidence goes to show that the Abattoirs are not built on the most enlightened and modern principle, that the buildings are too low, that the ventilation is not sufficient, and that the drainage is not good enough? I do not think you could improve much upon the beef slaughter-houses, but the mutton slaughter-houses are not fit for any man to work in or do business in.
1098. You think that before a largely extended business could take place at the Abattoirs, it would be necessary to make considerable improvements in the buildings used for the slaughter of sheep? Yes; a very great improvement could be made.
1099. Do you know whether the carcase butchers have asked the Government for improved accommodation for slaughtering sheep? I believe they have made applications to the Board of Health, but the Board say that they have no money—I do not know whether it is a fact or not. The answer we always get is, "We have no money"; but I do not think the Government is in that state. 1100.

1100. Have you any suggestions to offer to improve the Abattoirs, or to increase the facilities and advantages for carrying on slaughtering operations, or to improve the road, the approaches to the bridge, and the bridge itself;—will you give the Committee your views on the subject? I am a butcher, not an architect. J. Levy.  
30 June, 1897.

1101. I should like to hear your views on the subject, because I know you have for many years been a large carcass butcher? We have been butchering for fifty years in this country. Since 1813 my father was a butcher, and I came here, a little boy, with him. I think, as regards the mutton slaughter-houses, there could be a great improvement made. They ought to have been done away with years ago, and new ones put up. There are twelve or fourteen men working in them in the summer-time. I do not think the roof is above 12 feet high. It is a terrible thing for men to work there in hot weather, without a breath of air, under a slate roof. These slaughter-houses are not half big enough.

1102. And not half lofty enough? Not half lofty enough. There is no room for men to move about in them.

1103. Does not the slaughtering of cattle in adequate places, where so many men are employed in hot weather, tend to cause the meat to become putrid more quickly than it otherwise would do? Yes.

1104. Therefore the consumers of mutton may suffer, as well as those engaged in killing the sheep? Most undoubtedly. I do not think you could improve much on the beef slaughter-houses. If they were only kept in repair they would do for a long time yet.

1105. Are the gradients on the approach to the Abattoirs favourable, and do they afford sufficient room for vehicles wishing to have access to the buildings? No; it is very narrow, and when there is any rush of business you cannot stir in the lane.

1106. Have your people never reported that to the authorities? Yes. There is one set here and another set there, and the only way it could be done would be by pulling one lot down and making the buildings wider. The mutton slaughter-houses would have to come down. They could easily reclaim the land at the back and at very little expense. It is only a matter of filling in. The stuff they pulled out of the old mutton buildings could be utilised again.

1107. Have you ever contemplated the probability of the Glebe Island Abattoirs being done away with, and public abattoirs being erected in some other place? Yes.

1108. What is your view? I do not think you could improve on the site. I think that if you were to travel over every country in the world you could not improve on that site. It would make very little difference to me. Wherever they went I would have to go with them.

1109. Does not the presence of public Abattoirs on Glebe Island afford facilities for small butchers to go, without losing much time, and purchase the meat they require? Certainly. I think it is much better for the whole of the community, in this way: that if you kill at Glebe Island you always get a nice blow of air—no matter whether it is summer or winter, you will catch any breeze that is going. I think meat will keep longer there; but if it is killed 8 or 10 miles away in the country, it will not keep half as long as it does at the Abattoirs. Anything that is frozen never eats as well—I do not care whether it is fish or anything else—as it does in a natural state.

1110. Does not the presence of the Abattoirs so near to Sydney not only afford great facilities to small butchers to purchase what they require, and to inspect it too before they purchase it, which they could not do if the slaughtering were done a long distance from the city, but also greater facilities for the Board of Health to see that only healthy stock are killed? Yes; that is the only place where there is any inspection. At the outside places there is no inspection; they can kill what they like and put any sort of diseased meat on the market, and you have no way to detect them unless you keep a man for that purpose. I cannot kill one animal unless there is an inspection, and I do not want to kill one unless there is.

1111. *Mr. Hassall.*] Even in the country they would dodge the inspector if one were appointed? Yes; and they do it, from what I have been told.

1112. *Mr. Hoskins.*] Do you know, or have you reason to believe, that there is slaughtering carried on in private establishments within 10 miles of Sydney? Yes.

1113. Do you know whether there is any proper inspection by an officer of the Board of Health, or by competent persons, to see whether the stock is in a healthy condition? Yes; they have sent an inspector there, but he has not stopped there more than an hour or two. I know a certain party, whose name I cannot mention, to whose place the Board of Health sent an inspector, and he cut two or three of these bullocks down while they were killing, and the inspector said, "Kill away." "No fear," he replied, "we are not going to kill when you are here, but when you are gone we will kill them. You would cut our cattle down—you would condemn them." That is a nice state of affairs to exist.

1114. Is much dead meat sent from the country to Sydney and sold here? Any amount of it. There were 120 bodies down at the markets on Monday.

1115. *Mr. Clarke.*] From Riverstone? No.

1116. *Mr. Hoskins.*] Is the trade in country-killed meat, which is sent to Sydney, increasing in volume? The season is so bad that it is not increasing; but last year it increased very much. It is all according to the season. If they have a good season in the country, a lot of meat will come to the market. If it is a bad season, we get all the best of the cattle here, for the simple reason that they get a better price for it here.

1117. Which is better for the people—to get the chilled-meat or to get the live cattle? Which would you sooner eat yourself—an apple which was frozen, or an apple which was just plucked from the tree.

1118. I am talking of cattle, not apples? That is the best way I can answer your question. I think the best way to get meat is to get it as fresh as you possibly can, to let it set for four or five hours, to keep it in your shop to-night and serve it out to-morrow.

1119. And to have the beast killed here? Yes; because you get all the nutriment in it. The cold kills the nutriment in the meat.

1120. Seeing that Mr. Mort and others have established slaughtering-places in the country and chilling places too, how do you account for the fact that that business has not increased, but on the contrary that a great portion of the meat which is consumed in Sydney is sent down alive and killed here? Because it is much better. If it is frozen, you have not got the nutriment in the article which you will get if the animal is killed fresh.

1121. Do you think that the dead-meat trade from the country to Sydney will increase, or will the present practice of killing the animals at Glebe Island be continued? I think you will have local abattoirs in any

J. Levy.  
30 June, 1897.

any case, no matter where they fetch the meat from. People will send their small stock to the central market.

1122. What about the large stock? Homebush, or any local market, rules the market.

1123. Do not the stock greatly deteriorate through being in the trucks so many hours without food and water? It cannot do any good, but still it is better to do that than to starve them along the road.

1124. Is it better to do that than to kill the cattle in the country? Yes. Most people do not care about chilled meat. It is all right in England, where meat is 9d. and 1s. a pound. If they can get our meat for a third of the price, they are sure to go for our meat. You get a good bullock from the country and let him stand for a few days in a paddock, and you will find that the meat is just as good as if the beef had been killed in the country. It is much better to get an article without being frozen than to have it frozen.

1125. You believe there is every probability of the slaughtering of stock at Glebe Island increasing? Yes.

1126. And that if the business increases the facilities for reaching Glebe Island should be improved, including the erection of a better bridge? I think so. As our population increases our trade must increase.

1127. *Mr. Clarke.*] You stated that the buildings at Glebe Island, where the sheep are killed, are not fit for the purpose;—does that apply to the killing of calves, of which a large number are slaughtered? They are killed in these slaughter-houses too. They are not fit to kill either pigs or sheep in.

1128. A large number of pigs are killed for the purpose of bacon curing? Yes, a great number.

1129. There are several large bacon-curing establishments about Balmain? Yes; Barnes', McLeau's, and Murphy's.

1130. All the pigs are killed at Glebe Island before being sent to the bacon-curing establishments? Yes.

1131. You think that some alterations should be made so as to give greater facilities, and have a better mode for killing pigs as well as sheep? Yes.

1132. *Mr. Fegan.*] Are you inconvenienced in your business by the state of the Glebe Island Bridge? At times it gets blocked, and we have to wait there a long time. When the swing has been turned and a vessel has been going through, I have seen the whole of the bridge and half-way up the hill taken up with vehicles, and all that traffic has to be cleared away before any vehicles can go on the bridge from the other side.

1133. Is there any regulation to prevent that congestion? I do not see how you can prevent it. The two men employed on the swing are very good and attentive to their duty.

1134. They work the swing as expeditiously as possible? They do.

1135. One of the chief complaints of the carcase butchers is that the bridge is too narrow? Yes.

1136. You cannot get the quantity in the load which you would like to take on account of the condition of the bridge? Certainly not.

1137. If the bridge were perfectly safe you could take greater loads on the waggons? Yes, if it were level.

1138. It must mean a great loss of time to you? Yes.

1139. In your opinion, is there a better site than the present one to connect the two places? I do not see how you could find a better site.

1140. Do you think it is the best site which could be found? I think it is as good as any other way. I do not see any other way, unless you cut right through the hill to Harris-street.

1141. Are you well acquainted with the land surrounding the small township of Belmore? Yes.

1142. Would that be a good site for slaughter-houses? I think it would be a very bad one, because it would breed typhoid fever and every other fever. There is not sufficient water there, and it is too much closed in with the hills.

1143. You could not consider that position a favourable one for the erection of new slaughter-houses? I do not think so.

1144. Do you think that, with the erection of a new bridge, the Abattoirs at Glebe Island would meet all the requirements of the traffic for many years to come? I think so.

1145. You think the time has come when the present bridge should be replaced with a new and better one? Certainly.

1146. *Mr. Hassall.*] Do you think it would be advisable to remove the mutton slaughter-houses to the other side of the road? It would be advisable to shift them from where they are for the sake of the business and the men. Perhaps Mr. Elliott could give you more information about them than I can, because he does the business. From what I can see of them, I think they are very much cramped there.

1147. On the northern side of the road, towards White Bay, there is any amount of land which might be utilised for that purpose? It would have to be cut away and levelled.

1148. Would anything of that kind have to be done on the present site? Yes.

1149. It must be done to a certain extent if you want to increase the accommodation for slaughtering sheep? Yes. I think it would be a good thing to kill the sheep on the other side of the road. It would give us more room, and we could get more air for the beef.

1150. You would get all the air which is taken up with the mutton slaughtering-houses—and the air is to a certain extent vitiated; and you would have more room to carry on your beef operations? Yes.

1151. The site on the northern side would be as good as the present site, and the appliances for conveying the offal by barge would be equally as good? Yes. If they were to shift the mutton slaughter-houses to the other side they could enlarge the beef slaughter-houses if they wished to do so. They could carry them further forward, at very little expense, by knocking out the front and shifting the baulks further on.

1152. You are practically jammed in between the beef-killing houses and the mutton-killing houses? Yes.

1153. You think it is absolutely necessary that new slaughter-houses should be provided for the sheep, the present ones being too small, too inconvenient, and too crowded, and the air not being so pure? Yes.

1154. You have seen that trade grow up from your boyhood? Yes.

1155. Has the traffic along the bridge increased very materially during the last ten years? I think it must have been very nearly doubled during the last ten or twelve years.

1156. You know that the western suburbs have increased very largely in population, and that the great bulk of that traffic has to go across Glebe Island Bridge to get to Sydney? There is no other way to get to Sydney. None go round by Petersham now. They all go over the bridges from the northern suburbs.

1157. You think the time has arrived when the Government would be justified in erecting a larger and more convenient bridge to carry on the traffic? Yes. I think they ought to build a bridge to carry a tramway. I believe we shall see the time when a tramway will go down Harris-street over to Balmain.

1158. You think it is advisable to build a bridge which will carry a tramway if future requirements should necessitate the construction of a tramway in that direction? Yes. J. Levy.  
30 June, 1897.
1159. You do not think that Glebe Island can be excelled as a killing depôt? I do not think it can be excelled in any part of the world.
1160. Is it a fact that the flies are never troublesome at the Abattoirs? We never see a fly except in summer-time, and no blowflies. I have worked in the Abattoirs at Melbourne, and I never saw such an unsightly place in my life. Three years ago I went all through their Abattoirs at Flemington. It is a terrible place. It is more like a gaol than an abattoir; everything is closed in. I do not know how they can keep the meat any time; they cannot keep it any time in summer.
1161. Do you think that at any time the improvement of the trade would warrant the extension of the railway from the sale-yards at Homebush to Glebe Island, so as to bring the cattle by rail instead of by road? I do not think they could ever improve that; the two truckings would never do. If you had to retruck the cattle, they would knock themselves about ten times more than they had done in coming to Homebush.
1162. You think that once you take them out of the trucks you had better leave them out? Yes; I would sooner travel a bullock 20 miles than truck him again.
1163. Do you think that some better arrangement might be made to bring the cattle from Homebush to Glebe Island in the middle of the night? Yes, that might be done.
1164. You think a regulation might be made that the cattle should be driven between 11 p.m. and 4 a.m., so as to be out of the way of the general traffic? Yes; between 10 p.m. and 6 a.m., because there are not many people out after 10 p.m., and if there are I think they ought not to be.
1165. The traffic is pretty thin after 10 p.m.? Yes.

THURSDAY, 1 JULY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

<p>The Hon. FREDERICK THOMAS HUMPHERY. The Hon. JAMES HOSKINS. The Hon. CHARLES JAMES ROBERTS, C.M.G. The Hon. WILLIAM JOSEPH TRICKETT. The Hon. DANIEL O'CONNOR. HENRY CLARKE, Esq.</p>		<p>CHARLES ALFRED LEE, Esq. JOHN LIONEL FEGAN, Esq. THOMAS HENRY HASSALL, Esq. GEORGE BLACK, Esq. FRANCIS AUGUSTUS WRIGHT, Esq. FRANK FARNELL, Esq.</p>
--	--	---

The Committee further considered the expediency of constructing a New Bridge at Glebe Island.

John Ashburton Thompson, M.D., President, Board of Health, sworn, and examined:—

1166. *Chairman.*] What official position do you hold? I am Chief Medical Officer of the Government, and President of the Board of Health.

1167. *Mr. Hoskins.*] You are acquainted with the nature of this inquiry? Not exactly.

1168. The Committee has been appointed to inquire into the propriety of building a new bridge from Sydney to Glebe Island; it is reported, and the evidence shows, that the bridge is in a bad state of repair, and that it is an unsuitable structure; I presume you have come here to give evidence, not in respect to the bridge, but in respect to the Abattoirs? Yes. J. A. Thompson,  
M.D.  
1 July, 1897.

1169. Have you any statement which you would like to make? The sole thing I have to say is that if any alteration is made in the road beyond the bridge—that is, on Glebe Island—it might and should be carried round, either on one side or the other—either to the left or to the right round the nob, and not be continued as at present it is, through the abattoir buildings, dividing them and raising dust, and attracting people who have no business there, and so forth.

1170. Are you of opinion that the Abattoirs at Glebe Island ought to be enlarged—or, in point of fact, do you think that they ought to be modernised; a carcase butcher has stated before the Committee that the mutton slaughter-houses are very defective and very small; that the roofs of these buildings are very low; and that the perspiring of the men in killing sheep in a building inadequately ventilated and incommodious in its character, tends to the speedy putridity of the meat? It is quite true that all the buildings at Glebe Island are now out of repair, that they were originally ill-planned, and that they are no longer large enough to do all the business that has to be done for the city. I gave evidence, in August last I think, before a Committee of the Legislative Assembly on this subject, and I then went into the matter rather fully. My fixed opinion is that these Abattoirs must be reconstructed, and the only question is, whether they should be reconstructed where they stand at present, or whether they shall be removed.

1171. What is your opinion as to the ineligibility of that site for a slaughter-house, or do you think that some other place should be selected? I think that there are many objections to the present site, and that a fresh place should be selected. As far as I see at present, the governing condition is the situation of the sale-yard. The Abattoirs and the sale-yards are concerned in one business, and should be near to each other.

1172. What are your objections to the present site of the Abattoirs? In the first place it is in a neighbourhood which now is populous; and it is too small, unless one could look forward to cutting down the island. That is a matter which has already been reported upon for another purpose, I understand, and would be an exceedingly expensive business. The main objection, perhaps, is the distance of the Abattoirs from the sale-yards, and from the resting-paddocks. Cattle which are brought in from the country should be deposited in the sale-yards, and after they are sold they should not have any distance to travel. They should go direct to the resting-paddocks or feeding-paddocks,—they need not be pasturages—and there stay until they can be walked quite a short distance to the place where they are to be killed as soon as they are cooled down and recovered.

1173. You think the Abattoirs should be a longer distance from Sydney than they are at present? I think it very desirable that the abattoirs should not be in the immediate neighbourhood of densely populated districts. I do not know, apart from every other consideration, that Glebe Island could not be

J. A.  
Thompson,  
M.D.  
1 July, 1897.

adapted to hold the enlarged abattoirs, and that if that were done there would be no particularly sanitary objection to it—that is, regarding it as a site for the abattoirs alone; but, considering that the animals come in from the country, and are first sold in the sale-yards, it seems to me a round-about way and troublesome to have the abattoirs at a distance.

1174. Have you looked at the matter in this light: that, as the present abattoirs are so near to Sydney, small butchers can go there in the morning and purchase any quantity of meat, however small, they like, and that the tendency of this opportunity for small butchers to purchase from the carcase butchers at the slaughter-house is to allow men of moderate capital to engage in business; but that, if the abattoirs were fixed at a longer distance—say, 7 or 8 miles from Sydney—it would have a tendency to throw the whole of the trade into the hands of large capitalists, and the result would be that small butchers would not go out every day to get meat, and that might have a tendency to increase the price of meat to the consumer? I do not think there is anything at all in that.

1175. Will you tell me why? In the first place, there is round Sydney a very large number of people in a small way of business. They usually have their own slaughter-houses, and that is a very undesirable thing, because it renders inspection of the meat impossible. These small people, at all events, do not find it necessary at present to go to the Abattoirs to do their work, but they do do it actually in what may be called the neighbourhood of the sale-yards. The largest portion by far of these small slaughter-houses is scattered about Canterbury, Enfield, and that region. If the Abattoirs were moved a little distance out of town, then it appears to me it would be necessary to have some cooling accommodation at the Abattoirs to which butchers who live on the other side from Sydney, for example—say in the neighbourhood of the Abattoirs—may resort and get their supply of meat perhaps every day if they choose; and then there must be another freezing depôt here in Sydney, to which butchers on this side, and the butchers who belong to Sydney, may resort. I do not see any difficulty about that. I think the cooling of meat for our consumption should begin to become the custom of the trade, so that we might get our meat after it has been hanging for three or four days, or a week, which would be a great improvement.

1176. Do you know that to a certain extent that has been tried—that the Dibbs Government established freezing works at Pymont, with a view to encourage the bringing down of meat from country slaughter-houses, and selling it to the butchers, who used to go over there and purchase the meat; but, nevertheless, that did not tend to prevent the slaughtering of stock in a large way at Glebe Island? No. Can you tell me why it failed.

1177. I do not know; but I am inclined to think that it is because the carcase butchers have the command of such a large amount of capital that they can go into the country and buy large quantities of stock, and because they have so many retail butchers under their thumb? That is almost what I thought. There are so many questions connected with this, one does not quite know. There was no objection to the chilling, I apprehend. Meat can be chilled. In America, you do not have fresh meat. You always get your meat after it has been hung a few days in a chilling room. I do not see why we should not do that here. My interest in moving the Abattoirs, and seeing abattoirs established by some municipality, consists in this—that as soon as that is done, under the law the Board of Health will have power to proclaim an area around that abattoir within which there shall not be any private slaughter-houses; and, consequently, we shall by a simple step be able to bring the whole of the meat slaughtered in the metropolitan district under inspection.

1178. I suppose you are aware that there is a very strict regulation in force against the slaughtering of meat in private establishments about Sydney and suburbs—I mean in respect to inspection and drainage? Yes.

1179. One of your objections, I gather, to the present situation of the slaughter-house at Glebe Island is the increasing population in the neighbourhood? Yes; it is already very big.

1180. I suppose you have seen public abattoirs in Europe? Yes.

1181. You are aware that round the public abattoirs in Paris there is a large, densely populated neighbourhood? Yes.

1182. And that it is pretty densely populated around Islington in London? Quite so. I said just now that, regarding the single question of abattoirs, I do not know that the Abattoirs might not be reconstructed and continued at Glebe Island without any inconvenience or harm happening. I think it might. But I always have in view the other items of the business. I was thinking very much of sale-yards, and the need for resting the cattle which come in by rail from a long journey which, as a rule, lasts thirty-six hours, and sometimes much longer.

1183. May I take it that you have no great objection to Glebe Island as a site for a slaughter-house, always providing that every provision is made to prevent any injury to the public health, and to ensure cleanliness in the buildings? Yes.

1184. You have inspected the slaughter-houses at Glebe Island? Yes; I go there once a week at least.

1185. Do not you think that some of the slaughter-houses, especially the mutton slaughter-houses, are very defective and badly ventilated, and require to be replaced with more lofty buildings built on modern principles, and better suited for the purpose? Yes. I have, within the past three or four months, caused a considerable sum to be spent in improving the ventilation. Something has been done. It is enough for the cold weather, but when the weather gets warmer, it will be necessary to do something more. I may say, at once, that the whole of these buildings, in my opinion, are unsuited for the purpose. They cannot be improved; they must be pulled down and reconstructed.

1186. You are aware that the Government have about 30 acres of land on the island? I believe so.

1187. There would be no difficulty in the way of clearing the land with a view to extending the Abattoirs? I believe not.

1188. It was stated by a witness yesterday that nearly all the refuse, instead of being treated with the desiccators, is towed out to sea at great expense and dropped into the water, and the inspector said that the reason why the use of the desiccators was discontinued was because the public would not give a payable price for the manure;—has it not come under your knowledge that the use of desiccators is very largely availed of in abattoirs and meat-chilling places, and that they are usually attended with the prevention of any nuisance in the neighbourhood? Yes. I have myself insisted that some chilling works in the country should provide desiccating apparatus for that very reason; I considered that they could not keep their places free from nuisance unless they did. The reason given by the inspector is good, as far as it goes; that was the outcome. It cost us £7 a ton to make the manure, for which we could

could get only £5 a ton in the market. The reason was partly—but that is quite a subsidiary reason—that the machinery had become worn out and was obsolete. The real reason was the bad construction of the abattoir buildings, which results in the impossibility of catching the blood separate from the washing-down waters. The consequence was that there was delivered a diluted liquid at the desiccating works, all of which had to be evaporated. The quality of the residue was not what it would have been had it been pure blood, and the cost of evaporating made the difference of £2 a ton, which we could not get over.

J. A.  
Thompson,  
M.D.  
1 July, 1897.

1189. Then the apparatus was old, worn out, and of bad design? Yes; there are better designs now. It may have been the best design when it was bought, but it is worn out. We decided that it was better to shut down the desiccating works than to spend money in the purchase of new machinery when we should have still to do all the expensive evaporation; we should never have been able to make it pay.

1190. Does not the meat preserving company at Auburn use desiccators of a modern type? Yes.

1191. Does not their use tend to prevent any nuisance arising in the neighbourhood from the works? Yes, of course.

1192. The reason why the desiccators at Glebe Island were discontinued was because the machines were old and out of date, and could not be properly utilised;—do not you think that if new slaughter-houses were erected, and more suitable desiccators were used—such as are used in Vienna, Berlin, and other large cities on the Continent of Europe—the whole of the offal and refuse might be so utilised that there might be a demand for the article, if not here, in Mauritius and other places where sugar is grown, and where they require good manure for their land; and profitable prices might be obtained? Certainly. The essential difficulty at the Abattoirs as they stand is in the construction, not of the desiccating works themselves, but of the slaughter-house, which is such that they cannot separate the blood, and get the blood comparatively pure to the desiccator, but you must have it mixed with an immense quantity of water. These slaughter-houses must be reconstructed before we can profitably manufacture manure as other big works manufacture it at the present time.

1193. Looking to the fact that if any other site were selected for public abattoirs within a reasonable distance of Sydney, the Government would have to purchase land as well as to erect the buildings, and that the conformation of the country would not offer such facilities for drainage as Glebe Island does; and looking further to the fact that that island belongs to the Government,—do not you think, all things considered, that if improved abattoir buildings of a modern stamp and better adapted to the purpose than the present buildings were to be erected, worse places could be found near the City of Sydney than Glebe Island? Well, that seems to me to be mainly a business question. I do not know whether my opinion is worth very much on that point. All I should like to say is, I do not quite see how you are to slaughter your meat under the best conditions as long as the slaughter-house is at a distance from the place at which the railway deposits the cattle when they arrive from the country.

1194. I presume you are of opinion, as you frequently visit Glebe Island, that if the slaughtering of stock be continued there, the bridge road and the bridge are not what they ought to be—that a new bridge, or a very great alteration of the present bridge, is required, and that the approach to the bridge should be widened? There is no doubt of that. I have here two little plans which I caused our consulting engineer to draw, which shows how the road might run either on the northerly side of the island or on the southerly side, so that it would no longer run through the abattoir itself.

1195. You are aware that the approach to the Abattoirs is also used by vehicles and persons going to Balmain and Ryde? That is my objection to the present road.

1196. *Chairman.*] Will you hand in the sketches to which you referred? I beg to hand them in. I may say there is a descriptive note on each plan.

1197. *Mr. Wright.*] Did I understand you to tell Mr. Hoskins that there is no offensive smell from the Sydney Meat Company's works? I did not say so.

1198. You are aware that a very serious nuisance is caused by those works? I am. I think Mr. Hoskins' question was whether the desiccating plant helped to prevent a nuisance.

1199. There is a desiccating plant at those works now? Yes.

1200. What is your experience of the effect of that on the surrounding atmosphere? None. The desiccating plant affords them a way of getting rid of wastes without nuisance, which would be offensive if they were kept. It is good as far as it goes.

1201. But it only partially cures the evil? Partly, certainly.

1202. The treatment of the refuse at the works on the Parramatta River still causes a very serious nuisance? Yes; but that is the soup from the digestors.

1203. They are not in a position to evaporate that? They will be in some weeks.

1204. The same difficulty which occurs with their soup has caused a large amount of fluid—blood and water from the slaughter-house—to get mixed? I think not. The liquid which causes the nuisance you are acquainted with is the result of boiling down the carcasses, and has nothing to do with the slaughtering, and nothing to do with the present question as to the Abattoirs. The desiccating plant there, as elsewhere, is used to deal with the blood and the guts, and it enables them to make something profitable out of these materials. It also enables them to put them into a condition in which they will not putrefy.

1205. Is there any method known to modern science by which fresh offal—the blood and the contents of the parts, and so forth—can be absolutely evaporated without causing any serious smell? Yes; by the desiccating plants, of which there are many different patterns.

1206. It is competent to do that without creating any nuisance? Yes. I have insisted on certain country freezing works putting in such an apparatus, because I perceived that without it they could not dispose of that class of waste without creating a nuisance. They had no means of getting rid of it. They might bury it, but they never would. I insisted on their manufacturing the refuse. They lose no money—in fact, they get some profit—and they also get rid of the nuisance.

1207. What was the value of the manure which you did produce at Glebe Island with the desiccators? The market price for that class of fertiliser was £5 a ton, and it was worth that price.

1208. The inspector has stated that a large quantity which was left there had to be sold for 7s. 9d. a ton? It was a forced sale. We wanted to get rid of it.

1209. You had to get rid of accumulated stocks? It was an accumulated stock, and was not worth the same money as it was when it was turned out.

1210. I suppose the exposure to the air had deteriorated the manure? Quite so.

1211.

J. A.  
Thompson,  
M.D.  
1 July, 1897.

1211. Does it not strike you that £7 a ton is a very big price to pay for that material? I am only speaking from my general knowledge when I say that £5 a ton is the average market price for that class of stuff. Nobody ever did get £7 a ton for it.
1212. I understood you to say that it cost that sum to make the article? Yes; on account of the quantity of water we had to evaporate in order to get a dry residue. You may take it that it was the amount of water alone. Had it been a more question of machinery we should have replaced it like other people do, but the question of the water was an insuperable one.
1213. Would there be no way by which the whole of the water might be filtered off from the rest of the stuff? The proportion of water to blood is so large that it would all go through the filter together.
1214. Blood and all? Yes; because the water is in very large proportion.
1215. I suppose the principal fertiliser is the blood? Yes.
1216. And if that passed away the product would be of no value at all? Quite so.
1217. You referred to the necessity of deviating the road over Glebe Island, and you stated that the works were now divided by the road;—is there any slaughtering going on on the northern side of the road? Some mutton slaughter-houses are located there. We have used the building on the northern side for that purpose.
1218. You think that the very large traffic over the road causes impurities to fly about over the meat? Yes.
1219. You think it would be better if the whole of the slaughter-houses were concentrated, and a road could be made quite distinct from the Abattoirs? It would be much better.
1220. Would you prefer, if the traffic road is taken round by the southern side, that the island should be cut down so as to decrease the grade of the road? You would get a much better grade.
1221. *Mr. Fegan.*] You are well acquainted with the township of Belmore? Fairly well. There are not many houses out there.
1222. It has been suggested that Belmore would make a very good site for public abattoirs;—would you mind expressing your opinion on that point? I think suitable land might be found there—probably not very far from the end of the Marrickville-Burwood Road railway.
1223. It has also been pointed out that it is very strange that there is an entire scarcity of blowflies on Glebe Island and of smaller flies? I think there are very few.
1224. I understand that other abattoirs are infested with these flies? I think they are.
1225. That speaks very well for the present site of Glebe Island? Yes. Supposing it to be correct—I think, now that you remind me, it is so. It may be because we keep the island clean.
1226. At other abattoirs which are well supervised, they cannot keep these things away, showing at once that Glebe Island must be a very open place, to which plenty of air can get? Yes.
1227. You stated that, at some expense, Glebe Island could be made very suitable for abattoirs;—what would it cost approximately to do that? I do not know what it might cost. There would be some cutting down. The existing buildings are useless and would have to be pulled down. They are wrongly designed; they could not be converted. You would have to build new buildings from the ground.
1228. As the access to Glebe Island gets more populous, it would be a question whether cattle will be permitted to be driven to the Abattoirs? That is, of course, an important point, and one I have in mind when I recommend, as I have recommended, that the Abattoirs should be adjoining the sale-yards; and then there would not be any more driving of the cattle through the streets.
1229. Do you think there is a sufficient supply of water at Belmore or Flemington for the purpose? It is near to the pipe-line, and therefore there is no difficulty about the water.
1230. You use a great quantity of salt water at present to do your sluicing? We do, because it is handy, and in order to reduce the fresh-water bill.
1231. It is a consideration to the men employed in the trade to save as much as they possibly can? We pay the water bill.
1232. It would be impossible to get any water, except from the pipe-line at Flemington or Belmore? Yes.
1233. But taking all the circumstances into consideration, you think it would be much better to remove the public abattoirs from the present site? That is my opinion; but I am very well aware that there are a great many business considerations involved in that question with which I am not very well acquainted.
1234. Do you think the consideration which Mr. Hoskins pointed out as regards small butchers, is one which ought to be weighed? No; I do not think there is anything in that. That is a point I know something about.
1235. So that if the slaughter-houses were to be removed from Glebe Island, the Committee would not need to consider the question of building such a huge structure, or making such conveniences as they otherwise would if the abattoirs were to be continued at the island? You would have to build new buildings from the ground, whether you moved or whether you stopped. There would be no other proper way of doing it.
1236. *Mr. Hassall.*] You do not disapprove of the site at Glebe Island as being prejudicial to the public health in any way? No, not on that ground.
1237. The situation is pretty good for a trade of that kind to be carried on? Yes.
1238. That is, with the least nuisance to those persons who live in the vicinity of the Abattoirs? Yes.
1239. Do not you think that it would be difficult to get another place with so many natural advantages as this site possesses for the purpose of slaughtering stock? I do not see any difficulty on that score about a site, either in the neighbourhood of Belmore or in the neighbourhood of the sale-yards.
1240. As far as the trade itself is concerned, there are many things to be considered in reference to the removal of the Abattoirs? I admit that. I think it cuts both ways. Really what is wanted is a decent place to do the slaughtering, and then to get all the slaughtering done at the place, so that we can have reasonably complete inspection.
1241. Even if you had the slaughter-yards at Homebush? Small butchers would buy cattle there and drive them to the local slaughter-house and treat them just the same as they do now? As a matter of fact, as things are, if the new Abattoirs, or the same Abattoirs, were built by the Government, that would be possible. If, on the other hand, these Abattoirs, or new Abattoirs, were handed over to the City Council, and they became municipal abattoirs, then at once the Board of Health would be able to forbid slaughtering within such a radius as they thought the central abattoirs would serve.
1242. You think it would be advisable, in the interest of the health of the community, that the City Council should have control of the Abattoirs as well as sale-yards? I would rather say I think it advisable in the interest

interest of the community that the slaughtering should be done at a central place. As the law stands, no doubt it would be necessary that Glebe Island should be handed over to the municipality, because the law says that the Board shall have the power mentioned only when the municipality or combined municipalities erect a slaughter-house. If, however, the Government decided that this Sydney slaughter-house should still be a Government establishment, it would be very easy for them to alter that provision in the Noxious Trades Act. Therefore, I would rather say that the point is we want all slaughtering to be done at a central place, because in no other way can you secure reasonable inspection.

J. A.  
Thompson,  
M.D.  
1 July, 1897.

1243. A considerable number of cattle is slaughtered outside Glebe Island? I think a very great number.

1244. To a great extent these outside slaughter-houses escape inspection? They largely escape inspection, because they can slaughter at any hour of the day they like. The inspectors are the inspectors of nuisances and the officers of police, and these have a great many other things to do.

1245. So that the inspection is only intermittent? It is intermittent. It is properly done when it is done, but it is not systematic.

1246. Have you any knowledge of the traffic over Glebe Island way? I only know that there is a great deal. I go over there at least once a week.

1247. Do you ever suffer any inconvenience from the delay which takes place from the opening of the swing, and from the difficulty of getting over the narrow bridge? Yes. Going there at 9:30 a.m. I am almost always stopped: the swing is almost always in use at that time. Then I find a collection of 100 or 150 vehicles—waggons and so on—waiting, and it takes me a very long time to get across. The entrance to the bridge will only take one vehicle at a time.

1248. Very great loss of time is sustained by gentlemen like yourself who have not a very great deal of traffic on the road;—as a rule when you do go, a deal of inconvenience is suffered from the delay which might be avoided if a more convenient bridge were built? Undoubtedly.

1249. You think it advisable, from what you have seen, that some steps should be taken to increase the facilities for traffic? I very often, indeed, thought the bridge was entirely inadequate to the traffic which I actually saw.

1250. And the swing is in a very inconvenient position? It is.

1251. If the swing were placed in the centre it would not be so bad, and it might be made wide enough to carry two lines of vehicles? Yes; that would be a great improvement.

1252. Judging from the traffic you have seen crossing the bridge, you think it advisable to erect a more convenient bridge at a reasonable cost? I have long been strongly of opinion that a new bridge was wanted.

1253. *Mr. Black.*] It has been given in evidence here that the most perfect method of slaughtering, because it would save the travelling of the cattle and the loss in weight, would be to kill in the country at central places, and to convey the meat to Sydney in refrigerating cars;—have you formed any opinion on that matter, or has it come before you at all? Yes; I think experience, as far as we have got, shows that for some reason or other it is not practicable. A great deal of meat is, and always will be, slaughtered in the country, and sent in as you describe. But still you must always have a slaughter-house in every town. One might, for instance, take Newcastle and that district. They are much nearer to a place where a great deal of slaughtering is done. The people thought of putting up a central abattoir, and one of the objections raised by some people was that they had not any security: that, though they might put up their central abattoirs, the Aberdeen Company would send meat down at once, and cut them out. But people who knew most about the matter pooch-pooched that, and they asked if it was not worth the while of the Aberdeen Company to send down meat now, why should they do it when an abattoir was put up. As a matter of fact, the Aberdeen Company does not send down any meat worth speaking of to Newcastle. A local slaughter-house, therefore, seems to suit the people better.

1254. Is there any objection to that system of country slaughtering on the score of careless inspection, of admitting cancerous meat, and so on, into consumption? Yes; as things are arranged at present there is an objection which would be removed as soon as establishments had attached to them an inspector, so as to put them on a footing with public abattoirs.

1255. You spoke favourably of Belmore as a site for abattoirs. May I ask you is it superior to Glebe Island in any way? I do not know that it is, but as part of an organisation which has the transit of cattle from the country in view, and then their slaughter, and next their distribution, I think it is.

1256. There would be no gain? There would be the gain of concentrating your business, and not carrying it on in two places 7 miles apart.

1257. Could not a similar concentration take place on Glebe Island? I believe that 50 acres of land might be rendered available at Glebe Island. That is my recollection of the evidence I gave in August last.

1258. Do you think 50 acres is necessary for the erection of sale-yards? I really think that that is a question to be put to some one in the trade, or to the City Council, who have the sale-yards at Flemington.

1259. Fifty acres would be a great space merely for abattoirs? I say I believe there are 50 acres on the island. You could put up some resting paddocks and sale-yards, but whether you could put up all that are wanted or not, I scarcely know.

1260. Do you think no less a space than 50 acres would be sufficient? Considering the area which is actually covered by buildings at this moment, and judging the area of the sale-yards from sight, I should say you want fully 50 acres.

1261. I gather from your remarks that you think one of the drawbacks to Glebe Island is the absence of direct railway communication? No, I have not expressed that opinion.

1262. You did not say so, but I drew that inference, which may be a mistaken one? I do not think I conveyed that opinion.

1263. You do not think it would be an advantage to have cattle conveyed by rail there direct from the main line? Cattle which are conveyed by rail are delivered after not less than thirty hours travelling during which they have been starved and had no water. You cannot turn them out to the slaughter-house. They ought to be fed though they are not; but they must rest at all events, and therefore you must have areas on which to rest them.

1264. If you had those 50 acres, would there not be sufficient room for that purpose then? I do not know whether there would be room or not. I am not competent to speak on that point.

J. A.  
Thompson,  
M.D.  
1 July, 1897.

1265. You mean that there would be no benefit unless there were sufficient paddock space available to turn out the cattle to rest after their journey? That is what I mean.

1266. Such space being available, and an improved bridge being constructed, do you consider that Glebe Island would be a suitable place to maintain the abattoirs? If there were space, accessibility, and everything of that kind which is required, then I believe the only objection that could be raised would be either, because of the thick population surrounding the abattoirs, which would be much inconvenienced by the noise of cattle and dogs in the yards, or else on the score of position which might not be all that the trade would like—I do not know. But in the abstract from those surrounding circumstances, if there were room for the necessary resting yards, and so on, and if the buildings were suitable, I do not know that there is any objection, quite apart from those considerations.

1267. Mr. Fegan has said something in regard to blowflies. Now, if the resting yards and sale-yards were in close proximity to the Abattoirs, would you not be more likely to have blowflies in numbers than you do now? If the dung were not regularly swept up, and kept in covered vessels until it was disposed of, then it would be likely that you would have more flies.

1268. In the event of precautions being taken, there would be no increased trouble on that score? I should say not.

1269. *Mr. Hoskins.*] In the event of new slaughter-houses being built at Glebe Island on modern principles, such as you would approve of, and having an arrangement by which the blood could be saved and treated with the most modern desiccating machinery, do you not think that manure manufactured from the offal and refuse could be sold at less than £7 a ton, and at the same time leave a profit? Yes, provided there was a market.

1270. All the difficulties, then, in respect to the non-use of desiccating machinery, and the throwing of the products into the ocean, arose from the defective construction of the building, and also obsolete machinery? Exactly.

1271. *Chairman.*] Have you made an estimate of the cost of removing the Abattoirs? No estimate has been made, because it is not yet decided that the Abattoirs should be removed.

1272. *Mr. Hoskins.*] I suppose if it is considered highly desirable by the Government to erect new buildings there, you, as President of the Board of Health, would like to be consulted as to the kind of building and the arrangements to be made for the work to be carried on there, before the plans are drawn? Undoubtedly, I should expect that. I desire to add that having remarked on the large amount of traffic which I see once a week or oftener on the Glebe Island road, that that traffic does not appear to me to be to any important extent connected with the Abattoirs. The vehicles belonging to the Abattoirs, which I either know by sight or which have names painted on them, and can be identified, are a minority—a very small proportion of the great traffic which I see always going across there, and which, therefore, I suppose will always continue to go to Balmain.

1273. *Mr. Wright.*] Have you thought about the question of converting Glebe Island into sale-yards as well as a site for abattoirs? Yes. What I said was that I did not know whether or not there would be room enough for sale-yards.

1274. On Glebe Island there are 34½ acres of land, exclusive of the reclaimed land at White Bay. If it were possible to cut down the island, to erect sale-yards there, and to bring the cattle to them by rail, would there be any strong objection on sanitary or sentimental grounds? Supposing there were room, only on this ground, that there is a very large number of people around who would be disturbed all night by the lowing of cattle, barking of dogs, and shouting of men. I think that would be a rather strong objection.

1275. There are still greater difficulties in the way by the lowing of cattle when driven through the streets? Yes.

1276. It would minimise that danger and the deterioration of the cattle from the harassing which they get? It would.

1277. If there were room for sale-yards there, do you think it would be an improvement on the existing state of affairs to have a railway brought straight to the island? I think that to bring the slaughter-house and sale-yards together, wherever it was, would be an improvement.

1278. I have noticed that all through your evidence you have suggested that the slaughter-house and sale-yards should be side by side, so that the cattle could go in in a fit condition to be killed? I am strongly of that opinion.

---

Ernest Macartney de Burgh, M.Inst.C.E., Assistant Engineer for Bridges, Department of Public Works, sworn, and further examined:—

E. M.  
de Burgh,  
M.I.C.E.  
1 July, 1897

1279. *Mr. Humphery.*] Since your last examination you have made further inquiry into the present traffic over the bridge to Glebe Island? Yes.

1280. Will you state the result of that inquiry? I had the traffic counted from the 19th to the 29th June, and, omitting Sundays, I endeavoured to separate the Abattoir traffic as far as it was possible to do so. I find that the daily traffic across the bridge averaged 2,032 vehicles, 51 horsemen, 215 driven animals, and 1,295 pedestrians.

1281. Can you give the state of the traffic during a similar period previous to 1893? In 1889, which is the only other record I have, the figures were:—vehicles, 196; horsemen, 102; driven animals, 456; and pedestrians, 1,011.

1282. For what period in 1889? It was taken in December, 1889. It was not stated in the return from which I obtained this information how many days the average was computed from.

1283. Do you think it is a fair comparison between the traffic of 1889 and the traffic of 1896? I think so.

1284. Have you separated the Abattoir traffic from the ordinary business traffic, apart from the Abattoirs? Yes.

In the first place we may suppose, I think, that the bulk of the animals which crossed the bridge from Sydney were going to the Abattoirs. It is only an assumption, but I think it is a fair assumption, for this reason: that in a day we have 178 driven animals crossing the bridge towards the Abattoirs, whereas we only had on an average 37 driven animals coming back again. I think it is a fair assumption that at least 120 animals per day crossed the bridge to the Abattoirs from the Sydney side.

1285. Have you separated the vehicular traffic in connection with the Abattoirs? Yes. I find that, as nearly as possible, one-fifth of the vehicles crossing the bridge were, or might be supposed to be, going to the

the Abattoirs. In a great many cases we were able to stop the vehicles sufficiently to ask the man where he was going, and in a great number of cases we got answers from the men, so that we were quite certain of it: but there were a number of butchers' carts which went by so rapidly that we could not interrogate the drivers. What with watching them go over from day to day for nine days, and getting familiar with the carts, I think it is a very fair assumption that the whole of this one-fifth were going to or from the Abattoirs. The actual figures are: 201 from and 212 to the Abattoirs.

E. M.  
de Burgh,  
M.I.C.E.  
1 July, 1897.

1286. Can you state the number of horsemen or pedestrians who went to the Abattoirs? I made no inquiry as to the horsemen or foot passengers. When I was previously before the Committee, I said I thought the traffic had increased since 1894. I wish to draw attention to the fact that there is an increase of 240 vehicles a day.

1287. How do you arrive at that conclusion? We have the figures which were taken in 1894, and which I gave on a previous occasion.

1288. An increase of 240 vehicles per day would be an increase of over 13 per cent.? Yes.

1289. *Mr. Lee.*] From the plans which have been handed to you, do you observe how the road through Glebe Island might be deviated round the northern side or round the southern side? Yes.

1290. These diagrams have been submitted to the Committee by an authority who has expressed the opinion that the road could, with advantage, be deviated in either direction;—do you know of any valid objection to a deviation of that kind? No; I am aware that the matter of cutting down portion of the island, so as to form a frontage available for wharf purposes, has been often considered, and considered as likely to be a useful and profitable scheme.

1291. If it were deviated to the south side of the island, it could be made to serve the purpose of a road and an approach to the wharfs which might be built on that portion of Rozelle Bay? Yes; but on the other hand, it appears to cut off the Abattoir water frontage where they get rid of their blood and offal into the punts.

1292. But that would not be a very great difficulty, provided that it did not interfere with any of their buildings? I take it that they could make other arrangements to get rid of their refuse, but at the present time that is their outlet.

1293. Suppose it is taken on to the northern side of the island, by that means you will give an approach to White Bay as well as a road away from the Abattoirs? I think it would be a great advantage to avoid the Abattoirs for the main portion of the traffic.

1294. The main object would be to avoid the Abattoirs? At present the traffic has to go practically right past the Abattoirs.

1295. Will you be good enough to consider that matter of deviating the road in connection with the design for constructing a new bridge, and give us your opinion later on? Yes; I have no doubt that the Engineer-in-Chief for Public Works when he brings down his designs for a bridge to the Committee will be in a position to speak about a deviation of the road.

Alexander Brown Portus, Superintending Engineer for Dredges, Department of Public Works,  
sworn, and examined:—

1296. *Chairman.*] You are Superintendent of Dredges in the Harbour and Rivers Branch of the A. B. Portus Department of Public Works? I am Superintending Engineer.

1297. *Mr. Trickett.*] Do you think it is desirable or necessary that a new bridge should be constructed to Glebe Island? Much would depend upon whether it would be considered desirable to do away with the bridge altogether, and go across the land recently reclaimed, and make the crossing at Gordon-street at the head of Rozelle Bay. We have reclaimed about 40 acres of land between Glebe Point and Annandale. If the road were made from the Kauri Timber Company's place at Wentworth Park right across to the head of Gordon-street—of course a tunnel would have to be made or a diversion round about—that might obviate the necessity for a bridge. Whether it would be justified as far as expense is concerned, I do not know. It is a project which has been mooted.

1298. The expense would be very great? The expense of the tunnel would be considerable.

1299. And the distance round would be considerable? It would depend upon where you wanted to go. If you wished to go to Glebe Island alone, the distance from Pymont Bridge Road would be about twice as much by the new road as by the present bridge. If you had in view only the trade to Balmain, the distance would be about the same.

1300. What would be the road, say, from Sydney to Balmain? The present route; but instead of going along towards the bridge at Glebe Island you would go straight across by the wharf at Wentworth Park, and then straight through by a tunnel to the reclamation I have spoken of.

1301. Can you state the depth of the water at the site of the Glebe Island Bridge? It is about 14 feet. I have not taken any soundings there.

1302. Do you know whether it is soft bottom there or rock bottom? We have not come across any rock there. In dredging on the Sydney side of Glebe Island, where the cattle are shipped, there is not very hard bottom; the hard bottom is close in to the island, but about the middle of the bridge I would not expect to meet any hard bottom at 30 feet.

1303. What depth of water is there inside the bridge? In some places it is 7 or 8 feet, in other places it is deeper. Perhaps 9 to 11 feet would be the average depth.

1304. So that with the present depth of water, without very extensive dredging operations, only vessels of comparatively small tonnage can go inside the bridge? Yes.

1305. Have you noticed what kind of vessels generally go inside the bridge with trade? Vessels drawing about 12 or 13 feet of water, and up to about 300 tons register.

1306. What is the chief trade they carry? Timber vessels going to the Kauri Timber Company's works, and to Guy's saw-mill, and Swan's, and vessels with blue metal for roads.

1307. Mostly timber vessels? It is almost wholly a timber trade.

1308. Is the site of the swing in the present bridge a desirable one? It is not. It would be far better to have the swing in the middle of the bridge.

1309. It is quite behind the times, I suppose, with regard to its construction and its position? Yes; it is very slow.

- A. B. Portus. 1310. If a punt or a vessel of any size were moored alongside Brown's iron-works, which are just outside the swing, it would be impossible for a ship to get through the opening? It would be very awkward indeed.
- July, 1897. 1311. There would be a danger of colliding? Yes.
1312. In the new bridge, you think the swing should be put in the centre? Yes; and the opening should be wide. We require nearly 60 feet to take the dredge "Groper" under the bridge where the ferry boats pass through.
1313. What width do you suggest should be available to all vessels likely to pass through the opening? I should say that 60 feet would do very well.
1314. Do you mean that there should be an opening of 60 feet on either side of the pivot which the swing works on? I have not looked at the drawings, but I think it should be 60 feet in the clear, so that a vessel with 59 feet beam could get through the bridge.
1315. *Mr. Hoskins.*] Do you mean that there should be two openings of 60 feet each, or only one? As long as you have an opening of 60 feet in the clear it will do.
1316. *Mr. Trickett.*] Is there not a tendency at the present time to widen sailing vessels? Yes.
1317. What is the width of the dredge you mentioned just now? The "Groper" has a 50-foot beam; but there are projections on each side, and we would require about 57 feet. The span in the bridge where the ferry steamers pass was recently altered so that the "Groper" could get through. The width of the central span was about 40 feet, but about eighteen months ago the Department increased the width to 60 feet to allow the "Groper" to get through.
1318. Are there likely to be continuous dredging operations inside the bridge for some years to come? Yes; we have instructions now to deepen the whole area. It is a stand-by work. About 80 acres of land are being reclaimed on the shores of Rozelle Bay—that is, between Glebe Point and Annandale, and on the other side of Annandale—and material is required for that work. The dredge has been working there, and material from other parts of the harbour has been sent there and pumped ashore on to the land.
1319. You are likely to be engaged in dredging there for a considerable time? Yes; we have still about 300,000 tons to pump to complete the present reclamation. But if the whole place is to be deepened to a depth of 24 ft. to accommodate large vessels, the cost of the dredging will be very considerable, because the material will have to be sent to another reclamation, which would involve two operations, namely, the lifting of the material and the sending of it to a reclamation at some distance, to be pumped on to the land.
1320. To dredge out 300,000 tons; how long would it take in the ordinary course? From about nine months to a year. It depends upon the size of dredge employed.
1321. To get the stuff to do that reclamation inside the bridge, would you go on a uniform system of dredging? Yes.
1322. What would it increase the depth to to take out that quantity? About 18 ft. over part of it. We usually consider 18 ft. quite sufficient for present requirements; but, perhaps, in view of the new bridge. A greater depth would be left to accommodate a larger class of vessels.
1323. As the deepening goes on inside the bridge, will it be necessary outside the bridge to go in for dredging operations, or is there deep water there? Yes; for the larger class of vessels. Quite recently we have made a channel from Peacock's Point, opposite the old A.S.N. works at Darling Island, up to White Bay, where reclamation has been carried out. That channel, which is 200 ft. wide with about 22 ft. of water, could be availed of by vessels drawing 22 ft., but a branch to the opening of the Glebe Island Bridge would have to be made; that would not, however, be very expensive, for it is no great distance.
1324. What is about the average depth from the channel you mentioned up to the bridge? I should think it is about 18 ft., but I have not taken any soundings lately.
1325. So that, following the deepening of the water inside the bridge, you would have to dredge a channel to the opening in the new bridge? Yes.
1326. With regard to this expenditure for dredging inside the bridge, do you think it is likely to be beneficial to the wharfs around there? As far as any revenue to the Government is concerned the benefit would not be so great. If you could get a larger class of vessels to use the wharf at Wentworth Park it would be a distinct advantage.
1327. Suppose the Government wharf opposite Wentworth Park has a frontage of 1,400 feet, how many ships of the size which would be likely to use that part of the harbour could be berthed alongside that wharf without any piers being run out into the water? I think you might put the length of the vessels down at from 150 to 200 feet, and that would give from six to eight vessels. The number would lessen as the size increased.
1328. Having in view the wharfage dues which are charged by the Government, I suppose the return from these vessels would be a very small item in proportion to the expenditure which is going on in the way of reclamation and dredging? Yes, looking at it from that point of view alone, I do not think it would justify the expenditure.
1329. I suppose the revenue derivable by the Government from wharfage would not be very large? There is all that length of frontage recently resumed by the Government, and the reclamation areas would have to be added to that. It could all be converted into valuable land.
1330. Is it not contemplated to use that area of 80 acres as a recreation reserve? I think it would be most unfortunate for the country if land of that kind were to be given over for recreation purposes. It would be far better to utilise it for commercial purposes, or to sell alternate blocks, and thus recoup the Government for the expenditure incurred in dredging operations.
1331. Is it in a suitable position to be utilised for commercial purposes? Yes; it could be used for timber dépôts or other purposes.
1332. Would it be used by people who carry on business in Sydney, or by people at the Glebe? Manufacturing industries would spring up on that side, just as they have done on the opposite shore, where you will see saw-mills, glass-works, a box-factory, and a canning establishment.
1333. You think that the establishment of manufacturing on this land, and the use of this wharf, can be kept in view as a factor to recoup the cost of reclaiming the bay and constructing the new bridge? Yes.
1334. You recognise that it is impossible to carry on much longer with the present bridge? It is impossible to carry on very long with the present bridge.

1335. It is very old and shaky and too narrow, and the opening is most unsuitable? Yes; it is quite inadequate to the requirements of commerce. A. B. Portus.  
1 July, 1897.

1336. What height do you think the bridge should be, either in part or in whole, to enable small steamers or vessels to go under without having to open the swing? As high as you could possibly arrange. I should say that if you could manage to give 30 feet in the clear it would be very desirable.

1337. What class of vessels would that enable to pass under the bridge? I am speaking more for steamers and tugs going through.

1338. Sailing vessels, even ketches I suppose, would have to go through the swing? Yes; I do not see how you could very well arrange for them unless it was made much higher.

1339. For the purpose of ferry boats and a larger class of tugs? For such tugs as have no arrangement for lowering their funnels it will be desirable to have a height of 25 or 30 feet.

1340. Have you given any attention to the construction of bridges? No. I have not seen the design of this bridge.

1341. You would not care to say whether it is desirable or otherwise to have a bridge with a hump in the middle as this one has? I think it would be desirable. It would not be sightly, but it would be very desirable as far as the accommodation for vessels is concerned. The higher you can get it the better.

1342. I suppose that if the bridge were improved, and the swing improved in regard to its size, there is every possibility of the trade increasing considerably in that portion of the harbour? I think so.

1343. It is surrounded by a large population area? Yes.

1344. I suppose for filling in Roselle Bay you use sand pumps? Sand pumps, in connection with ladder dredges. The sand pumps are not available at any very great distance from the shore.

1345. How far can you eject the sand from the pump on to the land? The greatest distance we have sent it through pipes yet has been about half a mile. The dredge is moored generally about 300 or 400 feet from the shore; you require a number of pontoons and pipes to reach the shore and pipes only on the land.

1346. I suppose, in the case of a good deal of the dredging and filling-in which you have done, you have moved the dredges from where the stuff was taken out and then pumped it on to the shore? No; most of it has been material which has been dredged in other parts of the harbour—say, in Darling Harbour and other places—and sent alongside the suction dredges and pumped on to the land to be reclaimed.

1347. Suppose you went in for extensive dredging in this part of the harbour, could you moor your dredge half a mile from the shore, and by floating-pipes pump the stuff on to the place to be reclaimed? We could do that very well, but it would be a very expensive matter as far as the pontoons were concerned, for you would require a number of pontoons and pipes.

1348. You do not adopt that system then? No. In practice we moor at about 300 feet or 400 feet from the shore, and then we have pipes with flexible joints to the shore and ordinary pipes for the remaining distance.

1349. So that when you got some considerable distance away from where you are reclaiming, you would adopt the same system as you do when the silt is brought from a considerable distance? Yes, dredge, and then you tow your punt to the suction dredge, dump the contents, and pump ashore.

1350. Is there a retaining-wall all round this place which you are filling in? Yes, a stone wall.

1351. Is it so constructed that it could be utilised for wharf purposes, or is it simply rubble shot in? It is a rubble wall, and probably the best arrangement would be to drive in piles beyond the wall to form a wharf.

1352. What is the area of the water above the bridge? Mr. Halligan estimates it will be possible by dredging to deepen that part of the harbour above the bridge to a depth of 22 feet at low water over an area of 120 acres.

1353. How many tons of stuff would have to be removed? Mr. Halligan, the chief surveyor, in his minute, says:—

I ESTIMATE that it will be possible by dredging to deepen that part of the harbour above Glebe Island Bridge to a depth at low water of—

18 feet over an area of .....	160 acres.
22 " " " .....	120 "
26 " " " .....	100 "

and the amount of material to be dredged will be as follows:—

If dredged 18 feet deep .....	4,200,000 cub. yds. (say)	5,670,000 tons.
" 22 " .....	4,880,000 " "	6,588,000 "
" 26 " .....	5,500,000 " "	7,425,000 "

It would be hardly desirable to go to that expense. The better way would be to dredge a channel all round the shore 300 feet or 400 feet wide, and the cost of the dredging would be lessened by one-half in that way.

1354. You have not had recent soundings taken over that area? There has been no survey made by our Department. Mr. Halligan has taken this from an old Admiralty survey. There has been a good deal of filling up from sewage and deepening by dredging.

1355. If dredging operations were proposed to be carried out largely there, it would be quite sufficient to dredge a belt right round the wharfage area, approached by a channel from the centre of the bridge? Yes; and widen it out from time to time as circumstances rendered it necessary, making bays for very long vessels to turn at special places.

1356. Have you any other figures which you would wish to give? The dredging would cost about 7d. a ton if the material had to be taken to Homebush, as would have to be done with that quantity. To dredge it by a ladder dredge, and to convey it to the reclamation above Ryde Bridge, and pump it ashore there, would be an expensive affair.

1357. When you have shot in your 300,000 tons of silt, then, in case of any future dredging of the water inside the bridge, the silt will have to be taken to some other place? Yes; perhaps 4 or 5 miles away, or further.

1358. Which will involve an extra cost of 7d.? The total cost would be 7d., and it would be less than half that sum if we could get rid of all the material locally.

1359. How much a ton does it cost to put the stuff where you put it now? If the one machine were employed—merely a suction dredge—the cost would be about 2½d. a ton; but if you have to pump the silt half a mile, the cost is greater than for depositing at a short distance.

- A. B. Portus. 1360. Could you put down the cost of dredging and filling in now at about 2½d. a ton? It is a mixed up arrangement, because part of the original material is sent ashore, and the remainder is from dredging plant working elsewhere. We never send any material to sea if we can help it. We always put it on to land.
- 1 July, 1897. 1361. You cannot say what it costs? I will go into the matter. If it were desirable we could put 2 feet more on to the present reclamation, which would lessen the cost necessarily.
1362. Can you tell us what the cost of the present filling in has averaged per ton? You may say 2½d. per ton in one case, and about 7d. in the other; because there is the second dredge to be put to work, and the expense of towage from one place to the other.
1363. The cost of the present works may be put down as the mean between 2½d. and 7d.? Probably that would be a fair estimate, but I think if the reclaimed land is sold, the transactions, after paying for the dredging, will leave a large profit balance to the Government.

FRIDAY, 2 JULY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKEPT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the expediency of constructing a New Bridge at Glebe Island.

William Henry Austin, Carcase Butcher, Glebe Island, sworn, and examined:—

- W. H. Austin. 1364. *Chairman.*] You are a member of the firm of Austin and Windred, carcase butchers? Yes.
- 2 July, 1897. 1365. *Mr. Clarke.*] Can you give any reasons why a new bridge should be erected at Glebe Island? The present bridge, which has been up for a good many years, is in decay in places, and the swing is a great annoyance, causing great delay to the public. At times, it is open for a full quarter of an hour, and there is a string of carts reaching back to the top of Glebe Island hill and for the same distance on the other side. It must cause a great delay to everybody, more especially to business people. We sometimes send vehicles to catch a train or a boat, but the bridge opens and upsets our calculations.
1366. It must cause considerable delay to the passenger and goods traffic across the bridge? Yes. The swing is altogether too slow, and the bridge is out of date. In the new bridge I think the swing should be erected in the middle.
1367. Do you think the new bridge should be considerably wider than the present bridge? I think it ought to be constructed wide enough to allow two vehicles to pass on each side, with a 6-foot pathway on each side, and a swing of about 80 feet in the middle, giving a 60-foot fairway for vessels and allowing 20 feet for the swing to rest on.
1368. Do you think the bridge is unsuitable for the present traffic? In every sense it is. The only better way to accommodate the traffic would be to put up a good bridge from Glebe Point to Balmain. It could be done at a much less cost than the other, and I have no doubt it could be put across without having to use a swing, which, of course, will make a lot of difference in the construction of a bridge.
1369. Will you indicate on the map the bridge which you would recommend in preference to a new bridge to Glebe Island? I would recommend the erection of a bridge from Glebe Point Road to Mullens-street, Balmain, because it would cost far less than the other. If the road were brought round to Pymont Bridge Road it would be much nearer than to go down Glebe Island Road, and it would not be much further for us. It would give more space on the island. Glebe Island would be isolated; it would be out of the sight of the public, who complain of the Abattoirs and the smell and unsightly things they see. I think the bridge could be built at much less cost, and it would answer the same purpose as a bridge from Pymont to the island. It would serve another good purpose: In years to come you will have to run a railway or tramway to Drummoyne or Ryde, and by having the bridge I recommend you would have a straight road from here to Drummoyne and Ryde.
1370. Do you not think it would cost a great deal more to put up a bridge in that position than to erect one alongside the present bridge? Not at all, I think.
1371. There seems to be a large area of water to cross? No; the water would not be so deep.
1372. Would it suit the business at the Abattoirs as well as the present bridge? It would make a difference of about a minute and a half in going from there to the city.
1373. Do you consider that Glebe Island is a suitable place to carry on the butchering business? I do. As far as I know and have seen, it is second to none. I have not seen a site so suitable for abattoirs as this is. It naturally drains itself, and if the road were run away from the Abattoirs it would be isolated and out of everyone's way.
1374. Are the facilities at the Abattoirs suitable for the killing of horned cattle, sheep, and pigs? The Abattoirs are old, and no doubt it costs a lot to repair them at times. I think the time is not far distant when new ones will have to be built.
1375. In your opinion, are the present buildings and the present facilities for the butchers sufficient? No. Just now, when stock are rather short, they are big enough. Last summer we were a bit pressed for room, but there is ample room to make improvements in the size of the Abattoirs and the structure of the buildings.
1376. It has been given in evidence that the buildings for killing sheep, calves, and pigs are not sufficient—that they are utterly inadequate for the purpose? The sheep-houses are very small. To my idea, they are badly ventilated, and the roofs are very low. When they were built they were big enough. There was not nearly the same business done then as now. At the present time there is a lot of business done in these mutton-houses, and a lot of men are working among the sheep. The carcases all are hung together, and the place is not big enough at all.
1377. The same remark would apply to other small stock? Yes. The cattle-houses are fairly good at present; they are plenty big enough.

1378.

1378. The calves and pigs are generally driven from the Corporation sale-yards at Market-street? Yes. I think those yards should be on Glebe Island, and instead of small stock being driven from the city over the bridge, it should be landed on the island from the boats. The majority of this small stock comes from the boats. Some small stock comes from the trains; but it should be driven to the island and sold there in yards instead of at Sussex-street.

W. H. Austin.  
2 July, 1897.

1379. Would not the same thing apply to the large stock? Yes.

1380. To cattle sold at Homebush? To cattle and sheep; but whether the City Council would agree to that I do not know. The City Council, who have a large capital invested at Flemington, would not care to relinquish their hold there unless they had some concession made to them at Glebe Island.

1381. Suppose that all large stock were trained from Homebush to Glebe Island;—is the area on the island sufficient to provide sale-yards there? Yes; I reckon there is ample room, and will be for 100 years for the city trade. There is another reserve at the head of Rozelle Bay, but beyond the tram-line. That swamp which has been filled in lately would make a capital railway yard for stock. It is a large area, and it will not be much good for anything else.

1382. Your recommendation is to have a sale-yard at Glebe Island, not only for pigs and calves, but also for sheep and horned cattle? I think all stock should be brought to Glebe Island that are likely to be wanted in the city and suburbs, and there sold and killed. There would then be no trouble about driving stock along the road. If a light line of railway were constructed down White's Creek from Petersham or Stanmore, I do not think the cost would be great.

1383. You think it would be better, in the interests of all concerned to provide sale-yards for all stock, whether large or small, at the island? Yes.

1384. Would there be sufficient room for paddocks for the cattle? We would not want paddocks; we would only want flats, the same as they have in other countries—that is, yards with a bit of a shed, water, and hayracks. There would be ample room, and the cattle would not be kept above twenty-four hours, or at the outside thirty-six hours, in the flats.

1385. If all the improvements which you and others suggest were carried out, you think that no better site could be obtained in the immediate vicinity of Sydney? No better site for an abattoir could be obtained anywhere. I have never come across a place like Glebe Island for abattoirs.

1386. What means have you to get rid of the blood and offal? If that were treated as it should be treated, as the Sydney Meat Company treat theirs, it could be turned into manure, and sold at a profit—it would be a valuable asset.

1387. Some time ago the offal was desiccated;—was that process a success? I think the method was a very expensive one. I do not think the Government availed themselves of proper machinery. I believe the Meat-preserving Company have a far better and cheaper method of treating their offal.

1388. You think that if a proper method were introduced the manure would pay for the expense of desiccating the blood and offal? It should do if it were properly treated.

1389. Hitherto it has not paid for the expense? No. Some time ago, all they seemed to be doing there was to cart coal to the boilers and put it through—it was a sort of thing for consuming coal rather than a desiccator. I think the manure should always pay for the cost of desiccating the offal.

1390. What is the present process of treating the offal? It is run into a punt and towed out to sea. It seems a funny thing, in a country where they want manure on the ground, to throw this manure into the Pacific Ocean.

1391. The Government has to bear the expense of taking the stuff in punts outside the Heads without getting any return? Yes.

1392. *Mr. Lee.*] Do you think the unpleasant sights and smells which the public complain of could be avoided if the road were taken round to the south along the foreshores, instead of going in a straight direction as at present? If it were run around on the south side, you would have to do away with the punt, or find some other method of treating the refuse.

1393. Could not the refuse be run into the punt at some other point? You could not get the punt to lie close to the Abattoirs unless you put it there. By leaving the bridge on the western side and making a detour to the north, round by the Inspector's house, and thence round towards Mullens-street, you would avoid the Abattoirs.

1394. If that route were adopted, the unpleasant sights at the Abattoirs would be avoided? Yes.

1395. Would it be very expensive to make that road? I do not think so.

1396. Would it necessitate much cutting down? I think they have been cutting down rock for a couple of years round that way.

1397. Suppose you had to choose between the present road and a road by the route you suggest, which would you adopt? A road round by the western side of the island.

1398. If the northern route were adopted for the general traffic road, then the existing road from the Abattoirs to the bridge would meet the requirements of the Abattoirs people, and the general public would be kept away from the Abattoirs? Yes.

1399. It is on account of the general public being brought in contact with unusual sights and smells that they offer such strong objection to the Abattoirs? Yes.

1400. And if they were kept away from the Abattoirs, they would not know anything about them? No, nor of the driving of the stock.

1401. You think that if a new bridge is built of sufficient width, and with a wide opening in the centre, and a detour is made in the road to Balmain, it will meet all requirements? I think so.

1402. *Mr. Hassall.*] How long have you been engaged in the trade? I have been a master butcher for twelve years, and I have been in the trade for twenty-one years. I have been connected with Glebe Island for twenty-one years.

1403. Does your firm do a large business? We do a large business in cattle.

1404. More in cattle than in sheep? Yes.

1405. Do you supply a very large number of retail shops in various parts of Sydney and in the suburbs? Yes.

1406. You also do a pretty fair shipping trade? Yes.

1407. You bring the bulk of your meat across the bridge? Yes.

1408. Do you take any meat out from the Abattoirs by the other way? Yes; to Leichhardt, Drummoyne, Marrickville, Newtown, and all those places.

W. H.  
Austin.  
2 July, 1897.

1409. You do not cross the bridge in going to those places? Not as a rule; but at times we may do so in going to Newtown. Four-fifths of our meat should, I think, be brought over the bridge.

1410. How many trips a day do you average? Half a dozen vehicles a day.

1411. That is, half a dozen different trips? Yes.

1412. Do you suffer any great inconvenience from the delay in opening the swing, and from the narrowness of the swing? Yes, we suffer great inconvenience sometimes there, more especially on a busy day. Our busy day is Friday in summer, and Thursday in winter.

1413. Will you relate your experience as to the delays you suffer in going to and fro? The delay there sometimes is very annoying. The Abattoirs gate is shut at 6 p.m. Suppose we have a waggoner going back at 5:30 p.m. to load and get away before 6 p.m. If the bridge happens to be open, perhaps he misses the Abattoirs gate. Consequently, he cannot get his meat, and then there is a disturbance with the retail butchers as to why the meat was not delivered.

1414. Very often it causes great inconvenience to you and to others in the trade? Yes, to all business people.

1415. In your experience of twenty-one years, have you noticed any very large increase in the traffic? It has increased considerably, especially within the last five or six years. It is going on apace, and it will not be long before the bridge will only just do for carrying one vehicle to and fro.

1416. To what do you attribute that increase of traffic? To the increase of population and to the increase of trade in the locality. Since Lever Brothers started business at Balmain there is a deal of traffic—and heavy traffic too—to their factory, over the bridge. Every day I have noticed a number of trollies going to their works with tallow and other products. Of late years many factories have sprung up in Balmain. There is a lot of traffic to and from the Globe Canning Company, whose works are close to the island. Again, there is a lot of traffic in timber and one thing and another to all those factories down on Mr. Hutchinson's property. The traffic there is growing apace.

1417. The bridge, which was suitable for traffic six or seven years ago, is practically out of date now? Yes.

1418. I suppose that where you had one vehicle crossing the bridge in those times, you have five or six vehicles crossing now? We had one vehicle ten years ago, and we have thirty vehicles now.

1419. You think that a bridge should be constructed which would carry a double line of traffic, and with a swing in the centre? Yes; and it should be as wide as the road. The present swing is in the wrong place.

1420. On the present swing only one vehicle can go at a time? Yes.

1421. Would it be advisable to make it wide enough to carry a tramway, in view of the probable great development of those suburbs? Yes; a bridge to allow two carts on each side would be wide enough for a tram. The swing should be built strong enough to carry a tram. I should think it would be an expensive affair to put up a swing to carry a tram.

1422. A tramway would be a very great convenience to all those persons who do business at the island? Yes; and I think it would pay the Government.

1423. *Mr. Black.*] You prefer a bridge communication between Mullens-street and Glebe Point Road? Yes.

1424. Is the ground of similar height, or nearly so, on each side? Yes; I should think that the point where the bridge would abut on to the land would be 15 feet above high-water mark on each side.

1425. Is it an easy grade throughout on both roads? It is easier on the Mullens-street side than on the Glebe Point side? There is a bit of a pinch coming up Glebe Point.

1426. Would that road, if a bridge were constructed between those points, be as good to travel on as the present road? No; on account of the hills.

1427. Would not a bridge in that position interfere with an extension of the tram from Harris-street across the Glebe Island Bridge to Balmain? If a tram were brought from Drummoyne down the Western Road, and over the Glebe Island Bridge *via* Pymont, it would be a far nearer route than to go *via* Glebe Point, and it would be far more convenient to the public who would be travelling by tram that way. It would be nearer to the city.

1428. In that respect the proposed bridge would be more convenient and suitable than the bridge you suggest? The Glebe Island Bridge would be more suitable for all intents and purposes than a Glebe Point Bridge—that is, to ourselves, and no doubt to the public travelling to the city or the railway.

1429. You would also have to consider the matter of connection on the city side? Yes. Of course the Harris-street tram could easily be carried through to the bridge I purpose on the Pymont side, at the back of the sugar-works.

1430. But to carry a tram from Harris-street round the Pymont Bridge Road, and across your suggested bridge, would be rather a roundabout way? It would.

1431. It would be almost as bad as the route of the present tram to Balmain? Yes.

1432. *Mr. O'Connor.*] Did you mean to imply just now that you cannot send any meat from the Abattoirs after 6 p.m.? Yes; our business has to cease at 6 p.m. We are stopped from sending out meat after that hour every evening.

1433. Who made that regulation? I suppose the Board of Health did. They have made a lot of by-laws and regulations of late years—far different from what they used to be.

1434. It is a very serious interference with the trade of business men? Yes.

1435. Does it prevail all the year round? I believe it does. In former times they used to allow us to send out meat up to 7 p.m. on Friday night. I am not certain, but I believe that practice is done away with.

1436. It is not done to prevent the men from being overworked? I do not think so. Years ago, they used to close the gates, I think, at 7 p.m., and no doubt before that time they used to close the gates at any time they liked.

1437. How long is it since this rule was established? I think it has existed ever since the Board of Health took over the Abattoirs.

1438. The object of the rule is that the meat shall be inspected? The meat is inspected when it is killed, but we have to cease work there at 6 p.m. on ordinary days, and I think at 3 p.m. on Saturday.

1439. Who is the inspector of the meat? There are half a dozen inspectors. Two inspectors were discharged, and two fresh ones appointed this week.

1440. What are their duties? They inspect the meat as it is slaughtered.

1441. Do you know them? I do not know them by name.

1442.

W. H. Austin.

2 July, 1897.

1442. Do you know the qualifications of the inspectors;—are they butchers? Not all of them.
1443. Have they had any experience of the butchering trade? One of them, MacDonald, is a butcher.
1444. Do you think he is a capable man? As he has been a butcher all his life, he must be a capable man.
1445. Are all these men under the control of the Board of Health? Yes.
1446. What is the distance from Glebe Island to the place which was formerly occupied by Mr. Tankar as a boiling-down place? I should think it about a mile. It is round on Bullock Road.
1447. Who owns the property round there? The greater part of it is owned by the Government. The ground which the Government have resumed runs right back to where Mr. Tester's place used to be. There is another reserve alongside Glebe Island which the Government resumed six years ago.
1448. Is there a water supply available for the cattle and sheep? There is the city water supply.
1449. The same facilities which are afforded at Flemington could be afforded to the surroundings of Glebe Island if sale-yards were established there? Yes.
1450. That would obviate all the trouble as to driving of sheep, cattle, and pigs in the busy portion of the day? The stock-driving nuisance would be overcome.
1451. The present bridge is altogether inadequate to meet the great demands made upon it from Glebe Island and the surrounding districts? Yes.
1452. Do you not think that in view of the importance of the locality, and the great business done there, the Government could well afford to go to some expense to construct a bridge with a swing strong and wide enough to carry a tramway to be laid down in the future? I think they could well afford to go to great expense, and build a good bridge which would carry a tram, and convenience the public generally.
1453. Do you not think that it would be a great source of revenue to the Government? Yes.
1454. You said that Glebe Island is one of the finest naturally-drained places in the world? I have visited a few abattoirs, but I have never visited a site to equal Glebe Island.
1455. By a fair expenditure of money it could be increased in value for present purposes, and made to accommodate all the business which would take place for many years to come? For the next hundred years.
1456. *Mr. Trickett.*] Do I understand you to say that the Abattoirs are very suitable? I say the site is very suitable for abattoirs.
1457. Did you ever see an abattoir for a large city on such an irregular and inconvenient site as Glebe Island? I have never seen an abattoir which had the same natural drainage.
1458. Are they not generally level in their arrangements? Yes; at Deptford, for instance.
1459. Is not that a disadvantage? Level abattoirs are an expense in pumping and driving water and refuse about in different directions, and in carting.
1460. Do you think that Glebe Island is a sufficiently large site for the abattoirs of a large growing city like Sydney? I do. Glebe Island, if a proper sea-wall were built all round it, could be made much larger than it is.
1461. In its present state, you do not think it is large enough? I do; but I point out how it could be made larger. Factories and stores could be built on the northern and western sides of the island, warehouses, and all that sort of thing, with a deepwater frontage.
1462. You look upon it as a suitable site as regards its accessibility for the purpose of sending cattle, pigs, and sheep there to be slaughtered? Yes; I look upon it as second to none for anything connected with the butchering trade.
1463. Do you think it is desirable that the cattle should be driven over that length of road from the railway? I think a light line of railway should be taken to the island.
1464. You do not think the present system of taking the cattle to the island is suitable? I am sure it is not. It is a great inconvenience to the public, besides being a nuisance and a terror in some cases.
1465. How should that be remedied? The only remedy you could have would be to construct a railway from Stanmore or Darling Harbour or Darling Island.
1466. You think it desirable that the stock should be trained into the Abattoirs? I think they should be brought direct to sale-yards at the Abattoirs. To re-truck the cattle at Flemington would never do. It would mean expense, cruelty to the animals, and all sorts of things.
1467. Does not that point to the fact that it would be better to have the abattoirs adjoining the sale-yards at Flemington? I should say it would be better to have sale-yards adjoining the Abattoirs at Glebe Island.
1468. Is there space to make large sale-yards? Yes; the same number of cattle would not come to Sydney as come to Flemington, because a lot of stock sold at Flemington go back to the country. Country buyers—for instance, from Wollongong, Parramatta, and different places—come to Flemington and buy stock. There was a buyer there from Goulburn yesterday.
1469. There could not very well be two sale-yards, because the stock are all sent to one place for sale. There may be some stock to send back to the country, and some to send to Glebe Island. It would not do to have two sets of sale-yards, because you could not separate the stock? If there were sale-yards erected near or at Glebe Island, you would find that that would be the market, and not Flemington, which would be only a sort of side show.
1470. The bulk of the animals come to Sydney for the purpose of being slaughtered? Yes.
1471. Do you regard the buildings on Glebe Island as being up to date? No; the mutton houses are not large enough nor ventilated as they should be. In hot weather they are not fit for men to work in. The beef-houses are certainly better, but great improvements could be made in them.
1472. If Glebe Island is kept going as a great slaughtering centre for Sydney, it will have to be improved as regards its arrangements and the buildings? Certainly.
1473. I understood you to say in answer to Mr. Clarke that Glebe Island is suitable for slaughtering purposes, because the cattle and other stock which are taken there do not have to go without water for thirty-six hours? The animals do not have to go without water. There is water for them as soon as they are driven there. At the present time in our bullock paddocks at Five Dock we have water laid on, and we have holes so constructed that they get filled, and if they go dry the city water is available. The stock when taken out of the train are well supplied with water up to the time they are slaughtered.
1474. How do they get on with regard to food? If the auctioneers hold them any time they feed them with lucerno hay, and if we hold them any time we do the same.

W. H.  
Austin.  
2 July, 1897.

1475. What do you call "any time"? I should say a week. I generally hold cattle a fortnight before I handle them.

1476. And you feed them all the time? Yes.

1477. Is there any foundation for the rumour which we hear sometimes that between the arrival of the cattle by rail and their despatch to the slaughter-houses a considerable time elapses without their having any food? I have heard that rumour ever since I was connected with the trade, but I have never seen it done.

1478. You do not believe there is any truth in the rumour? I am sure it is not true. All sorts of rumours get circulated about these things. If a person is not actually there when you feed a bullock, of course he never sees it fed, and it cannot be fed.

1479. As a carcase butcher, with a very large business, you deny the statement that the animals are left in a starving condition for a considerable time before they are slaughtered? I do.

1480. You think that Glebe Island will continue, or ought to continue, to be the central slaughtering-place for the meat supply of Sydney? I think so, because it is in the centre of the whole of Sydney. From Sydney we send to Manly, North Sydney, Willoughby, and all the suburbs; and likewise meat is sent away in the train. It is central for all purposes. The climate of Sydney is not like the climate of other cities, where they can kill meat in the country and let it hang for a time—perhaps two or three days or a week—as they do in parts of America and England. We have to kill the cattle, and the beef has to go into consumption very quickly, or else it goes bad.

1481. You still maintain the opinion that Glebe Island is a better site for slaughter-houses than a portion of what is known as the Wentworth Estate, which is close to the Flemington saleyards? I do. There is no other site to compare with Glebe Island in position or anything else, and no site more suitable for abattoirs than it is. As for myself, I do not care a fig if it were shut up to-morrow as far as the business goes; but if it were closed things would drift into a channel. The butchers would have a far better way to do business than they do now. They would have things more in their own hands. They would very soon form some rings, and do all that sort of thing; and the price of meat would go up considerably in the town.

1482. *Mr. Hoskins.*] They would have a better chance to kill cattle which might be diseased? Yes.

1483. *Mr. Trickett.*] That is another reason why you think it would be better to have slaughter-yards at some little distance from the sale-yards? Yes; I think the inspection at Glebe Island is perfect. In the interests of public health I think all meat should be inspected before it is put on the market. The same thing should be done here as is done in the United States. If a carcase butcher or a company—it does not matter whether it is in the city or in the country—puts up a lot of meat for sale, or sends it to a market, before that meat is allowed to be sold in the market a Government inspector gives him a certificate to the effect that the meat is fit to eat; and when he wants to sell the meat he can produce the certificate, which will clear him, and satisfy the public at the same time that the meat had been inspected. We know very well that there is a lot of meat sold in Sydney in different places which is not inspected. It is hard to inspect meat once it is slaughtered and dressed. It wants to be inspected when it is slaughtered. The inspector wants to be there, and to see the inside of the pig, beast, or sheep brought out. He can see then whether it is diseased. Sometimes the inside of a beast is diseased, but the carcase does not appear to be diseased; and if it is not inspected at that time it drifts along into the market and is sold, and nobody sees it or detects it. In a country like this, where we have an ample stock at most times—at present it is a bit short—that sort of thing should be carried out in its entirety. At Glebe Island, as the meat is slaughtered, there stands the inspector over it, and anything which is wrong with the inside he can detect.

1484. I think you said that the desiccating of the blood and offal at Glebe Island was a farce? There is no desiccating there now. It is all run into a punt, and carted away to sea.

1485. You have visited many slaughter-houses in other parts of the world? I have visited some.

1486. Have you ever been to Chicago? I was never in America.

1487. You have visited Melbourne? No; but I visited Marseilles, Depford, and Copenhagen Fields.

1488. As a general rule, when the blood and offal are converted into manure, it meets with a large sale? Yes.

1489. In Melbourne, I understand, it is a source of profit? Yes; I believe it is when it is properly handled.

1490. Would it not be advisable to do the same thing at Glebe Island? I believe it would. I think the manure ought to pay for the working of the desiccator.

1491. Have you seen any desiccating works? Only at Glebe Island. Two or three years ago the Sydney Meat Preserving Company imported a new desiccator from England, and an overseer there tells me that it works well.

1492. Is the process of desiccating offensive to the surrounding country to any extent? Not that I am aware of. I know that at times the smell from the desiccator at Glebe Island used to be offensive, but I think it could be overcome as is done in other abattoirs and in boiling-down places. You could make them condense the vapours.

1493. *Mr. O'Connor.*] As regards the smell at Glebe Island, is it not now to a very large extent destroyed compared to what it used to be years ago? A stranger may detect a smell there, but I cannot.

1494. Every precaution is taken to keep the place thoroughly clean, and the disinfecting process has been successful? Yes.

1495. Do you think that Glebe Island, as a great slaughtering establishment, is in any way deleterious to the health of the permanent residents in the locality? I do not. A number of people reside on the island, but I have never known of them to have any sickness which would arise from bad smells. For a number of years the gate-keeper has lived in a little place alongside the desiccating-house, right down among the drains, from which the Government derive some rent, but in which I would not like to keep pigs for a number of years, but I have never known him to have a day's sickness.

1496. Where do you reside? In Balmain, about a mile from the Abattoirs.

1497. Have you ever suffered in health from going to the Abattoirs? No.

1498. Have the members of your family ever suffered in health from going past the Abattoirs to and from Sydney? I have never known sickness to arise from bad smells or anything connected with the island.

1499. Have you ever heard of an epidemic breaking out among the large population immediately surrounding the island, or of people being very ill there? No. Taking Balmain as a whole, the people are the most healthy people about Sydney.

1500. Are the men who work at Glebe Island a healthy body of men? They are very healthy. The butchers, I suppose, are the healthiest body of men you could find.
1501. At what time do these men go to work? They start at 6 a.m. and leave off at 6 p.m. The advantage which Glebe Island possesses over any other place is that you can telephone from any suburb, no matter how hot the day is, for a body of beef, and the men stand up, down it comes, and out it goes, delivered in the shop within an hour. You could not do that if the Abattoirs were situated in the country. Although the men are at the Abattoirs from 6 a.m. to 6 p.m., often they do not work above three or four hours a day.
1502. In your opinion, the place is healthy for the men to work in, and the people surrounding the island have no ground to complain that they are inconvenienced by any smells? That is so. The only drawback to the men is, that the mutton-houses are not big enough to work in in very hot weather; but I never knew one of the men to become sick from working there.
1503. Is it not a fact that they pay a rent at Glebe Island for unhealthy places? That is so.
1504. The rents of the houses there are enormous? Very large.
1505. And the facilities for the working men, and even the employers, are very poor? Yes. We have not the accommodation for the working men we should have. There ought to be a good dining-room for the men. There is a very small place, but the men do not care to go into it. I think there is only one bath-room to accommodate all the men. There ought to be a bigger place for the men to undress in and hang up their clothes.
1506. The slaughter-houses are very narrow and poor? Very narrow.
1507. And the rents are very high? Yes.

W. H.  
Austin.  
2 July, 1897.

Daniel Sheehy, Shipwright and Contractor, Glebe, sworn, and examined:—

1508. *Chairman.*] You are a member of the firm of D. Sheehy and Sons, shipwrights and contractors? Yes.
1509. *Mr. Lee.*] Where do you carry on your business? At the Glebe, just above the bridge.
1510. In your opinion, is there a necessity to erect a new bridge to Glebe Island? I think you could do better without a bridge.
1511. What would you substitute for the bridge? One proposal is to make a road starting at the intersection of Pymont Bridge Road and Blackwattle Cove, tunnelling under Glebe Road, coming out at the junction of the Allen Estate with Rozelle Bay reclamation picking up the tram line at Johnstone-street, and following it to the junction of Abattoir Road and Gordon-street.
1512. That would practically bring you on to the tram-line? You can leave the tramway at Gordon-street and go along Abattoir Road.
1513. That would be a long way round for the people who use Glebe Island to get into the city from the Abattoirs? Only for the Miller's Point portion. It would be a short road, I think, to Paddington, Redfern, and all those suburbs.
1514. If they wanted to go into the heart of the city, it would be a long way round coming from Glebe Island? Yes; but you would do away with the bridge. You have a lot of valuable property there. I believe that if the bridge was open, you could go round by that way more quickly than you could if you waited till the bridge was shut. It would be a nearer route to Paddington and all the suburbs, and the city is growing out that way. It is only to Market-street and such places that the present bridge is any advantage.
1515. The construction of a tunnel from Pymont Bridge Road to the reclaimed land at Annandale would be a very costly undertaking? I went into the matter, but not minutely. I reckon that for the excavations, brick, and everything, it would cost about £50,000.
1516. From Glebe Point across the reclaimed land would be an ordinary road? Yes.
1517. Have you any idea how long the tunnel would be? Half-a-mile was the most I could make it.
1518. To carry the ordinary vehicular and pedestrian traffic, it would have to be of a considerable width? Yes; you could make the tunnel as big as you liked.
1519. Did you take that matter into consideration? No; I allowed for a width of 66 feet and a height of 20 feet.
1520. Admitting that that would be sufficient to carry the traffic, do you not think that there will be some very grave objections to taking a large traffic of that kind underground? I cannot see it. It would be a straight line right across to Balmain.
1521. I presume your main object is to keep the whole of Blackwattle Cove and Rozelle Bay intact for shipping purposes? Yes, without a bridge.
1522. And when it is dredged out, to enable vessels to come in and out at all times, and to allow ordinary traffic to go by the route you have described? Yes.
1523. Have you ever formulated this idea to people there, or is it a private scheme of your own? I have spoken about it to several, but they seem to object to the tunnel; they would sooner have a road. You could get a road cheaper than a tunnel. You could get a road by nearly the same way as the tunnel with about the same grade as there is in Charlotte-place for about £40,000, including the land resumption and everything.
1524. That would be to get a straight road? Yes.
1525. If it were necessary to have a road on your lines, could it not be done by picking up your line of route at Glebe Road, and following that up to Ferry-street, and thence across to Pymont over a bridge? You want to get off from the Pymont Bridge. From the end of Blackwattle Wharf, near the Glebe, you want to get off, and the best way to get off from there, I reckon, is with a tunnel, and then you could have a road as level as this floor: but if you got off that open road you would have to go a different direction, but not much. It would not make much difference.
1526. There would be only the angle of Cross-street, which, in point of time, would not increase the length much? It would not increase it by two minutes. Then you could go across the Glebe Point Road. At the tram terminus it would not interfere with the tram—and down on to the reclaimed land and across the head of the bay. If you were to visit the locality you would see the advantage of the proposal quite plainly, or you might get the route surveyed, and ask a practical man to give you his opinion on the proposal.

D. Sheehy.  
2 July, 1897.

- D. Sheehy. 1527. If the tunnel were made it would pass very largely under buildings? It would be well under the buildings, as the Glebe is very high land. I reckon that it would go somewhere under Toxteth House, or a little lower down.
- 2 July, 1897. 1528. How do you arrive at your estimate that it would cost £50,000? Excavation of a tunnel, half a mile long, 66 feet wide, by 20 feet high, 129,360 yards, at 2s., £12,936; and brickwork, 16,000,000 bricks at 40s. per 1,000 laid, £32,000.
1529. Suppose the tunnel portion of your scheme could not be carried out satisfactorily, could a road be obtained, say, from the Glebe Point Road to Pymont? You must start from the end of Blackwattle Wharf, which will come in for everybody and everywhere—you start from that point, and go across vacant land, and come up on an angle, and you get a good road, which I reckon, speaking roughly, could be made for about £40,000.
1530. Have you lived in that locality for any time? I have been there about three years, but I have only lived there about fourteen months.
1531. What do you think of a proposal to make a bridge from Globe Point to Mullens-street on the other side? That would not be a bad idea. You could get a good high bridge there—about 40 feet high I should think; but it would increase the traffic along Glebe Road a lot. That road is none too big now for the traffic. It is a very narrow road, and with a double line of tram a good wide cart cannot pass the tram, and if it pulls up against the kerb the tram has to squeeze by.
1532. Your objection would be not so much to the site as to the bridge? If the road could be widened the traffic of all the suburbs would go that way.
1533. The street as it stands would not be able to carry the traffic? No; it would be blocked all the time.
1534. If that idea were adopted, that road of necessity would have to be widened? Yes; it would not be much of a job to widen that road, because, in accordance with a condition in Allen's plan of subdivision, nearly every house along the road has been kept back 14 or 15 feet from the street. If you took that frontage it would make the road wide enough for the traffic.
1535. It would have to be resumed? Yes; I do not think it would be very costly to resume it.
1536. Supposing it could be carried out, do you think it would be a good route? It would be a very good route, and you would not block much water above that point.
1537. I suppose the vessels which will be accommodated in future at the top of Rozelle Bay, will only be small vessels? Small schooners and ketches.
1538. I suppose a bridge with a fairway of 40 feet would be sufficiently high to suit those vessels? Yes.
1539. You would want no swing in the bridge? A swing would not be necessary there. You would want the piers to be about 70 or 80 feet apart so that vessels could pass under the bridge.
1540. Are there any special reasons why the traffic should be kept away from Glebe Island, and brought in by a more direct route? Most of the traffic which comes from Glebe Island comes from Balmain. I suppose for one person who uses this bridge ten persons would use the other.
1541. Why would it increase the travelling public ten times? Because it would be a shorter route for the majority of them, for they nearly all go to the south. It is a short-cut only for the people about Miller's Point, but for Redfern, and all the big suburbs to the south, the other route would be shorter.
1542. But the fact remains that Balmain is a large centre of population? Yes.
1543. And it is also getting to be a manufacturing centre? Yes.
1544. The people who now come by that route to the city and to the railway at Darling Harbour and Redfern are compelled to use that road? Yes.
1545. Where would you find ten times more people go over the road you suggest? You have to come to the intersection of Jones-street and Pymont Bridge Road to get to the Glebe Island Bridge, and if you measure the distance by each route from that point, you will find that the route I advocate is shorter than the other.
1546. But the people of Balmain would not be in such direct communication with Pymont Bridge as they are by the present route? I beg your pardon, sir, they would; and if you measure the distance you will find that they will be just as close.
1547. Suppose they were equally close, what advantage would there be? The advantage of doing away with the bridge, and giving you just as good a communication. A bridge is an everlasting expense from the time it is erected until it tumbles down; and when it is open it is always a nuisance.
1548. Your opinion is that the day for a bridge to Glebe Island disappears, and in consequence of the reclamations and the opening of the road on the southern side of Rozelle Bay, the road should be made direct from Pymont Bridge Road, *via* Rozelle Bay, to Balmain? Yes.
1549. Which road would give communication to Balmain and other suburbs on that side, and also afford the necessary accommodation to the Abattoirs, and for the stock going to the Abattoirs? Yes.

TUESDAY, 6 JULY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES MOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the expediency of constructing a New Bridge at Glebe Island.

Henry Macnamara, Junior, Carcase Butcher, Glebe Island, sworn, and examined:—

- H. Macnamara, Junr. 1550. *Chairman.*] You are a carcase butcher, managing a carcase butchering business? Yes.
- 6 July, 1897. 1551. *Mr. Roberts.*] Does your business frequently take you over the bridge to Glebe Island? On an average about twice a day.
1552. Have you been journeying that way for many years? About fifteen years. 1553.

1553. Can you give, from experience, any reason why a new bridge should be erected? I do not think a new bridge should be erected there.

1554. Do you never experience any difficulty or great delay in getting across the bridge? Yes; delay is occasioned by vessels passing through the opening, and the delay is increased by the fact that only one string of vehicles can pass over the swing at one time.

1555. But notwithstanding an inconvenience of that kind, you do not think the time has arrived when a new bridge should be erected? I think if the swing were widened, so as to allow two lines of vehicles to pass at one time, the bridge is capable of carrying the whole of the traffic. I suppose we have thirty waggons and butchers' carts running to and from the island daily.

1556. Are you aware that the timbers of the bridge are said to be in a state of decay? I have noticed them repairing it for many years; but I do not see that it is getting any worse. I have not taken particular notice of its state.

1557. You did not form your opinion from any knowledge as to the state of the structure? No.

1558. Did you ever notice that it was at all rickety? Not lately; I did about two years ago, but since then it has been built up with iron girders in the centre. At one time they prohibited our trollies going to the wool-washing, tanning, and boiling places from carrying a weight over 4 or 5 tons.

1559. Has that restriction been removed? Yes.

1560. Vehicles can travel at any rate if they think fit? I travel over the bridge pretty fast, and I have never been stopped.

1561. You are not aware of any restriction as to the pace to be travelled? No.

1562. Would you recommend an alteration in the position of the opening;—would it be better to have the swing placed in the centre? As far as the vehicular traffic goes, I do not think there is any objection to the opening being where it is. I do not see any benefit from putting it in the centre.

1563. What work would have to be carried out to allow two vehicles to pass on the swing? I have seen two vehicles pass one another on the swing as it is, but with difficulty. I think it could be made sufficiently wide as the bridge is. If the footpaths on either side were taken in, it would widen the swing considerably, and on the outside of the bridge a footpath might be built similar to that on the Five Dock Bridge.

1564. Assuming that the bridge is sufficiently strong to carry the traffic, you do not see any necessity to alter the existing state of things? With the exception of the widening of the swing, I do not; and if that alteration is made, I would suggest that a certain time be fixed for vessels to pass through the opening during the day. I have seen thirty or forty vehicles stopped on each side of the bridge allowing one little schooner to pass through the opening.

1565. How much wider do you think the swing ought to be made? Wide enough to give sufficient space for two vehicles to pass. I should think it ought to be 6 feet wider in the cart-track.

1566. Is there any footpath for pedestrians on the bridge? Yes; on both sides.

1567. Are they exposed to any danger when the traffic is very great? They have need to be careful.

1568. Is there a guard to protect the pedestrians? Only in the shape of a piece of timber about 12 or 18 inches high, and any person walking near to that guard is, perhaps, in a little danger.

1569. Would you recommend the taking in of the footpath right across the bridge? No; only on the swing. There is plenty of room on the other part of the bridge for vehicles to pass one another at any pace they choose, if they exercise ordinary care.

1570. Has the shipping traffic through the swing increased of late? I should think it has. It has been increasing for a number of years. I can remember the time when I do not suppose above one vessel a week would pass through, with the exception of the tug-boats; but they have increased the height of the central span, so that the tug-boat taking out the offal to sea can go right under the bridge without opening the swing.

1571. Do you know whether the public suffer any inconvenience in passing the Abattoirs? I have not heard of any complaints. Of course, there has been an uprising against the Abattoirs for a great number of years.

1572. Is there any offensive odour which could be objectionable to passers-by? I do not think so; but I may be more used to it than others, being there so many times.

1573. Would you think it necessary to make another road for the public nearer to the shores of White Bay? No; there is a big wall right round the Abattoirs, and it is only at the sheep-yard down towards White Bay, or the main gates, when carts are going in or out, that the public can see anything. I have seen hundreds of people pass there, and they do not seem to take any objection.

1574. Do you regard with favour Glebe Island as a site for abattoirs? I do not think there could be a better site.

1575. What are its chief recommendations? The Abattoir is built on a hill, and the drainage runs straight down to a punt. The island is near to the city for the butchers to drive across, and buy their supplies of meat. It is also handy for the carting away of the skins and by-products out to the different works. Then there is the advantage of the island being surrounded by the harbour. A large number of sheep are killed on the island, and a barge is brought to the foot of the hill to take the carcasses round to the freezing-chamber at Kirribilli Point.

1576. Have you visited any abattoirs elsewhere? At Riverstone, Melbourne, and Adelaide.

1577. Are there any improvements in those abattoirs which you think ought to be made in ours? In Melbourne, I think, the sheep-killing is done upstairs. That is an improvement, because it allows the offal and skins to be thrown away off the floor, so that if there is any disagreeable matter it does not rise, and interfere with the carcasses hanging there.

1578. Do you think there is sufficient space now for the work done at the Abattoirs? I think there is more than sufficient space at the present time. There is a shortage of stock coming in, but at any time the inspector has been able to cope with the increased supply of stock. I have never heard of any stock being brought there where he could not provide accommodation to have them killed. We do the largest business on Glebe Island. We pay a rent of from £45 to £50 a week for three mutton-houses, a beef-house, a calf-house, and a pork-house.

1579. Does any other firm lease as large a space as you do? No. I think the greatest number of houses any other firm occupies are two.

1580. How are the stock brought to the Abattoirs? The sheep are driven in along the Parramatta-road, and from that point along Bullock-road.

H.  
Macnamara,  
junr.  
6 July, 1897.

1581. Do the stock approach the Abattoirs from Balmain? The pigs and calves from the city yards, and the cattle and bullocks come from Balmain.

1582. Do you know that the driving of the stock through the streets is a source of great inconvenience and a danger to the people? I have heard so.

1583. Have you heard many complaints? Only what I read in the newspapers. Generally, I have not heard many complaints. I think it all could be remedied.

1584. In what way? I would suggest that the cattle should be driven from Homebush or the paddocks between midnight and 3 or 4 a.m.—say, 3 a.m.—and that the electric light should be installed on Glebe Island, so that the inspectors could count them in and inspect them just the same as they do in daytime. There is no traffic on the roads between those hours. The whole of the sheep could be brought in before 8 a.m. It would do away with the nuisance of bringing in the stock during the day. The pigs and calves from the city yards could be brought to Glebe Island before 8 a.m.

1585. Could this regulation be faithfully adhered to without greatly inconveniencing the persons engaged in your line of business? We are in the largest way of business at the island as regards pigs, calves, sheep, lambs, and cattle. I feel certain that if that rule were brought about it would not be any great inconvenience to us, and I take it, therefore, that it would not inconvenience anyone else. It would stop all these complaints about the driving in of cattle in the morning.

1586. At present there are no regulations as to the driving of cattle? Yes, there are. The cattle must all come in between 6 a.m. and 8 a.m., and if not in before 8 a.m. they are liable to a fine of so much a head.

1587. You think it should be fixed much earlier? They can drive the cattle easily during the night—from midnight to 3 a.m. Hundreds of times we have had our cattle brought in during the night.

1588. At what hour are the sales generally held at Flemington? The sheep sales start at about 9.30 a.m. At present they are getting the sheep sales over before lunch on Monday, and at about 3 p.m. on Thursday; but when there is any surplus of stock it takes them all day to sell the sheep. The cattle sales start at 1.30 p.m. on Monday and Thursday, and they are often not over until 5 p.m. or 6 p.m. They can bring cattle straight in from Homebush in about three hours nicely.

1589. Would it add materially to the expense? Not at all. There is only the one droving to be done.

1590. In what time have the stock to be removed from the sale-yards? They give the buyers up to next day—twenty-four hours.

1591. Do you think there will be any necessity to connect Glebe Island with the railway system of the Colony? Not the slightest necessity. I am sure it would never be workable.

1592. For what reason? Suppose that we were getting from 350 to 400 head of cattle for Glebe Island. On the journey down from the borders of Queensland the cattle very often are untrucked and trucked again. We have to suffer enough from the bruises which the cattle receive in the train on the journey down; and we would not re-truck them for such a short distance to Glebe Island. We pay a rent of £40 or £50 a week at the Abattoirs, and if we had to pay for the trucking of the cattle to the Abattoirs, it would simply be a monstrous act, and the result would be that we would have to go out into the suburbs to kill.

1593. The quality of the cattle would be seriously deteriorated? Yes.

1594. And you would be put to a large amount of unnecessary expense? Yes; it would mean that all the stock would need to be trucked from Homebush as soon as it was bought, and there would not be yardage accommodation on Glebe Island for it.

1595. Would you regard with favour the proposal which has been spoken favourably of here to have sale-yards at Glebe Island? There is not room enough. The space occupied at Homebush in the selling of cattle and sheep is very large. Suppose that stock arrives on Friday or Saturday for Monday's sale, it means that the auctioneers have to hold the sheep and cattle for that day. Take, for instance, the number of sheep we have yarded—between 70,000 and 80,000, and 75,000, I think, was the largest yarding—there would not be nearly sufficient room at Glebe Island for anything like that number of sheep, let alone the cattle. Again, all the stock which is sold at Homebush does not go to Glebe Island.

1596. Does 75 per cent. of it go there, or more? Barely 75 per cent.

1597. Where does the remainder go? To suburban slaughter-houses, as they call them, and up country a few miles outside Parramatta, Penrith, and Liverpool, and across to Hunter's Hill.

1598. To different suburbs through which trains pass? Yes; cattle are often bought at Homebush and trucked back to Maitland. Buyers from Liverpool and Campbelltown come down to Homebush to buy. If the whole of the stock were brought to Glebe Island these men would have to go there to buy, and truck the stuff back.

1599. You regard the sale-yards at Flemington as being in a position fairly convenient to the majority of the people engaged in the trade? It suits country people, and it suits metropolitan people.

1600. *Mr. Black.*] I understood you to say that the swing in the present bridge to Glebe Island does not interfere with the road traffic;—does it not interfere with the water traffic? In what respect.

1601. Is it not difficult for boats to get in and out there? There has been a difficulty with the larger boats.

1602. Even with the smaller boats, is it not in such a position that a boat requires very careful handling, and some time is wasted in getting her into the necessary position? Yes; I have seen time lost in doing that kind of thing.

1603. Does not anything which interferes with the water traffic interfere with the road traffic? Yes: I suppose it would cause the road traffic to be delayed.

1604. We may infer from your evidence that a central swing would be more convenient for the road traffic as well as the water traffic? It might not be worked with any more efficiency than the present swing at the end. I am not experienced in the navigation of vessels.

1605. You were asked this question: "Do you think that a new bridge is required there";—am I right in inferring from your answer that you think a new bridge in some other position would be better? No; with the alterations that I suggested the bridge as it is would meet all requirements.

1606. What area do you think is in use at Homebush for sale-yards? I could not say, as I am a bad judge of areas.

1607. You are sure that there is not a sufficient or a similar area available on Glebe Island? No; nothing like it.

H.  
Macnamara,  
junr.

6 July, 1897.

1608. Have you taken the hill at Glebe Island into consideration in answering the questions? Yes; I am speaking not only of the yards at Homebush, but also of the paddocks, where they have to be drafted before they can be brought in for sale.
1609. These paddocks would require to be very roomy? Yes.
1610. What extent do you think would be necessary? I think I have heard them say that they have paddock accommodation at Homebush, just round about the yards, to the extent of about 1,500 acres. The Wentworth estate is, I think, 1,000 acres in itself.
1611. Can you suggest anything which would improve the efficiency of the Abattoirs at Glebe Island? I think the place is quite capable of doing the whole of the slaughtering which is required there at the present time. Of course the slaughter-houses are not of the most improved style. I think the whole of the slaughtering—both cattle and sheep—ought to be done overhead, and the offal and one thing and another thrown down to be treated underneath in a separate room.
1612. That is the practice followed in the Meat Preserving Company's works? That is the practice followed in America, too, I believe.
1613. *Mr. O'Connor.*] On many occasions you have seen vessels jammed for a considerable time in the swing of the bridge? Yes. I have known the traffic to go right round by White Bay and through Leichhardt, but that does not occur very often. It has occurred only three times to my knowledge.
1614. If the swing were improved all the other conditions would be fair? I think so.
1615. *Mr. Trickett.*] As affecting the suitability of the Abattoirs at Glebe Island, may I ask how long are animals kept there before they are slaughtered? We bring in our sheep this afternoon for next day's slaughter, and the cattle come in in the same way, but, of course, in the morning. We do not kill cattle straightaway, unless we happen to be out of cattle, and then I bring them in from Homebush through the night, and they are allowed to rest three or four hours before they are slaughtered.
1616. Suppose they come from outlying places, such as Bourke, how many hours' rest do you give them before they are driven from the sale-yards at Homebush to Glebe Island? From twenty-four to ninety-six hours. It is very seldom that they are killed straightaway.
1617. Is not twenty-four hours a very short period to elapse before they are killed? I do not know. They seem to be in a settled condition as far as the meat is concerned—not what they term "veiny."
1618. Dr. Ashburton Thompson, in his evidence before another Committee, said it is necessary for the good state of the flesh that an interval of three days should elapse before the animals are killed? It is a matter of opinion. Dr. Thompson may have that opinion; I have not.
1619. What do you think should be the shortest time? I think that if a beast gets twenty-four hours' rest, and a drink of water, that is sufficient
1620. To compose it for the purpose of animal food? I think so.
1621. There is no desiccating plant in use at the island now? No.
1622. Do you not think a desiccator would be a great improvement on the present mode of wasting the material? No. I think the present mode is by far the best. The stuff is taken away fresh, and there is no smell arising from the Abattoirs now as there used to be when the desiccating plant was at work.
1623. Were not the desiccators of a very inferior and primitive construction? I believe they were.
1624. If the offal and blood could be converted into a marketable commodity without being offensive to residents of the neighbourhood, do you not think it would be desirable to adopt that plan instead of sending the stuff out to sea and wasting it? It is hardly a question of waste. Perhaps it might cost as much to work up the blood and offal as you would get for the manufactured article.
1625. As you have visited the Melbourne Abattoirs, you know that they go in for desiccating there? It is some time since I was there. I think they did, but I was not there very long.
1626. Perhaps you are not aware that the work is attended there with a profit? No. If we had a slaughter-house away from Glebe Island I do not think we should bother to work up the blood as they have done at Glebe Island.
1627. Have you gone into the commercial aspect of the question? No; but I have spoken to plenty of men who have done so.
1628. What is your opinion on this point? It is just as well to run it away as to work it up.
1629. You think there is nothing much in it? No.
1630. Do you think freezing-houses in conjunction with the Abattoirs are necessary? I think it would be a very good idea. There is room enough there for a freezing-house, and to my mind it could not be put in a better spot, for vessels could go up to the foreshore of the hill and be loaded from there.
1631. Do you think that a cool storage department on the island would be a very good adjunct to the Abattoirs? Yes, for the purpose of export.
1632. It would be put right on board the ship, instead of being punted away? Exactly.
1633. *Mr. Lee.*] Are you satisfied that the bridge to Glebe Island is in a proper position? Yes, and I think it meets requirements.
1634. Are you quite satisfied with it? Yes.
1635. Would you offer any objection if the new bridge were built from Glebe-road to Mullens-street? I do not think that is necessary. Most of the traffic which passes over there to Glebe Island is in connection with the Abattoirs, and if people wanted to go from the city to the Abattoirs they would need to drive round by a circuitous route.
1636. Could the road be deviated from the site of the present bridge round the island, either to the north or to the south, with advantage to the public as well as those who use the Abattoirs? Possibly it could be done, but I have not heard any great outcry on the part of the public who pass the Abattoirs.
- 1636½. Would it be any advantage to the occupiers of the Abattoirs to have the public traffic taken away from the Abattoirs-road? I do not think so.
1637. You offer no objection to it? I have no objection to the traffic past the Abattoirs
1638. Whether it comes past the Abattoirs, or is taken round on either side? It is quite immaterial to us.
1639. *Mr. Wright.*] Would it not be better if a new road were formed across the island with a better grade and a better approach? I do not suppose Glebe Island is the nicest place in the world for people to pass, and if it were decided that a new road should be put there it would be an acquisition to the public who travel to these suburbs.
1640. The road on the eastern side of the island is very narrow and steep for heavy traffic? Yes.
1641. It would be better if the road were widened and the grade flattened by cutting out some of the hill? I think it is only occasionally that any vehicles get stuck there with loads. We have no difficulty with our teams.

H.  
Macnamara,  
junr.  
6 July, 1897.

1642. You do not, but there is some traffic very much heavier than yours, and that steep grade is inconvenient to them? Our traffic would be coming down the hill.

1643. Do you not think that if a new bridge is built the whole of the approaches should be very much widened and improved? If a new bridge is built no doubt it would be better if the approaches were widened.

1644. Is there water on the island for the cattle when they come in? In every pen.

1645. They do not suffer for want of water? No.

1646. I suppose there is no such thing as feeding the cattle? There is no occasion to feed them, because they are killed within twenty-four hours. If they are left from Saturday to Monday the regulations of the Abattoirs demand that they shall be fed, and of course we feed them.

1647. If the island were levelled down, and proper yards were made, and proper facilities provided for the beasts to be watered and fed, would it not be of very great advantage to yourselves if the cattle were brought in there for sale? I daresay it would be an advantage to have them handy to the slaughter-house, but if that is required to be done, why not have the slaughter-houses up near the sale-yards.

1648. From what you have said I gather that you consider the island is the best site which could possibly be obtained for an abattoir, being isolated, with perfect drainage, and removed to a large extent from any population? Yes.

1649. Now, if the island were flattened down, and proper yards built, do you not think that it would be an improvement to have sale-yards for all stock likely to be required at the island? There would not be room enough for that.

1650. You are quite positive about that? Yes.

1651. The island contains an area of  $34\frac{1}{2}$  acres, and at White Bay there is a reclamation of 12 or 14 acres? I am sure there would not be room enough there.

1652. The disadvantage to that site, you think, is that you could not possibly get resting-paddocks for the cattle? No.

1653. I suppose the resting-paddocks at Homebush are perfectly denuded of feed? There is no feed on them, with the great number of stock passing through the yards.

1654. All they get is the privilege to lie down and a drink of water? Yes.

1655. Is there not room enough for that at the island? I suppose there is, but I do not approve of it.

1656. If it is determined to do away with the present bridge, you think the new bridge should be made direct from Pymont, and not from Glebe Point, to the island? From Pymont, most certainly.

1657. *Mr. Hassall.*] It is a great advantage when you take stock out of trucks after a long journey to be able to put them into a roomy paddock;—to walk about and cool off after the journey, which naturally creates a state of fever in horned cattle? Yes; and in sheep as well.

1658. For that reason you think it would be very injudicious to attempt to remove the sale-yards from Flemington, where every convenience except grass is available? Yes.

1659. There is any amount of water, and roomy paddocks are available for the stock to lie down and rest? Yes.

1660. Did you state that it would not be advisable to re-truck the stock from Homebush? I did.

1661. Are not the cattle knocked about very much in the sale-yards? Yes; from the trucking. Cattle coming in by road are free from bruises. Bullocks, when they have been driven about, trucked and re-trucked, get wild and sulky, and it would be a terrible thing to re-truck them.

1662. That operation at Homebush would not only be attended with a great deal of danger, but would deteriorate the value of the beast most considerably? Most certainly.

1663. Therefore the road-driving to Glebe Island is beneficial to the cattle rather than otherwise? Exactly. They are driven in quietly.

1664. As a practical man, I presume you would say that the location of the sale-yards at some little distance from the slaughter-yards is an advantage to the cattle rather than otherwise? Certainly.

1665. If the slaughter-yards were in the immediate vicinity of Homebush, the chances are that cattle would be run in and killed there straight away without waiting twenty-four hours to cool? Yes.

1666. So that your beef would not be of as good quality when distributed to the public as it is now? It would not.

1667. You have a good deal of traffic over the bridge in connection with your business? We have upwards of thirty waggons, carts, and trollies passing to and fro, and as they average about four trips a day to the island, they would pass backwards and forwards 240 times.

1668. Any stoppage of the traffic at the bridge means a considerable loss of time, and in some cases, I presume, considerable inconvenience? Certainly.

1669. Can you get into the Abattoirs after 6 p.m.? No. The gates are closed at 6 o'clock sometimes, and at 7 o'clock at other times.

1670. The regulation is that you cannot take any meat out after 6 p.m.? Yes; in an urgent case you have to get special permission.

1671. Suppose a cart is expected to return to the Abattoirs before the gate is closed, but owing to a block of the traffic on the bridge it does not arrive at the Abattoir gate until 6.5 p.m., it has to go back to the city empty? Yes. It is very desirable to have the bridge erected in such a manner that it will be as free as possible from blocks, because it injures our business. I have seen three or four of our vehicles on either side of the bridge when a block has happened, and that is why I suggest that a certain time should be fixed for the vessels to pass through the swing, no matter what bridge is built.

1672. Do you suffer any great inconvenience from the swing? Suppose there are forty or fifty vehicles on either side of the swing, the vehicles on the bridge are allowed to pass over before any vehicles are allowed to come in off the road. That regulation is the outcome of a suggestion I made to the man in charge of the swing three or four years ago, when they complained that the bridge was in a bad condition and there was so much traffic. I asked "Why let the traffic come off the road and pass over the bridge at the same time as the traffic on it which was blocked." There would possibly be from eighty to 100 vehicles on the bridge, which would mean a great strain on it. Now, if you are on the roadside, you have to wait for the traffic to come off the bridge.

1673. Has the traffic increased very largely of late years? Yes. Drummoyne, Birkenhead, and all those places out there have been built upon largely, and consequently there is a great deal more traffic.

1674. The great bulk of that traffic comes over the bridge? It all comes into Sydney by that way.

1675.

H.  
Macnamara,  
junr.  
July, 1897.

1675. The bridge which was suitable to carry the traffic of fifteen years ago is now practically out of date? It is as far as the swing is concerned.

1676. It would be a great advantage, not only to Glebe Island, but to the western suburbs, if a larger and more convenient bridge, with a wider swing, were erected? I think the bridge is all right if the swing were widened.

1677. The great inconvenience in connection with the bridge is the narrowness of the swing? Yes.

1678. Do you think it would be justifiable to erect a more convenient bridge, in view of the evidence we have had that the structure is comparatively unsafe? If the structure is unsafe it will be just as well to have the bridge made a little wider, with a swing which will enable two vehicles to pass in opposite directions.

1679. You have no doubt that the Abattoirs will be retained at Glebe Island for some years to come? I think so. We are going to leave Glebe Island this year, and we are now making arrangements to kill in the country, in order to reduce the heavy expenses we are under—not that we are dissatisfied with Glebe Island as a killing centre. We intend to go to some place along the line within a radius of 15 miles of Sydney, and bring in the meat by rail to Darling Harbour, where we have a meat-room. Most of our meat is carted there from the Abattoirs for the Sydney trade.

1680. A considerable quantity of meat comes from Riverstone to Darling Harbour? Yes.

1681. You propose to carry on your business exactly as the Riverstone Company does? Yes.

1682. I presume, in the event of your leaving the island, somebody else will try to get the accommodation you occupy? They may. There is plenty of room there now if anyone wants to get it.

1683. I presume the consumption of meat is increasing year by year? Yes, our business has increased. A few years back there was only one slaughter-house, but as the population of the suburbs has increased I suppose between Sydney and Parramatta, there are on either side of the suburban line twenty or twenty five suburban slaughter-houses, which stop the local butchers from coming in to Glebe Island to make their purchases. Glebe Island does very little business further out than Petersham.

1684. Have you any idea of the system of inspection at the country slaughter-houses? I do not think there is any inspection at all. A man can kill at these places at any hour he chooses, and on Sunday as well. On Glebe Island no killing is done on Sundays, and you have to kill within certain hours, and in the presence of inspectors; but in the suburbs there is perhaps one inspector for six or eight slaughter-houses, and, of course, it is utterly impossible for him to inspect all the meat.

1685. I suppose, as a rule, they kill when he is not there? I know I should if I were out there. I suppose they do the same.

1686. Under these conditions, I presume it is exceedingly probable that a lot of meat which would not pass inspection at Glebe Island goes into consumption? There is not the slightest doubt about it. I have been buying stock at the city yards for a good many years, especially pigs. If a man's pig is condemned at Glebe Island the auctioneer has to refund to him the purchase money. Therefore, if an auctioneer is selling a pig, or a pen of pigs, which he thinks are diseased, it is to his benefit to see that somebody gets them with a chance of their being killed without being condemned by an inspector, and very often the auctioneers arrange with outside buyers and sell to them privately. The remark is often made, "At suburban slaughter-houses no inspection, and no chance of any refund." There is not the slightest doubt that stock is killed in suburban slaughter-houses which is diseased.

1687. And which would not pass muster at Glebe Island? Yes. There is no stock killed at Glebe Island without its being properly inspected. There is a whole army of inspectors at the island.

1688. It is utterly impossible for a country inspector, in charge of eight or ten slaughter-houses, to inspect the stock slaughtered at those places? Yes.

1689. If they had any diseased beast on the premises they would keep it out of sight until the inspector had gone, and then put the knife into it and dress it up and send out the meat? There is no doubt about that. An inspector under the Board of Health told me that he went out to a certain suburban slaughter-house where they had a fall of two head of cattle on the ground slaughtering. He inspected two beasts and condemned them. The man knocked off killing, and the inspector said, "Are you not going to kill any more?" and the man replied, "Not until you have gone." The inspector presumed that after he had gone the killing went on.

1690. There is a proper system of inspection at Riverstone? They have an inspector there.

1691. If you started operations in the country you would want an inspector at your establishment? Yes; I would offer no objection to an inspector.

1692. You get a refund for any beast which is condemned? Not for any cattle; only for the pigs.

1693. *Mr. O'Connor.*] Do you not get a proportion in respect of cattle? No. Some time ago if you had any cattle condemned you would get two-thirds of the cost price refunded. Now that is done away you do not get anything. That is where it benefits suburban slaughter-houses, who get rid of any cattle which are diseased.

1694. *Mr. Hassall.*] In that case it is possible that some steps may be taken to more properly supervise country slaughter-houses, or compel them to slaughter at places where they may be supervised? There is any amount of room to kill the whole of the cattle at Glebe Island. It is only a distance of 8 or 10 miles to carry the carcasses. They carry the carcasses now from Glebe Island right out to Waverley, which is no further from Glebe Island than is Ashfield or Burwood. If the Waverley Council would license a slaughter-house in that borough, there is no doubt that there would be a slaughter-house out there. If the whole of the stock within a radius of 15 miles were killed at Glebe Island, there is plenty of room, and the public would be well satisfied that no diseased meat would go into consumption.

1695. They would know that the meat was sound as far as human judgment could prove that it was? Yes.

1696. If this evil is growing, some steps should be taken to protect the public? Yes. We send meat from Glebe Island as far as the Rookwood Asylum, a distance of 14 miles, I think, and if we can do so in that case it can be done in every case.

1697. There is every possibility of Glebe Island being fully occupied for some years for the slaughter of cattle for consumption in the city and suburbs? Yes; but if they keep on erecting many suburban slaughter-houses there is not the slightest doubt that most of the trade will be taken to those places where there is no inspection.

1698. *Mr. O'Connor.*] Have you heard that the bridge was built specially for Glebe Island, and for the convenience of the business done at the Abattoirs? I have heard that.

- H. Macnamara, junr.  
6 July, 1897.
1699. Since its erection, Balmain, from a very sparsely-populated place, has become a great city? Yes.
1700. Do not all the people who use vehicles to come to Sydney cross by that bridge? Yes; all the traffic from Balmain, Birkenhead, Drummoyne, Gladsville, and Ryde comes by that way to Sydney.
1701. One thing which surprised me during your examination was how can that bridge, which was built twenty-five years ago, only to carry the traffic between Sydney and Glebe Island, be suitable now to carry the traffic between Sydney and all those suburbs, as well as the traffic to and from the Abattoirs? If it was built too large in the first instance for the requirements of the island, of course it will bear out my argument that it will do now to carry the traffic; but if the bridge is in an unsafe condition it does away with my contention.
1702. How long has the rule that you may not enter the Abattoirs after a certain hour been in force? The gate is open until 6 p.m. in winter and 8 p.m. in summer.
1703. Twenty years ago you could go to the Abattoirs up to 11 p.m., and sometimes up to 1 a.m., and then they had as much as they could do to get over the bridge;—how can that bridge to-day, with so many people travelling from Drummoyne and Balmain to Sydney, be capable of carrying all the traffic? My opinion is that it is capable of carrying the traffic if the swing were widened; but I may be wrong in that respect.

Walter Cummin Macdougall, Proprietor, *Balmain Observer*, sworn, and examined:—

- W. C. Macdougall.  
6 July, 1897.
1704. *Chairman.*] You are the proprietor of the *Balmain Observer*? Yes.
1705. *Mr. Farnell.*] How long have you resided at Balmain? Thirteen years.
1706. Have you had a good opportunity to notice the traffic over the bridge? Yes, especially for the last eight years, when I have been travelling between Newtown and Balmain in connection with my business.
1707. Your business brings you to town pretty often, and I suppose you drive? I drive, I travel on a bicycle, and I ride a horse over the bridge.
1708. Have you ever suffered any inconvenience from the present structure not being suitable for the requirements? Yes; I have repeatedly suffered inconvenience from the opening of the swing for half an hour. I have missed trains going to the country, and on two occasions I have had to drive round by Annandale, and through Camperdown to the city.
1709. What is the longest time you have had to wait for the swing to be closed? Thirty-five minutes; generally it is less than fifteen minutes.
1710. How many vehicles have you seen on the bridge when the swing has been open? I have seen vehicles stretching right up the hill on Glebe Island, and I suppose beyond that point out of sight.
1711. There would be a considerable tonnage on the bridge then? The bridge was completely blocked up with vehicles, and almost two deep in some places.
1712. Do you remember a notice being posted on the bridge to the effect that no vehicle was to be allowed to pass over the bridge if loaded with more than 2 tons in weight? I know that a notice was posted up, but I think the load was restricted to 5 or 7 tons. Some time ago a notice was posted up that nobody could drive quickly over the bridge.
1713. Do you not think the latter notice was more significant as to the state of the bridge than the other? It was significant when you could not drive a buggy over the bridge at a trot. They even stopped a buggy driving over at a trot.
1714. Did you ever notice any vibration on the bridge? I have often noticed a vibration when two vehicles were passing.
1715. Have you ever looked at the girders in the structure? No; I have not minutely examined them, but I have seen plenty of rotten wood taken from the bridge when repairs were being made.
1716. The dangerous condition of the bridge has been a subject of common talk in the district of Balmain? Yes.
1717. Suppose the Committee should decide to recommend the erection of a new bridge, do you think the approaches should be widened at the Glebe Island end? I think a great deal of expense could be spared by making a causeway for a third of the distance on each side with the material taken from Glebe Island, shortening the length of the bridge, and putting the opening in the centre as high as possible for small craft to go under without any possible interference with the traffic from the suburbs of Drummoyne, Marsfield, Ryde, and Balmain, and even a portion of Leichhardt. The present swing is located at a part of the bridge where it is dangerous to vessels.
1718. And only vessels of small tonnage can get through the opening? Yes.
1719. You think due provision should be made for the development of the industries which have been established in Blackwattle Bay and Rozelle Bay? Yes, and the bridge should be sufficiently strong to carry a tramway.
1720. Would you prefer an iron or a wooden bridge? I should think an iron or steel bridge would be more profitable in the end.
1721. If a causeway were made as you suggest, it would be more economical to have a steel bridge, because the bridge would be shorter? Yes.
1722. Do you anticipate that eventually the tramway it is proposed to construct in Harris-street will be extended to Balmain? I do, and it was promised by Mr. Bruce Smith when he was Minister for Works.
1723. Do you remember a proposal being made some years ago to run a tramway down Harris-street, through Balmain, across Drummoyne, across the Parramatta River, and on to the Field of Mars? Yes.
1724. Is there not a permanent survey or staked line for such a tramway? It has been surveyed by that route, in answer to repeated deputations which I have been on.
1725. It seems to be the natural route to take to give the easiest and quickest access to the city? Certainly; and it would be very much better than the present tramway, which takes forty minutes to get to Circular Quay from Balmain.
1726. Do you think a bridge would still be necessary if the Abattoirs were removed from Glebe Island? Certainly; because the traffic from the suburbs has been increasing year by year, especially from Balmain in heavy traffic.
1727. *Mr. Lee.*] Do the residents of Balmain offer any objection to the position of the present bridge? No; they are quite content with the position of the bridge, as being the only communication they can get, except by a tram.

1728. Is it a cause of complaint amongst the citizens that they have to pass the gates of the Abattoirs? It is a cause of complaint on the part of aristocratic people who drive in from Drummoyne in their carriages. They have to go past a place which is unenticing, and often smells pretty high. There are a lot of dirty men hanging around there whom they would naturally complain about.

W. C.  
Macdougall.  
6 July, 1897.

1729. That would affect all persons who use that road? It would to an extent, but others do not complain.

1730. If the offensive sights are there it would apply to all who use the road? Yes.

1731. Have you ever heard of complaints made in the newspapers in respect of these things? Yes.

1732. Are you prepared to suggest how that difficulty could be got over? The road difficulty could be got over by taking a sweep round the southern shore, and meeting the bridge without passing the Abattoirs.

1733. By making a deviation on the western side of the bridge and running right round the southern side of the island, and meeting the road at Mullens-street? At Mullens-street or at Crescent-street, as the Drummoyne traffic would naturally go by that way to get to the Western-road.

1734. It could also be taken round on the northern side of the island? The Abattoirs occupy the land on that side right to the water's edge, and there would have to be more cutting down.

1735. Inasmuch as it is possible that a bridge may be erected on that site, do you recommend that a deviation should be made in the road across the island? The bridge, of course, is considered to be a necessity, but whether the expense of that road would be justifiable is a matter for consideration.

1736. You must remember that the bridge would be there for all time, and the question is, does such a nuisance exist at the Abattoirs as to render it necessary in the public interest that the road across the island should be deviated? It has in the past; but there is no necessity for that nuisance, because the Abattoirs could be so conducted that you could avoid the nuisance.

1737. Your reply is, that the present road across the island will do very well? Yes; if the Abattoirs are well conducted.

1738. *Mr. Fegan.*] How long does it take you to go by tram from Sydney to Balmain? From terminus to terminus, 40 minutes.

1739. At times there is great inconvenience from the overcrowding of the trams, on account of the large number of people who travel as far as the Newtown-road? Yes.

1740. In the course of this inquiry, is it not an important point to consider whether a better route should be taken over the Pymont Bridge, in order to shorten the time and the distance by tram? Certainly.

1741. If this bridge must be erected, and if the people of Balmain want better communication than they have, the bridge must be made strong enough to carry a tram? The new bridge ought to be made to carry a tram.

1742. Has there been any agitation for its construction? Yes.

1743. How long does it take you to drive from Balmain? Twenty minutes.

1744. How long would it take you to come by tram over this bridge? Not as long as it would take you to drive.

1745. That would mean a material saving in time and wear and tear? No doubt it would.

1746. What is the fare to Balmain by tram? Fourpence. Few business men use the tram, except to go home in the evening. It takes too long. I have started from my office 4 minutes after the tram has passed it, and got to the railway station *via* the ferry and omnibus at the same time as the tram. They go by the ferry. I am a director of the ferry company, and they average nearly 10,000 passengers a day.

1747. You think that if a tram were taken over this bridge it would materially increase the traffic? Certainly.

1748. And very soon pay for the extra cost of the bridge? Certainly.

1749. What is the population of Balmain? Nearly 30,000.

1750. How many newspapers are there at Balmain? Two.

1751. It is a go-ahead suburb? Yes; all the foreshores of Balmain are being occupied with works.

1752. Recently some new works have been started at Balmain? We have Lever Brothers' works and a coal-mine on the other side.

1753. How many men are employed there? I cannot tell you.

1754. Before the works are complete there will be a large number of men employed there? Yes.

1755. You have a coal-mine on the opposite side? Yes.

1756. Therefore it is really necessary that some better system of communication should be provided than the present one? Certainly.

1757. Do you not think it is a great inconvenience to the public to have to wait as long as thirty-five minutes until the swing is closed? Certainly; but the average delay is fifteen minutes, and with the openings averaging twelve and a half a day it means a loss of three hours every day.

1758. You are aware that a large number of people are agitating for a city railway in order to get in two or three minutes sooner? Yes.

1759. It has caused the people of Balmain to ask for improved means of communication? Certainly; everyone doubts the strength of the present bridge.

1760. Have the people of Balmain taken any steps to ask the Minister, as regards the traffic on the bridge, to provide better communication? Yes; repeated deputations have waited on the Ministers since 1889. I took the traffic on the bridge for the deputation in 1889. It was 2,229 vehicles, 100 horsemen, and 700 foot passengers. We did not count any pigs. To-day, at dinner time, I counted the traffic for ten minutes, and I saw thirty-three vehicles pass in that time.

1761. Did you count the passengers? No.

1762. Was there a large number of passengers waiting there? People were travelling to and fro, but I did not take any notice of them.

1763. The swing was not open? No.

1764. Is that the busiest portion of the day? No; it is the slackest portion of the day, because the men are having their dinner.

1765. What is the busiest portion of the day? Between 9 a.m. and 10 a.m., and at about 4 p.m.

1766. *Mr. Trickett.*] In 1894 you were examined before a previous Committee, and you furnished some figures as to the traffic on this bridge? Yes.

1767. There is a considerable increase on those you quoted for previous years? Yes; they were both taken by my own direction, and by responsible men

W. C. Maccougall. 1768. In the evidence you gave on the 11th June, 1894, you said, "The traffic on the 11th of last month was in twelve hours:—Foot passengers, 1,553 to and fro; 2,715 vehicles, and 1,417 horsemen, besides bullocks, pigs, and cattle?" I saw a proof of my evidence, and the figures were correct.

6 July, 1897. 1769. You are confident that the traffic in each case is not decreasing? It has greatly increased.

1770. *Chairman.*] Is there anything else you desire to say? I suggested to Mr. Farnell that a causeway should be constructed from each side for a third of the distance, as a way to cheapen the cost of the bridge, and to save the cost of maintenance and repairs. I think that if the Government thought fit to use some of the sand-shifters for the labour portion of the work it could be done more economically—that is, to use practical men to do the practical work, and to let the stuff be shifted by anybody. It would be a great relief to the traffic to expedite the opening of the swing in the bridge.

S. E. Perdriau. Stephen Edward Perdriau, Surveyor, Department of Lands, sworn, and further examined:—

6 July, 1897. 1771. *Mr. Black.*] Have you prepared a statement for the information of the Committee? I have.

1772. Will you be good enough to read the statement? It is as follows:—

SCHEDULE of Water-frontage Lands used for business purposes upon that part of Port Jackson lying southward of Glebe Island Bridge, with the names of the occupiers thereof, description of the business carried on, statements by the occupiers relative to same, and relative to the present bridge-opening, and that required in the new bridge, if erected.

Name of occupier or owner.	Approximate dimensions of land.		Description of business carried on.	Statements by the occupiers as to extent of business done and relative to the facilities for shipping afforded by the opening in the present bridge, and the requirements in this respect in a new bridge, if erected.
	Water-frontage.	Width.		

Commencing at Pyrmont, at the eastern end of the bridge. The whole of the frontages of the sheet of water indicated above used for businesses are described in succession, making a complete circuit to the opposite end of the bridge.

*North side of Blackwattle Cove.*

John Harris (of Shane's Park).	138 feet...	90 feet...	Vacant .....	Suggested to be resumed for new bridge.
Mathew Harris .....	1,070 feet..	110 feet... average.	Vacant.	
Attwood and Overall	50 feet...	130 feet...	Sydney Iron and Steel Works.	Do very little ship-work now, but could do it if large-size vessels came through the bridge. Present value of machinery and plant about £2,000.
Saxton and Binns.....	76 feet... (area 3	220 feet... roods.)	Timber depôt; this firm have steam sawmills close by.	Principal business done is in Oregon and Kauri pine, of which they import about 5,000,000 feet per annum. This has all to be discharged in Johnstone's Bay (because the ship cannot come through the bridge) and rafted or lightered through the bridge, which greatly increases the cost. About half a million feet is now being received. About one-third of the 5,000,000 feet is cut up by them. They also receive about 100 hardwood logs per month from the northern rivers brought by the North Coast Co.'s and other steamers; this also has to be rafted. Such logs are discharged on the wharf when brought by ketches of not more than 150 tons. Sixty men are employed by this firm on an average.
(Here Miller-street.)				
Allen Taylor, late Mazes' wharf.	80 feet...	270 feet...	Timber merchant	Has vessels of 300 tons coming to this wharf; one of these vessels of 28-feet beam cannot come through during windy weather except by using long ropes; they have to wait for calm weather. Ten men are employed by Mr. Taylor.
Holdship & Co. (Ltd.) Bowra Wharf.	250 feet...	300 feet...	Sawn-timber merchants.	The water frontage is the great attraction at this place, which will be the centre of the timber trade. Has attended many deputations to the Government requesting the widening and deepening of the bridge opening, the present opening being insufficient in these respects is a serious obstruction to business. The vessels consigned to them are from 300 to 1,000 tons register. 1,000,000 feet of timber is now being received by this firm from the "Speke," a vessel of about 2,500 tons register. This is brought through the bridge by lighters because the vessel is too large to come through.
H. Doze .....	120 feet...	330 feet...	Steam sawmills and cooperage.	Attended deputation last year re improvement of the bridge opening. Receives his timber by lighters from foreign vessels anchored in Johnstone's Bay. Vessels of about 100 tons come to his wharf. About thirty men engaged usually.
R. Guy .....	300 feet...	430 feet...	Unoccupied—recently purchased by the E. S. & A. Bank.	100 feet frontage of this land is rented by Holdship & Co.
(Here Gipps-street.)				
Saxton and Binns..... (Here Pyrmont Bridge-road.)	340 feet... (about 3	400 feet... acres.)	Timber merchants.	Saxton and Binns have only lately taken a lease of this land; it is to be used in conjunction with their other business described above.
Government of New South Wales.	1,075 feet	.....	Blue-metal wharf, Elijah Waite in charge.	About 2,400 tons of blue metal, broken and ready for the roads, are landed here per month. The trade is increasing. The largest vessel brings 330 tons on a draught of 11 feet loaded; she cannot come through the bridge except at full or nearly full tide.  The manager for Mr. Salmond, whose steamers discharge metal here, stated to me that the present bridge opening is so awkwardly situated that their vessels of about 270 tons register have several times lost blades of their propellers when going through.

Name of occupier or owner.	Approximate dimensions of land.		Description of business carried on.	Statements by the occupiers as to extent of business done and relative to the facilities for shipping afforded by the opening in the present bridge, and the requirements in this respect in a new bridge, if erected.
	Water-frontage.	Width.		
<i>South side of Blackwattle Cove.</i>				
Kauri Timber Co. (Robert Walker, Manager).	390 feet... Area about	430 feet... 4 acres.	Steam Sawmills.	They receive 10,000,000 feet per annum in sawn timber and logs, varying in size from 3 in. x 1 in. to 60 in. x 60 in. Of Oregon and other American timber they received 3,000,000 feet during 1896, varying from 3 in. x 1 in. to 20 in. x 20 in. They are now expecting a vessel, called the "Star of France," with 1,300,000 feet, all dressed timber. It must all be lightered, as the vessel cannot come through the bridge. The lightering will increase the cost from 4d. to 6d. per 100 feet. They are now lightering a vessel in Johnstone's Bay, of 1,100 tons register. With great difficulty vessels of 350 tons can come through the bridge. They employ about 120 men. The timber merchants cannot pay the rents required for city water-frontage, and so they come to Blackwattle Cove; in the city would suit them better. Balmain side would not suit, being too far away; and wharfage is too high at Woolloomooloo Bay to do the business profitably.
One large unimproved property, and Ferry-road, Glebe, intervene, and then is reached the Kauri Pine Co.'s wharf.				
The Sydney Kauri Pine Agency Co., Limited (J. H. Smith, Manager), now Greenaway and Henderson. (Here Forsyth-street.)	95 feet ...	200 feet...	.....	At present vessels of only 150 tons come to this wharf, and for them the bridge-opening is sufficient. Occasionally they receive timber from large vessels, which have to be lightered in Johnstone's Bay.
Borough Council of the Glebe.	140 feet...	.....	Blue-metal depôt and public wharf.	The blue metal for the roads of the borough is landed here; the statements relative to the requirements of blue-metal vessels running to the Government wharf at the head of the Cove apply to those berthing here also.
Daniel Sheehy and Sons.	230 feet...	400 feet...	Ship-builders, pile-drivers, and marine contractors.	Have taken borings and find that they can get 30 feet of water at their frontage before rock is reached. Find the bridge a great impediment to business. The archway in the centre of the present bridge is of no use for anything with a mast in it; at high water there is not more than 12 feet from the water to the bridge. The opening should be 60 feet wide. Has seen a vessel, the "Rio," 317 tons, stuck in the opening, on the 25th May last, for half an hour. About six months ago another vessel was stuck there for two hours. The rock near the opening is a great nuisance. Their punt, 30 feet wide, loaded, draws 6 feet of water, and cannot get through at low tide. Mr. Sheehy thinks the bridge ought to be removed altogether, and has a scheme whereby he thinks that could be achieved, substituting a tunnel from Pymont Bridge Road under Glebe Point to the Government reclamation at Johnstone's Creek.
From this point the water-frontage is used for private residences; there are no large business premises (excepting Whetton's pile-driving depôt at Glebe-road) until Johnstone-street, Annandale, is reached, but the frontage of the Government reclamation extending from Glebe-road to Johnstone-street, about 1,700 feet, will be required for wharfage purposes.				
(Here Rozelle Bay commences.)				
Annandale Borough Council.	100 feet...	.....	Public wharf and blue-metal depôt.	The information above relative to the Glebe Council's blue-metal depôt also applies to this.
Union Box Factory (A. Guthrey, Manager).	150 feet...	146 feet...	Timber depôt. The sawmills are on the opposite side of the bay.	The manager stated that they receive 2,500,000 feet of timber per annum in planks from 1 inch to 3 inches thick. On an average they have fifty men employed. Their vessels are from 200 to 300 tons register. Even a 300-ton vessel, if of deep draught, cannot get through the bridge, and portion of the cargo has to be lightered. One of our vessels—the "M. A. Doran"—of less than 300 tons, had to wait for a spring tide to go through. He is of the opinion that the present facilities for getting through are not equal to the requirements. A strong wind from north or south makes the passage dangerous, and although the captain of a vessel might be willing to venture, the bridgeman will not open because the vessel might get jammed in the opening. Mr. Guthrey says that he saw two or three vessels so jammed during the year 1896, it took from half an hour to one hour to get them clear. He does not remember seeing any jammed this year.
Langdon, Hopkins, and Langdon (they claim that they do the largest timber business of any firm in the metropolitan district).	200 feet...	100 feet...	Depôt for all sorts of timber from 2 in. x 1 in. to 12 in. x 12 in.	Their vessels carrying 30,000 feet of hardwood can get through the bridge, but their American timber has all to be lightered from Johnstone's Bay. At present the "Speke," with 1,250,000 feet of Oregon for them, is being so discharged. She has also 1,000,000 feet for Holdship, &c. Complain that the bridge-opening is not wide enough, nor deep enough. The "Speke" draws 27 feet of water loaded. The manager thinks it would pay the firm to make a large contribution towards the cost of a new bridge with a more convenient opening, because to discharge the timber at the wharf costs 1s. 3d. per 1,000, whereas by lightering it costs 3s. per thousand.

Name of occupier or owner.	Approximate dimensions of land.		Description of business carried on.	Statements by the occupiers as to extent of business done and relative to the facilities for shipping afforded by the opening in the present bridge, and the requirements in this respect in a new bridge, if erected.
	Water-frontage.	Width.		
<i>South side of Blackrattle Cove—continued.</i>				
Goodin, Hitchcock, & Co.	100 feet	100 feet	Timber merchant's depôt.	Receiving-yard for foreign and colonial timber; have vessels coming from the northern rivers carrying 60,000 feet. Foreign timber received by them has to be lightered from Johnstone's Bay, increasing the cost of discharging from 1s. 3d. to 3s. per thousand. They get on an average 600,000 feet of foreign timber in the year from about six vessels. The manager thinks the water-frontage of the Government reclamation close by would be valuable for timber depôts, and would let readily for that purpose.
Langdon, Hopkins, and Langdon.	132 feet	100 feet	Depôt for Oregon and red-wood timber.	See description for this firm's business above.
(Here Gordon-street on embankment, fronting Government reclamation at mouth of White Creek, about 500 feet water-frontage belonging to the Government, not used at present except where a ferry wharf has been erected.)				
<i>North side of Rosette Bay.</i>				
Justin McSwency	290 feet	400 feet	Federal Timber Co.'s Wharf.	Have vessels with blue-metal of 9 feet draught discharging here; the largest vessel is 250 tons register. Also four timber schooners from 50 to 120 tons register. If the required opening in the bridge were made, say 60 feet wide and 20 feet of water to accommodate vessels of 1,500 tons, they could load hardwood for export, especially wood-blocks. The land is large enough to give quick despatch to such vessels.
Hutchinson's Wharf.	530 feet	260 feet	Co-operative Flint Glass Company; J. West, wood and coal depôt.	West complains of the length of time it takes to get a vessel through the bridge in windy weather, the opening being so awkwardly situated. Vessels of 150 tons come to his wharf. In order to get through the bridge after sundown application must be sent to the bridgeman in writing, and if you are not there to time the bridge is not again opened, and you must wait until the morning. In winter the bridge will open between 7 a.m. and sundown. In summer from 6 a.m. to 6 p.m.
			Union Box Factory; Globe Meat Factory.	Union Box Factory, steam sawmills. Vessels up to 300 tons discharge here. Once in twelve months they have a large vessel, and she has to be lightered.
			Alston Soap and Candle Company.	Alston Soap-works. Managing Director complains that the bridge takes so long to open that they often miss the train at Darling Harbour through the delay, and that the archway in the middle is not high enough; in going under recently they lost the funnel, and the new one cost £8 10s.
Mrs. Symons	390 feet	130 feet		Wharf formed, and land reclaimed. It is to be let.
J. Barnes (Manager)	60 feet	190 feet	Globe Meat-preserving Works.	New stone building 160 feet x 60 feet, 3 storeys. Do not use the water-frontage except for lighters. Their goods are sent by road mostly.
J. Henderson	60 feet	190 feet	Ship-builders; also, Young and Sons, ferry-steamer-builders.	If the bridge-opening were improved it would be a great advantage, for larger vessels could be dealt with.
Swan Bros.	300 feet	170 feet	Steam sawmills, timber merchants.	State that they have to pay 1½d. extra per hundred to vessels to come through the bridge. They want to bring vessels of 700 tons alongside, but cannot get larger than 250-ton vessels through the bridge. The swing should be 60 feet wide. The depth of water at their wharf is 18 feet, but the increased depth is of little use, because it is only 12 feet 6 inches on the sill of the bridge. It should be 20 feet deep at low tide on the sill.

(Here Abattoir-road frontage; thence Globe Island frontage extends to the western end of the bridge.)

NOTE:—Boat-builders' sheds have not been described; there are several of them.

WEDNESDAY, 7 JULY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
 The Hon. JAMES HOSKINS.  
 The Hon. CHARLES JAMES ROBERTS, C.M.G.  
 The Hon. WILLIAM JOSEPH TRICKETT.  
 The Hon. DANIEL O'CONNOR.  
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
 JOHN LIONEL FEGAN, Esq.  
 THOMAS HENRY HASSALL, Esq.  
 GEORGE BLACK, Esq.  
 FRANCIS AUGUSTUS WRIGHT, Esq.  
 FRANK FARNELL, Esq.

The Committee further considered the expediency of constructing a New Bridge at Glebe Island.

Henry Daly, sworn, and examined:—

1773. *Chairman.*] What is your occupation? I am not in any occupation at present. I reside at Glebe Point.

H. Daly.

7 July, 1897.

1774. *Mr. Hoskins.*] Do you wish to make a statement to the Committee as to the propriety of erecting a new bridge near to the existing bridge to Glebe Island? The existing bridge, or any bridge which would be constructed, would be more for the purpose of serving the Abattoirs than perhaps of serving Balmain; and I take it that if the Abattoirs are removed, there will be not so much necessity for a bridge there. At present, pretty well two-thirds of the traffic over the bridge is to and from the Abattoirs, which is a meat-market as well as an Abattoir; and the traffic is in connection with the carriage of meat, or people going to make their purchases of meat. Furthermore, if a bridge is constructed there it will always be a matter of expense more or less, to say nothing of the bar it will be to shipping entering Blackwattle Cove and Rozelle Bay. Blackwattle Cove, from its position, and from the easy access to it that there is at Blackwattle wharf, must become a very important place for discharging and loading ships, and a bridge will be more or less of a barrier to the class of business there.

1775. But a bridge will not necessarily be a barrier to the trade, provided that it is sufficiently high to allow vessels of a good size to go under it, even if they have to strike their topmasts, as they have to do in other ports, and provided also that a swing not less than 60 feet wide is placed in the centre of the bridge? But you cannot have a bridge at any great elevation. You could not have any bridge there in the nature of the bridge, for instance, which could be constructed to North Shore, because the approaches on Glebe Island would not admit of a very great deal of height.

1776. Still we have had evidence that if a better structure with a wider roadway and stronger piers, and with an opening in the centre to allow vessels up to 1,000 tons to go through, is built, it will not interfere with the traffic or with the shipping? Yes; but that would all be in view of the Abattoirs being continued in their present site.

1777. Do you wish to see the Abattoirs removed from Glebe Island? Undoubtedly; because it is a totally unsuitable place for them.

1778. All the evidence we have had here has been as to the suitability of the island for that purpose? Well, I can give evidence to the contrary.

1779. Will you kindly give the evidence? In the first place, the Government is losing a very large annual sum by the treatment of the waste from the Abattoirs. At present between 15,000 and 20,000 tons of blood and offal are discharged outside the Heads every year, and allowing for the cost of treatment it is worth at least £7,000 a year when it is converted into a manure, and even not to sell it in this market. Of course it should be properly treated. The methods which have been employed to treat these waste products at Glebe Island up to the present have been little better than worthless. Furthermore, the Abattoirs should be, and are in all well-ordered instances, beside the sale-yards. In this instance the cattle slaughtered are of such a nature that it is positively dangerous to the inhabitants of the surrounding places to bring them to Glebe Island. To treat the number of animals that are slaughtered at Glebe Island satisfactorily and economically, and to associate kindred trades with them, it would be necessary to have an area of at least from 1,000 to 1,500 acres of land. It is necessary that the cattle should be rested before slaughter, but they are not rested at all on Glebe Island; in fact, the animals are hunted from their resting-places to Glebe Island, where they arrive in a condition absolutely unfit to be slaughtered, especially cattle. The cattle or animals should be slaughtered somewhere contiguous to the railway line, and brought down to a central meat-market, or to a meat-market in Sydney; for, as I observed, Glebe Island is both a meat market and a slaughter-house. I, as a resident of Glebe Point, personally have no objection to the Abattoirs remaining where they are. It does me no personal injury, provided that they are carried on from the point of view of the smell arising from them. In summer-time I have written several letters to the Treasury, complaining of the terrible smell arising from the Abattoirs. Up to about six months ago it was not an infrequent thing to have the blood discharged straight into the bay. I have frequently seen it at noon; but latterly there was a receptacle provided, in order that the blood and offal which they could not run into the punt should be stored there. After it had remained there some time, pending the arrival of the punt from outside the Heads, it was generally discharged into the punt. It was in a putrid condition by this time, and the smell, of a most disgusting character, could be noticed for miles around.

1780. That state of things is discontinued? No; it is continued.

1781. I thought you said until the last six months it was done? Until within the last six months they used to run the blood into the harbour occasionally, but now that practice is absolutely stopped, and it is run into a vat on the island. There is only one punt, and if through stress of weather or other circumstance that punt cannot proceed to sea, this material is stored on the island, and it may remain there for one and a half or two days until it is run into the punt, and the smell from it is abominable. In summer time the punt gets filled more frequently, and the material is carried to sea more often than is done in winter time, because not so much slaughtering is done there in winter as in summer.

1782. We have had evidence here that there used to be a disagreeable smell from the Abattoirs at the time they desiccated the blood and offal, but since that practice has been discontinued, and the blood and offal has been taken out to sea, the bad smell has not been so noticeable? They did not desiccate the blood

H. Daly. blood and offal—they burnt it. It was not carried on in sealed vessels. The vapours arising from the drying material were not properly condensed. In order to treat the material properly, it must be treated from first to last in sealed vessels, so that none of the fertilising elements can escape. These elements are preserved in the finished article; whereas at Glebe Island, the men did not understand the methods of working the apparatus, which was of a very inefficient character.

7 July, 1897.

1783. We have had evidence here to the effect that the drains were not properly constructed to carry down the offal into the desiccating pans, and the desiccator was one of the original type, being old and almost worthless? That is not the case. They had a fair grasp of the principle, but it was badly constructed.

1784. The President of the Board of Health said that one of the reasons why the desiccating was discontinued was not only in consequence of the defective nature of the desiccator itself, but also because the drains were not made in the slaughter-houses to take the blood to the desiccating plant in the most expeditious way? What I would say in answer to that statement is, that it involves the treatment of this material at the Abattoirs. I understand very clearly how it should be done; but there is nothing at all attempted there. For instance, the blood and the washings of the establishment are all run down together, and that is absolutely improper. It is difficult even to treat it in that way, because you have to eliminate all the water out of the material before you can get the finished article.

1785. Have you never made a complaint to the Superintendent of the Abattoirs about running the blood and water down together? I have gone to a telephone at Glebe Point and asked the Board of Health to be good enough to telephone to the island, telling them to stop the people from running the blood out in day-time—not to let us see them doing it. We do not mind so much if it is done at night; we do not care to see it done in the day.

1786. You object to the erection of the new bridge because you think the Abattoirs ought to be removed from the island? I do not object to a new bridge; but I do not see that there is any necessity for so expensive or so substantial a structure if one is erected. I really do not think that a bridge should be erected at all.

1787. We have had evidence to the effect that a great deal of the traffic over the bridge goes to Balmain, Ryde, and other suburbs? There is no doubt about that.

1788. And that the traffic to the Abattoirs is by no means the largest proportion? I disagree entirely with that.

1789. Suppose that the present bridge is considered to be unsafe; if a new bridge is not erected, how are the people who use that road to get to Balmain, Ryde, and other suburbs? They can get there by a road from about where the Kauri Timber Company is located at Blackwattle Bay. If there was a road constructed to join with the reclamation in Johnstone's Bay, and to go around the head of Rozelle Bay, it would not be such a very great distance longer than the present road.

1790. If these people were compelled to go round by the route you have described, would there not be great complaints made of their having to travel so much out of their way? I do not think so, because it is not such a very great distance further than the present road.

1791. Your suggestion to have the sale-yards, resting-paddocks, and abattoirs in one locality would involve the purchase of a very large area of land, and also the expenditure of a very large sum for works; but this proposal to construct a bridge to an existing road, which is used by the residents of Balmain and Ryde, as well as the people who go to the Abattoirs, only involves the necessity for erecting a new bridge; and, therefore, we have to consider how much less that would cost than your proposal? That is always remembering that the Abattoirs are to remain where they are. I cannot believe that the Government will allow the Abattoirs to remain much longer where they are. I cannot believe that they will, from what I have seen elsewhere.

1792. To what places do you refer? I have seen the greater number of the Abattoirs on the Continent of Europe. Take, for instance, the Paris Abattoir.

1793. Is it not surrounded with a dense population? It is, but the circumstances as between Paris and Sydney, are altogether different. First of all there is the vast difference in the climate of the two cities; and secondly, there is a vast difference in the nature of the cattle to be slaughtered. The cattle to be slaughtered here are wild, or semi-wild; whereas in Paris you can take the cattle by the horns, and lead them into the slaughtering-place. Here there is a continuous danger to life and limb in driving the cattle to the Abattoirs. Scarcely a week passes but some person is maimed for life. I guarantee that I could point out many instances of that kind. Only last week, for instance, a female child was taken up on a bullock's horns and badly mangled.

1794. But Mr. Macnamara, a carcass butcher, has told the Committee that the cure for that would be to drive the cattle in in the night, as used to be done in this very city years ago, say from midnight until 3 or 4 a.m., and to drive the sheep in in the early morning? No doubt the sheep may be driven. All these regulations are in force, but it is not done, and frequently cattle break away in a state of fury, and it takes the men until the middle of the following day to catch them, although they were being driven in at night. Very frequently it is the cattle which are being driven in at night which do this damage.

1795. Children are not running about in the middle of the night? No; it is the cattle which escape while being driven at night that commit the damage I speak of.

1796. Do you not know that at Home, Scotch and Welsh cattle frequently horn people while being driven from the railways to Islington? The greater portion of the Scotch cattle which come to London come dead.

1797. Lately? The greater portion of it is killed meat. I have seen trains full of it; very little of it comes alive. I wish to show you the contrast between the method in Paris and the method in Sydney. I have already pointed out to you the quietness of the cattle in Paris. You say that the Paris Abattoir is surrounded with a dense population. It is surrounded with a dense population, but it is a poor population; it is a very poor quarter, and the value of property surrounding the Abattoirs is all depressed from the very presence of the Abattoirs, notwithstanding the fact that the utmost cleanliness is observed there, and that really no person would know that an Abattoir was being conducted thereat all. The sale-yards are beside the Abattoirs, and the cattle are just taken across a canal to the Abattoir and slaughtered there. In Paris every scrap of material, every scrap of the animal, is turned to account, and nothing whatever remains on the premises which would create any unpleasant smell or be unpleasant to the people in the neighbourhood.

1798. I agree with you that it is waste to take our blood and offal out to sea: but we have evidence to the effect that when the blood and offal were desiccated the manure was only saleable at such a price that it left no profit, but a loss? I took the trouble to consult a firm of engineers in England on this subject some time ago. The wholesale price in England of manure manufactured from blood is £8 a ton, and the wholesale price of manure manufactured from offal is £6 a ton. In England it is properly manufactured in the way I have indicated. It is not burnt up, as was done at Glebe Island. I saw the men treat the stuff at Glebe Island. I made inquiries, and I listened to what they had to say. All the fertilising elements were completely eliminated, and it was only an innocuous powder which remained.

H. Daly.

7 July, 1897.

1799. We have had evidence to the effect that it used to cost nearly £7 a ton to produce the manure at our Abattoirs, but that it was not of the value it should have been, in consequence of so much water being mixed with the blood? That is one of the points I want to convey to you. They mix the blood and the swillings of the establishment, and all the water has to be eliminated; whereas the blood should be caught immediately the animal is slaughtered, and treated then. It takes 18 tons of that blood to make 1 ton of manure. You have to eliminate 17 tons of water before you can get a ton of the finished article; therefore, how much more difficult it is to treat the stuff when it is surcharged with water in the way I have indicated.

1800. We have had it in evidence here from the Inspector, Mr. Shelley, that it costs £5 a ton to manufacture the manure, and that the last surplus sale they had realised 7s. 9d. a ton; there was a great loss then? If I had 1,000 tons of blood manure I could get £5,000 instantly for it—that is, properly manufactured.

1801. I judge from what you say that the persons who had charge of this work did not seem to understand how to treat the stuff properly? No.

1802. In the second place, the desiccating machine was of an antiquated type, and very little use, comparatively speaking; and thirdly, as Dr. Thompson has pointed out, so much water flowed down with the blood into the receptacles that the quality of the article was deteriorated, and hence it cost more to produce it than it realised? I will describe the method I saw at the island. The blood and the swillings of the establishment were run down into a tank. It was there boiled: the blood became somewhat coagulated, but meanwhile all the fertilising elements were escaping. As it was boiled in an open vessel, the fumes escaped into the air. The pure blood should have been conveyed into the desiccators, and the operations from start to finish carried on in a sealed vessel.

1803. Did you ever hear who was responsible for the working of the desiccating machine? It could not be Mr. Shelley. He has so much to do, and has such a cramped space, that I do not see how he could devote any attention to the desiccating work. It was never done on proper lines; it was never worked on business lines at all.

1804. It has been suggested by several witnesses, that the rooms appropriated for the slaughtering-abattoirs are too small, that the sheep slaughter-houses are not very well adapted to the work, and that the area of the slaughtering establishments should be enlarged; Glebe Island comprises an area of 34 acres; I gather from what you say, that you would disapprove of the area of the slaughter-houses being extended, or of the slaughter-houses being improved, because you object *in toto* to the abattoirs being on the island? I say it is not the proper place for them, and that the slaughtering will continue to increase at the island, and that all the inquiries which have been held into the matter, with the exception of the last inquiry, have all pointed in the direction of the removal of the Abattoirs.

1805. Where would you suggest that they should be removed? To Blacktown.

1806. Do you know that one advantage of having the Abattoirs at Glebe Island is that butchers in a small way of business can go there and buy their meat at first-hand at a cheaper rate than they could do if they had to buy it at second-hand from large carcase butchers, which would be the case if the Abattoirs were removed to Blacktown? I do not know it, and I do not believe it.

1807. I am speaking from personal knowledge that that is the case? I do not believe it.

1808. I know respectable men in a small way of business who could not go to Blacktown to purchase their supplies? There is no necessity for them to go to Blacktown to purchase their stuff. Nine-tenths of the meat which is consumed in New York is slaughtered 900 miles away from that city, and you might as well say that the butchers in New York should go to where it is slaughtered to buy their meat.

1809. At all events, it has not been the practice here; we know very well that in New York the business is done by rings of wealthy capitalists or men with large credit, whereas here people with smaller capital have been able to go into the butchering business; I have said that Glebe Island is a meat market as well as an Abattoir;—why not have a meat market somewhere else and the Abattoirs somewhere else? If your contention was that the small butchers could go over to Glebe Island and slaughter their cattle for themselves, there would be something in it.

1810. I believe they can? They can, but very few do it, because they find it is unprofitable. They find it more profitable and satisfactory to buy their meat from the large slaughterers. There is plenty of competition between the large slaughtermen now.

1811. You are not in favour of having a new bridge erected in lieu of the present bridge, because you think the Abattoirs are in the wrong place, and because the people who do not travel to the Abattoirs, but go to Balmain, Ryde, and other suburbs, could go by another road, which would be very little longer for them? Precisely: and the whole of these bays would be open to shipping and traffic.

1812. A new bridge, such as I have described, would not prevent that? It would be always a source of expense and inconvenience, because more shipping must come to Blackwattle Bay. It is coming there every year. I have lived at Glebe Point for fifteen years, and I see the improvements which are taking place, and the way shipping is crowding gradually in that direction. A great deal of shipping must go there. The Government itself has a very large and most valuable property there which must be thrown open for large ships sooner or later. A bridge is always an inconvenience, especially to shipping.

1813. But if provision is made in a suitable bridge for vessels to go through to Blackwattle Bay and Rozelle Bay, a very trifling impediment will be placed in the way of any vessel wishing to go there? I would not say a very trifling impediment. A bridge is always an impediment, because there is always the opening and closing of the swing, and the stoppage of the traffic, as you can see at the Pyrmont Bridge.

1814. That bridge has been built nearly forty years, and the bridge, as well as the swing, is of a very antiquated type; but modern bridges are provided with a swing for a vessel which can be opened in a few minutes? Quite so.

1815.

- H. Daly.  
7 July, 1897.
1815. Such a bridge would not be a great obstacle to traffic? I do not suppose it would; but I do not see the necessity for putting a very heavy, substantial, expensive structure there, because nearly all the heavy traffic of Balmain is carried by water. The most convenient thing which a bridge at that point would afford to Balmain would be access to the railway-yard at Pyrmont, but the distance would not be much further if a road were carried in the direction I have indicated.
1816. The route which you have just pointed out on the map would be much further than the present route? It would not be a very great deal further. It is a longer distance to the Abattoirs, but it is not much longer to Balmain.
1817. Would it not go through private property? It would.
1818. It would involve the expense of resuming that property? There is the expense of constructing the bridge.
1819. But there is a much longer road to travel? You would get a free waterway instead of having a bridge, and you could bring vessels of any size to the Government wharf in Blackwattle Bay.
1820. *Mr. Humphery.*] With regard to the existing bridge, what is your idea? The longer it is maintained the more expensive it will become, and it is pretty well worn out now.
1821. Do you suggest that it should be removed, and should not be replaced by a new bridge? Not replaced.
1822. You think no bridge is necessary? Yes.
1823. Assuming that the Abattoirs should remain at Glebe Island, do you think you would meet the convenience of the people using that island by the road you suggest? Well, the population of the city who use meat largely are more or less going into the suburbs, and the greater quantity of the meat that is slaughtered at the island is carried to the southward, and not in the direction of the city. The only portion of the suburbs which would be inconvenienced by perhaps half a mile extra haulage would be the eastern suburbs, but all the western suburbs and southern suburbs would be as well served by a road such as I have indicated as by a bridge in the present place.
1824. Assuming, as you said, two-thirds of the traffic across the bridge to be in connection with the Abattoirs, does it not occur to you that some means should be provided to enable people on the Pyrmont side to reach Glebe Island and Balmain without traversing a road which would probably be double the distance? There is practically no road at the present time in the direction I have indicated; you would have to go up Johnstone-street, in Annandale, to get on to the Parramatta-road, whereas you could go in a southerly direction if a road were made across the reclamation in Rozelle Bay.
1825. Your contention is that that road would be as convenient to two-thirds of the present traffic as is the existing bridge? It might not be quite as convenient for the full two-thirds, but it would be as convenient for half of it, always remembering that the Abattoirs remained at Glebe Island.
1826. As to the remaining third, we are told that the traffic is very considerable; that between 2,500 and 3,000 vehicles daily cross the bridge; that would mean that you would have to provide for 700 or 800, perhaps 1,000 vehicles, which would be traffic altogether apart from the Abattoirs;—do you think the convenience of that remaining third would be met in any way by your suggestion? If you speak of the traffic of Balmain alone, I suppose it would be a quarter of a mile longer by my route; but if you speak of the traffic of Five Dock and the west end of Balmain, it would be as well served by my route as by the bridge.
1827. I will put it in this way, that as far as Balmain is concerned the route you indicate would be longer and less convenient, but places beyond Balmain and the west end of Balmain would be equally well served? Yes.
1828. Is not the population of Balmain very large and increasing? It is a large population.
1829. Has not the reduction of the fare on the Balmain ferry to 1d. been the means of largely increasing the population there? I daresay it has; I have no actual knowledge of it. Cheap fares always do induce population to come to a place.
1830. For 1d. you can go to almost any part of Balmain? Passengers can, but not vehicles.
1831. With regard to the passenger traffic, would it not be much more inconvenient if that bridge were dispensed with? No; because it would be cheaper for them to go by steamer.
1832. I am talking of the foot-passenger traffic across the bridge? It is infinitesimal. Nobody walks to Balmain now; they take the ferry.
1833. In the event of it being desirable to connect Balmain with Sydney by means of a tramway, would it not be much more convenient to retain the bridge at the present site? If you speak of a tramway, undoubtedly.
1834. I wish you to give your evidence on the assumption that it may be desirable at no distant time to connect by means of a tramway? Of course, it would be very much shorter; you would get over the Pyrmont Bridge which is to be built, but you would have the inconvenience of having an opening in the bridge, which is always inconvenient where you have steamer or tram traffic.
1835. As to the inconvenience of vessels passing the bridge, have you made yourself familiar with the details of the proposed bridge—that it is to have an opening 60 feet wide, and is to be of such a height in the centre as to allow small craft to pass under it? I believe it is to be 25 feet above high water. I have seen several similar bridges.
1836. Do you think the rapid opening and closing of the swing in the bridge by the most modern appliances would be a serious inconvenience to vessels which pass, or are likely to pass, to Blackwattle Bay and Rozelle Bay from Johnstone's Bay? I cannot say that it would be a serious inconvenience; but it is some inconvenience, and there is always some risk, more or less.
1837. With regard to the removal of the Abattoirs, I suppose you have in view eventually the adoption of a scheme you have propounded yourself;—you have made some suggestions? Only here.
1838. I thought you said you had been in correspondence with the Government for a long time? Not with the Government, but with sanitary engineers in England.
1839. What recommendations have been made through you or to you in connection with your complaint of the Abattoirs being at Glebe Island? All I have done was to write and complain of the intolerable smell, and to hope that they would soon remove the Abattoirs, and that Mr. Reid would keep his promise that they should go.
1840. Have you made any suggestions? No; a suggestion would not be listened to from me, perhaps.
1841. Do you not think the strongest argument to use in favour of your view is to suggest some scheme? To make a suggestion to such a body as this Committee is one thing, but to write a letter to the Minister

is another thing. I have written repeatedly to the Treasury about the condition of the Abattoirs, and the abominable smells arising from them, but I have never suggested any remedy.

1842. It is much more difficult to suggest a remedy than to make complaint? I can suggest an ideal scheme.

1843. Will you give the Committee the benefit of your views? I suggest that the Abattoirs should be removed to Blacktown. There is an alternative place to put the Abattoirs, and that is quite close to the existing sale-yards at Flemington. But when we consider the class of settlement there, in the first place, it would be doing a great injustice to the people who have settled round there; and, in the second place, it would altogether lower the character of the settlement there. In this climate—and it is a very warm climate—it will be necessary also that the kindred trades for the treatment of the various matters in connection with slaughtering should be associated with, or very close to, the slaughtering establishments. At present all these things, such as the heads and entrails of cattle, are carted through the streets of Sydney to Botany. To any person who is not accustomed to such a thing it is a disgusting sight to see portions of animals carried through the streets in open carts in this way.

1844. May I put it in this way: That, as a site for abattoirs, Flemington would be equally as objectionable as Glebe Island? No. I do not say that Flemington would be equally objectionable: but I say that Blacktown would be a very much better site.

1845. Your idea is that Blacktown is the one site which would be suitable by reason of existing conditions for abattoirs and sale-yards? It is one site—not the site. There may be other sites on the Southern line I know not of. I have seen Blacktown, and looked at the place from various points of view, and I consider that it would be very suitable for the purpose. You can get excellent water accommodation, which is a very great consideration in abattoirs, because you are quite close to the Prospect dam; and then there is the matter of drainage, which could be very excellently arranged there.

1846. Have you made yourself familiar with the process adopted by the Sydney meat-works for the treatment of blood and offal? I do not know what it is; I have not been to their place.

1847. You have no information with regard to the process in operation at their works? No.

1848. What information do you possess with regard to the process of desiccation by which the results are found to be profitable? Do you wish me to describe the method.

1849. No;—I want to know on what knowledge you base your evidence? I have seen the treatment of blood and offal in Nottingham, in England. I have also seen the treatment of fish-guts at the great Grimby fish-markets, in the west of England, by the very same machinery—the very same method as that which is used for the treatment of blood and offal on profitable liues.

1850. Are you familiar with the method adopted in Melbourne? It is that method I speak of.

1851. Can you say from inquiry you have made whether in Melbourne there is any profit attached to the treatment of blood and offal there? I believe there is not. They use a very expensive machine there for the purpose. They use Farmer's machine, and I know what it is.

1852. You can understand that commercial people, unless they can see a profit, very rarely engage in an enterprise such as you speak of? They are very glad to get blood and offal manures in England at the prices I have mentioned.

1853. There are people here who would be very glad also to purchase the manures; but if the cost of treatment were greater than the price obtained for the manure, there would be no advantage to those engaged in the enterprise? No.

1854. I suppose that is the reason why at present these are waste products? I beg your pardon, sir, it is not the reason. The reason why they waste the products is that it is a more rough and ready method of getting rid of it, and they do not know, or have not been familiarised with, the proper method of treating it.

1855. You think that they are blind to their own interests? Yes. The blood and offal are there, and it is easier to take them outside the Heads to the sharks.

1856. Can you relate any other instance, besides the one you mentioned to Mr. Hoskins, as to the treatment of cattle in the yards at the Abattoirs? Yes.

1857. Will you state, for instance, the distance which would influence the condition of the cattle before they are slaughtered? You cannot form any estimate of the cattle in the older countries as compared with the cattle here. The cattle here are always in a wild, or more or less semi-wild, condition, and they are as frightened as a deer; whereas in all the countries on the Continent of Europe and in Canada, where they are all stall-fed, they are quite quiet, and may be taken from the pastures at any time to be slaughtered. All cattle require to be rested more or less before being slaughtered. Wild cattle like ours undoubtedly require very much longer time to become thoroughly quiet and rid of any fever which may have been induced by travelling.

1858. *Chairman.*] Taking it for granted that the routes are common to Pymont Bridge, I find, on scaling the plan, that the route you suggest to Western-road is three-quarters of a mile longer than the present route? No doubt it is further to the city of Sydney, but if you take such suburbs as Petersham, Camperdown, and Glebe it is quite as near.

1859. *Mr. Clarke.*] In the event of the Abattoirs not being removed from Glebe Island, do you consider that a new bridge is necessary? I do, indeed.

1860. A bridge about 60 feet wide, and with a 60-foot opening? It would have to be a substantial structure, because there would be a large amount of traffic, and it would require to have a wide opening.

1861. We have had evidence here by practical men—carcase butchers—that Glebe Island as a site, although rather small, cannot be improved upon as far as slaughtering is concerned? As regards the mere cutting of their throats, there is no doubt that you could not get a better place, but the getting of the cattle to the place is the point.

1862. Could they not be brought down in the night? It has never been satisfactory. They have been doing it for fifteen years, and occasionally some of the cattle escape, roam about the streets, and attack the first person they see. There is no more infuriated animal you can meet with than a knocked-up bullock. If you come across one in the bush he will warn you.

1863. I suppose it would not be practicable to re-truck the cattle if a railway were made from the sale-yards to Glebe Island? It would be like humpty-dumpty. You might get the cattle out of the trucks, but to get them in again would be a job. I have seen plenty of cattle de-trained, but I have never seen the same cattle put back in the same truck by anybody.

1864. You think it would be impracticable to re-truck them? It would be highly impracticable with the class of cattle you have here.

1865.

- H. Daly.  
July, 1897.
1865. We have had it in evidence that it might be practicable, if a railway were made from Glebe Island to Flemington, not to take them out of the trucks, but to take them to markets erected at Glebe Island? A proportion of the cattle which would go there would not be sold—they would be held waiting for a future market, and they would have to be driven away to some paddocks pending a future market. You would have the same driving business all over again. You could not re-truck them and bring them back to that place for a market. There is by no means a sufficient area of ground which could possibly be got at Balmain for the purpose of slaughter-yards and sale-yards.
1866. You think it could not be done? It is impracticable here altogether. It would be a futile experiment.
1867. Several witnesses have said that a healthier place could not exist than Glebe Island? I have seen it in evidence from these gentlemen that it is the finest place in the world; but they had never seen any other.
1868. We have had evidence by several carcase butchers that a better place than Glebe Island could not possibly be found in the Colony? I have seen that statement in evidence. I have also seen in evidence that they have travelled over all the Colonies, and that that is the finest spot in the world.
1869. Mr. Austin, a carcase butcher, said he had been in Europe and America, and he thought that if the accommodation were improved, particularly for sheep and pigs, the Abattoirs would be suitable to the public, and would last for a number of years? I do not pretend to combat that at all. What I say is, that you can erect slaughter-houses on Glebe Island of a most perfect character; but the point is, how are you to bring the cattle there to be slaughtered. If you cut their throats at Flemington, and brought them down dead in the trucks, it might be all right; but to get the cattle to the island is the point. Even the sheep are a terrible nuisance. They are driven in in the day-time, and in the streets through which they travel they raise dust and ruin everything. If the slaughter-yards were erected, as I suggest, at some distance from the metropolis, surely with our present railway accommodation we could run them down easily in an hour to the meat-markets, and no harm could come to any meat in that time. In America they have very great advantages over what we have here. In America they can conserve large quantities of ice and chill their meat. It is a very easy matter in the hottest part of summer there to chill their meat and convey it a long distance; whereas here all our cold must be produced artificially. If you slaughter your cattle, and have your abattoirs within an hour's railway run of the city, surely to goodness it is an easy matter to run the meat down to the meat-markets. It would be far more convenient for small purchasers to go to a meat-market at Darling Harbour than to the Abattoirs at Glebe Island.
1870. I suppose you know that there is a considerable number of private slaughter-houses in the suburbs? I know that well.
1871. Do you approve of that? By no means. The method which should be employed is that which is employed in France. Every person who has slaughtering going on must have a Government official on the spot, and he stamps every portion of the animal, even the entrails. The finest abattoir I have ever seen is the Abattoir at Hamburg, which was built at a cost of £700,000, in the most elaborate manner. They take the very greatest possible precautions as to the character of every animal slaughtered there.
1872. How are the cattle brought there? The Abattoirs are close to the sale-yards.
1873. Do the cattle come from the interior of the country, or are they landed from ships? A good number are landed from ships; but they are pretty well tamed when they are taken off the boats.
1874. Do they come from Germany, Sweden, and Denmark? The largest proportion of them are home-grown cattle.
1875. A good many, I suppose, come from Holland? Yes; Danish cattle and Swedish cattle.
1876. Would the drainage at Flemington and Blacktown be complete? The drainage is a matter I have given a great deal of attention to. There is an amount of difficulty in connection with it. The method which would be employed for the drainage there would be something like the method which is employed in inland towns in England. There, the sewage is run into reservoirs, the solid matter is precipitated with a cheap chemical of a ferruginous character, the limpid matter is allowed to flow off, and the sludge is pumped up in filter presses, and it comes out in the shape of dry cakes, which are sold to the farmers as fertilisers. It is not an expensive process by any means.
1877. Does the sale of the stuff result in a profit or a loss? It is profitable in England. They make a profit in many English towns out of their sewage which is treated as I have described.
1878. You think that at our suburban slaughter-houses there is not sufficient supervision, and that a good deal of inferior and diseased meat is sold to the public? Undoubtedly. Glebe Island is very well looked after indeed, as far as inspection is concerned. Rigid inspection seems to be the prime point in the management of the Abattoirs there.
1879. Would not the road you propose to make involve a considerable amount for land resumption, or would it go through any Government land? I have not attempted to make an estimate; but I have gone over the route, and seen the surrounding ground and properties, and observed what the levels would be likely to be.
1880. I suppose you are aware that in the case of all land resumptions the Government have to pay high prices? No doubt; but there is a limit.
1881. Would the cost of the land resumptions be as much as the cost of building a new bridge, speaking approximately? I daresay the cost of constructing the road and resuming the land would pretty well amount to as much as the cost of constructing the bridge. I do not say it would be a cheap way of doing it by any means.
1882. *Mr. Lee.* Suppose the Abattoirs were removed from Glebe Island, do you not think the necessity would still exist for bridge communication between the island and the mainland? Hardly.
1883. Have you any accurate knowledge of the amount of traffic which passes over the bridge? Not an accurate knowledge, but I see the traffic. There is a continuous steady traffic from 4 a.m. to night-time, principally to the Abattoirs.
1884. Would you be surprised to find that the daily traffic across the bridge amounts to 2,032 vehicles, 51 horsemen, 215 driven animals, and 1,295 pedestrians? It does not surprise me.
1885. The traffic amounts to at least 3,378 persons, and includes 2,032 vehicles;—do you not think that a traffic of that magnitude would warrant the continuation of the bridge thoroughfare? But there would not be that traffic if the Abattoirs were removed.
1886. You do not pretend to say that the bulk of this traffic passes to and from the Abattoirs? I do.
- 1887.

1887. The vehicular portion of the traffic I have described passing to and from the Abattoirs on the same day amounted to 413 vehicles. The traffic was taken by a man stationed on the bridge for ten days, and although the traffic to the Abattoirs by vehicle is large, yet in proportion to the general traffic over the bridge it is rather small? Yes. H. Daly.  
7 July, 1897.

1888. Now that you are placed in possession of these facts do you not think that the necessity for a bridge would continue to exist whether the Abattoirs are removed or not? Yes; but all that traffic does not come to the city. There is much of that traffic which would be served by the route I have indicated. For instance, all the brewers' drays going over to Balmain would not of choice go by the bridge. If they had the other road all the brewers' drays going to the western portion of Balmain would not of choice go by the bridge.

1889. Of necessity, it would be a fair assumption that the bulk of that traffic would be between the city and Balmain, over Pymont Bridge? Perhaps it might; I am not prepared to say that.

1890. You will understand that the bridge is a very imperfect structure, and that when the swing is open the delay is great? I do not think it is inordinately great.

1891. As much as fifteen or twenty-five minutes? I daresay it is.

1892. If this large traffic proceeds under the disadvantages of a bad swing, is it not reasonable to assume that with a proper bridge, provided with a wide swing, that traffic will increase very largely? I do not think so.

1893. If you were mayor of Balmain, would you advocate the abolition of the bridge in favour of a road to be given in the direction you have indicated? If I were mayor of Balmain and did that I would be stoned.

1894. Does that not arise from the fact that the large population of Balmain desire to be served in as direct a manner as possible, and require as direct communication with Pymont railway station and the city as possible? I take it that the railway-station is the point which is the necessity for this.

1895. It is a great feature in the inquiry? Yes.

1896. For the simple reason that factories are springing up around the foreshores of Balmain, and are wanting to get access to the railway-station? They are springing up around Rozelle Bay and Blackwattle Bay more than at any other part of Balmain.

1897. Chiefly timber-yards? There are little factories springing up in those bays, but the only large business, in the nature of a manufacturing business, which is carried on in Balmain is at Mort's Dock, and that is principally with shipping. There is a large amount of traffic to Balmain done by water. For instance, the coal is brought alongside Balmain. They will be digging it out of the ground there directly.

1898. It is a great feature that there should be direct road communication between Balmain and the railway-station? No doubt.

1899. As a business man, you admit that? No doubt.

1900. I take it that your chief objection to the whole thing is the retention of the Abattoirs at Glebe Island? That is from a public point of view.

1901. If the Abattoirs were removed you would offer no serious objection to the continuation of the bridge thoroughfare across to the island? No; I am speaking of the benefit which would accrue to the two bays by having an open waterway, not hampered by a bridge in any way.

1902. As a matter of public convenience, would it not appear to you that a large section of the public who have been accustomed to use this thoroughfare for so many years would hardly tolerate the closing of it? It would be a case of *volens volens*—if it was not there they would have to go by the other road.

1903. If the State could not give these people equally as good communication as they have now, do you not think that they would be discontented? If it would be three quarters of a mile further to get to the city, as the Chairman has pointed out, no doubt it would be a ground for complaint on their part.

1904. Admitting your contention, as far as Blackwattle Bay and Rozelle Bay are concerned, but providing that ample accommodation is made to admit ordinary vessels under the bridge, and by an open swing to allow large vessels to pass through the bridge, do you not think that that will give all the necessary access required to those bays? Yes; but there is always an objection, more or less, to a bridge barring a waterway. The manufacturing places in these bays, as well as the travelling public, would be inconvenienced while the swing was opened.

1905. But if the bridge is made sufficiently high to allow small craft to pass underneath without opening the swing, in the future, when these bays have been dredged out, do you not think there will be equally as much accommodation for anyone to settle in those bays as is likely to be given to shipping and others above Pymont Bridge? Yes.

1906. Well, if they are put on the same footing as the people above Pymont Bridge, what possible objection can there be to this proposal? People above Pymont Bridge are complaining now.

1907. But they are to get a very good bridge, with a fine swing in the centre. If they are all put on the same footing, your objections will, to a large extent, disappear? I daresay.

1908. If it is found that it is not possible to remove the bridge, the next best thing is to provide for very large accommodation in the future. Would not that very largely remove the objection you have to the bridge being there at all? I daresay it would.

1909. There is a proposal to carry a tramway to Balmain by that way? No doubt it would considerably shorten the distance to Balmain, but a tramway on a bridge with an open swing would certainly be very objectionable. An electric tramway would be a serious bar.

1910. The chief objection you offer is that it would be more in the interests of the community not to have a bridge there at all? Notwithstanding what you suggest, and notwithstanding what is promised, I consider a bridge is not a desirable thing to cross a waterway of this description, where a large amount of shipping is bound to come in the near future.

1911. But when it has been shown to you that so large a number of people will be put to serious inconvenience without a bridge, would you not, under conditions of that kind, waive the objection which you raise; would you urge the adoption of your plan in preference to the adoption of this proposal? I do not think that the people of Balmain would be so very seriously inconvenienced by it. They have a very fine water communication; they get across the harbour for 1d, and the trams run right up into Balmain.

1912. The road would lead to other places than Balmain? Certainly. It would bring Leichhardt very much nearer to Sydney.

- <sup>A</sup> H. Daly. 1913. It would lead to Drummoyne and Ryde? It would be almost as short by the route I suggest. It is Balmain proper—the part represented by the mayor—which would suffer most if the bridge were taken away.  
7 July, 1897.
1914. *Mr. Fegan.*] I think you said that the Hamburg Abattoirs are the best situated and the best supervised of any abattoirs you know? The most expensively constructed.
1915. Have you visited other abattoirs? Yes.
1916. Under what supervision are they? Municipal, not Governmental. Everywhere I have seen abattoirs they have been under municipal control.
1917. How far are they from the centre of the town? You might say that they are in the town.
1918. Do you not think that the nearness of the Abattoirs to the harbour, and to the waters there, has something to do with the visitation of cholera now and again? No; the Abattoirs in Hamburg are scrupulously clean.
1919. Where does the water from the Abattoirs go? Into the drainage of the city.
1920. Is it not a fact that the drainage empties itself into the river, and that the people use the river water for drinking purposes at times? Not in Hamburg.
1921. Just before the epidemic of cholera visited Hamburg they did? No. The sanitary arrangements in Hamburg are rapidly becoming very excellent indeed; in fact, all the garbage of the city is burnt. They have spent £90,000 in less than four years.
1922. When did you visit Hamburg? I was there in 1892.
1923. That was before the cholera visited the place? Yes. There has been nothing serious in the way of cholera there. There were only a comparatively few isolated cases. You must recollect that until within the last eight or ten years Hamburg was an insanitary city, and it is only lately that they have taken up extreme sanitary measures, as they have done also in Berlin.
1924. But still, is it not a fact that hundreds, nay thousands died during that epidemic in Hamburg? I am not sure; I would not say so.
1925. Thousands a day died there during the epidemic? I am sorry to hear it. The cholera must have been introduced there; it did not grow there as a natural product.
1926. It went from there to other centres? I do not know; perhaps you know about it.
1927. It was mooted at the time that the cholera broke out in Hamburg on account of the insanitary condition of the city, which the authorities had to take immediate steps to improve—and that that was owing to the nearness of the Abattoirs to the centre of the town? I assure you that no epidemic—no case of illness—has ever been traced to properly-constructed abattoirs; in fact, it is one of the boasts of the people of Balmain that no disease or affection of any sort ever commences from the Abattoirs on Glebe Island.
1928. That points out at once that the position of the Abattoirs and their condition are such as to guarantee their retention at Glebe Island until a better site than has been suggested so far is found? It is to be hoped so.
1929. At the island they use, not only the city water supply, but also salt-water from the harbour? Yes; the blood runs down in the morning, and they pump it up in the evening. It is the blood pumped out of the bay that they wash down the floors with.
1930. *Mr. Hoskins.*] They have a large fresh water tank? They do not use that at all.
1931. *Mr. Fegan.*] Do you think that Blacktown is in a very good position for abattoirs? I do.
1932. If there were a railway to the island, or a possibility of conveying the animals by water, then a great deal of your objection to the present site would be removed? Yes; but you cannot get away from the sale-yards question.
1933. Your great objection is the inconvenience and danger caused by the travelling of the stock along the road? Yes; and the condition of the stock when they are slaughtered, as much as anything else, because meat slaughtered in the country brings 1d. more in Sydney than does meat from the Abattoirs.
1934. The objection you raise to the retention of the Abattoirs at Glebe Island is on account of the danger and inconvenience to the people? Yes; and the deterioration of the meat.
1935. Will you raise that as an objection to their retention? I do, undoubtedly; and a strong objection, too.
1936. If the cattle were run by a branch line from Flemington or Homebush into the Abattoirs, that would materially alter the position? I do not think it would help it at all. It is one of those things you could not do.
1937. Why? How will you re-truck the cattle again?
1938. If there is a railway to the island you can re-truck them? That is where I differ with you. You cannot re-truck cattle. You can hammer them into the trucks, no doubt, but when you get them to Glebe Island you will have them condemned for being in a bruised and unfit condition for sale after slaughter. Out of 77,000 bullocks slaughtered in 1895, 1,500 were bruised, and the proportion would be much larger if they were re-trucked. You will find all the slaughtermen concurring in the opinion that it is next to impossible to re-truck cattle. The sheep can be handled all right, but the cattle cannot be re-handled. Once wild or semi-wild cattle are put into trucks and untrucked, you cannot re-truck them.
1939. What are the principal features of Blacktown to recommend it as a suitable site for abattoirs? A large area of land can be secured there in one block. The water for the purpose of manufacturing the various products and of dressing the meat is close at hand in the Prospect reservoir. The district is a fairly good agricultural district, and the waste products can be disposed of, or there is a fair prospect of getting a market for the material among the settlers. It is within an hour's run of the city, and the meat can be sent down here for the purpose of disposal at a central market.
1940. Where would you remove your sale-yards to? I would take the sale-yards from Flemington to Blacktown.
1941. It has been suggested here by a witness that Belmore is a good site for sale-yards and abattoirs? That may be. I know nothing about Belmore: I have not seen it.
1942. Did you go to Blacktown with the express intention of seeing this good site? Yes. I saw some evidence by a gentleman concerning this site, and I went to Blacktown and had a look at it myself. I have no interest in the place.
1943. There would be no danger, I suppose, of the water filtering from the abattoirs back to the Prospect dam? None whatever; because the fall is in the opposite direction. It would not go into the watershed.

1944. *Mr. Hassall.*] I think you said that Glebe Island is totally unsuitable for abattoirs? Yes; that is, under existing conditions. -H. Daly.  
7 July, 1897.
1945. The trend of the evidence before the Committee has been that it is the most suitable site for the purpose? Yes; but I have already pointed out that you cannot get the material to be operated upon there satisfactorily. You must have your sale-yards at the abattoirs, especially in this country, on account of the nature of the cattle themselves. You must have your sale-yards at the abattoirs in order to have an ideal scheme, as we ought to have here. You cannot have that at Glebe Island.
1946. You think the cattle ought to rest after being through the sale-yards? Undoubtedly; and that is acknowledged on all hands.
1947. A large carcass butcher has stated here that in all probability, if the sale-yards were alongside the abattoirs, or *vice versa*, the cattle would be run almost directly from the sale-yards into the abattoirs, and killed while in a state of fever; but the location of the slaughter-yards at some little distance from the sale-yards is beneficial in this respect, that it allows the cattle time to cool down? That is so.
1948. You have seen the cattle come from the sale-yards at Homebush? Yes; it is a regular hunting expedition from Homebush. They are not driven; they are hunted.
1949. It is a case of hunting the cattle from the time they leave the railway trucks until they go through the sale-yards? Their tongues are hanging out when they get to the Abattoirs, and they are dead meat in an hour.
1950. Would not the same thing occur anywhere else? No; it is all a matter for consideration by the owners of the cattle. If I owned cattle, and was a slaughterman, I would slaughter them in the best condition, in order to have my meat in the best condition. You can always tell meat that is properly bled. If you kill a beast, and it is properly rested, it will be properly bled, and the meat will have a healthy, sound, and inviting appearance; whereas, if you kill a beast which has been hunted and driven, it will not bleed properly; it will be suffused with blood. The meat which is not properly bled, and the meat which is killed in a fevered condition, will not keep as well as the other meat.
1951. You seem to think that it will be advisable for the meat to be slaughtered in the country? There are many difficulties in connection with that being done. The climate is against it. We have very little natural cold here; all the cold would have to be produced artificially. In America, where they carry meat 900 miles, all the ice is saved from the lakes. Their ice costs them practically nothing; whereas here, for every pound of ice you make, you have to pay dearly.
1952. We cannot alter the climate? The next best thing you can do is to bring the animals' meat within a reasonable distance of Sydney, and slaughter them there under proper conditions.
1953. Even when they slaughter cattle at Riverstone they have to send the meat down in chilled cars, especially in summer? I believe so. It is very good meat; it comes in very good condition; it brings the highest price.
1954. The question arises, then, whether any more suitable spot than Glebe Island can be found for the Abattoirs;—in the event of proper machinery being provided it may be possible to turn these products into a commercial article with very little nuisance to the residents? The blood and offal could be treated so perfectly, easily and satisfactorily, that any person entering the establishment would not be able to tell what process was being employed. If the material is treated from start to finish in sealed vessels all the manurial qualities are preserved, and it is sold at per unit of ammonia, or of whatever constituent it contains. There was no such thing as an analysis of the manure produced at Glebe Island. The men there could not tell you what constituents it contained any more than the man in the moon. All they did was to burn it up, and put it into bags; it was burnt dry dust. From Glebe Island a very large quantity of the offal is taken away for pig-food, and the driving of that stuff through the streets is a horrible nuisance. I have seen it filled into the bags and carried along the streets. The guts hang out of holes in the bags. It leaves a trail of stench behind it. All these things are disgusting, offensive sights in a large population.
1955. The municipal authorities or the Board of Health might make those who convey this offensive matter through the streets provide proper receptacles for it? It is very difficult to do that, because in this country these waste matters will decay and go into a putrid state in about six hours, especially in summer. Unless they are taken away very quickly there will always be a smell, and even in a fresh state, to people not accustomed to slaughtering, an offensive odour arises from the stuff. That is my experience of it.
1956. Do you think the present bridge is equal to requirements? No. Every day it is there it is expensive, and costs a large sum for maintenance, and you have to support a staff to open and shut the bridge. It is a continual cause of expense even as it is. I have suggested an alternative scheme—whether it would meet with the views of people I do not know.
1957. Do you not think that if the bridge were removed from that position it would result in great difficulties to the people who have been using it so long? No doubt. The people at the west end of Belmain want to keep the Abattoirs at Glebe Island.
1958. The agitation for a new bridge is justifiable in many ways? No doubt.
1959. As the present bridge has practically outlived its usefulness, do you not think a more substantial bridge should be erected in its place? If a bridge has to be provided there a good one should be erected.
1960. *Mr. Roberts.*] You said that in England manure manufactured from blood brought £8 a ton, and manure manufactured from offal £6 a ton;—do you know what that manure costs per ton to manufacture it? The blood manure costs in England about £5 per ton, and the offal manure about £3 15s.; but the raw material has a money value there, whereas here it is treated as waste and punted out to sea and discharged.
1961. *Mr. Black.*] You spoke of the injustice which would arise to the people of Flemington if the Abattoirs were removed to that place;—do you think that the Abattoirs could be established anywhere without an injustice arising to someone who was settled there? The very presence of an abattoir—no matter how well supervised and conducted it is—always has a lowering influence on the character of the neighbourhood. My experience is that an abattoir always depreciates the character of the neighbourhood where it is established.
1962. Then you think it is wise to remove the Abattoirs from a place where that depreciating effect has already been gone through to some other place where a similar effect will have to be undergone? A similar effect could not be undergone at Blacktown, because there is no settlement there.

- H. Daly. 1963. Is there not a village there? It is a comparatively small place. I am speaking now of some distance from the railway. You are not taking the abattoirs into any settled population which is already there.
- 7 July, 1897. 1964. But if there is a population there you are? There is no population of the nature you indicate there.
1965. What do you mean by saying of the nature I indicate? You indicate the population which is round Balmain. The population at Flemington is totally different. The class of settlement at Strathfield and Flemington is totally different from that at Balmain.
1966. Do you think that what is offensive to people of a certain class will not be offensive to people of a lower class—that the people of a lower class have no sensibilities to be considered? No; that does not enter into the thing at all. Practically, the Abattoirs where they are do not touch the houses of the people, whereas if they are established at Flemington or Strathfield, settlement will go on until it comes close up to the abattoirs. The men, for instance, who are employed in the abattoirs, and the people who make their living round them, will keep spreading out and out until they touch the fringe of the better class of settlement.
1967. Why should settlement ever come up so as to touch or fringe on the area occupied by the abattoirs? It is bound to come. You are bound to have a lot of associated trades there.
1968. I do not see it;—you have set apart at Flemington a certain area for the sale of cattle, and you have also a certain area (which they say is about 1,015 acres) for the resting of cattle;—suppose you put your Abattoirs in the centre of that block of 1,015 acres, which is permanently reserved for this purpose, however is settlement to so nearly approach the Abattoirs as to feel its injurious effects? I am not prepared to indicate how it is to approach it. The residents of that locality, or the better class of people who are employed in the city, have moved out in that direction in order to escape the crowding of the city, and if you put an abattoir down close to them it certainly will have a depreciating effect on the neighbourhood.
1969. Yet you say that you can so conduct the desiccating of the blood and offal that it will be possible for anyone to enter the abattoirs without knowing what process is going on? Quite so.
1970. You also say that the killing of cattle in Paris and Hamburg is not prejudicial to the health or objectionable to the inhabitants of those cities? I do not say it is not objectionable; but I say the class of settlement around those abattoirs is a poor class.
1971. Who are not supposed to be sensitive? I have nothing to do with their senses.
1972. Why should they not have as much consideration as others? That has nothing to do with it.
1973. It has this much to do with it, that if you consider one class you should consider all? It is merely a matter of peoples' tastes. Take me, for instance; I would not, out of choice, buy an allotment of land and reside in the neighbourhood of an abattoir let it be ever so well conducted.
1974. *Mr. Roberts.*] The nearer the abattoir the lower the rent? Rather. It is the case everywhere I have seen. The men who are employed in abattoirs like to be near their work.
1975. *Mr. Black.*] Do you think the people of Balmain object, as a rule, to the present site of the Abattoirs? I am quite sure they do. I was at a meeting in Balmain which was called to bolster up the Abattoirs, and all the men who were there were simply the employees of the Abattoirs.
1976. How far is the site at Blacktown from the Prospect reservoir? I suppose it is half or three-quarters of a mile.
1977. Do you think it would be wise to place the abattoirs so near to the public water supply? I do not see what injury could result from it.
1978. Do you not think that some of these sensitive people you think about might object to drink the water from the reservoir? They could please themselves about that.
1979. The people of Sydney might object to the proximity of the abattoirs to their water supply? It could not injure their water supply.
1980. Whether it could or could not, do you not think that there would be an objection on sentimental grounds to the presence of the abattoirs so near to the water supply? An abattoir cannot be a pestilential place if it is properly conducted. Nothing arises from it which could be detrimental to health. Our food supply comes from the abattoirs, and, therefore, it must be in good condition in all circumstances. Nothing can arise from it, except matter is allowed to putrify, and allowed to contaminate and pollute the water supply, which could be any danger to the people.
1981. Do you not think that substances which are prejudicial to health—which contain the germs of disease and contamination—can be carried a great distance by birds or insects? I have heard so.
1982. Is it not just possible that the seeds of contamination might be carried from the proposed abattoirs at Blacktown to the Prospect reservoir and dropped into the water there? I do not think so. If you allow an open sewer to be there, and putrid matter to flow from the abattoirs, and create an abominable stench—if you allow that sort of thing to obtain there, and birds and animals pick it up and drop it into the water—that may come about; but I think it is absolutely impossible in a well-regulated establishment that it could happen.
1983. Do you consider the establishment at Glebe Island well regulated? If you view the inconvenience of the place, and the conditions under which the men have to slaughter, and the bad accommodation there, I really think it is marvellously well looked after. The means for conveying the blood and offal away are inadequate.
1984. Do you know any reason why, with certain improvements which you have suggested, and which others have suggested, the Abattoirs at Glebe Island could not be made just as unobjectionable to the public as any Abattoirs which may be situated elsewhere? I do, undoubtedly; but the getting of the material to be operated upon there is the trouble.
1985. To refined persons, especially? You can kill a beast in this room, and clear up the debris, and come in here to-morrow, and you will not know that there has been a slaughter here. You can erect a slaughterhouse in the middle of a city, and keep it scrupulously clean and remove all the material.
1986. Then it would be possible to greatly minimise the nuisance supposed to exist at Glebe Island? Undoubtedly it would be possible. You could erect substantial abattoirs there; but notwithstanding that you would not be able to have an ideal scheme, or such a scheme as there should be in this country.

THURSDAY, 8 JULY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
 The Hon. JAMES HOSKINS.  
 The Hon. CHARLES JAMES ROBERTS, C.M.G.  
 The Hon. WILLIAM JOSEPH TRICKETT.  
 The Hon. DANIEL O'CONNOR.  
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
 JOHN LIONEL FEGAN, Esq.  
 THOMAS HENRY HASSALL, Esq.  
 GEORGE BLACK, Esq.  
 FRANCIS AUGUSTUS WRIGHT, Esq.  
 FRANK FARNELL, Esq.

The Committee further considered the expediency of constructing a New Bridge at Glebe Island.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and examined:—

1987. *Mr. Humphery.*] Is the design of the proposed bridge similar in every respect to the design which was placed before a former committee? No; the design I am prepared to recommend to the Committee is what is known as the causeway design. C. W. Darley.  
8 July, 1897.

1988. Will you briefly explain your design to the Committee? The centre line of the causeway will be about 90 feet, on the southern side, from the centre of the existing bridge. It will be constructed of a solid bank of stone, extending out towards the centre from each side, with a steel swing-span in the middle, covering two openings of 60 feet in the clear, and two side spans, each 80 feet long. The swing portion will be 194 feet overall, which covers two openings of 60 feet each, two rest-piers of concrete and masonry, and two side spans of 80 feet long, so as to reach on to the stone causeway. The clear headway under the bridge will be 20 feet, and the roadway will be 40 feet wide, with two footpaths of 5 feet each.

1989. *Mr. Hoskins.*] Why do you require to have two side spans? Because otherwise the stone from the causeway would run out and block the waterway.

1990. Even though you have two openings in the centre? The object is to span the slope of the stone, otherwise you would have to put up very heavy masonry rest-piers to act as an abutment. It is cheaper to put a span on to the causeway than to make a heavy abutment there. In my estimate I have allowed for the cost, which will be ample, of excavating the stone on Glebe Island, and bringing it into position. I have taken a very full estimate, but I have reason to believe that it will be very much cheapened by a large quantity of material being brought from the city out of foundations. For instance, the Railway Department are about to construct a large power-house near Harris-street, in connection with the electric tramway system. There will be a large amount of excavation on that work; I do not yet know how much, but there will be a considerable amount, I understand from the Engineer-in-Chief. The contractor must have a place to tip the stuff, and this place is immediately available as a site. By putting the material here we will actually cheapen their operations. Again, if the city railway extension should be authorised—a thing I cannot count on—there will be very great difficulty in readily getting rid of the material. Here would be a dumping ground for the material excavated from the city railway extension. That would practically enable this causeway to be made free of cost. The estimate of £25,750, which I have put down for the causeway, might be written off. It is the most convenient dumping ground which could be found for city material. There is no other place within that radius which could be found for dumping a large quantity of excavation from the city. From my experience of the filling done at Circular Quay you have but to offer such a site for sound filling, and you can obtain it readily poured in. I have not counted on getting any material. I have simply put down what is a good price for excavating the material on Glebe Island. That all goes to the good if we can get the material or any portion of it from the sources I have indicated. I estimate the cost of the whole structure at £84,500.

1991. Is that for the causeway alone? It is the cost of the causeway and the bridge, including the swing. £25,750 of that sum is for stone; it is possible that the whole of it may be saved, but certainly a large proportion will be saved.

1992. *Mr. Humphery.*] Have you ever estimated how much of the £25,750 would be required to remove the stone from Glebe Island? That is the full value of excavating the stone at Glebe Island. It is an outside estimate.

1993. Have you made any allowance for the cost of the causeway on the Pymont side? No; I have treated the two causeways as one work.

1994. Have you made any estimate of the value of the material which you will obtain from the excavations for the power-house near Harris-street, and possibly in connection with the city railway extension? At this stage I do not know how much is likely to come from the power-house. I do not think the plan has sufficiently developed yet to get that information. In my estimate I have not calculated on getting any portion of this material free. I have put down an estimate of its cost as if we had to excavate the material at Glebe Island.

1995. The total cost of the bridge and causeway will be £84,500 on the assumption that you will have to pay for all the material you use? Yes.

1996. It is possible that that estimate may be very greatly reduced if you obtain, as you hope to do, a large portion of the material free of cost? Yes.

1997. Can you say approximately what the saving in that direction may be? It may be as high as £25,750.

1998. Practically that would reduce the cost of the bridge to below £60,000? A little below that sum.

1999. How do these figures compare with the estimated cost of the wooden bridge with a steel swing-span, which was placed before a previous committee? The first cost estimate of the wooden bridge was £59,500. Of course, a wooden bridge is more costly to maintain than a steel bridge. The estimated cost of a steel bridge throughout, with stone piers, is £92,400, as is illustrated on the drawing to my right.

2000. Would you regard a bridge, as now designed, with two causeways as being superior to either a wooden or steel structure? In my opinion it is.

2001. Will you be good enough to explain wherein the superiority of the structure lies? Over three-fourths of the length of the structure will be absolutely permanent, and will require no maintenance other

- C. W. Darley. other than the surface-maintenance of the road. It will be dealt with as an ordinary street or road; but beyond its maintenance, there is nothing to deteriorate or depreciate in the permanent structure.
- 8 July, 1897. 2002. What is the estimated difference in the cost of maintenance between the proposed causeway and a wooden bridge with a steel-swing span? I have the maintenance and working expenses put together. The working expenses are so large in proportion that it does not leave much difference between the two. There is the labour of attending to, and opening and shutting the swing-span.
2003. Can you separate these items, because I suppose the estimate for opening and closing the swing-span will be common to all schemes? Yes. In the case of the roadways, as regards maintenance and working expenses, there is no very great difference. A steel bridge altogether will cost £46 more to maintain than a causeway. The renewals come to £672 a year in the steel bridge as against only £234 in the causeway. In the wooden structure it would come to £1,578 18s. 4d., compared with £234 in the case of the causeway.
2004. So that there would be an annual saving of about £1,300? No; because you have to include the interest. The interest on a wooden bridge is so much less than the interest on the causeway.
2005. Suppose you answer my question on the assumption that you will be able to effect the saving you anticipate, and reduce the actual cost of the bridge and causeway to £60,000, which is about the same as the estimate submitted for a wooden bridge? Then the interest would stand the same. I have worked everything out on the maximum basis, assuming that we get no material from outside at all.
2006. On the maximum basis what will the saving be? The interest, renewals, and working expenses in the case of the causeway will be £5,040 a year. The difference in the total annual cost to the country is £230 in favour of the causeway. Capitalising the total cost to the country, and allowing for renewals, interest, and maintenance, in the case of the causeway it is £126,000, as against, in the case of the timber bridge, £137,750, so that actually in the long run, the causeway is the cheaper of the two, calculating it on the most costly basis.
2007. That is to say, on your maximum estimate, there would be that saving? Yes.
2008. And upon the reduced estimate, in the event of a portion of the material being obtained free of cost, how much will the saving be, calculated in the same way? It will come down to £111,000. The capital value of the whole structure and its upholding will be £111,000 as against £137,000 in the case of the timber bridge.
2009. Have you taken into consideration the cost of renewals? Yes; I am putting down the same for renewals, giving the different portions of the bridge a different life.
2010. On the calculations you have made as to the matter of cost, would the construction of the causeway result in a very large saving ultimately? It would.
2011. Are there any objections to the construction of a causeway that would not apply to the erection of an open structure? I do not know of any.
2012. Have you considered the question of dredging? Yes.
2013. Would more dredging be necessary with a causeway than with an open bridge? No more.
2014. Would there be any possibility of greater pollution at Blackwattle Bay by reason of a causeway than by reason of a timber or steel bridge? None whatever; there is nothing to cause pollution. The entrance here is of an immense size in proportion to the area of the water in the bay inside.
2015. *Chairman.*] There will be no diminution in the amount of water entering the two bays? None. The proportion that the width of the entrance bears to the area inside the bay is exactly four times what the width of the Sydney Heads bears to the area of water inside the Heads. As the Committee have fresh in their minds the entrance at Lake Illawarra, let me make a comparison with that place. The width of the entrance into Rozelle Bay through this opening is exactly forty times as large as the proposed entrance to Lake Illawarra. In the case of the Sydney Heads it is four times the size. In other words to pass the same quantity of water through per hour, in proportion, as Sydney Heads do, you can reduce it to a fourth of the present width.
2016. *Mr. Humphrey.*] The proposal is to have the road on the causeway of the same width as the roadway on the bridge with two 5-foot pathways? Yes.
2017. Have you a design of the causeway showing the width of the base? I had not time to prepare a cross-section. It is a 40-foot roadway with two 5-foot footpaths.
2018. Do you propose to pitch the face of the causeway? The slopes I propose to hand-pitch from low-water mark upwards, so as to give it a trim and tidy appearance.
2019. *Chairman.*] Is the causeway likely to cause the bay to silt up, or is there any force to take out the silt? There is nothing to cause the bay to silt up. There is no run there. It is not like a river's entrance.
2020. Have you any idea what the velocity of the water passing between the causeways would be? It would be almost imperceptible.
2021. *Mr. Wright.*] Is it 3 miles an hour? It is not a mile. Practically, the current is not worth considering, as the area of water in the bay is so small. There is only a water area of 170 acres inside the bridge.
2022. *Chairman.*] What is the width of the water between the causeways? The net waterway is 235 feet—that is, after deducting the width of the central pier and the two resting piers. The area of the water inside the bridge is so small that the current would be inappreciable.
2023. What is the rise of the tide in the bay? From 3 ft. 6 in. to 5 ft. 6 in.
2024. Would you average it at 4 feet for all practical purposes? At 4 ft. 6 in.
2025. *Mr. Humphrey.*] Where do you propose that the causeway shall start from on the Glebe Island side? At about 90 feet from the southern side of the present bridge. It will be parallel with the present bridge at both ends.
2026. To some extent it will straighten the present road on Glebe Island? It will take away a portion of the existing curve on that road.
2027. Your causeway will be much higher than the present roadway? Yes.
2028. How do you propose to deal with the road on the Glebe Island side? I propose to fill up, so as to get a better gradient up to the Abattoirs. There is a rather steep gradient rising up from the Abattoirs—1 in 15. I propose to alter the gradient so as to get not less than 1 in 20.
2029. Do you propose to widen the roadway? I propose to widen and improve the roadway.
2030. Now, on the Pyrmont side, do you propose to make any alteration in the approach to the causeway? I propose to widen it considerably.
- 2031.

2031. Do you think it necessary on the Glebe Island side to make any deviation in the roadway? No. C. W. Darley.
2032. You think it is better not to do so? I think it is better to keep it for the present on the same line. 8 July, 1897.
2033. The previous proposal was to take it straight across the island? At this stage I would not like to recommend that that should be done, because the future use of Glebe Island is not determined on. I am afraid that if a road were now taken across the island, it would interfere with the usefulness of the island for railway traffic. It will be better to keep the road, for the present at any rate, where it is.
2034. *Mr. Wright.*] Would not a straight road across the island take up very much less space? No; it would mean having two roads instead of one. You must keep the present road.
2035. *Mr. Humphery.*] The present road is almost direct; the only reason for a suggestion of the kind which has been made to the Committee is that, at present, the road divides the Abattoirs;—is not that so? I rather think that that is of small moment at the present stage.
2036. How long will it take to construct the causeway and complete the bridge? I think it will be very nearly three years' work.
2037. Will the bridge be ready for use within three years from the time of commencing the work? I think there is no difficulty in doing the work in three years.
2038. Have you considered the present condition of the Glebe Island Bridge, and are you of opinion that it may be maintained during the erection of the causeway? We would have to maintain it until the other was finished. It may be more or less costly, but it must be done.
2039. Have you any doubt about your ability to maintain the present bridge during that period? I think we can do it.
2040. Can you make any suggestion as to providing a better approach to the bridge from the Pyrmont side;—you see from the plan on the easel that the present road is certainly not a direct road, but has very sharp angles? Of course, it is possible to provide a better approach, but I do not think it would warrant the cost. It would be done at very great cost, because it would interfere with too many vested interests. There are so many large businesses established facing the road that I think it would be very hard to make a deviation.
2041. The present road is about as direct as you can make it without incurring very great cost? Without incurring unreasonable cost.
2042. Could a shorter route through Glebe Point and round the head of Rozelle Bay be obtained? I could obtain a route, but not a shorter route.
2043. What would be the length of the shortest route, starting from the letter B on the plan, that you could obtain? I have made a calculation of the distance from a common point at the junction of Pyrmont Bridge road with Union-street to a common point at the junction of Weston-street with the Abattoir-road. The present distance *via* Glebe Island Bridge, starting at the intersection of Union-street and Pyrmont Bridge road, *via* Union, Miller, and Bank streets, the Abattoir-road and Weston-street to Gordon-street, is 1 mile 46 chains; but going from the same point, *via* Pyrmont Bridge road, Brougham-street, Lyndhurst-street, Glebe-road, over the embankment at Rozelle Bay to Weston-street, it is 2 miles 54 chains; or 1 mile 6 chains longer than the direct route.
2044. Could that be shortened without considering the cost? It could be shortened, but it would be very costly indeed, instead of following the Pyrmont Bridge road into Glebe-road, to go across either by tunnel, or through private property.
2045. What distance could be saved in that way? I do not think you would save more than 30 chains.
2046. That would bring you to the point on Weston-street which you just mentioned. Yes, to the common point of junction for the traffic going to Hunter's Hill and the western district, Glebe Island; but to go round to Glebe Island Abattoirs, it makes a difference of 1 mile 72 chains.
2047. Will you now state the distance from that point on Weston-street to the Abattoirs? It is 40 chains from that common point to the Abattoirs.
2048. Making what difference between the road you have described and the present road to the Abattoirs from Sydney? To the Abattoirs it will be 1 mile 72 chains longer than the present road.
2049. So that assuming the present bridge to Glebe Island to be removed, and no new bridge to be built in its place, for all the traffic between Glebe Island and Pyrmont there would be a difference of nearly 2 miles? Yes.
2050. Do you think these figures are quite correct? The difference to a common point for all traffic going to the west and north—to the Hunter's Hill district—would be 1 mile 6 chains longer.
2051. That would be for all traffic going beyond the point on Weston-street which you have mentioned? Yes.
2052. Therefore the residents to the west of Balmain would have to travel an additional mile if the present bridge were removed? Yes.
2053. As a matter of convenience it would be out of the question to adopt the suggestion which has been made to the Committee to take a road round by the head of Rozelle Bay? Not without putting the people to extra trouble.
2054. Have you considered the cost of connecting the end of Glebe-road with Glebe Island—that is, across Rozelle Bay? I have not made an estimate of that.
2055. I suppose any suggestion in that direction would not commend itself to you? No; it would be very nearly as costly, because it would still require an opening span in the bridge.
2056. And there would be no advantage? I do not see any advantage to be gained. You would require an open span to go through that bridge, and practically it would be as costly a bridge as the other.
2057. Do you see any objection on the score of delay to vessels passing through a large swing (say) 60 feet wide, to get into Blackwattle Bay and Rozelle Bay? None whatever.
2058. Have you considered the time which will be required to open and close the swing? The swing can be easily opened in half-a-minute, and closed in the same time.
2059. The only delay will be while the vessel is passing through the opening? Yes; the question of opening and closing the swing hardly enters into consideration.
2060. Do you consider that an opening 60 feet wide would be more than ample for all the traffic in connection with the two bays? Quite sufficient.
2061. Can that causeway and the swing-span be so constructed as to admit of tramway communication between Pyrmont and Glebe Island? Yes.

- C. W. Darley. 2062. Is it your intention to so construct the bridge? It is not contemplated that a tramway shall be laid on the bridge, but it is strong enough to carry a tramway.
- 8 July, 1897. 2063. Would there be any difficulty in passing a tramway over a swing-span? No difficulty.
2064. Would there be any danger? Not with proper precautions. There is danger, of course, with every swing-span.
2065. Would there be any special danger? No.
2066. Therefore, for tramway purposes a bridge or a causeway with a swing-span may be regarded as an ordinary road? It may.
2067. *Mr. Lee.*] Have you considered the question whether the road on Glebe Island could be deviated with advantage to the public of Balmain? I do not think it would be to the advantage of Balmain to deviate the road. It is nearly as direct a road as you can have.
2068. Instead of going directly past the gates of the Abattoirs, where at times there are unpleasant sights and smells, could you, with advantage, deviate the road to the north without incurring any large additional expense? It would mean considerable expense, because you would have to cut a good depth through the island. Of course, it could be done, but I think at this juncture it would be unwise to determine on it, because we cannot just yet lay out the possible future of the island. If it is to be utilised for railway purposes—for shipping purposes—it would be a pity to fix levels on the island which would be inconvenient for its utilisation hereafter.
2069. It is possible that in the future the Abattoirs may be removed, and the island turned to much better account? Yes.
2070. For shipping either coal or merchandise? Yes.
2071. You hold that if we were to make a large cutting through the island, it would seriously interfere with its future utilisation in that respect? With the future development of the island.
2072. You know of no reason why the road should not continue to run past the Abattoirs? I do not see any objection at all.
2073. I presume your objection would hold equally strong against a deviation of the road on the eastern side of the island? It would. The road if deviated in that direction would block off the access to very valuable water frontage, which is part of the scheme for developing the island.
2074. If a day should come when Blackwattle Bay and Rozelle Bay are dredged out to accommodate a vessel of moderate size, all that frontage will be required for wharfage purposes? I think so. I think the day is not far distant when we will find it desirable to commence utilising the various frontages around Glebe Island. It would be a pity at this stage to go to the expense of constructing a road there which you may have to do away with then.
2075. A large amount of sewage is discharged into Blackwattle Bay? Yes.
2076. If that practice is continued, and you build a causeway, will it not largely impede the discharge of that sewage from the bay? No. The amount of sewage discharged into the bay is decreasing every year, and as the sewerage system becomes completed the amount going into the bay will be lessened. But any sewage which goes into the bay is deposited near the mouth of the sewer. It is not as if it were deposited in a river. It is not water-borne, and in the absence of any current it is precipitated and arrested near the mouth of the sewer. We dredge it up time after time. It is not carried away into the bay. At a little distance from the mouth of the sewer you would find the water comparatively pure. There is no current from the bay out as compared with a river. If there were a river running down there and passing through that opening, it would be a matter for consideration, but in the absence of any disturbing influence of that kind there is nothing to create a deposit behind the piers, any more than in other portions of the bay.
2077. And therefore it is not likely to become more offensive than it is? No.
2078. Is it the intention of the Sewerage Department to discontinue discharging the sewage into this bay when their scheme is completed? Practically so.
2079. Is that likely to be very long? No. The western suburbs scheme is well advanced, so that in two or three years really the sewage of that portion of the suburbs will be diverted and taken through the sewers.
2080. That being the case, there can be no possible danger of a nuisance springing up there from that cause? None whatever.
2081. Practically then, the sewerage system may be completed almost as soon as the bridge is built? The great bulk of the sewage will be diverted from that bay before the bridge can possibly be constructed.
2082. When the reclamations are complete and the sewage is removed, and the bays are dredged for the purpose of admitting ordinary shipping, then you think the bridge you propose to construct will be sufficient to give ample accommodation for any vessel which can possibly trade to that water? Ample.
2083. Are you very clear on that point? Quite clear.
2084. That will cover the objection that such an opening in the bridge might interfere with the navigation? There is no ship entering the harbour which would not go there easily.
2085. The class of ships likely to go there will be fully accommodated by that swing? Fully. There is no ship which has ever entered Sydney harbour which could not go through there.
2086. *Mr. Wright.*] Do you know the beam of the "Orlando"? I am not quite sure, but I think it is under 60 feet.
2087. I believe it is 62 feet, and the "Nelson" is 60 feet in the beam; but of course you are speaking of merchant ships? Even the "Nelson" would go through.
2088. What depth of water have you at the swing and the two spans? There is only from about 17 to 18 feet now, but it is proposed to dredge it.
2089. I suppose the construction of your piers and causeway would allow that to be dredged to a depth of 27 or 28 feet if necessary? In my estimate I propose to dredge to a depth of 25 feet right away.
2090. That will not be deep enough for a large class of ships? There is no reason to dredge to a depth of 28 feet. I am going to dredge it to a depth of 25 feet before constructing the bridge.
2091. It has been pointed out that there is a possibility of a very large type of ships frequenting that bay, and therefore you would require to have a depth of 28 feet;—would it interfere with your estimated cost of the work if it were dredged to that depth? Not in the least.
2092. What is the idea of that extreme batter at the end of the causeway;—would it not be better if it were built up plumb? You would have to build a retaining wall to hold it, and that would be a costly work. I let the stone take its natural slope. I propose to let it rest well, and after it is consolidated to face it with hand-pitched slope, so as to give it a tidy appearance.
- 2093.

C. W. Darley,  
8 July, 1897.

2093. That is principally on the score of economy? Yes.
2094. It seems to me that you lose a good deal of waterway by that big batter, which you might get if the wall were plumb? The waterway is of very little object. If we want it, we will simply increase the span and set it further back. Two 60-foot openings are ample for the place. The other two openings can be used by small vessels.
2095. Will a boat, drawing 7 or 8 feet of water, be able to run through the outside openings? Yes. When the bridge is finished there will be a depth of 20 feet on that side span, with a clear width of 24 feet.
2096. Would it be possible to use the sides of the causeway eventually as a timber wharf? Certainly; you could construct a wharf for the island on each side of the causeway.
2097. You could get a sufficient depth of water there for all practical purposes? Yes.
2098. I think Mr. Humphery asked you a question about the grade of the road over the island, and the increased height of the causeway as compared with the present road? From the bridge is hilly all the way, but a good portion of the road is about 1 in 15, where it is principally in side cutting. I propose to continue the level of the causeway until it meets a gradient of 1 in 20 from the top of the island.
2099. That will be an advantage to the traffic? Yes; it will improve the road, and at the same time give a wider road.
2100. You propose then to widen the road over the island? I propose to widen the portion of the road through the cutting. It is a sort of side cutting which we propose to widen.
2101. You disapprove of the idea of cutting down the island, so as to make a straight road through? Yes; at this juncture.
2102. Because it will interfere with purposes for which the island may in the future be found suitable? Yes.
2103. Is the total opening which you propose to leave proportionate to the original opening, before the reclamations in Blackwattle Bay and Rozelle Bay were made? Not quite.
2104. A large area of the water in those bays has been filled up, and you think your proposed opening will not be proportionate to the opening before the reclamation was made? No; I think it will be a little less in proportion.
2105. Still you think it is ample for all purposes? Ample.
2106. There is no danger of the tide not getting in there at its full flow? I am quite sure about that. The area is so very small in proportion to that opening.
2107. A road taken round the head of Blackwattle Cove, along the foreshore of Glebe Point, and across the head of Rozelle Bay, would be a mile and a half longer than the present road? It would be 1 mile 6 chains longer from a common point to a common point.
2108. The only advantage which would be gained from a deviation of that kind would be the abolition of the bridge? Yes.
2109. That would give the people a very much longer route, and though a gain to the State it would be a loss to the people? It would be a loss of time, which is money.
2110. Your causeway is to be 50 feet wide on top;—I suppose it will be 100 feet wide at its base? 210 feet. I have taken the stone until it goes right down to the clay. It will not take as much stone as I have estimated. I estimate that the stone will displace from 12 to 14 feet of silt, and instead of the silt, which is overlying the clay, we will have a bank of stone. As a matter of practice, I know that that will not occur, but if it did occur the width would be 210 feet. If I were carrying out the work, I should dredge a gullet right across on the line of embankment and remove about 12 feet of soft mud. If that were not done, with the stone going in on top of the mud, there would be a very great risk of its forcing the mud away and knocking down the old bridge too soon.
2111. There would also be the possibility of future sinkages? I think the stone would go down pretty quickly. It would come to a state of rest before it was all completed. In my estimate I have allowed for dredging a gullet right through the main part of the embankment to good firm ground.
2112. Inside your causeway you can tip not only stone but sand and clay taken out of excavations? I should use all good sound filling and cover it over with stone. Assuming that the city railway extension is authorised, that causeway will be constructed practically at no cost to the bridge, because the contractor for the railway-station must find a dumping ground, and he could not get a more convenient dumping ground for the excavated material than that place. One of the difficulties in connection with the railway extension will be to find a place to dump the material, and they could not find a place nearer or more convenient to the city to convey it to than this place.
2113. Do you know anything of the quality of the stone at Glebe Island? There are some very good beds on the island. There is some inferior stone there also. Some beds on Glebe Island come very closely up to some of the Pyrmont beds.
2114. There is more stone to be obtained from Glebe Island than you are likely to require? It would only make a small indent into the island to take that quantity.
2115. Before or after the construction of the bridge would you recommend the making of a good wide channel up Johnstone's Bay and the dredging out of Blackwattle Bay and Rozelle Bay to a fair depth? Only as trade demands it. It would be too big an undertaking to dredge out the whole bay. We would have to dredge a channel and run out wharfs as trade demanded it.
2116. One witness has stated that eventually a large produce trade will be done in the two bays, that they will be frequented by timber and wheat-laden ships which cannot go up there at present; and your reply is that as trade develops you are prepared to provide sufficient water there? Yes.
2117. *Mr. Hoskins.*] Two witnesses before the Committee have objected to there being a bridge to Glebe Island at all, and evidence has been given to show that not more than a third of the traffic over the bridge goes to the Abattoirs; that the major portion of the traffic is to Balmain, Drummoyne, Ryde, and other suburbs; and these two witnesses say that by having another road—a road such as you have pointed out—the people at Balmain would not be greatly inconvenienced;—what is your opinion on that point? Every person travelling would have to go more than a mile further than he would by the present road. The cost of all that road construction must be considered. There is a long length of road to be made.
2118. They admit that; but would the residents of these suburbs have to travel much further by the route than they have to travel by the present route? One mile 6 chains longer.
2119. Suppose that Parliament sanctions your scheme, how soon can you commence the work after you get that sanction;—would the commencement of the work depend on the probability of the extension of

- C. W. Darley. the railway into the city being authorised? I would commence with the dredging and the foundations for the piers. I would get a contract out for that work as soon as possible.
- 8 July, 1897. 2120. Suppose the commencement of the city railway extension were delayed for a couple of years, would you delay the commencement of this work after it was authorised, or would you commence the work without delay? We would have to commence it at once.
2121. A great deal of the material to be excavated by the contractors for the city railway extension would not be stone, and you want nothing but stone for your causeway? Not necessarily all stone.
2122. How do you propose to fill in the interior of the causeway? It can be any clean material—sand would do very well. Mostly all material excavated in the city is of a sound nature—clay, sand, and stone mixed.
2123. If the tide is pretty strong, would not the water drive the sand through openings in the causeway? There is no tide there to speak of.
2124. Not sufficient to cause any sand or loose material in the interior of the causeway to flow out? There is a rise and fall of the tide, but no run.
2125. If the extension of the city railway is not commenced for some time, your estimate of the probable cost of the causeway will be increased, because you cannot get the material for nothing? My estimate does not contemplate getting 1 ton of the material for nothing. A case in point is furnished by the Centennial Park reservoir, where the contractor had to take out a large rock excavation. He had to cart nearly the whole of the material for a considerable distance. The bulk of it was carted away, and all he had was 2s. 2d. for excavating, dressing the bottom, and dressing the sides carefully. In my estimate I put down 2s. 6d. a cubic yard for the whole of this material. I know that it is a very ample estimate.
2126. The stone you will require for the outer walls of the causeway would have to be large stones? Not necessarily large stones; good stones which you can roll into place by hand.
2127. Suppose you could not get good stone for the outer walls of the causeway, would you have to get it from Glebe Island? Yes. I have put down a special price for the hand-pitching.
2128. Has your Department ever erected a long causeway which has answered the purpose intended when it was constructed and which has not sustained any damage from rushes of water? Blackwattle Bay was dealt with exactly in the same way. It was a causeway which had been constructed in the old days across the bay with a little opening span near the Pyrmont end. That opening span is now used at Lake Macquarie.
2129. Would there not be a greater rush of water here than there? In proportion the opening here will be very much larger than the opening which was left in Blackwattle Bay, and which at the outside was only 35 feet.
2130. *Mr. Hassall.*] Would it not be similar to the causeway across Cook's River? That is simply stone tipped in, but not hand-pitched. I propose to finish the slopes of this causeway in a somewhat better style. I have allowed the price at 5s. per yard.
2131. *Mr. Fegan.*] Your causeway bridge will carry a tramway if necessary? Yes; it will carry any railway.
2132. *Chairman.*] Why has your Department decided to recommend a causeway in preference to an iron bridge as it previously proposed;—why has it abandoned its previous attitude with regard to the best means of communication between Pyrmont and Glebe Island? I never went very fully into the matter before.
2133. The reasons you give at present are permanence of work, cheapness of construction, and cheapness of maintenance? Cheapness of maintenance, and permanence of construction. I may point out that this causeway scheme, as contemplated in the estimate I have laid before the Committee, is altogether a superior class of work—not only in the solidity and permanence of the causeway—but in the construction of the swing portion. It is a more permanent, more costly class of work than I contemplated for or estimated for in the case of the steel bridge.
2134. We understand that for the road traffic it would be more satisfactory, and as regards the water traffic that the swing being a superior one will work more satisfactorily? The mechanism of the swing will be practically the same in each case; but instead of having a timber top on the swing, I have estimated for using trough girders filled with concrete and wood-blocking.
2135. It is virtually a roadway over the swing? Yes.
2136. Of the amount of material which you will want for the causeway, the material to be obtained from the excavation from the power-station will certainly be available? Yes.
2137. What proportion would it bear to the amount you would require? *Mr. Deane* has not got his plans fully developed to take out the quantities.
2138. That much is a certainty? I think we may count upon getting the surplus from the power-house, and I know that I can get a very large quantity of material from town foundations. At Circular Quay we had a large area to fill up, and in a very short time we got an enormous quantity of stone and good sound material tipped in. In fact we had a difficulty to stop the people bringing the stuff there. It poured in faster than we anticipated. We got thousands and thousands of tons. The people were only too glad to get a place to tip the stuff. Again, I know that I can get a very large quantity of material from Sanders' and other quarries at 1s. a ton. Although I put down 2s. 6d. in my estimate, I know if we say, "Here is a tipping place, and we will give you 1s. a ton for all you put in," we will get thousands of tons in that way. It would pay them well to cart it in. I have not taken any account for that in my estimate. I have estimated all through that we will pay 2s. 6d. a cubic yard for the material. I know that we can effect a very large saving in that item.
2139. This item means 30 per cent. of the cost;—these are three certain sources from which you can obtain material either for nothing, or very cheaply? No doubt we will get a large portion for nothing, and we will get a considerable portion very cheaply, much more cheaply than I estimate.
2140. If the city railway be constructed you will have a very large quantity of material? If it was authorised and started within a reasonable time, I think the Committee might count on our getting the whole of that material put in practically for nothing.
2141. And therefore save £25,000? I believe the contractors would take some of the work more cheaply, knowing that this tip would be available. There is no other place so near the city where they could dispose of the material.
2142. *Mr. Lee.*] Do you think the contractors would be prepared to deposit the material on the same terms

terms on the Glebe Island side? I think so; it is only a matter of going across the bridge and tipping C. W. Darley. it. We could commence tipping from the middle of the present bridge.

2143. The remarks you make as to the cheapness of the material apply to both causeways? Yes.

8 July, 1897.

2144. *Chairman.*] Will you now state the depth of clay and depth of rock? The under part of the bridge is 20 feet over high-water mark, and then allowing 6 feet for the tide, 20 feet of water below low-water mark.

2145. Does that bring you to the mud? A depth of 18 feet will bring you to the present mud. We propose to dredge out to a depth of 25 feet during the construction of the bridge.

2146. What do you get at that depth? It is still mud at that depth. The firm clay is practically about 34 feet below low-water mark.

2147. At what depth do you get rock? It goes down to 90 feet.

2148. The rock is the foundation of your piers? No, we do not propose to get to the rock. We propose to put in groups of piles and carry block concrete. In this case, it is too deep to go down to the rock with cylinders, and it would not be safe to stop short with the cylinders, so that it is better to put in groups of piles.

2149. Will you just state the estimated cost of the swing-span, the side-spans, and the causeway? The swing-span including pivot-piers, and two rest-piers is estimated to cost £35,050; the side-spans, with the piers, abutments and superstructure, £10,740; the rubble causeway, £32,130; the approaches on both sides, £3,250; and the tram track and protecting platform, £3,330; making a total of £84,500.

2150. Less, perhaps £25,000? Possibly less £25,000.

2151. What is the cost of land resumption? The improvement of the Abattoir-road, and the resumption of land are common to all the schemes, and the two together are estimated to cost £4,600, which would have to be added to all the estimates. It is not usual in preparing estimates, to include the cost of land resumption.

2152. Will you be good enough to state definitely to the Committee why you have decided to submit this scheme, consisting of two causeways and a swing-bridge? With regard to the scheme at present before the Committee, although the matter had received some thought, it had never been fully considered; but after fully considering the matter, and getting out the quantities, it appeared to me that because of the cost and the stability of the work, it would be a wiser thing for the country to carry out this scheme.

2153. *Mr. Humphery.*] Your former answer was that a stone causeway would cost £126,000 as against £131,000 for a timber bridge, and £146,000 for a steel bridge? The matter was not fully gone into originally. Then I took up the matter, and on looking into it, I very soon came to the conclusion that it was desirable to submit a stone causeway to the Committee. I wish the Committee to understand that I had nothing to do with this matter, directly, before. It was only last week that I knew the matter was before the Committee. I have been out of the Colony, but since I have returned I have been going into the matter fully, looking into all the estimates, and getting the different estimates taken out. The more I went into the matter, the more convinced I became that a causeway was the proper thing to recommend, and I determined to submit it to the Committee.

2154. *Chairman.*] Is there anything you desire to add which has not been brought out? Not at this stage.

FRIDAY, 9 JULY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
The Hon. JAMES HOSKINS.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
The Hon. DANIEL O'CONNOR.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL WEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.  
FRANCIS AUGUSTUS WRIGHT, Esq.  
FRANK FARNELL, Esq.

The Committee further considered the expediency of constructing a New Bridge at Glebe Island.

Alexander Martin Milne, Alderman of Balmain, sworn, and examined:—

2155. *Chairman.*] You were at one time mayor of Balmain? I am the ex-mayor. I was mayor for two years. A. M. Milne.

2156. *Mr. Trickett.*] How long have you resided in Balmain? Nearly thirty years.

9 July, 1897.

2157. Do you favour the proposal to construct a better bridge with a finer swing than the present bridge to Glebe Island? I think there is another proposal which should be considered by the Committee.

2158. Do you think the bridge scheme is the best, or have you another scheme to propose? I propose to erect a bridge higher than the bridge which is shown on the drawing. I propose to take a road through the vacant land on the Harris Estate, Pymont, which is now subdivided and offered for sale, and to build a bridge from the top of the hill, to which a road runs on the plan of subdivision, to the high land on Glebe Island. I think it would give a headway of 80 or 90 feet. If the bridge were carried higher you could do away with your swing and let a lot of intercolonial steamers pass under the bridge without an opening at all. An opening, no matter whether it is in a causeway or in an iron bridge, will be a great nuisance to the traffic.

2159. Will you describe your route? The highest point on Glebe Island is 80 or 90 feet above high-water mark, and on the Pymont side it is a little higher. The water in the bay above the bridge is not suitable for very large steamers to use; it is shallow water, comparatively speaking.

2160. Your proposal is for the traffic to go across Pymont Bridge, along Union-street, over the ridge of the hill on the Harris Estate and thence by a bridge to a point above the site of the bridge on Glebe Island? Yes. You may align the bridge with the Pymont Bridge if you take that route.

2161.

- A. M. Milne. 2161. You propose to construct a high-level bridge? Yes, at a height of about 80 feet, or higher, if possible.
- 9 July, 1897. 2162. You state that the water above the bridge is shallow, and that therefore large vessels would not go up there; but it is contemplated by the Government to dredge out that basin, so that it will be deep enough for almost any vessel which comes into Sydney Harbour? I do not think that large vessels would go up there. I think they would prefer to berth on the outer side of the bridge. It would be waste of public money to dredge out this bay when there is so much cheap land to be got in Balmain and Pyrmont outside the bridge. The cost of dredging would nearly build the bridge.
2163. Are not the sites above the bridge used as very large timber yards now? Yes. The bridge I propose would allow most of the timber vessels to go underneath.
2164. What tonnage do they average? I should say some of them are 2,000 tons measurement.
2165. Would your bridge land on Glebe Island past the Abattoirs? It would make the bridge between 200 and 300 feet longer. It would land on Glebe Island where the cottage residence is situated. The reason why I make this proposal is that there is not the slightest doubt that all these water-frontages will be taken up for manufacturing purposes, particularly as timber yards and city iron works. The timber merchants import very long timber, and if they are allowed to use this road, and you have a tram or a light railway, the chances are that you will have to widen the present road. By my proposal you would shorten the present road considerably between Pyrmont and Glebe Island Bridges.
2166. By your route the only land to be resumed would be the land between the corner of Union-street and the approach to the bridge? The Harris Estate can be purchased at a price now from Richardson and Wrench, between Union-street and the bridge. If you are going to cut down the island for export trade, it will be a great advantage to be up high so that exports could gravitate down to the water. For abattoir purposes it is better to keep it up. If you level down the island, and put the Abattoirs on level ground you will have to pump up the material, whereas if it is not levelled down it will gravitate down to the desiccating yards, or to the punt, or it can be run round to the Bondi sewer in Mullens-street, Balmain.
2167. Have you ascertained the tonnage of the ships whose masts would be 80 feet high? I only judge by the vessels I see floating in Johnstone's Bay.
2168. You have not measured their spars? I should say that some of the vessels were as large as 2,000 tons, and that some of the spars are as high as 120 and 130 feet.
2169. A vessel with a mast of that height would not go under your bridge? It would by striking its topgallant mast.
2170. A witness stated yesterday that a vessel of 1,000 tons would have a mast 125 feet high? They vary in height. Some ships have three long masts, and others will have four short masts.
2171. What would be the good of your bridge with a headway of 80 feet when vessels of 1,000 tons which have to go up there have masts 125 feet high? I think, by striking their topgallant masts, they could get under the bridge.
- 2172-3. A good many vessels do not strike their topgallant masts;—many of these three or four masted schooners which carry timber have their masts in one piece? Then I think they could do as they do at present. They could unload their cargo into a punt on the outer side of the bridge, and take it under the bridge into the bay.
2174. You advocate this elevated bridge on the ground that it would be a more direct route than the Pyrmont Bridge,—that it would preserve an uninterrupted route for foot and vehicular traffic at all times, and that it might be so constructed as to carry a tramway or a railway without any interruption by the opening of a swing? Yes.
2175. These are the advantages which you claim for your proposal? Yes.
2176. And that a great many ships could go under your bridge, but that the others would have to unload in Johnstone's Bay, and punt the stuff up into Blackwattle Bay? Yes; I believe that all the coastal steamers could go under the bridge.
2177. But large vessels would have to unload their cargo on the outer side of the bridge and punt it up? Yes. It would be quite possible to keep the bridge higher by building up to the top of the hill, but I do not think it worth while to do that. If you provide for intercolonial steamers and vessels going under the bridge I think it will be quite sufficient, and the others can do as they do now.
2178. They go through the swing in the present bridge and take their cargo up to the wharf? Yes, but all the vessels which go there now, and even larger vessels, would be able to go through without using a swing.
2179. Have you thought whether it should be a suspension or a pier bridge? As far as I am concerned, it does not matter materially which sort of bridge is constructed, so long as it is kept high. I have not gone into the matter of cost, or the qualities of different bridges. Looking at it from the Balmain point of view, and as one who knows a lot about the district, I consider that any break in the bridge will be a nuisance.
2180. You advocate a high-level bridge as a matter of convenience to your borough? Yes.
2181. And you have not gone into the question of expense? No.
2182. Is there any very great outcry now about the inconvenience of the present bridge? A very great outcry.
2183. But that is admitted to be a very old-fashioned bridge with a swing of a primitive description in a very inconvenient position? Yes.
2184. With a good wide bridge, such as the Government propose to erect with two 60-foot swings of the most modern style, which could be opened and closed quickly, and with a headway of 20 feet so that all the ferry steamers and small craft could go under, do you not think that the people of Balmain would be very much better inconvenienced than they are now? They would be more inconvenienced but still a swing would be a nuisance. I do not think the amount of trade which is done up the bay warrants the Government in putting up another swing, if they put a high-level bridge across that water.
2185. How would your bridge work in with the present road to the Abattoirs;—would it be higher than the Abattoir-road? No, it would be about level with the top of the hill.
2186. That is level with the gates of the Abattoirs? Somewhere about that.
2187. May I ask if this is your own individual opinion, or do many others agree with you that it should be a high-level bridge? I was the first to speak about it in Balmain, and a great number of the aldermen were of opinion that it would be better to keep the bridge high and have no swing. It is backed up by the opinion of the other aldermen and residents. 2188.

2188. Would the cost of purchasing the necessary land from Union-street to the beginning of your bridge be very great? No. The cost is stated on the subdivision plan here. The subdivision shows that there is a street called Hill-street running almost in a line with Union-street and the Pyrmont Bridge. This street if widened could be utilised, which would minimise the resumption. A. M. Milne.  
9 July, 1897.

2189. Have you worked out what it would cost? About £2,000 an acre. I do not suppose you would want to take more than a quarter of an acre for the road. Hill-street, in the Harris estate, would only require widening.

2190. As an engineer, I suppose you can state whether a high-level bridge of this kind would cost more or less than £84,000? It would cost a trifle more than that sum. I do not profess to be a bridge engineer. I do not think any engineer could jump at a price without going into the matter. If I had plans, and went carefully into the matter, I daresay I could make an estimate, but I would not like to say, off-hand, what it would cost.

2191. The bridge it is proposed to build is to have a headway of 20 feet, and is to cost about £84,000—your bridge is to have a headway of 80 feet, or four times as much as the other, and therefore I suppose you can realise that your bridge will cost very much more than the other? As regards the platform of the bridge there will be no extra cost. The only difference will be in increasing the height of the piers. You would save the cost of the swing; but you would have extra work in regard to the increased height of the piers; and the bridge would be a little longer than the other. I think the Committee would be warranted, even if it should cost more than the other, in recommending a bridge of that sort on account of the facilities which would be afforded in keeping the bridge high. It would be a mistake to level down Glebe Island if you are going to use the island for export purposes. Great inconvenience is experienced through the Iron Cove Bridge being kept so low.

2192. You are looking at your project as one of great convenience to the people of Balmain, and the people who go between Balmain and Sydney, irrespective of cost? Yes; and to the people beyond Balmain too. The extra cost would be very small when you consider the benefits which would be derived by the districts interested. The extra cost is hardly worth considering when you consider the great benefits which would be derived from shortening the distance and serving the people. If a tramway were going by that route to Balmain it would be almost unworkable, unless you widened the road on Glebe Island, if they are going to carry on the same business there as they are doing now.

2193. As a resident of Balmain, do you find the Abattoirs objectionable? No; but rather a benefit to the borough.

2194. In what way? They give a lot of employment to the people, and the men who work there have bought land and built their little homes, on which they have to pay rates and taxes like other people. Looking at it, from a municipal point of view, I say they are a benefit to the borough.

2195. As regards any offensive smell or any objectionable traffic, you have nothing to say against the Abattoirs? I do not see any objection to them. Of course there is room for great improvement at the Abattoirs, and the engineer, who seems to be up to date, is making improvements there very fast.

2196. What are your views as to driving the stock from Homebush by a suburban road to the Abattoirs? I think a railway connection from the Darling Harbour station to the Abattoirs would get over that trouble. The distance is under a mile I should think.

2197. I suppose you recognise that the driving of stock and sheep is objectionable? It is a terrible nuisance, especially with sheep. You cannot drive sheep along the road without raising great clouds of dust and impeding the traffic.

2198. It stops the traffic, and is somewhat dangerous? Yes.

2199. If the Abattoirs are to remain at Glebe Island, do you recommend that there should be a railway connection made between the sale-yards and the Abattoirs? Yes.

2200. We have heard sometimes that the Abattoirs as regards the traffic to and fro, independent of the driving of the cattle, is a nuisance;—do you, as a representative of Balmain, bear that out. Have you ever heard of any objection to the traffic across the bridge? Yes; I have been delayed there nearly half an hour sometimes. On the swing there is room for only one vehicle to go over at a time. Whichever vehicle gets on the swing first, after it is closed, is followed up by all the other vehicles coming from that direction. It is generally a scramble to see which vehicle gets on the swing first, then it is like a procession for a quarter of an hour; but if you happen to be at the end of the vehicles on the other side of the swing, it takes another quarter of an hour to get over. This occurs frequently through the day.

2201. The wide swing in the proposed new bridge would very much, if not altogether, remove that objection? It would to a certain extent. On the Pyrmont Bridge two vehicles can pass abreast, but still it is a great nuisance; it means a big stoppage of the traffic, therefore a great loss to the public.

2202. A little while ago you said that a swing was also a great objection;—have you been impeded in crossing the bridge by vessels going through the swing? Yes; they try to get vessels too large for the opening to go through. The vessels pass through very slowly, and they stop the traffic considerably. I used to drive round.

2203. That is all an objection to the present swing; but if, in the new bridge the swing was made wide enough to allow the largest vessel which comes here to go through, and it could be worked quickly, would not that objection be very much minimised? The only way to remove that objection would be to open the bridge at stated hours in the day, say three or four times a day, and let the shipping wait until it is open. People would then know the hours when the bridge would be open, and they would take care not to be there at that time. Under regulations, it might work very well, but not on the go-as-you-please style they have now.

2204. If the Government officials or the Committee do not see their way to adopt your recommendation, you think that the present provision for the accommodation of the traffic could be very much improved by a wider bridge being built, with a swing in the middle, which could be opened quickly? Yes.

2205. You are aware, I suppose, that the Government proposal is to build a bridge which will carry a tramway or a railway? I think I heard Mr. Young say that.

2206. That would meet your views in some respects? Yes.

2207. An alternative proposal has been made to get to Balmain, namely, to take a road through Glebe Point and across the reclamation in Rozelle Bay, and to come out at Balmain, the distance being more than a mile longer than the present route *via* Glebe Island;—how do you favour that suggestion? I was here when the evidence was given, and I thought that it was a bit of nonsense to talk in that way.

2208.

- A. M. Milne. 2208. How do you view that proposal? It would never answer. Where you have a bay you have corresponding ridges to go over, which Mr. Daly forgot to point out to the Committee. I know Mr. Daly well. He has been in the habit of attending public meetings and trying to upset our proposals for a bridge. His idea—and it is the idea of some people—is to dispense with a bridge. I am speaking from a Balmain point of view. If the bridge is done away with, the next best plan will be to make a road from somewhere about the junction of Newtown-road with Parramatta-street.
- 9 July, 1897. 2209. That would also be a very circuitous route? Yes.
2210. As regards the distance, you regard these proposals as being highly unsuitable to Balmain and the western suburbs? Yes.
2211. I suppose you recognise that it is absolutely necessary to do something with the present bridge? Yes; it is keeping Balmain back. A lot of industries are starting there, and trade is increasing wonderfully. There is an immense traffic across the bridge, and I consider that its condition may be the means of preventing other industries from starting in our midst.
2212. *Mr. Clarke.*] Have you taken into consideration the probability of the Abattoirs being removed from Glebe Island to another suburb? I have been on various deputations in reference to that matter, but I have never heard any argument from those who are against the retention of the Abattoirs at Glebe Island which convinced me that they had found a more suitable place for them. If the Abattoirs are removed to Blacktown the sewage is bound to be a great trouble; but at Glebe Island the water, which seems to give the most trouble, can be connected at a very small cost with the Bondi sewer which runs along Mullens-street.
2213. Is there not a great objection to the present mode of driving the cattle to the Abattoirs as being dangerous to passengers? It is objectionable. It would be objectionable anywhere, but you have a better chance to get over the difficulty when you have the Abattoirs at only that distance from the railway.
2214. How do you propose to remove that objection? I am not well up in the slaughtering business, but I think that if under a regulation, so many cattle a day were brought to the Abattoirs from the resting-paddocks, there would not be any trouble. They must carry the cattle by rail in other countries as far as I can hear. I think the training of the cattle would be the most feasible way to get over the difficulty.
2215. You mean by a direct railway from Homebush to Glebe Island *via* Darling Harbour? Yes, but in special trucks.
2216. Are you aware that after the cattle are untrucked and sold, it is objectionable to re-truck them as they get knocked about so much? I heard that evidence given, and I daresay there is a good deal of truth in it. If they brought them down from a long way inland under regulation, I daresay they could be brought to the Abattoirs. They know how many beasts are slaughtered every day, and therefore they would know the number required to be slaughtered for daily consumption.
2217. What traffic, apart from the Abattoirs, comes over the present bridge from Glebe Island? There is traffic going all night long. The fruit carts start very early in the morning from Castle Hill and other districts. I should think that most of the traffic comes from districts beyond the Abattoirs.
2218. Do you think the causeway which is depicted on the plan here would be better than a steel bridge? I do not think there is much to choose between the two. You would have to find material to fill in. The cost of that would depend on the amount of settlement in the stonework when they are filling in. I should think it is proposed with a view of levelling down the island, and if they have to experience the settlement they had to contend with in other places the work would be costly.
2219. But if it were found that it would give as good a communication and be cheaper in construction, have you any objection to offer to it? I do not see that anybody could object to that. The objection I have is to the levelling down of the island. If they are going to make any sort of an export depot on Glebe Island, you want to keep high up with the bridge. You could level it down a bit on the cap of the hill.
2220. We have it in evidence that a causeway would cost less to construct and maintain than would a new bridge? It would cost a long way less to maintain a causeway than an iron bridge.
2221. Do you think it would be as good as or better than a new bridge? In the event of your not adopting a high-level bridge, it is immaterial to the Balmain public whether you go across with one or the other; but I favour a high-level bridge without a swing for the reasons stated.
2222. Would it not require to be of a great height? You have high land on each side to give you that height. A still greater height could be obtained by raising the abutment on the Glebe Island side.
2223. The masts of some vessels are 220 feet high;—you would not expect to keep the bridge as high as that? It would allow any ordinary coastal boat to go under, and the others could discharge into punts outside the bridge as they do now.
2224. *Mr. Lee.*] It is proposed to make a causeway on either side for a certain distance, and to connect the two causeways with a steel bridge with two swings of 60 feet each;—suppose it becomes a question of an ordinary low-level bridge, leaving your own scheme out of question, have you any particular objection to offer to that proposal? None. The only objection I have is that it looks as if it were designed with the intention of levelling down Glebe Island, which would be a mistake.
2225. It is designed, we understand, to give better facilities to the island and not to interfere with any of the approaches;—are you of opinion that the residents of the localities indicated by the figures on this population map are served directly and indirectly by a thoroughfare across the bridge? Yes; a lot of the people of Balmain are served by the bridge, and there is a great future before the district, which should be considered when erecting a bridge.
2226. The areas shown on that population map behind you embrace a population of over 42,000 people,—do you think that that is an over-estimate? I do not.
2227. Are the whole of these people served directly and indirectly by having a passage over the bridge from Glebe Island? Yes.
2228. Any scheme to do away with the bridge and to divert that road is not likely to be entertained with favour by the residents of those western districts? No.
2229. The population of those districts being so large, the accommodation necessarily must be great? Yes.
2230. Therefore, whatever may be determined upon, you must confine your attention to the maintenance of the thoroughfare across that water? Yes.
2231. You stated that a quantity of fruit from the Field of Mars goes across Pymont Bridge;—would its destination be the fruit markets and the railway station? Some would go along Harris-street to the Haymarket and some to Russell's Wharf.

2232. Would any portion go direct to the railway station at Darling Harbour for shipment to the country? *A. M. Milne.*  
Yes. If a tramway were constructed to Drummoyne, and round that way, the chances are that it would take all the traffic from the Parramatta, Ryde, and Castle Hill districts. 9 July, 1897.
2233. You think that the population resident in those localities will require a thoroughfare in the shape of a bridge from Glebe Island, no matter whether the Abattoirs are removed or retained? Yes.
2234. There can be no doubt in your mind that there must always be a main thoroughfare there? Yes. These districts are developing very rapidly. The people are building very quickly in these districts. A great number of houses were run up in Balmain last year, and a lot are going up now. Drummoyne is going ahead very fast; the houses are going up there at a considerable rate. They go to the top of the Western Road by the Balmain tram. The route reduces the distance from Parramatta considerably.
2235. As the population increases, the tendency to get to the city in a more direct and quicker way is increasing? Yes.
2236. It must necessarily keep pace with business arrangements? Yes.
2237. You think it would be a mistake to adopt any other route for a passenger thoroughfare than the one which has been used for so many years? Yes.
2238. Suppose that no tramway is made, are you still of opinion that a bridge ought to be built? Yes.
2239. *Mr. Roberts.*] Have you any knowledge of the shipping traffic through the present bridge? Yes.
2240. Is it not a fact that it has been on the increase during the last few years? Yes. Holdslip's timber company has started business there. Two or three other firms, whose names I forget, have also started there. Swan Brothers have extended their works. Daniel Sheehy has bought a property up there; but I fancy all his boats can go under the bridge.
2241. Is it not likely that the traffic will so increase that the size of the vessels going there will increase? That is quite possible. It is a question in my mind whether we should consider the ships before the people. At the Pyrmont Bridge you will see a line of vehicles from the bridge away up the hill on the island side, and the same on the Sydney side. If you compare the value of the time which all these people lose in waiting there with the cost of the inconvenience to the ships in not being able to go through there, you will find that the people suffer considerably more than the ships do. If the ships do not like to make their top-gallant masts so that they will slide down they should be inconvenienced, and made to do their business on the outer side of the bridge. I do not think the through traffic should play second fiddle to the shipping.
2242. Is it not true that at the present time a number of vessels are unable to get through the swing of the Glebe Island Bridge? Yes; vessels loaded with imported timber.
2243. And the timber merchants are put to very great inconvenience and expense in getting the timber up to their wharfs? They are put to a certain amount of expense. They have to punt the timber, but there are no wharfage dues to pay when the vessel lies out in the bay. I think the people lose a great deal more by these delays than do the ships or those who do business with the ships.
2244. Had you in view the possible development of the traffic when you formed the opinion that a high-level bridge without a swing should be built? I propose a high-level bridge without an opening because it would be cheaper than a bridge with a swing and it would be better adapted for the requirements of the people, and the tram service over the bridge would not be interrupted.
2245. The swing in the proposed bridge would be of the most modern type; very little time would be lost in opening and closing it, and therefore there would not be the same delay to the traffic as now takes place? Not with modern appliances.
2246. Notwithstanding all that, you think it should be a high-level bridge? Yes.
2247. Is the vehicular traffic from the districts to the west of Balmain increasing every month? Every month you see a great increase.
2248. What is the nature of the traffic—omnibuses and buggies? Omnibuses to Ryde, and fruit-carts from the districts in Central Cumberland. There is a big timber business with all the various timber merchants. A large business is done with Elliott Brothers' chemical works. All the heavy girders and joinery work for the new Markets were made by Phippard Brothers in Balmain and taken over the bridge. Mort's Dock Company sends a lot of its manufactures round that way; they make baths and various things for Hordern. Goodlett and Smith do a good business there. I think the coal-mine alone will take 10,000 casks of cement, which very likely will all go over the bridge. A meat cannery has been started lately, which will cause a lot of traffic across the bridge.
2249. It will be an ever-increasing traffic? Yes.
2250. Are you favourable to the Abattoirs remaining where they are? Yes; I think if modern Abattoirs were built there, you could not find a better site.
2251. You are not aware of their being a nuisance in any way? Not a bit. I was here when Mr. Daly gave evidence as to the putrid matter going into the punt. I saw the engineer, Mr. Houghton, about that evidence, and he says it is not true; that the punt is never away for more than six hours at a time, and that the stuff which goes into the punt is never more than six hours old, so that it could scarcely get putrid in that time. Mr. Houghton could come here and contradict all these statements by Mr. Daly if he is called.
2252. Are you in favour of any alteration in the road from the Glebe Island end of the bridge towards Balmain? The road would be all right if you kept the bridge about level with the top of the island.
2253. Have you heard many complaints from the public as to the proximity of the road to the Abattoirs? Yes, the place where the sheep are killed is near the road;—there is no objectionable smell, but from a bus you can see the heads and skins and entrails lying on the ground. It is more an eye nuisance than anything else. I think they ought to improve that portion of the Abattoirs.
2254. Are the public loud in their complaints? No; they make passing remarks when travelling on the buses.
2255. In view of these facts would you recommend a deviation of that road or make another road for the public? I reckon that if we are entitled to the construction of a bridge, the better way would be to continue Union-street right on to the bridge, and align Glebe Island Bridge with Pyrmont Bridge. You would not only give us a short road by going up Mullens-street, but you would make a great saving at Pyrmont. If the Government purchased the Harris estate and made a good road, the chances are that it would sell out the balance of land at a big profit, and cover the expense of a lot of the work.
2256. Do you think it will be necessary for the comfort of the travelling public to take the road going past the Abattoirs to Balmain nearer to the shores of White Bay? It would be better if you were going to

A. M. Milne. to allow the Abattoirs to remain there; but I believe it is intended to shift the Abattoirs, or to make new ones. If you were going to make new abattoirs I should think you would want to put them where you suggest the road should go. The present road would do splendidly if you were going to make new abattoirs. If you were going to build new abattoirs you could not build on the present site; you would have to build the new abattoirs towards the point, and then pull down the old ones.

9 July, 1897.

2257. A road by that route would be an improvement as regards avoiding any unpleasant nuisance at the Abattoirs? The 'buses would naturally take the shortest route. It is only a few people who are fond of talking that propose to have a road right round the point.

2258. Did not your council at various periods ask the Government to make the road? I think they did, but they do a lot of foolish things at times.

2259. *Mr. Black.*] Do you not think that much of the delay on the Pyrmont Bridge arises from the inferior character of the appliances for turning the swing? Yes. The swing is not wide enough, and it is turned with a handle like a grind-stone.

2260. Do you not think that most of the time is lost in moving the swing? It is a very slow process. It is too close into the side, and there are shelving rocks going out into the water.

2261. What time is occupied in opening or shutting the swing? I should say five minutes to open and five minutes to close the swing.

2262. The swing which it is intended to put in the new bridge will take two minutes to open and two minutes to shut;—I suppose it will affect a considerable saving of time during the day? Yes.

2263. It will obviate much of the objection to the swing? Yes.

Ernest Macartney de Burgh, Assistant Engineer for Bridges, Department of Public Works, sworn, and further examined:—

E. M. de  
Burgh.

9 July, 1897.

2264. *Mr. Clarke.*] I believe you have a statement to make to the Committee? I have brought a statement as to the height of the masts of vessels passing through the opening in the Glebe Island Bridge. I had the masts of thirty-seven vessels which passed through the opening measured from water-line to truck. The average was 68 feet, the maximum was 105 feet, and the minimum was 18 feet.

2265. I presume you mean vessels which have been going through the opening lately? These are the actual measurements of the masts of the vessels for which we had to open the swing during the past week. I know of vessels which go through there with higher masts, but they did not happen to go through during the week we were taking the measurements.

2266. If the water is deepened larger vessels will be able to go through the opening? Certainly.

2267. Do you know the population in the neighbourhood or the traffic which goes backwards and forwards? I have prepared a small population plan for the information of the Committee, and the figures on it I obtained from the Electoral Office, in order that they might be reliable. A very great portion of the traffic which comes over the bridge, apart from the Abattoirs traffic, comes from the Municipality of Ryde, the Municipality of Hunter's Hill, a portion of the Municipality of Marsfield, and a small portion from the Chatswood district. The old road from Ryde to Hunter's Hill was across the Gladesville ferry and down the Great Northern road to about Ashfield. That road is now abandoned, because there is no ferry, and it was in connection with this traffic largely that the bridge over the Parramatta River (the Drummoyne bridge), and the Iron Cove bridge, were built.

2268. *Mr. Lee.*] They all form a part of a general line of communication over Glebe Island bridge and Pyrmont bridge to the city? Yes. The line was extended in a northerly direction by the construction of a bridge over Lane Cove river. That bridge to a certain extent brings traffic in to feed this main line, and it in turn passes on over the Glebe Island Bridge. While there can be no doubt about the traffic from the Ryde district and from the Hunter's Hill district using this line of bridges to reach the city, there is a doubt when we come up towards Chatswood, because there is an alternative road open to travellers. A man who is on Chatswood corner, where the Lane Cove Road comes into the village of Chatswood, would have a shorter road to go to Sydney than by the bridges; he could go down the Lane Cove Road and by paying a toll could cross in the ferry. But directly you go from Chatswood towards Hunter's Hill the distance to the ferry increases, and that by the bridge road lessens, so that from about half-way between Hunter's Hill and Chatswood the traffic by choice would go over the bridges.

2269. In the aggregate the figures given on the population map represent 42,000 persons? Yes.

2270. *Mr. Clarke.*] I suppose, independently of the Abattoir traffic, a large traffic goes over the present bridge, and would continue to go over the new bridge? In my previous evidence I pointed out that only a fifth of the present traffic could be traced to the Abattoirs.

2271. You are satisfied from your mode of checking the traffic that your estimate is perfectly correct? I am quite satisfied that it is correct.

2272. *Mr. Lee.*] Any removal of the bridge from its present site to any other part of that bay would destroy the purpose for which the Drummoyne, Lane Cove, and Parramatta River bridges were constructed, namely, to give a perfect chain of direct communication to the city? It is difficult to see a position in which it could be placed which would give more direct communication to the city.

2273. Suppose the bridge were abandoned, and the road deviated round the head of Roselle Bay, it would utterly destroy the original idea for which the other bridges were built? It would increase the distance.

2274. All these connecting links—all these expensive bridges—were provided for the purpose of giving a chain of direct traffic to one point? That is the purpose for which they were constructed.

2275. The time has gone by to entertain a proposal to remove that bridge to any other place? I should think it would be a mistake to interrupt the line of traffic.

2276. What would you think of a high-level bridge with a roadway of 80 feet being taken across to Glebe Island from Pyrmont? I do not think it would be high enough if you wanted to have a high one.

2277. Where would the bridge bring you out? I suppose you would be right up on top of Glebe Island, and on the Sydney side you would have to climb up a long hill.

2278. I suppose any proposal of that kind is quite out of consideration? I should consider it quite out of the question. The mere fact that the island will probably be cut down for wharf accommodation will put that bridge out of question, because you would have to go over on a high bridge and then get down on to the island.

2279. Although the roadway of the bridge now submitted by the Department is a little less than the roadway of the proposed Pyrmont Bridge, it is the same as the roadway of the Iron Cove Bridge and the Gladesville Bridge? Yes.

THURSDAY, 26 AUGUST, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY,  
The Hon. JAMES HOSKINS.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
The Hon. DANIEL O'CONNOR.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.  
FRANCIS AUGUSTUS WRIGHT, Esq.  
FRANK FARNELL, Esq.

The Committee further considered the expediency of constructing a New Bridge at Glebe Island, to replace the existing structure.

William Henry Wilks, Esq., M.P., sworn, and examined:—

2280. *Chairman.*] You represent the Electorate of Balmain North in the Legislative Assembly? Yes. W. H. Wilks, Esq., M.P.
2281. *Mr. Lee.*] I might explain to you that it was originally proposed to erect a new bridge to replace the present Glebe Island bridge; but it has since been proposed that a causeway should be constructed, with a central swing-span? I am acquainted with both proposals. I consider that it is absolutely essential that the existing bridge should be replaced by a new structure, because of its apparent uncertainty, and because it is inadequate to the immense traffic which goes along that road. A journey over the bridge will show at once how much a new bridge is required. Near the swing-span the whole of the traffic is congested into a single file of vehicles, and this causes a delay of sometimes of half an hour, and even of three quarters of an hour. Thousands of people pass over the bridge in the course of twenty-four hours, some of them in pursuit of pleasure, others pursuing their business avocations, either in connection with the Glebe Island Abattoirs, or in conveying goods to the western suburbs, such as Drummoyne, and to Ryde, and to Balmain. It will therefore be apparent to the Committee how great the convenience is. The vibration of a bridge when a vehicle—even an ordinary four-wheeled vehicle—passes over it is very noticeable. I very seldom go that way, but I have noticed that the panes of glass in all the lamps are broken because of it. The general appearance of the bridge would indicate that its life cannot be a very long one, and I understand that that is the opinion of experts. With regard to the proposal to make a causeway, it has much to recommend it to the Committee, because material could readily be obtained close at hand. Glebe Island could be put to much better uses if it were razed, and the stone thus obtained would go a long way towards making the causeway.
2282. In the middle of the causeway there would be a steel swing-span to allow of the ingress and egress of vessels? Yes; I am not tied to any scheme. I think it is for the Committee to decide what is the best scheme to adopt, and no doubt the causeway proposal will meet with a great deal of approval. The general opinion of the people who use the present bridge is that what is wanted is a new and up-to-date structure, giving a better headway for vessels wishing to proceed up Roselle and Blackwattle Bays.
2283. They want a wider bridge for the vehicular traffic, and for the foot-passenger traffic as well? Yes.
2284. That is a necessity? Yes; with the swing-span situated where it is at present, vessels have to make a difficult detour to get into and out of the bays. If the swing-span were in the middle, it would be much easier to navigate vessels passing through the bridge, and I believe that the natural scour would be retained. I would favour the construction of a timber bridge on the score of economy; but whatever bridge you construct you must anticipate the probable future construction of a tramway, and even of a railway in this direction. The present Balmain tram takes a very round-about course, and no doubt the railway authorities would favour a more direct connection *via* Pyrmont, and across this bridge. Any bridge constructed, and be sufficiently strong to carry a tramway, or even, perhaps, a railway.
2285. I understand that public opinion is strongly in favour of having the new bridge constructed close to the site of the present bridge? Yes; if you are going to construct a causeway, you have the necessary material close at hand, and while you were making the causeway, it would be possible to provide a second roadway around Glebe Island. The existing road runs right across the island, and you could make an alternative road where you took out the material for a causeway.
2286. Would that be on the northern side of the island? Yes; running in again to meet the present road on the other side.
2287. Have you ever heard the residents of these suburbs express an opinion as to the undesirability of being taken past the doors of the Abattoirs;—do you think that the Abattoirs are an offence to the people round about? There is no doubt that it would be a great advantage to have a second road. A second road would be of advantage to the people passing across the island, and also to the Abattoirs traffic.
2288. Have you any special reason to urge against the construction of the causeway? None at all. Of course the construction of a timber bridge would give employment to a large number of shipwrights, carpenters, and timber-getters. I do not know which is the cheaper—a causeway or a bridge, but I think it would be wise to adopt the cheaper construction. I believe that in a few years another route of communication to Balmain will have to be opened up.
2289. The swing of the present bridge is old-fashioned, and a positive obstruction to traffic? Yes; that is self-evident. Any honorable Member can see that for himself by paying a visit to the place.
2290. You prefer this site for a bridge to any other? Yes, because of the immense amount of traffic going along the road.
2291. It has been pointed out that it would be of advantage to take a bridge from Glebe Point across to Mullens-street? So far as the distinct trade of Balmain is concerned, I think that that would be a better road; but the present bridge serves the traffic not only from Balmain, but from Drummoyne, Ryde, and other places. If that traffic were taken round to Mullens-street, it would be considerably diverted from its direct route.
2292. You look upon the road which passes over the Glebe Island Bridge as part of one of the main roads into Sydney? Yes.

- W. H. Wilks, Esq., M.P.  
26 Aug., 1897.
2293. That would be a strong reason for improving the bridge? Yes. If the bridge were one for serving local traffic only, it might perhaps be an advantage to take it over to Balmain from about where the sugar works are.
2294. But you are in favour of putting a new bridge close to the site of the existing Glebe Island Bridge? Most decidedly.
2295. I presume that the fruitgrowers of Drummoyn and Ryde and other places, and the manufacturers about Balmain, have often to do business at the goods station at Darling Harbour? There is a large tract of country out in the direction of the Field of Mars and Ryde, from which many people are compelled to come into Sydney by this road; while on the eastern side of Balmain and thereabouts we have places such as Lever Brothers' manufactory, and John Booth & Co.'s place. This proves the advisability of making a new bridge, and the possibility of ultimate railway extension.
2296. The main northern line from Hornsby to Strathfield, and the Milson's Point line, have been sufficiently long in existence to prove that they cannot take the whole of the through traffic from the districts to which you refer? I think so.
2297. This road is also necessary to enable the people in those districts to get to the city? There are many people who prefer to come into Sydney by vehicle instead of by the train.
2298. The inference is, that they take the cheapest route? That is my opinion.
2299. There appears to be a great tendency for manufacturers to establish themselves round the foreshores of Balmain? Yes; it is very marked.
2300. To give them the easiest access to Sydney and to the railway system, you can do nothing better than improve this bridge? Not at the present time.
2301. Of course, in the future it would be an advantage to give them more direct tram accommodation; but at the present time, if the bridge were taken away, what would their position be? No doubt the people would not stand such a thing very long, and the agitation would be so powerful that you would be compelled to provide a new bridge. To show that it is probable that the foreshores of Balmain will be used even more extensively for manufactories in the future, I say that I know of several people who are willing to construct a private railway through Glebe Island and round the shores of Johnstone's Bay, if they can get power to do so. The Australasian representative of one of the firms established there told me that he could obtain money for the work, if he could get power to construct it.
2302. *Chairman.*] Such a line would, of course, connect with the main system? Yes; but no definite plan has been formulated. Still, people are so taken with this neighbourhood as affording good sites for manufactories that they would be willing to spend the money in making this line.
2303. If the necessities of the people demand that Pyrmont Bridge should be perpetuated, it follows, as a matter of course, that the Glebe Island Bridge must also be perpetuated? Yes; and a more opportune time than the present could not be obtained for constructing a new bridge, especially a timber structure. It is well known to people in the trade that at the present time there is a splendid opportunity for constructing a timber bridge.
2304. Do you think it would be wise to fill in the upper portions of Blackwattle and Roselle Bays, and to make a causeway across to the south-western side of the island? I have not sufficient knowledge to give an opinion upon that scheme.
2305. Do you think it would be desirable to fill in any portion of the water-way? Not any of it that is usable at the present time. There might be small reclamations which could be recommended, but nothing more. The more open water spaces we have the better. I think it would be suicidal to destroy any possible water-way in these estuaries.
2306. There are several wharfs in Blackwattle Bay now, and several business places established there? Yes. Some two years ago it was strongly represented by the timber-merchants and others around Blackwattle Bay that the present swing-span in Glebe Island Bridge interfered with the passing of vessels.
2307. Do you feel disposed to corroborate the opinion that if proper facilities were given for the entrance and exit of larger vessels the business in these bays would increase? I think it is reasonable to assume that that would be so, especially taking into consideration the possible intention of the Government to create cold storage works at Glebe Island. Vessels would then have to lie close up to Glebe Island to load the meat, and if you did not allow them to go through the bridge a lot of the foreshore would be lost.
2308. Do you desire to offer any opinion in regard to the proposed alteration of the approach on the eastern side of the bridge? You might have to widen the road there. There is the face of the quarry on one side, and some reclaimed ground upon the other.
2309. Do you know if there has been any expression of opinion against the proposed renewal of the bridge? No, but there has been continual agitation for a new bridge.
2310. That agitation has been going on for years? Yes. The tradespeople throughout Balmain complain of the present arrangements.
2311. You are of opinion that the re-building of the bridge cannot be safely delayed any longer? I am strongly of that opinion.
2312. *Mr. Hoskins.*] Have you any doubt as to whether, if the causeway were made, sand-banks would be formed in the corners at each end? I am not in a position to say whether that would happen.
2313. *Mr. Fegan.*] You have heard complaints about the position of the present swing-span? Yes; numerous complaints.
2314. This is the most important bridge you have? It is the only bridge.
2315. You want no other bridge? In time we shall be compelled to ask for another bridge going across from about where the sugar-works are.
2316. Have you heard any complaint in regard to the circuitous route now followed by the tram? Yes. It is an "all-round-the-hat" business to get to Sydney now, and no doubt if a strong bridge were built it would not be long before the railway authorities would suggest a direct line.
2317. You think that a bridge wide enough and strong enough to carry a tramway should be constructed? Yes. I take it that that is a matter of the utmost concern.
2318. *Mr. Clarke.*] Do you think that a bridge is preferable to a causeway? I do not know the relative costs, but, as I have already said, it is a very opportune time for the construction of a timber bridge.
2319. If a causeway could be constructed as cheaply as a wooden bridge, you would have no objection to its construction? No. An improvement of the present conditions would be a great gain to the public at large.

2320. A causeway would not require continual repairs as a bridge would? That is evident.
2321. I understand that at the present time punts and small vessels can get under the bridge? They would be vessels of perhaps only 5 tons burden.
2322. If a causeway were made all vessels would have to go through the swing? Yes.
2323. I suppose that the construction of a new bridge would mean a large increase of trade in Rozelle Bay and that part of the harbour? A new bridge would give better facilities for traffic, and I take it that that portion of the harbour would be more used.
2324. Have you given any thought to the advisability of removing the Abattoirs to some other place? I was a member of a Select Committee which inquired into the matter.
2325. If the Abattoirs were removed there would be so much less traffic over the bridge? Even if the Abattoirs were removed, it is not reasonable to think that the State would allow Glebe Island to continue unused. Indeed, the establishment of cold storage works there is contemplated. That would give a considerable traffic; but even apart from that traffic, there is now a large and rapidly increasing traffic from Balmain, and from Drummoyne, Five Dock, the Field of Mars, Ryde, and all that portion of the western suburbs.
2326. *Mr. Triekett.*] Do you hear many complaints about the location of the Abattoirs? I do not hear many local complaints, but I have heard of complaints. Of course, while the Select Committee, to which I have referred, was making its inquiry, we had evidence both for and against the removal of the Abattoirs; but the general opinion was decidedly in favour of the retention of the Abattoirs.
2327. Are the complaints about the offensive character of the business carried on there, or about the danger and trouble caused by the driving of the animals through the streets? The complaints arise in regard to both matters. The offensive character of the business could be mitigated by the adoption of scientific appliances.
2328. I understand that it is almost the general opinion that it is highly undesirable to drive cattle from the sale-yards at Homebush to the Abattoirs? It is not only highly undesirable, but it is dangerous. You should have either a special road or a special means of conveyance.
2329. A branch line of railway? Yes.
2330. Do you think that if the Abattoirs are permanently established at Glebe Island something of that kind must be done? Yes; it cannot be avoided.
2331. Even if the Abattoirs were removed, would the construction of a new bridge still be necessary? Absolutely. There is no other way of communication between the southern end of Balmain and Sydney, unless you go right round through Leichhardt and Petersham.
2332. If there were a tramway across the bridge, would it be used in place of the tramway that now goes *via* Annandale? No; that tramway would still be used. The new tramway would be of advantage to the people in Balmain North, and to some of the people in Balmain South.
2333. Is the present tramway largely used except by the people in Balmain South? Yes; a large section of the people in Balmain North use it.
2334. But I suppose most of the Balmain people come to Sydney by steamer? Yes; the people in the north-eastern portion of Balmain use the ferries. They cannot get round to Sydney in vehicles unless they drive right through Balmain and round by this bridge.
2335. There is no night ferry service to Balmain at the present time? No.
2336. Do you think that a tramway across the Glebe Island Bridge would be a paying concern? I am satisfied that it would. It would create fresh traffic for itself. The saving of time which it would bring about would encourage people to patronise it.
2337. *Mr. Roberts.*] When you say that there is a probability of another bridge being asked for, where would you suggest that that bridge should be placed? I was speaking wholly of the future requirements of Balmain. I think that a bridge might be taken across from Pymont, near the sugar-works, to what is known as Ford's property, close by where the late Sir Henry Parkes used to live. When you view that suggestion in connection with a scheme of extending the line to North Shore, you will see the probability of this being pushed forward a few years hence.
2338. You think it probable that the connection will be made? I think it a feasible proposal.
2339. Has the population of Balmain increased during the last few years? Yes, decidedly. During the last fifteen months, 160 new tenements have been put up there, and several manufactories have been started. Balmain will soon be the most thickly populated place near Sydney.
2340. The establishment of manufactories there will probably lead to an increase of population? Yes; and the suburb having quick communication with Sydney and possessing water frontages, it offers strong inducements to people belonging to the middle and working classes to reside there.
2341. What is your estimate of the present population of Balmain? I should think it is somewhere about 30,000; it may be a little more or a little less.
2342. Do you think that the construction of a direct tramway there would increase the population of Balmain? Yes; it would materially assist the place.
2343. If the tram were taken over the Glebe Island Bridge, and then over the Parramatta Bridge, it would be a still greater improvement? Yes; I hold to the opinion that the railway authorities would favour such an extension of our tramway system.

Sydney James Law, Esq., M.P., sworn, and examined:—

2344. *Chairman.*] You represent the Electorate of Balmain South in the Legislative Assembly? Yes.
2345. Are the Abattoirs situated within your electorate? Yes.
2346. *Mr. Wright.*] Have you any statement to make in regard to the proposal now under the consideration of the Committee? I think that any bridge that is constructed should not have less headway than the proposed Pymont Bridge, which I understand will have a headway of 25 feet. Of course the higher the bridge and the wider the span the better it would be. I suppose there are more than 100,000 people living westward of the Glebe Island Bridge. In Leichhardt and Balmain alone, the population amounts to 50,000 people, and the bridge is used also by the traffic coming from Ryde, Drummoyne, Gladesville, Ermington, Hunter's Hill, Bourketown, and many other places which are fairly well populated. Most of the traffic coming over the Lane Cove, the Parramatta, and the Iron Cove bridges, comes across the Glebe Island Bridge. I believe that the greater part of the vehicles travelling between Sydney and Parramatta

Esq., M.P.  
26 Aug., 1897.

- Parramatta cross the Glebe Island Bridge. Most of the fruit-growers come in this way. I think that any new bridge should be at least 40 feet wide and have side-walks in addition, and it should have a swing span which would be right up to date. I see that it is proposed to make a causeway, which I believe would considerably lessen the expense, though I do not pretend to have a particular knowledge about these matters. I take it that what the people want is a stable structure which will be worthy of the splendid position which this bridge holds, situated as it is on one of the main outlets of the greatest city in the southern hemisphere. Whatever bridge is put there, it should be a first-class bridge, capable of lasting for all time, and commensurate with the importance of the future destinies of the city.
2347. The opening of the present bridge is 34 feet, and it is proposed to make it 50 feet? Well, I think we want as wide an opening as possible.
2348. An opening of 60 feet would admit the largest vessel that has ever come here? In that case the opening would be large enough.
2349. The proposed bridge is to be 20 feet above high-water mark? I should like to see it higher. I would point out that any bridge which is made should be of sufficient stability to carry a railway or tramway at some future time.
2350. Do you think that the present bridge is in the right position? I do not think it could be in a better position. In my opinion, however, it would be possible to carry the bridge over the top of Brown's works. There is a lot of high ground there on both sides, and I think it would be possible to have a bridge 70 feet high, though I have not gone into the details of the cost.
2351. You do not think that a headway of 20 feet is enough? We want as much headway as possible. We must have a bridge, however, whatever the headway.
2352. A new bridge is absolutely required? Yes.
2353. The proposed new bridge will allow vessels of the largest size to enter Blackwattle Bay? Yes. That will become a very important place in the near future.
2354. There is a very large traffic from the suburbs on the Parramatta River across this bridge? Yes.
2355. There is also a large amount of traffic in Leichhardt, Five Dock, and around about Iron Cove? Yes. There is no other site for a bridge which would be so convenient. I believe it has been proposed that a bridge should be taken from Glebe Point to the other side of the Abattoirs; but that would make it necessary to go a long way round to get to Balmain, and it would not suit the convenience of the people there.
2356. The population of Balmain is rapidly increasing? It is increasing at a fairly rapid rate, and more so than most of the suburbs. New industries have been started there lately, and there is more employment for the people. Mort's Dock has employed more hands during the last eighteen months than ever before. Balmain has 7,000 people more than any other suburb near Sydney, and it contains the largest industries in Australia.
2357. The tendency of these industries is to grow? Certainly. They are extending Mort's Dock at the present time, and there is every indication of the recent great increase of business continuing.
2358. I suppose the ferry service is only for the use of pedestrians? Yes. The tram also takes a large number of people. It is doubtful whether more people travel by ferry than by tram. I might point out, however, that the ferry company, which has not been in existence for more than three or four years, charges 1d. fares, and is always declaring 10 per cent. dividends besides putting large sums to the reserve fund, so the traffic must be very large. We have a 15-minute ferry service and a 20-minute tram service.
2359. But neither the ferries nor the trams enable you to transport goods? No.
2360. It is necessary to have some means of transporting heavy goods? Certainly. It was said in 1894 that the present Pyrmont Bridge had a life of only three years. The three years are now up, so that the sooner the new bridge is built the better.
2361. The present bridge is inconvenient and unsafe? Yes; it is altogether unsuitable and behind the times.
2362. You are opposed to the construction of a bridge from Pyrmont to Balmain? I think that it would be three times as expensive as the proposed bridge, and that it would obstruct a far greater portion of the harbour.
2363. If you put the bridge at a much higher level, how would you get an approach to it from the Sydney side? I think Union-street could be taken right through. That would give almost a direct line from the Pyrmont Bridge. A tramway crossing both bridges would enable people to travel from Balmain to the General Post Office in 15 minutes, whereas the tram journey through Forest Lodge takes 35 minutes. The proposed extension to Union-street I speak of would go through vacant land. There is a quarry there which is now lying idle.
2364. *Mr. Egan.*] Has there been any agitation for a tramway such as you suggest? No large amount of agitation.
2365. Has the matter ever been brought before the Secretary for Public Works? I believe so. Of course the extension of a tramway across the bridges has always been advocated; but in the past the people of Balmain have asked too much, and up to the present they have not got anything.
2366. How long is it since any representation was made to the Minister? It is a long time ago.
2367. Since then no move has been made? No; the people complain that the present tram follows a round-about route, and, no doubt, when the new bridges are constructed, they will advocate a direct tramway connection.
2368. The saving of time you speak of would be of great importance to the business people living out towards Balmain? Yes.
2369. That would tend to an even larger settlement than you have there now? I do not think there is anything better calculated to accelerate the progress of Balmain and the adjacent suburbs.
2370. You were a member of a Select Committee which inquired into the condition of the Abattoirs? Yes.
2371. Will you give us the benefit of your views upon the propriety of removing the Abattoirs to another situation? My opinion is that they should not be removed, and most of the members of the Select Committee were of opinion that a better site could not be obtained in any part of the world. Of course, it is universally conceded that everything there is much behind the times, and that new machinery is required. There has been no agitation for the removal of the Abattoirs, except by a handful of people living

living over at Drummoyne, and at Glebe Point a small public meeting was called to consider the subject, but I think only twenty people attended, and it was a fizzle. There is hardly anybody in favour of the removal of the Abattoirs.

S. J. Law,  
Esq., M.P.

26 Aug., 1897.

2372. How long have you been living in Balmain? Sixteen years.

2373. You have not found the Abattoirs a nuisance? No; but the practice of driving cattle and sheep through the streets is a nuisance. What is required is a railway from somewhere near Petersham. There are 40 acres at Glebe Island, and the late Mr. Eddy, in giving evidence upon the proposed extension of the railway into the city, said that eventually there must be a line to Balmain, and that it would be a profitable concern.

2374. If the Abattoirs are remodelled and improved the necessity for a better bridge will increase? Yes.

2375. *Mr. Hassall.*] During your residence in Balmain the population has very largely increased? Yes; I suppose it has nearly doubled in the time.

2376. And I suppose the population of the adjoining suburbs has also increased? The population of Leichhardt has increased to an even greater extent.

2377. And there has been a considerable increase of population at Ermington, Ryde, and other places on the Parramatta River? Yes.

2378. The traffic along the road from Glebe Island has, therefore, become so great that it is absolutely necessary to improve the Glebe Island Bridge? Yes.

2379. The cost of an iron bridge is stated to be £92,400; of a wooden bridge, £59,500; of a causeway, with a steel swing-span, £84,500, from which last amount £24,500 must be deducted as the amount saved by allowing stuff excavated in the construction of buildings and so on to be thrown in to fill up, making the cost of the causeway and swing-span £60,000;—under those circumstances, do you not think that the causeway would be better than the timber bridge? Certainly. I would advocate, however, the construction of an iron bridge. I do not think that £90,000 is too much to spend there, considering the importance of the roadway.

2380. There would be no great difficulty in increasing the headway under the swing-span if the approaching causeway were sloped up a few feet? That is so. Whether the Abattoirs remain or not, Glebe Island is the property of the Crown, and will always be used. I daresay the 40 acres there are worth £500,000.

2381. At the present time the Government get a large amount of revenue from the Abattoirs? I believe they do.

2382. And the only cause of complaint is the cattle-driving? Yes. Several people have been gored by wild bullocks, and only recently a young girl was very severely hurt.

2383. Would it not be possible to do away with the nuisance by fixing certain hours for the driving of cattle through the streets? That is done now; but there are always a few people about. People have had to get into the lattice work of the Iron Cove Bridge in order to avoid cattle crossing over that bridge.

2384. But, with ordinary precautions, the nuisance need not be sufficient to warrant the removal of the Abattoirs? No; the difficulty would be obviated altogether if the Government were to construct a railway to Glebe Island. The late Mr. Eddy, the greatest authority upon railway matters who has visited the Southern Hemisphere, stated that such a railway would pay. This line will have to be constructed in any case some day.

Stephen Edward Perdriau, Surveyor, Department of Lands, sworn, and further examined:—

2385. *Mr. Black.*] I believe you have some additional evidence to lay before the Committee? Yes; I have here a description of the roads and district travelled by stock from the metropolitan cattle sale-yards at Flemington to the Abattoirs at Glebe Island:—

S. E.  
Perdriau.

26 Aug., 1897.

#### THE SALE-YARDS.

THE metropolitan sheep and cattle sale-yards at Flemington railway platform are the property of the Sydney Municipal Council.

An area of about 30 acres is occupied by the sale-yards. They adjoin the railway, and extend to the Parramatta-road, the length being about 25 chains, and the width about 11 chains.

The land was purchased for this purpose by the Sydney Municipal Council in the year 1881, and the yards were opened in November, 1882. The cost is stated to have been about £80,000. A large one-story building of brick, in a convenient position to the various yards, provides offices for the caretaker and 13 sheep and cattle salesmen and agents.

Sales are held twice a week, viz., upon Mondays and Thursdays. Sheep and cattle are sold on both days. Monday being the more important day for cattle, and Thursday that for sheep. The charges made by the Municipal Council for use of the yards for the sale of sheep is 3d. per head, and 5d. per head for cattle. The number of sheep sold in 1896 was over 2,650,000, and over 110,000 cattle. The revenue, therefore, is about £12,000 per annum, and the expenses of management are said to be about £1,000 per annum.

The stock are brought to the sale-yards by railway as well as by road. Those brought by railway arrive generally in sufficient time to allow of their resting before being sold, but sometimes there is no time to spare for that purpose, and they are taken straight from the railway trucks into the sale-yards.

The resting paddocks comprise many hundreds of acres lying to the north, south, and west of the sale-yards. These paddocks are held by various agents, Hill, Clark, & Co.; Pitt, Son, and Badgery; and others.

The sales commence at half past 9 a.m., and purchasers are allowed until 8 o'clock on the following morning to remove the animals.

#### ROUTES TRAVELLED BY THE STOCK.

Upon leaving the sale-yards, the whole of the stock going to Glebe Island travel along the Parramatta-road for about 2½ miles—that is, until the borough of Five Dock is reached. There a considerable number turn in a northerly and north-easterly direction into the borough of Five Dock, and on to Drummoyne, eventually reaching Glebe Island via the Long Cove Bridge, Weston-road, and West Balmain. This route is about half a mile shorter than that travelled by the remainder, which continue along the Parramatta-road, through the boroughs of Ashfield and Leichhardt, to the Abattoir-road, which meets the Parramatta-road at a point northerly from, and distant about half a mile from, Petersham railway station. Thence they travel along the Abattoir-road (which was made for the purpose), through the boroughs of Leichhardt and Balmain, and skirting the north-western side of Rozelle Bay to Glebe Island.

At various places along the above-described routes there are resting-paddocks, viz., on the Great North road at Five Dock; on Lyons-road, Drummoyne, near the western side of the borough; at Ramsay's Bush, Dobroyde, extending from the Iron Cove Bridge on the Parramatta-road north-easterly to, and on the other side of, the tran-line. There is one paddock in Leichhardt within about ¾ of a mile of the island.

#### TIME DURING WHICH SHEEP AND CATTLE TRAVEL ALONG THE ROADS MENTIONED.

Sheep may be driven at any time during the day or night, as they are almost harmless to human life; but cattle are restricted to the hours between 6 p.m. and 8 a.m.

From the sale-yards the section of the Parramatta-road and contiguous land thence to Powell's Bridge, about three-quarters of a mile, is not included in any municipality, and consequently there is no restriction as to the time that cattle may roam over it.

The

S. E.  
Perdriau.  
26 Aug., 1897.

The Parramatta-road is maintained by the Government. At Powell's Bridge, the boroughs of Burwood and Five Dock are reached (the Parramatta-road divides them), and cattle are not allowed to pass this point until 6 p.m. The actual block across the road is the railway-gate on the Strathfield-Newcastle railway, close to Powell's Bridge, which is not opened until that hour, and the drovers leave the sale-yards at such a time as to arrive there about that time. After 6 o'clock the cattle are on the roads, generally in about half a dozen mobs, varying in number from about 20 to 200, and perhaps more.

They are taken part of the way to the Abattoirs at night, viz., to the various resting paddocks above mentioned. They are not allowed to pass through the borough of Leichhardt before 10 p.m. Thence, between 6 and 8 o'clock in the morning, they complete the journey, and are driven to the Abattoirs. Cattle going to Parramatta and intervening suburbs are, of course, driven along the road, westward; those for Enfield, Canterbury, Hurstville, &c., cross the railway at a point close to Flemington, either by the subway or by the over-bridge; while those intended for Moss Vale and such places, 50 miles or more away, are re-trucked.

NOTE.—I am informed by the officer of the Works Department in charge of the roads that the Parramatta-road—that is, the Great Western road—and the Abattoir-road are maintained by the Government, but that the Weston-road, Balmain, is not.

I beg to hand in a statement by Mr. C. A. Simms, Secretary to the Board of Health, of the number of sheep, cattle, calves, and pigs slaughtered at Glebe Island. The calves and pigs are brought coastwise and driven to the island *via* Pyrmont and Glebe Island Bridges after having been sold at the Corporation Yards near the Market Wharf, Sydney.

Sir, Office of the Board of Health, Sydney, 25 June, 1897.

In answer to your letter of the 19th instant to Mr. G. W. Shelley, the Inspector of the Abattoirs at Glebe Island, I am directed by the President to inform you that the return subjoined shows the number of animals driven from Flemington to the Abattoirs for slaughter during the year 1896.

I have, &c.,  
C. A. SIMMS,  
Secretary.

Sheep .....	1,159,000
Cattle .....	70,000
Calves .....	9,528
Pigs .....	64,690
Total .....	1,303,218

S. E. Perdriau, Esq., Lands Department.

CATTLE DRIVING DANGEROUS TO HUMAN LIFE.

The boroughs or suburbs above mentioned, through which the cattle are driven, are all more or less populated. All along the Parramatta-road there are shops and other business premises, and a large township at Leichhardt. On the Weston-road, Balmain, there is also a large township.

Generally, there are two drovers on horseback and several dogs with each mob of cattle. One drover rides a short distance in front of the cattle to warn people on the road, the other drover with the dogs bringing up the rear. There is one drover who takes charge of a mob, and has no assistance except from dogs. On dark nights the cattle cannot be distinguished further than 20 paces off, except when there are lights. There are public gas lamps on the southern side of Parramatta-road, in the boroughs of Burwood and Ashfield, but there are no public lights on the northern side in the boroughs of Concord and Five Dock, which means that for 3 miles on one side of the road it is very difficult indeed to see the cattle before one gets right up to them. Such circumstances need only be mentioned to show the danger existing. Evidence of this also is afforded by the shopkeepers, who state that on cattle nights they do scarcely any business, because people are afraid to venture on the road, for, of course, the cattle are wild, and they travel faster than they otherwise would, because dogs on the roadside dart out at them unexpectedly, and make them more furious. They may be driven on any other nights besides Mondays and Thursdays, and are sometimes a nuisance to church-goers.

If a beast knocks up it is roped to the fence or the nearest suitable post on the road-side, and left there till the morning, when it is shot, its throat cut, and then carted to the Abattoirs. Thus it remains on or near the footpath all night, and becomes a dangerous nuisance.

The cattle cannot be kept in the roadway, but run all over the footways as well, and the drovers must go on to the footpaths—especially at cross roads and lanes—to prevent the cattle turning into them. If any break away into such places they are brought back to the mob as quickly as possible; the drover, urging his horse at full speed, makes the cattle almost gallop on to the road again. Sometimes the mobs are driven considerable distances up the cross roads to endeavour to attract the strayed ones to it again. The Parramatta-road is 1 chain wide, but several of the streets *en route* through Five Dock and Drummoyne are only half a chain wide, hence the danger is increased. If any beasts happen to get clean away, the drover cannot leave the mob, but must complete the journey with them, and afterwards return for the strayed ones, which in the meantime have roamed at will, a scourge to the neighbourhood. This is not an uncommon occurrence, and these separate ones often become very fierce, and refusing to be driven, have to be shot when found. It is not necessary to burden this report with every detail of danger, resulting from the cattle-driving; but I should add that during my two days' inspection of the routes particulars of three deaths, occasioned recently through vehicles being overturned by bullocks, were narrated to me, besides numerous serious accidents and escapades. Scores of the latter could be obtained in a few hours if required. In fact every person resident for any considerable length of time in the district affected knows of several, and they are unanimous and vehement in their denunciation of the present practice, and point to the agitation—intermittently extending over a long period of years—for its abolition. Many deputations on the subject have waited upon Ministers of the Crown, and these have frequently been composed of aldermen from several of the boroughs affected.

The danger would be decreased by restricting the driving of cattle to the hours between 12 p.m. and 6 a.m. (that is twice as long a time as is required for the whole journey), but this would not secure complete immunity from danger, for occasionally some would break away.

CATTLE-DRIVING DETRIMENTAL TO PROPERTY AND ROADS.

Owners of property in the district affected complain bitterly of the detriment caused by cattle and sheep driving, and state that houses fronting the Parramatta-road are difficult to let, and rents decreased on that account (people with children dislike the position), consequently the value of land for building purposes is depreciated; also that the bullocks destroy the fences. The council clerks of the various boroughs *en route* state that in assessing land values they decreased them for land fronting and within a certain range of the cattle road, and that this is warranted by their experience of this nuisance. Another serious nuisance is the dust raised, especially by flocks of sheep (sometimes 5,000 in one flock); this, of course, depreciates the value of goods exposed for inspection.

The roads are much cut up by this traffic, especially in wet weather, and metal newly laid is displaced and scattered all over the road. New asphalt footpaths are said to have been destroyed in a fortnight. The whole width of the road is affected, and even when the cattle are kept off the footpaths the drovers must go on them to head the cattle: this they do at a great speed, which in itself is dangerous, but when summoned for the offence by the local borough council, the case was dismissed for the Magistrate stated that as cattle-driving was legal the drover must not be restricted to any one portion of the road, and that as the object in view in going on the footpath was to prevent accident it was unavoidable.

The nuisance is keenly felt in Five Dock which suffers more than other boroughs, both because the bullocks traverse it throughout its whole length, and that its streets are narrow. For a length of 2½ miles in Five Dock and Drummoyne the roads travelled by the cattle are only half a chain wide. I was informed that a movement is now afoot in Five Dock Borough Council to establish a toll bar to raise funds to repair the damage to the roads caused by the cattle.

The tramway authorities find it necessary to exercise special supervision over the lines travelled by cattle on account of their treading stones into the grooves.

GLEBE ISLAND AS A SITE FOR CATTLE SALE YARDS AND ABATTOIRS COMBINED.

The total area of Glebe Island and the reclaimed land lying between it and Balmain is about 46 acres. A proposal was made some time ago to reclaim a further area of 15 acres, extending from the north-eastern end and round both sides, to be used for wharfage purposes.

The

The stone and material required would be obtained upon the island close to the water.

Thus the total area available at this place could perhaps not be increased beyond 60 acres without expensive resumptions.

S. F.  
Pordriau.

This area would not be sufficient for abattoirs, sale-yards, and resting paddocks if the present custom of selling only twice a week be adhered to, because buyers having to purchase sufficient for their requirements between those days apparently require a larger area for resting paddocks than would be available.

At Flemington there are hundreds of acres (perhaps thousands) used as resting paddocks.

It might be worth while inquiring of the wholesale butchers and others whether the holding of sales every day would be practicable, for, if so, possibly sufficient area could be obtained at Glebe Island to meet all requirements.

If when the proposed railway to the island had been constructed the cattle had still to be taken to resting paddocks through Balmain the nuisance would have been only partially overcome.

The pens on the island hold 1,000 cattle and 10,000 sheep, and this accommodation could be largely increased.

It is some time ago since I prepared this information, but three accidents happened just about then to which I would like to draw the attention of the Committee. The paragraphs in which two of them are mentioned are taken from the columns of the local newspapers:—

*Thursday, 24 June, 1897.*

(1.) *A girl gored by a bullock.*—Yesterday morning a girl named Ethel Best, aged 11 years, residing with her parents at Nelson-street, Rozelle, was in Weston-street when a number of bullocks were being driven to the Abattoirs. The girl ran to the colonnade of the Rozelle post office for safety, when one of the bullocks charged her in a sensational manner, goring her three times. Her screams attracted attention, and when the girl was rescued it was found she had received serious injuries to her legs and body, and one of the bones in one of her hands was broken. The bullock was shortly afterwards destroyed.

*Western Suburbs Weekly Budget, 12 June, 1897.*

(2.) *Blocked by sheep.*—Quite a commotion occurred on Thursday afternoon, in close proximity to Catherine-street, consequent upon Parramatta-road vehicular and tram traffic being completely blocked by sheep. A very large mob was being driven to the Glebe Island, and at the corner of Catherine-street, a strike occurred amongst them. For some time neither force nor entreaty could induce them to give up possession of the street, they being complete masters of the situation—tram and vehicular traffic being completely blocked. The nuisance is becoming unbearable, and apart from the cruelty meted out to the poor brutes in a vain endeavour to force them along, in the interest of the business people, also the tram passengers, the Government should take immediate steps to minimise the nuisance.

NOTE.—Catherine-street is the Abattoir-road.

(3.) The Catholic priest at Leichhardt stated to me on the 25th June, that that morning in the church ground he had to shoot a wild bullock, it having broken away from the mob which had passed along the Abattoir-road near the church at about 7 o'clock. Another man shot the bullock twice, but the shot used being too small he had to obtain larger shot. The bullock was fired at three times. Mass was being conducted when the bullock got into the church ground, and the thirty people attending had to wait until the bullock was killed before they could leave the church.

2386. *Chairman.*] Do you know what the rise and fall of the tide of Blackwattle Bay is? I believe that they have lately been making observations in regard to the rise and fall of the tide. It averages 42 inches, I believe. The extreme difference between high spring tides and low tides is 6 feet.

2387. Is there any current under the existing Glebe Island Bridge? I do not think there is any noticeable current.

2388. If the waterway were narrowed to one-third it would increase the current? That would be the tendency; but I do not know if even then the current would be perceptible.

2389. Do you care to express an opinion as to the likelihood of there being any silting up alongside the proposed causeway? No doubt there would be a certain amount of silting up at the ends of the causeway near the land, but how much it would be I cannot say. The mud there is very soft, and is easily moved by the tide.

2390. Have you had any experience of similar obstructions to the tide in other parts of the harbour? I have seen all the stone wharfs and piers erected in the harbour, and I have noticed that in corresponding positions there is a tendency for silt to be deposited round them to some extent.

2391. *Mr. Humphery.*] The silt that now goes down into Johnstone's Bay would be obstructed by the proposed causeway, and would lodge against its inner side? Yes; but it would be cheaper to dredge it up if it were always in one spot. When the bay is dredged to a depth of 20 feet, nearly all the silt there will be removed.

2392. *Mr. Hoskins.*] Has Blackwattle Bay shoaled very much in the last ten years? I think so. They are always dredging it to increase the depth. By scale on the city map I make the area of Blackwattle and Rozelle Bays 180 acres.

2393. *Chairman.*] The process of silting up is going on gradually all over the harbour? Yes.

2394. *Mr. Trickett.*] In what connection did you quote those instances about cattle getting into people's gardens, and injuring people? Only to show the danger of driving cattle from Homebush sale-yards to the Abattoirs.

2395. It is necessary that something should be done to get rid of this danger? Yes, it is a very serious matter indeed. I went over there two or three nights to watch the cattle being driven along the streets, and there is no doubt that on dark nights it is very dangerous to be in the streets where they are being driven, because you cannot see them until they are right on top of you. The sheep, too, are a serious nuisance in the daytime.

2396. Does this practice of driving cattle through the streets absolutely prejudice the properties along the line of route? There is no doubt it does, especially where the roads are narrow. In the borough of Five Dock some of the roads are only half a chain wide. I think it would be a wise thing for the Committee to get evidence upon this subject from some of the council clerks of the boroughs traversed by the cattle.

FRIDAY,

FRIDAY, 27 AUGUST, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the expediency of constructing a New Bridge at Glebe Island, to replace the existing structure.

Edward James Howes Knapp, C.E., made an affirmation, and was examined:—

E. J. H.  
Knapp, C.E.

27 Aug, 1897.

2397. *Mr. Fegan.*] You have seen the plans of the proposed Glebe Island Bridge and causeway? I have had an opportunity of looking at them since I have been here this afternoon.
2398. You are well acquainted with the road which leads over the present bridge? Yes.
2399. Have you any statement to make with regard to the question under the consideration of the Committee? Yes. I have come here to-day because I have a strong opposition to the damming up of any of our water-ways or parts of the harbour if it can be prevented. The disadvantages of the proposal may not be patent to everybody, but in years to come any bridge will be a positive hindrance to the commerce of this great city, which I need not tell you will shortly have to enter into very keen competition with the neighbouring Colonies. If Federation be accomplished as I hope it will, on right lines, the proposal I have to make is, that instead of building a new bridge to Glebe Island, the traffic should be taken round through Glebe Point. I have a good knowledge of Glebe Island, having been appointed by the Surveyor-General in 1860 to subdivide it for residential sites. I then pointed out to him privately the danger of building bridges across the harbour. My objection to a bridge is that it largely interferes with water frontages which will in the future be required for commercial purposes. It shuts in about 3 miles of water frontage, about 1 mile of which now belongs to the Government. I object to it too, because of the annual expense which it involves in repairs of wear and tear, and in keeping men to open and shut the swing span.\* The removal of the bridge would give free access to the water frontage of which I have spoken, and would therefore, of course, increase its value, and the betterment system might be applied to the properties that were benefited. In place of the present bridge, I would suggest that the traffic be taken round through the Pyrmont Bridge road, and then at the back of the Kauri Timber Co.'s yard, crossing Ferry-road and Forsyth-road into Leichhardt-street; then round into the Glebe Point-road just below where the tram stops, down the Glebe Point road westward, and across reclaimed land to the intersection of Burt and Gordon streets. The distance to that point by my proposed route would be only a little over 30 chains more than by the route crossing the Glebe Island Bridge, from the Pyrmont Bridge, Darling Harbour. Such an arrangement would divert a lot of traffic from George-street West, and from the Parramatta-road, and would give quicker access to the city from Balmain South. The new road which I suggest should be made, would be about 70 chains in length. Forty chains of this could be utilised for connecting the Glebe tram with the Balmain tram. This would save the journey round through Forest Lodge. I estimate the cost of the new road at £28,956 for resumptions, and £10,500 for formation and work necessary to make it convenient for vehicular traffic, or £32,456 altogether.† The gradient would be a very easy one, and I think the road would open up a good deal of property. When we recollect that Glebe Island is only 2 miles, as the crow flies, from the General Post Office, it must be apparent that at some future date it will be a very busy place. You know how Balmain is going ahead now, and the new water frontage that I speak of will give much greater accommodation for shipping. I would respectfully impress upon the Committee the desirability of preventing the erection of permanent works which have the effect of shutting up the foreshores of the harbour from commercial use. In my opinion, it would be a mistake to perpetuate the evil created by the present bridge.
2400. Do you consider that the water frontage which you speak of would be closed against shipping if we replaced the present Glebe Island Bridge by a causeway, having a central swing span giving an opening wide enough to allow the largest ships to pass through? I think it must be apparent that where you have free waterway, to which you can get access at any time without hindrance, the value of the foreshores is greatly increased. We know what a hindrance to trade and what a congestion to traffic the Pyrmont Bridge now causes, and, no doubt, as time goes on the same thing will occur at Glebe Island.
2401. Are you in favour of keeping the Abattoirs at Balmain? I am very hopeful that the Abattoirs will be removed before very long.
2402. Suppose they are not removed? Then the traffic will have to come round the road I speak of.
2403. Do you think that that would be convenient? No doubt the arrangement would cause some inconvenience, but in view of its advantages, I do not think that that inconvenience should be taken into consideration.
2404. But if you knew that the Abattoirs were to be remodelled and improved and established at Glebe Island permanently would you recommend the abolition of the Glebe Island Bridge? I would, for the reasons I have stated.
2405. *Mr. Hoskins.*] If your proposal were carried into effect persons coming to Sydney from Ryde and places on the north side of the Parramatta River would have a much longer journey to make? They would have to travel 30 chains further than they travel now. I should like to get rid of all the bridges—the Iron Cove Bridge, the Gladesville Bridge, and the Hawkesbury Bridge. I think that they should never have been constructed.
2406. Do you think people would like to travel a longer distance? No doubt they would grumble at having to do so, but the individual interest must be sunk in the public good.

2407.

NOTE (on revision):—\* There would be no such expense with the new road I propose.  
NOTE (on revision):—† I am prepared to carry out formation for the sum named.

R. J. H.  
Knapp, C.E.  
27 Aug., 1897.

2407. How do you consider that the welfare of the community would be served by making this traffic travel half a mile further than it has to travel now? I admit the the people you speak of would be inconvenienced; but I want to have our harbour frontages thrown open for free access, so that we shall be able to meet the keen competition that will take place within the course of a few years.

2408. There are a large number of people residing at Ryde, Dobroyde, and other places in the western suburbs who use this bridge;—are not they part of the body politic whose interests you say should be considered? I admit that. Of course they would be inconvenienced slightly.

2409. If an opening is left in the proposed bridge which will be wide enough to admit the largest vessels coming to the harbour, do you think the proposed structure would be a serious hindrance to the commerce of the port? Well, I would object to the proposed causeway, because it would have the effect of silting up that part of the harbour.

2410. We have had it stated in evidence that there is scarcely any flow of the tide there, and that the construction of a causeway, while it might necessitate a little more dredging, would have very little other effect upon the harbour? So much the worse. If there were a good flow of the tide the scour that would be created by the narrow opening under the swing span would deepen the channel, but if there is hardly any flow, in my opinion the place would silt up rapidly.\*

2411. *Mr. Wright.*] Possibly you are not aware that it has been stated in evidence before the Committee that our present wharfage accommodation is nearly four times as great as the existing trade requires? Admitting that, it is, in my opinion, no reason why we should not look ahead, so that we may construct only such public works as will be of convenience to the coming generation.

2412. Is your only objection to the bridge your belief that it will close up this waterway? Yes; in my opinion, if the existing bridge had not been built that water frontage would now be in use for commercial purposes. The effect of the construction of that bridge has been to preclude the construction of large wharfs in the locality, although it is one which is admirably adapted for a commercial centre, being within easy range of the city and of the railway.

2413. Has not the water frontage been closed to shipping because of the narrowness of the bridge opening and the small depth of water there? The difficulties would be reduced if the proposal before the Committee were carried out; but you would not have the same free access to that water-way that you would have if there were no bridge.

2414. In the event of its being determined to put either a bridge or causeway there, which would you prefer? I should prefer to have a bridge right across.

2415. *Mr. O'Connor.*] In the event of your proposal being carried out, would not the people of Balmain be greatly inconvenienced? Some of them would have 30 chains further to go; but the greater part of Balmain is so well served by the ferries that the people have no occasion to use this road.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and further examined:—

2416. *Mr. Hoskins.*] In the event of its being decided to replace the existing Glebe Island Bridge by a new structure, which would you recommend—a bridge, or a causeway with a steel swing-span? A causeway with a steel swing span. C. W. Darley.  
27 Aug., 1897.

2417. It has been stated by several witnesses that in their opinion the construction of a causeway would bring about the silting up of that part of the harbour;—is that your opinion? I think that there is no foundation for such a belief. The proposed causeway could not possibly have that effect. It is not as if it were placed across a river. The only source from which deposits of silt reach that part of the harbour is the various stormwater drains and some local sewers which open into the heads of the bays. The matter brought down in the sewers is, however, deposited within a very limited area, and we can pick it up at the place of deposit with the dredges. The stormwater sewer delivering into Rushcutters' Bay deposits material within a comparatively limited area in the bay. The material forms a bank near the outfall of the sewer, and we can easily dredge it up. There is no current from the sewers towards the proposed causeway which would have the effect of causing the silt to be precipitated near the causeway. I have explained that we would remove the greater part of the mud and soft material from this part of the harbour, and there would be nothing to cause it to accumulate again.

2418. If you had a causeway, would more dredging be required in that part of the harbour which would be shut in by it than is required there now? No.

2419. *Chairman.*] When you last gave evidence before the Committee, you spoke of a problematic saving of £25,000 in connection with the making of the causeway;—are the Committee justified in believing that that amount could be saved? Yes, under the conditions I stated. My idea is that the whole amount asked for should be voted, and that we should save the amount you mentioned, if possible, by getting as much material as we could from outside sources.

2420. I understand that you would take material for the causeway from Glebe Island;—would the improvement thus effected make Glebe Island a more valuable asset;—could the value given to the island by the improvement be taken into consideration as a set-off against the cost of the proposed work? I think not. The improvement is too remote to value. 2421.

\* NOTE (on revision):—In substantiation of my answer to this question, I desire to draw attention to the fact that, in 1860, when I subdivided Glebe Island for the Surveyor-General, both White's Creek and Johnstone's Creek were navigable for small boats. In 1887, when I made a survey, in the Supreme Court case *Onan v. Payne*, the former creek was silted up to the old post-hole in the rock near the junction of Abattoir-road and Cecilly-street, and both high-water mark and low-water mark a good distance from this old post-hole, which was formerly just above high-water mark. The same applies to Johnstone's Creek, and it has necessitated the reclamation of the south arm of Rozelle Bay. Then, again, Blackwattle Bay, by reason of silting up, and giving out an offensive smell at low tide, has also had to be reclaimed. In my opinion, even a bridge is contributory, to some extent, in hastening silting. As proof of this I point to the fact that, in 1864, when I made a survey of the Sawyer Estate, Balmain, I fixed the position of high and low-water of its frontage to Waterview Bay. There was then no Corporation pier at the foot of Cooper-street. The Council subsequently built their pier from the low-water of 1864, extending 80 feet into deep water. In 1886, when I made a subdivision of this land, the pier was high and dry, as low water extended a few feet away out from it. There is much about the same current here as at Rozelle Bay. I could multiply instances from old surveys and field books to support my evidence, but that I think the above sufficient proof.

- C. W. Darley. 2421. Will you tell us, briefly, why you think a swing span preferable to a bascule? That is a matter of detail which it is my intention to investigate before finally working out the plans. So long as an opening is provided, I do not think it matters whether we have a swing span or a bascule.  
 27 Aug., 1897.
2422. Does not the question of cost come in? Yes; the relative costs will have to be investigated. It would take me some considerable time to ascertain which would be the better form of construction in this position. There are many points to be taken into consideration.
2423. *Mr. Black.*] Can you conceive of any set of conditions under which the proposed causeway would prove an impediment to the commerce of the city? No.
2424. You think that very large vessels are not likely, at all events in the immediate future, to seek this portion of the harbour as a place for discharging or taking in cargo? Well, they will not be prevented from going there, because they will be able to go through the opening.
2425. It may be that we shall have vessels coming here too wide for the opening? Well, if it were necessary, you could make the opening larger. That would be as easy to do with a causeway as with a bridge.
2426. *Mr. Wright.*] It has been suggested that it would be an advantage to continue Union-street right through to the Pyrmont Bridge, and raise the height of the bridge? That would add to the expense of the work very largely. You would have to abandon the causeway, and use tall piers.
2427. Would a headway of 20 feet allow the ordinary small boats trading in the harbour to pass under the bridge? Most of them could pass under.
2428. *Mr. Hassall.*] The causeway, as planned, would give them a comparatively level approach to the swing span. Would it be possible to create a slope so as to raise the swing span 3 or 4 feet? That could be done; but if you made the causeway very high it would be difficult to give access to Brown's works, which are close to the bridge. Of course, for every foot that you raised the causeway you would largely increase the cost.
2429. Do you think the advantage gained would justify the increased expenditure? No; small boats trading frequently to that part of the harbour will have masts low enough to go under the bridge.
2430. But if it were necessary the approach could be raised 3 or 4 feet? You could put a gradient on the approach.
2431. You do not know what the additional cost would be? I could not tell you off-hand what it would be.

THURSDAY, 9 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL PEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the expediency of constructing a New Bridge at Glebe Island.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and further examined:—

- C. W. Darley. 2432. *Chairman.*] The question is whether we should construct a bascule or a swing-bridge; you were to consider the matter and give a definite opinion? I have gone into the matter as far as I could since, and I do not feel inclined to recommend the bascule, but to adhere to the swing-bridge.  
 9 Sept., 1897.
2433. Is your opinion based upon a general consideration of the question? Yes; to make the bascule system economical it would be necessary to make the superstructure as light as possible. We should have to sacrifice to some extent permanency of construction as compared with a swing-bridge. We could not make any saving with a concrete and wood-blocked deck on a bascule bridge; we should have to put on the ordinary timber decking, to make it light.
2434. Would a bascule bridge be more expensive? No; they would both be about the same price.
2435. Then a bascule bridge would not be such a good roadway? You can have no economy. The object in departing from the swing-bridge is to bring about economy. You would have to go in for a cheaper roadway instead of such as would be designed for a swing-bridge. For the swing-bridge we have designed a roadway of trough plates with concrete filling and wood blocks—a good permanent roadway. A bascule bridge with the same class of roadway would cost about the same amount, but there would be really nothing gained by making the change. The bascule bridge is used where there is not sufficient room to work an ordinary swing-bridge, but that reason does not obtain with regard to Glebe Island. I prefer to recommend a swing-bridge.
2436. The mole is your present proposal? I said I strongly recommended the proposal to have embanked approaches with a bridge in the centre. I still adhere to that.
2437. *Mr. Lee.*] You have seen no reason to alter your opinion? No.
2438. *Mr. Wright.*] Have you seen the advisability of raising that bridge, and continuing straight from Pyrmont Bridge? It would be very costly to raise it.
2439. You have not considered that aspect of the question? I think it would be too costly to entertain.
2440. In your estimate you contemplate purchasing the material for making the embankments? No, to excavate at Glebe Island.
2441. *Mr. Lee.*] Supposing you found it unnecessary to cut down Glebe Island, in consequence of getting the material from other places, would you advise the cutting of a new road through the island so as to avoid passing near the Abattoirs? No; I am opposed to that scheme. I think that a new road there would interfere with the laying out and utilisation of the island hereafter. I think it would be a pity to do anything that would limit the usefulness of the island for railway and general shipping purposes. It is hard to say yet how it will develop.
- 2442.

2442. Beyond improving the present road you would not touch it? I do not propose to touch it at present. O. W. Darley.

2443. *Mr. Wright.*] Would it not be possible to bring the bridge a little further south? In lengthening the bridge you would come further south. At present we are on rock on both banks; as you come south you get off the rocks. 9 Sept., 1897.

2444. *Mr. Hassall.*] Did you make any estimate of the cost of raising the embankment 3 or 4 feet? I did not.

2445. Do you think the height sufficient for all purposes? I think so; there is 20 feet clear headway.

2446. *Mr. Wright.*] Could there be any regulation made by the Marine Board to compel all boats up to a certain tonnage to have low funnels and to be without high sticks, so that they could pass under a bridge like that, or that all boats in the harbour should have telescope funnels? I do not think that the Marine Board has power to pass such a by-law. It is recognised by the Board of Trade that vessels of all kinds have a right of way on the water. To make a by-law of that kind, you would require a legislative enactment. Where you have a bridge 20 feet high, the owners will adapt their boats to it so as to save delay. Most of our steamers about the harbour are adapted for running under the Iron Cove Bridge, which has the same headway.

2447. Would it not be advisable, where there is such a traffic as that on Pymont Bridge, to compel the owners of these small boats, where they have no necessity for high sticks, to have low masts and funnels? That is a matter requiring consideration. If I had a steam yacht which would require to go up there for repairs, it would be very hard to have to cut her masts down so as to go under the bridge.

Charles Ulick Carruthers, L.R.C.S., Irel., sworn, and examined:—

2448. *Chairman.*] You are a resident of Balmain? Yes; I have been there about seventeen years.

2449. *Mr. Hassall.*] During that period, have you been in the habit of coming over into the city? Yes; about three times a week. O. U. Carruthers. L.R.C.S., I.

2450. It is proposed to erect a new bridge at Glebe Island;—are you here to give evidence in favour of that proposal? Yes. 9 Sept., 1897.

2451. Will you state the reasons why you think the bridge should be erected? It is almost a necessity; it is almost as necessary to have a bridge there as to have the ferries going across to North Shore—the traffic is so heavy.

2452. You have a bridge at present? The present bridge is not suitable. In driving over to Sydney this morning I was blocked on the bridge because a small boat was passing through. A new bridge is absolutely necessary to accommodate the large district of Balmain, Ryde, Drummoyne, and Pennant Hills—one of the most beautiful districts around Sydney. You could not get a nicer drive than the road across Pymont Bridge, through Drummoyne, on to Ryde, and through the orchard district of Pennant Hills.

2453. During your residence in Balmain, has the population increased to any great extent out to the west? Considerably. I remember when at Leichhardt there was hardly any population. When I first went to Balmain there was no bridge at Drummoyne.

2454. Does the traffic for Leichhardt and those districts to the west come over Glebe Island Bridge? Yes; all the traffic from the west end of Balmain, from Leichhardt and Lillyfield, and all the traffic from the other side of the water—from Drummoyne, Ryde, Birkenhead, and the Field of Mars—comes across there; then there is the Abattoirs, which has a large traffic itself.

2455. Consequently there is a considerable amount of traffic on the bridge every day, and all the day? Yes; and even at night.

2456. The inconvenience, I presume, is caused by the narrow entrance to the bridge where the swing is, and the traffic is also occasionally stopped during the passing of a boat? Yes; it is in the opening of the bridge, and the uncertainty as to whether you will not be blocked upon it.

2457. Can two vehicles pass together on the opening? No; not on the opening.

2458. So that the traffic in one direction has to remain stationary until the traffic from the opposite direction has got through? That is so. Formerly they let the city traffic through first; now the traffic from Balmain gets through first, because there is only room for one trap to pass on the swing.

2459. Then they do not keep the traffic standing on the bridge? No—only whilst the bridge is open; but the minute the bridge is shut, they are so frightened of the weight of the double traffic on the bridge, that now they let the far side traffic through first.

2460. So that practically they reduce the weight on the bridge by 50 per cent.? Yes.

2461. They had to do that? They were frightened of the weight of the second traffic coming on whilst the other traffic is standing on the bridge.

2462. How long have you had to wait there at any time? I think from about twenty-five minutes to half an hour.

2463. I presume, then, that there are occasions when the traffic is delayed for half-an-hour at a time? I should say from twenty minutes to half-an-hour.

2464. What has been the increase in the traffic during the last ten years? I should say that it has increased three times.

2465. There is three times as much traffic now as there was ten years ago? Quite that.

2466. Are there any signs of an increase of business round Balmain to necessitate the building of a larger bridge? Yes; there is a considerable amount of building going on in Balmain and that district at present. Drummoyne is growing very much, and so is Hunter's Hill.

2467. It is principally a fruit-growing district? Yes; and people are going to live there.

2468. The produce has to be brought to market? Yes; at 3 and 4 o'clock in the morning you will see fruit-carts coming through from Pennant Hills.

2469. Have you seen the plans submitted to the Committee? Yes. I did not go particularly into them.

2470. There is an idea of making a causeway with a swing span, with a centre height from the water to the under deck of 20 feet, and providing a sufficient opening for two vessels to pass in opposite directions;—do you think that will be sufficient for all requirements? Yes. I do not know whether it is intended to alter the approaches, but no bridge will be satisfactory the approach to which goes past the Abattoirs.

2471. Why? When I went to Balmain first the Abattoirs were on one side of the road. The Government then erected a large refrigerating chamber that turned out a failure. Now they have made it into

C. U.  
Carruthers,  
L.E.C.S., I.  
9 Sept., 1897.

into a sheep-killing place, and as that is on the opposite side of the road from the other portion of the Abattoirs, in going along that road you have to go through the centre of the Abattoirs.

2472. What would you do to avoid that? You will have to go round on the northern side. Instead of taking the road from the present bridge and going across the Abattoirs, you would turn off after passing Johnstone's Bay and take the northerly direction towards White Bay, and then bear in a westerly direction.

2473. Where would you come out? You might come out on Robert-street.

2474. That would make a detour, would it not? Not a very large one. There is a very bad hill near the Abattoirs. There is a lot of traffic near the Abattoirs, and in passing there you see men with their clothes covered with blood carrying lights and liver, which is most objectionable. I do not think any bridge will be satisfactory the approach to which goes through the Abattoirs.

2475. I suppose it would not be necessary to alter the position of the bridge? Yes; there is a nasty turn on the city side, just at the entrance to the swing.

2476. But with a wider approach, and with a wider bridge, would not that be to a great extent remedied? Yes.

2477. Would the position of that bridge be suitable for the formation of another road leading towards White Bay, and then joining the main Balmain Road at the point beyond Glebe Island? Yes.

2478. In the event of a new road being made, it could be made from that site quite as well as from any other, could it not? I do not think so.

2479. Then it would be a question of shifting the bridge lower down Johnstone's Bay? No.

2480. There would be no difficulty in taking a road from the site of the proposed bridge in the direction you point out? No.

2481. It would not necessitate the shifting of the site of the bridge? No. I think it would be better if the bridge, instead of running across, as shown on the plan, to the end of Glebe Island, were shifted further north and a new road made round the island.

2482. Would not that be inconvenient for the Abattoirs? No; there would be no traffic except to the Abattoirs along that road. Speaking on behalf of the residents of Balmain, I am of opinion that a road should be laid out so as to avoid passing the Glebe Island Abattoirs, carrying the traffic to Balmain and the district to the west.

2483. I presume your opinion is that the present structure has practically outlived its usefulness? Certainly.

2484. It does not answer the requirements of the district, and it causes a very great feeling of inconvenience and loss in consequence of the difficulty of approach and the delays occasioned by the water traffic? Yes. Then, as to the new bridge, I do not think it would be satisfactory unless it is strong enough to carry a light railway or tramway. It is absolutely essential that it should be strong enough to carry either a light railway or a tramway. My reasons for saying that are these: There is an enormous traffic from the Abattoirs, and there is a great nuisance there caused by the cartage of skins, bullocks' heads, &c. The Abattoirs must remain there. I look upon that as essential, because a better place could not be found. I do not think any city in the world has a better place for abattoirs than Glebe Island. The bridge should carry a tramway, so that all those skins and offal could be removed in the morning before the ordinary traffic starts. It is a very disgusting thing when driving in summer to be blocked on that bridge behind a vehicle loaded with skins, bullocks' heads, and other offal covered with flies. This sort of traffic ought to be regulated. The offal ought to be removed early in the morning; and if there is a light railway or tramway, and it would not cost much to bring it down there, that could be done. That would relieve the bridge of a very obnoxious traffic in the daytime. Those heavy trollies, covered over with sacks saturated with blood, are most objectionable. If you get behind one of them on a hot day and you are blocked, you wish you were somewhere else. If the new bridge is strong enough to carry a tramline or a light line of railway, it would not cost very much to make the line from there to Harris-street.

2485. Then the engineers ought to consider whether they could erect a bridge strong enough to carry the additional traffic of a tramline? Yes; and I see that Mr. Law has been advocating that route as the shortest for a tramway to Balmain.

2486. But you have a tramway to Balmain? Yes; and it is forty minutes' journey to Sydney by that tramway. If I am not blocked on the bridge I can go from the General Post Office to my house in twenty minutes.

2487. The Abattoirs are not looked upon as any great annoyance to the residents of Balmain? There is a little annoyance as they are conducted at present; but there ought not to be any if they are rebuilt and reorganised.

2488. You think there should be no annoyance to anyone? No; why should the meat we are going to eat be an annoyance to anyone? It is not very nice to think that you are going to eat meat which is considered to be a nuisance. I do not want to go into the question of the Abattoirs, but the bridge is so mixed up with it that it becomes unavoidable. If the traffic were diverted there would be no necessity to go by the Abattoirs. People do not care to go by the Abattoirs, where they see butchers going about with leather leggings up to their knees covered with blood.

2489. It is a question of getting a different route for the traffic that will not necessitate going by the Abattoirs? Yes.

2490. Speaking on behalf of the people interested, you say that it would be advisable, or rather that it is almost imperative, that some fresh roads should be made to enable people to avoid passing the Abattoirs? Yes; it is imperative in building a new bridge to make a new road round the island.

2491. Do you think it would be advisable to build a bridge and agitate for the road afterwards? It is of no use building a bridge if you have not the approaches.

2492. *Mr. Roberts.*] You spoke of the Abattoir traffic as being a traffic by itself? Yes.

2493. Suppose that the Abattoirs should in the near future be removed, would the necessity for a new bridge still exist? Most decidedly. You cannot do without a bridge there for the people of Balmain, Drummoyne, Pennant Hills, Hunter's Hill, and other places.

2494. That is altogether outside the Abattoirs' traffic? Yes; you must have a bridge.

2495. Is it on account of the delay that takes place in reaching the city from Balmain that you advocate the erection of a new bridge? Yes; that is one reason, and the congestion of the traffic on it. There are always a great many meat-carts passing to and fro. I suppose, as a medical man, I am entitled to go first; but you dare not go near them, because if your buggy came into collision with a meat-cart it would not come off best.

2496. Do you know that the present bridge is in a state of decay? It is hardly fit for the traffic.
2497. If even the present bridge were not worn out, you think it is altogether inadequate for the present traffic? It is quite inadequate for the present traffic of the district and the Abattoirs. There is a very large district out there, and it is becoming a very popular drive on a Sunday. A great many carts and traps go out that way. I look upon it as the most charming district in the vicinity of Sydney in the direction of Hunter's Hill, Lane Cove River, and Pennant Hills. But the road has got a bad name because people do not like to go past the Abattoirs; everyone complains of it.
2498. Do you regard the present site of the bridge as being the most convenient for the people of Balmain and the population to the west of Balmain? Yes; I do not mind a little, one way or the other.
2499. Do you prefer that a road should go from Glebe Point to Mullens-street? That would be absurd. Do you mean to go across Rozelle Bay to Glebe Point.
2500. Yes? It is absurd. You might as well say, do away with the bridge, and let us go by Leichhardt and Parramatta-road, and past the University. I should almost prefer to go that way.
2501. *Mr. Farnell.*] You were speaking about a bridge to carry a tramway;—what sort of one would you recommend? The rails could be put across the bridge.
2502. Do you know there was a proposal to get an electric tram? It does not matter what the motive power is as long as they get the stuff away; a light branch railway would do.

C. U.  
Carruthers,  
L.B.C.S., I.  
9 Sept., 1897.

John Musson, Civil Engineer, sworn, and examined:—

2503. *Mr. Roberts.*] Are you acquainted with the proposed scheme to erect a bridge connecting Glebe Island with Pymont? Yes, I am thoroughly acquainted with it. I lived for some years at Glebe Point, close to it.
2504. Have you looked into the plans? I have.
2505. Perhaps you have prepared a statement? I have a short statement, which I will read:—

J. Musson.  
9 Sept., 1897.

#### THE GLEBE ISLAND AND BALMAIN BRIDGE.

THE question under consideration of your Committee is that of rebuilding the bridge to Glebe Island, on which are situated the slaughter-houses from which the city and suburbs on this side of the island are supplied with fresh meat. The said bridge would also carry all the large and increasing traffic to Balmain and the suburbs beyond, over the iron bridges at Iron Cove and the Parramatta River, to Ryde, &c. One great objection to the present route is having to pass close to and in front of the slaughter-houses, which is certainly objectionable, but cannot be avoided with the existing bridge or one to replace it on the same site. The carriage of meat to the city cannot, however, be dispensed with, and provision for that purpose must be provided, and that I propose doing by constructing a bridge at the Glebe Point, and reaching Glebe Island beyond the slaughter-houses. A bridge in that position, suitable for all purposes required of it, would cost very much less than a bridge on the present site, and the maintenance thereof, for reason that it would be much shorter and the foundations less costly, and would not require to be a swing or drawbridge, and involve the constant daily expenses attending thereto. It would also be a great advantage to Blackwattle Bay in not having a drawbridge to pass through.

The interruption to road traffic and possible tram traffic of such a bridge would not only be very great, but dangerous.

By building the bridge on the site I propose all these difficulties are removed, as there is practically no water traffic beyond such site but what could be met by a bridge some 30 feet above water-level; the land at Glebe Point is even higher than that.

I would propose that a causeway of stone be constructed as approaches to the bridge. Such approach to be 3 feet above water, on which piers would be built to support the floor of the bridge; the approach to serve as a wharf. The causeway of the Departmental bridge is 35 feet high.

I propose that a new street or road be constructed from the Glebe Point to the Pymont Bridge Road near the Wentworth Park. The distance is about 40 chains. On such road could be constructed a tramline or railway that would connect Balmain and Glebe Island with the Darling Harbour station, passing under Ultimo by tunnel.

The distance of my proposed route at a point opposite Glebe Point to the Pymont Bridge is nearly 400 yards longer than the present route, but from nearly all the suburbs the distance would be about  $\frac{1}{2}$  mile shorter than the existing route; and, considering that those suburbs get nearly all their supply of meat from Glebe Island, the saving of  $\frac{1}{2}$  mile is important.

2506. What is the estimated cost of your scheme? I did not go very particularly into it, but the bridge would cost less than what you propose, for the reasons that it would be shorter and the foundations would be easier.

2507. There would be no swing? I do not propose a swing, although there might be a small bascule. The bridge being 30 feet high it would not be required.

2508. You have not gone into the cost of the bridge? The bridge and the approaches to it, roughly speaking, would cost about £35,000. Iron Cove Bridge cost £40,000. On the Blackwattle Bay side of the Glebe Point road there is no parallel road. A proper street is wanted very much from the end of Glebe Point road through to Wentworth Park. I think that a very favourable arrangement could be made there.

2509. Do you think that a connection with Glebe Point would be as convenient for the Balmain people as the present route? I consider that it would be much more so in every respect. By the route I propose they would avoid the Abattoirs; it is very objectionable going that way; the flies attach themselves to your clothes, and you bring away an odour that is not pleasant. Then you cannot very well have a tramway on a bridge that is frequently open to allow vessels to pass, as would be the case by the present route. At Glebe Point there is already a tramway. A tramway or railway could be constructed direct from there to Darling Harbour. On a previous occasion I submitted plans for a railway from Darling Harbour, and that route would carry any locomotive, and cattle could be carried to Glebe Island, and the offal from the island could be removed at night. The route would cross the park and go under Ultimo by a tunnel at a cost of £8,000 or £9,000. I think the scheme would cost altogether to Darling Harbour about £50,000. I have not gone much into details.

2510. In order to form the new street you speak of in your scheme, would it not be necessary to resume certain portions of land? Yes, less than 4 acres.

2511. Is the land to be resumed all built upon? No; the land, according to the opinion of a competent valuator, is worth about £1,500 an acre.

2512. *Mr. Fegan.*] Have you allowed space in the width of the bridge for a tramway? The bridge I propose would be quite sufficient. I would suggest that the bridge be built strong enough for both a railway and the ordinary traffic.

2513. Would £50,000 cover the whole expense? It would go pretty well over it all. The Iron Cove Bridge cost £40,000, and there is the Parramatta River Bridge; I think that the two cost £90,000. A tram could go right up there. It is an easy road throughout, and it would be an immense advantage to Balmain.

## PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## New Bridge at Glebe Island.

## APPENDIX.

## A.

[To Evidence of C. W. Darley, Engineer-in-Chief for Public Works.]

## COMPARATIVE STATEMENT OF COST.

Sir, Department of Public Works, Engineer-in-Chief's Office, Sydney, 30 August, 1897.  
I have now the honour to forward herewith three tabulated statements, showing in detail the calculations on which was based the diagram giving the annual charge and capital values of the three schemes submitted to the Public Works Committee.

I would also add that in the scheme recommended by me at a cost of £84,500 it is possible, when carrying out the work, a saving may be effected in the item of £25,750 allowed for stone in causeway; but no notice has been taken of this in the attached statements.

The Chairman, Public Works Committee.

I have, &c.,

1897.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

VACCINATION.

(REPORT FOR 1896.)

Presented to Parliament by Command.

Printed under No. 17 Report from Printing Committee, 26 August, 1897.

The Chief Medical Officer of and Medical Adviser to the Government to The  
Principal Under Secretary.

Sir,

Sydney, 14 August, 1897.

I have the honor to forward herewith, for the information of the Chief Secretary, the Annual Returns of Vaccinations performed during the year 1896 by the Government Vaccinators of New South Wales.

The returns show that 951 vaccinations were performed during the year, of which 945 were successful. Of the total number, 78 were performed in Sydney and its suburbs and 867 in country districts. It will be seen that public vaccination was performed in only 13 country districts. In about 100 districts in which there are Government Vaccinators no vaccinations have been reported, and it is presumed that none have been performed.

Of the successful cases, the patients in 60 were under 1 year; in 166 between 1 and 5 years; in 436 between 5 and 10 years; and in 283 upwards of 10 years of age. The unsuccessful cases were 6, or '63 per cent. of the whole number.

The number of births registered in the Colony during 1896 was 36,613, and the vaccinations give a percentage of 2.58 on this number. In addition to vaccinations performed by Government vaccinators, a number are performed by private practitioners; but of these no returns are made. There is reason to believe, however, that these cases would not add very materially to the percentage above given.

The Department continues to supply pure calf-lymph to legally qualified medical practitioners on application to the office. This calf-lymph has up to the present time been procured fortnightly from an establishment in New Zealand, and has been of satisfactory quality.

I have, &amp;c.,

J. ASHBURTON THOMPSON.

RETURN (No. 1) showing the number of Births during the past thirty-six years, and the number of Vaccinations performed by Government Vaccinators during the same period.

Year.	Births.	Vaccinations.	Proportion of Vaccinations to every 100 Births registered.	Year	Births.	Vaccinations.	Proportion of Vaccinations to every 100 Births registered.

1897.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

**BOARD OF HEALTH.**

(MEMORANDUM BY THE PRESIDENT OF THE, ON PREVENTION OF TUBERCULOSIS IN MAN AND IN CATTLE.)

*Printed under No. 22 Report from Printing Committee.***Memorandum by The President of the Board of Health on Prevention of Tuberculosis in Man and in Cattle.**

August, 1897.

It has already become generally known that tuberculosis or consumption is a disease common to man and some animals, that it is communicable from animals to man, and that man is liable to acquire it by eating the milk or flesh of consumptive beasts. The following case pointedly directs attention to the danger which the public, and especially children among them, run at present of catching consumption by means of milk.

2. On 1st June Mr. Veterinary Inspector Melhuish, M.R.C.V.S., made report to the Board of his annual inspection of dairies in a populous suburban district. He remarked of the district in general that the execution of the Act as regarded inspection of cows was "most perfunctory." He went on to mention especially the dairy of one X who had a herd of eighteen cows, and supplied a large number of customers with milk by retail. His premises were in good condition—well-paved, clean, safely connected with the sewers, and supplied by constant service with water from the mains only; but among the herd there was a cow "which was a most glaring case of disease. The animal had very extensive glandular swellings around the throat, the breathing could be heard some distance away, and on exertion there was a troublesome cough. The appearance was sufficient to justify any inspector in condemning her for dairy purposes. When the inspector of dairies to the local authority and I spoke to X about her condition, he stated that it happened about three weeks ago, and the swelling was produced by the kick of a horse. He fetched her from the paddock, and I examined her in the bail and condemned her. X said that the milk was mixed with that obtained from the other cows, and was distributed around. There is no doubt that this animal has been in this condition for several months, and it is hard to conceive how any man could be so depraved as to keep an animal in this condition in a dairy. He stated that he had had this cow for two years."

3. On 2nd June a letter was delivered to the clerk to the local authority, in which he was informed that this animal was obviously in the last stages of consumption, and should have been detected by the local inspector; that having been killed, its internal organs had been found riddled with tuberculous abscesses; and, as it had been long ill, that it was certain that the cow-shed had become infectious, and probably that other animals of the herd had acquired the disease. The likelihood that more or fewer children among X's customers had consequently been infected with consumption was mentioned; and the local authority was requested immediately to cancel X's registration, and to prevent him from trading until the premises had been cleansed and disinfected. X's name was forthwith erased from the register by the local authority, and in consequence he became unable to sell the milk of his herd to any person in any district whatever.

4. On 3rd June the required disinfection of the premises was begun under veterinary supervision, and the other seventeen cows were put to the tuberculin test. Six were found to react well, two indcisively. The value of the six animals having been agreed upon, in order that X might be compensated if any of them were found after death not to be diseased, they were slaughtered in presence of the Board's inspector and a veterinary surgeon acting in X's interests. All of them presented marked signs of consumption.

5. On 17th June the consumptive cows having been destroyed, and the premises cleansed and disinfected to satisfaction of the Board, the local authority was informed that X's name might be restored to the register, and resumption of business by him consequently allowed.

6. What is the nature and extent of the danger thus betokened? The report of the Royal Commission appointed to inquire into the effect of food derived from tuberculous animals on human health, which sat at Westminster, and reported in April, in 1895, furnishes the answer to this question; and it is only necessary to add that the conclusions drawn are at bottom matters of fact, that is to say, they rest on demonstrations furnished by a large number of trustworthy experimenters, who have worked during many years past in various parts of the world. In some lesser respects they are supported by consideration of a large body of evidence of other than experimental, but still of trustworthy kind.

7. The following is a very brief statement of some of the more important points mentioned in the evidence just referred to:—Consumption or tuberculosis is one and the same disease in man and in the food-animals. Every person who takes tuberculous matter into his body as food incurs some risk of acquiring consumption. Of the several forms of the one disease (tuberculosis) from which mankind suffer—consumption of the lungs, of the brain, of the bowels, and of glands or of joints—some are almost peculiar to children; and probably the proportion of persons who acquire consumption through food is larger among children than among their seniors (an opinion in accordance with the experience which shows that the young of all susceptible animals are especially easily infected by feeding them on the meat and milk of consumptive animals). Milch cows are especially liable to acquire tuberculosis; and to all the tuberculous among bovine animals, cows contribute the largest proportion. Thus there are two reasons why milch cows should be watched with great care; they are more likely to be tuberculous; children are easily infected by the milk of tuberculous cows. The conditions requisite to render the milk of consumptive cows infective to those who drink it is that the udder shall be affected. Affection of the udder is not peculiar to advanced stages of the disease, and occurs in mild cases. Nor can it always be easily detected; for “if reliance be placed on the general condition of the cow, and on physical examination of the udder, an accurate diagnosis of tubercular disease of the udder is not possible”; in other words, given a tuberculous cow (and, as will appear later, whether a bovine is tuberculous or not often cannot be determined by ordinary examination) the healthiness of its udder cannot be vouched for, although on physical examination it appears to be healthy. Besides that, disease of the udder sets in suddenly, and progresses with alarming rapidity; so that an udder thought to be healthy after a physical examination, may be seen to be obviously diseased at a second examination made only a fortnight later. Consequently “no tuberculous animal of any kind should be allowed to remain in a dairy. The milk of cows affected with tuberculosis of the udder possesses a virulence which can only be described as extraordinary”; that is to say, the infection is much more likely to take, and causes a form of the disease which runs a much more rapid course when animals are inoculated or fed with tuberculous milk than when they are inoculated or fed with tuberculous meat or tuberculous matter of other descriptions. Pigs are especially easily infected by feeding on tuberculous milk or meat. It is important to note this for two reasons: one has reference to the feeding of pigs on separated milk which is so common in this country, and to their being fed on the flesh of condemned, and consequently often tuberculous animals, which still is common though in course of prevention under the Noxious Trades and Cattle-slaughtering Act, which has lately been extended to apply to pig-keepers; the other is that it is possible by this means to produce in pigs, whose throats have specialities of construction in which they closely resemble the human throat, some of those slower forms of consumption which affect the throat of man; for thus is suggested “the possibility of widely different forms of human tuberculosis owning an origin in milk.” Lastly, “as to the proportion of tuberculosis acquired by man through his food, or through other means, we can form no definite opinion, but we think it probable that an appreciable part of the tuberculosis which affects man is obtained through his food.” To this it may be added that while it is generally considered that practically all the consumption of the bowels among children is due to tuberculous milk, it is also considered that consumption of parts of the body remote from those with which food comes into immediate contact are also often due to infection received through the bowels. These are the main facts now known concerning causation of this prevalent and fatal disease; they reveal a removable risk which all persons alike run at present. But all persons exposed to this risk do not surcumb, because the natural defences of the healthy body against infection are potent. Hence consumption is not so prevalent among raw-milk drinking children (for instance) as from the above facts might at first sight be expected. Yet those natural defences are weakened or lost during ill-health, or do not avail against large doses of the infection; and therefore, notwithstanding their usual efficiency, consumption is still very common among children. Adults, it must be repeated, have their share in this risk, though the lesser share; they are more liable to contract the disease from eating meat infected with tuberculous matter. The points of most importance in connection with the case of X’s dairy are that consumption is common among children; that the young, both of man and of the lower animals, are especially liable to acquire it from feeding on the milk of consumptive cows; and that consumption is entirely preventable, both among man and among animals.

8. All risk of infection by milk might be avoided by the simple expedient of never drinking uncooked milk; but in order to deprive it of its infective power it must be cooked with knowledge, care, and unflinching regularity. For this purpose Pasteurisation (though valuable with milk in other relations) is useless; raising the temperature of the milk to between 160° F. and 170° F. for a moment, in which the process of Pasteurisation consists, does not suffice to kill this infection. It can be killed with certainty if the milk be raised to 185° F., and kept at that temperature for five minutes. The simplest instruction is to raise it to boiling-point, and to keep it briskly bubbling for one minute; then it is quite safe. Easy to apply as this safeguard is in itself, however, it is likely that no considerable proportion of any population could be depended upon to boil all milk with scrupulous care and unflinching regularity before taking it; but there is no need in this matter to speculate on probabilities. The Board has accumulated a very considerable body of actual experience in connection with outbreaks of typhoid fever in earlier years, which, also, might have been prevented had all the milk been boiled; and the fact revealed by its inquiries seems to be that while scarcely one family in fifty even professes to boil its milk, still fewer boil it with a semblance of regularity. The meat of consumptive beasts may be spoken of in similar terms; if it were always thoroughly cooked—if it were always raised throughout its thickness to the temperature attained by the exterior in the course of roasting, for example—there would be no danger of contracting consumption from that source. But the necessary temperature is seldom attained towards the centre, either by roasting or boiling. Suppose, however, that meat and milk were always and regularly exposed to the temperature known to be necessary to kill this infection if it happened to be present in them, still the source of danger—presence of the disease among food-animals—would be left untouched; other precautions, therefore, must be taken, which shall have prevention of the disease at its origin for their object, that is to say, among the cattle at breeding stations.

9. Steady and determined attempts to prevent consumption among cattle have begun to be made but recently; and the reasons are two. First, the minute organism which is the actual or essential cause of the disease was discovered only in 1882. Until then, therefore, it was little more than an opinion that consumption was maintained and diffused by communication of one or other sort—direct or roundabout—  
between

between diseased animals and those which were still well; but as soon as the essential cause was discovered it became a matter, not of opinion and of strong probability, but of demonstration or of fact appreciable to the senses that the disease was spread by direct or by roundabout communication between the sick and the healthy. Merely to know that the disease spread by contagion, however, was not enough to permit effectual efforts to be made to prevent it, because of that peculiarity of consumption in cattle which has been alluded to above; namely, that the disease can take hold of a beast and progress to a serious extent before betraying its presence by obvious external signs. Consequently, as long as only ordinary means of detecting tuberculosis were at command, efforts to prevent its spread by separating the diseased from the healthy could not succeed; for although the obviously sick animals were separated from the rest, there would still remain a number really affected, and capable of communicating their disease, which perforce would not be detected. And, therefore, the second reason why systematic attempts to eliminate tuberculosis from herds have but lately become possible, is that the means of detecting the disease in its early stages have only been discovered recently, namely in 1891. In that year the injection of tuberculin as a test of freedom from consumption first began to be tried with cattle, and during three or four subsequent years its usefulness and trustworthiness for this purpose were thoroughly established. To-day tuberculin, used with certain precautions, is relied upon by breeders in all countries for this purpose; although, it should be added, it is not absolutely infallible.

10. At the present date, then, two things are known with certainty; first, that if an animal (whether man or other species) has consumption, it is because it has taken into its body the essential cause of that disease, *and taken it from some other animal already suffering*; secondly, that the fact of freedom from disease or (notwithstanding external appearances) of infection with it can be ascertained by injecting tuberculin, a proceeding which produces no important effect on healthy beasts. From these two items of knowledge, the breeder can draw all the procedure required to eliminate consumption from his herd. First, he must ascertain with tuberculin which of his herd are affected; then he must remove the affected from the healthy; lastly, he must never add fresh animals to his herd until they have been tested, and thus proved to be free from disease. These are the chief steps, stated very briefly; but there are others of importance. Consumption cannot appear unless the essential cause is taken into the body from some previously affected animal. That is invariably true; but it was remarked above of children that not all who drank infected raw milk contracted the disease, because a healthy body has certain natural powers of defence, a statement which applies also to lower animals. Consequently, the essential cause alone, though taken in, is not always sufficient to give the disease; and usually there must be present also some secondary causes. These are such as lower the general health; they are comprised under darkness, dampness, filth, want of ventilation, and improper or insufficient food. It is therefore necessary that both breeder and dairyman should take care that none of these foul conditions exist on their premises; and the first essential is that cow-sheds, bails, dairies, and other buildings used either for cows or to handle milk in shall be suitably designed, and constructed of materials, which, from their non-absorbent nature and comparatively smooth surface, can be kept clean with little trouble. This is one reason why the Board strongly objects to the use of wood for floors in dairies, bails, and cow-sheds. But there is still another qualifying circumstance which must be mentioned, and which has special importance in relation to cattle. It is, that if the essential cause be introduced by inoculation, even a healthy animal will succumb. If a healthy animal, unaffected by the secondary causes just mentioned, breathe in or swallow the essential cause, it still has many chances of conquering it, and of escaping; but if that cause be injected under the skin, for instance, then good health will stand in little stead, and it will almost certainly become ill. And therefore, when inoculating to protect against pleuro-pneumonia, care must be taken that the matter to be inoculated has been taken from a beast which was not suffering from tuberculosis, otherwise that disease may be communicated as well as the mild attack of pleuro it was intended to cause.

11. The ways in which consumption spreads which are of greatest practical importance may be summarised as follows, namely, as from man to man, from man to the lower animals, from lower animals to lower animals, and from lower animals to man.

- (1.) From man to man.—For all practical purposes the sole danger lies in careless scattering about by consumptives of their expectoration, which contains the essential cause of the disease; from drying of this, so that it can break up into dust, and float on the air; and from breathing into the lungs of this infective dust by people who are in such a state of health that the essential cause when thus breathed in can take root in their lungs, live, and grow there, and thus cause them to become consumptive.
- (2.) From man to animals.—Here again the danger of spreading lies in the expectoration of the consumptive man; but animals may either breathe it as dust or swallow it, and infection may consequently take place either by the lungs or by some part of the digestive tract. Dogs, cats, and fowls have been observed to become consumptive from swallowing the expectoration of consumptive man rather often; cows, on one or two occasions (their risks from this source being manifestly likely to be fewer than those of the other animals named).
- (3.) From lower animals to lower animals.—The ways are more varied, and should be more carefully considered. It is unnecessary to mention all of them; they include every chance by which the essential cause, thrown off from the body of a consumptive animal, can gain access to the body of a healthy animal, and the more obvious are the following:—In the first place the expectoration, saliva, &c., of consumptive animals is as infective as that of man; tuberculous bovines which are stalled, therefore, or fed out of the same manger or box, or which lick their calves, may communicate the disease either directly (by coughing, licking, &c.), or by depositing their expectoration on mangers, walls, &c., whence it can be either breathed in after drying, or swallowed by the healthy. Secondly, the infection can be communicated by means of milk to the calves; to pigs fed either on whole or separated milk derived in whole or in part from consumptive cows; and to others of the lower animals who get such milk. Here it is to be noted once more that young animals of all species are especially liable to acquire consumption from infective milk. Thirdly, communication can occur when healthy animals feed on the flesh of consumptive animals; consequently, pigs, dogs, cats, and fowls are likely to contract the disease in

this

this way.\* Fourthly, the influence of heredity, or of a consumptive bovine on its offspring cannot at present be exactly defined, but it is possible for a calf to be already infected when dropped. Heredity, therefore, has importance, and tuberculous animals should not be used for breeding.

- (4.) From lower animals to man. Here the danger of infection is practically confined to eating meat and milk produced by consumptive animals. Infection takes place by way of the digestive tract, but, as has already been remarked, the disease does not always develop at the point by which the infection entered. Without having done any damage at that place, it may reach other parts of the body and cause the first signs of illness to show themselves there. Once again, the young—whether infants and young children, or calves, &c.—are especially susceptible to infection by swallowing, the medium in their case being infected milk for the most part.

12. The scheme for preventing this disease can be deduced without difficulty from the foregoing facts. *In the case of man, isolation is unnecessary*, for man is an intelligent animal, and can be caused to take the small amount of trouble with his expectoration which is necessary to prevent risk to others; but periodical disinfection, cleansing, and thorough exposure to light of the quarters occupied by consumptives are necessary. *In the case of animals, on the contrary, separation of the sick from the healthy is an essential step in prevention*, for, of course, the lower animals are not intelligent in the present sense. For separation to be effectual, the disease must be detected early, and before it has proceeded so far as to be recognised by ordinary methods of examination. Tuberculin, used according to certain rules, must be employed for this purpose. No bovine which has not withstood the tuberculin test should be allowed to remain in the herd with healthy animals, should be allowed to suckle its own calf, should be used for breeding, should remain on dairy-farms or premises, nor should be used as a source of milk or meat, whether for human beings or for lower animals. After death, the bodies of infected animals must be safely disposed of either by burning or else by boiling-down at places to which no other live animals have access. Every time, after discovering an infected animal in a herd, the stalls, cow-sheds, bails, feeding-boxes, &c., must be very carefully cleansed and disinfected to prevent communication of the disease to the healthy in any of the roundabout ways already referred to.

13. It will now be apparent that prevention of that part of the incidence of consumption on mankind which is due to eating meat and milk produced by consumptive beasts is inextricably bound up with prevention of this disease among herds, and is only secondarily connected with inspection of dairies and slaughter-houses. That it can be entirely prevented among cattle has been proved by many individual breeders in different countries, who, acting on the lines indicated above, actually have eliminated it, and now possess herds which are free from tuberculosis. Those breeders can safely undertake to sell stock under the condition that every beast shall withstand the tuberculin test, and, in short, under a guarantee that every beast sold is free from consumption. This is a result of very great value to the public health, how great it is not possible at present to say exactly, but it has importance of another kind which concerns commerce, and which, practically, is not less worth attention. Stock-breeders and farmers have a direct personal interest in freeing their herds from tuberculosis; for this disease, though it progresses rather slowly, nevertheless causes cattle to die prematurely; and it is felt by all that the losses thus incurred, though they have never been estimated in this (nor, as far as information goes, in any other) country, must be great. They have also another direct interest, which is of even greater commercial importance. Sanitarians and breeders alike are now aware both that consumption is preventable among herds, and that the meat, milk, and butter produced from consumptive animals are sources of real danger to man; consequently, guarantees of the healthiness of the animals which have furnished the meat, butter, and milk which are offered for sale in the world's markets are being demanded by purchasers with more and more stringency day by day. At no great distance of time such products, when they are furnished from animals among whom consumption is known to be a rare disease will have a very great advantage over other such products derived from animals among which consumption is either known to be rife, or concerning which no good information is procurable. It only remains, then, to consider how the business of preventing tuberculosis among cattle can be best set going; for although self-interest is a powerful incentive, it often takes people long to learn where their profit truly lies.

14. It is convenient at this point to recapitulate the preventive measures already in force in New South Wales. In the first place, it has been shown that the public could protect themselves by very thorough cooking of meat and milk; but it has also been observed that this is not, and never could become, a good practical safeguard on the public scale. As regards milk, the Dairies Supervision Act, 1886, gives certain powers of inspection and control over dairies to local authorities, under supervision of the Board; and, as the case of X shows, those supervisory powers are exercised by the Board not only habitually but also promptly and effectively on special occasion appearing. But the occasion in that case (and in too many others) was detected by the Board's inspectors in course of execution of their annual supervision, and not, as it should have been, by the local authority in the course of its daily duties. Further, even if the action both of local authorities and of the Board as a supervising authority were continuous and always thoroughly efficient, still diseased cows would be constantly drafted to dairy herds from breeding stations. Those cows, if they were in the earlier stages of illness, would be used for production of milk, because their disease could be detected only by a rather lengthy process of testing; and thus there would be no end, neither to the labour of testing herds at individual dairies, nor yet to the losses which the dairymen would suffer in consequence. The case with animals used for food is slightly different.

\*Although pig-keeping (as has already been noted) and poultry-farming were declared noxious trades on 31st December, 1896, under the provisions of the Noxious Trades and Cattle-slaughtering Act, 1894, and although by by-laws framed to regulate those trades, it is illegal for any pig-keeper or poultry-farmer to receive on his premises any diseased animal or the body of any dead animal, the following events happened after condemnation of X's first, or obviously diseased, cow. X said he would send the animal to a boiling-down works, and this arrangement was considered satisfactory by the Board's veterinary inspector. But when the latter came to get the address of the man to whom it had been sold for 10s., and the next day went there to examine the carcase, it turned out that the premises were used not for boiling-down or fat-extracting but as a poultry-farm; and the veterinary inspector, accompanied by the inspector to the local authority in whose district the premises were situate, found the carcase partly cut up, and saw fowls, a dog, and a cat feeding upon it. The veterinary inspector then discovered that this poultry-farmer was trading illegally, without being licensed, for which he was subsequently prosecuted by the local authority and fined; and that this was the case was due to the neglect of the local authority to perform the duty cast upon them by the law. All the animals mentioned can acquire tuberculosis by feeding, although in the ordinary course of life they do not usually suffer, and fowls are food-bodies might very easily, and in such a neighbourhood very likely would, be eaten by pigs, which also can take the disease, and, again, are food-animals.

different. Under the Diseased Animals and Meat Act, 1892, the Noxious Trades and Cattle-slaughtering Act, 1894, and the several older Cattle-slaughtering Acts, the Board has legal powers which are sufficient to prevent diseased meat from entering into consumption; and here the labour of testing is not necessary, because the animals are to be killed, and disease can be easily detected by inspection of their carcasses. But, as matters stand at present, just as the cow-keepers losses from condemnation for tuberculosis would be continuous as long as diseased beasts were bred and sold to him, so the butcher's losses actually are continuous for that very reason. Probably all butchers would agree that the flesh of diseased animals is not suitable for the food of man, and that the flesh of tuberculous animals cannot be consumed by him without an appreciable direct risk to life; but, on the other hand, the loss caused by condemnations of diseased carcasses under the provisions of the laws mentioned fall upon them alone, and that they feel to be a hardship. It is the interest of every person concerned, of the public, the dairyman, butchers, agents, and all other middlemen, back to the breeder, to take steps to eliminate tuberculosis from herds, to prevent the disease itself. How can breeders in general be brought to take the necessary precautions?

15. Consideration of X's case furnishes a valuable hint. Six of his cows, it will be remembered, were apparently in average health; even a veterinary surgeon could not have told, or at all events could not have made sure, by ordinary methods of examination, that they were suffering from tuberculosis; and yet, as soon as they were suitably tested, it turned out that they were tuberculous—a conclusion which was amply supported as soon as their carcasses were examined after slaughter. Having lost six cows, X desired to supply their places, to do which he must go into the open market. There he would handle the stock for sale, and with every care would select six which were in apparent good health. But his recent experience had taught him that freedom from tuberculosis cannot be ascertained by inspection; and, consequently, he felt that, notwithstanding all his care, he might nevertheless buy beasts which were not sound. This being the case, what guarantee had he that officers of the Board might not visit him again after he had spent his money, and having used the tuberculin test condemn his new purchases? And, if that happened, what end could he force to his losses? This dilemma is unfair. Choice must be made between relinquishing attempts to protect the public health by withdrawing tuberculous beasts from the dairy, and making such systematic efforts to prevent the disease itself, as would not merely protect the public, but would largely benefit every branch of this business. There can be no doubt that the latter course will, and indeed, must be taken. X, and all dairymen, all butchers, and all breeders must be able to buy under a guarantee of freedom from tuberculosis. There seems to be only one way of effecting this: the sale of every bovine animal, and of every pig, though ostensibly "with all faults," must, nevertheless, be conducted legally, subject to an implied agreement that every such animal shall withstand the tuberculin test applied under conditions to be fixed. Gradually, under the necessity which would thus be imposed upon them, breeders would weed their herds, and in four or five years might and should be in a position to regard this legal condition with indifference, for it would by that time cease to operate against them. At the same date they would find that their prosperity had been materially enhanced and had become assured.

16. If this condition were imposed it would still be necessary to continue supervision over slaughter-houses and dairies; but the present methods require improvement. As regards slaughter-houses, the legal powers already conferred on local authorities and on the Board as the supervising authority are sufficient; but the circumstances under which much slaughtering is at present done are such as sometimes hinder efficient inspection. For the sake of the home trade—that is to say, for protection of the public health of the people of New South Wales, slaughtering for export being done already under convenient conditions—it is necessary that private slaughtering should be abolished as much as possible, and without exception at every considerable centre of population. With this object in view, and amendment of the Noxious Trades and Cattle-slaughtering Act, 1896, by which local authorities, alone or in combination, might erect a public slaughter-house at any convenient point within or outside their district, and by which the Board should have power as soon as such a public slaughter-house had been established to declare private slaughtering illegal thence forward within such radius as might be deemed by it to lie within reasonably easy reach of the public slaughter-house. No advantage has as yet been taken of this provision, which, it should be noted, is merely an improvement on powers granted by the principal Act so far back as 1894; and it has now become a question whether local authorities should not be obliged to establish public slaughter-houses on being required to do so by the Board. The investment (under a monopoly of slaughtering within the radius) would be safe and even remunerative unless it should be thought desirable to apply profits to reduce slaughtering fees; and it might be advisable to allow local authorities to borrow the required capital from the Government at a low rate of interest.

17. With the Dairies Supervision Act the case is a little different. Power to systematically test dairy herds with tuberculin should be explicitly given; and in case it should be thought at first sight that this (and the consequent destruction of some animals) might involve hardship, it is well to mention here that one of the large milk companies, which has its own circle of suppliers in country districts under contract with it, has made it a condition of contract already that every beast found by its inspector to be tuberculous shall forthwith be slaughtered, no compensation being paid to owners unless it is found after death that a mistake has been made, and that the animal was not diseased. This condition has so far been cheerfully accepted, and there is no reasonable doubt that it will continue to be accepted without demur, provided the dairymen find that they can supply the places of the slaughtered animals with sound stock, and thus in return for their losses find that they are gradually acquiring a herd entirely free from consumption; but very many of such dairymen are themselves breeders. It is therefore important that they should be made aware of the steps necessary to eliminate tuberculosis; and for that purpose it is essential that they should be systematically instructed. This is not practicable with the veterinary staff at present under control of the Board, and with those methods of inspection which, efficient as they are, were designed without special reference to the prevention of tuberculosis. Inspection, weeding out, and instruction in management and breeding so as to prevent consumption can only be given (a) by qualified veterinary surgeons who (b) shall be resident in the district of which they have charge. It should be made illegal to return to suppliers any separated milk from creameries, butter factories, &c., except after boiling it. It should be made illegal to inoculate for pleuro-pneumonia except with virus taken from animals ascertained to be free from tuberculosis. Lastly, the distribution of tuberculin should be in the hands of the Board, which alone can give the necessary guarantees of purity and efficiency; and it should be made illegal to use any that has not been approved by it.

### Commission.

VICTORIA, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen,  
Defender of the Faith, and so forth,—

To Our Trusty and Well-beloved:—

JOSEPH BARLING, Esquire, one of Our Justices of the Peace of Our Colony of New South Wales, Associate of the Institution of Civil Engineers, and Chairman of the Public Service Board;

TIMOTHY AUGUSTINE COGHLAN, Esquire, one of Our Justices of the Peace of Our said Colony and

GEORGE ALEXANDER WILSON, Esquire, one of Our Justices of the Peace of Our said Colony,—

Greeting:—

KNOW ye, That We, reposing great trust and confidence in your ability, zeal, industry, discretion, and integrity, do, by these presents, authorise and appoint you, or any two of you, as herein-after mentioned, to make a diligent and full inquiry into the management of the Marine Board of New South Wales, incorporated under the provisions of the Navigation Act of 1871, 35 Victoria No. 7, and to report whether, and if so by what means, that Department can be placed upon a more efficient and economical basis: And We do, by these presents, grant to you, or any two of you, at any meeting or meetings to which all of you shall have been duly summoned, full power and authority to call before you all such persons as you may judge necessary, by whom you may be better informed of the truth in the premises, and to require the production of all such books, papers, writings, and all other documents as you may deem expedient, and to visit and inspect the same at the offices or places where the same or any of them may be deposited, and to inquire of the premises by all lawful ways and means: And We do give you power, at your discretion, to procure such clerical and other assistance as you may deem necessary for enabling you duly to execute this Our Commission: And Our further will and pleasure is that you do, within three months after the date of this Our Commission, certify to Us, in the office of Our Chief Secretary, under your or any two of your hands and seals, what you shall find touching the premises: And We hereby command the said Marine Board and all persons employed by them, and all Government Officers and other persons whomsoever within Our said Colony, that they be assistant to you and each of you in the execution of these presents: And We appoint you, the said JOSEPH BARLING, Esquire, to be President of this Our Commission, which said Commission We declare to be a Commission for all purposes of the Act 44 Victoria No. 1, intituled "*An Act to regulate the taking of Evidence by Commissioners under the Great Seal.*"

In testimony whereof, We have caused these Our Letters to be made Patent, and the Great Seal of Our said Colony of New South Wales to be hereunto affixed.

Witness Our Right Trusty and Well-beloved Cousin, HENRY ROBERT, VISCOUNT HAMPDEN, Our Governor and Commander-in-Chief of Our Colony of New South Wales and its Dependencies, at Government House, Sydney, in New South Wales aforesaid, this fourth day of February, in the year of Our Lord one thousand eight hundred and ninety-seven, and in the sixtieth year of Our Reign.

By Deputation from His Excellency,

(L.S.)

FRED. A. DARLEY,  
Lieutenant-Governor.

By His Excellency's Command,

JAMES N. BRUNKER.

Entered on Record by me, in REGISTER OF PATENTS No. 18, page 309, this sixth day of February, one thousand eight hundred and ninety-seven.

For the Colonial Secretary and Registrar of Records,

CRITCHETT WALKER,  
Principal Under Secretary.

VICTORIA, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen,  
Defender of the Faith, and so forth,—

To our Trusty and Well-beloved—

JAMES POWELL, Esquire, one of Our Justices of the Peace of Our Colony of New South  
Wales,—

Greeting:—

WHEREAS by an instrument under the Great Seal of Our Colony of New South Wales, bearing date of the fourth day of February, one thousand eight hundred and ninety-seven, We did appoint certain gentlemen therein named to be Commissioners, to make a diligent and full inquiry into the management of the Marine Board of New South Wales, incorporated under the provisions of the Navigation Act of 1871, 35 Victoria No. 7, and to report whether, and if so by what means, that Department can be placed upon a more efficient and economical basis: And whereas it hath appeared to Us to be expedient to appoint an additional Commissioner: Now therefore know you, that We, of Our special grace, have thought fit to appoint, and do hereby appoint, you to be such additional Commissioner accordingly.

In testimony whereof, We have caused these Our Letters to be made Patent, and the Great Seal of Our said Colony of New South Wales to be hereunto affixed.

Witness Our Right Trusty and Well-beloved Cousin, HENRY ROBERT, VISCOUNT HAMPDEN, Our Governor and Commander-in-Chief of Our Colony of New South Wales and its Dependencies, at Government House, Sydney, in New South Wales aforesaid, this twenty-second day of March, in the year of Our Lord One thousand eight hundred and ninety-seven, and in the sixtieth year of Our reign.

(L.S.)

HAMPDEN.

By His Excellency's Command,  
JAMES N. BRUNKER.

Entered on record by me, in register of patents No. 18, page 369, this twenty-fourth day of March, one thousand eight hundred and ninety-seven.

For the Colonial Secretary and Registrar of Records,

CRITCHETT WALKER,

Principal Under Secretary.

---

ROYAL COMMISSION TO INQUIRE INTO THE MANAGEMENT OF THE MARINE  
BOARD OF NEW SOUTH WALES.

WHEREAS it is necessary to extend the time within which the Commissioners are to make their return in the above matter: Now therefore, I do hereby, with the advice of the Executive Council, extend the time within which the said Commissioners are to make such report for a period of three months,—to take effect from the 4th proximo.

Given under my hand, at Government House, Sydney, this twenty-sixth day of April, one thousand eight hundred and ninety-seven.

HAMPDEN.

By His Excellency's Command,

JAMES N. BRUNKER.

ROYAL

## ROYAL COMMISSION ON MARINE BOARD.

### MINUTES OF PROCEEDINGS.

The first meeting of the Royal Commission on Marine Board, was held at the offices of the Public Service Board, 50 Young-street, Sydney, at 12 o'clock noon, on Monday, 22nd March, 1897.

*Present* :—Mr. Joseph Barling, J.P., President, Messrs. George Alexander Wilson, J.P., and James Powell, J.P.

Captain Francis Hixson, R.N., President of the Marine Board of New South Wales, attended.

The President announced that this was a Commission appointed to make diligent and full inquiry into the management of the Marine Board of New South Wales, incorporated under the provisions of the Navigation Act of 1871, 35 Victoria, No. 7, and to report whether, and if so by what means, that Department can be placed upon a more efficient and economical basis; Mr. A. F. Basset Hull, would act as Secretary, and he would call upon him to read the Commission.

The Commission, dated the 4th February, and a letter from the Principal Under Secretary, accompanying the Commission, and dated the 9th February, 1897, were read by the Secretary.

The President announced that since the Commission had been issued, James Powell, Esq., J.P., had been added to the Commission.

Captain Francis Hixson, R.N., President of the Marine Board of New South Wales, was sworn, and examined.

The Commission, at 12:25 p.m., adjourned until Wednesday, the 7th April.

The second meeting of the Commission was held at the offices of the Public Service Board, Sydney, 7 April, 1897, at 2:15 p.m., on Wednesday, 7th April, 1897.

*Present* :—Mr. Joseph Barling, President, Messrs. T. A. Coghlan and James Powell.

The minutes of the previous meeting were read and confirmed.

The Secretary read the Commission appointing James Powell Esq., J.P., as an additional Commissioner.

The Secretary read an opinion given by the Crown Solicitor, upon the effect of the repeal of the Imperial Act 17 and 18 Vic., c. 104, upon the Navigation Act of 1871.

Certain correspondence was also read.

The examination of Captain Francis Hixson, R.N., President of the Marine Board, was continued.

The Commission, at 4:45 p.m., adjourned until 10 a.m. on Thursday, 8th April.

The third meeting of the Commission was held at the Offices of the Public Service Board, Sydney, 8 April, 1897, at 10:15 a.m. on Thursday, 8 April, 1897.

*Present* :—Mr. Joseph Barling, President, and Mr. James Powell.

The examination of Captain Francis Hixson, President of the Marine Board, was continued.

Captain Hixson produced certain returns.

The minutes of the previous meeting were read and confirmed.

The Commission, at 12:30 p.m., adjourned until Wednesday, 21 April, at 10 a.m.

The fourth meeting of the Commission was held at the offices of the Public Service Board, Sydney, 21 April, 1897, at 10 a.m. on Wednesday, 21 April, 1897.

*Present* :—Mr. Joseph Barling, President, Messrs. G. A. Wilson, T. A. Coghlan, and James Powell.

The minutes of the previous meeting were read and confirmed.

The President stated that the period granted for execution of the Commission would expire on the 4th proximo, and that in consequence of the Commissioners being engaged on other urgent matters, it would be necessary to ask for an extension of time, which, he suggested, should be for three months.

The suggestion meeting with the approval of the Commissioners, the Secretary was instructed to write to the Principal Under Secretary, requesting that the necessary steps be taken to secure such extension.

The Commission, at 10:15 a.m., adjourned until 10 a.m. on Friday, the 23rd April, 1897.

The fifth meeting of the Commission was held at the offices of the Public Service Board, Sydney, 23 April, 1897, at 10 a.m. on Friday, 23rd April, 1897.

*Present* :—Mr. Joseph Barling, President, Messrs. G. A. Wilson and James Powell.

The examination of Captain Francis Hixson, R.N., President of the Marine Board, was continued.

Commander George Sidney Lindeman, R.N., Secretary to the Marine Board of New South Wales, was sworn, and examined.

Mr. Francis Rule, Accountant of the Marine Board of New South Wales, was sworn, and examined.

The minutes of the previous meeting were read and confirmed.

The Commission, at 12:55 p.m., adjourned until 10 a.m. on Tuesday, the 27th April, 1897.

- 27 April, 1897. The sixth meeting of the Commission was held at the offices of the Public Service Board, Sydney, at 10.25 a.m. on Tuesday, 27th April, 1897.  
*Present* :—Mr. Joseph Barling, President, Messrs. G. A. Wilson, and James Powell.  
 The following witnesses were sworn, and examined :—  
 Captain James Edie, Government Shipping Master, Sydney.  
 Mr. William Douglas Cruickshank, Chief Engineer Surveyor, Marine Board.  
 Captain John Henderson Bedford, Examiner in Seamanship, Marine Board.  
 Mr. Lion Henry Walford, Tide Surveyor, Customs Department; and  
 Mr. William Hare, Clerk in the Registration of Shipping Branch, Customs Department.  
 Mr. Hare produced certain papers in connection with shipping registered at Sydney and Newcastle.  
 The minutes of the previous meeting having been read and confirmed, the Commission, at 1 p.m., adjourned until Wednesday, the 28th April, at 10 a.m.
- 
- 28 April, 1897. Seventh meeting. The Commission met at Circular Quay, at 10 a.m., on Wednesday, the 28th April, 1897, and proceeded by the Marine Board's steam launch, "Nea," to the lightship "Bramble," at Port Jackson Heads.  
*Present* :—Messrs. G. A. Wilson and James Powell.  
 Captain Joseph Leddra, Superintendent of the lightship "Bramble," was sworn, and examined.  
 After inspecting the lightship, the Commission proceeded to the pilot steamer "Captain Cook."  
 The following officers and members of the crew of the "Captain Cook" were sworn, and examined :—  
 Captain Joseph Creer, Master-in-charge of the Pilot Service;  
 Mr. Herbert Orton, cook and providore;  
 Captain James Fotheringham, chief officer;  
 Captain Andrew William Jack, senior pilot;  
 Mr. Edward Brodrick, chief engineer;  
 Mr. James Nuth, leading fireman;  
 Mr. George Avelar, seaman;  
 Mr. John Moncrieff, seaman; and  
 Mr. E. Stratton, seaman.  
 Statements were made by two representatives of the firemen.  
 The Commission, at 1.20 p.m., adjourned *sine die*.
- 
- 30 April, 1897. The eighth meeting of the Commission was held at the offices of the Local Marine Board, Newcastle, at 10 a.m. on Friday, the 30th April, 1897.  
*Present* :—Messrs. G. A. Wilson and James Powell.  
 The following witnesses were sworn, and examined :—  
 Captain Herbert Robert Cross, President of the Local Marine Board, Newcastle; Messrs. Duncan John McLean and Frank Gardner, members of the local Marine Board, Newcastle; and Captain Henry Newton, Harbour Master at Newcastle.  
 At 1 p.m. the Commission adjourned until 2.30 the same afternoon.  
 At 2.30 p.m. the Commission received a deputation from representatives of the commercial and shipping interests of Newcastle, who urged that a steam-pilot-boat be at once sent to Newcastle.  
 At 3.15 p.m. the members of the deputation withdrew.  
 The Commissioners then granted an interview to pilots Sweet and Morris, of the Newcastle Pilot Station, who asked that the anomalies in the salaries at present paid to the pilots be removed, by increasing the salaries paid to the junior pilots.  
 The Commission, at 3.45 p.m., adjourned until Saturday, 1st May.
- 
- 1 May, 1897. Ninth Meeting. The Commission met at 10.30 a.m. on Saturday, 1st May, 1897.  
*Present* :—Messrs. G. A. Wilson and James Powell.  
 Captain Henry Newton, Harbour-master at Newcastle, conducted the members of the Commission round the harbour in his launch, to view the general aspect of the harbour; and pointed out what might be done in the way of dredging and the construction of ballast jetties, &c., to provide increased accommodation for shipping.
- 
- 3 May, 1897. The tenth meeting of the Commission was held at the offices of the Local Marine Board, Newcastle, at 10 a.m. on Monday, 3rd May, 1897.  
*Present* :—Messrs. G. A. Wilson and James Powell.  
 The following witnesses were sworn, and examined :—  
 Mr. Thomas Brooks, Lloyd's Surveyor, Newcastle;  
 Mr. William B. Sharp, Shipping Agent and Colliery Shipping Manager, Newcastle;  
 Mr. Henry William Finch, Shipping Clerk to R. B. Wallace, Newcastle; and  
 Mr. George Melville, Assistant Harbour-master, Newcastle.  
 At 12 o'clock noon the Commissioners received a deputation representing the Chamber of Commerce, Newcastle, upon general matters appertaining to the Port of Newcastle, mainly as to the urgent necessity for a steam-pilot-boat.  
 The Commission, at 1 p.m., adjourned until 7.30 p.m. the same day.
-

The eleventh meeting of the Commission was held at the "Great Northern Hotel," Newcastle, at 3 May, 1897, 7.30 p.m. on Monday, 3rd May, 1897.

*Present*:—Messrs. G. A. Wilson and James Powell.

The Commissioners granted an interview to Messrs. William G. Adams, — M'Kinnon, and Roderick M'Leod upon the question of hours of duty, uniforms, and wages paid to the boatmen at Newcastle.

The Commission, at 8 p.m., adjourned *sine die*.

---

The twelfth meeting of the Commission was held at the offices of the Public Service Board, Sydney 19 May, 1897, at 2 p.m. on Wednesday, the 19th May, 1897.

*Present*:—Mr. Joseph Barling, President, and Messrs. G. A. Wilson and James Powell.

The following witnesses were sworn and examined:—

Mr. Joseph Henry Storey, J.P., merchant, and Chairman of the Underwriters' Association;

Captain James Fotheringham, Chief Officer of the Pilot steamer "Captain Cook" (second examination); and

Mr. John Lawrence, clerk to Harbour-master, Marine Board.

Letters from Mr. J. Vine Hall, Mr. T. R. Allt, and the Under Secretary for Finance and Trade were read and dealt with.

The minutes of the six previous meetings were read and confirmed.

The Commission, at 3.45 p.m., adjourned until Friday, 21st May, at 12 noon.

---

The thirteenth meeting of the Commission was held at the offices of the Public Service Board, 21 May, 1897, Sydney, at 12.10 p.m. on Friday, 21st May, 1897.

*Present*:—Mr. Joseph Barling, President, and Messrs. G. A. Wilson and James Powell.

The following witnesses were sworn and examined:—

Mr. Thomas Robert Allt, J.P., Chairman of the North Coast Steam Navigation Company (Limited);

Mr. Francis John Thomas, Manager of the Newcastle and Hunter River Steamship Company (Limited); and

Mr. John See, M.L.A., merchant, and Director of the North Coast Steam Navigation Company (Limited).

A letter from Mr. B. B. Nicoll, with reference to his giving evidence before the Commission, was read, and the Secretary was instructed to arrange with Mr. Nicoll for a time that would be mutually convenient.

The minutes of the previous meeting were read and confirmed.

The Commission, at 3.55 p.m., adjourned *sine die*.

---

The fourteenth meeting of the Commission was held at the lighthouse, Yamba, Clarence River, at 30 May, 1897, 3.30 p.m. on Sunday, 30th May, 1897.

*Present*:—Messrs. G. A. Wilson and James Powell.

Mr. Henry M'Auley, pilot at Yamba, was sworn, and examined.

The Commission, at 4 p.m., adjourned *sine die*.

---

The fifteenth meeting of the Commission was held at the Court-house, Ballina, at 12 noon on 1 June, 1897, Tuesday, 1st June, 1897.

*Present*:—Messrs. G. A. Wilson and James Powell.

Mr. Robert Adie Fraser, pilot at Ballina, was sworn, and examined.

The Commission, at 12.30 p.m., adjourned until 2.30 p.m. the same day.

---

The sixteenth meeting of the Commission was held at the office of the District Engineer, Harbours and Rivers Department, Ballina, at 2.30 p.m. on Tuesday, 1st June, 1897.

*Present*:—Messrs. G. A. Wilson and James Powell.

Mr. Thomas William Keele, District Engineer, Harbours and Rivers Department, Ballina, was sworn, and examined.

The Commission, at 2.45 p.m., adjourned *sine die*.

---

The seventeenth meeting of the Commission was held at the "Freemason's Hotel," Lismore, at 2 June, 1897, 8 p.m. on Wednesday, 2nd June, 1897.

*Present*:—Messrs. G. A. Wilson and James Powell.

Mr. J. F. O'Flynn, Mayor of Lismore, was sworn, and examined.

The Commission, at 9 p.m., adjourned *sine die*.

---

The eighteenth meeting of the Commission was held at the "Australian Hotel," Tweed Heads, at 5 June, 1897, 7.45 p.m. on Saturday, 5th June, 1897.

*Present*:—Messrs. G. A. Wilson and James Powell.

Mr. William MacGregor, pilot at Tweed Heads Station, was sworn, and examined.

The Commission, at 8.45 p.m., adjourned *sine die*.

---

18 June, 1897. The nineteenth meeting of the Commission was held at the offices of the Public Service Board, Sydney, at 2 p.m. on Friday, 18th June, 1897.

*Present*:—Mr. Joseph Barling, President, and Mr. Powell.

The following witnesses were sworn and examined:—

Mr. Frederick William Jackson, Manager of the Union Steamship Company of New Zealand;  
 Captain Francis Hixson, R.N., President of the Marine Board (second examination);  
 Captain Henry Pettit, Harbour-master, Marine Board;  
 Captain Frederick Bracegirdle, Assistant Harbour-master, Marine Board;  
 Captain Thomas Robertson Thompson, Assistant Harbour-master, Marine Board; and  
 Captain Alexander Sangster, Water Bailiff and Inspector of Shipping, Marine Board.

The Secretary was instructed to summon several owners of sailing vessels trading to the northern rivers for the next meeting.

The minutes of the six previous meetings were read and confirmed, and the Commission, at 5 p.m., adjourned until Monday, 28th June.

28 June, 1897. The twentieth meeting of the Commission was held at the offices of the Public Service Board, Sydney, at 10.30 a.m. on Monday, 28th June, 1897.

*Present*:—Mr. Joseph Barling, President, and Messrs. G. A. Wilson and James Powell.

The following witnesses were sworn and examined:—

Mr. Bruce Baird Nicoll, merchant, and formerly owner of steamers trading to the northern rivers;  
 Mr. Alfred William Meeks, of Messrs. Gibbs, Bright, and Co., & Chairman of the Chamber of Commerce;

Mr. Alfred Settree, merchant, and owner of sailing vessels trading to the northern rivers.

Mr. Alfred Langley, merchant, and owner of sailing vessels trading to the northern rivers; and

Mr. George de Frainc, owner of the subsidised steam-tug at Camden Haven.

A letter from Mr. Henry Selfe, Engineer Surveyor, Marine Board, relating to an economical method of lighting the entrance to Sydney Heads, was read, and the Secretary was instructed to summon Mr. Selfe for the next meeting of the Commission.

A letter from the Secretary of the Chamber of Commerce, Newcastle, with reference to a system of signalling vessels entering and leaving the Port of Newcastle, was read, and the Secretary was instructed to prepare copies of evidence, correspondence, and papers relating to the matter, and already in the hands of the Commission, for consideration at the next meeting, and to summon Captain Hixson to give evidence on the question.

The minutes of the previous meeting were read and confirmed.

Arrangements were made for a visit to the Macquarie light at South Head on Friday, 2nd July, and to the pilot station at Wollongong on Saturday, 3rd idem.

The Commission, at 12.45 p.m., adjourned until Thursday, 1st July, at 2 p.m.

1 July, 1897. The twenty-first meeting of the Commission was held at the offices of the Public Service Board, Sydney, at 2.15 p.m. on Thursday, 1st July, 1897.

*Present*:—Mr. Joseph Barling, President, and Messrs. G. A. Wilson and James Powell.

The following witnesses were sworn and examined:—

Mr. Cecil West Darley, J.P., Engineer-in-Chief, Public Works Department;

Mr. Henry Selfe, Engineer Surveyor, Marine Board;

Captain Francis Hixson, R.N., President of the Marine Board (third examination); and

Captain William Newton, Inspector of Shipping, Marine Board.

The Secretary reported that, acting under instructions from the President, he had written to Captain Hixson, President of the Marine Board, requesting him to intimate to the Wardens of the Marine Board that this Commission would be glad to take any evidence they might desire to tender. A reply had been received from the Secretary of the Marine Board stating that the Wardens had no wish to see the Commissioners.

The minutes of the previous meeting were read and confirmed.

The Commission, at 4.15 p.m., adjourned until the following day.

2 July, 1897. The twenty-second meeting of the Commission was held at Sydney at 10.30 a.m. on Friday, 2nd July, 1897.

*Present*:—Messrs. G. A. Wilson and James Powell.

The Commission proceeded to South Head, and there inspected the Macquarie light, the Hornby light, and the signal station.

The Commission, at 3 p.m., adjourned until the following day.

3 July, 1897. The twenty-third meeting of the Commission was held at the Custom House, Wollongong, at 11 a.m. on Saturday, 3rd July, 1897.

*Present*:—Mr. Joseph Barling, President, and Mr. James Powell.

The following witnesses were sworn and examined:—

Mr. Andrew Thompson, Pilot and Harbour master, Wollongong; and

Mr. Edmund Potts, Customs Officer, Wollongong.

Port Kembla was visited,

The Commission, at 12.30 a.m., adjourned *sine die*.

The twenty-fourth meeting of the Commission was held at the offices of the Public Service Board, 5 July, 1897. Sydney, at 12 noon, on Monday, 5th July, 1897.

*Present*:—Mr. Joseph Barling, President, and Messrs. G. A. Wilson and James Powell.  
Mr. Thomas Martin Davis, M.L.A., was sworn, and examined.  
The Commission, at 1.30 p.m., adjourned *sine die*.

The twenty-fifth meeting of the Commission was held at the offices of the Public Service Board, 9 July, 1897. Sydney, at 10.15 a.m., on Friday, 9th July, 1897.

*Present*:—Mr. Joseph Barling, President, and Messrs. G. A. Wilson and James Powell.  
The minutes of the four previous meetings were read and confirmed.  
A letter from Mr. Francis Buckle, intimating that he would be glad to give evidence, was read, and the Secretary was instructed to summon Mr. Buckle for Monday, 12th July, at 10 a.m.  
Mr. Robert Rowan Purdon Hickson, Under Secretary for Public Works, was sworn, and examined.  
The Commissioners then proceeded to consider their Report.  
Arrangements were made for inspection of the hulks "Tinonee" and "Argo" the same afternoon.  
The Commission, at 12 noon, adjourned until 2.30 p.m. the same day.

The twenty-sixth meeting of the Commission was held at Sydney, at 2.30 p.m. 9 July, 1897.

*Present*:—Mr. Joseph Barling, President, and Messrs. G. A. Wilson and James Powell.  
The Commissioners proceeded by launch to Kerosene Bay and Johnstone's Bay, and viewed the hulks "Tinonee" and "Argo," both of which were found to be in a totally unseaworthy condition.  
The Commission, at 4 p.m., adjourned until Monday, 12th July, at 10 a.m.

The twenty-seventh meeting of the Commission was held at the offices of the Public Service Board, Sydney, at 10 a.m. on Monday, 12th July, 1897.

*Present*:—Mr. Joseph Barling, President, and Messrs. G. A. Wilson and James Powell.  
Mr. Francis Buckle, owner of the subsidised steam-tugs at the Bellinger, Nambucca, and Macleay Rivers, and at Port Macquarie, was sworn, and examined.  
Mr. Buckle was asked to prepare certain estimates in regard to the tug service, and his examination was adjourned until the 14th July.  
The Commissioners then further considered their Report.  
The minutes of the two previous meetings were read and confirmed.  
The Commission, at 11.20 a.m., adjourned until Wednesday, 14th July, at 10 a.m.

The twenty-eighth meeting of the Commission was held at the offices of the Public Service Board, Sydney, at 10 a.m. on Wednesday, 14th July, 1897.

*Present*:—Mr. Joseph Barling, President, and Messrs. G. A. Wilson and James Powell.  
The examination of Mr. Francis Buckle was concluded.  
The minutes of the previous meeting were read and confirmed.  
A letter from Captain Hixson, R.N. President of the Marine Board, with reference to the suggested fixed light at the Sow and Pigs, was read and received.  
The Commissioners then proceeded to further consider their Report.  
The Commission, at 12 noon, adjourned until Friday, 16th July, at 10 a.m.

The twenty-ninth meeting of the Commission was held at the offices of the Public Service Board, Sydney, at 11.30 a.m., on Friday, 16th July, 1897.

*Present*:—Mr. Joseph Barling, President, and Messrs. G. A. Wilson and James Powell.  
The minutes of the previous meeting were read and confirmed.  
The Commissioners further considered their Report.  
The Commission, at 12.30 p.m., adjourned until Tuesday, 20th July, at 10 a.m.

The thirtieth meeting of the Commission was held at the offices of the Public Service Board, Sydney, at 10.5 a.m., on Tuesday, 20th July, 1897.

*Present*:—Mr. Joseph Barling, President, and Messrs. G. A. Wilson and James Powell.  
Captain Angel Cooper Turner, Managing Director of the Illawarra Steam Navigation Company, was sworn, and examined.  
The minutes of the previous meeting were read and confirmed.  
A letter from Mr. Alfred Setttee, asking that certain portions of his evidence be omitted, was read.  
Agreed to.  
Mr. Alfred Langley having added some remarks in revising the copy of his evidence, it was decided to treat such remarks as a letter.  
The Commissioners then proceeded to further consider their Report.  
The Commission, at 11.10 a.m., adjourned until Friday, 23rd July, at 10 a.m.

The thirty-first meeting of the Commission was held at the offices of the Public Service Board, Sydney, at 10.15 a.m. on Friday, 23rd July, 1897.

*Present*:—Mr. Joseph Barling, President, and Messrs. G. A. Wilson and James Powell.  
The minutes of the previous meeting were read and confirmed.  
The Commissioners considered and adopted their Report.  
The Commission, at 11.45 a.m., adjourned until Monday, 26th July.

6 July, 1897. The thirty-second meeting of the Commission was held at the offices of the Public Service Board, Sydney, at 10 a.m. on Monday, 26th July, 1897.

*Present*:—Mr. Joseph Barling, President, and Messrs. G. A. Wilson and James Powell.

The minutes of the previous meeting were read and confirmed.

Certain portions of the Report were reconsidered and amended.

The Commission, at 11:50 a.m., adjourned until the following day, at 10 a.m.

---

27 July, 1897 The thirty-third meeting of the Commission was held at the offices of the Public Service Board, Sydney, at 10 a.m. on Tuesday, 27th July, 1897.

*Present*:—Mr. Joseph Barling, President, and Messrs. G. A. Wilson and James Powell.

The minutes of the previous meeting were read and confirmed.

The Report was finally adopted.

The proceedings of the Commission terminated at 10:40 a.m.

---

ROYAL COMMISSION ON MARINE BOARD.

REPORT.

To His Excellency the Right Honorable Henry Robert, Viscount Hampden,  
Governor and Commander-in-Chief of the Colony of New South Wales  
and its Dependencies.

MAY IT PLEASE YOUR EXCELLENCY,—

We, the Commissioners appointed by your Excellency on the fourth day of February, and the twenty-fourth day of March, 1897, to make a diligent and full inquiry into the management of the Marine Board of New South Wales, incorporated under the provisions of the Navigation Act of 1871, 35 Vic. No. 7, and to report whether, and, if so, by what means, that Department can be placed upon a more efficient and economical basis, have the honor to submit the following Report:—

1. Owing to the important and extensive nature of the inquiry, the necessity for visiting and inspecting distant branches of the Marine Board Department within the Colony, and also to your Commissioners being engaged upon other urgent matters, it became necessary to request an extension of the time granted within which to make a report, and Your Excellency was pleased, on the 26th day of April, to grant an extension to the 4th day of August, 1897. Extension of time for report.

2. Our investigation was commenced as early as practicable. Thirty-three meetings were held, 20 in Sydney, and 13 at Newcastle and the more important pilot stations on the coast. Fifty-four witnesses have been examined, and considerable time has also been spent by us, together or separately, in visiting the offices and branches of the Marine Board in the country as well as in Sydney, in order to gain a clear insight into the system and working of the Department, and matters appertaining thereto. Extent of investigation; meetings held, and number of witnesses examined.

3. We have to acknowledge the willing testimony given by a number of gentlemen of extensive shipping and commercial experience, whose valuable evidence has enabled us to frame many of the recommendations embodied in this Report. In response to a letter intimating to the Wardens of the Marine Board that your Commissioners would be glad to take any evidence they might desire to tender in the matter of this inquiry, the following reply was received:—"That they have administered their Department according to law; and they have no wish to see the Commissioners in respect thereto, unless it is necessary to meet any charges that have been made against them." Willing evidence given by commercial and shipping representatives; and attitude of Wardens of the Marine Board.

4. Under authority of the Navigation Act of 1871, the Marine Board of New South Wales is incorporated by the Governor by Letters Patent under the Seal of the Colony. The Board consists of seven members, viz., a President and six Wardens. The President and three Wardens are appointed by the Governor, and the other three Wardens are elected for a term of three years, and are eligible for re-election. The election of Wardens is directed to take place on the first Monday in April in every third year. The qualification of an elector is the registered ownership of foreign-going or coast-trade ships employed in trading without or within the jurisdiction, Constitution and powers of the Marine Board under 35 Vic. No. 7. Sec. 5. Sec. 8. Sec. 9.

jurisdiction, registered at the port of Sydney, or at any other port in the Colony. For not less than—

100 tons,	such elector has	1 vote for each	Warden.
250	„	2 votes	„
450	„	3	„
750	„	4	„
1,100	„	5	„
1,500	„	6	„

and one vote for every 500 tons over 1,500, but the number of votes may not exceed ten for any one Warden.

Sec. 14. An elective Warden must be a qualified elector, and also the registered owner of not less than 250 tons of foreign-going or coast-trade shipping registered in New South Wales.

Secs. 87, 88. In cases of alleged incompetency or misconduct of any master, mate, or engineer, or of shipwreck, collision, or other casualty the Marine Board may institute an investigation or direct a local Marine Board to institute the same. The local Marine Board must have the assistance of a local Stipendiary Magistrate, or, if none, a competent legal assistant. Where there is no local Marine Board, or where the local Marine Board is unwilling to investigate, power is given to the Marine Board to direct an investigation to be instituted before two Justices of the Peace or a Stipendiary Magistrate. This power, we are informed, has never been exercised, all investigations having been conducted either by the Marine Board at Sydney, or the local Marine Board at Newcastle.

Comparison of constitution and powers of Marine Board with those of Great Britain and Australasian Colonies. 5. In support of our principal recommendation hereinafter contained, we venture to give a brief outline of the present constitution and powers of Marine Boards and Courts of Marine Inquiry in Great Britain and the Australasian Colonies.

57 and 58 Vict., c. 60. Sec. 464. Sec. 465. (a) In the United Kingdom, under the Merchant Shipping Act, 1894, in cases of marine casualty involving loss or abandonment of or damage to ships, or loss of life, a preliminary inquiry may be held by the inspecting officer of the coastguard or chief officer of customs residing at or near the place where the casualty occurs, or by any person appointed for the purpose by the Board of Trade.

Sec. 466. Where it appears necessary to such authorised person, he may apply to a Court of summary jurisdiction to hold a formal investigation. A Wreck Commissioner, appointed under the Act, may hold such investigation with the assistance of one or more assessors of nautical engineering or other special skill or knowledge, to be appointed out of a list of persons approved for the purpose by a Secretary of State, such list of assessors to be in force for three years only. Where the investigation involves cancelling or suspension of certificate, the Court shall have the assistance of not less than two assessors. The Court shall, after hearing, report to the Board of Trade.

Sec. 471. For inquiries into the alleged incompetency or misconduct of the holder of a certificate, the Board of Trade may appoint a person or direct a local Marine Board to hold the inquiry. The local Board shall hold the inquiry with the assistance of a Stipendiary Magistrate or competent legal assistant appointed by the Board of Trade, to which body report must be made. The Lord Chancellor may appoint a wreck commissioner or commissioners, so that there shall not be more than three at any one time. A Court of Survey, consisting of a Judge, sitting with two skilled assessors, may survey any ship, inspect and report upon the machinery, equipment, cargo, &c., release or detain the ship, and report to the Board of Trade.

41 Vic. No. 3. Sec. 5. Sec. 37. (b) In Queensland, under the Navigation Act of 1876, the Marine Board is appointed by the Governor, and consists of a Chairman and four other members, such Chairman being the Portmaster of the Colony for the time being. The Board may themselves investigate, or may cause an investigation to be held by Justices, in any case of wreck or casualty to vessels, and incompetency of master, mate, or engineer.

(c)

- (c) In South Australia, under the Marine Board and Navigation Act, 1881, the Governor is empowered to appoint eight persons to be President and first Wardens, the latter to hold office for three years, and, at the expiration of that time, to appoint seven persons to be Wardens, to hold office for three years. Of these seven Wardens, one is nominated by the South Australian Chamber of Commerce, one by the Adelaide Underwriters' Association, and two by the owners of ships registered at any port of registry in the province, who have votes at the nomination of a Warden as follows:—

50 tons, 1 vote ;

250 tons, 2 votes ; and for additional tonnage in the same proportion as in New South Wales. An elective Warden must be a qualified elector and the registered owner of 100 tons of shipping.

A Court of Marine Inquiry is constituted, consisting of the Judges of the Supreme Court of the Province, all Special Magistrates of the Province, and nautical or engineering assessors appointed by the Governor from a list of persons approved of as eligible, and furnished from time to time by the Marine Board.

The Court of Marine Inquiry is authorised to make inquiry into charges of incompetency or misconduct, and also as to shipwrecks and other casualties affecting ships; and for such purposes a quorum of the Court shall consist of a Judge of the Supreme Court with two assessors, or a Special Magistrate with two assessors, according to the nature of the Inquiry.

- (d) In Victoria, the Marine Act, 1890, constitutes a Board consisting of twelve persons, three to be appointed by the Governor, two to be elected by merchants and traders, one by underwriters, two by owners of ships registered in Victoria, one by Port Phillip pilots, one by masters, one by certificated engineers, and one by seamen. The Governor has the power of appointment of President and Vice-President from among the members. The registered owner of ships registered in Victoria of not less than 30 tons has one vote in respect of every 30 tons owned, but the number of votes is not to exceed three. The Board makes preliminary inquiries into wrecks, casualties, &c., and reports to the Court of Marine Inquiry, which consists of the Police Magistrates of Victoria and any number of persons, not exceeding ten, possessed of nautical, engineering, or other special skill, appointed by the Governor. The Court of Marine Inquiry is authorised to hold investigations into all cases so reported; and a quorum of such Court shall consist of one or more Police Magistrates and two skilled members, such members to be nautical or engineering or other specially skilled members, according as the investigation is into a charge against a master or engineer, or into some matter requiring special skill or experience, respectively.

- (e) In Tasmania, under the Marine Boards Act, 1857, the Governor in Council is empowered to establish Marine Boards in Hobart and Launceston, having control of ports, wharves, &c., and all other executive matters within their respective jurisdiction. Local Boards may also be established at out-ports.

By two separate Acts passed in 1885 and 1886 the number of Wardens of the Hobart and Launceston Marine Boards was increased to nine in each case. Two Wardens are appointed by the Governor, two are nominated by the Municipal Councils, and two by the Chambers of Commerce, in each city respectively, while the Mayor, the Collector of Customs, and the Chairman of the Chamber of Commerce are *ex officio* Wardens.

The Enquiry into Wrecks Act, 1874, provides that in all cases of marine casualty involving loss of or damage to ships, or loss of life, the principal officer of Customs, or an officer appointed by him, may make an inquiry, and, either with or without such inquiry, may apply to any two Justices of the Peace or to a Police Magistrate to hear the case. Such Justices or Magistrate may cancel or suspend any certificate.

(f)

42 Vic., No. 35.

41 Vic., No. 54.  
Sec. 237.

Sec. 241.

Sec. 244.

60 Vic. No. 37.  
Sec. 3.Judicial functions  
generally separated  
from executive.Desirability of  
adopting the same  
system.Insufficient  
qualifications of  
certain elective  
Wardens.Small interests re-  
presented by elective  
Wardens.

(f) In New Zealand the executive functions are carried out by local governing bodies, styled "Harbour Boards," and under the Shipping and Seamen's Act, 1877, in cases of shipping casualties, &c., the Collector of Customs, or any other person appointed by the Minister for the purpose, may make a preliminary inquiry into such casualty, and, with or without such preliminary inquiry, may apply to any two Justices or to a Resident Magistrate to hold a formal investigation. Such Justices or Magistrate shall have the assistance of an assessor or assessors of nautical, engineering, or other special skill or knowledge, to be appointed by them for the purpose. The said Justices or Magistrate, subject to confirmation by the Governor, may cancel or suspend the certificate of any master, mate, or engineer. Where such investigation is likely to involve cancellation of a certificate, one of the assessors to be appointed shall be a person having experience in the merchant service. In 1896 the Shipping and Seamen's Act Amendment Act provided that where any investigation relates to a steamship casualty, and a question may arise affecting the engine department or a person employed therein, at least one of the assessors must hold a first-class engineer's certificate.

6. From this *resumé* of the practice at the present day obtaining in Great Britain, and in the Australasian Colonies other than New South Wales, it will be seen that in all cases, with a partial exception in the case of Queensland, the judicial functions now exercised by the Marine Board of New South Wales are entirely separated from the executive or administrative functions properly devolving upon a Marine Board, and are carried out by a legally qualified Court, duly constituted by Statute, provided over by a Judge, Commissioner, Magistrate, or Justices, assisted by assessors of nautical, engineering, or other special skill.

7. We cannot too strongly express our opinion as to the desirability of adopting the system so universally in vogue, and we are moved in no small measure to make this recommendation by our sense of the inadvisability of placing the judicial control in the hands of gentlemen whose ordinary avocations may bring them into business relations with persons upon whose conduct they are called upon to pass judgment.

We do not desire in any way to reflect upon or impugn the perfect impartiality of the members of the Marine Board, but as a question of principle, we feel that there should be no possible ground upon which complaint of supposed bias could be founded. We are of opinion that if the private interests of any member of a Board exercising judicial functions might in any way conflict with his public duties, such interests form an insurmountable bar to his proper qualification for the performance of such duties.

8. One of the qualifications required by section 14 of the Navigation Act for an elective Warden is the ownership of 250 tons of coast-trade or foreign-going shipping registered in this Colony. We have ascertained that two of the present elective Wardens based their claim to such qualification upon the ownership of the ships "Tinonce" and "Argo." Both of these vessels are, and have been for upwards of two years, mere hulks, that under no imaginable circumstances could be considered as seaworthy, or even capable of being put into that condition, short of entire reconstruction. We understand that the Wardens referred to have, since this inquiry was commenced, obtained the necessary qualification by purchase.

9. With regard to the present elective system, there is still another point to be taken into consideration, viz., the very small maritime interests represented directly by the elective Wardens. They are elected by the owners of locally registered shipping, of which the aggregate annual tonnage entering the ports of the Colony does not exceed 100,000 tons; while intercolonial and foreign shipping, amounting to over one and half million tons annually, is absolutely without direct representation on the Board, although the officers in charge of the vessels are all subject to its judicial control. In cases of collision between locally registered and foreign ships, the question of conflicting interests at once arises, and a most undesirable state of affairs is brought about.

If

If the present system of vesting the judicial control in an elective Board were to be continued, it is clear that every interest should be represented; but, as already pointed out, your Commissioners hold that the whole principle is entirely wrong, and the judicial functions should be carried out by a Bench which would be far above all conflicting interests. This view is supported by the general consensus of opinion expressed by the witnesses examined in this Inquiry, who, in fact, are almost unanimous upon the point, although they represent widely differing interests.

10. In view of the evidently obsolete and undesirable constitution of the present Marine Board, we unhesitatingly recommend that the whole of the judicial functions now carried out by that Board should be vested in a Court of Marine Inquiry, presided over by a District Court Judge, assisted by two or more assessors of nautical, engineering, or other special skill or knowledge, who shall be nominated by the Government and paid by fees. This Court should be invested with power to inquire into and adjudicate upon all marine casualties, misconduct, &c., under sections, 87, 88, 89, and 90 of the Navigation Act, involving collision, loss or abandonment of ships, or loss of life. A duly authorised registered list of such assessors should be prepared annually, from which a panel could be selected by the Judge for each inquiry. The list should be published or exhibited, in order that the parties interested may have an opportunity of exercising the right of challenge.

Judicial functions should be carried out by Court of Marine Inquiry.

Your Commissioners do not think that the additional work thus thrown upon the District Court Judges would necessitate the appointment of another Judge. The number of inquiries into marine casualties and charges of misconduct held by the Marine Board at Sydney, during the period of five years from 1892 to 1896 inclusive, was 92, or an average of a little over 18 per annum. These inquiries occupied the Marine Board at 220 sittings, or an average of 44 per annum. Of these sittings, however, a considerable proportion were merely formal meetings for the purpose of delivering reserved judgments. During the past ten years 65 inquiries have also been held at Newcastle.

The system recommended would be of very great advantage from the facilities which would be afforded for conducting an Inquiry in any part of the Colony where it might be required, and where witnesses could be at once obtained, thus effecting a saving both of time and expense.

11. The executive or administrative functions of the Marine Board, consisting of the collection and disbursement of moneys, issue of certificates and licenses, inspection of ships and machinery, control of the Pilot Service, management of light-houses and lightships, care of harbours, beacons, buoys, and signals, and all other administrative details, should be placed under the control of an Advisory Board, consisting of three members—a Superintendent of Harbours, Lights, and Pilots, as Chairman, who shall perform the Departmental duties now devolving upon the President of the Marine Board; the Shipping Master, and the Engineer Surveyor to be *ex officio* members. This Board should meet as often as occasion may require for the issue of certificates and the performance of other matters of executive detail now performed by the Marine Board.

Advisory Board to be appointed to perform executive functions.

12. In connection with the foregoing recommendations we quote the following salient points of evidence:—

Salient points of evidence.

*A. W. Meeks, Esq.*, Chairman of the Chamber of Commerce, said:—"The present Constitution is wrong in principle. I doubt whether a Marine Board is wanted. The administration is really in the hands of the President and Secretary; the other gentlemen on the Board are only for inquiries about disaster, &c., which would be better dealt with by a Judge or Magistrate as Chairman, and such assessors as the case might require. I would advise the nomination of a formal panel, and take them in rotation as the Judge might require their services."

*F. W. Jackson, Esq.*, Manager of the U.S.S. Co. of N.Z.:—"A Board presided over by a competent legal authority, say, a District Court Judge, with selected assessors, would be a much more satisfactory tribunal than the present."

*John See, Esq., M.L.A.*:—"The most important point is to get these inquiries conducted by impartial people. The Court should be exactly like the Courts of law—judicial. I think that the Board should be a nominee Board entirely. Three men would be ample, a first-class nautical man, a first-class engineer, and a man something like one of our District Court Judges as Chairman. You would get rid of all that trouble about shipowners, sailors, engineers, and merchants electing men to the Board."

*Bruce B. Nicoll, Esq.*, Late Shipowner:—"I do not think a Board is wanted. Instead of a Board, I think it would be quite sufficient to have a harbour-master as head of the branch to supervise pilots, lights, and harbours. I do not think the elective principle is the right one. I think the judicial

judicial functions of the Board should be separated from the executive. They inquire first, hear the case, summon a man to answer a charge which they prefer, and sentence him themselves. I approve of a Court presided over and directed by a Judge or Stipendiary Magistrate, with nautical or other assessors. I think the Board should be nominated, and an Appeal Court constituted."

*Captain Brooks*, Lloyd's Surveyor, Newcastle:—"I do not think the elective principle has been a success as representing the general interests of the Colony. Outside of Sydney is not represented at all."

*W. B. Sharp, Esq.*, Newcastle:—"Judicial inquiries should be free from political influence. Inquiries should be conducted by a District Court Judge, with two nautical assessors. In New Zealand the Courts are under judicial jurisdiction, and assessors are appointed. In England similar provision is made. I think this plan would be equitable for all concerned."

*The President*, Chamber of Commerce, Newcastle:—"I am decidedly of opinion that the Marine Board is not the proper tribunal for trying cases. I am in favour of a Marine Court presided over by a District Court Judge with assessors. Such a court would deal with all marine disasters. The local board can act as a board of inquiry, but it cannot issue a license certificate. Things were very much better done before we had a Marine Board."

*T. M. Davis, Esq., M.L.A.*:—"I recommend the complete severance of the judicial from the executive functions. The executive functions should be entrusted to an officer subject to the Treasurer. I would not continue the Board. I would have an executive officer. I would take away the elective principle altogether. If a Board is considered necessary, it should be an Advisory Board. Have two nautical assessors who will give to the Judge a proper nautical outline of what is right and what is wrong, to cross-examine witnesses and bring out the truth, and let both of them sum up, and let the Judge decide on points of law. The assessors can do the technical work between them and let the Judge do the legal. I think this proposal would be an immense improvement, a benefit to all classes. I unhesitatingly say it would be much better than the present Board. It will be less expensive, and it certainly cannot give less satisfaction."

*Mr. Cruickshank*, Engineer-Surveyor, Marine Board:—"I think two nautical assessors would under a Judge, be better than the present arrangement. In many cases our wardens cannot sit because they are interested personally, and it is the opinion of those who are capable of judging that representatives ought not to be shipowners, because they are personally interested."

*Captain A. C. Turner*, Managing Director of the Illawarra Steam Navigation Company:—"The Marine Board is a body that is nearly obsolete now. . . . We should have a Board constituted somewhat after the lines they have in the Old Country and in many other countries. Where the certificate of a master or a mate is to be dealt with, it should be dealt with by two nautical assessors, men experienced in marine matters, presided over by a Stipendiary Magistrate to assist them on any legal point upon which they might require his assistance. The Marine Board is composed of persons who are all more or less interested in business—some ship chandlers, some marine surveyors, others on Boards of steam companies, and such like, which must clash with the proper working of the Board."

*Mr. Hare*, Registry Clerk, Customs Department:—"The bulk of the votes for Wardens are held by the owners of small vessels. Two of the elected Wardens hold qualifications given by vessels not sea-going. The Revision Court sits annually, and is conducted by two justices. Appeals are not frequent; I have never known of one during the six years I have been in charge. No interest is taken in the courts."

*Mr. Walford*, Tide Surveyor, Customs Department:—"Both vessels (the "Tinonee" and the "Argo") are quite unfit for sea. The decks are blown out of the "Argo" from end to end, and I think nearly every deck beam is broken. She has been laid up for about four years. They are using the "Tinonee" as a hulk for any spare gear at the dock. She is not in a sea-going condition. She has been laid up for about four years."

*Captain Hixson*, R.N., President of the Marine Board:—"The tonnage not registered in Sydney is not represented at the Board. The large mail steamers have no representation. The British and foreign shipping visiting our ports is about 1,500,000 tons, and the Colonial registered about 90,000 tons. Our own shipping is our first care; but I admit that the money spent in the port by British ships is very much greater than that spent by Colonial ships."

## II. *The Officers and Employees of the Marine Board; their salaries, emoluments, and duties.*

13. Your Commissioners have to report that in their opinion the present salaries and wages paid to officers and employees of the Marine Board are in some cases excessive, when the nature of the duties performed is taken into consideration. They are much higher than those paid to officers in other Departments, and these salaries, not being controlled by the Public Service Board, present a contrast when compared with the salaries paid throughout the Service generally, which is undesirable and

Salaries and wages excessive. Unsatisfactory effects of the increment system.

and unfair. The Marine Board, under the powers conferred by the Navigation Act, recommend for appointment their Secretary, Surveyors, Inspectors, and other officers at such remuneration as the Governor may think adequate.

The Governor, with the advice of the Executive Council (13 August, 1885), approved of certain Regulations concerning the officers of the Marine Board, not classified under the 7th section of the Civil Service Act of 1884; fixed the salaries—minimum and maximum; the value of quarters, fuel, and light, and the annual increments payable to each officer. The increment system is, in the opinion of Captain Hixson, still in abeyance, and he wishes to continue the increments as a contract with all concerned. It is unnecessary for us to dilate here upon this contention, and the demands which would be made upon the Government if it were upheld. The increment system is answerable for much confusion and dissatisfaction throughout the Marine Board Department. There are twelve pilots employed at Sydney and Newcastle with salaries varying from £200 to £398 per annum. At the present time four pilots receive £398 per annum each, three receive £353 each; there are one each at £250, £218, and £209 respectively, and two at £200 per annum each. Several of these officers entered the Service under the Regulations of 1885, expecting to receive the annual increments of £10 until the maximum pay fixed by the Regulations was reached. The duties performed by the pilots are of the same kind, and the same responsibilities attach to all. The pilots at £200 and those under the maximum complain that their salaries are not only inadequate, but that the Regulations under which they accepted their positions have not been complied with. The salaries of the second-class pilots employed at the out-ports vary from £240 to £150. These salaries are very unsatisfactory to the pilots, whose contention is that they expected the salaries to be increased according to the Regulations.

The salaries now paid by the Marine Board are far in excess of the salaries in the year 1883 for services of the same kind. This is partly due to the increment system authorised by the Treasurer in 1885.

It may be pointed out that the Regulations above referred to provided for comparatively high maximum rates of pay; and in the case of boatmen, an unnecessarily brief period elapsed between entering the Service and qualifying for maximum pay, the period in this case being only five years, while pilots could only attain the maximum salary after twenty years' service.

14. We are informed by Captain Hixson that many of his officers entered the Service late in life, and that the larger number of the men employed by the Board had passed the prime of life before they entered the Service. There are 32 men over the age of 60 now in the Department, of whom 13 are over the age of 65. Of this number, the Marine Board has recommended the retirement of 7, ranging from 65 to 76 years of age, but the Public Service Board thought it undesirable to move in the matter pending the report of this Commission. The majority of the other 25 who are over 60 should also retire, but there are two or three exceptions, active men who are still well fitted to perform their duties. Advanced age of officers.

15. We would call attention to the absence of any systematic check upon the Departmental accounts, other than the annual check by the Treasury Inspector and the Audit Department. Want of a Departmental check upon accounts.

The frauds carried on for a considerable period by a former Accountant of the Marine Board conclusively pointed to the necessity for some effective system of control over the accounts. No effort appears to have been made in this direction, and we have the evidence of the Secretary (Commander Lindeman) showing that he has no control over, or responsibility in connection with, the accounts; and that of the Accountant himself, who states that beyond the initialling of his pass-book by the President, his accounts are not in any way controlled or checked, except by the Treasury and Audit Department officers at long intervals. We consider that in the light of previous experience such a state of affairs should not be allowed to continue.

16. We have merely touched upon the lines where reforms are needed in regard to the office management and the salaries paid to officers, and advise that, in order to secure a proper and effective reorganisation of the Department, it should be placed upon the same footing as other branches of the Public Service. Marine Board should be placed on same footing as other branches of the Public Service.

Salient points of evidence.

17. The following are the salient points of evidence in connection with the foregoing recommendation :—

*Captain Hixson, R.N.*, President of the Marine Board :—“ A great many officers are over the age of 60, having entered the Service late in life. The larger number of the men employed by the Board have passed the prime of their lives in the Mercantile Marine Service before they entered the service of the Board.

“ The system of increments was stopped in my Department by Ministerial authority ; it is still in abeyance ; the men have what they consider to be a claim.

“ The increment system is necessarily continued by the Marine Board, although increments under the Civil Service Act were abolished in October, 1886.

“ The Secretary has no control over the officers, save in my absence. I do not find any inconvenience in checking the expenditure (£50,000). I am sure the Secretary has less time to do it.

“ Our maximum wages would be considerably higher than the maximum of the wages paid in the merchant service.”

*Commander Lindeman*, Secretary to the Marine Board :—“ I never had any supervision over the accounts. If I had been responsible to the President the frauds mentioned would never, I think, have gone on. For a whole year the late Accountant was not checked, except by the President. I did draw the President's attention to the unsatisfactory state of the Accountant's work. I have no control.”

*Mr. Rule*, Accountant :—“ There is no inspection except that of the Treasury Inspector who visits the office about every twelve months. There is no other check. Captain Hixson initials the pass-book at the end of the month. He does not check at all, he merely looks at it and initials it. He does not compare it with any documents. The collections in my office are about £1,600 per annum. Captain Hixson signs the salary abstracts which I prepare. He does not demand anybody's signature as a guarantee of correctness. There is practically no check upon me, except the Treasury and the Audit Office checking. Captain Lindeman has no control whatever over the accounts.”

### III. The Pilot Service.

Efficiency of service.

18. The Pilot Service appears to be in a satisfactory state of efficiency, both at Port Jackson and at the out-stations. The necessity for a steam pilot service at Newcastle was very strongly urged upon us, and is very apparent, but as the “ Ajax ” has been recently selected for service at that port, it is unnecessary to refer any further to the matter in this Report.

Excessive cost.

19. While recognising the general efficiency of the service, we are compelled to point out that it has been established and is being maintained at a cost altogether disproportionate to actual requirements and the benefits accruing from its operations. The pilot steamer “ Captain Cook ” is a most expensive vessel, having cost £22,500. Her general appearance, fittings, and appointments are those of a private steam-yacht, rather than a serviceable pilot boat. The total annual cost for salaries and wages amounts to about £3,300, inclusive of the wages of four boatmen employed on a steam-launch used for taking pilots from outward-bound vessels. The salary of the master, £416 per annum, is much higher than the pay of masters in first-class vessels on the coast. The master, mate, engineers, and pilots are paid a liberal victualling allowance of 18s. per week each, and a cook and providore is also paid £143 per annum to make all necessary purchases and arrangements. The sailors are paid on a less liberal scale, and rations are not found for them. We are of opinion that the victualling could be carried out much more economically by contract. Although maintained at such a heavy cost, the “ Captain Cook ” is idle for the greater part of her time. During the month of March last she was away from her moorings for thirty-eight hours only. That the men are idle fully two-thirds of their time is admitted by Captain Hixson.

Pilot steamer should be in charge of a pilot.

It has been suggested that a considerable saving could be effected by placing the pilot steamer in charge of a pilot instead of a master ; and that the pilot last on board should be in command of the vessel until his turn comes for a ship, and be replaced in due order, the first officer, who is also a qualified pilot, being in return command when the two pilots have been placed in charge of vessels.

When the Navigation Acts Amendment Bill was before the Legislative Council in 1894, a comparison was instituted between the system of a Government Pilot Service as adopted in this Colony and the New York system of licensing pilots, who compete for employment.

We carefully considered this aspect of the question, and came to the conclusion that, although the licensing system may be admirably adapted to a country where the population is large, and the shipping trade correspondingly so, we think it would

not

not be wise to wholly depend upon such a system; but, by reference to the following paragraph, it will be seen that we recommend the grafting on to the present system of a modification of the licensing system.

20. We are informed that the cost of the Port Jackson Pilot Service is equal to 57 per cent. of the whole; that of Newcastle, 27 per cent.; and that of the out-stations is represented by the remaining 16 per cent. In 1896, 629 vessels were attended by pilots at Sydney, and 837 at Newcastle. There are twelve pilots employed—five at Sydney and seven at Newcastle. It will thus be seen that the number of vessels to each pilot for the year was 126 at Sydney and 119 at Newcastle, or about one vessel per pilot every third day; but at Newcastle the pilots are also engaged in the harbour removals of vessels, which are much more frequent than at Sydney. We consider that the number of staff pilots might be reduced, and those not retained on the staff might be employed for occasional services as licensed pilots, and paid at per ship or otherwise.

Work performed by pilots. Staff might be reduced.

21. There appears to be a considerable loss of revenue owing to the irregular and unauthorised removal of vessels in and from the harbour. It will be the duty of the Superintendent of Harbours, if such an officer be appointed, as suggested in paragraph 11 of this Report, to stop this leakage of revenue.

Loss of revenue.

22. In connection with the foregoing recommendations, we quote the following salient points of evidence:—

Salient points of evidence.

*Captain Hixson, R.N.*:—"If you take the intermediate wage of the captain and officers of the 'Captain Cook,' I do not think they are high, but if you take the maximum they are. I have no doubt that you could get men to fill these offices at the salaries named, viz.:—mate, £15; second mate, £12; fireman, £10; seamen and boatmen, £9, per month. The men are idle much longer than they are engaged—perhaps two-thirds of their time idle. (Captain Cook's crew.) There are times when all hands are more or less unemployed."

*F. J. Thomas, Esq.*:—"I think £416 a year, and 18s. a week, is too much for the master of the 'Captain Cook,' considering that men of equal qualifications can be obtained for less in other services."

*J. H. Storey, Esq.*:—"I was a member of the Civil Service Commission. We thought the officers on board the 'Captain Cook' grossly overpaid."

*Captain Creer, Master of the "Captain Cook"*:—"I cannot see that in any single case my officers are overpaid. I would not reduce the number, nor advise the reduction of wages."

*Captain Cross, Newcastle*:—"I think the duties of the Newcastle are very much more onerous than those of the Sydney pilots. I think the master of the 'Captain Cook' is very well paid. I consider the master of the 'Ajax' well paid at £250 per annum, and 18s. per week allowance."

*Captain Hixson, R.N.*:—"The amount paid for victualling the 'Captain Cook' (£470 per annum) does seem large for seven people. It would, perhaps, be more economical to put all hands on sea-going wages, and feed them by contract. The Pilot Service outside the Port of Sydney is carried on at a considerable loss."

#### IV. Lighthouses, Lightships, and Beacons.

23. The salaries of lightkeepers are not paid in accordance with the relative importance of the lights. There should, in our opinion, be a classification of the lights, taking into consideration their relative value to shipping, isolated or dangerous position, &c., and the salaries should be fixed in accordance with the nature of the duties.

Necessity for classifying lights.

24. A large proportion of the lightkeepers are men of advanced years. It would be well to fix a limit of age for all lightkeepers in accordance with the provisions of the Public Service Act.

Advanced age of lightkeepers.

25. The Members of the Marine Board make an annual tour of inspection of the lighthouses and pilot stations. We are informed that it not infrequently happens that some of the lighthouses cannot be visited owing to bad weather, and, consequently, they sometimes remain for two years without any inspection, being visited only by the steam-tugs which are under contract to carry supplies to them. Such a condition of affairs should not be allowed to continue, and we recommend that it should be the duty of one of the responsible officers of the Department to visit all lighthouses and pilot stations at irregular intervals at least once in every year, thus ensuring a far more efficient supervision. This could be accomplished without an addition to the staff.

Insufficient inspection of lighthouses and pilot stations.

Excessive cost of  
lightship "Bramble."

26. The lightship "Bramble," on the Sow and Pigs, is maintained at what your Commissioners consider the excessive cost of £800 per annum in salaries and quarters. A suggestion has been made to us that it would be possible to connect the Macquarie and Hornby Lights, and a fixed light on the Sow and Pigs by cable, and light all three by electricity generated at the one station. Whether this scheme will be found practicable or not, there is no doubt that the present cost of maintenance of the lightship might be considerably reduced without in any way impairing its efficiency. Gas is supplied within a few yards of the Hornby Light, and it appears desirable that it should be laid on for lighting purposes.

Evidence.

27. We quote the following evidence in connection with the foregoing recommendations:—

*Captain Hixson, R.N.*:—"It has been the practice of the Marine Board to visit the lighthouses and stations annually with our secretary. We used to pay £400 for the steamer, and the unofficial members of the Board were paid 15s. per day as travelling allowance. The lighthouse-keepers and their assistants look forward to the visit of the Board, and have everything shipshape. I think men might be employed up to 65 years of age at lighthouse work, except at places like Solitary and Montagu Islands."

*Captain A. C. Turner*:—"Touching the lighthouses, the inspection is almost a farce. The people at all the lighthouses know a month before that there is going to be a picnic, and, of course, everything is got in order for the inspection. It should be done as it is in the other colonies. The Superintending Engineer goes round occasionally when he is not expected, and he sees things as they are, and not as they are got ready for inspection by the Marine Board."

*Bruce B. Nicoll, Esq.*:—"I think there should be an Inspector of Lighthouses and Pilot Stations, to go right along the coast. They want looking to occasionally. I think these places should be visited more than once a year."

#### V.—The Tug Service.

Tug Service should  
be amalgamated  
with Pilot Service.

28. The tug service at the Northern Rivers has received our earnest attention, and we are of opinion that it could be rendered very much more useful, both to the settlers and shipowners trading to those rivers, by combining it with the pilot service in such a manner that the whole would be directly under Government control. It has been suggested to us that it was an unnecessary step on the part of the Government to take up such an expensive work in the first instance, as it was carried on for many years without any assistance, and wherever trade appeared vessels were found ready to undertake the necessary towage work without subsidy; but your Commissioners think that, taking into account the great importance of the trade of the flourishing districts drained by these Rivers, and the comparative absence of railway facilities which other parts of the Colony enjoy, a wise policy has been pursued in establishing a tug service. They, however, consider that each tug should be entirely under the control of the Government pilot and his crew.

Advantages to be  
gained.

29. The advantages to be anticipated from a combined pilot and tug service are very great, both on the grounds of economy and efficiency. As at present maintained, the two services are carried on at a very heavy cost to the Government, and, in the case of the tugs, to shipowners also. Both services are maintained for the same object, viz., to afford facilities to navigation; but being under separate control, the one of the Government and the other of private enterprise, there is a frequent clashing of interests, resulting in friction between the pilots and the tug-masters. The object of the latter is to earn what they can for their principals in addition to the subsidy, and to avoid risk of damage to their vessels as far as possible. It can therefore be easily understood that, in attempting to do the best for their employers, the tug-masters come into conflict with the Government pilot, and thus the public interests suffer. The evidence taken by your Commissioners conclusively shows that it is very desirable in the best interests of the public that the two services should be combined and placed under control of the pilots.

Greater usefulness of  
combined services.

30. It has been proved to your Commissioners that the northern river pilots are in most instances unemployed for a large proportion of their time, and they are not only willing, but anxious to do more work. If they had a steam tug at their disposal they could, in the intervals of towing work, perform the duties of sounding and buoying the river bars, attending to leading lights, and other necessary details, with far greater expedition than is possible at present. When not required for the work of the Marine Board, the tug would also be available for occasional service in connection with the Public Works Department.

31. The following evidence is quoted in connection with the foregoing Evidence. recommendations :—

*John See, Esq., M.L.A.* :—“The pilot men have not got enough to do. The Government should provide the tugs, using the present pilots' crews to man the tug boats. There would be a considerable saving, and a much better service for the shipowners and steamers. The North Coast Company paid the tugs £1,025 in 1896. The present charges are excessive. I give my cordial support to having the tugs (Government) on the rivers. The life of a tug on the Richmond would be about fifteen years. I do not think the tug service as capable and efficient as it might be, unless the boats are absolutely under the control of the pilots. At present it is a money-making business, and it ought not to be. I am sure that with what they would save, and with the towages earned, the Government would make an enormous saving on the whole service. I would propose that the tug boat be the pilot boat.”

*J. H. Storey, Esq.* :—“The tugs are absolutely necessary. I have been long of opinion that tugs should be the property of the Government, manned by the pilot and a proper crew. Whenever vessels get into difficulties, the tug owners make special charges for any services they render, over and above the tonnage charge.”

*T. R. Allt, Esq.* :—“The tug service and the pilots do not work well together. The pilot should have full charge of the tug. Whilst the pilot and the tug services are separate, there will always be trouble on the rivers. During the last five years we have paid the tug services £3,220. Most of the tugs draw six feet. The service at present is very unsatisfactory. I am strongly of that opinion.”

*Bruce B. Nicoll, Esq.* :—“The pilots are generally at loggerheads with the tug-masters. The pilot has not the slightest control. He may want to go out and sound the bar, and because it is rough the tug-master may refuse to go. I used to pay the tug at the Richmond £1,500 a year for towages. I have known ten or twelve vessels waiting at the heads to go out, and the tug has gone to Lismore to tow a vessel 65 miles. The pilot could do nothing. I have known the same kind of thing to happen at the Tweed. The Government should own the tugs, and have them under the control of their officers. I do not think it would be more expensive than the present system. A boat suitable for the Richmond could be built for £3,000; the boats for the other rivers need not be so costly. The cost of the crew would not come to the cost of the subsidy; if you put the pilot's crew on it would be much cheaper. There always will be friction between the pilots and the tug-masters. The boiler of such a tug as you describe would last ten years, and the hull twenty years. The machinery, with care, would last all the time.”

*Captain A. C. Turner* :—“The principle of subsidising tugs for the pilot service is a very good thing for the owner of the boats. We used to pay in the olden days, and now the Government are good enough to step in and pay the subsidy, and so reduce the towing expenses.”

*T. M. Davis, Esq., M.L.A.* :—“The Government might take up the tugs. I think it would be more economical to subsidise boats. If the Government had the tug the pilot would be the master. At present the pilot and the tug captain get at loggerheads. The captain of the tug-boat is the real captain.

*R. R. P. Hickson, Esq.*, Under Secretary for Public Works :—“I have always held that there was a very large unnecessary expense in connection with the pilotage and the tug service of those ports. With regard to the northern rivers, it is, of course, necessary to have a steamer, but I think the steamer and the pilot service ought to be amalgamated. Where the tug-boats are required they should be placed under the charge of the pilot, and have only the one service. I think it would be better for the Government to supply the tugs themselves. I am quite satisfied that the service could be kept up at the present cost of the pilot service alone, if the pilots had the tugs.”

*T. W. Keele, Esq.*, District Engineer, Ballina, Richmond River :—“It would be more reliable if the Government owned the tugs and utilised the services of the pilot as master and the boatmen as crew. I think the sole control should be in the hands of the pilot. I have always been of that opinion; it would save all this friction and would give a better and, I think, a cheaper service. They have a very good man on the tug, but he is not a trained seaman; he is a landsman. The pilot might think it right to go out and sound the bar, and the master of the tug, representing the owner's interest, might think it wrong. If the pilot had full control he would have all the power and all the responsibility.”

*Pilot Thompson, Wollongong* :—“I have not had occasion to take the tug out once this year to date for our own purposes. Tug subsidy, £28 per month.”

*Captain McAuley, Pilot, Yamba* :—“I do not see why we could not work a tug of our own with the station crew. I think it would work. The master of the tug and myself have had little differences—a little friction—that would all be removed if we had our own tug. I think there is no question that we might work a tug of our own—it can be done all right by my crew.”

*Captain Fraser, Pilot, Richmond River* :—“I think the tug must have got £1,500 beyond the subsidy in 1896, outside what she received from the Dredging Department. There is always a certain amount of friction with the master of the tug. The insurance is a heavy item; it is against the boat going out in bad weather when she is most wanted.”

*C. W. Darley, Esq.* :—“There are some most active and efficient pilots, and men, who, if they had charge of the tugs, would get good work out of them.”

*Captain Hisson, R.N.* :—“I am adverse to any changes in the present system. If you give £10,000 to the Richmond you would have to give it to every other river in the country. I think it would be a very great mistake to introduce such a plan as that you suggest. Private enterprise does the work as effectually as the Government could do it. I have seen many of these schemes—they look well on paper—but they do not turn out well. I am very adverse to it. There is really no necessity for a tug at the Clarence River.”

## VI.—Miscellaneous.

Present limited powers of Newcastle Local Marine Board.

32. Very great stress was laid by the members of the Local Marine Board and the members of the Chamber of Commerce, at Newcastle, upon the limited powers of the Local Marine Board as at present constituted. Complaints were made that for such a simple matter as the issue of a waterman's license, it was necessary to remit the fee to Sydney and obtain the signatures of the principal Board to the license before it could be issued. Such restricted powers appear to be altogether inadequate, when the importance of the port of Newcastle is taken into consideration. Should the recommendation of your Commissioners with regard to the establishing of a Court of Inquiry be acted upon, such Court will of course be opened at Newcastle for the purpose of conducting local inquiries.

We quote the following evidence in regard to the Local Marine Board at Newcastle :—

*Captain Cross*, Chairman of the Local Marine Board :—“ We have no powers. We are subordinate to the Board in Sydney. We cannot issue certificates of any kind. We cannot issue a waterman's license. We send the fee to Sydney, and when the license is signed by the President and members of the Board it is returned. It is very irksome to be in such a subordinate position, having to refer everything to the Sydney Board.”

*Duncan J. McLean, Esq.*, member of the Local Marine Board :—“ The merest trifle has to be referred to Sydney. The Board, as now constituted, is not satisfactory to the public at Newcastle. With the experience I have gained, I do not consider it desirable to continue the Local Board as it is.”

Necessity for greater ballast accommodation at Newcastle.

33. The urgent necessity for greater ballast accommodation was prominently put before us at Newcastle. Great dissatisfaction has been expressed by the shipping community with regard to the limited berthing space now available for vessels discharging ballast, there being frequently three or four ships abreast, either waiting their turn or discharging over the intermediate vessels.

Life-boat Services.

34. The Life-boat Service is apparently in a most unsatisfactory and inefficient condition both at Port Jackson and Newcastle. When your Commissioners were visiting the latter place, evidence was given that the life-boat had for some time been considered absolutely dangerous; but since that visit we are informed that a new life-boat has been placed on the station. We are of opinion, however, that there is far too little practice on the part of the crew, and that in proportion to the work done the present cost is excessive. Twenty-two boatmen are paid £12 per annum each, and a coxswain £50 per annum, for manning the life-boat, which appears to have been taken out “ about once a month ” or “ about twice a quarter,” according to two different accounts.

The Port Jackson arrangements are of a surprisingly haphazard nature. A signal is hoisted on the flagstaff at irregular intervals to notify to casual fishermen and others that a crew is required to take the life-boat out for exercise. As 10s. is paid to each of the crew it is not difficult to secure a complement, but whether the same spirit of competition for a place in the boat would be shown in a case of shipwreck in heavy weather is altogether a matter for conjecture. Captain Creeer as “ organiser ” receives £1 each time the boat goes out.

In pleasing contrast to the foregoing we found that the pilot at the Clarence had improvised a life-boat by fitting a whale-boat with air-tight tanks. This boat is manned by the pilot and his boatmen, and they neither ask nor receive any special pay for this duty.

Obstructions to navigation of Northern Rivers.

35. The Mayor of Lismore called our attention to the difficulty of keeping the waters of the north arm of the Richmond River in a clear state for navigation, and of preventing the blocking of the fairway by timber rafts and fallen timber. He pointed out that, in order to procure the prosecution of offenders, it was necessary to refer each case to the Marine Board at Sydney, and obtain authority to take proceedings. Valuable time was thus lost and the difficulty of securing a conviction increased, while the obstructions remained as a menace to navigation. He suggested that some officer residing in the district should be appointed as representing the Government, with power to remove obstructions and take proceedings against

against offenders. We consider that it is necessary to provide for either executive or legislative action to empower local officers to take immediate steps in such cases. The Navigable Waters Protection Act of 1862 contains provisions regulating the discharge of ballast and preventing any obstruction being placed in navigable waters. The administration of this Act was entrusted to the Public Works Department, which provided a wholesome check; but after the Navigation Act came into force it was decided that the Marine Board alone had jurisdiction in respect of the navigable waters. Since that decision no further action appears to have been taken by the Public Works Department. The Engineer-in-Chief for Public Works informs us that his Department maintains an expensive staff to take snags out of the Northern Rivers; that residents fell trees into or across the rivers, and men have to be sent to remove them. Reports have been made to the Marine Board, but "their system is so cumbersome and troublesome as to be practically unworkable."

The powers conferred by the Navigable Waters Act of 1862 might be revived, and the administration carried out, as before, by the Public Works Department.

36. Dissatisfaction has been expressed to us by seamen and boatmen that a certain preference is shown towards some of the boatmen (18 at Sydney and 2 at Newcastle) who are each supplied with two suits of uniform every year. These boatmen, we are informed by Captain Hixson, are employed in conveying distinguished visitors about, and it is considered necessary that their appearance should be presentable. Your Commissioners are of opinion that, as the uniform is supplied to such a large proportion of the men, it should be supplied to all, which would, at a small expense, remove a cause of complaint. Uniforms for boatmen.

37. Steamship owners are of opinion that the law requiring that all passenger-carrying steamships shall be surveyed twice at least in every year, at such convenient times as the Marine Board may direct, is harsh and oppressive. It is urged that the opening up of machinery every six months is not necessary, and that the delay caused by such examinations inflicts serious loss upon owners. It is pointed out that the present active competition compels them, in their own interests, to maintain their vessels in a high state of efficiency, and that consequently the half-yearly inspection is both harassing and unnecessary. The Navigation Act gives the fullest power to the Marine Board to suspend certificates at any time, and in other ways to protect the travelling public. The additional fees imposed by the Act 60 Vic. No. 36 have largely increased the cost of these frequent examinations, and consequently with the added delay caused by the half-yearly overhaul, and the loss of the earnings of the vessels, the charges against passenger steamships have become greatly increased in this Colony.

38. The following evidence is quoted as bearing upon the subject of periodical surveys:— Evidence.

*F. W. Jackson, Esq.*, Manager, Union Steamship Company of New Zealand:—The delay is anything from three days to a week. We, as well as other companies, feel it very much, because, for our own sakes, we keep our steamers in good order. We do not want to court a break down. The engineers on board are supposed to, and they do, keep the vessels in good order; but, according to the laws here, we have to stop our ships every six months, in order that the authorities may examine them. The Government engineers at ports of call, and other authorities, can go on board the steamers, and satisfy themselves whether or not the vessels are being kept up; and, if they have reason to find fault, they can call upon the owners at any time to put the steamers into seagoing order. The fees are increased also—an additional £1 is charged for every 300 tons or part thereof; that is somewhat a tax upon us. One steamer the other day cost us £10 or guineas, instead of £4—the maximum charge before November, 1896, for certificate fees.

*Captain A. C. Turner*, Managing Director of Illawarra Steam Navigation Company:—In New South Wales certificates (steam) are granted for six months. That was necessary with the old boats; but now, owing to competition, an owner cannot allow his boats to get into disrepair. It is the owners' interest to keep the boats in good running. We find it rather irksome opening everything up every six months, and we think it is unnecessary.

*Mr. D. Cruickshank*, Chief Engineer Surveyor:—"We are compelled to have examinations every six months. Of course, we have the power to make an examination as often as we like. It is necessary to have frequent examinations of small steamers because there is no skilled labour in them, but in the large ships there is always skilled labour. The shipping people have complained several times. I regard that as a defect in the Act. I think, with provision to meet special cases, an annual examination would be sufficient."

## SUMMARY OF RECOMMENDATIONS.

To sum up we recommend :—

1. That the judicial functions of the Marine Board be separated from the administrative functions; that a Court of Marine Inquiry be constituted, to be presided over by a District Court Judge, assisted by two or more assessors of nautical, engineering, or other special skill or knowledge, nominated by the Government, and paid by fees; and that the judicial functions of the Marine Board be vested in such Court of Marine Inquiry.
2. That a Marine Board be nominated, consisting of a Superintendent of Harbours, Lights, and Pilots as Chairman; the Shipping Master, and the Engineer-Surveyor, who shall carry out the administrative functions of the Department.
3. That the Officers of the Marine Board Department be graded at salaries upon a scale uniform, as far as possible, with that current in other Branches of the Public Service.
4. That several officers of advanced age be retired.
5. That a systematic check upon the Departmental Accounts be instituted.
6. That the lighthouses and pilot stations be inspected at irregular intervals by a responsible officer of the Department.
7. That the Public Works Department be re-invested with the necessary authority to deal with obstructions in Harbours, Rivers, and Creeks in manner provided by the Navigable Waters Act of 1862.
8. That the Tug and Pilot services be amalgamated and placed under control of the pilots—the service to be carried out by steamers either owned or chartered by the Government.
9. That the Life-boat service be reorganised.
10. That the Navigation Act, 35 Vic. No. 7, sec. 29, be amended and made to accord with the Merchant Shipping Act of the United Kingdom, and the Acts of other of the Australian Colonies, which require that steamships intended to carry passengers shall be surveyed once at least in each year.

In closing our Report we desire to state that our colleague, Mr. T. A. Coghlan, left the Colony shortly after the work of the Commission began, and consequently he has not had an opportunity of acting, except during two of the earlier sittings. We also desire to acknowledge our obligation to Mr. A. F. Basset Hull, the Secretary of the Commission, for the zealous and efficient service rendered to us in carrying out the details of the Commission.

We have the honor to be,

Your Excellency's most obedient Servants,

J. BARLING, President.  
G. A. WILSON,  
JAMES POWELL.

A. F. BASSET HULL, Secretary.

Sydney, Tuesday, 27th July, 1897.

## WITNESSES EXAMINED.

1. Captain Francis Hixson, R.N., President of the Marine Board.
2. Commander George Sidney E. Lindeman, R.N., Secretary of the Marine Board.
3. Francis Rule, Accountant, Marine Board.
4. James Edie, Government Shipping Master.
5. William Douglas Cruickshank, Chief Engineer and Surveyor, Marine Board.
6. John Henderson Bedford, Examiner in Seamanship, Marine Board.
7. Lion Henry Walford, Tide Surveyor, Customs Department.
8. William Hare, Clerk in the Registration of Shipping Branch, Customs Department.
9. Joseph Leddra, Superintendent of the lightship "Bramble."
10. Joseph Creer, Master-in-charge of the Pilot Service.
11. Herbert Orton, Cook and Provodore, "Captain Cook."
12. James Fotheringham, Chief Officer, "Captain Cook."
13. Andrew William Jack, Senior Pilot, "Captain Cook."
14. Edward Brodrick, Chief Engineer, "Captain Cook."
15. James Nuth, Fireman, "Captain Cook."
16. George Avelar, Seaman, "Captain Cook."
17. John Moncrieff, Seaman, "Captain Cook."
18. E Stratton, Seaman, "Captain Cook."
19. Herbert Robert Cross, President of the Local Marine Board, Newcastle.
20. Duncan John McLean, Member of the Local Marine Board, Newcastle.
21. Frank Gardner, Member of the Local Marine Board, Newcastle.
22. Henry Newton, Harbour-master, Newcastle.
23. Thomas Brooks, Lloyd's Surveyor, Newcastle.
24. William B Sharp, Shipping Agent and Colliery Shipping Manager, Newcastle.
25. Henry William Finch, Shipping Clerk to R. B. Wallace, Newcastle.
26. George Melville, Assistant Harbour-master, Newcastle.
27. Joseph Henry Storey, J.P., Merchant, and Chairman of the Underwriters' Association.
28. James Fotheringham, Chief Officer, "Captain Cook" (second examination).
29. John Lawrence, Harbour-master's Clerk, Marine Board.
30. Thomas Robert Allt, J.P., Chairman of the North Coast Steam Navigation Company, Limited.
31. Francis John Thomas, Manager of the Newcastle and Hunter River Steamship Company, Limited.
32. John See, M.L.A., J.P., Merchant, and Director of the North Coast Steam Navigation Company, Limited.
33. Henry McAuley, Pilot at Yamba, Clarence River.
34. Robert Adie Fraser, Pilot at Ballina.
35. Thomas William Keele, District Engineer, Harbours and Rivers Department, Ballina.
36. J F O'Flynn, J.P., Mayor of Lismore.
37. William Macgregor, Pilot at Tweed Heads.
38. Frederick William Jackson, Manager of the Union Steamship Company of New Zealand, Sydney.
39. Captain Francis Hixson, R.N., President of the Marine Board (second examination).
40. Henry Pettit, Harbour-master, Marine Board.
41. Frederick Bracegirdle, Assistant Harbour-master, Marine Board.
42. Thomas Robertson Thompson, Assistant Harbour Master, Marine Board.
43. Alexander Sangster, Water Bailiff and Inspector of Shipping, Marine Board.
44. Bruce Baird Nicoll, Merchant, and formerly Owner of Steamers trading to Northern Rivers.
45. Alfred William Meeks, J.P., of Messrs. Gibbs, Bright, & Co., Merchant, and Chairman of the Chamber of Commerce.
46. Alfred Settree, Merchant, and Owner of Sailing Vessels trading to the Northern Rivers.
47. Alfred Langley, Merchant, and Owner of Sailing Vessels trading to the Northern Rivers.
48. George de Fraine, Owner of Subsidised Steam Tug at Camden Haven.
49. Cecil West Darley, J.P., Engineer-in-Chief, Public Works Department.
50. Captain Francis Hixson, R.N., President of the Marine Board (third examination).
51. William Newton, Inspector of Shipping, Marine Board.
52. Andrew Thompson, Pilot and Harbour Master, Wollongong.
53. Edmund Potts, Customs Officer, Wollongong.
54. Thomas Martin Davis, M.L.A.
55. Robert Rowan Purdon Hickson, Under Secretary for Public Works.
56. Francis Buckle, Lighterman and Steam-tug Proprietor.
57. Angel Cooper Turner, Managing Director of the Illawarra Steam Navigation Company.

1897.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

MARINE BOARD OF NEW SOUTH WALES.

(EVIDENCE AND APPENDICES TO THE REPORT OF THE ROYAL COMMISSION APPOINTED  
4 FEBRUARY, 1897.)

Presented to Parliament by Command.

Printed under No. 15 Report from Printing Committee, 12 August, 1897.

INDEX TO WITNESSES EXAMINED.

	PAGE.
1. Captain Francis Hixson, R.N., President of the Marine Board (first examination) .....	1-20
2. Commander George Sidney Lindeman, R.N., Secretary of the Marine Board .....	21-23
3. Francis Rule, Accountant, Marine Board .....	23-25
4. James Edie, Government Shipping Master .....	25-29
5. William Douglas Cruickshank, Chief Engineer Surveyor, Marine Board .....	29-31
6. John Henderson Bedford, Examiner in Seamanship, Marine Board .....	31-34
7. Lion Henry Walford, Tide Surveyor, Customs Department .....	34
8. William Hare, Clerk in the Registration of Shipping Branch, Customs Department .....	34-35
9. Joseph Leddra, Superintendent of the lightship "Bramble" .....	35-36
10. Joseph Creer, Master-in-charge of the Pilot Service .....	36-39
11. Herbert Orton, Cook and Providore, "Captain Cook" .....	40
12. James Fotheringham, Chief Officer, "Captain Cook" (first examination) .....	40-42
13. Andrew William Jack, Senior Pilot, "Captain Cook" .....	42-43
14. Edward Brodrick, Chief Engineer, "Captain Cook" .....	43
15. James Nuth, Fireman, "Captain Cook" .....	43-44
16. George Avelar, Seaman, "Captain Cook" .....	44
17. John Moncrieff, Seaman, "Captain Cook" .....	44-45
18. E. Stratton, Seaman, "Captain Cook" .....	45
19. Herbert Robert Cross, President of the Local Marine Board, Newcastle .....	45-49
20. Duncan John McLean, Member of the Local Marine Board, Newcastle .....	49-50
21. Frank Gardner, Member of the Local Marine Board, Newcastle .....	50-51
22. Henry Newton, Harbour-master, Newcastle .....	51-53
23. Thomas Brooks, Lloyd's Surveyor, Newcastle .....	53-55
24. William B. Sharp, Shipping Agent and Colliery Shipping Manager, Newcastle .....	55-56
25. Henry William Finch, Shipping Clerk to R. B. Wallace, Newcastle .....	56
26. George Melville, Assistant Harbour-master, Newcastle .....	56-57
27. Joseph Henry Storey, J.P., Merchant, and Chairman of the Underwriters' Association .....	57-60
28. James Fotheringham, Chief Officer, "Captain Cook" (second examination) .....	60
29. John Lawrence, Harbour-master's Clerk, Marine Board .....	61-62
30. Thomas Robert Allt, J.P., Chairman of the North Coast Steam Navigation Company, Limited .....	62-65
31. Francis John Thomas, Manager of the Newcastle and Hunter River Steamship Company, Limited .....	65-66
32. John See, M.L.A., J.P., Merchant, and Director of the North Coast Steam Navigation Company, Limited .....	67-70
33. Henry McAuley, Pilot at Yamba, Clarence River .....	70-71
34. Robert Adie Fraser, Pilot at Ballina .....	72-73

	PAGE.
35. Thomas William Keele, District Engineer, Harbours and Rivers Department, Ballina ..	74
36. J. F. O'Flynn, J.P., Mayor of Lismore .....	74-75
37. William Macgregor, Pilot at Tweed Heads .....	75-78
38. Frederick William Jackson, Manager of the Union Steamship Company of New Zealand, Sydney .....	78-79
39. Captain Francis Hixson, R.N., President of the Marine Board (second examination) .....	79-85
40. Henry Pettit, Harbour-master, Marine Board .....	85-86
41. Frederick Bracegirdle, Assistant Harbour-master, Marine Board .....	86-87
42. Thomas Robertson Thompson, Assistant Harbour Master, Marine Board .....	87
43. Alexander Sangster, Water Bailiff and Inspector of Shipping, Marine Board .....	87-89
44. Bruce Baird Nicoll, Merchant, and formerly Owner of Steamers trading to Northern Rivers .....	89-92
45. Alfred William Meeks, J.P., of Messrs. Gibbs, Bright, & Co., Merchant, and Chairman of the Chamber of Commerce.	92-93
46. Alfred Settree, Merchant, and Owner of Sailing Vessels trading to the Northern Rivers .....	93-94
47. Alfred Langley, Merchant, and Owner of Sailing Vessels trading to the Northern Rivers.....	94
48. George de Fraine, Owner of Subsidised Steam Tug at Camden Haven.. ..	94-95
49. Cecil West Darley, J.P., Engineer-in-Chief, Public Works Department.....	95-96
50. Henry Selfe, Engineer Surveyor, Marine Board .....	97-98
51. Captain Francis Hixson, R.N., President of the Marine Board (third examination).....	98-100
52. William Newton, Inspector of Shipping, Marine Board .....	100-101
53. Andrew Thompson, Pilot and Harbour Master, Wollongong.....	101-102
54. Edmund Potts, Customs Officer, Wollongong .....	102
55. Thomas Martin Davis, M.L.A. ....	102-106
56. Robert Rowan Purdon Hickson, Under Secretary for Public Works .....	106-107
57. Francis Buckle, Lighterman and Steam-tug Proprietor .....	108-111
58. Francis Buckle, Lighterman and Steam-tug Proprietor .....	111-112
59. Angel Cooper Turner, Managing Director of the Illawarra Steam Navigation Company .....	112-113

---

ROYAL COMMISSION ON MARINE BOARD.

MINUTES OF EVIDENCE.

MONDAY, 22 MARCH, 1897.

PRESENT :—

JOSEPH BARLING, Esq., J.P., PRESIDENT.  
 GEORGE ALEXANDER WILSON, Esq., J.P.  
 JAMES POWELL, Esq., J.P.

Captain Francis Hixson, R.N., sworn and examined :—

1. *President.*] You hold the position of President of the Marine Board? I have held the office of President of the Marine Board of New South Wales for the last twenty-six years—since the Act of Incorporation was passed by Parliament. Captain  
Hixson, R.N.  
22 Mar., 1897.
2. Then you have continuously occupied the office and discharged its duties for twenty-six years? Yes; I have discharged the duties of the office since the Act of Incorporation was passed in the year 1871.
3. Prior to that you occupied another position? Yes; I was Superintendent of Pilots, Lighthouses, and Harbours.
4. And you carried out all the duties of the Board? Yes, in connection with the members of the Marine Board.
5. This is merely a formal sitting; it is not intended to go on at once, but we should like you to be good enough to produce some documents, of which I will give you a list, and then we shall ask you a few questions? I shall be very glad to produce what you require.
6. We would ask you to supply us with the following documents :—
- (a) Return of the number of inquiries held by the Marine Board at Sydney concerning wrecks and other marine casualties, from 1887 to 1896 (both inclusive), showing the number of vessels and total tonnage for each year.
- (b) Return of the number of inquiries held by the Marine Board at Newcastle, concerning wrecks of vessels and other marine casualties, from 1887 to 1896 (both inclusive), showing the number of vessels and total tonnage for each year.
- (c) Return of the number of inquiries held by the Marine Board concerning wrecks of vessels and other casualties, from 1887 to 1896 (both inclusive), at ports or on rivers other than at Sydney or Newcastle, showing the number of vessels and total tonnage for each year.
- (d) Return showing the total revenue of the Marine Board Department for the year 1883, under the several headings, viz., pilotage, harbour, light, and removal dues; fees, licenses, charges, &c.
- (e) Return of the total expenditure of the Marine Board Department for the year 1883, showing the amount paid for contingent expenses, the amount of salaries and fees paid to members of the Board, and the amount of salaries and allowances paid to each officer, together with his full name, age, and position held for each station during that year.
- (f) Return of steamers subsidised by Marine Board, showing where located, amount of annual subsidy, periods of existing contracts, dates when contracts expire.
- (g) Return showing names of present members of Marine Board at Sydney and Newcastle, distinguishing those appointed by the Governor from those elected by shipowners and merchants; dates when their respective tenures of office close; stated times of meeting; individual attendances of members during year ended 31st December, 1896; rates of remuneration granted to members (a) by salary, (b) by fees; amount of salaries, fees, or allowances received by each member during year ended 31st December, 1896.
- (h) Return of officers and employees, classified under the various branches, such as office staff, engineers, surveyors and inspectors, pilot boats and boatmen, lighthouse keepers. The particulars to be furnished respecting each officer and employee are:—Surname; Christian name in full; age last birthday; date of appointment—(a) by examination, (b) by nomination, (c) by whom recommended; length of service up to 28th February, 1897; break in service (from to); position held; amount of annual salary; amount of allowances, fees, or other emoluments; total amount of salary and emoluments; description, in detail, of duties performed.

Captain  
Hixson, R.N.  
22 Mar., 1897.

- (i) Two copies of regulations under which officers and employees of the Marine Board were granted annual increments of their salaries from the year 1884.
- (j) Two copies each of "Navigation Act of 1871," 35 Vic. No. 7 and 36 Vic. No. 30; also, any subsequent Acts on the same subject, and 60 Vic. No. 36. Regulations issued by the Marine Board to pilots, light-keepers, &c. Laws and regulations (abstract) issued by the Marine Board, 1897.
7. Can you tell us, Captain Hixson, how many steamers and launches you have? There are seven or eight, I think. 1. The pilot steamer "Captain Cook," employed at the Heads; 2. The "Carrington"; 3. The "Premier"; 4. The "Nen"; 5. The "Gladys"; 6. The "Sol"; 7. The small pinnace, and a steamer employed at Newcastle, the name of which is the "Barrossa."
8. All these, with the exception of the one at Newcastle, are employed at Sydney? Yes.
9. Can you supply us with the primary cost of these vessels, and the cost of maintaining the service in which they are employed? Do you require it at once?
10. No. You can prepare it? Yes, I will prepare a return.
11. How long will it take, do you think, to prepare that information? I think it will take a week or two.
12. If we adjourn until this day fortnight, do you think that will give you sufficient time? Yes; I think it could be prepared in that time. I might say that we have really no staff in the office, and are not able to prepare important returns at once. We have a secretary and an accountant, but very little else.
13. Several of the returns are merely formal? I think the returns can be prepared in the time, but I should be glad if you could make it any other day but Monday; this is my Board day.
14. Say Wednesday afternoon? Yes; that would do better.
15. If we gave you temporary assistance could you not do it in a week? I do not think so. You see it is work of a character that can only be done by the men in the office. If you give me until Wednesday fortnight I think it can be done.
16. In the meantime we might inspect the Marine Board Offices, and, although it has not been settled, we might find it necessary to visit some of the lighthouses at Newcastle, Wollongong, and on the Clarence and Richmond Rivers;—could you give us a typical lighthouse? Yes; the Macquarie Light, or Smoky Cape, or Solitary Island; but Solitary Island would be difficult to get at. You would have to go by sea, and would then have to be hoisted up by a rope, which would be rather inconvenient to the members of the Commission. It would incommode the Commission to go there, perhaps; but Smoky Cape would not be either so inconvenient or so difficult.
17. *Mr. Powell* (to the President): When you referred to the cost of the steam and launch service, did you mean the cost and working of each launch? *The President*: I mean first to get the primary cost of the vessels, and then the cost of keeping up the service. *Witness*: We have only twelve men for all the reliefs, and some go to work at 6 o'clock in the morning and some at 7. It is arranged so as to bring it as nearly as possible to the eight-hour system. We cannot keep the men always on duty.
18. We shall be glad, Captain Hixson, of your assistance in this matter? I shall be glad to help you in every way possible.

WEDNESDAY, 7 APRIL, 1897.

PRESENT:—

JOSEPH BARLING, Esq., J.P., PRESIDENT.  
TIMOTHY AUGUSTINE COGHLAN, Esq., J.P.  
JAMES POWELL, Esq., J.P.

Captain Hixson, R.N., further examined:—

19. *President*.] Captain Hixson, we asked you to kindly furnish us with returns, and that you have done;—are these the returns? Yes. (*Vide Appendices 3, 4, 5, 6, 7, and 9.*)
20. *Mr. Powell*.] It appears from one of these returns that 227 persons are at present employed in the Department? Yes.
21. I see that there are ninety-nine who are under 41 years of age, ninety-nine who are under 61, and twenty-nine who are over 60? Are these the numbers given in one of the returns?
22. Yes;—do you accept them as correct? Yes.
23. Is it a fact that the Board has recommended the retirement of seven officers? Yes.
24. The Board has recommended the retirement of G. Whitnall, 76; J. R. Lawrence, 73; S. Williams, 71; W. May, 69; J. Skelton, 69; W. Gambell, 68; and J. Pain, 65; and are continuing six others over the age of 65, and nineteen over the age of 60? We are scarcely retaining these others, but we are making a commencement with the seven.
25. Does it not appear to you that the master of the "Captain Cook," a man 70 years of age, should give place to a more active man? He would have followed if the first batch had been retired. According to the Act he should retire.
26. Are there not charges made against him? Yes, partially.
27. What was the nature of such charges? The second officer, a man named Hay, was strongly recommended to me. He was officially recommended to me. Eventually he was appointed second mate of the pilot steamer. He gave a lot of trouble. He was once summoned before the Marine Board, and was very rude to the Board. He suggested that Captain Creer, master of the "Captain Cook," was never wholly sober. The Board held an investigation, but the charge was not proved.
28. Will you lay the papers on the table? Complete papers are not available, but the Board were satisfied that the charges were groundless.
29. *President*.] You did not take the evidence on oath? I am not sure whether this man was sworn or not. It was a departmental matter, and I am not sure whether we have the power to take evidence on oath in such cases.

30. You are not sure whether you have the power to take evidence on oath when it is only a departmental matter? I am not, I am sure we do not consider we have.

31. *Mr. Powell.*] Have the salaries paid to the officers of the "Captain Cook" been reduced since this report of 1894? No; except in accordance with the regulations. But I have never seen an official report relating to the "Captain Cook." Was there one?

32. Yes; there was one. [*Copy report handed to witness*]? Oh, yes! But this document never appeared before the Marine Board.

33. Since that time have they been reduced? Those who have been taken on since have been taken on at a lower rate of pay.

34. There have been taken on two at £173, two at £118, and one at £101, and that shows a saving of £8 a month? Yes.

35. And as to the other employees all along the coast? These men have also been taken on at a lower rate of pay.

36. *President.*] As new men came on, they were put on at a lower rate of pay; while those who were on were left at the rate they were getting in 1883? Yes. Ever since then the Board—just like the Public Service Board have been doing—have been grading the men.

37. And, as the old men fell out, the new men came in under the revised scale? Yes.

38. *Mr. Powell.*] There are two look-out men—one paid £165 per annum, and the other £150 per annum;—what are the duties of these look-out men? They keep a look-out at night. They look out from South Head. I may mention that the look-out at South Head is one of the most important of the stations around Sydney. We have a system of signals there, the night signals being coloured lights. One of these men attends to the leading lights—apart from his duty as look-out man—for which he gets £1 per month; the other also attends to the leading lights in his turn, and in addition is second coxswain of the life-boat, for which he receives some remuneration.

39. I should like to understand exactly how these men's duties are arranged? There are two men, and the watch is divided; one being on watch the first part of the night, and the other the latter part. They are not both on the look-out duty at the same time. The man who is not on look-out duty attends to the leading lights. This is an economical way of providing for this duty.

40. I see that the man who acts as coxswain of the life-boat also receives £12 per annum for that duty? Yes.

41. The duties of the second coxswain are purely nominal, I think? He has to keep the life-boat in order, and be available in the event of the boat being wanted.

42. The man who receives £165 per annum, I understand, is 56 years of age; and the other, who receives £150 per annum, is 66 years of age? Yes. The Board drew the attention of the Government some time ago to the fact that there were many over the age, and recommended that they should be gradually retired. It was then proposed that this man, Francis, who is 66 years of age, should be one of those to go.

43. Are rations supplied to all the officers on board the "Captain Cook"? Yes.

44. The pilots as well? Yes, to the officers and pilots.

45. Are rations supplied to the seamen? No.

46. To the boatmen? No.

47. To the look-out men? No. The pilots are sometimes on the steamer and sometimes on shore; they are thus taken away from their homes, and allowance is made to them and to the officers who mess with them on the steamer.

48. Is the "Captain Cook" continually outside the heads? No; only occasionally.

49. Does she only go out when vessels are signalled? No. I send her away on occasions, and she is used in case of fire breaking out in the harbour.

50. She only goes out for pilot duty when vessels are signalled? Yes; except that she lies between the Heads in thick weather when signals cannot be seen.

51. How many pilots go out with the vessel? There are two put on board and left there until they are shipped, and then others take their places.

52. Do the pilots live on board the ship? They are obliged to remain on board when once signalled for, and are only released by being shipped.

53. Is it a fact, as stated in your evidence before the Civil Service Commission, that the "Captain Cook" cost over £23,000? £22,500. This question was put to me unexpectedly, and I did not attempt to make up an exact estimate.

54. Is the reduced wages account for the vessel, as it stands now, £3,300 per annum? Yes.

55. Without including the salaries of pilots? Exclusive of the salaries of pilots.

56. There are four sea-pilots at £398, and one at £250 per annum; I suppose that difference is explained by the regulations? Yes.

57. *President.*] Due to seniority? Yes. We found that it has established quite an *esprit de corps* by taking young men at small salaries and increasing them gradually.

58. *Mr. Powell.*] Are the pilots all engaged on the same kind of duty? Yes.

59. Is the salary paid to the pilots a net salary, or are there any deductions or payments? The only deduction is the percentage to the Superannuation Fund.

60. An allowance of 18s. per week is made to the master, engineer, and two pilots for rations;—to whom is that allowance paid? It is for the men on board the vessel, and is actually paid to the master, the same as the other payments.

61. There is a cook and providore shown on the list;—I suppose he caters and cooks for the seven officers? Yes, and for the crew as well.

62. The provisions for the crew are not supplied by the Government? No.

63. Is there anything to show that the providore actually expends this £6 6s. per week allowed by the Government? In early days there was an inquiry into this matter by a Select Committee of the House, and the report advised that the money should be given to the master in place of the providore, and this practice is still followed.

64. How does he deal with the money? I do not know exactly.

65. Is it possible that the 18s. per week is paid to the persons for whom it is intended, and they allowed to expend it in purchasing their provisions? No, I do not think so.

66. *President.*] All you know is that the money is paid to the master, and you make no inquiry as to how

Captain  
Hixson, R.N.  
7 April, 1897

Captain  
Hixson, R.N.  
7 April, 1897.

how it is spent, and you have heard no complaints? None. The money is expended for those on board the vessel, and I am pretty sure the master can show how it is expended.

67. *Mr. Powell.*] The cook receives a high salary? Yes.

68. Is this 18s. per week paid from a Parliamentary Vote or from Contingent Expenses? From Contingent Expenses.

69. Can you explain why the seamen are paid sea-going wages, which includes board, of £8 per month, and the boatmen £128 per annum, an average of £10 13s. 4d. per month? They are taken on according to the regulations at £8 per month, and their salaries gradually increased.

70. I see that there are six seamen and four boatmen employed? You are now referring to another class of boatmen. These men are engaged on the "Carrington," and are called the "up harbour boatmen." Attached to the crew of the pilot steamer there are the four boatmen and two look-out men.

71. What is the "Carrington"? She is a small screw steamer that takes the pilot off the vessel after he has brought his ship into port.

72. Speaking generally, all seamen are boatmen? Yes.

73. And most boatmen are seamen? Yes.

74. There is no reason why there should be such a discrepancy in the salaries except that you explained? No.

75. *President.*] The regulations are passed by the Marine Board? Yes.

76. This "Carrington" was a steam launch? She has always been in the service upon which she is at present engaged.

77. *Mr. Powell.*] Are not the wages paid to the officers and crew of the "Captain Cook" high in comparison with those paid on first-class passenger steamers? If you take the intermediate wage, I do not think they are; but if you take the maximum, they are.

78. With regard to the salaries of Captain Creer and the mates, are they not high compared with those paid on first-class passenger steamers? They are if you only consider the maximum salary; but if you take the average, I do not think so.

79. The money actually paid? It is, perhaps, high now.

80. *President.*] What you mean is that by the working of the regulations the amount fluctuates, and that at the present time it is abnormally high, but will come down? That is so.

81. *Mr. Powell.*] Are not the wages paid by the Marine Board very much in excess of the wages paid in the other colonies to all concerned? Perhaps they are in some cases, in others not so. We have papers where pilots at Newcastle compare the lowness of their wages with those of pilots in the other colonies.

82. In some cases the wages paid appear to be double? Yes.

83. Is not the pay of £25 per month higher than that received by the masters of vessels of about 1,500 tons? Yes, I think it is; but if you refer to the master of the pilot steamer, I must point out that he is the Chief Officer of the Department in Watson's Bay. Everything is under his control there.

84. He appears as master of the "Captain Cook"? Yes; but he has control over everything in Watson's Bay.

85. The firemen are paid, one at £123, one at £145, one at £123, and one at £120 per annum;—that seems rather high in comparison with the pay of leading firemen on the steamers? The men on these steamers are found. Our maximum wages are, no doubt, liberal.

86. Looking at it from an economical point of view, do you think there would be any difficulty in getting a master for the "Captain Cook" at £25 per month, mate at £15, second mate at £12, firemen at £10, seamen, boatmen, and look-out men at £9, without allowances, or any of the other officers at their respective salaries? I have no doubt you could obtain men to fill these offices at those salaries without allowances.

87. You have a Chief Engineer on the "Captain Cook" at £272 per annum, and a second engineer at £200, with an allowance for rations of 18s. per week? Yes; the regulations are responsible for that.

88. Are not the engineers' salaries regulated by their Association? We have never heard anything about the Engineering Association, but you will find by the regulations that they come in at a minimum wage and arrive at this stage by servitude.

89. *President.*] How long does it take a man to rise to the top of his grade? It takes a pilot twenty years; a boatmen several years.

90. *Mr. Powell.*] Comparing the number of hands engaged in unskilled labour on the "Captain Cook" with the number on intercolonial ships, does not the number seem excessive; there are fifteen men on board the "Captain Cook" in addition to the officers? I must point out that the service in that ship is different to any other service on the coast, as these men are always on duty, Sundays, holidays, &c., and we must have a strong crew. We have excessive numbers on account of the constant duty the men have to perform. Leave must be given to some of them.

91. They have nothing to do but stand there all the time? They have to keep their ship and engines in proper order.

92. *President.*] I suppose they keep a correct log of their work? Yes.

93. Could you tell us, roughly, for about what period during the twenty-four hours they are actually employed? They are lying idle much longer than they are engaged—perhaps two-thirds of their time they are idle.

94. *Mr. Powell.*] Is it a fact that it is proposed to alter the "Ajax" at a cost of £4,000 for the Pilot Service at Newcastle? Yes.

95. Will that amount be sufficient for the purpose? I have reason to believe it will not.

96. Parliament has voted £1,573 for the salaries of a crew for that vessel? Yes.

97. No one is yet employed for that particular service? No.

98. What is the reason for paying the master of the "Captain Cook" a salary of £416 and rations, while it is only proposed to pay the master of the "Ajax" £250 per annum? This is a special case, and these men will be taken on for their first service in the Government.

99. *President.*] I understood that you had recommended Captain Creer's retirement; in that event, what salary would you give for the position? We would probably recommend one of the pilots; whether he would receive anything in addition I do not know.

100. What would you consider the commercial value of that position? I should say about £350 per annum.

101. And that you would think a fair proportional value in comparison with the "Ajax"? Yes.

102. *Mr. Powell.*] Are there fewer difficulties to contend with at Newcastle than at Sydney? In Sydney, the captain has independent charge; at Newcastle there is a harbour master on the spot. 103.

Captain  
Hixson, R.N.  
7 April, 1897.

103. If the proposed arrangement is carried out and the "Ajax" goes to Newcastle, the masters and the officers will be treated in the same way as the master and officers of the "Captain Cook"? Yes; probably.
104. Why are the crew not supplied with rations? There would be no trouble as far as the boat at Newcastle is concerned; but, if we were to pay the crews of these two vessels for rations, we should be called upon to pay all the lighthouse men, boatmen, &c. on the coast, as well.
105. *Mr. Coghlan.*] Is there any difference between paying this allowance to the officers and to the crew? The officers are taken from their homes; the men are supposed to live on board their vessel.
106. *President.*] Would the men be more active at Newcastle? Yes.
107. Would you think the "Ajax" would be employed for two-thirds of her time? Perhaps she would.
108. *Mr. Powell.*] In that case the "Ajax" would be doing more work than the "Captain Cook"? Yes.
109. The engineers' salaries seem to be much lower than on the "Captain Cook"? They are put down according to regulations.
110. In the "Captain Cook" you have four firemen and six seamen, and you only propose for the "Ajax" three firemen and two seamen? There are four men on shore at Newcastle who would be transferred to the "Ajax."
111. Then the Estimates do not show the whole cost of this vessel? No.
112. These four men do not appear on the books of the "Ajax"? No.
113. In the return of the Collector of Customs, it appears that the pilots in Sydney attended in all 629 vessels in the year 1896, and that 847 vessels were attended by the pilots at Newcastle? That is so.
114. Twelve pilots seems a very large staff for that work? If we knew when the vessels were coming a smaller staff would suffice; but as it is, I do not think we could reduce the pilots at Sydney or Newcastle. These men are kept constantly on board the vessel waiting for a job.
115. *President.*] Have you ever compared the relative shipping with the expenses in Newcastle and Sydney? No I have not, but this could be easily done.
116. *Mr. Powell.*] Is it a fact that there are times when all hands, more or less, are unemployed? Yes.
117. In your estimate for 1896-7, the cost of the Newcastle pilot system is shown at £5,158 per annum, while the collections for 1896 were £18,650; so that it cost 27 per cent. at Newcastle to maintain the service? Yes.
118. At Sydney the system cost £7,334, and the collections for the year totalled £12,886—that is, 57 per cent.—a difference of 30 per cent. between the two ports; do not these figures show that the Newcastle pilot system earns more and costs less than Sydney? Yes.
119. Can you explain that? Only by the fact that there are more vessels at Newcastle in a smaller space requiring pilot's services than at Sydney. The Sydney staff is often idle, but still I do not think we could reduce the figures you have brought forward. Sometimes I have known twelve pilots required in Sydney in the one day. I would like to point out, however, that in both cases the collection is considerably in excess of the cost.
120. *President.*] Is it not likely that the charge for pilotage will be reduced? The shipping authorities might ask for a reduction if they knew we had such a large return, but the pilot fees are being reduced considerably.
121. *Mr. Powell.*] You stated in your evidence before the Civil Service Commission that the pilots and boatmen go out in bad weather, and that they also go outside Nobby's; that being so, and the service at Newcastle being well performed at a much lower cost than the Sydney service, do you still recommend the "Ajax" for pilot work at Newcastle? Yes; there have been numerous appeals from there for a steam pilot service. The boat system is very dangerous.
122. The pilots' pay at Sydney, I see, averages £368 per annum; at Newcastle, £269—a difference of £100 per annum;—is there any reason for this difference except the regulations? No.
123. *Mr. Coghlan.*] Are there any special difficulties in regard to the pilot service of Sydney? No; the ships are sometimes very large, and of course more difficult to handle.
124. How do they compare with Newcastle? There are more difficulties to contend with in Newcastle than in Sydney. In bad weather both places are difficult.
125. *Mr. Powell.*] Taking the other ports, excepting Newcastle, the highest salary is £240 per annum;—is there any reason why the pilots at Sydney should be paid the larger salary? I think that the first-class pilots, as at Sydney and Newcastle, have a higher marketable value for their services than the bar-harbour pilots.
126. The bar-harbour man is in the second grade? Yes.
127. *President.*] The shipping that frequents the bar-harbours is very much smaller than in Sydney; but would the difficulties of navigation be greater? Perhaps they might be; enormous difficulties have to be contended with sometimes.
128. Taking the Manning River for instance, would not a great deal of skill be required to take a vessel in there? Yes; but local knowledge overcomes difficulties of that kind to a great extent.
129. *Mr. Powell.*] At the sixteen out stations at which pilots are employed there are in all 52 men, costing £3,421 for pilots, and £6,115 for boatmen; what work can be shown for this £10,000;—have you any record of the number of vessels that enter the ports? Yes; we have a return from the pilot at every bar-harbour giving such information.
130. Will you furnish us with a return of all vessels entering the various ports of the Colony other than Newcastle and Sydney, distinguishing the regular coasting steamers from ordinary vessels? Yes.
131. Steamers are employed at ten of these ports, and there are also tugs shown in some places;—are these tugs in constant employment? It is difficult to say; they work under special arrangements.
132. When vessels are brought in, do they pay the pilot? No; they pay the tug.
133. And the Government pay the tug subsidy in addition? Yes.
134. Are these tugs regulated as to the charge they make? Yes.
135. How do you know that they do not charge more than they are entitled to? I take it that we would have complaints from their employers.
136. Do you think this is a good arrangement? I think it is a logical and well devised system. The Government occasionally call for tenders for carrying out the service, and everything is left between the shipowner and the tug; we simply pay the tug the subsidy agreed upon.
137. There is a sum of £900 voted for a tug for the Clarence River, and £500 for one at Wollongong;—is this £1,400 required in addition to the subsidies paid to the tugs? Yes; but this money is not all expended. It is provided on the Estimates, but we only pay according to the tender for the service. The total is £7,387; that is the actual cost for the tug service for the year.

Captain  
Hirson, R.N.  
7 April, 1897.

138. Taking the Richmond River as an example of these out-stations generally, there is a total outlay for the pilot station there of £2,656; as there is a tug, why are the boatmen needed? They are required to man the boat for the pilot to attend to buoys and beacons, and many other things in connection with the service. The tug is sometimes at sea, or some distance up the river, and not always on the station. The reason there are six boatmen at the Richmond River is that one is in charge of the lighthouse and another is the look-out man on a hill close by.
139. Take the Tweed River; the cost there is £965, and the tug subsidy £849—a total of £1,814;—is there anything to warrant the expenditure of that sum? It is a difficult river to navigate.
140. This tug is supposed to be for the benefit of the Tweed and the Brunswick Rivers; there is no station at the Brunswick now? No; but it was a busy place when the railway was being constructed.
141. Is it possible to obtain any information with regard to the amount of work done by these subsidised tugs? Scarcely; I do not think the trade of the rivers could be managed nearly as well without the tugs.
142. Could we get any information of the number of vessels they give service to? I do not think so.
143. The Bellinger River costs £1,400 per annum;—that is a large sum? Yes; it does seem large.
144. Altogether, subsidising the tugs has cost in ten years the sum of £85,824. Now, looking at this outlay of money, and without knowing what work is done, do you consider it an economical system? No, I do not; but I think the ships are charged for this convenience, and as the Marine Board Department has always been a revenue-producing one, I do not think that the shipowners would be satisfied unless they got all these conveniences. Every ship that visits our ports pays 4d. per ton for harbour and light rates twice a year. In consideration, the Shipping Companies expect the Government to give them such a service as they now have.
145. Was not the port of Newcastle at one time subsidised? Yes; but it now pays for itself.
146. I see the subsidy at the Manning River is down to £400; it was previously £600? Yes; these subsidies gradually vanish as the trade increases.
147. At Kiama there is a pilot without any boatmen, and he is returned as pilot-in-charge of lighthouse and moorings—salary £236, quarters £30;—what does he do? He is there to look out for the warps on the wharf, and has charge of the lighthouse.
148. £266 is a large salary for the duty? It is not an illiberal one.
149. Is it known that some of the pilots, from lack of work, follow other occupations? I have heard of one man who owns some cattle, but he is the only one.
150. At one of the stations the pilot has his son as a boatman;—is that desirable? I do not know. I have never heard any complaints. Perhaps it would be better if he were employed at another station. I do not think the father is engaged in farming and grazing.
151. These men are not fully employed? No.
152. Do you think it is advisable to maintain pilot stations where there is no commerce? Yes; I think so, as the ships are taxed.
153. Do you not think the rates generally might be fixed at a much lower scale? Yes; they might.
154. Do you think some of these stations might be done away with? If we attempted to withdraw these stations, the people interested would make very strenuous objections.
155. With regard to lightkeepers—the highest paid is stationed at the light-ship in Sydney—their salaries range from £120 to £319 per annum; is that caused by the regulations? Yes.
156. Supposing there was a vacancy at Montague Island, or the Solitaries, would a man be sent there at £120 per annum? He might be sent there at £96 per annum.
157. Then the importance of the light does not count? There are harbour and ocean lights; the ocean lights are paid the most for. When we take a man on first we send him to one of the outside places at £8 per month.
158. The highest salary is £319, and the lowest £120 per annum? Yes; if you count quarters.
159. Does the £96 per annum carry quarters? The £96 I mentioned is not including quarters.
160. The highest paid lightkeeper is stationed at the light-ship? Yes.
161. Why is such a large staff required for the light-ship? They have two pile lights in addition. We pay the master £2, and the boatmen £1 per month for looking after those lights.
162. £816 per annum seems rather a large sum to pay for this light? Yes.
163. At Newcastle you have three lighthouse-keepers whose respective ages are 60, 59, and 63 years of age;—is it desirable to keep three men of such an advanced age at the same station? The first man is Johnston, the man saved from the "Dunbar." He is quite fit for his duties.
164. These men come under the Local Board at Newcastle? Yes.
165. Do you accept their recommendation? The men are actually under the control of the Marine Board, but we accept in almost every case their recommendation.
166. It appears from your return that the majority of your people attained the maximum salary on the 13th August, 1885? I may say that about thirteen of those have been recommended for retirement.
167. I suppose the increments granted subsequent to that date are for good conduct? Yes.
168. The pilot at the minimum salary, £200 per annum, has all the qualifications of the pilot at £400? Yes, except experience.
169. Has not the increment system had the effect of forcing wages above the market value? Perhaps it has; but I think that the midway wage is about the right wage for the Service.
170. Is it a fact that the wages paid by the Marine Board have regulated the wages paid to boatmen in every Department of the Service? I do not know.
171. Do you think it would be possible to get any number of active boatmen at £100 per annum? We take them on at £96 per annum.
172. According to the regulations of 1885, pilots received £200 per annum and an allowance of £50 per annum for quarters; if you take a pilot on and have not a house to put him into you give him £250 per annum? The regulations are that if a man is found a house he gets £200, and otherwise, £250 per annum.
173. This increment system is continued by the Marine Board although it has been abolished by Parliament? Necessarily so.
174. Was that system stopped by Ministerial authority? It was, and is still in abeyance.
175. Is it an understood rule that at isolated lighthouses three men should be stationed? Yes; I may mention that not long ago at one of our isolated lighthouses one of the men was killed, and a short time afterwards another blew his hand off.

176. Three men are only required in the isolated places? Yes.
177. You are still proposing to retain these old lightkeepers? We were going to follow up our previous recommendation, but the matter was delayed by the Public Service Board. Captain  
Hixson, R.N.
178. Do you think it is desirable to keep men over the age of 60 years at lighthouse work? Yes; except at places like Solitary and Montague Islands, I think they might be employed up to 65 years of age. 7 April, 1897.
179. You make different arrangements on the rivers for the maintenance of lights? We make an arrangement with the people in the locality to maintain these lights for a certain amount of money.
180. How are they paid? Out of the Incidental Vote of the Department.
181. How much each? Some £9, and others £7 per quarter; we make the best arrangements we can with them. We provide the lamps and shades and they supply the oil and wicks. There are eight of these lights on the Richmond, four on the Clarence, and five on the Macleay River.
182. You have recommended the assistant at the flagstaff for retirement—he is 71 years of age; also the signalman at South Head? Yes; and Francis is also over age.
183. You have a junior operator at the Heads who receives £100 per annum and £30 for quarters;—what does he do? He assists the signal master in hoisting signals and keeping a look-out, and works the telegraph instrument.
184. Who does he telegraph to? To the head office.
185. He does not telegraph to the other man at Fort Phillip? Yes; through the Exchange and head office.
186. Salaries of £50 and £25 per annum are paid to persons in charge of moorings at various places;—what benefit is gained? A little coaster goes in occasionally, and these men are pilots in charge of the moorings. They have to assist the vessels coming in. Some years ago these amounts were the same, but ten or fifteen years ago one of them was doubled without reference to the Marine Board.
187. The list of boatmen is very formidable; there are 102 men, costing £14,676 per annum; the salaries range from £229 to £96—there are twenty-three different rates of pay; I suppose that can be explained? Yes; in 1883, before any increments were granted, the boatmen were receiving £108 all round and the scamen £108 per annum.
188. There are two boatmen, 76 and 65 years of age respectively;—have you recommended them for retirement? Yes.
189. Some of these boatmen are really not boatmen? That is so; they are on the staff as boatmen, but are actually not boatmen; they are lightkeepers.
190. With regard to quarters generally, are we to understand that when an allowance is shown it means the occupation of a building owned or hired by the Government? Yes; and in the Marine Board Department the people are obliged to live at those particular places.
191. Do you think that all men employed by the Government should be required to reside within a reasonable distance from the place of their employment? Yes.

THURSDAY, 8 APRIL, 1897.

PRESENT:—

JOSEPH BURLING, Esq., J.P., PRESIDENT.  
JAMES POWELL, Esq., J.P.

Captain Francis Hixson, R.N., further examined:—

192. *Witness.*] With regard to the return of the cost of the tug service, a far greater saving is effected in the present service than this list shows. It gives the figures for 1886 and 1896, but towards the end of the latter year the tenders received were considerably reduced, so that the actual rates are less than would appear from the return furnished. (*Vide* 144.) Captain  
Hixson, R.N.
193. *Mr. Powell.*] I think you told us that you had been President of the Board from its inception until now? Yes. 8 April, 1897.
194. You have had ample opportunities of forming an opinion of the working of the elective principle of that Board? Yes.
195. How do you think that principle has worked? Very well.
196. Is the voting strictly confined to the owners of vessels registered within the colonies? Yes.
197. No other interest of any kind is represented under the present Act? Only ships registered in the Colony are represented.
198. Do you know how many persons are entitled to vote? Something like 150. The list is published annually.
199. I find there are actually 159? Yes.
200. If you analysed the voting power you would find that the control rested with owners of shipping of an aggregate tonnage of from 100 to 250? I have not studied the system very much. These men are elected apart altogether from the Marine Board. I have a general knowledge of the affair.
201. You take the names from the return furnished by the Collector of Customs? Yes. I think it would be very improper on my part to interfere in such matters.
202. Are the owners of vessels registered outside this Colony wholly unrepresented at the Marine Board? The vessels registered outside the Colony have no representation on the Marine Board.
203. So far as you can judge, you think the elective principle assures the return of the fittest persons as Wardens at the Board? It should do so.
204. Do you think it does? There has been considerable competition in early days, and the shipping community have taken much interest in the matter. There was no contest last year.
205. Is not the tonnage registered within the Colony infinitesimal compared with the tonnage trading with the port? Yes.
206. For what period are the Wardens elected? Three years.
207. Are their seats vacant at the end of that period? Yes, for a day or two.
208. There must be an election, or a form of an election, every three years? Yes.
209. Have elections been contested of late years? Yes.
210. Could you form an idea of the number of votes recorded at the last election? Somewhere between 200 and 300 for the successful man, and for his opponent about thirty or forty votes.
211. The old members were returned by a large majority? Yes. 212.

- Captain Hixson, R.N.  
7 April, 1897.
212. The number of votes for each could not have been more than the total appearing on the list? No.
213. Are these elections conducted by personal voting? Yes; unless there is no opposition.
214. Proxies are not taken? No.
215. How do the companies vote? They usually vote by their secretary or manager.
216. Is the voting by ballot? Yes.
217. The members of the Board at Sydney and Newcastle divide fees to the extent of £800 per annum? Yes; that is correct.
218. Has there been any change in the Wardens elected of late years? No; not for many years.
219. Have Captain Broomfield and Captain Maclean held their seats for twenty-two years? Yes; Captain Broomfield from the inception of the Act, I think, in 1871.
220. Captain Jenkins has held his seat for many years? Yes.
221. In the qualification for these gentlemen, it is necessary that they should be owners of not less than 250 tons of shipping? That is so.
222. Section 9 of the Act restricts the voting to owners of foreign-going and coast-trade ships? Yes.
223. Do you think the owners of ships laid up and not sea-going should be entitled to vote? No.
224. You know nothing about their being on the list? I have no control over that.
225. During the year 1896, I see by your books, the Board had fifty-six meetings;—was the business generally of a formal nature, such as the issue of certificates and dealing with ordinary correspondence—practically what might be considered the duties of a Chief Clerk or Under Secretary of a Department? Yes.
226. A great deal of the business is made up of that kind of correspondence and confirmation of certificates? Yes; according to the Act. If there are no inquiries, the business is exactly of the nature you describe.
227. It appears that the average number of inquiries for ten years was about twenty per annum at Sydney and about 6·4 at Newcastle? Yes.
228. In cases of collision, involving loss of life, on the Darling or Murray Rivers, is any action taken by the Board? We have scarcely ever taken any action in such cases.
229. If vessels get snagged or cargoes damaged? We have not gone that distance from head-quarters.
230. The owners of those vessels are registered with the Board? Yes.
231. In cases of accident the matter is not referred to you, and you do not institute inquiry? There have been several attempts to establish local Boards, but the Marine Board have always set their faces against it.
232. In dealing with the cancellation and suspension of certificates, are the investigations conducted under the provisions contained in the eighth part of the Act 17 and 18 Victoria? They are dealt with as provided for by our Act, which embraces the Act that you refer to.
233. You conduct your inquiries under the eighth part of the Imperial Act? Yes; that is, if the certificates of the person being dealt with are Imperial.
234. Has the local Marine Board at Newcastle ever made any investigations into cases of misconduct? Yes.
235. Does the local Newcastle Board hold inquiries without reference to you? The local Board has to apply to the Marine Board for authority to hold these inquiries.
236. You think the local Board are under the control of the Sydney Board? Yes.
237. Has the Marine Board at Sydney ever set aside the finding of the local Board? No; but we have modified them.
238. With or without the evidence before you? With the evidence before us.
239. You review the action of the local Board? We do.
240. You do not have the advantage of hearing the evidence? No.
241. In connection with the inquiries instituted by the Marine Board, do you find the members of the legal profession attend as advocates? Frequently.
242. Does the Board have any legal assistance? Very seldom.
243. In that case, does the legal assistant sit as a member of the Board? No; he merely has the advantage of suggesting questions to meet any point raised by the other side.
244. I suppose you are aware that in the English practice, according to the Act relating to unsafe ships and the sending of unseaworthy ships to sea, the powers are exercised by Courts of Survey? The Court you refer to has the benefit of a surveyor's report for its guidance.
245. The Courts of Survey contemplated by the Imperial Act refer all such cases as these to a Judge and one of the Courts—the District Court, or such Court as the Board may arrange with the Lord Chancellor, and two assistants of nautical skill sit with the Judge;—you have no such conditions? No.
246. Do you report any of your findings to the Board of Trade? All of them; and if we are dealing with the certificates of the neighbouring colonies we send full reports of the matter to them also.
247. Do you send the reports to the Board of Trade as a matter of courtesy? No; as required by the Imperial regulations.
248. You act for the Board of Trade? Yes; and they have the power of revising our findings.
249. The second subsection of section 88 recognises that you conduct your inquiries under the Imperial Act? Yes; but for that subsection we could not deal with Imperial certificates.
250. And you advise the Marine Boards of the other colonies of the suspension and cancellation of certificates? Yes; if we are dealing with a certificate issued by them.
251. When you suspend or cancel a certificate do you take such action before the report has been confirmed by the Governor? The Act necessitates our having the findings on a case relating to an Imperial certificate approved by the Governor, but the local certificates are different.
252. Is there any appeal against the decision of the Board relating to the suspension or cancellation of certificates? Not in the Act, but the Common Law provides an appeal to the Supreme Court.
253. With regard to the fixing of the load line, is that a voluntary act on the part of the owners? Not by the late legislation.
254. The fact remains that the fixing of the load line is, in the first place, a voluntary act on the part of the owner? Not now; it was.
255. Have you the power to fix the load line, and do you fix it? Yes.
256. Do you charge a fee for this purpose? Yes.
257. In every case? If the vessel is under survey for a passenger's certificate, we do not make a special charge; but if a special request is made we charge a fee for the surveyor's work. 258.

258. About those Llewellyn frauds; the secretary reported that when the Board made their annual visitation to the lighthouse they found that the salaries were in arrears, and the discovery led to a report being made to the Under Secretary for Finance and Trade? That is correct.

259. The Treasury Inspector reported that the secretary should have exercised control over the accountant, but was not allowed to do so; in your memo. you stated that the contrary was the case? That case was dealt with by the papers being put on the Table of the House, and the Premier stated that I had made an explanation which was considered sufficient.

260. Does the secretary, by virtue of his office, have control over every officer in the Department? Only in my absence.

261. Does he supervise the accountant's work? Scarcely; but there would be no objection to his looking into the books.

262. Should he not do it as his duty? I think it comes within the province of my duties.

263. That makes the secretary responsible to you for his own work only? Perhaps. The same would apply to the pilots and every officer who is responsible to me. The secretary has ample work to fill up his time.

264. In answer to questions before the Civil Service Commission, you said that the accountant has to receive certificate fees and pay them to the Treasury;—are they paid to the Treasury? Yes; certain of them.

265. You have a banking account? Yes.

266. And pay them to that account? No; we pay them direct to the Treasury in the end.

267. What becomes of the money during the time you hold it? It is paid into our banking account.

268. Is the banking account in your own name? Yes.

269. Where do you bank? At the City and Commercial Banks.

270. You have an account at the City Bank in your own name, and you draw cheques occasionally and pay them to the Treasury? Yes.

271. You examine and check the pass book? Yes.

272. You initial the pass book? Yes.

273. And you say that all the entries are properly made? Yes.

274. Do you think that you can give sufficient of your time to check the expenditure of £50,000 per annum in such a manner as to satisfy yourself that everything is correct? I do not find any inconvenience in doing it; I am quite sure the secretary has less time to do so.

275. It has been the practice of your Board to visit the lighthouses annually in company with your secretary? Yes.

276. Can you give us an idea of what amount these trips cost when you charter a special steamer? We used to pay £400 for the steamer.

277. What other expenses are there? The unofficial members of the Board were paid 15s. per day travelling allowance.

278. Your latest trip was made in the Government steamer—that only cost you the Wardens' fees? The Wardens did not draw fees.

279. Then there was no expense attending the latest trip? No expense.

280. I suppose the lighthouse-keepers and their assistants, isolated as they are, look forward to the visit of the Board, and have everything in nice order? Very much so; but there are frequently little troubles to settle.

281. They have everything ship-shape in anticipation of your visit? Certainly.

282. *President.*] With regard to the £400 paid for the charter of the steamer, does that include provisions? Yes; but not wines.

283. Do the members of the Marine Board draw their 15s. per day as well? These members were put to expense for wine, &c; and it is their time which is taken up, not the Government's.

284. *Mr. Powell.*] Have you any guarantee that the condition of efficiency you find on your annual visits is maintained during the whole year? I think our lights and stations bear an excellent character; and if there was anything wrong we should soon find complaints.

285. But you do not know anything about it apart from that? No.

286. Would it not be more effective if an officer were to visit, examine, and report? No; I do not think an inspector would be at all an advantage.

287. How many days do these trips last? Ten or twelve.

288. A good number of stations are visited? Yes.

289. *President.*] Do the non-official members of the Marine Board get their fees while they are travelling? They can scarcely be called fees. It is a payment of £2 2s. per week. This is all they get, no matter what they do.

290. *Mr. Powell.*] In 1896 there were fifty-six meetings held, and the wardens were paid £2 2s. per week each, without reference to the number of sittings? Yes.

291. Would it not be possible to classify the lighthouses in the first, second, and third classes? They are classified at the present time.

292. Is Montague Island first-class? Yes.

293. Hornsby? Second-class.

294. The light-ship? Second-class.

295. Fort Denison? Third-class.

296. Newcastle? Second-class.

297. Green Cape? First-class.

298. Broken Bay? Second-class.

299. Port Stephens? Second-class.

300. Cape St. George? Second-class.

301. Ulladulla? Third-class.

302. Nelson's Bay? Third-class.

303. You told me that there were first and second class lighthouses;—are the salaries fixed by the regulations? Yes.

304. Out of the Vote for Miscellaneous Services I notice that the sum of £60 is paid for a leading-light in the eastern channel;—is that light attended to by the lightship people? No.

Captain  
Hixson, R.N.  
8 April, 1897.

305. There is a sum of £1,000 for beacon lights at several places? We have eight pairs of lights on the Richmond River, five on the Macleay River, and four on the Clarence River. Besides that, there are a lot of leading-lights at Newcastle.

306. Do you regard the electric light at South Head as a success? Yes, quite a success.

307. Is it more economical than oil-lighting? No; it costs about 16s. 6d. per night to maintain, irrespective of salaries.

308. The engineers' pay amounts to £473 for two men;—how does this compare with men at the same class of work outside the Service? I do not think there is anyone with whom you can compare them.

309. The point we are upon is whether these men are paid more or less than they should be? The principal engineer is the man in charge of the whole establishment. He gets a salary of close upon £300 per annum. The £473 pays the salaries of the two men and provides them with quarters.

310. Can you compare these men with anybody else? This place is peculiar. The men work all hours—Sundays, holidays, &c.

311. In the return furnished by you it appears that the salaries have increased from £30,434, in 1883, to £51,187, in 1896;—is that correct? No; I think there is some mistake. That £51,187 is the gross expenditure of the Department.

312. I see now that this includes some tug subsidies and contingencies? You will find that there is not a marked increase in the salaries.

313. There is a difference of £10,000? No; I think the difference is about £7,000.

314. The pilot, harbour, and light rates are collected by the Customs? Yes.

315. The amount for 1895 was £59,000? Yes.

316. And the fees and licenses, amounting to £1,600, were collected by your own officers? Yes.

317. Would it not be better to have the whole lot collected by the Customs? No. The two things are very different. There is no trouble whatever in collecting the pilotage, harbour rates, &c., at the Customs, as the vessel clears there; but in the matter of the rates for certificates it is different. It is better for the man to come to the Secretary of the Board, pay his fee, and receive his certificate right away.

318. What check have you? We have the Treasury check.

319. From the return it appears that you have seven steam launches, at an annual cost of £3,000;—what service is rendered by these vessels? The "Carrington" is the up-harbour pilot boat; the "Premier" is the yacht used by the Government and distinguished visitors to the port; the "Nea" is the Governor's boat, and used by Ministers and other celebrities as required. The other three launches are all closely engaged in the business of the Marine Board—harbour pilots, inspectors, and various other works.

320. With reference to the boatmen, you said you tried as far as possible to keep them within the eight hours' work;—what hours constitute a day's work in the launches? There are two sets of crews. One comes on at 6 a.m. and remains till 2 p.m.; the other comes on after breakfast and remains till 6 p.m.

321. Under the changed conditions of the pilotage rates, do you think your estimate for the financial year will reach the sum named—£24,000? I went carefully into the matter. I think there will be a good deal less pilotage within the next few months, but we have absolutely given up the issue of exemption certificates except to the coast trade and South Sea Islands. This will eventually increase the rates largely.

322. Have you legal power to do that? Yes.

323. *President.*] You say that some of the launches are used for distinguished visitors and others;—is your authority alone sufficient to grant the use of a launch? As a rule the request comes from the Government, but I have the power to grant the use of the launch when I think necessary.

324. *Mr. Powell.*] You have made alterations with regard to exemptions lately? Yes.

325. I notice in a return from the Collector of Customs that the pilotage collections at Newcastle are much larger than at Sydney? That is so.

326. Taking the years 1894 and 1895, the Sydney collections for pilotage were £27,000; for Newcastle, £35,000;—is that due to strange ships visiting Newcastle? Yes.

327. The removal dues for Sydney for these years totalled £2,700, and for Newcastle £7,100;—how is that accounted for? In Newcastle there are more ships to move and more moves to be done.

328. You say that you know it is a fact there is a difference in the two ports? Yes.

329. Is it a fact that the shifting of a ship without a pilot is not a breach of the Navigation Act? It is not a breach.

330. Did not the Marine Board, prompted by a letter from Mr. Dick, M.P., take some action with regard to the breaches of the 61st clause of the Navigation Act? The Marine Board made regulations to deal with the matter and sent them to the Treasury, from where they were forwarded to the Crown Law Office, but in the meantime the Government had passed a Bill making illegal the very thing the Board were trying to stop, and the matter is now in abeyance.

331. Did you receive a report from the Newcastle Board that forty-two ships had been moved without pilots? Yes.

332. Does not that seem to show that there are an insufficient number of harbour-masters there? No; it shows that the tugs and private people take the work out of the hands of the harbour-master.

333. Then the harbour dues at Newcastle are immensely beyond Sydney, and they do more work there? Yes; I think so.

334. Do you know that charges are made for removals, although that work is not done by the harbour-master? It is not so now.

335. Has it been reported to you that the harbour pilots have been in the habit of taking ships from the wharf direct to sea? No; but it might be done in case of a trial trip.

336. When a harbour pilot is paid for removing a ship into pilot water, would he take her to sea? Not to sea; he takes her into the stream, and the master, being exempt, takes her on.

337. Has it been brought under your notice that harbour pilots have taken ships to sea? No.

338. It is alleged that the harbour pilots do this? I do not think it is a fact; I have never heard of it.

339. Is there any special reason for employing elderly men as harbour-masters? No; except that elderly men as a rule, as long as they are not too old, are the best pilots.

340. There is a harbour-master who is 66 years of age and the assistant 64 years? Yes; Pettitt, the harbour-master referred to, is the best man in the port at handling a ship.

341.

341. The harbour-master at Newcastle is also Chairman of the local Marine Board? No; not at present.
342. Who is President now? Captain Cross.
343. As harbour-master, does he take his part of the work in moving ships? No; as harbour-master of that port he directs removals by the pilots.
344. He does not do any active work himself? No; he is the head of the Department in Newcastle.
345. Can you tell us how it is that at Newcastle, where they are collecting a larger sum for harbour dues, that the whole of the work is done there with one harbour-master, while in Sydney there are three employed? The harbour-master and his two assistants in Sydney do all the work of moving the ships; the harbour-master at Newcastle directs the pilots to do the work.
346. If one man can do work that returns £7,000 per annum, how is it that it requires three men to do less than one-half of the work? One man has seven assistants to do the work, while the other has only two assistants. The system at Newcastle differs from that of Sydney. At Newcastle there is a harbour-master, an assistant harbour-master, and six pilots; they do all the in-work, out-work, and removals. In Sydney there are five pilots at the Heads, who only do the sea work and bring the vessels into port. The harbour-master and his two assistants move them from where the pilots leave them to the wharfs.
347. In 1896 you collected for harbour dues £1,865, and it cost £1,789 to do the work; so that the whole of the earnings were absorbed by the salaries paid? Very nearly.
348. In addition to that there is the salary of the harbour-master's clerk, £288 per annum? There is an actual loss on that part of the service.
349. I gather from the papers that the larger number of the men employed by the Marine Board have passed the prime of their lives in the mercantile marine service before they entered your service? That is so.
350. It can hardly be expected that men who have passed a certain age can do the work expected of them? During the last ten years we have made regulations to deal with this, and we now do not take men on over 35 years of age.
351. Is it a fact that removals are always effected with the assistance of steam-tugs at Sydney and Newcastle? Yes.
352. I see that the salaries of the harbour-masters are rather high;—are they dependent on the regulations? No.
353. The assistant harbour-master at Newcastle receives a very large salary? This man is really paid as a pilot; he is an inspector under the Marine Board, for which he receives £50; he has a Government house valued at £50, and his pay as assistant harbour-master is, therefore, only £321 per annum.
354. The harbour-master receives £516 per annum, £100 of which is an allowance for quarters? Yes.
355. What is meant by a water bailiff? An inspecting water bailiff is a man that has to look round the foreshores and see that no improprieties are being carried on with regard to reclamations; he is also inspector for other Marine Board purposes.
356. *President.*] Is it not a fact that the Cumberland Ranger looks after the harbour reclamations? Yes; but the bailiff assists in the work.
357. *Mr. Powell.*] The town water bailiff is practically an inspector? Yes.
358. There is an inspector shown at £263 per annum;—what are his hours? He has no special hours.
359. Does this man look after the deck cargo, load-line, &c., of vessels? Yes.
360. What is the scale of fees charged for certificates issued under the provisions of the 35th section of your Act? By the new Act the charges are slightly increased. The maximum charge was £4; it is now an additional £1 for every 300 tons in excess of the old rate.
361. *President.*] The qualifications for voting powers for the Wardens is based on the registration of tonnage in the colonies? Yes.
362. The tonnage which comes to the port which is not registered in the Colony has no representation on the Board? No.
363. The large mail steamers? They have no representation in the Colony.
364. How does the aggregate tonnage of vessels registered in Sydney compare with that of vessels visiting the port which are not registered here? I should say the foreign tonnage was three or four times larger than the local tonnage.
365. As a matter of fact, the comparison is 3,000,000 tons foreign to 90,000 tons local? Many of the foreign-registered vessels are shown three times; I think it would be 1,500,000 tons against the 90,000.
366. I understand, then, that the British and foreign shipping which visits the ports of New South Wales amounts to about 1,500,000 tons, and the Colonial 90,000? That is about it.
367. This large amount of shipping has no representation on the Marine Board? They are not represented in any way, unless you can say that the Government nominee represents them. There are four nominees of the Government against three of the local shipowners.
368. Is there any reason why Colonial shipping should have greater representation than the British and foreign shipping? Of course, our own shipping is our first care.
369. Would not the money spent in the port by the British and foreign-going ships be very much greater than that spent by the Colonial ships? Certainly it would.
370. Therefore, the interests of the Colony in this respect should be very much more in favour of British and foreign-going ships than in the Colonial ships? Quite so.
371. *Mr. Powell.*] Is it not a fact that the great proportion of the intercolonial trade has no representation on the Board because the vessels are not registered here? Yes.
372. *President.*] Do you think that is a wise state of affairs? I do not know how it could be remedied.
373. What particular interest has the most representation on the Board? The members are the owners of sailing ships, but the votes which put them in power are derived from all the shipping communities in the port.
374. Are there any other interests connected with the port which are not represented at all? Certainly; there is the insurance and the mercantile interest.
375. The interest which is represented is simply that of the owners of the ships registered here? Yes.
376. There are other important interests which have no representation whatever on the Board? Yes.
377. What would those interests be? All the interests connected with the vessels that visit the port, and are registered elsewhere.
378. Are there not a larger number of other interests, such as, for instance, the cargo—that is to say, the merchants—which have no representation? Yes.

Captain  
Hixson, R. N.  
8 April, 1897.

Captain  
Hixson, R.N.  
8 April, 1897.

379. Although they are vitally interested in the safety and efficiency of the vessels, they have no representation? No.
380. Then there is another interest—the seamen who navigate these vessels; their lives are at stake, and it seems to me that they should be represented? Yes.
381. Is there not another interest which outweighs in number all these—the travelling public? Yes.
382. Are they represented in any way? Except by the Government nominees. no.
383. The interests that are represented are simply the owners of the vessel? Yes.
384. The other interests, which are more vital, have no representation whatever? None.
385. Would it not be quite possible for a case of this kind to arise: that it would be to the interest of shipowners to send unscaworthy vessels to sea? It might be so.
386. It would be to the interests of the owners that the ships should founder, in order to enable them to recover the insurance? Yes.
387. The Act contemplates that the only interest worth looking after by direct representation is that of the owner, whose interest might be directly antagonistic to the interests of the merchant, the seaman, and the general public? Yes.
388. Is there not a radical error in the matter? I think that, as represented by you, there is a radical error, but there is a preponderance of representation in favour of the general public. There is a Bill going through the House now, providing representation for the seamen, engineers, masters, mates, etc.
389. Are the general public represented directly in this new Bill? Yes; by the Government nominee.
390. Coming to the members of the Board themselves—what qualifications entitle them to sit? The possession of 250 tons of shipping.
391. Does that mean 250 tons of shipping actually employed in sailing between port and port? Yes.
392. It would not represent the ownership of punts and hulks in the harbour? The interpretation is that, unless vessels are in active service, the qualification does not hold.
393. It is not your province to inquire into the matter of qualification? No.
394. Can you tell me whether the intercolonial steam fleet is represented on the Board? Not otherwise than by votes.
395. As far as the Wardens are concerned? There is one—Captain Maclean.
396. You do not know what tonnage Captain Maclean represents? No; but I can tell you the vessels. He owns, in conjunction with his partner, the "Tamar," the "Western," and some others.
397. A member is qualified for election to the Board by reason of these qualifications? Yes.
398. Supposing after election he should cease to be qualified in that way, would he have to give up his seat? According to law, yes.
399. *Mr. Powell.*] I would like to know what is the exact connection of the Newcastle Board with your Board? The Newcastle Board have local powers to deal with all Marine Board matters in their port, under the superintendence of the Marine Board of New South Wales.
400. Supposing a shipping disaster occurred at Newcastle, what course would be followed? The local Board would, if they thought fit, appeal to us to direct an inquiry into a catastrophe they were going to investigate.
401. The report would be made to them? Yes.
402. Supposing a vessel be stranded at Newcastle, are they not compelled by law to report the matter to the Marine Board at Sydney? It would be reported to the Board at Newcastle, and they would report it to Sydney.
403. Your Board would have to meet to give the necessary consent? It depends. The Marine Board should meet to direct an inquiry.
404. Is it a fact that the Marine Board meets in Sydney to deal with such cases and direct an inquiry? I am given discretionary power in the matter, and afterwards report to the Board.
405. They cannot institute an inquiry until you have given them the necessary authority? They must get our direction.
406. Do they report their finding to you? Yes, and we confirm or otherwise deal with their finding.
407. They can do nothing without the authority of your Board? That is so.
408. Have the Newcastle Board any executive powers—have they the supervision of the pilots? Yes; there is power under the Act to do so. There is an inferential power.
409. With regard to the pay-sheets and all expenditure that is incurred there,—does it come before the Board for approval? Yes.
410. Everything at Newcastle is done by the local Marine Board, acting under the sanction of the Marine Board in Sydney? That is so.
411. *President.*] With regard to the Marine Board inquiries, Mr. Powell just now gave us the number which had been held during the last ten years;—how long do these inquiries last? Sometimes several days.
412. Can you give us a return for the last five years, showing the inquiries which have been held and the length of time taken? It will be furnished.
413. I gather from the statements you have made to Mr. Powell that you limit the duties of the secretary. For the sake of comparison, the Board, or yourself, may be looked upon in the light of the Ministerial Head of a Department; in that view, does Captain Lindeman take the position of an Under Secretary? Much the same.
414. The Under Secretary would be responsible for everything in the Department? It is somewhat the same.
415. I gather from the papers in the Llewellyn case that he made representations to you that he should be given authority to supervise the work of the accountant? The accountant in the office is more directly connected with me than with any other officer, and I could not tell exactly what occurred in this case; but I never prevented Captain Lindeman from going to the accountant.
416. You would not think it necessary for him to look over the accountant's work? No.
417. Would it be an additional safeguard for you if a secretary were entirely responsible for the efficient carrying on of the whole office? I would not object to it; it might be desirable; it would be a very good system.
418. Who signs the cheques? I do.
419. Countersigned by the accountant? Yes.

420. When you see the accountant's signature on the cheque, you do not look upon that as any check outside of the accountant; therefore, if he were a dishonest accountant, there would be no object in having the cheque countersigned? That is so.

421. Supposing the cheques were countersigned by the secretary, would not that be an effective check? Yes. The system at present is: when a bill is sent in to the office, the secretary signs it if it is correct.

422. If he were to sign the cheques and the pass-books would not that be an additional security to yourself? It would; but I think the amount of extra work which would devolve upon him would not be justifiable.

423. Would it not have prevented these defalcations? No; I do not think it would, as the robbery was perpetrated after the cheque had been signed.

424. Would it not be the duty of a secretary to see that for every cheque signed there was a receipt? That is attended to by the Audit Office. We only pay cheques for wages; the cheques for services are drawn by the Treasury.

425. If necessary, would it not be better to give the secretary additional assistance to enable him to carry out what appears to me to be an important duty? I do not see any objection.

426. Would you not feel perfectly secure then? I feel so now.

427. Do you ask him to show you the receipted voucher? Yes.

428. Does not the secretary sign all the vouchers? If it is a voucher for service rendered, and the secretary knows it is correct, he initials it and sends it on to the accountant; the accountant brings it to me and I deal with it.

429. Is it a fixed rule that he has to sign every expenditure voucher? Except salary vouchers.

430. Supposing an officer were away from duty, would the secretary know of it? Yes.

431. Would it not be desirable that the secretary should sign the vouchers? If there is anything not out of the ordinary, the matter goes on to the accountant, but if there is any change, the secretary initials to show that it is right.

432. When the pay-sheets are submitted to the secretary, does he initial them? No.

433. Do you think it would be more desirable to make the secretary do more responsible work than he does at present? Yes, perhaps it would.

434. Has he ever represented that to you? No.

435. Do you think it would be desirable to make the secretary responsible for everything that goes on in the office? Perhaps it would.

436. Would you offer any objection if some such regulation were proposed? No.

437. Are you satisfied with the manner in which the secretary conducts his duties? They are most satisfactory.

438. With regard to the other officers of the Department? I am proud to say that the officers of the Marine Board are a splendid body of men.

439. With regard to appointments: supposing a vacancy occurred among the pilots, what plan do you adopt? If we can, we promote in the Department; if we do not consider there are suitable men in the Department, we advertise for applicants.

440. Is that invariably done? Invariably.

441. How do you decide the matter? We go through the applications and ballot for them in the ordinary way.

442. With regard to the boatmen, how do you select them? As we think fit.

443. Have you the power of appointment? No.

444. It must be approved by the Treasury? We recommend, and the Governor approves.

445. You must recommend in the first place, and your recommendations are usually carried out? Invariably.

446. You said no one should be taken into the service who is over 35 years of age;—is that invariably adhered to? If not to the strict letter, to the spirit of the law.

447. You would not go over 40, say? No.

448. You said the regulations provided for increments;—are those increments put before Parliament? They are shown year by year on the Estimates.

449. Every year Parliament sees the effect of the regulations? Yes.

450. *Mr. Powell.*] With regard to the qualification of the elective Wardens—if a man has 250 tons of registered shipping, that is sufficient qualification? Yes.

451. With regard to the electors, every Warden must be an elector? Yes.

FRIDAY, 23 APRIL, 1897.

PRESENT:—

JOSEPH BARLING, Esq., J.P., PRESIDENT.

GEORGE ALEXANDER WILSON, Esq., J.P.

JAMES POWELL, Esq., J.P.

Captain Francis Hixson, R.N., further examined:—

452. *President.*] I should like to ask first about the powers of the Board of Trade with regard to their revision of your findings;—that only relates to English-registered ships? To all certificates recognised by them. We are a sort of branch of the Board of Trade, and we take hints from them in very many matters—in the qualifications for the holders of the different certificates, for instance. The fact is, that the English and the Colonial Acts are synonymous in matters of that sort.

453. That is, they work together? They work together. For instance, we issue in Sydney a master's certificate, foreign-going, which the Board of Trade at Home recognise—that is to say, if we pass a man here and he goes to England, they recognise our certificate and allow him to command a ship just the same as if they had examined him themselves. Matters of this sort really are identical between all the colonies and the Board of Trade.

454. Is that founded on a specific English Act? Yes.

455. That is recognised by Act of Parliament? Yes; in fact, the Imperial authorities have passed legislation inviting us to take the subject up, and, of course, we have done it.

Captain  
Hixson, R.N.  
23 April, 1897.

Captain  
Hixson, R.N.  
23 April, 1897.

456. Of course, there would be no need of legislative action as far as this Colony is concerned in regard to matters which come within the jurisdiction of the Home authorities? We must legislate here and accept the same authority in our Board that the Board of Trade have.

457. Would there be any need of legislative authority here for you to deal with British ships, or would you take your authority from the Imperial Act? That is rather an open question. Some people say that all Imperial Acts relating to ships have jurisdiction here, whether they are taken up by the local Legislature or not; other people say that inasmuch as there is a local Legislature here, anything that is to be binding in law must pass through our Legislature.

458. That, of course, must necessarily be so with regard to our own shipping? Yes.

459. But British shipping is under the Imperial Act, by which they recognise your authority? The Imperial Act gives us authority.

460. And they recognise the certificates you issue here? Yes; certain of them. For instance, our coast-trade certificate would not necessarily be recognised by the Board of Trade—in fact, the Board of Trade at Home do not go so far in protecting life and property as we do here. They only issue foreign-going certificates, but we issue coast-trade certificates as well.

461. You pay a sliding scale of wages? Yes.

462. Can you tell what would be the difference in the annual cost if the minimum were reverted to in every case? I could not tell you off-hand, but it would be considerable.

463. You might give it to us later on; how do the rates of wages paid compare with the outside service? They are not excessive.

464. Take the minimum rate: is the minimum rate lower than the average rate ruling in the merchant service? No; I do not think it is in ships, but it is for seafaring men on shore.

465. So that our minimum rate would be something equal to the average ruling rate in the merchant service? Yes, perhaps it would; but in the merchant service the men are supplied with food.

466. But taking that into account? Yes.

467. Our maximum wages would be considerably higher than those paid in the merchant service? When it comes to the maximum it would be considerably higher.

468. Is the principle of the sliding scale recognised in the merchant service, or have they a fixed current rate? They have a fixed current rate.

469. The principle of maximum and minimum rate does not obtain? No. I may point out that, as far as the seamen of this coast are concerned, they earn considerably more than their wages by overtime. When I say that our wages are higher, I refer to the actual wage; if overtime is considered, the men along the coast earn more than our men do.

470. Under what conditions do they get overtime? If they work beyond the eight-hours system. I think the hours are 8 and 6; if they work before 8 in the morning or after 6 at night.

471. Would that refer to men on shore only? No; to the men in the vessels when they are working cargo, or when they are working in port.

472. Of course, the eight-hour system does not obtain during sea service? Not for only shipping work. They only get overtime when they are doing something in connection with cargo.

473. They are practically doing lumpers' work? Yes.

474. And for that work they get overtime? They get overtime.

475. They may have to go on at 1 or 2 in the morning to clear the hold, and in that case they get overtime? Yes.

476. Do you give your men overtime? Only in Sydney; not at different parts of the coast.

477. I suppose you would at Newcastle? No.

478. Then, as far as Sydney men are concerned, the payment of overtime in the merchant service need not be taken into account in comparing their wages with those paid in the merchant service, because there is an equation applicable to both cases? Yes; they both get overtime.

479. You were saying that the private tugs at Newcastle took the work out of the hands of the pilots? To a certain extent. The people who own the private tugs are so familiar with the peculiarities of the harbour, that they induce the masters of vessels that they are going to move about to do away with the employment of a pilot, because they can do it themselves.

480. The masters of the tugs are practically pilots themselves, and therefore able to do the work of moving the ships about in the harbour? Yes.

481. It is necessary for every ship that has not an exemption certificate to take a pilot? Yes, it should be.

482. Would the majority of ships coming there be without exemption certificates? Yes. I have explained before that we have been in the habit of issuing exemption certificates wholesale, owing to the excessive charges, but now the conditions are in a state of transit.

483. Do the pilots have the moving of the ships in Sydney? Yes; the harbour pilots.

484. For which a definite charge is made? Yes.

485. And are they compelled to take the harbour pilots? They are supposed to do so, but there is a loophole in the law, and in some cases they evade it; but all the big ships without question are very glad to take the harbour pilot.

486. The practice, then, is somewhat different in Newcastle to what it is in Sydney? No, sir; the two cases are precisely the same. They do the same thing. If not against the actual letter it is against the spirit of the law. They do away with the services of a pilot to save the cost in both ports.

487. The practice is more rife in Newcastle than it is in Sydney? Perhaps it is—yes. Until lately the charges on ships were so excessive that they did everything they could to evade expense.

488. The pilotage fees have been reduced from 4d. to 2d.? Yes. Now there is a maximum of £20. Very large ships have previously had to pay over £100 pilotage.

489. You have practically abolished exemption certificates for those ships? Yes.

490. Therefore you hope to make more in one way than you have lost in another? Yes.

491. You think it would be best to have the "Ajax" stationed at Newcastle? Yes. In rough weather the pilotage work is attended with very great risk. More so in Newcastle than here.

492. You quite approve of the "Ajax" being commissioned for service there? I could not, as an experienced man, say that the old whaleboat system should continue.

493. That will, I presume, increase the cost of the pilot service there? Yes.

494. Will it considerably increase the cost? Yes, it will.

495. Will it increase the cost by the cost of commissioning the "Ajax" and keeping it in repair? Yes; and the wear and tear, coals, and so on.
496. That will come to £3,000 a year? Something like that.
497. So that something like a sum of £3,000 has been added to the cost of the Newcastle pilot service by the introduction of the "Ajax"? Yes.
498. And the reduction of the pilotage dues will still further increase the cost? For a short time.
499. Do you think that the abolition of the exemption certificates will have as marked an effect on the revenue in Newcastle as it will in Sydney? More so.
500. You expect the equalising process there will be as great as here? I am sure the Marine Board Department in the future will be more self-sustaining than it is at present, and it always has been self-sustaining.
501. Regarding the Government representation on the Board;—you said the Government representative represented all interests? Yes.
502. Then, of course, the Government represent the owners of ships as well as any other interest? Yes.
503. Therefore the owners of our Colonial boats have not only Government representation, but they have also a special representative of their own? Yes; but you can hardly say that. On the one hand there are representatives specially to protect the interests of the shipowner, and on the other hand there is a preponderance of members representing the general public.
504. The Government representative is just as much bound to represent the shipping interest as any other interest? Perhaps so.
505. Then the owners of ships have got a common interest in the Government representation, and a special representation of their own? Yes; quite right, if there is no division of opinion on the Board.
506. I think the tonnage was rather incorrectly stated last time? Mr. Powell said between 9,000 and 10,000 tons.
507. *Mr. Powell.*] It was 90,000 tons.
508. *President.*] The Colonial registered shipping is 90,000 tons? Yes. What Mr. Powell gave was the aggregate amount of British shipping. Some of these ships come in two or three times a year.
509. I see Mr. Powell has made it out that the Colonial tonnage is 90,000 and the foreign vessels 2,900,000 tons? Those 2,900,000 tons represent some ships which are here two or three times.
510. Perhaps you would kindly let us have an exact comparison? I think it would be very difficult. The only way would be to get the foreign shipping entered only once.
511. *Mr. Powell.*] This includes all our coastwise trade? Yes.
512. Then our coastwise trade is the largest part of it? Yes, for one entry.
513. As a matter of fact, the greater part of that shipping is made up of our intercolonial boats;—the north coast boats are in and out every day? Yes.
514. They are registered here, and form part of that? Yes.
515. But they do not in any way compare with this foreign tonnage? No.
516. When I speak of foreign, I mean everything foreign to ours? Everything foreign to New South Wales.
517. *President.*] You think it would be a fairer comparison to take the 90,000 tons and the 1,500,000 tons of shipping? Yes; that would be a fairer comparison. But as the English, or rather foreign, ships are entered every time they come into port, the Colonial ships should be treated in the same way.
518. And that interest has no more representation on the Board than the Government representation? That is so.
519. Can you tell me whether in any other part of the world there is a pilot system carried on as we carry on here? In some parts of the world—in Queensland and in South Australia, and in many other colonies—the pilots are *bonâ-fide* Government officers. In other places they merely receive the rates they get from the ships they bring in.
520. Do you know what the system is in America? I am quite sure that it is not a Government system there.
521. Is it done by private contract? Yes. There is a certain pilotage levied on every ship entering the place. A dozen pilots would purchase a steamer or a schooner, and they would use this schooner between them; and they sometimes go to sea for miles and miles for the sake of being the first to get a ship.
522. I understand ships sometimes pick up the pilot 400 miles from port in American waters? Yes.
523. Is it a fact that these pilots are licensed by the Board of Commerce in America? Yes; I believe so.
524. And when licensed they are allowed to compete? Yes.
525. Is there an Act which gives them a maximum amount for the tonnage rates? Yes.
526. Something like our wharfage dues? Yes.
527. Then they are left to compete amongst themselves for the business they can pick up? Yes.
528. Was not some system of that sort adopted here years ago? Yes.
529. How was it found to work? It was found to be a failure. In place of competing the pilots used to combine.
530. They formed a ring? Yes.
531. Supposing it were thought desirable, from American experience, to adopt some such plan here, would there be the same danger again? Yes. Where there is an excessively large shipping trade some such system might answer; but when the trade is limited there is a difficulty in creating competition. Since I have been in office we have had the competing system, and they have made out that they were competing with each other; whereas they let the man on turn take the ship, and the others enjoyed themselves at home.
532. In America they have a much larger population than here; that explains the difficulty? Yes. Our Act provides for the system, and, in fact, it has been in vogue here; but from the nature of the service it is difficult to make people compete here.
533. Are you aware that the competing system is adopted in England? Yes.
534. Does it work well there? No other system has been adopted there for ages.
535. And it works well? It works well, I believe.
536. Then our system stands out singular as regards other parts of the world? Ours and all other sparsely-populated countries. I may mention here that there is nothing approaching complaint ever made against our system since we have had the pilot steamer. I have no doubt that there are complaints about Newcastle, but the employment of the "Ajax" will correct that.

Captain  
Hixson, R.N.  
23 April, 1897.

Captain  
Hixson, R.N.  
23 April, 1897.

537. Have you given a return showing the revenue received from each of the pilot stations and the expenses of each? Yes; it is among the papers. I may almost say that the revenue of the out-stations is nil.
538. So that the expense of the out-stations must be put against the revenues received in Sydney and Newcastle? Yes.
539. You think that is a fair thing? Well, the shipping are specially taxed for harbour and light rates, and they expect all the conveniences that we can give them. Although the pilot is not actually on board the vessels at these bar-harbours, as a matter of fact he does pilot the vessels, because they do not think of entering until he hoists a flag for them. He makes the system as easy as possible, and buoys the channel, and is always ready to help in case of accident or trouble.
540. Then the charges they pay in Sydney are supposed to cover the conveniences they get on the out-stations? I think that is a fair thing to assume.
541. On the Richmond River they have a number of lights? Yes, up the river.
542. Do they pay anything for that? No.
543. That is considered to be part of the general conveniences? The shipping are taxed. There is a pilotage system and a light system provided for them for the tax that they pay.
544. Therefore we must not go into the details of the harbours along the coast? I think not.
545. The payment in Sydney is supposed to cover conveniences along the coast? Yes. I think it is fair to say so. The Navigation Act was established in order to provide benefits for life and property all along the coast, and this tax was to meet the expenses that the Act brought into existence.
546. That is to say, we must take the thing as a whole? I do not think you should deal with it piecemeal.
547. Do the colonies combine in the expenses of any of our lights? That is a moot question just now. We do contribute towards the cost of the lights in the Bass Straits. Previously we used to pay a portion of the cost of the lights in Victorian territory, but we have latterly discontinued to do that, and now we only pay for the lights on our own coast and for those in Bass Straits.
548. What proportion do we pay for these? In accordance with the tonnage of vessels arriving here passing those lights.
549. Then the Victorian authorities pay the expenses of those lights? Not the Victorian—the Tasmanian. They are recouped by the Victorian and New South Wales authorities in accordance with the use made of the light.
550. That cost is taken into account in arriving at your financial statement? Yes.
551. I should like to know what is the exact legal value of your decisions with regard to cases that come before you? Well, they are of considerable value. They frequently prevent further litigation—that is to say, people sometimes agree before they go into the dispute that they will be guided by the Marine Board verdict.
552. Your decision is not final, I presume? It is, so far as the conduct of the master is concerned, but not in a money sense.
553. I suppose it has no legal status? It has no money value whatever.
554. Therefore the Vice-Admiralty Court is open to them? And it is frequently taken advantage of; but in many cases there is so much respect for the Marine Board decision that they agree to settle on that.
555. Can you tell the proportion of appeals that have taken place from your decisions in the last few years? You mean that litigation has followed up?
556. Litigation has followed up your decisions? Perhaps half—not quite half. Then there is another aspect where the Board's decision is sometimes objected to; if a master thinks we have dealt wrongly with him, he has an appeal to the Supreme Court.
557. Do you think it would be advisable to strengthen the position of the Marine Board in that respect? I do not. The tendency of the Englishman is to fight; and if he is prevented from fighting further, instead of taking the thing agreeably it would have the opposite effect.
558. But would it not do this way: give a legal effect to your decisions, leaving it open to appeal just as in all other cases—the same as the appeal from the decision of one Judge to the Full Court in connection with cases where money was at stake? Perhaps you might go as far as they do in Queensland. They have a provision in their Act that if the parties agree before the inquiry has commenced to abide by the decision of the Board they cannot go further. It is final then.
559. But still there might be a modification of that by giving the decisions of the Board a legal value, with the right of appeal to the Full Court? I think that would be advisable.
560. Do you think it would assist in bringing that about if a lawyer were on the Board—say, a District Court Judge? Perhaps; I have not thought the matter out.
561. You said there was an appeal from your decision as to certificates? Yes; in the first instance it goes to a single Judge, and then there is a further appeal to the Full Court. It is the same as in Common Law.
562. Do the Home authorities accept your verdict on certificates issued by them? Yes; but they have the right of re-issuing if they think fit.
563. At Home it is the Court of Survey? Yes.
564. There is no body exactly like yours at Home? Scarcely; but there are certain local Boards like ours under the Imperial Act.
565. But the Court of Survey is composed of two nautical assessors and a Judge? Yes.
566. What is the value of their decision? I think, on the whole, the seafaring men approve more of our decision, on the principle that they are tried by their peers; but I do not think that there has ever been any great objection to the system at Home. One advantage of our system is that there is no loss of time. A ship is wrecked to-day, and here we could hold a Court to-morrow; but at Home the proceedings are much more lengthy. There is considerable inconvenience in waiting in cases of that sort; because when a vessel is wrecked the crews lose their homes; they are in a very awkward position in a strange city, and they want matters settled quickly so that they may go elsewhere.
567. In such a case the Court of Survey would have a distinctly judicial authority and the after proceedings might be shortened by reason of this? Yes.
568. Your engineers examine the boilers and machinery of passenger steamers every six months? Yes.

Captain  
Hixson, R.N.  
23 April, 1897.

569. I suppose you have the power at intervening periods to hold a survey if you think fit? Yes.
570. Does that hold good with cargo steamers? Not in Sydney. We only give certificates as to the sound and good condition of the whole ship in cases where the vessels carry passengers, the others are only open to ordinary inspection. We do not neglect them altogether, but we do not take the same pains with those vessels as we do with vessels that hold our certificates.
571. According to the Act it is strictly confined to passenger-ships? That is what I mean.
572. But you have no jurisdiction? There are other parts of the Act which say that the Marine Board inspector may go aboard all ships and do what they think fit. The same supervision is not extended to them that is extended to vessels which hold our certificates, which say that this vessel is thoroughly sound in hull and machinery and fittings for the purpose for which she is engaged. Although we do not go to the same extent, we do supervise all other ships, though they do not carry passengers.
573. Do you think it is advisable to have a more strict supervision over non-passenger vessels? The Bill that has passed the Assembly will carry out that suggestion—that is to say, all steamers, whether they carry passengers or not, are to be surveyed in future by the Marine Board. The English system is only to insist on passenger-vessels carrying over twelve being subject to special survey; and in Melbourne, on the other hand, they make every vessel that goes to sea take a certificate, and here we make every vessel which carries passengers; so we are midway between the old country and Victoria in this respect.
574. *Mr. Wilson.*] I think you said you allowed the Sydney people overtime and did not allow the Newcastle men? Yes.
575. Why is that? The work at Newcastle is pilots' work. The only men who are allowed overtime in Sydney are the men up the harbour here who man the launches during regular hours. The men who are at Newcastle for pilot work, work day and night, Sundays, and holidays in rotation, and they are not allowed special overtime pay.
576. Why specially Sydney? Because we have only a limited number in Sydney, and if they are wanted after hours it is harder on them than on the Newcastle people, who are not kept from their homes when they are on turn even.
577. I think you said the Newcastle people work constantly? Yes, as a body; but there are so many of them that there can be a boat's crew on watch constantly there.
578. What number of men have you in Sydney and in Newcastle? We have twelve in Sydney and in Newcastle twenty-two.
579. And that is the reason why you allow overtime in Sydney? That is the reason. Often in Sydney men are sent to Broken Bay or to Botany Bay for two or three days, and an allowance has to be made to provide for them.
580. An allowance is not overtime? But the men would not be away from their homes as well as during overtime.
581. How is that. I can quite understand your giving a man an allowance when he is away from home, but that is not overtime? If a mail steamer is expected here we do not know what time she may come, so the men have to wait at the boat-shed for her, and some of the men may be sent to Botany Bay, and they are allowed this overtime in both cases.
582. And nothing of the kind arises in Newcastle? No; this state of things only prevails at the boat-shed in Sydney.
583. With reference to your allowance of £225, that is apparently for quarters and gas? Yes; I am provided with a house with gas laid on to it.
584. No other allowances? No. I may say that I am subject to calls day and night. I live there for the purpose of being available for any emergency.
585. Are the pilotage rates in Sydney and Newcastle the same? Yes.
586. *Mr. Barling* asked you if you thought it would strengthen the judicial side of the Board to appoint a lawyer to it;—is the judicial function any necessary part of the Marine Board at all? Only so far as it deals with the holders of their certificates.
587. Arising, say, from a collision or a wreck? Yes; but the Marine Board functions are confined to the conduct of the masters of the vessels. Of course the master carries with him the responsibility of the owner, and in many cases, as the Marine Board have to give a decision as to the master, the owners are content to let the matter rest as they decide it, but there is no necessity.
588. There was a Bill introduced into Parliament last year providing for the representation of engineers and seamen on the Board? Yes.
589. Suppose the judicial part of the Marine Board duties were performed by a Judge and two assessors, as in England, would there be any need for such representation? No.
590. Would not seamen and engineers, captains and owners, and everybody else, have the same confidence in such a court as the general public have in the Supreme Court, say? I do not think they would. There are constant complaints on the part of sailors that they are tried by people who do not know anything about the case.
591. But there are two men who will advise the Judge on technical points? I am confident that the seafaring people in Sydney prefer our court to such a court as you suggest.
592. Then why is there such an agitation for representation on the Board? That is to give the different classes of people who have to do with vessels representation. The seamen and the engineers want representatives, but they do not object at all to the judicial functions of the Board.
593. Would a court constituted in that way be likely to approach these things in a judicial spirit? I can scarcely express an opinion on that. It depends largely on whom the different parties send to represent them.
594. They represent divergent interests, and it is not to be expected that they would look on things in a judicial way? I am not in a position to speak with authority, but I do know that there is no objection to the present judicial powers of the Board.
595. There are two steam launches, one used by the Governor and distinguished visitors to the port, and another used by the Government;—are both these launches in pretty regular use? They are not in constant use, but they are frequently used.
596. Would one of them perform all the work? No; we often have demands for more than we can supply. The Government often order both when the Governor does not want one, and the Governor occasionally asks for both.

- Captain  
Hixson, R.N.  
23 April, 1897.
597. Are you aware of any other Government Department that has a launch? Yes; the Public Works Department.
598. Then these are both required? They are both required—not by the Marine Board. They do not want them at all; the Government want them.
599. They are frequently required at the same time? Frequently.
600. *Mr. Powell.*] Do you remember your answer to questions about the "Carrington";—you told us that four boatmen returned as part of the crew of the "Captain Cook" are employed on the "Carrington"? Yes.
601. And they are employed only to bring back the pilots from inward ships to the station at Watson's Bay? Oh, no; they have to take pilots up to Sydney to take ships to sea as well.
602. And they bring back the pilots from the inward ships? Yes; and to take a pilot, for instance, to Darling Harbour to take a ship to sea.
603. But we were told the other day that your pilots did not take the vessels from Darling Harbour? If I said so, I said so in a qualified manner. It is a common thing.
604. I understood that the harbour pilots took the vessel to the harbour border? That is the proper thing, but it is a common thing for a sea pilot to be ordered in the middle of the night to take a vessel, say, to Newcastle.
605. That is, from Darling Harbour? From any part.
606. In that case the Government lose the removal dues? Yes. Of late the ships have been excessively taxed, and they do everything they can to evade the port charges in this particular respect.
607. It seems to me that you have been assisting them, because you have allowed the sea pilot to go into the harbour pilot's water and take vessels direct from the wharf to the sea, thereby taking away from the revenue the harbour pilot's fee? We do not think of the revenue; what we think of is the facility for commerce and trade of the port in every way.
608. That is very good and very right, but at the same time as we are losing the harbour pilot's fee we are incurring the expense of £515 a year to provide a boat to take the pilot to the vessel? It is scarcely fair to put it that way. The "Carrington" occasionally does as you say, but she is not kept for that purpose.
609. The sea pilot's water commences at Fort Denison? It does, but there is no law to that effect.
610. When a vessel is removed she is supposed to be put alongside the wharf by the harbour pilot and the charge made; when a sea pilot brings a vessel in, one would suppose that she would be put alongside the wharf by the harbour pilot and the charge made also? This system has grown up in consequence of vessels not only wanting to remove from the wharf to the stream, but wanting to go straight from the wharf to sea. In some cases, such as the "Barbarossa," the harbour pilot would do a portion of this work and the sea pilot take her on, but if an ordinary small vessel wants to go to sea we let the sea pilot take her away.
611. There is a loss of revenue? Yes, there is.
612. And there is a great increase of expense in working the Department, because the sea pilot really ought not to go beyond Fort Denison? Yes; but there is no law to prevent it.
613. The work of the pilot would commence at Fort Denison, and a charge ought to be made? You know very well a charge used to be made, and whether the ship wanted to go to the wharf or not the charge was made, and there was so much agitation about it the Government very wisely gave it up.
614. The concession was "no work, no pay"? Yes.
615. This is double work, no pay—you do the work and you have to send for the man? There is no doubt that the system which prevails is precisely as you say, and there is a certain loss of revenue if we could legally claim it; but, as I tell you, there is no legal authority saying that a harbour pilot must do a certain amount of work and a sea pilot other work.
616. But the pilot waters are defined? No; except in our regulations. They are not defined in the Act.
617. *President.*] They are defined in your regulations, and that has the effect of law? No, sir; this is a regulation in our own Department, for the pilots.
618. But is not it a regulation which you are empowered to make by the Act? Yes; but we cannot charge the ships under it.
619. Is it approved by the Governor-in-Council? Yes.
620. In that case it has the force of law? Oh, yes, it has; but there is nothing in the regulation about charges.
621. *Mr. Powell.*] You know that a sea pilot's line is defined? There is a regulation issued merely for the guidance of the employees of the Department, but it is not a general regulation. There is no strict law defining what the duties of a harbour pilot are, and what are the duties of a sea pilot. There is a schedule in the Act saying that a harbour pilot shall be paid so much, but that is all we have on the subject.
622. Well then there is a loss of revenue? Certainly.
623. What is the practice at Newcastle,—do the sea pilots take the vessel there;—they act in the double capacity? They often do.
624. And in that case they charge for the removal as well as the pilotage? I do not think so.
625. The harbour removal amount is much larger in Newcastle than in Sydney? Yes.
626. And having no harbour-masters there, you tell us that the pilots do the removals? Yes. You asked me whether, in the case of a vessel being taken direct from the wharf to the sea, they charge for harbour removal as well as pilotage.
627. It is not so in Sydney? We supply the wants of the trade. In many cases the vessels are moved from the wharf to the stream to complete their crew, or half a dozen things they require to do before they go to sea. But if a vessel wants to go straight to sea we do all we can to facilitate commerce, and let her go.
628. The sea pilot goes straight to the ship, and that is the reason why the "Carrington" is partly required? That is it, sir.
629. You told us that the 4d. per ton was paid every half-year; that is paid for the right to use all the lights on the coast and all the harbours? Yes, it is a harbour and light rate for general purposes.
630. Every ship pays 8d. per ton annually for the use of the lights on the whole of the coast? That is so.
631. And for any advantages that they may have in connection with harbours? Yes.
632. But that has nothing to do with the pilotage service or with removals? No. In this instance the  
line

line has never been definitely drawn. The master of a ship, if he pays for a harbour and light rate, may say, you must do so and so for me, I expect it; but another man may not want anything.

Captain  
Hixson, R.N.  
23 April, 1897.

633. It is not what he expects, it is what is the law? Yes.

634. These vessels which trade to the bar harbours, such as the Richmond, pay a very small sum as harbour and light dues? It is not a heavy tax.

635. It is not worth talking about as a tax, is it? No.

636. Was the system of increments stopped in your Department by Ministerial authority? Yes.

637. And is it still in abeyance? Yes.

638. What do we understand by that;—do you mean to say that the men have what they consider to be a claim? Yes.

639. You said that the pilots rose to the top of their grade in twenty-five years? That should be twenty years.

640. And boatmen seven years? Yes.

641. The men at the Government boat-sheds appear to have had annual increments of £7, rising to the top of their grade in seven years? £5 I think, sir. There is some mistake there.

642. The coxswain rises to the top of his grade in seven years? (*Looking at list.*) Yes, you are quite right, if you mean the boatswain.

643. And the ordinary boatmen reach their maximum in —? Six years. The minimum rate is £96, and the maximum £144—that is, with quarters. This would be about ten years.

644. The maximum is £126, I think? Yes, with quarters.

645. Their reaching the maximum in six years accounts for your having so many boatmen at the high rate of pay? Yes.

646. Does it not seem extraordinary that the boatmen should reach their maximum in seven years and the pilots in twenty? Yes.

647. I suppose you are aware that the boatmen in Victoria have to serve twenty-five years to reach their maximum? I do not know it, sir; but it is very likely.

648. The victualling of the "Captain Cook" including the wages of the cook and providore amounts to £470 per annum;—does it not appear to you that that is rather a heavy sum for victualling seven people on board? It is.

649. Does it not appear extraordinary? It is heavy. The fact is, when we established this system we put the pilots on board the vessel and put them down at a salary of £350 a year, and previous to that they had been drawing between £800 to £1,000. They thought it very hard to be reduced to such a low salary, and we gave what was perhaps a liberal allowance for food.

650. Do you not think it would be better to pay all hands on the "Captain Cook" sea-going wages and feed them by contract? It would perhaps be more economical.

651. You have told us that the pilot service outside the port of Sydney is really carried on at a considerable loss; have you any idea what that loss is? It is almost the extent of their wages, but then those pilots are put there for very many purposes. They have not only to pilot in ships as they are wanted, but they are there for the protection of life and property. They have charge of the life-saving apparatus, they have to buoy and beacon the rivers, they have to put up leading marks, and to make tide signals—in fact, to guide every ship that enters the port, and do it at a considerable amount of risk at times. They do a lot of work, really, in the protection of the trade and shipping of their ports.

652. Do you not think that, at some of these places where there is very little to do, the Queensland system of appointing pilot boatmen and making the coxswain the pilot would be better? It might. You know there are rivers and rivers. If you compare the stations on the Richmond, for instance, with those in Queensland, I think you will find it necessary to have different men there. All the Queensland stations are behind the Great Barrier Reef, and the sea is nothing in comparison to that at our bar harbours. The settlers along the coast insist on having efficient pilots.

653. I think you have told us that the removal dues are a source of loss in Sydney, that they do not pay the expenses of the harbour-masters? You gave me the figures and they showed a pound or two on the wrong side. Since that return was made out we have had an increase in the harbour removal dues. The maximum charge previously was £3, now we have made the maximum charge £5, so that the service will be more self-supporting in the future.

654. There has been no reduction in the harbour and light dues under the new Act? No.

655. I have a return here of the pilotage collected for the month of March, and the whole amount seems to be £744 for Sydney; that being the case, will there not be a great loss on the pilotage for the next financial year? I would point out that March is our dullest month, and no doubt, in consequence of the reductions that have been made, the returns for the next few months will be less than latterly; but now the issue of exemption certificates is stopped there will be many more vessels that will have to take pilots and eventually there will be an increase.

656. And for the next financial year there will be a loss? Possibly, but although there is a reduction in the pilotage rates there will be no material reduction in the light rate, and as there are a lot of very large steamers coming in it will be gradually made up.

657. You deal with the Imperial certificates under the second subsection of section 88 of our Act? Yes.

658. You said, "But for that section we could not deal with the Imperial certificates"? That is so, I think.

659. That being the case, how do you propose to deal with the Imperial certificates now that the Act is repealed? A clause in the new Act keeps that going.

660. If you conduct your inquiries under the new Act, do you conduct them in the manner provided by the Act? What I say is, that the new Act keeps alive the local Act and our procedure, and therefore I think we shall make no alteration at present.

661. But do you conduct your inquiries according to the plan laid down under the Imperial Act, or do you adapt your own circumstances and the conditions of your Board to that Act? Our Act in that particular matter is really a transcript of the Imperial Act.

662. It is not, I think, to the extent of the manner? I do not mean as to the composition of the Board, but our legal finding is governed by exactly the same condition as that of the Imperial Act.

663. But then you are confined almost entirely under this Act to the cancellation and suspension of certificates? Yes, quite; we are confined to that.

664. And there are no questions of law in connection with the cancellation and suspension of certificates? No more than what might crop up with the two or three lawyers we often have at the table. 665.

Captain  
Hixson, R.N.  
23 April, 1897.

665. But in collisions and matters of that kind questions of law crop up? Either law or common sense, which is supposed to be law.

666. The English Act provides for legal assistance? I think the English system is most cumbersome and expensive, and we are more economical here in our proceedings than in any other place.

667. You spoke of the satisfaction given to nautical people generally by being tried by their peers. That may have its advantages, but do you not think it also has disadvantages, inasmuch as there can be a leaning on the part of their peers to them in dealing with matters connected with the profession? There might be, but I do not know that there is. I do not think they get off so easily before us; in fact, I have heard a large English ship-owner say, "I hope you will try the case out here, because you deal strictly and justly with the people; but if they get into an English Court it is not nearly so satisfactory." The man who said that to me was Mr. Green, one of the managers of the Orient Company.

668. Still that system seems to have been engrafted on your Act to some extent, because local Marine Boards are required to have a local Stipendiary; the Act directs you? No, not absolutely. It is if wanted.

669. [Read clause 87 of the Navigation Act.] In point of fact, when an inquiry is held at Newcastle the local Stipendiary Magistrate does adjudicate? Yes, if a certificate is to be suspended.

670. Does he sit with the Board? Yes. The fact is there are multitudinous functions performed under the Act.

671. Well, now, about those inquiries that you hold into collisions, &c. Take the year 1896, and, for example, the first case in the year,—the "Leveret-Gamecock" collision. There seem to have been seven sittings. Is the evidence taken? Yes; and not only that, all these depositions have to be copied to be sent to the Board of Trade. I will explain why there were seven sittings on that particular case. The Marine Board commence an inquiry of that sort without prejudice. Two ships are in collision. It is not for them or anybody else to say who is to blame in the matter. After what we call the preliminary inquiry the Marine Board make a report, and they say, for instance, that they believe this collision occurred because the master of the "Leveret" committed certain breaches of the steering and sailing rules. This report is then furnished to the man, and he is cited to appear before the Board to show cause why his certificate should not be cancelled or suspended for committing this breach of the Act, and then he has every opportunity of defending himself and getting out of the difficulty if he can.

672. Kindly turn up the Minute Book of the 7th January, 1896;—did the Board do any other business on that day? No.

673. Was it a special meeting for that purpose? Just exactly as I tell you.

674. Will you read the minutes, please? [Reading.] "Marine Board, 7th January, 1896. Present:—The President, Captains M'Lean, Jenkins, O'Sullivan, Moodie, and Broomfield. Commander Lindeman, Secretary. Captain Broomfield took his seat at 2 p.m. 'Leveret-Gamecock.' This case was proceeded with and again adjourned till 10 a.m. to-morrow." That means that we were through this "Leveret-Gamecock" matter all that afternoon; but besides this we have a full set of proceedings on another set of papers.

675. Then again on the 8th? Yes.

676. That was also devoted to that case? Yes.

677. Then on the 13th January? Yes.

678. You had a meeting of informal business, and the collision case was referred to? Yes.

679. How was it referred to? The Board reported that this case was caused by the wrongful act or default of the person in charge of each vessel, and they were called upon to say why their certificates should not be dealt with.

680. But there were only two sittings really on the case? Two sittings previously to that.

681. That is merely the finding of the Board? No, sir; that is the report of the Board. This case was resumed the next Monday.

682. That would be the 20th? Yes. [Reading.] "Marine Board, 20th January, 1896. Present:—The President, Captains Broomfield, M'Lean, Jenkins, O'Sullivan, Moodie, and Mr. Wildridge. Commander Lindeman, Secretary. 'Gamecock-Leveret.' The Board adjudicated in this case and suspended the person in charge of the 'Leveret,' J. H. Maiden's certificate, Harbours and Rivers, for three months; and that of Charles Larsen, the master of the 'Gamecock,' for one month."

683. That is part of the formal business of the day's meeting? Certainly.

684. So that there were only two sittings really to go into the inquiry? Two special sittings, and the others were part of the ordinary business.

685. Then take the 7th April meeting,—the "Petrel"? The master and crew of this vessel having been examined regarding the loss, the Board decided to give their decision next Monday. We went into the inquiry then, and we did not give our decision until the following Monday.

686. You gave your decision on the 13th? Yes. [Reading.] "'Petrel.' The Board adjudicated on this case, and decided that the wreck of the 'Petrel' was caused by the vessel attempting the bar and becoming stranded at the entrance of the Bellinger River, at a questionable time of the tide, when the wind failed her. Although the Board do not feel justified in depriving J. P. Smith, the master, of his certificate, they nevertheless reprimand him, and caution him against crossing a dangerous bar otherwise than at unmistakable flood tide."

687. That is part of the formal business of the day? That is all.

688. How long would the meeting last? It all depends upon circumstances. I might say that both these cases appear to be cases in which we have no lawyers, and we get through our cases much more rapidly when there are no lawyers than when there are.

689. But these cases, collisions and certificates, are the only cases you deal with—the others are only formal business? Yes.

690. The Members of the Board know nothing about them, and take them as they find them? Oh, no. They have the papers placed before them, and, of course, in issuing all these certificates there are certain necessary qualifications. For instance, a man has to show that he has served four years at sea before he can get a second mate's certificate, and those papers are put before the Board, and they initial them after examining them.

691. That is to say, you initial them for the Board? No, sir; a quorum of the Board initial them.

Commander

Commander George Sidney Lindeman, R.N., Secretary to the Marine Board of New South Wales,  
sworn and examined :—

Commander  
Lindeman,  
R.N.

692. *President.*] How long have you been secretary? Twenty-two years.

693. What are your duties there? To carry out the provisions of the Navigation Act, under the direction of the Marine Board. 23 April, 1897.

694. Now what does that involve on your part? I gave in a written list. It is rather a long one.

695. [*Handing list to witness.*] That is the list? Yes. [*Vide Appendix 9A.*]

696. This is a list of the books kept? [*List handed to witness.*] Yes. [*Vide Appendix 18.*]

697. Referring to the papers which were laid on the table of the House with regard to the Llewellyn frauds, I see it is stated on page 4, "The secretary, who should have exercised the necessary supervision over the accountant, has not been allowed to do so";—is that correct? I have never been told to do so. I have pointed out that I have no supervision, and I have never been told to have any supervision, and I did not think it was my place to do so. I pointed out to the President on several occasions the very unsatisfactory way in which the accountant did his work. It was nothing to do with his accounts, but his general carelessness, and so on. He sent for him and reprimanded him. Then the Treasury Inspector came down and reported that everything was all right, and then the idea of fraud passed away.

698. This fraud occurred, I understand, in cheques being drawn and not actually paid to the parties in whose favour they were drawn? There were complaints from the stations that they did not receive their pay for certain months.

699. What did you do? I immediately informed the President, as I had no authority over the accountant myself.

700. You took no steps yourself to inquire? It is some time ago, but I have no doubt that I sent for the accountant and said, "Why is this?"

701. When you called for vouchers would you know that these amounts had not been paid? No, because the vouchers are already receipted before they are paid.

702. How is that done? The vouchers come down receipted, and then the money is paid according to the way in which the pilots or lightkeepers wish it paid.

703. How is it paid? Sometimes it is paid into the bank, and sometimes it is sent to them.

704. Would not you have detected it at once if the bank receipts had been checked? I imagine so.

705. There was no complication about it whatever if that had been done? I suppose that that would be the way to find out.

706. It would be a very simple way. If it had been in your hands would you have considered it necessary to examine the receipts for all cheques that were signed by you or the President? If I had been responsible for the accountant to the President I am perfectly sure that I should have taken every care.

707. If that system had been carried out you are satisfied that these frauds would not have gone on? I do not think so.

708. I suppose that you are aware that in other departments that really is done? I am not aware of what is done in other departments.

709. How long did that go on? Two or three years; I think, off and on.

710. And you felt you had not the necessary authority to inquire into that? Quite so. I felt it my duty to report to the President.

711. I see by the statement here that these frauds extended over a period of three and a half to four years, owing to lax supervision and the non-existence of the most ordinary system of departmental check; and your explanation is that you had not the power to examine the accounts, and if you had it would have been found at once? So far as I know, I should certainly have detected it before long.

712. Do you think that you have a sufficient staff to carry out those duties of supervision, supposing that they were laid upon you? I am pretty hard at it now. We certainly have not more than we want.

713. Would it occupy very much more of your time? I do not know exactly how long it would take, but I would undertake to do it.

714. Without further assistance? I fancy so. I would do my best.

715. Is it a fact that the office relies on the Treasury inspection to discover any discrepancies which may occur of this kind? I believe the President thought that the Treasury inspection was quite sufficient, with his own supervision. He was quite satisfied that there was no fraud going on.

716. How often did that inspection take place? Once a year.

717. Do you mean that practically for a whole year the accountant was not checked? Except by the President.

718. It is shown by these Parliamentary papers that this was not done, and hence the frauds; you are quite satisfied that you have again and again drawn the attention of Captain Hixson to the general unsatisfactory state of the accountant's work? Yes.

719. Does that same state of affairs exist now? I have no more control over the accounting than I have ever had.

720. Are you aware whether the receipts are now checked with the cheques drawn? I have no means of knowing.

721. You do not know, and you still think it is desirable that you should? It is not my business.

722. Have you ever seen the bank book? No.

723. Do you countersign the cheques? No.

724. Then you have no more check over that part of the business than you had before? No more.

725. And you are still of the opinion that it would be desirable that this check should exist? I am of opinion, as I said before, that everything that goes on in the Marine Board should go through the secretary, and he should be responsible to the President and Board.

726. In other words, that you should occupy the same position to the Marine Board as an Under Secretary does to his Minister? Just so.

727. That view has not been taken by Captain Hixson? Not quite, inasmuch as I have no control over the accountant.

728. I see you have given us in your duties, "Supervise the vouchers of expenses";—does that mean you initial the pay abstracts? No.

729. That should be read with the correction, "Not salary abstracts"? Yes.

730. Suppose a man is away from his duties, who is responsible to see that his pay is stopped? It would be reported to me.

Commander  
Lindeman,  
R.N.

23 April, 1897.

731. Would you then call for the voucher and see whether any deduction had been made? No; I should simply report it to the President, who would take the necessary action.
732. You would not follow that up, and see how it is provided for in the abstract? No.
733. Then it would be quite possible for a person to be away from his duty altogether, and by an oversight or collusion on the part of the head of the station, wherever it may be, to be paid, although he may not be doing any work? I suppose it would be possible for a man to be away, and get his pay if it is not reported by his immediate superior.
734. If it is reported? I should report it to the President and carry out his instructions.
735. And then you do nothing more? Unless he directs me.
736. You do not consider you have any further responsibility? As regards his payment.
737. In fact, your position with the Board is a rather restricted one;—have you got authority to supervise the working of the Department? I have nothing to do with salaries.
738. Is not that rather an important part of the expenditure of the office? Yes.
739. And you have no supervision over that whatever? No.
740. And a man might be away without your knowing that his absence is provided for by the excision of an amount from the salary abstract? I never knew a case in point.
741. Still such a thing may exist without your knowledge? If a man was away from the station, and it was reported to the President, no doubt he would take steps to deal with his pay if necessary.
742. But, so far as you are concerned, you would have no power to deal with it? I should probably have to write a letter asking for explanation.
743. But you do not follow that up? I should know what was done, but I should not follow it up with the accountant.
744. You do not initial the salary abstract? No.
745. Do you not think it is advisable for you to do that? It might be an additional check.
746. And this unsatisfactory state of affairs still exists? So far as I am concerned, I have no more control over the accountant now than I had then; but we have a most satisfactory accountant now.
747. You depend, then, on the character of the accountant? Of course the President has his check; but, so far as I am concerned, I have no check. The work goes on very well.
748. Now, how do you obtain your stores? From the Stores Department, and some from the Public Works Department.
749. You take advantage of the expansive clause in the Public Works Department's contract for lighthouses; but are there not cases where you have to get stores outside the ordinary contractors? Sometimes.
750. Now, I notice in this report, page 21, "I have drawn attention to the fact that Messrs. Weisel & Co. have for a considerable time supplied hay, corn, and chaff to the lighthouses at what I consider to be exorbitant rates";—have you any control over that? Only so far as giving the orders.
751. To whom do you give the order? The requisitions come at a certain time of the year, and it is always the duty of an officer in the Department to see that the forage is supplied. It is a peculiar service. It is not like an ordinary service, where a local contractor would supply it. He won't. It is not big enough. The hay, &c., is cut up in small bales, and shipped in little schooners here and there. We can never get it done by open tender. They won't tender for it.
752. Who are Weisel & Co.? They are Sydney people.
753. So that if you have to supply hay, corn, or chaff to the lighthouse at Seal Rocks you purchase it in Sydney and ship it there? Yes; and there is a lot of bother about it. A man has to see it shipped.
754. Do you concur in this report of Mr. Brodie's, that excessive rates were charged? I think the rates were slightly high on that occasion.
755. Before you order things do you make arrangements as to price? It has been the peculiar business of an officer, Mr. Lawrence, to go round and try to get it done as cheaply as possible.
756. Who is Mr. Lawrence? He is the harbour-master's clerk.
757. It is left to him to fix the prices? It is left to him to get it done at the most reasonable price. Since that report we were ordered by the Treasury to get it done by tender in the usual way. They were called, I believe, with no response, and in the end Mr. Kirkpatrick submitted a recommendation that the Marine Board should purchase their forage in the open market, and that is going on now.
758. It is still left to Mr. Lawrence to purchase in the open market at the most reasonable rate? Yes; he has always been a trustworthy officer.
759. You have no reason to suppose that he is not? He has been doing this work ever since and before I came to the Department.
760. If excessive rates have been paid it is just a mistake—want of judgment on his part? I do not know that we could have got any other firm to do it; but Weisel has reduced the prices.
761. And in every case now you exercise close supervision on the prices? I exercise more supervision over this particular thing than I did before. I do not trust to Mr. Lawrence so much as I did. We take good care that we have it as cheap as possible.
762. What would be about the value of the material and forage obtained outside contract conditions? I could not say.
763. Would it be £1,000? I should not think so. We only supply forage and material when it is wanted at stations.
764. Would it come to £500, do you think? It might. It fluctuates. Of course the pilots build their own houses. We supply the timber and material and they put up their own houses. After the lapse of time the places require repairing, and we supply the timber and other material.
765. In what places would that be? All the out-stations except the pilot at the Richmond. He had his house erected because that erected by himself was taken down by harbour improvements.
766. In such cases as that, do you always send the material from Sydney? When they can purchase timber in the district cheaply, we let them do it.
767. If it can be purchased cheaper in the local market you would not send it from Sydney, like sending coals to Newcastle? Certainly not.
768. *Mr. Powell.*] This amount of £2,194, fees collected in 1896,—I suppose those are for fees for certificates and such like? Yes.
769. Does that pass through your hands? All fees are received by me.

770. You would receive that £2,194? Practically, yes; it all passes through my office.
771. Has the accountant anything to do with this money? It simply passes through me to the accountant.
772. In the Llewellyn frauds he appropriated some of this money? I am not prepared to say that he did.
773. I think it is shown in the report? Very likely. I do not know.
774. *President.*] Do you trace the fees to their destination at the Treasury or the bank, or do you simply hand them over to the accountant? A man comes in to pass his examination, and before I deal with his papers I make him pay his fee down, and if they are correct I hand the fee over to the accountant.
775. And you do not follow it up? My responsibility ends there. I do not follow it up at all. It is taken to Mr. Lawrence, who gives the receipt, and he pays it all daily to the accountant. The accountant may be out, and we want somebody on the spot to give a receipt.
776. You do not follow it up and see that it is properly banked or sent to the Treasury? Oh, no.
777. Does anybody do that? The accountant does.
778. But the accountant gets the money? No doubt the President checks the accountant; I do not.
779. You cannot say for certain whether he does or does not? No.
780. You are perfectly satisfied with the accountant now? Yes; very much so. He was my clerk in the office for several years, and is a thoroughly reliable officer.
781. He has got your confidence? Yes.
782. But you have no oversight over his business? No; except that I see he is never out of the office except on business.
783. You speak of him as you knew him when he was with you? When he was under me. Although I have no control over his books, I have a very good idea of whether he is doing his work or not.

Commander  
Lindeman,  
R.N.  
23 April, 1897.

Francis Rule, Accountant to the Marine Board, sworn and examined:—

784. *President.*] How long have you held your present position? Since the 11th July, 1895.
785. Have you given us a statement of your duties? I think you will find it there in the return supplied.
786. You might give us a brief account of your duties? I receive the revenue every day, and it is banked the next day. It consists of fees for steam certificates, watermen's licenses, ballast licenses, and parchment certificates, &c., &c.
787. You do not actually receive the money;—it is received by Mr. Lawrence, and then, at 4 o'clock —? Handed over to me.
788. And what do you do then? I bank it the following day.
789. You have a secure safe? Yes.
790. You bank it the next day;—does anybody check that? Only the Treasury Inspector, when he comes down.
791. There is no inspection other than that by the Treasury Inspector? No.
792. When does he come? About every twelve months, but unexpectedly.
793. So that for twelve months at a time you are not checked at all? No; but Captain Hixson visits me occasionally to see that the work is up to date.
794. No one checks you to see that you actually do pay into the bank the collections that Mr. Lawrence gives you? Other than Captain Hixson initialling the pass-book at the end of the month.
795. In addition to that, does he check? No.
796. He does not check it at all? No.
797. Then he merely looks at the pass-book? Yes, and initials it.
798. He does not compare it with any documents to see that those are the right amounts to be paid in? No, sir. Of course at the end of the month there is a statement sent to the Auditor-General.
799. That is called the attested statement, which is sent in every month? Yes.
800. But there is no other check than the Treasury check? That is a fact.
801. Can you tell me what the collections average per day? They fluctuate; they are about £1,600 per annum.
802. What about pilot fees, and so on? That goes through the Custom House. I have nothing to do with the pilotage.
803. That really represents the actual cash collections you have to deal with? Yes.
804. Every week there is a cheque paid into the Treasury, but there is no one to check that that is the right amount? Only every twelve months.
805. Captain Hixson never looks into that himself? No; he is satisfied with my explanation, and signs the cheque.
806. What responsibilities have you with regard to expenditure? I pay all salaries and wages and a certain amount of the incidentals. I pay everything that is not paid over the counter at the Treasury.
807. Who prepares the vouchers? I do—that is, the salary vouchers; the contingency vouchers are prepared by the people outside.
808. Do the out-stations return to you each month a statement of those who have been employed? Yes.
809. That is to say, although John Smith may be on your register as a pilot at the Manning, you would not enter his name on your salary-sheet until a return had been sent to you by the head pilot at the Manning that John Smith had been employed at the Manning for the whole month? That is correct.
810. And you make out your salary abstract from the salary register and the returns sent from the station? Yes.
811. You never think of entering a man's name on the sheet until you have had a certificate from the superintendent or the head man, as the case might be, that these people were actually employed during the time? No.
812. After that is done, does anybody check you? No; no one checks the salaries. Captain Hixson and Captain Lindeman would know of any change that took place in the meantime, and I would be notified.
813. Suppose that John Smith was away, does Captain Lindeman find out that his name is omitted from the pay-sheet? He does not look at the salary vouchers at all, so far as I know; he sends the vouchers on to me.
814. He merely hands you the paper, saying that John Smith is away; but he does not see that John Smith's name is not put on the voucher? No; not that I am aware of.
815. He does not check it in any way? It is entirely left to me.

F. Rule.  
23 April, 1897.

F. Rule.  
23 April, 1897.

816. When the vouchers are submitted to Captain Hixson he just checks your certificate? Yes.
817. Do you certify to the vouchers? I do not initial the vouchers in any way; I just make them out.
818. You present them to Captain Hixson for signature, and they are not initialled by anybody? No.
819. And there is nothing on those salary abstracts but Captain Hixson's signature? No.
820. He does not demand anybody's signature as a guarantee to him that they are right? No.
821. Does he examine and check them? No.
822. He leaves the whole thing to you? Entirely to me.
823. You prepare the salary abstract and submit it to Captain Hixson, and he signs it, and you do what? Pass it on to the Treasury.
824. Under a proper abstract? Yes.
825. What occurs then? They are checked at the Examining Branch. If there is any change they know of it.
826. What is done then? The money is lodged in the bank to the credit of Captain Hixson.
827. What is next done? The cheques are drawn by me. Captain Hixson signs; I countersign.
828. How are they made out? Sometimes in the name of the pilot, when he has an account in the bank.
829. And then you pay into his credit? Yes, and advise him of the lodgment of the salary.
830. And those that are not dealt with in that manner? I pay those by registered letter and cheque.
831. And is it a fact that they sign the receipts before the money is paid to them? They do, sir.
832. Do you consider that the correct way? It is convenient for adjustment. There is only monthly communication at some out-stations.
833. Does not that plan completely do away with its value as a receipt? It does.
834. Does not it do away with its value as a receipt? Yes.
835. Do not you think it can be done in this way: that you can get all the people to authorise a certain bank to receive the money, and then, when you pay that in, the bank could sign on their behalf? The banks do sign my deposit receipt-book.
836. Could not they sign the vouchers? Yes. I get a receipt as it is if I lodge it in the bank.
837. It does not give a receipt for the person? Yes, for those that I lodge in the bank.
838. The receipt before hand is a mere delusion? It is.
839. When you have done that, does anybody check over these receipts? No; it is left entirely to myself, except that I produce them to Captain Hixson when I am adjusting.
840. When do you adjust—once a month? I adjust every advance in ten days.
841. And then Captain Hixson goes through the vouchers to see that the receipts are attached? He signs the adjustments.
842. Does he check them over? He might not look at every voucher. He casually looks over.
843. It is not done at every payment—only when the adjustment comes? That is all.
844. Does he then check your bank-book;—say there is a voucher for £100 for salaries, does he check your bank-book to see that that £100 is actually paid in, or does he merely see that the vouchers are signed? He merely sees that the vouchers are signed.
845. Is there any value in that as a check? Well, of course he can see that the vouchers are receipted, and that is what the Audit Office require.
846. Is that any value as a check, seeing that every man signs the receipt before the money is paid? There is really no value at all; the man signs before he receives the money.
847. There is practically no check on you except the Treasury Inspector's check? That is all.
848. And the Auditor-General's check? Yes.
849. Does the Auditor-General see that the pass-book is signed? No.
850. Nobody checks you? Only the Treasury Inspector when he comes round.
851. Does he inspect your expenditure account? He does now.
852. Does he go through the bank-book and see that every voucher has got its proper receipt? Yes.
853. He is a check on you both on expenditure and revenue, but only once a year? Yes; but at the end of each month I prepare a statement showing the total advances, the balance in the bank, the dates of adjustment, and the total expenditure under various votes, and present them to Captain Hixson, who signs them.
854. Suppose you were to put the money in your pocket instead of sending it to the persons concerned, he would not know that? No; but if a man did not get his salary he would soon complain.
855. There is no check to prevent that, except the Treasury Inspector's check once in twelve months? Yes; but if the adjustment was not completed, the Audit Office would find it out.
856. But the Audit Office only get these fictitious receipts that are worth nothing at all; the only effective check on you is the Treasury Inspector's, once a year? Yes.
857. Otherwise you are left to your own devices? I carry out the President's instructions.
858. You pay contingencies;—how is that managed? The leading-light men at the rivers are paid from contingencies.
859. But they are salaries? They are salaries, but they are paid quarterly from the contingencies. They have contracts from the Board to maintain these lights.
860. Do they supply the materials? They maintain the light; they supply the oil.
861. Does the payment include the oil, and so on? Yes; I believe it does.
862. You do not supply oil? No.
863. You do not know for certain? Some vouchers are made out for maintaining the light, and some for supplying oil and maintaining the light. We do not supply the oil.
864. Do you carefully see that no oil is sent to the men who are paid for their services and oil? That has nothing to do with me. Mr. Lawrence looks after all requisitions; I have nothing to do with that.
865. Who is he responsible to? To Captain Lindeman, who checks all requisitions.
866. How do you deal with contingencies outside the salaries? If we want a buoy, or a rope, or anything out of contract, the firm send their account in and I send them to the Treasury for payment. I check it carefully before it is passed on.
867. So that, practically, the only thing you pay yourself is salary? Yes.
868. You say you check the vouchers? I carefully check the vouchers.
869. By what system do you check them;—suppose an account is sent in for a buoy—what is the value of your check on that? I go through the order-book, and if the order is there, I know the account is all right.

870. Is the price put in the order-book? Yes, sometimes.
871. Where it is out of contract is there a price put in the order-book showing the arrangement? It might not be in all cases. F. Rule,  
23 April, 1897.
872. How do you check in that case? The price submitted is generally accepted.
873. Without any question? Yes.
874. Who initials those vouchers? Captain Lindeman.
875. Then you do not consider that you have any responsibility as to checking the prices in those contingency vouchers? Captain Lindeman initials them.
876. Then your check is little else than just the mere computation? That is all.
877. There is no other check than that? No.
878. Now, what other duties have you? There are clerical duties. Nearly all the returns that deal with figures are prepared by me.
879. Are you fully employed? Yes.
880. Have you any assistance at all? No assistance whatever.
881. You do the whole of the work yourself? All the work in connection with accounts.
882. Captain Lindeman does not check the accounts at all? He does not interfere at all.
883. He has no control whatever? No control whatever. I am responsible to Captain Hixson alone.
884. *Mr. Powell.*] These salary cheques—you send them out to the people or put them into the banks? Yes.
885. Do you ever break cheques for them? No. If they are small amounts I draw the cash myself, and then pay it myself, and that is shown.
886. But you do not pay accounts for them in Sydney, or anything of that kind? If they request me to do it, of course, I would do it.
887. Suppose a man is owing money in the town, do you pay the money for him? No.
888. You do not act as agent? No.
889. Do you go to the bank and pay this in yourself? I pay the cheques and the revenue every morning. I take them to the bank myself.
890. This Expenditure Account has only been checked lately by the Treasury Inspector? On the 2nd November Mr. Green went through my accounts.
891. Prior to that, was there any inspection? No, sir; only Captain Hixson's occasional visits to see that the books were up to date.

TUESDAY, 27 APRIL, 1897.

PRESENT:—

JOSEPH BARRLING, Esq., J.P., PRESIDENT.  
GEORGE ALEXANDER WILSON, Esq., J.P.  
JAMES POWELL, Esq., J.P.

James Edie, Government Shipping Master, Sydney, sworn and examined:—

892. *Mr. Powell.*] You have been in command of ocean-going steamers between Sydney and Melbourne and New Zealand for a considerable time? Yes. James Edie,  
27 April, 1897.
893. Are you acquainted generally with the rates of wages paid on board ship? Yes.
894. The Commission is not desirous of knowing the highest or the lowest, but what would be a fair thing at the present time on board steamships trading between this and the other Colonies or on the coast—take the master for a commencement? The masters vary considerably; for instance, I think such companies as Howard Smith & Co., the Union Company, or the A.U.S.N. Company start beginners at £20 a month, and they go up to £30, which is about the maximum now. In the Union Company there are a number of older masters who have very much higher pay, and there may be one or two in Howard Smith and the A.U.S.N. Companies. Those are exceptional cases.
895. *President.*] Commanding such vessels as —? “*Monowai*,” “*Mararoa*,” and the new boat coming out—the “*Moana*.”
896. *Mr. Powell.*] First-class passenger steamers? Yes.
897. *Mr. Wilson.*] Old hands like Captain Carcy, for instance? Yes. But the ruling rate would be from £20 to £30.
898. *Mr. Powell.*] What would the masters of the vessels trading to the bar rivers—the Richmond, the Clarence, the Macleay—be paid? I think about £25 a month.
899. Now, take a class of vessels somewhat numerous along the coast;—how are they paid on steam-colliers? I think the masters of those vessels get about £20; but then they have the providing of the vessels, and that means something for them.
900. The masters would range from £20 to £30, and that £30 would represent the command of a first-class passenger boat? Yes.
901. *President.*] The rates mentioned by you would mean that they were found? Yes; they are all found.
902. *Mr. Wilson.*] Have they any allowances besides this? In a passenger ship they allow them £3 to £5 a month for entertaining.
903. *Mr. Powell.*] What would be the rates paid to the first officers? For first officers of cargo boats the Adelaide Company give £1 a month more than the others. Take a number of boats—the first officer of the “*Colac*” gets £15; the “*Era*,” £14; the “*Timaru*,” one of the colliers running to Newcastle, £10; the “*Wendouree*,” a collier, £15; and there is a collier that runs on the coast—the “*Captain Cook*”—the chief officer of which gets £10.
904. In the passenger steamers? The “*Elingamite*,” £15; “*South Australia*,” £15; “*Leura*,” £15; “*Ranelagh*,” £15; “*Tekapo*,” £15; “*Tyrian*,” £15; “*Wallowra*,” an Adelaide Company's boat, £16; the “*Barcoo*,” £15; “*Burrawong*,” £15; “*Coraki*,” £15; “*Arawatta*,” £15; the Sydney to Newcastle trading boats, £15. £15, with the exception of the Adelaide Company, who pay £16.
905. *President.*] Do they ever get overtime? It would not do for officers to get overtime, as they have to keep the men's overtime. That matter has often been discussed.

James Edie.  
27 April, 1897.

906. *Mr. Powell.*] What is the pay of a second officer? The Adelaide Company pay £12; the cargo boats—the “Colac” £12, and the “Era” £11; the “Timaru” has none. The “Wendouree,” £11; “Beeswing,” £11; the “Captain Cook” has none. In the first-class passenger steamers—“Elingamite,” £12; “Leura,” £12; “South Australia,” £12; “Ranelagh,” £12; “Tekapo,” £12; “Tyrian,” £12; “Wollowra,” an Adelaide boat, £13; “Barcoo,” £12; “Burrawong,” £12; “Coraki,” £12; “Arawatta,” £12; “Allowrie,” £12 (an Illawarra boat); and the “Sydney,” £12.

907. Have the wages been reduced at all lately? No. That is about a standard rate of wage I think.

908. How long would it cover—two or three years? Yes.

909. Take the engineers;—I suppose they differ very much? Lately they have come back on the horse-power arrangement. They have an understanding with the Ship-owners’ Association.

910. Their wages do not come under your notice? Oh yes, they appear on the articles; but the figures I have may not be the standard, because some of the articles were possibly drawn up before this alteration was made. They have it on a horse-power rate. £25 is the maximum.

911. What is your experience of the rate paid to engineers—give us the minimum and the maximum;—are they paid pretty level all through—is there any difference as to the kind of boat? It is a horse-power rate.

912. It does not matter whether it is a first-class steamer or a cargo boat; it is the horse-power that regulates the pay? Yes; they calculate the horse-power the same as the Board of Trade. The articles show “Colac,” £21; “Era,” £22; the “Timaru,” the collier, £18; “Wendouree,” £22; “Beeswing,” £19; “Captain Cook,” a small coast boat, £18 10s. Then the passenger ships—“Elingamite,” £24; “Allowrie,” £24; “South Australian,” £20; “Ranelagh,” £21; “Tekapo,” £21 10s.; “Tyrian,” £22; “Wollowra,” £25; “Barcoo,” £25; “Burrawong,” £20; “Coraki,” £20; “Arawatta,” an A.U.S.N. boat, £25; “Allowrie,” £20; and the “Sydney,” £21 10s.—that is a Newcastle steamer.

913. I think we may say from £20 to £25. £25 is the maximum? Yes.

914. Well, now, what are the wages of the second engineers? “Colac,” £16; “Era,” £17; “Timaru,” £11; “Wendouree,” £17; “Beeswing,” £15 (but I fancy the “Beeswing’s” articles were before the agreement with the Ship-owners’ Association); “Elingamite,” £18; “Allowrie,” £18; “South Australian,” £15 10s.; “Ranelagh,” £16; “Tekapo,” £16; “Tyrian,” £17; “Wollowra,” £18; “Barcoo,” £18; “Burrawong,” £16 (a North Coast boat); “Coraki,” £16; “Arawatta,” £18; “Allowrie,” £15; and the “Sydney,” a Newcastle boat, £16.

915. Well, then, it ranged from £15 to £22? I do not know that any of them go as high as £22.

916. £18 is the maximum? Yes; and the maximum for a third engineer is £15; and the maximum for all other engineers is £12.

917. About firemen? Donkeymen, as a rule, have £9 a month.

918. He is a kind of leading fireman? He is a responsible man, who has to get up steam on the donkey to work the cargo.

919. What are they paid as a rule? £9 a month. There is only one under that—the “Beeswing,” £8. I think that is the old rate, and it is £9 now.

920. And the other firemen? £8 a month.

921. What about the sailors? In the coastal steamers, with the exception of the New Zealand steamers, sailors’ wages are £6 a month. In the New Zealand steamers there is an understanding making it £6 10s. for trimmers and sailors, and £8 10s. for firemen. The wages ruling in New Zealand boats are 10s. higher than in Australia.

922. We can take £6 for the wages of sailors on the Australian coast generally? Yes, for sailors and trimmers; but they make considerable overtime.

923. Of course all these men are found in everything? Yes.

924. Can you give us an idea of the cost of victualling—say such a ship as the “Captain Cook”—with the master, mate, second mate, engineer, and second engineer, and two pilots—seven men in all? That makes it more expensive than if they were all hands. Those seven men would require a cook. He ought to be able to do it all without an assistant. He ought to be cook and steward as well for seven.

925. What do you think would be a fair sum to allow for the victualling of seven men in the positions mentioned? The cook would require at least £8 or £9 a month. That is about the lowest rate in the cargo steamers.

926. There are six seamen, four firemen, and the seven men mentioned, with a cook and providore in one—that is, eighteen in all;—suppose all were found, what would be a fair sum? Take them right through, about 2s. 6d. per head per day, and that would be for the providore to pay the cook himself.

927. Suppose the cook was on board and outside the contractor’s expense? The way it is usually done is that a tender is asked for a man to providore the boat per head—so many in the crew, so many officers—and he finds cook, stewards, and attendance, and whatever may be required. He will tender per head per day.

928. *President.*] Would not 2s. 6d. a day be high? He finds the labour.

929. But would not that be rather high, year in and year out? That is a top rate. You might get it done for 2s. or 2s. 2d. I know some boats that are provided for as low as 1s. 8d.; but I think that is on the low side.

930. So you think that 2s. would be about an average? Yes. If tenders were called it would be something like that. When meat was very much dearer than it is now it used to be 2s. for the seamen and 2s. 6d. for officers.

931. *Mr. Wilson.*] Does that mean a fixed ration? No; there is no fixed ration. It has got to be victualled in a proper manner.

932. *Mr. Powell.*] This 2s. and 2s. 6d. contemplates the finding of the cook and providore? That is the entire cost, and they are not included in the victualling. Say you have fifteen men, you call for tenders to victual fifteen men and to provide cook and providore, steward, and whatever may be required.

933. That would include all charges for labour and such like? Yes.

934. Would he provide material, such as crockery, and such like? No; but there would be an inventory taken of what he took over, and there would be an understanding that he would make good all breakages and losses.

935. Now, referring to the “Captain Cook”;—do you think it would be a fair thing to pay all the people on board a rate of wage something like those paid on sea-going vessels, and find them in provisions on board.

board the ship by contract;—would that answer with a vessel like the “Captain Cook”? For such a vessel I think it would be better to have a little higher than the ordinary shipping rate, because there is no chance of the men being anything more than they are there, and you want reliable men. Many of the coastal seamen here are as good a class of men as you will find anywhere. Go anywhere and you cannot beat them; but they would not take the likes of that, because they make more money owing to overtime.

James Edie.  
27 April, 1897.

936. You think the rate of wage should be higher because of the perquisites the other men are likely to get? Ycs.

937. Do you think the principle is a sound one of paying sea-going wages—perhaps the maximum—and victualling the ship, and not making any allowance for victualling to the men? I think it is very much better.

938. And wages should be on the principle of sea-going wages at, at any rate, the higher rates ruling? Yes. I do not know how they manage otherwise; they must go ashore for their meals. If the vessel is sent away for a week or so, who is to provide for the men?

939. Of course, we assume that she is at the Heads all the time; if she went away it would be a special matter.

940. *President.*] I should like to know on what basis the arrangement for overtime is made? They usually stipulate in the articles that the working hours in port shall be any eight hours from 6 a.m. to 6 p.m., with hours for meals, and they usually work overtime, when they are required, at the rate of 1s. per hour.

941. That would apply to the seamen only, the engineers would not be required? The firemen are not paid overtime for anything during the watch, but if required to work overtime during their watch off they get 1s. per hour.

942. They are hardly likely to be called? There are times when they are all bound to assist in the general duties of the ship.

943. When they are at sea the ordinary sea watches are kept and the overtime would simply apply to when they are in port? To when they are working cargo as a rule.

944. Are you aware of the wages that are ruling in the “Captain Cook” at the present time? No; we have nothing to do with that. We do not know anything of their working.

945. But your opinion is that the sailors of the “Captain Cook” should be paid the maximum rate of wages because they have not the same opportunities of working overtime? Yes; you want an inducement to get reliable men. For such a vessel you want men who mean to stay; men who are satisfied with the ship.

946. Would not the loss of overtime be compensated for by the certainty of the employment? The other service is just as certain.

947. Would not the seamen of the “Captain Cook” have an additional incentive through being in the way of becoming pilots? The other men have the prospect of becoming officers.

948. Is there anything in the pilot service which strikes you as desirable to make alterations in? I know very little about it. In Melbourne the pilots have their own vessel, and they are on their own hook, as it were, with everything. The Government regulate the charges, but they take it in turns. They own three vessels at the Heads. These are their own property; they belong to the Association of Pilots, and they work the whole affair themselves. There is a Pilot Board there, and they subscribe to a Retiring Fund, which is somewhat similar to the Superannuation Fund here. The Government has nothing to do with them except licensing them.

949. Are you aware whether it is open;—can as many as like go in and compete? No; the Pilot Board regulates that, according to requirements.

950. Supposing they wanted to keep a dozen pilots at the Heads, how would they select them;—how would they arrange for the persons who were eligible for the work? By advertisement in the paper they would call for applications, which would then be considered by the Pilot Board.

951. The pilots have to provide their own vessel? Yes.

952. Do you think that system works as well as ours? I have never heard anything against it. I think it works very well. They have two or three schooners, and one has to be always cruising about outside. They cruise about between Barwon Heads, Split Point, and Cape Schanck, and when one has been out for the term of her cruise, or sooner, if her supply of pilots is exhausted, she is relieved by another. Those vessels are valued at a certain sum, and anyone joining the pilot service has to subscribe his share of that money to the Pilot Fund.

953. It is managed amongst themselves? Yes.

954. Do you think that that system is an improvement on ours, or ours an improvement on that? I can hardly say, the difference of the ports is so very great. Pretty well every ship that goes in to Melbourne, with the exception of intercolonial traders, must employ a pilot.

955. There is no competition here practically;—there is so little work to be done, that for the pilot service to be kept up at all, it must be carried on in this way in Sydney? I do not think the pilots could afford to work it as it is worked in Melbourne.

956. You are aware that the exemption certificates are about to be done away with, with the exception of intercolonial steamers? That is the granting of more; but does that affect the existing ones?

957. But supposing that were done away with, then the same conditions would obtain here as in Melbourne? It would take a long time to work existing certificates out.

958. So under the present conditions you think that our present system is the only one that could be adopted? Yes, to keep an efficient staff. You may get a long spell of northerly wind, and there may be a number of ships down the coast, and a southerly wind comes and you may get a number of ships up which would expect pilots. If you worked as at Melbourne the system would only support a small staff, and you would not have enough for such an emergency as above.

959. Would that apply to Newcastle? Newcastle is a place where a man should get a pilot. It is a dangerous lee shore as a rule.

960. The Melbourne system would be more likely to be successful in Newcastle than in Sydney? Oh, yes, the Melbourne system would apply better to Newcastle than to Sydney, because there are very few of them, with the exception of the intercolonial ships, that care to take Newcastle without a pilot.

961. Do you know whether there is any complaint amongst sailors that their interests are not properly represented on the Marine Board? It is a growing complaint throughout the colonies. The sailors maintain

James Edie.  
27 April, 1897

maintain that they have a right to be represented. They say they are not represented. An argument used against them is: "What representation can a sailor require; he holds no certificate, he cannot be dealt with if he does wrong." But still his life is at stake all the same. The engineers are now represented, Mr. Wildridge being one. I see also that they have made it so in New Zealand now by Act of Parliament when steamship inquiries are held, and I think it is a very proper thing. The steam-boat trade predominates now, and a lot of old sailing-ship masters would be just about as far adrift as anybody could be in an inquiry into steam matters, and I think it is only right that there should be an engineer on the Board. I cannot see why a sailor should not have a say as well; he goes to sea in the ship, and he ought to have a say about the condition of the ship he is to risk his life in.

962. Might it not be contended that the Government representative represented the sailors? It might be. But they are usually retired ship-masters. The sailors could appoint one of their own men. There are many men before the mast who hold certificates, and many who do not who are well qualified to sit upon a Board of Inquiry. I see no harm at all in the seamen being represented. I think all classes who go to the sea in ships should be represented. Of course stewards would not be qualified to sit on a Board, as they have no practical knowledge of seamanship.

963. *Mr. Powell.*] Do you not think that a Court composed of a District Court Judge, a legally-trained man, assisted by two nautical assessors chosen for the particular case, would give greater satisfaction than a Board of elected men representing different interests. To put it in a familiar manner, suppose the inquiry is to be presided over by a District Court Judge, and it is a question of engineering, he would associate with him such men as Mr. Wildridge or Mr. Cruickshank, or if it was a matter of collision, they might perhaps call yourself to assist the Judge. The Judge would deal with the law and be assisted by competent persons on technical points. Would not such a Court as that give more satisfaction than a court of masters, seamen, engineers, persons who have direct interests which they would each endeavour to forward? The system in Great Britain, I think, is a Stipendiary Magistrate and two nautical assessors; but I think in England they have paid assessors. They go from place to place inquiring into accidents which take place. They have Marine Boards as well. In Melbourne I think they occasionally appoint a magistrate and a couple of assessors. Say it is a case of collision of steamboats, it is very little use getting a couple of men whose experience has been entirely in sailing-ships to sit on that case, because they would be foreign to it altogether. And take it the other way about. There are men, now-a-days, with certificates for steamboats only. There are some young officers growing up on steamboats who know little about sailing-ships.

964. If experts were called to deal with cases in which they had experience it would give more satisfaction to all concerned? Yes; and again, sir, you take a man on an ocean-going steamboat, he brings her within pilot waters, and then the pilot steps aboard and does the whole of the manœuvring of the ship. If it was a case that happened in the working of ships, in and out about wharfs, you should have men who are used to doing that work and capable of judging. If it was a case on the ocean it would be provided for by the rule of the road, and if it is a sailing-ship by all means appoint sailing-ship men.

965. Would you select the men who were most likely to give valuable assistance to the Judge? Yes; and if possible let them be men who knew neither party.

966. *Mr. Wilson.*] You would have to assume, in fact, that the assessors would be properly selected? Yes. That has been the mode of working in New Zealand for many years. In case of collision or shipwreck a couple of assessors are selected, usually from the ships in the port at the time.

967. Frequently the harbour-master used to be appointed? Yes; he would sit on it as Government representative.

968. In England the Marine Boards in no case try cases of collisions and such like? No; the Board of Trade regulates them.

969. They hand them over to a Stipendiary Magistrate? Yes.

970. Assisted by nautical assessors? Yes.

971. The Marine Board do not interfere in the matter except to hand it over? No. I think there is one Captain Raffles, who goes from place to place with the Board of Assessors.

972. If we had a man of the stamp of Captain Raffles, do you think it would be more satisfactory to leave these matters to him rather than to a Board, where there are so many conflicting interests represented? But then they have the Marine Board all the same.

973. If we had a man of the type of Captain Raffles in this Colony to deal with these cases, assisted by nautical assessors, do you not think that such a court would gain more confidence than one composed of persons representing a number of interests, such as underwriters, sailors, engineers, whose interests might be conflicting? There is just a possibility of their all working for their own party where interests are represented; but in the other cases the other system has worked well in other places.

974. *President.*] Do you think if a District Court Judge were appointed, who from his very position would be a highly competent man, and then let him select his assessors, that that would gain the confidence of the community? It appears to do so in the United Kingdom.

975. And you think it would do so here? It appears to work very well in other parts where inquiries are held. You would have the Judge there to hold the inquiry in a legal form, and the others to advise on technicalities.

976. And you think such a Court would secure the confidence of the seamen and the public? I think so. But still the Marine Board would have the controlling of vessels, and the saying what condition they are in when they go to sea. There should be a class representation; I think it is only right.

977. Do you not think if the Government were to appoint a highly competent officer in charge of the Marine Board, that his decisions, he being strictly responsible to the Government, and the Government to Parliament, would also secure the confidence of the people? What I have in my mind is to separate the judicial from the administrative functions of the Board. Let the judicial functions be carried out by such a Court as we have suggested, and the administrative by the appointment of a highly qualified officer, who would be responsible directly to the Government for the management of the Department, and for the granting of certificates, and so on. In Melbourne there is Mr. Wilson, who is the engineer. He reports on harbours and lighthouses, and is under the Government, not under the Marine Board. Mr. McLan is the engineer surveyor for Marine Board. Then the Marine Board have their regulations, and the Secretary to the Marine Board does the work of instructing for inquiries, and the granting of certificates after examinations have been held. In New Zealand the whole of that Department is under the Customs.

Customs. The Government have an officer, a seaman. Captain Johnson was for many years in that position. Now it is held by Captain Allmann. He is Government adviser to the Department in matters of buoys, lighthouses, harbours, &c. They have no Marine Boards in New Zealand. James Edie.  
27 April, 1897.

978. Does that work well? As far as I know.

979. That is direct responsibility to the Government? Yes. The Customs Department has the control of that. It used to be a separate Department, but it was done away with, and put in there.

980. The Secretary of Customs is the principal officer who directs all the operations under the Act? Yes.

981. And do you think that some such system would be satisfactory here? It is hard to say. The country is so different. I am only pointing out the different ways in which it is worked. In Melbourne there is a Harbour Trust. Pretty well every port in New Zealand of any size has a Harbour Trust, and the Government hand over to the Harbour Trust all the pilot dues, and the entire control of their own pilot staff in each port. For instance, Newcastle might be formed into a Harbour Trust.

982. That has been proposed? The entire control of each particular harbour would be under its Trust. The lighthouses are outside that. They are under the general Government control.

983. Still you would see no objection to such a system as that here, having either the Customs or a separate Department dealing with the administration of those functions which now come under the Marine Board apart from their judicial functions? In Melbourne it is separate. Mr. Wilson is not under the Customs. The Melbourne Harbour Trust only extends to Hobson's Bay. The lightships and buoys come under Mr. Wilson, who is the Ports and Harbours officer. The Government, I understand, retain the control of any port whose revenues are so small as not to support a Trust.

984. *Mr. Wilson.*] Is the Melbourne system better or worse than the Sydney system;—the pilot vessels in Melbourne are sailing vessels? Yes.

985. You have had a lot of experience in Melbourne? Yes.

986. Are you aware that there has been an agitation in Melbourne to have steam-vessels? Yes.

987. Are you aware that the vested interests of the pilots have to some extent stopped that? Yes, I have heard so. Their schooners represent a lot of money, and if put on the market would entail a serious loss to them.

988. So that while the public are agitating for steam-vessels, the pilots are against it, because they would have to find those vessels? Yes, I believe that to be the case.

989. So that those vested interests are obstructive? Yes, no doubt, to the introduction of steamers. I have heard that occasionally the pilots' boats have been caught inside.

990. From your experience in Melbourne, has it not happened within the last fifteen years that in rough weather the schooners have not been able to go out, and if they have gone out they have not been able to give assistance? They have got away to leeward.

991. They could not put a man on board an in-coming vessel? No.

992. And if they had had steam-vessels they would have been able to do it? Full-powered vessels, yes.

993. The pilots in Melbourne have really to pay to join, it is a close proprietary? The money they have to pay in is for the purchase of their share in the schooners, and for, say, ten pounds they pay in, the market value of the share would be considerably less.

994. A man coming in has to pay the value of his share to a man going out? Yes; I believe so. Just about 1888 there was considerable agitation in Melbourne about the pilot service, and the merchants in Melbourne insisted on their being more efficient, and they got a third vessel so that they could have two outside.

995. Do you not think that these facts that you have now admitted condemn the Melbourne system? As far as the vessels are concerned.

996. Steamers are preferable to sailers—and the same applies to Newcastle? Newcastle requires a steam-vessel—and a good one at that, one that can go out in all weathers.

997. These facts really condemn the Melbourne system? I prefer the steam vessels: yes.

998. You were contrasting the New Zealand system with the Sydney system. The New Zealand trade is split up among four considerable ports;—it is very much cut up? Yes; there are five, The Bluff, Lyttelton, Wellington, Auckland, Dunedin.

999. Therefore it does not follow that the New Zealand system, which is designed for a trade that is split up, would be suitable for a highly concentrated trade such as that in Sydney? Oh, no. In Lyttelton they have a tug to tow the pilot boat out. The pilot can go out in the tug and tranship outside. The Bluff has a tug, and at Auckland they can get out at any time. Newcastle is a place that necessitates very careful handling. Vessels should be able to get a pilot well to windward, as the wind they run in with forms a lee shore.

William Douglas Cruickshank, Chief Engineer Surveyor to the Marine Board and Examiner in  
Engineering, sworn and examined:—

1000. How long have you held your position? Twenty-three years next month.

1001. *Mr. Powell.*] You have two assistants? Yes.

1002. As assistant engineer surveyors? Yes.

1003. Will you be good enough to describe what the duties of yourself and assistants are? I have here a short statement which I will hand in [*Vide Appendix 20*]. According to law all steamers have to be surveyed twice in twelve months at least, sometimes three times, and sometimes four times. Those are passenger steamers, and the numbers I give here refer to passenger steamers.

1004. *President.*] You examine all specifications for steamers;—does everything come before you whenever a new steamer is being built? That is so.

1005. You have to examine before the engines can be built at Mort's, and calculate the strains? I have to pass it and initial the drawings, so that there will be no trouble afterwards.

1006. Supposing a new boiler is required, is that submitted to you? Yes, all the plans.

1007. And you calculate everything in connection with it? The drawings have to be submitted to the office, and tracings of the drawings of all new boilers and machinery are kept there, recorded, and filed.

1008. As the work proceeds do you attend the different ship-yards and see that it is carried out in accordance with specification? Yes, and certificates are issued.

W. D.  
Cruickshank.  
27 April, 1897.

W. D.  
Cruckshank.  
27 April, 1897.

1009. Then you examine at every stage from the initiation to the completion? Yes, and that applies to imported machinery. We have arrangements made with the Board of Trade, and imported machinery must produce certificates from the Board that it is constructed in accordance with their regulations, otherwise we do the same with it as we do with machinery manufactured in the Colony. The machinery has to be tested and supervised when put in the vessels, and certificates issued. When they produce certificates from the Board of Trade it saves us a lot of work.
1010. Is the machinery marked in any way? It is stamped. It is cut in, and the Board of Trade surveyor's initials and the date, but they have to produce a certificate from the Board of Trade as well.
1011. You do nothing in connection with the Government steamers, I presume? Oh, yes; we have all the small steamers under our control, with the exception of the Public Works Department's.
1012. You have nothing whatever to do with that? Nothing whatever.
1013. I suppose you can give us the number of vessels you have to deal with? We survey 500 or 600 vessels every year, and we have the supervision of the buoys and moorings in the harbour, besides the machinery in the Public Instruction Department at the Technical College, and the Government ferries.
1014. You have a rather big order in your work? We have plenty to do.
1015. *Mr. Wilson.*] What is Mr. Marshall's salary? £300 a year, and the salaries of the chief engineers in large vessels go up to £30 a month, and they are found.
1016. You are referring to such steamers as those of the P. & O. Co.? Yes; they are large steamers. We have to survey a number of those steamers, and lately I have had five of them. The chief engineers of those vessels are very highly paid—much higher than the engineer who has often to examine them. In the old days we had only the main engines to survey; now we have the auxiliaries, and there is more trouble about them than there is about the large engines. I may state that in New South Wales no one is allowed to survey machinery, under a penalty of £100, unless he has passed the high-class examination, and has the necessary certificates. I would like to say that I have earned the confidence of the shipping people, and no decision of mine has ever been questioned. In Victoria, there was the Sangster Board Inquiry into the manner of surveying vessels there, and it cost many thousands of pounds, lasting four or five months. I am pleased to be able to say that I have never had the slightest trouble with anybody during the time I have held the position. [*The witness then read an extract from a letter from Mr. Major, Board of Trade Surveyor at Cardiff, England, giving the programme of the Board of Trade, showing the treatment of their engineers, and their division into classes, with the pay attached to each class, Vide Appendix 21.*]
1017. *Mr. Powell.*] Do you conduct the examination for certificates? Yes; I conduct them all.
1018. What is their nature? There are five grades of examination.
1019. Are they named in the Act? In the Shipping Act. But we have grades which meet our local requirements so far as the harbour and river service is concerned. The Board of Trade regulations have three grades.
1020. You conduct the whole of the examinations, and upon your recommendation the Marine Board issue the competency certificates? They issue the certificates.
1021. The Board, as a Board, have nothing whatever to do with the examination of candidates, and know nothing about it? Nothing.
1022. Do you report in any way to the Board about these matters? Yes; I conduct a large correspondence, technical and otherwise, but the reporting is generally giving a description of any breakdown, collision, or any mishap to machinery.
1023. I suppose Mr. Wildridge is a competent man to deal with anything of that kind? As a member of the Board, yes.
1024. Prior to his appointment, there was no person skilled in steam as a representative on the Board? No.
1025. How many candidates present themselves in a year, as a rule? It varies—70, 80, or 90; sometimes more, sometimes less.
1026. Out of that number, how many would pass? There are generally from 20 to 25 per cent. fail.
1027. Do they come up again? Yes, sometimes. According to the law, if they have failed in arithmetic they are entitled to come up any time, but if they have failed in the vocal examination they must be put back three or six months, according to the opinion of the examiner.
1028. Have your assistants anything to do with the examinations? No.
1029. There must be some clerical work? Yes.
1030. Who attends to that? I do. We have to attend to it ourselves. We have a messenger upstairs whom we utilise as much as possible. We keep a complete set of books showing all work done every day, and we send in each month a condensed report of the work done, initialled by each surveyor.
1031. Is this a report made out by yourself? Yes.
1032. The average per month would be about fifty? Yes; about fifty steamers. There is a lot of work that cannot be put in that report.
1033. This report is made up from your diaries? No; it is made out from notebooks which each man keeps. We have a complete set of books which each man keeps.
1034. *President.*] What proportion of your time would the clerical work occupy about? There is a considerable amount of my time taken up in calculations.
1035. That cannot be deputed. It would seem, at the first blush of the thing, that it would be much cheaper to have someone to do your clerical work at a small salary, rather than occupy your time in purely clerical labours? I have always been anxious to get, not an expensive man, but a clerk who would do the clerical work, write letters, &c. As for the figuring, I do most of that at home.
1036. *Mr. Wilson.*] Have you ever asked for a clerk? Oh, yes. Our people are very economical in that line. When any examinations are taking place and I have to go anywhere, I have to lock them in until I come back.
1037. *Mr. Powell.*] Lock the candidates in? Yes, I have to lock them in; of course, I am not very long away.
1038. *Mr. Wilson.*] Do you not think that to have to conduct these examinations is a very serious responsibility—should you not have a small Board? No, I do not think so. I want someone there so that if I am called out there may be some one left in the office. There is no one in the office to-day. I have put the candidates off to-day.
1039. *Mr. Powell.*] I suppose that steamers are becoming more and more numerous among the vessels visiting

visiting the port, and the sailers are gradually taking second place? The steamers are not only increasing in numbers, but also in size and complication of parts. W. D.  
Cruikshank.

1040. And do we understand that in this work you off coat and go in for it, or do other people do the dirty work—how is it managed? Whoever has to do any particular ship has always plenty of dirty work. 27 April, 1897.

1041. Do you do that dirty work? Certainly; you have to go into all sorts of dirty holes. If you wish any evidence on that, any of the steam-boat people or the engineers would be able to give proof that we go into the dirty holes.

1042. *President.*] We only want to understand exactly what your work is? We have a large amount of work from Melbourne now on account of the Sangster Inquiry; a large number of the ships are coming here to be surveyed.

1043. Do you know anything about the working of any of the other branches of the Marine Board business? I do not think I do.

1044. *Mr. Powell.*] The different branches do not interfere with each other at all? No.

1045. You simply report, and the Board issues certificates on your reports, but they do not interfere with the working of your branch? No; a notice comes to me, and after the work is done an official declaration is sent to the secretary that it is done, and on that declaration the certificate is issued. In this Colony we issue six months' certificates. All the other colonies and the Board of Trade at Home issue twelve months' certificates, but there is no power in our Act which enables it to be done by us. We are very much behind in this respect.

1046. You are compelled to have examinations every six months, and sometimes three months? Yes; of course we have the power to make an examination as often as we like.

1047. Is it necessary to have twelve months' certificates? It is necessary for large steamers. It is necessary to have frequent examinations of small steamers, because there is no skilled labour in them; but in the large ships there is always skilled labour.

1048. Have you heard any complaints? The shipping people have complained several times.

1049. You regard that as a defect in the Act? I think so.

1050. With some provisions to meet special cases, you think an annual examination would be sufficient, generally speaking? Yes; it is considered sufficient by the Board of Trade, and in Victoria and Queensland and the other colonies. We are the only colony that issues six months' certificates.

1051. *President.*] With regard to the examinations, you set all the questions? I set every question myself.

1052. Do you compute the results yourself, not checked by anybody? Yes.

1053. Do you compute the results yourself—and the whole thing is in your hands? Yes.

1054. Do you not think it would conduce to your own comfort if you had some assistance? I think so.

1055. That is to say, someone who would set questions with you, compare notes, and compare results? If I had some young fellow who could read formula and understood figures, it would be a great assistance to me.

1056. How many candidates are there? Seventy or eighty a year.

1057. Is it all left to you? Yes.

1058. Are your certificates ever questioned? No.

1059. Does anybody ever interfere with you? No.

1060. Do the Marine Board interfere with you in any way? No, sir; they trust me implicitly.

1061. No one ever tries to influence you in connection with your work? Not in the slightest, never.

1062. You are left absolutely free? Absolutely free.

1063. Is there any suggestion that you can make to the Commission which would, in your opinion, improve the working of your Department? My opinion is not that, of course, of an expert in navigation; but all along I have thought that two nautical assessors and a Judge would be much more satisfactory.

1064. You come in contact, of course, with a great many engineers and nautical men of all grades, and what you say in that respect is borne out by the conversations you have had with nautical people generally? Yes.

1065. Do you think they would be more satisfied with such an arrangement as that than with representation on the Board? I think it would be more satisfactory.

1066. You think they would be perfectly satisfied? The logic of the thing is that, according to the Act, a man must be a shipowner in order to be a representative, and in many cases a number of our wardens cannot sit because they are personally interested; and it is the opinion of those who are capable of judging, that representatives ought not to be ship-owners, because they are personally interested.

1067. Are you aware that agitations have been got up to obtain representation on the Board for engineers and seamen—and do you think they would be satisfied if, instead of representation, they had an independent Court such as you described? No; the sailors would not be satisfied, but all the others would. The firemen and seamen want to be represented on the Marine Board as a body that deals with certificated men; but they have no certificates, and they would, therefore, be sitting in judgment on officers of ships who have qualified in the service; but any arrangement made that would leave them out would not satisfy them.

1068. In the case of the arrangement proposed, no one would be represented except the general public directly? So far as the engineers are concerned, the nautical assessors would have power to call expert evidence if they wanted it.

---

John Henderson Bedford, Examiner in Navigation, Seamanship, and Pilotage to the Marine Board, sworn and examined:—

1069. *Mr. Powell.*] What duties do you perform? I have to examine all the candidates for colour-blindness, for navigation, seamanship, and pilotage for all harbours on the coast. I examine masters of foreign-going vessels in lights, coast-trade masters in light; also examine for exemptions from pilotage. J. H.  
Bedford.

1070. How many examinations do you think you had last year? Two hundred and seventy-seven altogether of all grades. 27 April, 1897.

1071. That is the whole number of examinations conducted for the whole year? Yes. Some of the candidates may come up two or three times, but they pass every time, and have to go through the same examination as if they had not been up before. 1072.

J. H.  
Bedford.  
27 April, 1897.

1072. Out of that number how many passed? I could not tell exactly. Last year eighteen failed, but not passed; thirty-two failed, but since passed; eighteen failed altogether; but thirty-two, after failing, came up again and passed. This is in the different grades.

1073. When the men pass do you or the Marine Board issue the certificates? The man applies to the Secretary, and he is sent up to be examined in colours before any money is accepted from him. Then his money is taken, and the secretary signs his application form, and he comes up to me, and if he passes I fill up a form and the secretary gives him his certificate.

1074. The certificate is issued on your report? Yes.

1075. Do you sign the certificates yourself? No; I sign the form authorising the secretary to give the certificate.

1076. Do you find the applications for certificates are falling off? No; there are forty exemption certificates issued up to to-day. That is more than for the same period last year. During the period in which thirty-six were issued this year, thirty-four were issued last year. They are increasing.

1077. You have served in different offices, and have been harbour-master and inspector? Yes.

1078. Joint offices? Yes. I got £50 a year extra for being Inspector, and then I got my present position.

1079. When you say "joint offices," what do you mean—the harbour-master has to move ships, doesn't he? He moves the ships, and then at the same time, if there is any inspection to be done on board, inspecting ships coming from sea or going to sea, or any other duties that are performed by inspectors now, I had to do this.

1080. You mean to inspect deck cargo? Yes, and to see that vessels going on excursions did not carry more than their proper number, that they did not take too much cargo, or carry too much to interfere with the comfort of passengers on deck.

1081. How long have you held the office of examiner? Since 1886.

1082. *Mr. Wilson.*] You say the exemptions are increasing? Not at a great rate.

1083. It is only for a short time, so of course you cannot say? No.

1084. Have you any new instructions regarding exemptions? No.

1085. Does the Marine Board direct you in matters of that kind? No. If a man comes up to be examined for Sydney I test his qualifications for bringing the ship into the harbour. The "unlimited" certificate is for mail-boats, and certificates are issued from 50 to 100 or 300 tons, and after that the candidate must get one for unlimited tons.

1086. There is nothing to show that they will not go on increasing? No.

1087. Are you the sole examiner? Yes; I do the whole of it.

1088. Do you think it is desirable for you to do the whole of it from the public point of view and the point of view of the examinees? I can see no objection to it.

1089. Except that an examiner is like any other mortal and may make a mistake? I know that, sir.

1090. There is nobody to check you? No; it is the same in England.

1091. You do not know that they are not checked? I know exactly what they do in the outports in England. For instance, at Plymouth there are candidates to be examined. They send to London for the Plymouth papers, and a sheet is sent with all the answers to the different problems. After the papers are examined and passed they go up to London and are checked there.

1092. But no one checks yours? No. Anyone can inquire for the papers; I keep them all.

1093. You examine two or three hundred men a year;—is it not quite possible for you to make a mistake? Oh, yes.

1094. You have no second examination? No; but, according to the regulations, any member of the Marine Board may come and sit.

1095. Do they do it? No. At any time the papers can be produced, and it can be shown where the candidate has done them improperly.

1096. A man may fail through a mistake you have made—even if he does not raise the question he may still suffer an injustice? I am very careful that he shall not suffer from a mistake I have made. I compute all my own problems. It is almost impossible to make a mistake in that. I work back from the result to what I began with, and it must come out the same if it is right.

1097. What portion of your time is occupied? The candidates come in at 10 and remain until 4. They do not leave. The regulations are that officers commence at 9 and leave at 4:30, with an interval of three-quarters of an hour. I found it did not suit, and I spoke to the Board, who allowed me to begin at 9:30 and leave at 4, with no interval at all.

1098. Do you observe those hours every working day? No; the men getting exemption certificates can come up at any time, and I find it a very great convenience to be there between 1 and 2, because there are many men who come to me between those hours.

1099. Every working day you are on duty from 9:30 to 4 without an interval? Yes.

1100. And you are not checked? If I commence with a certain latitude, longitude, and time, and compute all the elements for that, and then work that back again, if it does not come out as I commenced it must be wrong; so that I would not give it to candidates unless I was quite sure it was correct; and these problems are computed weeks and weeks before the candidates get them, and I am certain that they are correct. About three weeks ago the Government Printer made a mistake in printing S.E.E. for S.S.E., so that it meant nothing. On looking through one of the candidate's papers I found him wrong, and gave it to him to correct, and he came and asked me what this S.E.E. meant, and I found they were all like that. The candidate takes the papers, works them, and brings them back to me, and if there is a mistake he is allowed to get the paper to correct it.

1101. *President.*] I suppose you hold all the higher certificates yourself? I hold all the highest a master in the merchant service can hold. The examinations commence on Tuesday. They are examined for colour-blindness on Monday. There are a master and a mate being examined now. If they go on and do not fail before, it will take them till Friday to finish. If a man comes up in the meantime for exemption I can attend to him, or to a coast trader or harbours and rivers man.

1102. Could it not be so arranged as to have a recognised time? Only for foreign-going men. There is a certain time arranged for that.

1103. How often do you have those examinations? Every week; and in fact every day in the week a person may come up for examination for a coast-trade certificate or for a harbours and rivers certificate, and on Tuesdays for foreign-going.

27 April, 1897.

1104. Does anybody assist you? No.
1105. Do you set your own questions? Yes.
1106. And you judge the results yourself? Yes; I see from my own worked examples whether the candidate is right or wrong. I have a book with all the examples worked.
1107. What is the nature of an examination for an exemption certificate? If a man comes up for Sydney I examine him, beginning at the Heads right up to Cockatoo Island, as to the depths of water in the different channels and in the different parts of the harbour, the leading marks for coming in and going out, and to see that he has such a general knowledge of the harbour as will enable him to bring a ship in or take her out of the port.
1108. Can anybody come up for certificates? A man has to be three times in and out as a mate of a coast-trade vessel, and now there is a new regulation that a man must bring a register to prove that he is going to take command of a ship, and until this I have known a third mate to come up.
1109. It has been represented to us that the exemptions will very largely decrease, and will be confined practically to our own intercolonial boats in consequence of the altered rules? That will be the effect of it. No foreign man can get exemptions now. He can get the certificate now, but it is of no use to him, except he is actually engaged in the coastal trade.
1110. You told Mr. Wilson just now that the exemptions were increasing? There have been more issued up to date this year than up to the same date last year—that is, three or four more: not a very large number. More candidates have come up. A man may come five or six times; he will get exempt for Sydney, and then go away and come back and get exempt for Newcastle and for the Tweed River, and his name will be down three times.
1111. He has to get exempt for every port? Yes.
1112. How long do these exemption certificates last? A man's lifetime, unless cancelled.
1113. Do foreign-going certificates that have been issued in the past hold good now under the new regulations? Those who had them are allowed to use them now because the certificate is "for any vessel that he may be master of."
1114. Then it will be some time before the new regulations will have any great effect on the amount of pilotage? Yes; there are so many people who are exempt in the Orient and P. and O., and German and Lund steamers; the masters and the mates are exempt.
1115. So the effect on the revenue will be very small? I do not think it will make any difference for years unless the Government say that those certificates shall not be used except when engaged in coastal trading.
1116. Would they have the power under the Act to say that now? I do not know. When the certificates were issued it was mentioned particularly that they were only to be used when engaged in coastal trade, so that if I went to New Caledonia or China I had to take a pilot, but if I went to Newcastle in the coastal trade I was allowed to use a coastal certificate.
1117. You have nothing else to do but examine? No.
1118. I suppose you have great experience in sea-going matters? Yes.
1119. Many years a captain yourself? Yes.
1120. Can you suggest to the Commission any way by which the conduct of the Marine Board can be improved in any direction? We all have our opinions—perhaps it might interfere with what has been said by the Heads of the Department.
1121. We are asking you individually;—we want to know if you can see any way in which the operations of the Marine Board can be improved? In all parts of the world where pilot vessels are engaged there are no captains in charge of the pilot vessels; the last pilot going on board takes charge of the ship. It is so in Melbourne. He is the captain for the time, and if he is put on board a ship the mate brings the boat back to port and the next pilot takes charge. That is done on sailers and might be tried on steamers.
1122. What would be the benefit of that? There would be one person saved—the saving of his salary.
1123. There are always three or four persons on board a pilot ship? Half the pilots are aboard.
1124. So you would suggest that the whole staff be made effective captains? Yes.
1125. And the man last on board? Would take charge of the ship, take her out and bring her in, and do anything required. If he can pilot a large steamer in and out of the port, surely he ought to be competent to take a small one.
1126. Have you been in any parts of the world where steamers have been employed? No; all sailers.
1127. Do you think there would be any difference in the case of steamers? I cannot see it. You don't require much seamanship to handle a steamer, but you require a lot of seamanship to handle even a small ketch. Some masters could not take charge of a ketch. There are certificates issued now for steamships only.
1128. Is there anything else? I have been in all the ports on the coast, both in sailing-ships and steamers. At the pilot stations the pilot required four men to go out on the bar and take soundings. There were no tugboats then.
1129. Now that there are tugboats, and the pilot can use them, does he require the same number of hands? He has the use of the tug to go out and take soundings, or for any other purpose. He does not use his whaleboat now, and would be foolish if he did.
1130. How many tugs are there? At nearly all the harbours on the coast.
1131. Do you think it is a good thing to have tugs at nearly all the bar harbours on the coast? A good thing for the ship-owners.
1132. But a large expense to the Government? Yes.
1133. Is that plan adopted anywhere else? The Government does not find them; it is left to private enterprise.
1134. Is there any reason why it should be done here? I do not see any reason why it should.
1135. So that the shipping community have facilities here which they have in no other part of the world? The Government find tugboats nowhere, neither in America or India, nor in any other place. The Government find a tugboat at the Mauritius, which you have to pay for.
1136. But here they pay nothing? They pay, but they do not pay so much as they would have to pay private people. In the Mauritius they must take the tug to berth their ships, so that it is not optional, as it is at the bar harbours. These coastal vessels will never take the tug nor a pilot, if they can help it.

- J. H. Bedford.  
27 April, 1897.
1137. Suppose the subsidy was withdrawn from these steamtugs, do you think there would be sufficient private enterprise to keep them up? I do not.
1138. The subsidy is the only thing that keeps them going? Yes.
1139. What they get from the ships employing them now would not be sufficient to induce them to remain on? No.
1140. Are the subsidies excessive? I do not know what they are.
1141. You say there are facilities given here to ship-owners which are not given in any other part of the world, and that at the expense of the Government? The only part of the world I know of where a Government tug is used is the Mauritius, but there every ship must use it, and it pays for itself.
1142. Suppose a regulation were made that every boat going into the harbour must use the tug? Then the ship-owners would complain.
1143. How often do they use it? Only when actually compelled to do so; whenever they cannot help it.
1144. The Government pays a subsidy on the off-chance of the tug being wanted? ————
1145. Don't you think it would be a fair thing, if the Government pays a subsidy, for them to compel shipping to use the tug, so that they would get revenue in return? Not compel them to use them, but pay something as a harbour rate towards the subsidy. There is a harbour and light rate that they pay along the coast, charged, I presume, to pay for the pilots and other assistants, but they pay no rate extra for the tugs.
1146. They had to pay the same pilot rates before the tugs were granted? Yes. If they want tug-boats they should pay to keep them there. It is a tax on the general public to keep up tugs for the benefit of ship-owners.
1147. *Mr. Powell.*] You said the ship-owners got the benefit of this? Yes.
1148. Has it not had the effect of reducing the rates of insurance? I do not know. I could not tell.
1149. *President.*] Is there anything else you wish to say? Our Sydney certificates are considered second to none in the world. We have men out of the Orient boats, from large sailing ships, and from all the vessels coming to the port to get their certificates from here, and there are more candidates coming up here for examination than in all the other colonies put together. Both the examiners in Brisbane and Melbourne passed the examination in Sydney, and I have read a letter from the New Zealand Treasurer in which he told a candidate for the position of examiner in Wellington that without he had had a Sydney certificate he would not get the position, and the harbour-master and deputy harbour-master in Launceston came up here to get their certificates, as they were recommended by their own Board to get Sydney certificates.
1150. Do they pay any fee for examination? Yes; a master pays £2 10s., and a mate £1 10s.
1151. Are the expenses of your Department covered by the fees? Yes, I think so.
1152. So that your salary is not an expense to the Government at all? I do not think it is.
1153. *Mr. Wilson.*] What is your salary? £380, and I was getting £400, and at the time of the 10 per cent. deduction £20 was taken off. In Wellington the man who holds the same position as I do here is getting £400.

Lyon Henry Walford, tide surveyor, Customs Department, sworn and examined:—

- L.H. Walford.  
27 April, 1897.
1154. *Mr. Powell.*] You visited and reported upon the condition of the "Argo"? Yes.
1155. Will you tell the Commission in what condition you found that vessel? The decks are blown out of her from end to end, and I think nearly every deck beam is broken.
1156. Is she stripped? The lower masts and top-masts are in her.
1157. So far as you can judge at present, is she fit for sea-going? No, and I should not think it would ever pay to put her into sea-going order again.
1158. Do you think she will ever go to sea again? No.
1159. How long has she been laid up there? About four years.
1160. Did you also visit the steamer "Tinonee"? I did.
1161. What condition did you find that boat in? They are using her as a hulk for any spare gear at the dock.
1162. Is she gutted? There are no spars or anything in her.
1163. Is she used as a kind of floating jetty? Yes, when they are cleaning vessels they lay them alongside her.
1164. She is not in sea-going condition? No.
1165. How long has she been laid up? I could not say how long; she has been there for some years—about four years, I think.

William Hare, clerk in the Registration of Shipping Department of the Customs Office, sworn and examined:—

- W. Hare.  
27 April, 1897.
1166. *Mr. Powell.*] Take that list, please [*handing list to witness*]. Does that list represent the names of persons entitled to vote at the election of wardens for the present year? Yes. [*Vide Appendix 22.*]
1167. Do you prepare a similar list annually, as directed by the Navigation Act? Yes.
1168. Does that list represent the registered owners of vessels on the registers kept at Sydney and Newcastle? Yes.
1169. Are there any other registry ports in New South Wales? No.
1170. Take the list. How many sailing vessels were registered in New South Wales on the 27th January, 1897? 472.
1171. What is the tonnage of the whole number? The registered tonnage, 51,493 tons.
1172. What is the average? 109 tons.
1173. How many steam-vessels were registered for the same period? 493 steamers, with a tonnage of 61,175, the average being 124 tons. The total of them all is 965 vessels and 112,668 tons.
1174. How many of the sailing and steam vessels are registered under 80 tons? 303 sailing, and 300 steam, or 603 in all.
1175. How many lighters have you registered? Thirty-six; that is, at Sydney and Newcastle.
1176. How many pleasure yachts? Thirty-nine, all registered in Sydney.

1177.

1177. Persons are granted votes for those small vessels if there are a sufficient quantity of tons to make how much? 100 tons one vote, and 250 tons to entitle a person to become a warden on the Board. W. Harc.  
27 April, 1897.
1178. Have you a return there showing the tonnage of vessels and the votes under each tonnage? I have a return here showing—72 entitled to 1 vote; 29, 2 votes; 22, 3 votes; 14, 4 votes; 11, 5 votes; 5, 6 votes; 1, 7 votes; 1, 8 votes; 1, 9 votes; 3, 10 votes. [*Vide Appendix 23.*]
1179. So that the bulk of the votes are with the small vessels? Yes.
1180. Are there several vessels registered which have not been trading to and from New South Wales for several years? I have no means of knowing. I cannot say.
1181. When you prepare the annual list do you keep in view the qualification of the electors in any way? I have the qualifications in front of me at the time.
1182. Vessels called "hulks" are vessels out of condition and vessels laid up;—do you knowingly return those? If I know of a vessel that has become unseaworthy I generally represent it to the owners and ask them to give a return, and if they have sufficient tonnage they are included in the list.
1183. Do you know there are a number of vessels in the harbour at the present time that are no longer seaworthy? It has not been brought under my notice. I can only deal with the registers, because they have to be produced at the Revision Court.
1184. The Collector of Customs has the power to reject any vessel? Yes.
1185. And the owners have the right to appeal to the Revision Court? Yes.
1186. I suppose you are aware that there are three elective members on the Board? Yes.
1187. What qualifications do the present elective wardens hold as voters;—for example, what qualifications does Captain Broomfield hold? The qualification there [*indicating list*] is 792 tons.
1188. How is that made up? He is joint owner in a pearling fleet of 200 tons, of which he is credited with 100 tons.
1189. How many vessels? I have not got it here.
1190. They are all small boats? All about 14 tons, I think. Then he owns half a vessel—492 tons. He is owner of a vessel registered as the steamer "Tinonec."
1191. Do you know that those vessels are out of condition and laid up? I am told that the "Argo" is laid up and the "Tinonec" also.
1192. Is the "Argo" owned in conjunction with Captain Jenkins? It is owned in conjunction, but not jointly; there are two shareholders.
1193. They each own half the vessel? Yes.
1194. And that half vessel owned by Captain Jenkins has been his sole qualification? Yes.
1195. And what are Captain McLean's qualifications? 22/64ths in the "Tamar," 21/64ths in the "Timaru," and 22/64ths in the "Western," making a total of 283 tons.
1196. And those vessels are running? Those three vessels are now running as colliers on the coast of New South Wales.
1197. Is it a fact that no owner can have more than ten votes? Yes.
1198. However large his interest may be? Yes.
1199. And that ten votes would represent what? 3,500 tons.
1200. The Revision Court sits once in every year? Yes, in the month of February.
1201. What time do the sittings occupy? From 12 to 1.
1202. And two Justices of the Peace are appointed? Yes.
1203. To conduct the Court? Yes.
1204. Are appeals frequent in your experience? I have never known of one during the time I have been in charge.
1205. How long is that? For six years, I think. I have never had one inquiry in regard to the Revision Court, and only one inquiry with regard to the voting list.
1206. And there seems to be no very great interest taken in the proceedings of the Court? No interest whatever taken in it.

WEDNESDAY, 28 APRIL, 1897.

[*At Sydney Heads, on board the Light-ship "Bramble."*]

PRESENT :—

GEORGE ALEXANDER WILSON, Esq., J.P.  
JAMES POWELL, Esq., J.P.

Joseph Leddra, Superintendent of the Light-ship "Bramble," sworn and examined :—

1207. *Mr. Powell.*] How long have you held your position? Going on for twelve years.
1208. And you have an assistant light-keeper? Yes; first and second, and three others.
1209. Will you give their names? Joseph Leddra, James Hursey, and Watt.
1210. What is Leddra? He is mate, Hursey is an assistant, Watt is an assistant, and the other man attends the cook and galley and keeps watch; that is Temple. There are five altogether, including myself.
1211. What are the salaries? The mate gets £9 12s., and I do not know the salaries of the others.
1212. What are their duties? I have to attend to everything concerning the ship and look after the two pile lights, and in case of accident we have to render assistance to boats on the harbour; I have to keep account of the stores and everything that comes on board the ship, and likewise apply for them. Here is a requisition that we have to make out.
1213. That is your annual requisition? No; for six months. There is plenty of work here, I can assure you, sir. We have to overhaul the moorings of the ship every twelve months, keep the ship clean and painted, and the boats painted, and keep watch day and night.
1214. You use seal oil? Mixed with kerosene.
1215. You furnish this return to the Marine Board? Yes; that goes in to the Marine Board every six months, showing the time of lighting and the time of extinguishing, and here is a return showing the watches kept and the oil consumed.
1216. The three men divide the watches? Three hours each. A man is three hours off and three hours on, and they go away every morning at 5 to put out the lights, and return about 8.

J. Leddra.

28 April, 1897.

- J. Leedra. 1217. Where are the pile lights? There is one up in Rose Bay and one in Watson's Bay.  
 28 April, 1897. 1218. Do they go from here? Every morning and evening, to light them and put them out, whether it is rough or fine. If the wind is foul in rough weather, the "Carrington" comes across and tows the boat up. The men are on shore now painting a boat.  
 1219. What shore leave do they get? Forty-eight hours a month.  
 1220. Do they get any additional pay for attending to the pile lights? £1 a month.  
 1221. Who gets it? £1 each to the men, three of them, and I get £2 a month.  
 1222. And beyond attending to the light and the pile lights, there are no other duties except keeping the ship clean? No other duties except keeping the ship clean and attending to everything.  
 1223. What is your salary? £21 7s. altogether, including the money for the pile light.  
 1224. Are there any allowances besides? No.  
 1225. Your quarters are rated at £50? Yes; salary £225, quarters £50, and allowance for attending to the light £24.  
 1226. And the mate has £127, and £12 for attending to the lights? Yes.  
 1227. And the next man, the assistant Watt, has £118 and £12 for attending to the pile lights? Yes; he came here off the "Captain Cook."  
 1228. Hursey has £96, and £12 for attending to the lights? Yes.  
 1229. Do they all live on board? Yes; they keep watch night and day.  
 1230. Are rations allowed you? No.  
 1231. Not to yourself? No.  
 1232. What age are you? I am 69.  
 1233. Is the mate your son? Yes; he has been here for nearly twelve years now. He was down at the Solitary Islands.  
 1234. Do you think you could work this vessel at a cheaper rate than it is now costing? I could not do with anyone less, because we must have a boat's crew. We get as little as possible. What we get here are only trifling things.  
 1235. Do you consider this more important than the Solitary Island light? It is more important, having regard to the vessels running in. There is a reef there [*pointing*], and there have been several vessels run on it since I have been here, and yachts are always running on it. When boats are capsized or sink we have to go and assist them.  
 1236. The pile lights are the only two lights that you have in charge that are away from the ship? Yes.  
 1237. Who looks after the leading lights? The men on the signal station.  
 1238. You are on duty here at all times, Sundays and holidays? The whole time, day and night. I have not been ashore once this month.  
 1239. Are the stores kept on the ship? Yes.  
 1240. Does anyone come down at any time to check them? No; they are all checked up at the store. I receive them from the "Carrington," and check them myself when I receive them.  
 1241. *Mr. Wilson.*] Are these men's services often called for in cases of accident or anything of that kind? Whenever a gale of wind is blowing we are on the lookout. We often have to go out in a gale of wind. There are generally accidents when they are racing.  
 1242. And are these men always ready? Yes; there are two boats. Four hands are only a boat's crew, and we could not do with less; and it is very heavy work overhauling these moorings—they are 1½ in. chain.  
 1243. I suppose you are aware that the expense of working this ship in 1883 was very much less than it is now? The wages were only £96. I do not know what the difference can be, unless it is the alterations in the salaries made in Mr. Dibbs' time.  
 1244. What class do these men belong to? Seamen. Hursey is not a seaman, but he pulls the boat well. The ship has been here seventeen years, and is beginning to want. We have had new tanks and new boats, and that is running into expense. The ship was built in Newcastle for this service. The vessel that was here before was the old "Bramble," but this is much larger. The ship wants coppering now. The "Carrington" supplies us with water, but we catch a lot ourselves.

WEDNESDAY, 28 APRIL, 1897.

[On board the Pilot Steamer, "Captain Cook."]

PRESENT:—

GEORGE ALEXANDER WILSON, Esq., J.P.  
 JAMES POWELL, Esq., J.P.

Joseph Creer, Master-in-charge of the Pilot Service, sworn and examined:—

- J. Creer. 1245. *Mr. Powell.*] Will you tell us something about your duties on board this vessel? We have always two pilots on board, ready at a moment's notice. The ship is always ready for any service. We have a first and second officer on board, first and second engineers, and always two pilots, four firemen, and six seamen. One fireman at £143, 1 at £125, 1 at £123, and 1 at £120.  
 28 April, 1897. 1246. One of the seamen is paid £123? Yes; that is for long service.  
 1247. Are the five at £96 recently taken on? Yes.  
 1248. Will they get increases? No; that is stopped.  
 1249. It was understood when they were appointed? Yes.  
 1250. The boatmen who appear on your list here are not employed on board this vessel? They are on board the "Carrington."  
 1251. What service does she do? She conveys pilots backwards and forwards. If a ship arrives with a pilot she attends and brings the pilot back, and if a ship is going to sea she takes the pilot to the ship, and if there is any hitch with the "Captain Cook" we do the work with her outside. Two of the men on board her are for day-work, and two for night-work.  
 1252. The highest wage is £155 and the lowest £96; I suppose that is explained in the same way? Yes.  
 1253. I have a return here showing that there are about 600 vessels inward and outward during the year? Yes; about that.  
 1254.

1254. How many pilots are there? Five.
1255. The highest in one month is seventy-three ships, taking the services of pilots, and the lowest thirty-two? If you compare January, 1896, with January, 1897, there is a slight increase, and it will increase. J. Croer.  
April, 1897
1256. How do you account for that? They have stopped the exemption certificates, and they are not granted now except to coastal steamers.
1257. Would that make a difference? It must make a difference.
1258. But surely the time has not arrived yet when the pinch is felt? You can see there is a difference.
1259. There are 572 vessels for five pilots. It does not represent a ship a day for each man? It is not the time for each man that is taken up. It is the attendance that is required. The pilot may be required several times for any one of those vessels. Last Thursday night we had not a pilot on board the ship here. They were all engaged except one, who was on leave of absence.
1260. Do you take pilots off at sea? If it is a sailing ship it is out at sea; if it is a steamer, they generally like to get the pilot clear as soon as they are in the fairway.
1261. In the logs you furnish you do not give the time that is occupied in taking pilots off? I have it in the log-book.
1262. There must be a great deal of time when all hands are unoccupied? Oh! no; they are always employed.
1263. How? Various jobs about the ship, keeping it in order. There must be always a watch day and night. The most important thing on the ship is the lookout.
1264. How do you manage about the victualling? The officers and engineers are allowed 18s. per week. There are seven—£6 6s. in all.
1265. And then you have a cook and providore? Yes; the cook acts as providore, and he has to find the steward, as there is no steward allowed for the vessel.
1266. No time is shown in the log that you furnish to the Marine Board? No; not in that.
1267. Taking the log for the month of March, and taking your own time for the inward vessels, it represents a service, between leaving the moorings and the return, of about thirty-eight hours a month? We are pretty fast about the work; it does not take long to do it. This is a fast vessel.
1268. Is that a fair average month's work? There are times when we are several hours out.
1269. Is this return a fair representation? It must be.
1270. The cook and providore is paid £143 per annum? Yes; he cooks for all hands throughout the ship. The men find themselves, and he cooks for them.
1271. What does he do as providore? Receives the money and finds the stores for the cabin. We pay him every month at the rate of £6 6s. a week, and he spends the whole of that. Sometimes he is a little in debt, and other times he may have a little surplus, but it takes about that to keep the ship going. He keeps account of the money in a book, and it is checked.
1272. If there is a balance, what happens? I do not suppose he has got any balance. The first time I heard of a balance was £6 this last month, but then he was in debt £4 the month before.
1273. Can we see the bills or the accounts, see how they are made up, and what they are? [*Book produced with accounts from storekeepers.*]
1274. Have you any idea of the cost of maintaining this vessel outside the cost of salaries and wages? I have forgotten. There are no expenses further than docking. She is docked every six months, and is there for about ten days. When she is in dock I do the work with the launches. I get one from town in addition to the "Carrington." It used to cost £10 a day.
1275. Are those launches found fit for the work? We are obliged to be very careful. I always go out in them myself. I never expect a pilot to go out without me, daytime excepted. Then we have got to tow the boat behind.
1276. The expense of salaries in the "Captain Cook" is about £2,700 a year? About that.
1277. Comparing that with vessels in the merchant service, of which you have had considerable experience, do you not think that expense is very high? I cannot say that.
1278. The rate of wages you are paying now is very much in excess of those paid on the coast? I cannot say what the wages are at present on board sailing vessels, but I fancy it is £7 a month, and then they are found.
1279. What is the average pay of a master? Some £25 to £30.
1280. And mates? I would not be positive about that. I have been twenty-three years in this service.
1281. Do you know what they pay now? No.
1282. Do you think that this vessel can be worked at a lower cost without impairing its efficiency? As far as the number of people on board are concerned, I should say no. Regarding anything else, I would not like to say.
1283. You would not like to say that the wages are too high? No; our men have very risky work indeed. There are many times that I feel very uncomfortable on dirty nights at sea, when our boat is away with the pilot. We have been very fortunate. We have never met with an accident yet.
1284. Are there any other duties that you are called upon to perform, with the exception of those relating to pilotage? If a vessel is in distress anywhere we are despatched immediately.
1285. That is, anywhere within reasonable distance outside the Heads? I have been sent as far as Gabo—half way to Melbourne.
1286. Anywhere else? To Lord Howe Island, on special service.
1287. In that case another vessel took your place? Yes; it was managed in our absence.
1288. *Mr. Wilson.*] You say the wages are not too high? I should think not, sir. It creates a bad feeling among the men forward, although I have not heard any complaint yet, for one man to have so much more than the others, but he has very long service.
1289. The fireman at £143, do you consider that a high wage? Well, it is the wage that was allowed. I really cannot say whether it is too much or not.
1290. There is one at £120 and one at £143;—is the man at £120 a satisfactory man? A very good man.
1291. Is he as good as the man at £143? Quite as good.
1292. Then have you no opinion about the man at £143 now? I really could not say.
1293. Seaman, £143;—what is your opinion of that wage? He has long service. It has been allowed.
1294. Is it a fair wage for a seaman? I really cannot say that it is too high. I wish they were all getting it.
- 1295.

- J. Creer. 1295. You think those at £96 are paid too little? They are glad to get into the service.  
 1296. Do you think those at £96 are paid sufficient? They are satisfied to come for that rate of wages.  
 28 April, 1897: 1297. Then why do you wish they were all getting £143? It would be more satisfactory to the men, I suppose.  
 1298. There are boatmen getting £155;—is that a proper wage for a boatman? £143 is the highest we have got for a boatman.  
 1299. The return I have is wrong then;—have any of these boatmen any allowances? No.  
 1300. Have they anything to do with the lifeboat? One of the look-out men, Harry de Frisier, is coxswain. He gets £143, and then he comes in for the allowance as lifeboat coxswain.  
 1301. In answering this question you have to consider the general wages outside, and the circumstances of the taxpayers of the country. I express no opinion myself. Do you think it is a fair thing to the country to pay a boatman £143 a year? I do not think it is out of the way.  
 1302. There is a boatman here at £96;—is he a good man? Yes, he is a good man; he has just joined the service.  
 1303. There is a difference of £47 between him and the other. If he is a good man why does he not get £143? He has just joined, and was perfectly ignorant of the work, and has been taught by the other men.  
 1304. He is capable now? Yes.  
 1305. How long has he been here? Not many months.  
 1306. You think that £143 in these days is not an unfair wage for a boatman? I do not say it is a fair wage for a boatman.  
 1307. There is a look-out man at £161. Is that a fair wage;—do you consider that these wages are fair? I do.  
 1308. You consider a fireman at £143 is not too high? I do not think it is.  
 1309. What is your opinion of the salary of the first mate at £175? It is very fair wages.  
 1310. And the second mate at £150? Yes, that is also fair.  
 1311. The first engineer, at £272? That is fair.  
 1312. And the second engineer, £200? That is fair.  
 1313. In fact, you see nothing in this salary list to lead you to think that any of these rates are excessive? I do not think so.  
 1314. You said that the salaries of masters outside were £25 to £30 per month;—what vessels would those be? Vessels trading to Melbourne and on the coast here.  
 1315. Would you consider that the duties of your post here are more arduous than the duties of a master trading to Melbourne, Queensland, and New Zealand? A great deal more responsible at times, as we get into such critical positions with this vessel in case of vessels in difficulties that it has been very responsible work in getting her out of it.  
 1316. In what way? The ship has been in a very dangerous position.  
 1317. The master of a ship trading to Melbourne, Adelaide, and Brisbane is constantly getting his ship in dangerous places through constantly taking her in and out of port? That is not going up against ships at night time. Vessels run close to shore, and we have to run great risk to get them out and ourselves.  
 1318. You think your post is more responsible even than the post of a master trading between the ports of Queensland, New South Wales, and Victoria? I certainly do. Many of them would not have been so fortunate as I have been.  
 1319. These men would be in charge of passenger steamers? Yes.  
 1320. What are the wages of the cook? £143.  
 1321. Do you consider that a fair wage? Well, he has got to find a steward.  
 1322. But he does not? He pays a steward out of that money.  
 1323. He is the steward? He has a good able boy.  
 1324. And the cook makes his own arrangement with this boy and pays him out of that £143? Yes.  
 1325. He is found? He is found out of the providore's money, and the cook too.  
 1326. Do I understand that, in addition to salary, the Government provide the seven officers of this ship with 18s. per week, and then you make arrangements with the providore to find the ship? Yes.  
 1327. The men are not found? No.  
 1328. The firemen, seamen, boatmen, and look-out men are not found? No.  
 1329. You have no suggestion whatever to offer to reduce the expenditure? I cannot see it.  
 1330. You cannot see that in any single case any of your officers or men is overpaid? I cannot.  
 1331. And you cannot see your way to reduce the numbers without impairing the efficiency of the service? No.  
 1332. You would neither reduce the numbers nor advise the reduction of the wages? No.  
 1333. Is there any difficulty in getting boatmen at £96 a year? Of course we can them at £96.  
 1334. And you have got them at £96? I daresay there are plenty more to be got too.  
 1335. In the face of that, do you still contend that £143 is a fair wage? Well, he has been on so long, do you see.  
 1336. That is not the point. It is not your own money, nor our money. You admit that you can get as many boatmen as you want at £96, and do you still contend that you should pay another man £47 more than you can get them for;—it is practically half as much again? I would not like to part with one of the sailors we have got here.  
 1337. You admit that you can get as many as you want at £96, and yet you state that £143 is a fair wage? Yes; I do not think it is a bit too much.  
 1338. You were talking about the risky nature of your work;—is it more risky than the work of others who are at sea? Very much. You ought to have been here the other day when we were boarding that mail-steamer. There is great danger of the boat getting capsized. We have been very fortunate that we have never had an accident, but still I never know what may happen.  
 1339. But men have all sorts of contingencies to meet at sea? Not boating, the same as we have.  
 1340. But they have other risks which you have not got; they are at sea in all weathers? We have to face all weathers.  
 1341. You contend that these men's occupation is more risky than that of the ordinary seaman going to sea? I do consider it a great deal more risky, and it takes the men a long time to get used to it.  
 1342. An ordinary qualified seaman? Yes, into the management of the boat. 1343.

1343. *Mr. Powell.*] Just a word about the leading lights;—take this man de Frisier: his salary is £143, and he has £12 a year in addition for attending to the leading lights? Yes.
1344. And he has another £6 as second coxswain of the lifeboat? Yes.
1345. That is a kind of retaining fee for him? Yes.
1346. Do they practise at all? Every three months.
1347. Four times a year? Yes.
1348. What do the crew get? 10s. for each practice.
1349. Can you say when the lifeboat went out last? About a month ago.
1350. Is she frequently called upon to go out? Only once in three months.
1351. I mean for necessity? It is very rare indeed. We have always done the work with the pilot steamer. We have been fortunate enough to do it with the pilot steamer when the lifeboat could not get near it.
1352. The boat is not required? She would be called upon to do it if the steamer got into difficulty, but we have been fortunate enough to keep out of it.
1353. They practise every three months? Yes.
1354. What is the cost? 10s. each man for thirteen men.
1355. Where do you get them all from? Pick up whoever we can get hold of—fishermen.
1356. Men at Watson's Bay, I suppose? Yes.
1357. Has your crew any interest in it? We have to follow them out with the pilot steamer every time they go out.
1358. And thirteen men every quarter are paid 10s. each to man this boat and take her out? Yes.
1359. Who goes in charge of her? Harry de Frisier.
1360. That is the coxswain? Yes. He gets 10s., the same as the rest of the men. He is allowed so much a year.
1361. If he only goes out four times in the year, it would be 30s. a time? Yes.
1362. The men get 10s. and the coxswain 30s.? Yes.
1363. But you have not known them go out for any requirement—to assist a wreck? They have never been the means of saving life.
1364. Are there any other payments made to any persons on account of the lifeboat? Yes; I get £1 every time the lifeboat goes out.
1365. You do not go out in her? I am in charge of her. I follow in the steamer.
1366. Does anybody else get anything? No.
1367. The lifeboat is always stationed down here? Yes.
1368. Have you, in your experience, known that boat to go out in any matter of exigency requiring her services other than to exercise;—have you ever known her to go to a ship in distress? Yes.
1369. How long ago? It was the time the "Centurion" was wrecked.
1370. When was that? In 1887.
1371. Then she has not been out for nine years for any purpose except for exercise? We saved the people from the wreck on that occasion. There was a ship between the Heads in a critical position, and I gave the coxswain of the lifeboat instructions to remain by that vessel until she was out of danger. The men were so exposed that they were quite paralysed when the other ship got into danger, and we had to go to the assistance of the other vessel and save the lives of those on board.
1372. Do you think it necessary to keep the life boat stationed here and incur this expense? It is quite necessary to have a lifeboat on the station, and we never know the moment she might be wanted. The pilot steamer might be away.
1373. If the steamer were not away, you would be better pleased to have the services of the steamer? Oh, no; I would like to have them both. The boat might be successful when we might fail or get into some mess that we could not get out of.
1374. *Mr. Wilson.*] You are in charge of the lifeboat;—what does that mean? I am responsible for the life-boat being in proper order. I saw her last a few days ago. If the boat were not in proper order I should be hauled over the coals about it.
1375. If it is for keeping the boat in order, why should you be paid at per trip when the boat goes out? I believe that is paid at all lifeboat stations.
1376. Where is the lifeboat? Down at the cove in a shed.
1377. *Mr. Powell.*] These men attending to the leading lights appear to be paid for work done in Government time? Their duty is from sunset to sunrise, and one of them takes it in turn night after night to attend to those lights. It is a long distance. They have to start early in the morning to put the light out and early at night to light it.
1378. Why this extra pay? It is extra work. They have only had to do the extra work since the lights have been erected.
1379. How long would they be on duty? One has to watch from sunset to midnight, and the other from midnight to daylight—until sunrise.
1380. Had not they that time of duty before these lights were established? Yes; but they did not have this extra pay for attending to the lights.
1381. They had the same hours of duty then as now, and they are attending to these lights in the ordinary routine of duty, and are not working more hours now than they were working then? The man that would come on at 12 at night would have to go over there the first thing in the evening to attend to the light.
1382. They work from daylight to dark and from dark to daylight? Yes.
1383. Those were the hours established before the lights were erected? Yes.
1384. They do not work any longer hours now than they did then? It makes longer hours, because the man who has got to turn out at 12 would not have had to go over there.
1385. How does it make longer hours? The man who might be resting until midnight has to go and attend to the light. One man will start away at sundown to attend to a light. He has a long walk over there on a very ugly road, and has to come back and get to his duty at 12 o'clock.
1386. Does it make longer hours or not? I do not know that it makes longer hours.
1387. Why pay extra then? They have to keep that light in order.
1388. But they are paid a salary for certain hours. It is not for them to say whether they will take a short walk during that time? —

J. Creer.  
28 April, 1897.

Herbert Orton, cook and providore, "Captain Cook," sworn and examined:—

- H. Orton.  
28 April, 1897.
1389. *Mr. Powell.*] Your salary is £143 a year? That is what I sign for, but I do not receive that. From that I have to provide an assistant to help me, because the job is too much for one man.
1390. Have you represented that to the master? I have seen Captain Creer about it.
1391. There is more work than you can do? Yes.
1392. And therefore you hire some person to help you? Yes.
1393. Do you get the money? Yes.
1394. What are your duties? To cook for the sailors and firemen; there are ten in all, but there are only three on board at a time. Also to cook for two engineers, two officers, captain, and two pilots. There are seventeen persons to cook for in all.
1395. Do the firemen and seamen provide their own food? Yes.
1396. They provide the whole of it—condiments and things of that kind? They find everything.
1397. Do they bring them to you, or do you buy for them? They buy their own, and bring it to me, and give to me whatever they require.
1398. Have they a mess of their own? Yes.
1399. And that is kept entirely separate from the other? Yes.
1400. Do you purchase the provisions for the seven officers? Yes. I go ashore for the purpose sometimes. I generally give an order to the launchmen, and they bring it to me.
1401. You deal with the people here? Yes.
1402. Do you pay as you go? No; I have monthly accounts.
1403. Does Captain Creer pay you the money? Yes; he gets it from the office and pays it to me as soon as he gets it.
1404. What was the last sum he paid you;—how much did you receive in March? £31 2s. 8d., I think it was.
1405. And you expended £24 odd, leaving a balance of £6 10s;—what has become of that? That is in my cabin.
1406. Who examines your accounts? The chief officer. He is responsible, and anyone else who chooses may inspect them. The chief officer has charge of them for a week after they are paid.
1407. Do those accounts represent the whole of the supplies? Yes, for each month.
1408. What does this item, in November, 1896, mean: "Captain and second officer, £2"? That was the time when we were in dock. When we go in dock they expect the money allowed them to live on board, and they want the money returned to them.
1409. That allowance is only made to the captain and second officer? No, sir. See the following month.
1410. I do. There is "Steward, £2 10s." What does that mean? The providoring was handed over to me in August, 1896, and it was arranged that I was to pay the steward out of the providoring. So the first two months they agreed to the £4 being taken out of it; but next month the bills were higher, so there was only a small amount left, and the next month I was told I was to pay it myself.
1411. In September, 1896, there was £3 14s. surplus brought on from the previous month? Yes.
1412. Was that to pay the shortage in the September month? There was £3 14s. 8d. over from August. During September I spent that money on odds and ends. I think the items are down there.
1413. Does Captain Creer always claim that money when the ship is in dock? When the vessel goes to dock.
1414. How long have you been doing this work? Since August.
1415. The engineers are fed on board, at the dock? Yes, and the chief officer.
1416. What about the pilots? They get the refund too.
1417. I do not see anything for wines and spirits or beer? Nothing like that on board, sir; it is against rules.
1418. There is nothing in the accounts for that? No.
1419. *Mr. Wilson.*] This £2 was returned because they were not victualled? Yes.
1420. *Mr. Powell.*] The pilots did not get it then? Yes, the next month.
1421. How many of them? Five of them got 10s. each.
1422. Is this a matter regulated by the Marine Board, or is it arranged on board the ship? Arranged by Captain Creer.
1423. Do you consider that the amount that is allowed is a fair thing? It is a fair charge. One month makes up for another. There is really no surplus.
1424. What do you pay your assistant? £3 a month.
1425. That leaves you £107 net for your own labour? Yes.
1426. And what you can make out of the providoring, if you can make anything? I have to return any surplus; that must be divided amongst those who find the money.
1427. It is distributed amongst the officers? It is to be when there is, but there has not been one yet.
1428. But suppose you go on having a small surplus, the money would be distributed amongst the officers? Yes.
1429. Have you ever done so? Only for the time when we were in dock.
1430. You have never had any real surplus except this month? No.
1431. Have you any experience in providoring? Yes.
1432. Have you ever provided any ship? No. I have been with the shore providore of Howard Smith.
1433. Do you know the contract rates? Yes.
1434. What would be a fair contract rate, taking the seven officers on board the ship, to find the food, cook, steward, and service? £30 a month.
1435. You are doing it at a cheaper rate here? The steward is not paid out of it.
1436. £30 a month would include all expenses? Yes.

James Fotheringham, chief officer of the "Captain Cook," sworn and examined:—

- J. Fotheringham.  
28 April, 1897.
1437. *Mr. Powell.*] How long have you been chief officer? Since the January before last—sixteen months.
1438. Had you any position on board the ship prior to that? Second officer.
1439. How long did you hold that position? I have been eight years in the service.
1440. What is the salary you receive? £175 per annum.
- 1441.

1441. Are there any allowances? None except the food.
1442. What are your duties as chief officer? To superintend the work of the ship under the captain's orders when he is here; and when he is not here I take charge, and take the vessel out and in the same as he does, night and day.
1443. Is there anything in the ship's books to show when he is not here? Nothing.
1444. There is nothing to show when you are in charge and he is not? No.
1445. What are your hours? All the time, with the exception of twenty-four hours' leave every week. There is a man in charge all night on the bridge, and I am liable to be called any minute.
1446. Do you not take turns with the second officer? We do not keep watch that way.
1447. What does the second officer do, then? He carries out any orders given him. He is also liable to be called at any hour; in fact, all hands are called when we proceed to sea.
1448. There is only one man on watch all night? Yes, on the bridge.
1449. If nothing comes in, then, you are not disturbed? Until it is morning. Sometimes we are not disturbed all night, and other times we are out all night; but that would be exceptional.
1450. Your log for March shows very little? There has been very little come in lately, owing to the exemptions.
1451. But we understood from Captain Creer that there was an increase? Lately there has been an increase. They have stopped the exemptions being issued, and new masters have been put in some of the vessels.
1452. The look-out man calls you when you are required? At night-time; I am on deck all day.
1453. Does the captain remain on board ship all night, then? Sometimes.
1454. What does sometimes mean;—was he on board last night? No.
1455. Or the night before? No.
1456. About the providore's accounts: I see here £2 paid to the second officer;—what is that for? When the "Captain Cook" is in dock the second officer stops on the station, and has to find himself. He is on duty all the time on the launch, and the chief officer is on duty at the dock, and is fed there by the cook.
1457. *Mr. Wilson.*] Have you had any experience at sea? Yes, all my life.
1458. You said the captain was not on board last night, nor the previous night; can you give any idea, if you have no actual record of his absences from the ship—how often? I could not remember.
1459. Is he on board four nights in the week, on an average? He may be; I cannot remember.
1460. Are his absences frequent from the ship at night? Yes. I would sooner that you asked somebody else.
1461. We call on you to tell us anything about the ship that you think the Government ought to know, and the Board will protect you. As a rule, does Captain Creer remain on board at night? No; the night that I am on leave he is on board.
1462. That is an arrangement by which you relieve each other? Yes. There used to be a captain and a mate on board before my time, and they used to relieve each other, for a man cannot be on board all the time. Then the captain prior to Captain Creer thought there ought to be three officers, so as to get more relief—that is what it generally is on steamboats; and the captain worked then so that the officers should have so much leave, and he could go on leave whenever he chose. Now we have twenty-four hours' leave every week, and of course the captain suits himself and comes on board when he wishes. I do not say that he is away from the station, but he is not on board the ship.
1463. We do not expect officers to be constantly on duty; but is it your opinion that in a service like this the master should be on duty at night and take his leave in the day;—is it not at night that casualties and troubles are more likely to arise in a service like this? Yes; that is the most dangerous time.
1464. I want your opinion as to whether the man who is in supreme authority here, and draws the big salary, ought to be here at night, and if he requires leave, should he not take it in the day;—is it not important that he should be on duty at night? Yes. I think, myself, that there ought to be two; that is my opinion, as a responsible officer.
1465. There are three of you? Yes.
1466. Your opinion is that there should be always on board at night either the captain and the first officer, or the captain and the second officer? I consider one responsible man sufficient for a small ship like this, supposing he has got a leading man forward amongst the men. At night time I am always on the bridge by myself, and I find no difficulty in managing the ship.
1467. If the Marine Board were to make an arrangement that the master and first officer were to take this night duty alternately, you think that would be a proper arrangement to make? I do.
1468. You do not think it necessary that the master should remain on board at night? Not every night.
1469. Is there anything else to say to the Commission that they ought to know? Of course I am talking now for myself. I do not consider that I get sufficient leave, seeing that I am on duty night and day. I get twenty-four hours a week. I never get a Saturday afternoon, nor a Sunday, nor any holidays. I have been eight years in the service, and have been twice to church with my family, and then I have had each time to ask for special permission.
1470. With three officers is there any difficulty in arranging it? There ought not to be.
1471. Either the master or you should be on board at night? One is always.
1472. Is there anything else? I do not consider that I get sufficient pay, considering the responsibility I have. There are several mates on this coast who are better paid than I am, and none of them have the same responsibility, as they are never in charge of the ship themselves. I have a master's certificate and a first-class pilot's license, and am liable to be put on board a ship to pilot her in, but would get nothing extra for it.
1473. *Mr. Powell.*] You were employed on board a Hunter River boat? I came out on the "Newcastle" when she was new.
1474. I hope you are not keeping anything back from the Commission that we ought to know? No.
1475. Does it not strike you as extraordinary that you have three highly-paid officers in charge of six seamen? Yes.
1476. Do you think such a thing as that would be allowed to exist in any private employ? No; but of course things are a little different.

- J. Fotheringham.  
28 April, 1897.
1477. Do you think that this vessel is worked expensively compared with privately-owned vessels? Yes, in some ways, because under the Marine Board Regulations increases were paid. But at the present time there is only one hand in the fore-castle who gets the high rate. The mate before me got £200. I really only got a rise of 8s. a month from second officer to first.
1478. As it stands now the Government are paying £741 in salaries to three men to look after six men with salaries of £603, and there is the addition of the 18s. a week each to the officers;—do you overhaul these accounts of the providore's? I go over them and see that the figures are correct. I have nothing to do with supplying the food.
1479. Are these articles usually supplied to vessels on the coast? Every vessel that I have been in has always been found.
1480. And found as liberally as you are found here? Just about the same as far as the food is concerned.
1481. Would it not be better to have this work done by contract? Perhaps it would. I do not know anything about it.
1482. Are you supposed to hold yourself responsible for these accounts? No; I have nothing to do with that.
1483. Who is responsible? Every month we each sign for our 18s. a week. I only feel responsible for my 18s. That is handed to the cook, who orders the food and pays the bills. He lets me see the bills every month for the satisfaction of any one.
1484. You never use the money? I never handle the money.
1485. And I suppose you would find fault if the supplies were not up to the mark? Yes, we would growl.

Andrew William Jack, Senior Pilot, "Captain Cook," sworn and examined:—

- A. W. Jack.  
28 April, 1897.
1486. *Mr. Powell.*] How long have you been in the service as a pilot? Twenty-six years and eight months.
1487. At what rate of pay did you enter the service? When I entered the service we were in competition, but we were allowed £350 a year.
1488. How many pilots were there at that time? Six.
1489. But then each pilot paid for his own boat? Yes; we had our own boat and boat's crew.
1490. Did you pay for that out of the £350? Yes.
1491. And you received £350 a year? Sometimes more. We were allowed 2d. per ton. Sometimes it exceeded that, and then we had a vote for the remainder of the money.
1492. You came in after the new arrangement of 4d. per ton in and 4d. per ton out? Yes.
1493. And the pilots took half the receipts? Yes.
1494. Do you think that £350 was a fair average? I think we made a little more in the second year.
1495. How much more do you think? I suppose we got about £600 for one year.
1496. Each pilot? I think so; I am not certain.
1497. How long did that continue? One or two years.
1498. Your salary now is £398? Yes.
1499. And you get 18s. a week? That is for the two pilots on board the steamer.
1500. You have no charges against that now? The 4 per cent. superannuation.
1501. I notice one of the pilots gets £250;—how is that? He is the last made pilot.
1502. You are at the maximum rate? There are four of us who receive the same.
1503. All at the maximum allowed by the Marine Board? Yes.
1504. Is there work enough at the Heads for five pilots? Yes, I think so.
1505. You know how many vessels enter? We are always supposed to be here night and day prepared for work.
1506. But if there are only about 600 arrivals and departures in the year and five pilots to do the work, your being here does not alter the question in the least;—how many of you are required to do the work that has to be done? We have managed to do it. It is not for me to say how many are required. We are always at work, always ready to be called upon. We cannot leave the station.
1507. Look at it from the commercial point of view? My flag is put up here. I am supposed to be on shore waiting, and as soon as the flag goes up I come here.
1508. Divide 600 by 5, and the result is 120, and 120 vessels in 365 days per pilot would suggest that there are more pilots than there is work for? It sometimes happens that there are perhaps three or four ships going out and two coming in. It happens sometimes with a southerly wind that there are three or four ships coming in and at the same time there may be a couple going out. I do not mean to say that we are over-worked.
1509. Do you think that the service can be performed with a less number of pilots than you have now? I really do not think it could, efficiently. We are sometimes sent for to a ship to come out at 6 o'clock at night and stay till next morning, and perhaps she does not go out at all.
1510. But you are entitled to the charge for detention? We do not get it. Since the Marine Board Act we do not ask for it.
1511. The regulations provide for it? You might ask for it, but you would not get it. I have gone to a vessel at 8 o'clock at night and left it at 6 in the morning, and got a telegram at 10 to return at once to take her to sea.
1512. Do you ever go above Fort Denison to take charge of vessels to bring them to sea? Yes.
1513. Do you go to the wharf? Very often.
1514. Why do you do that;—the harbour pilot should bring the ship to the sea pilot's waters? Since the Marine Board came into existence that has been done away with. We bring all the Newcastle ships away from the wharf—vessels going in tow to Newcastle.
1515. And for a great number of other ships? We go right up to the wharf.
1516. The delay that you mentioned before is caused simply by the Act not being complied with, for it seems to provide that the harbour pilot shall take the vessel from the anchorage to the sea pilot? It is the tug-boat that causes the delay.
1517. They have no right to summon you until the tug is there; the Act assumes that the harbour pilot will take the vessel into the sea pilot's waters at Fort Denison, and the sea pilot will then take her to sea; you

you are engaged in doing additional duties, weakening the staff at this end? These masters have the privilege of either taking or leaving the harbour pilot. A. W. Jack.

1518. Undoubtedly they have, and the more reason why you should not supply the place of the harbour pilot? If we did not attend, then there would be a complaint at the Marine Board the next day. We have written to the Marine Board about it, because, it gives us a greater amount of risk, and we have to work with a drunken crew. 28 April, 1897.

1519. The regulations provide that when the master of an outward bound ship finds that he does not require the services of a pilot on the day appointed he shall notify the same to the pilot, and no payment shall be made for such first attendance; but if, after renewed application for a pilot, the master shall find that he is not prepared to go to sea, he shall pay 10s. for each day, and no pilot shall be bound to take such ship to sea until such payment shall have been made; so the thing is entirely in your own hands? Yes; but who is going to collect it?

1520. You are going to collect it or not take the ship to sea? We used to work more in that way when we were working in our own boats; but that is a long time ago. You put that before the ship-master, he won't give it you.

1521. Do you go up and take out such a vessel as the "Barbarossa"? Yes, we always take them from the wharf. All steamers going to sea we take from the wharf direct.

1522. *Mr. Wilson.*] Suppose you have a certain wind and certain vessels coming from a certain direction, and other vessels going out, all the five pilots are engaged at one time;—does that happen? Yes, sometimes.

1523. Frequently? I will not say frequently. Occasionally you get three ships coming in and others going out. It has happened often in my experience as a pilot, even with this steamer.

Edward Brodrick, Chief Engineer, "Captain Cook," sworn and examined:—

1524. *Mr. Powell.*] You have a second engineer? Yes.

1525. Will you please describe what are your duties? I am responsible for everything relating to the machinery. E. Brodrick.

28 April, 1897.

1526. Do you live on board? Yes, and ashore too. I have a residence on shore.

1527. What leave do you have? I get away twenty-four hours a week. The actual duty is divided into two. I have twelve hours on and twelve hours off.

1528. How do you take it;—is it night duty and day duty? Yes; but when I am away for twenty-four hours the second engineer has to do the twenty-four hours, and I do the same for him.

1529. By arrangement between yourselves you can have twenty-four hours off whenever you like? Yes.

1530. You have one day in the week positively; in addition to that you may so divide the work that you only have three days' work a week each? No; we are on duty twelve hours out of the twenty-four all the year round. If I am on duty twelve hours in the day I have twelve hours off at night, and *vice versa*.

1531. You do not take all the nights off and the second engineer all the days off? No; we change about.

1532. You have four firemen;—the rates of pay seem rather high—£143, £125, £123, and £120;—do these men get rations or keep? No; they find themselves.

1533. And you? We are found.

1534. One of these men gets £143? That is the maximum arranged by the Marine Board. He has been the longest in the service. He was a sailor, and was made a fireman.

1535. Have you compared these wages with those paid on steamers outside;—are they not high? Some of them outside get £9 a month, and on the Manly Beach steamers they get £10 a month, and they have been promised another £1 a month when the company has got over its difficulties.

1536. *Mr. Wilson.*] But is not that explained by the fact that they work very long hours, constantly at it, under very high pressure? Yes, that is true.

1537. *Mr. Powell.*] This boat is in harbour the greatest part of her time? Yes.

1538. The time that you are engaged at sea is very small? Yes; but of course you understand that we have to be in readiness at any moment; for instance, if the signal went now I should have to rush in on top of the boiler. We have to be ready every minute of every day.

1539. You have control of everything relating to the machinery and the control of the firemen? Yes.

1540. Outside firemen get £9 a month and are found? Yes.

1541. This man gets £143 and is not found? Yes.

1542. So he gets £9 a month, or £108 a year, and the £35 represents his keep? Yes.

1543. In a steamer outside would there be two engineers on a ship this size? Yes; at sea machinery is being constantly watched. It is very hard at sea even for two engineers, because they have to do two hours on and two hours off. With regard to my own salary, the maximum was set down at £280, but with the reductions it is brought down to £261. There was the 10 per cent. reduction and the 4 per cent. superannuation.

1544. That is an investment? That is true. In the old boat I had the same salary, and here, with all this large amount of more modern machinery, I am getting only the same salary.

James Nuth, Leading Fireman, "Captain Cook," sworn and examined:—

1545. *Mr. Powell.*] What pay do you receive? £125 a year.

1546. Do you get any allowances? No.

1547. Any rations? No.

1548. What leave do you get? Two days off and six days on. We are on continuous duty sixteen hours a day, and the third day we are on board we are on twenty hours right off, so as to change the watches.

1549. How many are engaged on board now? There are three on board and one on leave.

1550. Why is there such a difference between your pay and that of the lowest, £120? We start here at £120, and receive increments of £5 a year. I have had one increment. The last fireman who came has had no increment. They commence at £120, but Alick Morgan and John Harrington receive the same as they had on deck.

1551. How long is it since you received your increase? 1893.

J. Nuth.

28 April, 1897.

- J. Nuth.  
23 April, 1897.
1552. Were the increases stopp'd in 1893? That was the last we had. They were never stopp'd; I believe they were held in abeyance.
1553. I suppose the firemen almost always keep the fires going? Day and night. We must keep one man on the fires all the time, and then we have the electric light to drive at night.
1554. Who attends to the electric light? The engineer is always on, but the fireman attends to it. One of us is always in the engine room.
1555. There is one engineer always on board at night? Day and night, twelve hours each.
1556. *Mr. Wilson.*] Are your wages the highest paid to a fireman here? At present, sir.
1557. Have you anything to say about your position on board, either on behalf of yourself, or on behalf of the firemen? We all consider we have a right to an allowance for providoring as well as those who are drawing £400 a year.
1558. Of course that would have to be considered in your wages? The others get their wages the same and this extra.
1559. Do you contend that you should be found the same as they are? Not so much, but we should have an allowance.
1560. In addition to the present salary? Yes.
1561. Is that on the ground that if one class of men are found the other should be as well? No. We are only drawing coastal wages.
1562. What are the wages of firemen outside? £9 a month.
1563. You get £125, and they get £96: that leaves £29 a year that you are allowed already beyond what firemen outside get, and they are constantly working up their fires? Yes.
1564. You are not constantly working up your fires? Their wages have been brought down. Some time ago they were £9 a month.
1565. Even at £9 a month you would be receiving £17 a year more than they, so that you are really receiving in your wages a consideration for your keep? But not a full consideration.
1566. Supposing the wages were all reduced to the sea-going wages, and you were all paid £9 a month and providored on board the ship, would you be satisfied with that? We would be satisfied, but as a rule the Government give a little more than they do in the commercial service.
1567. Do you think if you were paid sea-going wages on board the vessel, at £9 a month, or whatever they may be, would you be content if you were found;—would the men be content? I think so. I should be getting more then, because it costs me £2 per month.
1568. Would it not work disadvantageously in the case of married men? Yes; but we are kept aboard here for six days.
1569. You could not land? No.
1570. There is no opportunity of a man's wife sending provisions on board for him? We are away for hours at a time, day and night.
1571. *Mr. Powell.*] You live in messes now? Yes; the sailors and the firemen make one mess.
1572. So you live more economically in that way? Yes.
1573. *Mr. Wilson.*] Another objection is that now you can buy what you like, but if you are found you have got to take seamen's tucker, I suppose? It is not extra good. Some of it is better than others.
1574. If you get a good contractor it is very good, I think? Under the present circumstances, if we got the wages and the money allowed in addition to wages, we would sooner keep ourselves. If we got what we considered a sufficient allowance we would rather get the money.
1575. Do you think that you have been expressing the wishes of the others as well as yourself in what you have said? Yes, as regards the allowances.

George Avelar, Seaman, "Captain Cook," sworn, and examined:—

- G. Avelar.  
28 April, 1897.
1576. *Mr. Powell.*] What wages are you getting? £11 18s. 4d. a month.
1577. As leading seaman? Yes.
1578. What is there in your duties that makes the discrepancy between the money you receive and the salaries of the others? I have been here longer than the others.
1579. But do you do the same work? Yes.
1580. There is no difference between your work and their work? No.
1581. Only you have been longer at it? Yes.
1582. And you receive £143 a year? Yes.
1583. Is not that rather high, considering what the wages are on the coast? Well, I don't know, sir. You must go by the work we do here. We are always on duty here, night and day, holidays and Sundays.
1584. You are always here when there is work to do? Yes. There are many times we go here without sleep for sixteen or twenty hours.
1585. Why is that? We are working outside. We have to be here all the time for vessels coming in and going out.
1586. You are about the decks and not below? We are about the decks all the time. When the ship moves from the buoy we have always got to be up.
1587. I suppose you are satisfied with your position? Oh, yes, sir.
1588. Do you get rations? No. We have to pay for rations.
1589. You form a mess amongst yourselves? Yes.

John Moncrieff, Seaman, "Captain Cook," sworn, and examined:—

- J. Moncrieff.  
28 April, 1897.
1590. *Mr. Powell.*] What is your pay? £8 a month.
1591. And your duties are those generally of able seaman? Yes.
1592. Are you satisfied with your position? There is a vast difference in the wages. There are some getting more than I do.
1593. Your wages are the same as those on vessels on the coast? Just now they are.
1594. Where is the difference between your position and theirs? We find ourselves and they are found  
1595.

1595. *Mr. Wilson.*] The wages are not £8 and found? Not now, they are £6 and found now outside. J. Moncrieff.
1596. *Mr. Powell.*] Do you still think you ought to get more than you are getting? We are on duty here all the year round, Saturday and Sunday and every other time. We are always on duty here while we are on board. 28 April, 1897.
1597. So are sailors generally;—what leave do you get? Two days in twelve.
1598. Compared with the wages on board intercolonial vessels you do not seem to be badly paid; they are getting £6 and found and you are getting £8;—what do you reckon your keep worth? £2 a month.
1599. There is the difference; is there any other matter that you would like to speak of? We have to find our own clothes here. They expect to see us wear good clothes here, not rags like we would on a vessel working cargo.
1600. You want to be put in the same position as boatmen; they get uniform? Yes.
1601. Do the boatmen in the employ of the Marine Board get uniform? Yes.
1602. Is that found for them? Yes.
1603. The uniform you refer to is the usual serge that seamen wear? Yes.
1604. What would a private company do on a passenger steamer? I have never been in any where we have been compelled to wear uniform. The boat duty here wears out our clothes quickly and we are expected to wear good clothes.
1605. Does the Government compel you to wear uniform? No.

E. Stratton, Seaman, "Captain Cook," sworn, and examined:—

1606. *Mr. Wilson.*] What have you got to say about your position? When I first joined the "Captain Cook" it was at Cockatoo Dock, and I thought the wages were £9 a month. The chief officer told me if I joined her I would get the £9 increase the same as the others. I have been expecting a rise. I cannot work for £8 a month and find myself. I have lost 10s. by coming here. E. Stratton. 28 April, 1897.
1607. You knew the wages before you joined? Yes.
1608. You were told you would get an increase? I thought so, sir. He told me I would very likely get an increase like anybody else. I joined in March last year.
1609. The rises were stopped before then? I did not know it. We are on duty here day and night, with the exception of our leave.
1610. Is it not the case that if a seaman is needed he is called at any time, day or night? On the coast you can go where you like at night; there is watch and watch, but we have not got watch and watch. There is another thing: on the coast a suit of working clothes would last me twelve months, but I wear out in one six months here as much as I would in eighteen months in one of those boats.
1611. How is that? Sitting in boats rowing, the seat of your pants is always going. We have to go and fetch milk and food and papers and telegrams. Sometimes I have got wet through to the skin getting telegrams in wet weather; the clothes get full of salt water, and get rotten.
1612. You had £7 a month and were found? In the Illawarra boat—the "Bega."
1613. Now you receive £8 a month and are not found;—what do you reckon it would cost to keep you going on board the ship? £2 a month. Of course we cannot afford to keep ourselves here properly. I am married, and it is like keeping two homes. If I were in a coastal boat I would have only one home to keep. We only want a fair thing.

[Vide also Appendix 26.]

FRIDAY, 30 APRIL, 1897.

At the Board Room of the Local Marine Board Office, Newcastle.

PRESENT:—

GEORGE ALEXANDER WILSON, Esq., J.P.  
JAMES POWELL, Esq., J.P.

Herbert Robert Cross, Chairman of the Local Marine Board, Newcastle, sworn, and examined:—

1614. *Mr. Wilson.*] How long have you been a member of the Board? I have been a member of the Board since its inception in 1873, and have been chairman from 1888. H. R. Cross. 30 April, 1897.
1615. *Mr. Powell.*] Have you been continuously a member of the Board since 1873? Yes.
1616. How many members comprise the Board? Four besides myself—Mr. McLean, Mr. Logan, Mr. Reid, and Mr. Gardner.
1617. Do you know if the Act directs how many members are required to constitute a Local Board? The Act does not say.
1618. Then there may be two, three, four, or more? Yes.
1619. Are the members of the Board nominated by the Government? Yes.
1620. The chairman as one of the Board is also nominated by the Government? Yes.
1621. It is purely a nominee Board? Yes.
1622. No special interest of any kind is represented by the Newcastle Board? No.
1623. In the choosing of the persons to sit on the Board, is regard taken to the interests they represent? When I was made a member of the Board, being a seafaring man, I considered myself a representative of that interest—that is to say, of the marine interest.
1624. You think the marine interests should be prominently represented? Yes, very prominently; and the public think so too.
1625. As a matter of fact, Mr. McLean, Mr. Logan, Mr. Reid, and Mr. Gardner do not represent the shipping interest? Mr. McLean can be called a representative of the shipping interest, since he has a commercial business at this port and ships are consigned to him. Mr. Gardner can be called a representative of the marine interest, as he has been to sea and is a bit of a sailor; but he cannot manage ships and has never handled them, having left the sea when very young.
1626. Shipowners at Newcastle can vote at Sydney at the election of members for the Sydney Board? Yes.

1627.

- H. R. Cross. 1627. The shipowners of Newcastle have no voice in the appointment of the local Board? No; they may recommend, propose, or express an opinion, but no voting power is given to them under the Act.
- 30 April, 1887. 1628. They cannot record their votes to elect members at Sydney without going to Sydney—they cannot vote here? I cannot say how they record their votes.
1629. You cannot say practically that the shipowning and general interests of Newcastle are not represented by the local Board, except so far as you yourselves endeavour to represent them? Yes.
1630. Can you tell us generally what are the powers of the local Board? The Board has no power, being subordinate to the Marine Board of Sydney. Anything we may do is subject to the control of the Sydney Board.
1631. Then any of the acts of the local Board are subject to be vetoed by the Marine Board of Sydney? Yes; according to the Act.
1632. Is it not a fact that the local Board is not permitted to issue certificates of any kind, such as watermen's licenses? Yes, the granting of certificates, from boatmen up, must be confirmed by the Marine Board of New South Wales in Sydney.
1633. That is to say, watermen cannot get a license until the papers have been referred from you with a recommendation? Yes.
1634. You send a recommendation and you send a fee of 10s.? Yes, the fee is sent down by the secretary, giving the man's name and stating that the Board here think him a fit and proper person to have a certificate.
1635. And the license is signed by the President and members of the Board in Sydney? Yes.
1636. Can you tell us anything of the working of the service, here? In the first place, if there is a vacancy for a pilot, the candidates are required to pass an examination and to show themselves in other ways to be fit and proper persons for the position. The applications are submitted to the local Board, who consider them, and make a recommendation to the Sydney Board. The Newcastle Board practically make all appointments, because in every case where we have chosen a man, the Sydney Board have confirmed our action. This they ought to do, seeing that we, being residents here, know the people and are personally acquainted with their abilities.
1637. What control have you over the men engaged in the pilot service? The whole control and working of the pilot system here is in the hands of the harbour-master, and he is answerable for it. Should there be any wrongdoing or dereliction of duty on their part, he reports the matter to the Board, who then take action.
1638. What fees are paid to the members of the Board? One guinea each, per week, is paid to the members, and they set apart one day in the week for ordinary business.
1639. What fee do you receive as chairman? The chairman is allowed two guineas for each week in the year. Our formal meetings are held every Wednesday, but in the case of an investigation we have to sit so long as the investigation lasts, for which the Board receives no extra fee. The last investigation we held was into the collision of the steamers "Federal" and "Alice." This was a very important inquiry and occupied seven days, and it was 10 o'clock every night, except the last day, before we rose. No extra fees were allowed to the Board for that investigation. We have had several cases where the Board have sat day after day. On an average there are about six, or more, inquiries of this nature in the year.
1640. I find there are seven pilots employed in Newcastle, three at £353, one at £218, one at £209, and two at £200 a year;—are the duties of these men of the same nature and character? Yes; and the same responsibility in every case.
1641. Do you know any reason for this great difference in the salaries? Formerly the pilots received a yearly increment. At a certain date, however, the increments for some reason were stopped. Just before this additional pilots were appointed, who gave up very good positions fully believing that they would obtain an increment every year and thus their salaries would go on increasing until they reached favourable proportions. But, as I have said, the increments were stopped, with the result that those who have more recently joined the service are receiving lower salaries than the older hands who received several yearly increments. The junior pilots made several appeals to the Newcastle Board, which were forwarded on. It is certainly an anomaly and certainly an injustice. They are exceedingly good men, and they do the same work and have the same responsibilities as the older pilots.
1642. Comparing the position of the pilots at Newcastle with those in Sydney;—do you think the duties more onerous in Newcastle than in Sydney? Yes, very much more so, I should say doubly or more. We have a bar here that is very dangerous to cross; besides, in the harbour there is a continual shifting of vessels backwards and forwards, from morning till night. Some of the intercolonial boats, of course, do not require the services of pilots, but all sea-going vessels do. In Sydney Harbour pilots are appointed to remove vessels, and sea pilots do not go out of pilot water—say, to Fort Denison, where the harbour pilots take them up. At Newcastle, when a ship comes in, the sea pilot takes charge of her outside, brings her in, and moors her under the direction of the harbour-master. The same pilot attends to the ship in all her movements about the harbour, and takes her to sea again. The same man generally does the work all through. Removal fees are charged for that work.
1643. Removal fees at Newcastle are very much, and in fact double those in Sydney;—you cannot give any idea why that is? No.
1644. Twenty-five boatmen are employed at Newcastle in the pilot service, and the salaries vary from £136 to £194 per annum;—do you not think these larger salaries appear very high? No, not for the work they do.
1645. From a statement I have before me, it appears that besides his ordinary salary the coxswain of the life boat receives £50 a year for that duty, and £12 besides, I presume, for quarters;—is that not high? He has great responsibility on the lifeboat.
1646. Out of the twenty-five boatmen I notice twenty-two receive £12 per annum for life boat service;—does it require twenty-two to man the life boat? It requires thirteen or fourteen.
1647. How is it these extra men are retained? Some years ago, when it was very difficult to get the boat properly manned, and those who were willing to man it lived at a distance from the shore, we recommended that boatmen belonging to the service should live together, and they should not be appointed unless willing to form the lifeboat crew. Every one of the boatmen is bound to go on the life boat when required, and they all live handy on the hill.
1648. Are they trained? Yes; they go out periodically—about twice a quarter. I cannot say positively how

how often; the harbour-master could say. [*The regulations under which the lifeboat is managed were referred to. They direct that the men shall go out in the lifeboat for practice once a quarter.*]

H. R. Cross.  
30 April, 1897.

1649. You think it is necessary they should go out once a quarter? Yes.

1650. So that the whole of the boatmen get £3 each every time the boat goes out? Yes. I would here like to refer to a matter which I wish to bring before the notice of the Commission. A good many years ago—I think it was after the wreck of the “Cawarra”—the Government appointed certain persons to form a Lifeboat Committee. I was one of those. Our duties were altogether apart from those appertaining to the local Marine Board. Time went on; some of them dropped out, some of them died, and I am now the only one left. Our appointment was gazetted. Some years ago the duties merged into those of the local Marine Board, and the Board have taken over the management of the boat and placed it under the charge of Captain Newton, the harbour-master. This was done some years ago; but as three new members have been appointed to the Board, I thought it my duty to explain the matter to the Board at the last meeting, and to ascertain who really is responsible for the management of the boat and the expenditure of the funds voted for its maintenance.

1651. The taking over of the management of the boat was a voluntary act on the part of the Marine Board? Yes; somehow the charge of the boat silently merged into that body. I do not know how it was done. I thought it was necessary to tell the newly-appointed members how we have been managing—that we have been looking after the lifeboat here, and whether they were willing that we should continue to do so. They are quite willing to continue the charge of the boat; but they would like to have some authority for carrying out the duty, it being a business—so to speak—apart from the Marine Board. The secretary was, I think, instructed to write to that purpose to the Marine Board in Sydney.

1652. The boatmen have been receiving £12 a year for some years for lifeboat duty? Yes.

1653. When did the boat go out last? On Sunday or Monday—the day of the wreck.

1654. What condition was she in then? Not in perfect condition.

1655. She was unable to render any assistance? The best lifeboat in the world could not have rendered any assistance on that occasion, as the wreck was high on the beach; in fact, the crew walked on shore.

1656. Can you say yourself, as an old sailor, that the boat in her present condition is one you would like to trust your life in? Certainly not; I would not ask a man to go out in her.

1657. Not even for practice? No; unless in smooth water.

1658. Are the Government buying the new boat? Yes; the Government are finding the money. She is expected here every day.

1659. Where is the boat kept? In a shed near by.

1660. In addition to the £12 a year paid to the boatmen, are fees of any kind paid to any person or persons in connection with the lifeboat? Not that I am aware of.

1661. Does the harbour-master get anything? Not that I am aware of.

1662. Only the coxswain and boatmen? Yes.

1663. Have you anything to do with the regulating of the salaries paid to the officers at this port? No; I have nothing to do with the pay of the officers, nor with the regulating of it. The salaries are fixed in Sydney. We have no control over them. We might recommend; in fact, we forwarded on a complaint of those lesser paid pilots with a recommendation that it be considered, but nothing came of it. We can go as far as recommending, but the fixing of the salaries is done by the Act.

1664. The harbour-master at Sydney receives £371 a year without any allowance, and the harbour-master at Newcastle receives £416 a year as salary, and he has an allowance of £100 a year—I presume for house-rent? Yes.

1665. Comparing the two, does it not appear to you that the harbour-master at Newcastle is paid a very high sum in comparison with the Sydney harbour-master? His duties are considerably more onerous than those of the harbour-master in Sydney. The harbour-master in Sydney is simply subordinate to the Marine Board there, while the harbour-master at Newcastle has a very weighty amount of work to do, and is under a very great responsibility. This harbour is not to be compared to the Sydney Harbour in any way. The work of the pilots, boatmen, and everyone connected with the port is considerably more onerous than the work carried out by the same people in Sydney. Here they work night and day, and they all live on the hill close handy, and ready to turn out at a moment's notice. The harbour-master lives as closely as possible to the water's edge, and is liable to be called night and day—in fact, he is up regularly at daylight, and it is always very late before he retires to bed, and not until he has visited the hill. Captain Newton certainly does not spare himself.

1666. Do you require to obtain the authority of the Marine Board in Sydney before you can hold an inquiry? Yes.

1667. And you conduct investigations as a local Board under sections 87 to 90 of the Act—Cancellation of certificates, &c.? Yes.

1668. In investigating matters referred to in sections 87 to 90, are you assisted by a magistrate? We hold first a preliminary inquiry; out of that inquiry may come a charge of (say) incapacity against an officer. Then only is it necessary to have the presence of a Stipendiary Magistrate or Police Magistrate. The presence of a magistrate is not required until a charge has been made. Take, for instance, the last wreck. Next week we will hold an inquiry simply into the causes of the wreck. If at that inquiry it is shown (say) that the negligence of the captain was the cause of the disaster, he shall be called upon to show cause why his certificate should not be cancelled, and then will it be necessary for a magistrate to be present. We never have a Stipendiary Magistrate until we have called upon a person to show cause why his certificate should not be cancelled.

1669. From your long experience at Newcastle—and you have seen the port in all weathers—are you an advocate for the introduction of a steam pilot-boat for service at Newcastle? Yes; we have been strongly advocating that for some time. A steam pilot-boat is more necessary at Newcastle than in Sydney. If the bar be bad, and a ship cannot come in, the pilot can be of no use with only a miserable whaleboat.

1670. In the last wreck could a steam pilot-boat have rendered any assistance? Yes; in this way: We will assume the pilot steamer happened to be out, which in all probability would have been the case. She would have put a pilot on board at a safe distance from shore, and there is not the slightest doubt that the pilot, knowing the state of the bar, would have told the captain to stand off. There is not a doubt that if a steam pilot-boat had been well out, the “Adderley” would have been saved. As it was, it was too late to tell the captain to stand off after he had taken a tug.

1671.

- H. R. Cross.  
30 April, 1897.
1671. *Mr. Wilson.*] Even if the pilot could not have gone on board he could have spoken the vessel to stand off? Yes; the chances are she would have escaped under those circumstances.
1672. *Mr. Powell.*] Has there been any difficulty here lately about signals? There has been no hitch at all; but Mr. Logan thought, perhaps wisely, that we might make some little alteration and assimilate it more closely to the method of signalling in Sydney. At any rate, it is such an alteration that will not involve much expense, and it is not of much consequence whether it is adopted or not. I do not think it necessary myself, and every one seems to be satisfied with the present arrangement.
1673. I notice that the sum of £6,678 is provided on the Estimates for the "Ajax." £4,000 of this is for alterations, and the balance is for salaries, &c. The sum voted for the master is £250 a year as against £416 for the master of the "Captain Cook," the pilot boat at Sydney;—is there any reason for this difference? That salary of £250 was made up by our Board and recommended to the Sydney Board; but I do not think that we had any information at the time of the rates at which the corresponding people in Sydney are paid.
1674. From your commercial knowledge in connection with ships and shipping, does that salary of £416 for the master of the "Captain Cook," with 18s. a week allowance, seem high? I think he is very well paid.
1675. Would you consider the master of the "Ajax" at £250 a year and 18s. a week allowance well paid? Yes; we could get very good men for that.
1676. *Mr. Wilson.*] You told Mr. Powell that the local ship-owners were not directly represented in the constitution of the local Marine Board;—do you think that is a right thing? I do not see why there should be a difference between here and Sydney. It is a matter of opinion. The public are inclined to believe that the constitution of the Board here should be on the same line as the Sydney Board—that is to say, the several interests should be represented.
1677. In your opinion, it would be very proper that ship-owners should be represented? Yes, decidedly so.
1678. You say that in your opinion the local Board has little or no power;—is that, in view of the importance of this port, a proper state of affairs? No; I think we should have self-government. It is rather irksome sometimes to be in such a subordinate position, and having to refer everything to the Sydney Board.
1679. Is it, in your opinion, considering the importance of this port, necessary that you should have more self-government? I think so. I think it would give greater satisfaction if the Board were independent.
1680. Do you think there is very much feeling on the subject here? My opinion is expressed by the commercial people here.
1681. You say you have to refer the smallest matters, even the signing of a certificate, to Sydney? Yes, we are subordinate to Sydney in every way; but I must say that everything we have recommended has been confirmed.
1682. You have not even the power to sign a waterman's license? No.
1683. Does this arrangement, by which the pilots work under the direction of the harbour-master, work well for the port? Yes; I do not see how it could be improved upon. The harbour-master is the responsible head, and he has to direct everyone. The work is altogether different here to Sydney. It is more onerous—more risky.
1684. Do you, as Chairman, take a more active part in the management than the ordinary members? Yes. I attend at the office every day, and, if necessary, call meetings. I put in a little time at the office every day.
1685. You say that the duties of the pilots at Newcastle are more dangerous than in Sydney? Yes.
1686. You consider these lower salaries are quite inadequate? Yes; I do not see why there should be any difference. The duties are the same, the risks are the same, and the time is the same. Certainly those men who expected an increment when they joined are very much disappointed. I do not say that you should take off the larger salaries to increase the lower salaries, but that the lower salaries should be raised to the amounts now paid to the older pilots.
1687. You think there is too much disparity altogether? Yes; the lower-wages men have been too badly treated. They are good men, and no port could show better.
1688. The boatmen come in at £96 and go up to £194;—you do not think these larger salaries excessive? No, not for the work done.
1689. Then does it not follow that the £96 at which the boatmen enter is very low? If you would see the harbour-master, he would explain that better than I.
1690. If the man at £194 is only fairly paid, the man at £96 is very much under-paid? I think he is under-paid; but the harbour-master will explain that better than I can.
1691. As regards the steam pilot-vessel, is there any very strong feeling on the matter here—are the public agreed upon the point? Yes; there is a very strong feeling on the part of the public with regard to the necessity of a steam service. They held an indignation meeting the other day, after the "Adderley" wreck. The Chamber of Commerce has also taken the matter up.
1692. I suppose you know the work of the "Captain Cook"? Yes.
1693. Would the steam pilot-vessel here have more to do? Yes.
1694. The "Captain Cook" has a master receiving £464 16s. a year with allowances; a first officer, £175 and £43 16s. for rations; and a second officer;—what officers would you propose for the "Ajax"? A. master, first mate, second mate, an engineer, second engineer, and deck hands, &c.
1695. It has been stated to the Board that in some parts an arrangement like this obtains: Instead of having a master, the last pilot to come on board takes command of the ship;—do you think that is a workable arrangement? No, not here. Several vessels might require pilots at the one time. They come down here sometimes all of a heap, and exhaust the pilots.
1696. Who would then take charge? I think the ship should be under the charge of a proper staff of officers apart from the pilots, who have quite enough to do. I do not think it would be a practicable arrangement.
1697. Yet it works well at other ports? That may be, but I do not think it would work here.
1698. The mate must be a qualified man? Yes; all the men in the service here, even those in the lower grades in some cases, have masters' certificates.
1699. The mate, having a master's certificate, must be competent to take charge of a ship? Yes; but he must have local knowledge before he can handle a pilot-boat at this port.

1700. Have you anything you would like to say with reference to the claims of the port? There is an urgent necessity for further dredging, and a very urgent necessity for greater ballast accommodation. Several vessels have lately arrived, and have been waiting some time to get rid of their ballast, and are possibly running the chance of losing their turn to load. H. R. Cross,  
30 April, 1897.
1701. Who besides yourself would be able to give us information on that matter? Mr. Walsh, the district engineer, has the control of the dredging; but the harbour-master is continually sounding the varying depths of the harbour, and knows exactly where the dredges ought to be and what accommodation is required for the ships.
1702. Mr. Walsh has really the placing of the dredges in the harbour? Yes; they come under the jurisdiction of the Harbours and Rivers Department. It is the strong opinion of the public who have to do with shipping that further dredging should be done, and increased ballast accommodation provided. The necessity for increasing the accommodation for the discharge of ballast is very urgent.
1703. *Mr. Powell.*] It is more ballast-berths you want? Yes.
1704. Who regulates that? The harbour-master.
1705. What course should be taken to improve matters in the way you suggest? To create more berths you would, in the first place, have to dredge to make sufficient water along the dyke. The dredging and the increasing of the ballast accommodation should go hand in hand. It is no use making ballast-berths if there is not sufficient water for the ships to lie in. This is an urgent matter, and the delay in unloading ballast gives rise to much inconvenience.
1706. *Mr. Wilson.*] Despatch is reasonably quick here as a rule? Yes.
1707. The loading facilities are very good? Yes; about 50,000 or 60,000 tons a week is loaded. I should like again to particularly point out the anomalies in the pilots' salaries.

Duncan John McLean sworn and examined:—

1708. *Mr. Wilson.*] What business are you engaged in at this port? I am manager of the firm of *D. J. McLean, J. Ireland & Co.* *D. J. McLean,*  
30 April, 1897.
1709. *Mr. Powell.*] You are a member of the local Marine Board? Yes.
1710. How long have you been a member? Two months.
1711. You have been a member long enough to form some opinion as to the nature of the business of the Board? Yes.
1712. Is it a fact that the powers of the Board are of a very limited character? Yes.
1713. Would it be going too far to say that, as a Board, you have no power whatever? I am perfectly safe in saying that, so far as my knowledge is concerned, the merest trifle has to be referred to Sydney.
1714. You cannot issue certificates of any kind? No.
1715. You refer the matter to the Sydney Board and forward them the fees, and they furnish the certificate? Yes.
1716. Do you think that the local Board as it is now constituted is satisfactory to the public of Newcastle? I do not.
1717. You are aware that you have power to vote for the election of members to the Marine Board in Sydney—that, as ship-owners in Newcastle, you have that power to vote for three elective members on the Board? The new members have not yet been acquainted as to their powers. We gradually find these things out ourselves.
1718. As a ship-owner you would have the right to vote for three elective men in Sydney? Yes; I understand that.
1719. That would involve your going to Sydney? Yes.
1720. *Mr. Wilson.*] The business and shipping people at Newcastle have no direct representation on the local Board? No.
1721. The local Board are nominated by the Government? Yes.
1722. So that the shipping and commercial interests have no direct representation on the local Board? No.
1723. Do you think that is a proper state of things for a port like Newcastle? Personally, I think there should be a representation not only of the shipping, but of the commercial interests. The seafaring interest should also be represented.
1724. Do you think it desirable that this Board, for a port like Newcastle, should practically have no power? I feel that I do not care to belong to a Board that has not power to deal with matters in connection with the port.
1725. You are of opinion that the Board should have power to deal with matters without referring them to Sydney? Undoubtedly so.
1726. You are connected with the largest business house in Newcastle? Yes.
1727. Do you consider, as a business man, as a citizen, that the time has come for some more local government in the matter of the Marine Board? I do, undoubtedly.
1728. Is that opinion general? Yes; it is very strongly held by the business people here. I have heard (before I was appointed a member) that the outside public know nothing of what the Board are doing. I consider that they should know what is transacted by the Board.
1729. I understand then, that, considering the importance of the port, you are of opinion that the local Board has not sufficient power, and that there should be some more local control? If we had sufficient local control we could do a great deal of good.
1730. You think local control would be better for the Board, and, therefore, better for the community? Yes.
1731. You have sittings once a week? Yes.
1732. And special sittings when required? Yes.
1733. Have you looked into the question of pilots' salaries here? Only casually.
1734. As a new member of the Board you do not know very much; but you have noticed a great discrepancy? Yes; from inquiries I have made, I learn that the junior pilots are doing exactly the same work as the senior pilots.
1735. You know the port well;—do you consider there is any particular risk about it as compared with Sydney? I consider the risk is fourfold as compared with Sydney.
1736. Do you consider the duties of the pilots at Newcastle more arduous than at Sydney? Yes.

D. J. McLean. 1737. Why? Here they are out on the open sea at once, and the weather is so treacherous, even right close to Nobby's; and then again there are the currents. There is no shelter, and no facilities for getting into the port as at Sydney.

30 April, 1897.

1738. I understand that at the present time the piloting is done by means of whale-boats? Yes.

1739. Do you think that method is up to date? No; it is a most primitive method.

1740. Do you think the time has come for a steam pilot-vessel? Yes; undoubtedly.

1741. Is opinion very strong on that point here? Yes, very strong. I was President of the Chamber of Commerce three years ago, and was one to urge upon the Government the necessity for a steamboat.

1742. Have you looked into the question of boatmen's salaries here? I do not know a great deal about that; but I would like to say that I consider the salaries paid both at Newcastle and in Sydney are not at all commensurate with the risk incurred.

1743. You consider that the salaries paid both in Sydney and at Newcastle are too low? Yes.

1744. Are you aware that the boatmen's salaries go up to £194 a year? No; I thought the highest salary was about £145 a year.

1745. The salaries range from £96 a year to £194 a year;—if £96 a year is a fair salary, £194 must be too high, and if £194 is fair, £96 must be too low? £96 a year is too low.

1746. What do you say would be a fair salary for work such as these men have to do, and who are liable to be called out night and day? I think they should receive at the least £130 a year.

1747. Have you any matter relating to the good of the port that you would like to bring forward? I would like to say that I consider it absolutely necessary we should have the very best men available as pilots, and it is currently reported that some of these junior pilots left better positions to join the pilot service here in consequence of a promise made that their salaries would be increased by an increment.

1748. Is there any question as to the competency of the present pilots? No. I have always heard the shipping-masters who come here speak of the pilots in the very highest terms.

1749. These men state, then, that they were promised a yearly increment? Yes; they joined the service clearly on that understanding. I recollect that about eighteen months or two years ago they were allowed to interview the Premier personally. I think, so far as the boatmen are concerned, that there should be some more modern system of getting up to the far end of the Dyke. At present they have to pull up in boats. With a small steamer they would get through much more work. It is extremely hard work at times beating up against the current. My impression is that when it is necessary for the boatmen to go up to the Dyke any Government launch available should tow them up. With reference to the harbour-master, I merely wish to state that I am about very early in the morning, and I frequently see Captain Newton on the wharf before 6 o'clock, and I know it is very late at night before he returns—in fact, he practically lives on the wharf.

1750. *Mr. Powell.*] As to the boatmen,—you say £130 a year would be a fair salary? Yes.

1751. Would you deduct value of quarters from that? Yes.

1752. They should pay for their quarters out of that? Yes.

1753. Do you know anything about the life-boat? Only as a citizen. I have heard that the life-boat for some considerable time has been considered absolutely dangerous.

1754. With the experience you have gained at this port, do you think it desirable to continue the local Board as it is? No, I do not think so. I consider that the importance of Newcastle demands that we should have a local Board with full powers.

1755. If you had not to refer matters to Sydney, the work that would be entailed here could be done by the harbour-master and his clerk? Yes; the Board would only require a secretary.

Frank Gardner sworn and examined:—

F. Gardner. 1756. *Mr. Wilson.*] What business are you engaged in at this port? I am a shipping and general agent.

1757. *Mr. Powell.*] You are a member of the local Marine Board? Yes.

30 April, 1897. 1758. How long have you been a member? Only a few months. A short time ago there were three vacancies on the Board, and I was appointed to one of them.

1759. You have formed some opinion as to the working of the Board since you have had a seat? Yes.

1760. Is it a fact that you find yourselves without any powers? Yes.

1761. All you can do as a Board is to recommend to the Sydney Board? Yes.

1762. Is it a fact that you are even unable to issue certificates, such as watermen's certificates and matters of that kind? Yes; we can only recommend.

1763. You collect the fees here, and they are sent to Sydney by the secretary, and the Sydney Board sign and return the form to the local Board? Yes.

1764. Do you think the local Board as now constituted gives satisfaction to the public of Newcastle? I think so.

1765. Can such a Board that has no powers give satisfaction? I do not think that the general public are aware that our power is so limited.

1766. *Mr. Wilson.*] The public, you mean, do not know that the Board is almost powerless? Yes; that is what I mean.

1767. *Mr. Powell.*] If they were so aware would they be satisfied? I do not think they would.

1768. *Mr. Wilson.*] Do you think it is a satisfactory state of things that this Board should be powerless? Certainly not.

1769. You have had considerable experience at this port? Yes; I have been here thirty-four years, and I know a great deal of the place and its requirements.

1770. Is it your opinion that if you had a little more local government here in the matter of the Board you could further the interests of the port, and give more satisfaction to the public? I think so.

1771. Does the Sydney Board frequently veto your recommendations? To my knowledge everything has been approved of.

1772. So it is pretty well a formula? Yes.

1773. You recommend and they approve? Yes. In small matters it seems to me unnecessary delay that we should have to refer them to Sydney. I think this Board should deal with such matters at once, and thus obviate delay.

1774.

1774. Have you given any attention to the salaries of the pilots and boatmen? Yes.

1775. You are aware that some of the pilots are receiving a salary as high as £353 a year, while others are getting but £200 a year? Yes. This is a matter that should be rectified. The salaries ought to be to some extent equalised—the lower salaries should be raised. This also applies to the boatmen. I cannot see any justification for this difference in salaries.

1776. Is it your opinion that the present system should be superseded by a steam pilot system? Yes. I think if a steam pilot service had been in vogue, that vessel (the "Adderley") now lying on the beach would not have been lost. The vessel got too near, and then was doomed. I consider the substitution of a steam pilot service a very urgent matter.

1777. Have you any suggestions to make? When the steam service is adopted we might, I think, do away with some of the boatmen; so many boatmen would not be required. A small steam launch, if used instead of the boats, would utilise a lot of the labour now expended, and would be an economical arrangement. A small steam launch with two men on it could act as a tender to the pilot vessel, and could put men on board, &c.

1778. What constitutes a boat's crew? Four men, as a rule.

1779. Do you think that under the present system twenty-five men are wanted? Yes; the constant removals require fully that number.

1780. *Mr. Powell.*] Three men could work a small launch? Yes; I think two could. I have a suggestion to make regarding the signal station, but the advent of a steam pilot-vessel would do away with it to a certain extent. If a signal station were erected on Shepherd's Hill it would be of very great advantage to the port. At present the signal station is on Nobby's. By placing the signal station on Shepherd's Hill ships could be signalled half an hour earlier. As it is now, in easterly weather a ship is in danger before she can read the signals. This proposal, of course, would not require to be carried out if we are going to have a steam pilot service, as then the vessels would be warned to stand off by the pilot boat.

1781. What is your opinion regarding the life-boat? It is not fit for use, and it has been so for twelve months.

1782. Is she taken out for practice? Yes, quarterly.

1783. Are all the boatmen exercised upon her? Yes.

1784. And they are liable to be called upon at any time to man her? Yes.

1785. Do you consider it desirable to continue the local Board in its present condition, with its limited powers? No, not under the circumstances.

Henry Newton, Harbour-master of the Port of Newcastle, sworn and examined:—

1786. *Mr. Wilson.*] How long have you held your present position? I was appointed in December, 1894. H. Newton.

1787. *Mr. Powell.*] For a certain time you held the position of chairman of the local Marine Board? I was not chairman. I was a member of the Board. I 30 April, 1897.

1788. You had a good opportunity of seeing the working and the business of the Board? Yes.

1789. Is it a fact that the Board's powers are very limited? Yes; from my experience as a member of the Board I consider our powers were very limited.

1790. You were not allowed to issue certificates of any kind? No; we could only recommend them.

1791. Whatever powers you might have exercised were really subordinate to the Marine Board of Sydney? Yes.

1792. Are the pilots under your supervision? Yes.

1793. You have seven pilots employed at Newcastle—three at £353, one at £218, one at £209, and two at £200 a year;—are the duties all of the same nature? Yes.

1794. What reason is there for the great difference in the amount of pay? Under the Marine Board Regulations the employees were classified. The pilots came in on £200 a year, with a £10 increment, until a maximum salary of £400 had been reached. The boatmen came in at £96 a year, and received increments until the maximum salary of £126 was reached. And why some of the pilots are on the lower salary is because the increments have been stopped. They ceased some five years ago.

1795. Then these men on £200 entered at that salary, and have received no increment? Only one or two of the junior pilots have received an increment.

1796. As to the boatmen, you have altogether, I see, twenty-five men employed as boatmen at Newcastle, with salaries varying from £136 to £194 per annum;—does it not appear to you that these salaries are rather high? There are two men who receive £154 each. They are my crew on the launch. One is master of the launch, and the other is engineer. They both hold certificates. According to the Marine Board Regulations they must hold certificates.

1797. They are boatmen and something more? Yes.

1798. I notice that M'Kinnon has a salary of £126 a year as boatman, besides which he is allowed £50 as coxswain of the life-boat, and an additional £12 also for the life-boat? Of course, the coxswain of the life-boat is responsible really for the working of the boat. All the men are under his charge. During bad weather he is told off to keep a look-out, and he is authorised to fire the guns whenever the life-boat is required. It is for these duties he receives the extra £50 a year. He does not receive an additional £12 for the life-boat.

1799. How often is the life-boat taken out for practice? About once a month.

1800. Do you know that from your own knowledge? Yes; the boat is practically under my supervision.

1801. Are fees paid to any other person or persons for the life-boat service? None whatever.

1802. I notice that the pay of the assistant harbour-master at Newcastle is £421 per annum, while the pay of the assistant harbour-masters at Sydney is £231 for one and £326 for the other;—is there anything to account for this difference in salaries? Here the assistant harbour-master has a great deal more responsibility than the assistant masters in Sydney. The assistant harbour-master in Sydney is simply a mud pilot—*i.e.*, a harbour pilot—which is separate altogether from a sea pilot. My assistant, if it be necessary, will jump into a boat and go outside. He has had to do this on several occasions when we have been short of pilots. He can act as a harbour pilot or as a sea pilot. All the pilots act in that manner. I go out myself.

- H. Newton.  
30 April, 1897.
1803. We have been told that the pilot who brings a ship in attends to all the removals of that particular ship;—what reason is there for that? It is better for the one man to attend to all the removals of the ship he brings in if possible for him to do so. Of course he may be outside when the ship he brought in requires attending to. But we try to let the one pilot shift all the ships he brings in.
1804. He derives no advantage from it? This method gives rise to a healthy rivalry as to who gets through the most work.
1805. The present secretary is not an inspector of the Marine Board? No.
1806. Taking his duties simply as secretary to the local Board (if that be the only duty he performs) does not the salary allotted to him seem rather high? Yes, if not an inspector; but he assists in the clerical work of my Department, such as making out requisitions and pilots' returns. It is necessary to have an officer in the office at all times. I cannot be in the office continually. From 9 o'clock until 4 o'clock I am afloat, taking soundings, &c., and it is necessary for an officer to be in the office to issue the harbour-master's certificate to ships clearing out.
1807. As to your messenger? He is in receipt of £184 a year, and his quarters are valued at £30 a year. He has also £24 a year allowed him for attending to the lights on the hill. He lights them and extinguishes them, and takes care of them—cleans them, and he takes a casual look at them from his house during the night. They are lighted with gas.
1808. What do you want a carpenter for? He attends to our boats, of which there are about twenty. He also builds boats. He is a practical boat-builder. He built two boats last year, besides repairing others.
1809. Taking into consideration the number of boatmen you have, do you not think that the service would be far better and more economically served if you had plain launches? No; when we move a ship here we usually have strong tides to contend with, and the work to be done in getting a ship ready for removal could not be done with a steam launch; it must be done by boat. In 1886 we had a large influx of shipping, and I applied for an extra pilot. I refrained from applying for a boat's crew for him, because I thought the influx would perhaps not be permanent, and there would be a difficulty in getting rid of them. I have endeavoured ever since to do without that boat's crew. I have gone so far as to have boats constructed by the carpenter, first of all to man with three men instead of four, and now I have him building boats to be manned with two men. I could not carry out the work by having four men in each boat.
1810. What do the boats cost? The usual rate is £1 a foot, and our boats are from 23 to 30 feet in length.
1811. Comparing the salaries paid to pilots in Sydney, viz., £250 to £398 per annum, with those paid at Newcastle, viz., £200 to £353 per annum, do you know any reason why there should be so great a difference in the pay? I could not say. I think if I had my choice I should go to Sydney for less pay. The Newcastle pilot has got his work cut out, and he should receive just as much pay as a Sydney pilot. His work is far more onerous.
1812. Do you consider £200 a fair pay for a pilot at Newcastle? No.
1813. But you have two on that salary? Yes; we have them because they joined with the understanding that they were going to get an increment of £10 a year. We have men here who left £280 a year to come into this service, and they would hardly have done that if they thought £200 was going to be a permanent salary.
1814. It is reported that the vessels are delayed here in getting rid of their ballast? That is for want of accommodation for putting the ballast on shore. In some ports the discharge of the ballast is done by lighter, and no doubt if the Government had no ground to reclaim it would have to be done with lighters here; but, having ground to reclaim, it would pay the Government to erect ballast jetties, which would at the same time facilitate the despatch of ships that come to the port. [*Vide Appendix 32.*]
1815. *Mr. Wilson.*] Do you wear a uniform? No.
1816. Do you think it desirable that you should? I think a uniform is very necessary. I may tell you that frequently I have gone to a ship and received a very strong sort of reply. I think the uniform would have a tendency to command more respect.
1817. A smart cap and smart coat, with brass buttons and braid? Yes.
1818. As to the dredging,—Mr. Walsh, I understand, places the dredges, but you give the instructions to the men? No, I have nothing to do with the dredges. I take soundings, and I watch very closely the changes that are continually taking place. If I consider that a dredge is required to be placed in a certain position to remove some sandbank or some silting up that has taken place, I confer with Mr. Walsh, and, if possible, he places a dredge there.
1819. Is there any great want of more dredging in the harbour? There is. We want more accommodation for the shipping that comes into the port. There is not sufficient dredging work being done. The strides that modern shipping has taken in length and in draught make it absolutely necessary that we should have more accommodation.
1820. Is it a very pressing matter, this want of accommodation? Yes, immediate attention is required.
1821. You take the soundings? Yes, I give them to Mr. Walsh. There is an urgent want of more accommodation—ships have so increased in length and in draught.
1822. As to the pilot arrangements,—are you entirely in favour of this proposed introduction of a steam pilot-vessel? Yes, I consider it very necessary. With the present state of the trade of the port the existing arrangements are not up to date, and they are attended with very great danger. There is 75 per cent. more danger crossing the bar here in an open boat than in a steamer.
1823. Do you contend that with a steam vessel there would be less probability of the occurrence of wrecks? Yes, to an extent there would. But I would not suggest that the boat should go out and meet every vessel, such as small craft.
1824. The steam pilot-vessel could run out and warn any vessel coming down to stand off? Yes.
1825. Under those circumstances, the steam pilot-vessel might save lives and property? Yes.
1826. If a steam vessel were introduced, would it entail a rearrangement as regards the boatmen, &c.? I have worked that out, and suggested to the Board that if we had a steam pilot service inaugurated, I would, if possible, do away with one boat's crew (four men); but, at the same time, I would not do any injustice. Instead of dismissing them, let them take turn about on the steamer until such time as there may be an appointment.

1827. The introduction of the steam-vessel will, then, entail certain alterations and rearrangements? *H. Newton.*  
Yes.
1828. You give instructions to pilots? Yes, instructions where to place the ships. *H. Newton.*  
3 April, 1897.
1829. You stated that you thought the lifeboat was taken out for practice once a month, was it not once a quarter? No, once a month. Lately, however, she got damaged, and since then we have launched her as little as we possibly could help.
1830. It was suggested to us in Sydney, in reference to the "Captain Cook," that the same course should be followed in Sydney as is followed at certain ports in the old country; that, instead of having a master on the "Captain Cook," the last pilot to come on board should take charge of her—he would be the commander for the time being;—would you approve of such an arrangement? That is a good arrangement in some instances. Take Melbourne for instance, where they take on board six or seven pilots, and go out to the Heads. But we have here an enormous number of entries, and supposing we were to have only two pilots on board, the pilot boat would, perhaps, go out and it would meet two ships, then both pilots would have to leave the steamer. It would be cutting it too fine to adopt such an arrangement here. We would have to increase the staff to do it.
1831. Would it not be economical if one of the Government launches, several of which, I understand, are in this harbour, could be used for towing the pilot-boats when they have long distances to go? Yes. I could not get through my work if I did not use my launch in running the men from one ship to another. Last Friday we had six ships to shift, and the lifeboat was out with sixteen men, leaving me only eight. The shipping that has loaded at the cranes must not be neglected, as delay only means loss of revenue to the Government. Everything must be prompt.
1832. The salary for the master of the "Ajax" is set down at £250 a year;—would that be £250 and found? Yes; I think he would be round, or else get an allowance.
1833. The master of the "Captain Cook" gets 18s. a week allowance;—supposing they both got 18s. a week allowance, and the "Ajax" man a salary of £250 and the "Captain Cook" man a salary of £416, would you consider them fair salaries;—is the "Captain Cook" billet worth £166 more? The man here will have more work to do. The man who takes the "Ajax" will have his work cut out. He must have good officers—officers with masters' certificates. All our pilots must have masters' certificates.
1834. The "Ajax" billet will be a harder one than the "Captain Cook"? Decidedly.
1835. I gather that there is no excessive staff here? No.
1836. Is it sufficient? We have had two pilots in quarantine in Sydney. We have had another two, at the same time, off the coast and unable to get back. Another one was placed in quarantine here in a ship from London. I had, therefore, to stand by myself in case the second pilot should be required. My assistant was sick, and if two ships had signalled for pilots through the night, I only had one pilot to send, and would have had to go myself. I have also been in this predicament: when I steamed down on one occasion, all the pilots were up the harbour getting eight or ten ships away. There was a slight mist, and after it had cleared up, a ship was seen close to and in want of a pilot. Not having a man, I jumped into the dingy, pulled outside, and boarded the ship as a pilot.
1837. But these difficulties are only occasional? Yes.
1838. Under ordinary circumstances, a staff of seven is sufficient? Yes.
1839. How about this arrangement, and supposing there is sufficient local talent? You hold an examination for pilots, not for any immediate vacancy, but those who pass to be put on a list for employment in time of emergency, payment to be made by fee; understanding, of course, that they would have first claim to a vacancy, should one occur. Generally, the men that we appoint are in employment. We have no talent about here looking for work. Only lately I wrote to Sydney with reference to employing someone. At the time, several of our pilots were subpoenaed to appear at the Supreme Court, and I asked if we could employ an exempt master; but it could not be fallen in with.
1840. Is there no retired master here, not too well off, who is capable and who could pass an examination and be put on the list, and be retained by a small fee to work when required? I know of one. Your suggestion would be well worth a trial. An emergency man could do the harbour work, which would relieve the pilots considerably. I would welcome anything like that with delight.
1841. Have you any suggestions to make? I think accommodation and facilities for mooring ships, which really means dredging, as the one entails the other, should be pushed on with as soon as possible.
1842. *Mr. Powell.*] Will increasing the accommodation mean increasing the cranes? Yes. We have a 90-acre basin. The idea was to dredge it out, and duplicate the cranes by running a wharf up inside. If that were carried out it would be a great boon; but the dredging is going on very slowly. The time has come to push the thing along. The want of accommodation gives me a great deal of worry and anxiety. We have vessels lying three abreast, and you can understand, when it is blowing, the trouble there is in getting the inside ship out, especially if a strong tide be running. Increased accommodation would minimise this.
1843. Do you think the difficulty in getting this accommodation would be so great if you had a local Board with full power? I think the matter only wants bringing before the Minister for Works and it will be pushed along.

MONDAY, 3 MAY, 1897.

[At the Offices of the Local Marine Board, Newcastle.]

PRESENT:—

GEORGE ALEXANDER WILSON, Esq., J.P.  
JAMES POWELL, Esq., J.P.

Thomas Brooks, Member of the Chamber of Commerce, Newcastle, sworn and examined:—

1844. *Mr. Wilson.*] You are engaged in business in this port? Yes; I am a Lloyd's surveyor, and I have been thirty years at this port. *T. Brooks.*
1845. You know a good deal about the business of the port? Yes; I know the port from its inception. I was working for Mr. Moriarty when he laid out the harbour. *3 May, 1897.*
1846. What is your opinion of the present pilot system? My opinion is that it is not up to date. I think a steam pilot-vessel is an absolute necessity for the service. I thought so ten years ago.

1847.

- T. Brooks. 1847. Ship-owners, underwriters, and commercial people have no direct representation on the local Marine Board? No, none.
- 3 May, 1897. 1848. Do you think it is desirable that that should continue? I think the Marine Board should be swept away altogether. It is an abortion.
1849. Then how would you manage the harbour? The harbour-master and his staff could do that.
1850. Would you not require a trust of some kind—Harbour Trust, or some machinery of that kind? No; let it be worked on the same lines as the English Merchant Shipping Amendment Act of 1894, with such amendments as would be suitable to the Colony.
1851. Would it not be desirable to have trusts to have superintendence of all the dredging and berthing arrangements, &c.? No; that is already provided for by the Public Works Department.
1852. You think that even a local Board is not necessary? It is of little or no use except in an inquiry as to casualties at sea or collisions, and then you require nautical men for that.
1853. At present the Marine Board always inquire into such matters? Yes.
1854. That is to say, they exercise judicial functions as well as the functions of administering the work of the harbour? Yes.
1855. We will assume the Marine Board is to remain;—do you think it would be advisable to take away those judicial functions from the Board? If they remain, and you take that away, they will have nothing to do.
1856. Suppose you have a local Marine Board with full power, would it still be advisable that that Board should retain its judicial powers? No.
1857. Suppose you have a local Marine Board with full powers, even then you would recommend that the judicial inquiries should be provided for by a Judge, or a man of legal training, supported by two assessors with nautical or engineering experience, according to the matter to be inquired into, and such Court to sit apart from the present Marine Board altogether? Yes.
1858. Whether the Marine Board were swept away, as you advise, it would still hold good that such a court should be established? Yes; if we simply transcribe the English Act of 1894, with such modifications as would be suitable for the Colony, we will have all that is required.
1859. Then you are not in favour of a local trust for the management of the harbour? Individually, I think that our dredging is managed well and efficiently by men who have grown up in the business.
1860. Of course we know Captain Newton is a very efficient officer, but it is quite conceivable that you might have inefficient officers;—who should then be responsible for these officials if they were not efficient? The dredging operations come under the Works Department; but to control the pilot service you might have an advisory board of about three, as it would not be well to leave too much power or responsibility in any one man's hand. There must, however, be some alteration soon made in the present system, as now the Board are only agents to carry out the instructions of the Sydney Board.
1861. You are granting now that there must be a body of some kind to advise and instruct the harbour-master? Yes.
1862. Is it your opinion that it should be a local Board, independent of any other Board, and that they should have the management of the affairs of the port? Unquestionably. In one or two cases the Marine Board here have been questioned, because of taking action without first consulting the Sydney Board. There should be a local body, and the judicial functions of the Board should be taken away and vested in a Judge and two nautical assessors, who should be selected according to the nature of the matter to be inquired into. I think a court of that kind would have the confidence of the public.
1863. You are aware, I suppose, that in a Bill brought before a previous Parliament it was proposed to give representation to seamen and other interests;—supposing this court of a Judge with two assessors were established, do you think it would still be advisable that seamen should be represented on the Marine Board? If the judicial functions are taken away from the Board a great deal of the objection to having seamen represented on it would be removed. The way the Board is now constituted, should seamen be represented, the captain would run the risk of being tried by his cook.
1864. So far as this Marine Board is concerned there should be no representation at all, in your opinion? No; on the Marine Board we want good sound business men to administer affairs, and, on the whole, I believe the appointments would be safer in the hands of the Government.
1865. That is to say, that the Government might still have the nomination? Yes.
1866. You want a local Board and do not care very much whether it is nominated by the Government or elected by the shipping and commercial interests of Newcastle? Yes.
1867. Are you aware of any anomalies in the salaries paid to pilots and to the boatmen? Yes; I think the salaries ought to be equalised to some extent.
1868. Have you any suggestions to make? The berthing accommodation here is very deficient. They should commence immediately and construct a wharf inside the dyke, which would give relief. The same power that works the present set of cranes would be available for the extra set of cranes that would be placed on this wharf.
1869. Have you sufficient cranes? I think so, if worked to their utmost. The great detention is owing to the ships not being able to get rid of their ballast in time. We want additional facilities for discharging ballast.
1870. *Mr. Powell.*] Under the present system, the sea pilots are really harbour pilots as well? Yes.
1871. If you have an outside pilot-boat, the service will have to be reorganised somewhat; two sea pilots would be away in the vessel, and you would lose their services in the harbour;—do you therefore think it would be necessary to have harbour-masters for harbour movements, and keep sea pilots for going out? Two pilots would be required on the boat. They need not be outside altogether, as in fine weather they can see the ships a long way off. But if the matter was left to the harbour-master I feel sure he would make satisfactory arrangements.
1872. You state that you think local Boards might consist of Advisory Boards? Yes.
1873. Do you not think that the same system would apply equally well in Sydney? Most certainly.
1874. Supposing the judicial functions are confined to a Judge or a Stipendiary Magistrate with assessors, would that not give this advantage, that they could travel from port to port and constitute a court wherever they happened to be, or wherever their services were required? Yes; the best available men could be brought up here from Sydney in a very little time.
1875. Take the case of an accident on the Darling, it would carry justice to their door? Yes; it would be a very great convenience.
- 1876.

1876. Speaking of Harbour Trusts, I suppose you are aware that the experiment of a Harbour Trust has not been a great success in Wollongong? Yes. I think we ought to be thankful that we have our harbour under the care of the Government. T. Brooks.  
3 May, 1897.

1877. *Mr. Wilson.*] The Wellington Harbour Trust has been a success? But they did not require much money there.

1878. *Mr. Powell.*] There are three elective members on the Board in Sydney;—in what way are the Newcastle interests represented by the elective portion of the Sydney Board? They are not represented at all, but I do not think that matters much. The shipowners of Newcastle go to Sydney to vote, and it is only the shipowners that are represented. The number of votes is very small at Newcastle. I am aware that two of the members of the Sydney Board have held seats from the inception of the Act, and that the owners of small vessels, and even punts, can outvote the owners of large trading ships. I do not think that the elective principle has been a success as representing the general interests of the Colony. Outside Sydney is not represented at all. The Insurance Offices should not have special representation, and I do not believe in a class representation on the Board.

1879. Do you not think such a Board as was proposed to be constituted by the Bill that was introduced would very likely be a contentious Board? Yes, I am certain it would. There could never be a satisfactory result from a Board so constituted.

1880. Is it your opinion that urgency is required in this business of getting a pilot vessel? Yes; the urgency is very great, and I am surprised that this matter has been delayed so long. I certainly think that a temporary vessel should be engaged pending the completion of the fitting-up of the "Ajax." But then again, the circumlocution that would probably have to be gone through to get a temporary boat would be so great that little would be gained. This is a very urgent matter, and I would impress upon the Commissioners to have some provision made before the winter weather sets in. There is another matter I would like to refer to. Captain Wetherill, previous to his retirement, attended to the time-ball. Now it is attended to by the Marine Board's messenger, an irresponsible person altogether. Masters of ships lying here almost daily take the time from that ball. It may, and it may not be correct. You require someone more competent than a messenger to attend to a matter of that importance.

1881. *Mr. Wilson.*] Before Mr. Wetherill retired, the Public Service Board instructed the telegraph master to attend to the matter, but he also retired; then we appointed another official of the telegraph office to do the work; but, very much to our surprise, Captain Newton informed us on last Saturday that this official had not taken up the work, and we have made a note of it.

1882. *Mr. Brooks.*] With regard to the "Ajax," her coming here will save the £450 a year voted for the towing of the life-boat. This will be well, as the tug, at times, when she has been called upon to go to sea, has refused. Again, when the "Ajax" arrives, you will want one less boat's crew, but they need not be dismissed, they could go towards manning the "Ajax." It is not a question of dismissing them, but of transferring them. There is still another matter I would like to bring under your notice. There should be compulsory pilotage for all vessels entering this port from any other than Australasian ports, including, of course, New Zealand. I have calculated that the Government will lose this year between £800 and £900 through removals having been made in the harbour without pilots. The staff is sufficient here to do all removals. As to the signals, I think there should be a flag-staff on Shepherd's Hill. In thick hazy weather Flag-staff Hill is obscured. A flag-staff on Shepherd's Hill would give a look-out 2 miles further south and 100 feet more height, which would give a ship an opportunity of getting out of danger. At present she does not see the flag until she must either come in or go adrift. The present flag-staff should be left; but you would only want a man down there in thick, hazy weather.

William B. Sharp, Member of the Chamber of Commerce, Newcastle, sworn, and examined:—

1883. *Mr. Wilson.*] You are engaged in business at this Port? Yes; I am a shipping agent and colliery shipping manager. W. B. Sharp.

1884. You have had considerable experience in the Port of Newcastle? Yes, I have been here about 3 sixteen years. 3 May, 1897.

1885. As regards the constitution of the Marine Board here, they are simply nominees of the Government? Yes.

1886. The Newcastle shipping and commercial people have no direct voice in their election? No.

1887. Do you know what powers they exercise? They adjudicate in all cases of collisions in and adjacent to the port, and they have power to recommend the cancellation of certificates.

1888. Simply a power of recommendation? Yes.

1889. Do you think that a Board constituted as is the Marine Board at Newcastle, is the best conceivable body to hold judicial inquiries? No; I think all inquiries should be held by a body free from political influence. It ought to be purely judicial, say a District Court Judge with two nautical assessors. In New Zealand when an inquiry is to be made they call a court under judicial jurisdiction, and two assessors are appointed. The Government there have appointed a certain number of assessors, who are paid fees and take turns to sit. In England, under the 1894 Act, the Government make provision for the appointment of assessors by the Secretary of State.

1890. Do you think that if such a court were constituted here it would do away with the cry of representation for separate interests on the Marine Board? I think it would be a most equitable way for all parties concerned. I am not a very strong advocate for class representation on the Marine Board, because it is likely to lead to a clashing of interests within the Board itself. I think it would be much better if the Government appointed twelve nautical assessors for the Colony, who could adjudicate either in Sydney or at Newcastle.

1891. It has come out in evidence that the local Board have really very little power beyond that of holding an inquiry, and then that must be instituted by the Sydney Board, to whom must be submitted the recommendation;—do you think, seeing the importance to which this port has grown, that the local Marine Board should remain in that state? I think it would be very much better to have a judicial inquiry with assessors.

1892. That is the judicial side of the question, but take the administrative side? I certainly think the Board ought to be administered locally.

W. B. Sharp. 1893. And when a license is asked for by a boatman, you think the local Board should be authorised by law to issue such certificate? I think so. The Marine Board could still exist to advise the harbour-master in many little things.

3 May, 1897.

1894. Do you consider that the Marine Board at Newcastle has sufficient power? I think they have quite sufficient power for the local interest, but inquiries should be taken out of their hands.

1895. Take, as an instance, the issue of a boatman's license? I certainly think they should be allowed to issue a license.

1896. What is your opinion regarding the salaries paid to the pilots and to the boatmen? I do not think they are over paid.

1897. The point that stands out is the great difference between the salaries, whereby one pilot gets £200 and another £353 a year? I am not very conversant about the salaries.

1898. Do you think any more berthing accommodation is required here? Yes; that is demonstrated very nearly every day. Provisions have been made for the erection of certain cranes inside the Dyke, which would relieve the harbour very considerably, and would be a very good way of meeting the difficulty. There ought to be provision made for the shipment of cattle here, so as not to block the cranes and interfere with the coal trade. There is only one crane from which to ship bullocks, the No. 11 crane on the Dyke. The cattle trade is extending very considerably, and provision should be made for it, and thus relieve the cranes. If the £140,000 voted were judiciously expended on the break-water it would do a great deal of good. It is eighteen months since this money was voted and nothing has yet been done.

1899. *Mr. Powell.*] Do you think that a small advisory Board would be sufficient for all the wants of Newcastle—a small advisory Board responsible to the Minister, not to the Marine Board in Sydney? Yes, for the details of the harbour work.

1900. All judicial matters to be dealt with by proper legal authority? Yes, by a Judge or Stipendiary Magistrate with assessors.

1901. Do you not think that all licenses and small things like that might well be issued by the harbour-master without the intervention of any Board? Yes; the harbour-master might do most of the work himself.

1902. As representing the mercantile interests, do you think that a Board would work with shipowners, merchants, engineers, brokers, &c., represented on it? If there is going to be a representative Board here it would be better to have it on the lines of the English Act of 1894.

---

Henry William Finch, Member of the Chamber of Commerce, Newcastle, sworn, and examined:—

H. W. Finch. 1903. *Mr. Wilson.*] You are engaged in business at this port? Yes; I am a shipping clerk at R. B. Wallace's.

3 May, 1897.

1904. You have had long experience here? Yes.

1905. What is your opinion with reference to this question of a steam pilot-vessel? I think a steam pilot vessel is an absolute necessity. The present arrangement is not up to date, and is dangerous to life. This place is not like the majority of harbours. It is the centre of a bight, and the sea comes up in a few minutes. The sea is very dangerous in this bight, and there is no shelter.

1906. Are you aware that additional berthing facilities are wanted here? Yes; all round we want further berthing facilities. We very frequently have vessels waiting for a ballast berth, and at the same time the coal companies are ready to take them in. This want of accommodation causes much inconvenience. At present there is a vessel in the port with 300 tons of ballast, and the coal company is ready to take her on at once. Her master has, therefore, to pay 1s. 3d. per ton to lighter his ballast to accommodate the coal people, and being sand ballast, it has to be taken outside. Another thing, if the weather be bad you cannot take the ballast outside. Again, we often have three or four ships abreast. That is very bad. If it should be blowing you cannot get them out, and things get altogether capsized. If there was plenty of high-water space we could place the vessels singly, and the drawback would be removed.

1907. *Mr. Powell.*] Where could you place them? There is space at Waratah, and there is any quantity of water space to place ships to lie idle in the new basin. There is a small bar there, but that could be got over. Thirty or forty ships could be moored there if there were mooring-posts for them to lie against.

1908. *Mr. Wilson.*] Have you given any attention to the salaries paid to the pilots and boatmen at Newcastle? No.

1909. Have you any suggestions to make? We want constant dredging—constant improvement. Another thing, the cranes are so placed that if two ships are at (say) cranes 14 and 15, and one wants to load into the aft-hatch and the other into the fore-hatch, they cannot do it. At Home they have shifting cranes, which enable double the number of ships to be accommodated, as each crane can be moved along to each hatch.

1910. If these arrangements as proposed were made on the other side of the Dyke, and later on cranes were erected, travelling-cranes might be used? Yes; if ballast jetties were put down, a wharf could be put in, and new travelling-cranes could be placed on it. I would like to refer to the time-ball. Some years ago it was under the control of Captain Weatherill. It is now under no responsible control. The telegraph-master would be a good man to attend to it. The shipping people check their chronometers by the ball, which is dropped by signal from the Telegraph Office. I am not sure whether it does not now fall by electricity from Sydney. There is another matter I would like to refer to. Very frequently we are short of buoy-space for ships that have loaded. Only the other day a large ship, drawing 22 ft. 6 in., had to remain at the crane for over sixteen hours. There are only two berths in the harbour at which a modern ship drawing anything over 22 feet can lie, and then very frequently she has first to be put out of trim by loading deeper forward than aft.

---

George Melville, Assistant Harbour-master of the Port of Newcastle, sworn, and examined:—

G. Melville. 1911. *Mr. Powell.*] What is your age? I am 65 years of age according to the Government books, but I hardly know my correct age. I am almost certain that I am between 65 and 66 years of age.

3 May, 1897.

1912. Have you acted as a sea pilot at any time? Yes, but not often; only when none of the pilots were available. My work generally is to shift vessels at their berths.

1913.

1913. In what way are you assistant harbour-master? I carry out the harbour-master's instructions, and I appoint berths and remove ships. In his absence, which, however, is very seldom, I act on my own judgment. G. Melville.  
3 May, 1897

1914. How long have you been acting as assistant harbour-master? About three years. Previous to taking up this duty I was chief pilot, and was on the pilot staff. My present salary is £29 10s. 3d. a month—about £350 a year. I receive the pay of the highest pilot in port. I have no regular working-hours. I am continually at my post from 5 o'clock in the morning until 6 o'clock at night. I am required to turn out at all hours of the night to keep the channel clear. Our harbour is so small, we must keep the channel clear.

WEDNESDAY, 19 MAY, 1897.

PRESENT:—

JOSEPH BARLING, Esq., J.P., PRESIDENT.  
GEORGE ALEXANDER WILSON, Esq., J.P.  
JAMES POWELL, Esq., J.P.

Joseph Henry Storey, J.P., Merchant, sworn, and examined:—

1915. *President.*] Are you well acquainted with matters in connection with the Marine Board, more especially concerning the insurance of vessels and so on? Yes. I am engaged in underwriting business, and am also Chairman of the Sydney Underwriters' Association, which controls the business in this Colony. J. H. Storey.  
19 May, 1897.

1916. *Mr. Powell.*] You appear as representing the Underwriters' Association, and you are authorised to speak on their behalf? I am the Chairman, and the Association know that I am attending here.

1917. Are you and the Association generally interested in steam-vessels trading to the northern rivers of the Colony? Yes.

1918. Are you aware that a very large sum of money is paid annually by the Government for the services of steamtugs stationed at the entrances of several of the northern rivers? Yes.

1919. From your experience do you consider that that service, as now conducted, is efficient, or that it is capable of improvement; and, if so, in what way might that improvement be made? I think that the tugs are absolutely necessary on account of the treacherous nature of the bars; but I have long held the opinion that the Government should have the tugs in their own possession, and manned by the pilot and a proper crew. Some years ago I brought this under the notice of the Treasurer. It appears to me that there is a large expense in keeping up pilot stations at all these rivers; and the pilot and crew cannot be fully employed marking the channels and signalling the state of the tide, which is practically all the work they have to do. I think it is something like £6,000 or £7,000 that is paid in subsidies, and the total value of the whole of the steamers employed is not much more than from £25,000 to £30,000. The service can, I think, be better done with the pilot in charge of the steamtug. It is still worth the consideration of the Government whether they should not carry on the service themselves, although I am not an advocate of the Government doing everything.

1920. What I understand is that you think the Government should have suitable vessels commanded by the pilot and manned by the boats' crews now employed? Manned by efficient men.

1921. In place of the boats' crews now employed, with an engineer and assistant;—would that give a better service generally? I think it would give more satisfaction. The Government could then charge the towage.

1922. At the present time persons requiring the services of these boats pay the owners, and not the Government? Yes.

1923. It has been said that when a vessel gets into difficulties the owners of the tugs sometimes place themselves in the position of becoming salvors;—is that so? Whenever vessels get into difficulties tug-owners make special charges for any services rendered, over and above the towage charge.

1924. Then, of course, the owners of vessels are very much at the mercy of the tug people under such circumstances, and if the Government supplied the vessels difficulties of that kind could not arise? I consider that the difficulty would be minimised a great deal. If a vessel is rendered valuable assistance by a tug it should be paid for. There is a tendency as it is now to overcharge for services rendered.

1925. Then you think that small vessels of light draught and high power, specially constructed for the work and owned by the Government, would answer the purpose? I think so. The only river where there is a very expensive tug is the Richmond.

1926. The Government are paying £1,700 a year for a vessel there now? I did not know I was going to be asked about this; but I find that the subsidies paid are £6,200, and the value of the boats employed is about £27,000.

1927. There is another feature of the matter;—of course, you know that the pilotage rates have been reduced;—do you not think that if there were suitable vessels, such as we have spoken of, the vessels entering would generally take the services of the pilot, and be quite content to pay the small sum that is now charged for pilotage—2d. per ton? There would be no bar on account of expense. Of course, all the masters trading to those rivers are exempt. So long as the pilotage did not exceed what they pay at present for towage there would be no complaint. If they had to pay more, I am afraid they would not consider whether the service was better done or not.

1928. Do you think that if such vessels were placed on the stations it would reduce the cost of insurance in any way? It very likely would.

1929. And on the whole you think that vessels such as we have spoken of would give more satisfaction because they would be more under the control of the Government officer on the station? I think so.

1930. Going from that subject to the constitution of the Marine Board;—are you satisfied from your experience with the elective principle under which three wardens are elected; do you think the system is working well;—they appear to be elected, not by the large ship-owners, but by owners of small craft who have an aggregate which makes up the necessary voting qualification? I do not think the elective principle is the correct one. I do not think the representative Board is the correct Board, and if the ship-owners have representation, then there are very many other interests which have equal right to claim representation. I think the Board is faulty in that respect.

1931. Do you not think it would be better to separate the judicial functions of the Marine Board from the

J. H. Storey.  
19 May, 1897.

the Executive, placing the judicial in the hands of a Judge or a Stipendiary Magistrate with legal training, assisted by nautical assessors? I think that the present system of inquiry before the Marine Board is unfair to the person brought before them. They inquire into the cause of the accident, collision, or wreck, and, after hearing the case, they summon a man before themselves to answer a charge which they prefer themselves, and then they sentence him themselves, so that they are practically the judge and jury on their own charge. I think the plan adopted in all other judicial inquiries is best. Take the Coroner's Court, for instance. The Coroner inquires into an accident, and if he charges any person, that person then goes on to a higher tribunal. In that respect we might copy the Victorian system. When a collision occurs there, the Marine Board hold an inquiry, and, if there is no blame attaching to anyone, the matter drops; but if blame is attached to anybody, then they found a charge against him, which is heard by a Magistrate, with nautical assessors. The whole case is then gone into, and the man can defend himself. I think that is very similar to the practice adopted in England. In all cases I have seen in English papers I have noticed that it is before so-and-so, Stipendiary Magistrate and nautical assessors.

1932. And the nautical assessors merely sit with the Judge or Stipendiary Magistrate and assist him with their skill and knowledge? Yes.

1933. *President.*] You were suggesting that tugs should be obtained by the Government, and put on these rivers, instead of subsidised tugs as at present; take the Richmond River as an example;—I think Mr. Powell pointed out that the subsidy was now £1,700 a year? Yes.

1934. Is it your opinion that the pilots who are now working the boats there could work the steamer; would there be sufficient men there to man and work the steamer;—there are a pilot and four hands? Yes; I think so. She is the largest tug on the coast; but I do not think she would have more than five hands.

1935. What do you think would be the value of the tug required for that river? I doubt whether such an expensive tug is wanted; but still she is there, and originally cost a good deal of money. I should estimate her value now at between £7,000 and £8,000.

1936. That tug would be about the same power as the "Thetis" or "Ajax"? I do not know the relative power of those boats.

1937. It would cost between £7,000 and £10,000? Yes.

1938. You would have to put on (say) £400 for interest on that capital, and working expenses in addition to that;—do you think, taking all that into account, it would still be to the interest of the Government to provide a tug of that kind? I think so. The matter of expense, however, can be calculated, taking the interest on cost, working expenses, &c., as against the subsidies now paid and towages to be charged for. I know that we waited on the Colonial Treasurer once about it, and he referred it to the Marine Board, but they decided against it altogether.

1939. Was that on the ground of extra expense? We never heard the ground.

1940. Have you any idea about what is paid in dues to these tugs—what they receive in a year in towage? That could be ascertained easily by getting statistics showing the arrivals and departures at each of the rivers during the year. I think the amount of the towage is fixed in the contract for the subsidy. There is a maximum charge, and from the tonnage in and out you could make a fair estimate of the returns.

1941. *Mr. Powell.*] The North Coast Company are the principal people trading there? Yes; but I do not think their steamers take the tugs. It is the sailing vessels who use them, and the number entering and leaving each year could be ascertained.

1942. *President.*] Arrivals and departures? Yes. Before I went to the Treasurer I got a question asked in the House, and we got the return that way.

1943. Do you know whether every ship entering or leaving the ports takes a tug? They do not if they can help it. They will sail in and out if they can, but they very rarely can manage to sail in and out.

1944. You think that taking the outwards and inwards we would get the number of times roughly? It is quite the exception for them to sail in or out. At many of the bars the wind that will sail a vessel out is a head wind when she gets out.

1945. I merely wish to get a basis of cost for the two systems;—may we take it as almost certain that every vessel sailing to these rivers must use the tugs? All the sailing vessels must—not the steamers.

1946. Do you think that a tug could serve more than one river? I do not think so.

1947. There must be a tug at each river? At the present time there is one tug trying to serve two rivers, the Nambucca and Bellinger, I think it is.

1948. *Mr. Powell.*] There is no trading to the Bellinger River at all now? Oh, yes; last week there was only 5 feet of water on the bar. This week there are 9 feet; and there is plenty of timber there for sailing vessels.

1949. *President.*] Then they do go to the Bellinger River now? Yes.

1950. Would you advocate any further harbours or rivers to be served by tugs? I think the only place where one tug serves two rivers is at Nambucca and Bellinger, and the trade of those two rivers warrants a tug each.

1951. You would not suggest any others that want a tug? I think all the others that need tugs have got them. They have got them from Wollongong up to the Tweed.

1952. *Mr. Powell.*] Then the Government should have the command of the vessels, and would be able to use them buoying the rivers and testing the depth on the bar, &c.;—there is a lot of work done now which could best be done by a small steamer? Yes; but the Marine Board sometimes clash with the Harbours and Rivers Department in that work. The Harbours and Rivers Department look after the rivers, I understand.

1953. *Mr. Wilson.*] Did you give any evidence with reference to the Marine Board before the Civil Service Commission? No; I heard evidence, being on that Commission.

1954. Did you give any attention to the question of salaries? Only when the Civil Service Inquiry was on.

1955. Take the boatmen;—I see the boatmen vary from £229, boatswain, salary and allowances, down to £96 a year;—do you think £229 is a reasonable salary for a man in that position? I am not competent to speak on that.

1956. Would you know anything about the salaries of seamen or firemen? We went into that fully, and compared the rates of wages paid by the Government and paid for similar work outside, and I think the Government were far and away higher. I had a scale prepared at the time comparing the rates of wages paid.

paid to masters and engineers outside with those paid by the Harbours and Rivers Department, and there J. H. Storey. was a wide discrepancy.

1957. Do you know anything about the salaries of pilots? The salary of a pilot was £300 a year.

19 May, 1897

1958. You have no special knowledge of that? Except that I know the Sydney pilots get £300 a year. At one time it was competitive, and they got as much as they earned, but now they get a settled salary.

1959. You know the "Captain Cook" steamer, I suppose? That was a boat in which we thought that the officers were grossly overpaid. In our report we put the "Captain Cook" expenses as against one of the steamship company's expenses, and they showed a marked difference.

1960. The master of the "Captain Cook" gets £416 a year, and in addition 18s. a week for allowance? It is a gross overpayment. The master of a colonially-owned vessel, trading to any of the bar harbours, would get £300 a year, and their duties are much more arduous and risky.

1961. *Mr. Powell.*] I think you compared the expenses of the "Captain Cook" with those of one of the Hunter River boats? I took the Hunter River as the best paying one. If I had compared it with one of the others it would have been very much worse.

1962. *Mr. Wilson.*] We are advised that rather a different tug is wanted at the Richmond? I think a less expensive tug would now do. The Richmond is where all the money is being spent now to make it a good entrance. The trouble is that when vessels arrive off these bars the pilots cannot go out to them. If they commanded the tugs they would go off and sound the bar and tell the captains the depth of water on the bar. I have always been a great supporter of the present Marine Board, and think they have done very good work. We have got one of the finest-lighted coasts in the world, and I do not think the decisions of the Marine Board have been upset in a Court of law more than two or three times. I think that the Board should be nominated by the Government, and not a representative Board.

1963. *President.*] If we had a District Court Judge, with power to nominate two assessors, do you think a verdict of such a Court would carry great weight;—two assessors would be nominated in each case, not necessarily the same assessors each time, the Judge having the power of continually revising his Court, according to the necessities of the case? Such a verdict would most certainly carry great weight.

1964. Much greater weight than the present Court does? I think so. It would be fairer to the person charged.

1965. *Mr. Wilson.*] Do you not think it would have the effect of taking away this cry for special representation on the Board? I think it would. The only people who come before the Board for trial are officers and engineers, and if a seaman were on the Board he would sit on trial on a captain, while the seamen themselves are never put on trial.

1966. *President.*] It is almost inimical to the idea of calm judicial judgment to have conflicting interests among the judges themselves? Certainly so. The thing has worked so well in the old country that I think we should follow their example.

1967. Supposing such a tribunal as that were established, to what authority would you give the power to issue certificates? I think the Marine Board. It is their office to hold the necessary examination of the candidate, and I think they should issue the certificates.

1968. What I mean is this: If the judicial functions are separated from the administrative, you would have a Court to judge the cases, and there would be someone to take the management of marine affairs as superintendent of pilots, lighthouses, and harbours;—do you think it would be good to give him the power to issue certificates after proper examination? —

1969. *Mr. Powell.*] It is done virtually now;—Captain Hixson issues certificates on Captain Bedford's examination of seamen and Mr. Cruickshank's examination of engineers;—do you think there should be an officer simply under the Minister, leaving on one side questions of collisions, and loss of life, and suspension of certificates, and dealing simply with marine matters, pilots, lighthouses, &c.? The only difference I would make in the present system would be to take the final dealing with a person out of the hands of the Marine Board and pass them on to a Magistrate and assessors; but you must have a Marine Board to look after the navigation work of the Colony, and the lights, and the harbours. That body should issue the certificates.

1970. We suggest that we should put an officer in charge of pilots, harbours, and lights, &c., responsible to the Government and appointed by the Government, and give him power to issue certificates under proper regulation and examination, the Judicial Court having nothing whatever to do with that, but simply to inquire into collisions and accidents at sea, and to be a Court to deal with certificates on cause being shown? Would you propose that this Court should deal with cases from the initiation?

1971. Yes? Then, I think, there would be the same objection as there is now, because they could not pass the culprit—if I may so speak—on to some higher tribunal.

1972. Could not that be carried out by the officer I speak of;—should it not be his duty to bring these cases before the Court and prosecute? There are very many inquiries held where there is no occasion to prosecute.

1973. *Mr. Wilson.*] You think there should be a Board under any circumstances? I think so.

1974. And that the Board should still issue the certificates, because it has acted well in the past and there is no reason to change it? Quite so.

1975. *President.*] All you would recommend would be the Appeal Court? Yes; and that the elective principle be done away with. It should be a nominee Board. Originally the Board was composed of nautical men and two merchants. Mr. J. B. Watt and Sir George Dibbs were the members, I think. Now they have appointed Mr. Wildridge as a steamship expert.

1976. *Mr. Powell.*] He is nominated? Yes; for life. That is the worst of it; I do not think it should be for life. I think there are many cases in which the Marine Board do not make inquiries and which ought to be inquired into, such as collisions, &c., where masters have shown great carelessness, but by good fortune the damage has not been serious enough for the Marine Board to inquire into it.

1977. *President.*] How would you remedy that? I think the Marine Board should hold inquiry into all cases brought under their notice.

1978. *Mr. Wilson.*] If necessary, the Act should be altered? Yes.

1979. *President.*] Altered, so as to compel them to hold an inquiry? Yes.

1980. Is there anything else you could tell the Commissioners which you think would be of service to them in this inquiry? I do not think there is anything else. I have always been a supporter of the present Board. They have done good work, and, with the two exceptions I have pointed out, I should be very sorry to see any radical change, especially in the direction of a representative Board.

1981.

- J. H. Story 1981. You think that the present Board should be continued with the addition of the Appeal Court, and the members of the Board should be nominated by the Government? Yes.
- 19 May, 1897. 1982. *Mr. Powell.*] Do you think that the Board should take something like the position of the Board of Trade in England; that it should discharge all the executive functions, and that all cases of collisions, abandonments, loss of life, damage, &c., should be reported to a superior Court? Yes; the same as the Coroner and the Police Courts.
1983. *President.*] Would you make the decision of the Court final, or would you give an appeal to the Admiralty Court? I would be inclined to make it final; but I do not know how that would interfere with the principles of justice.
1984. *Mr. Wilson.*] I suppose you would be prepared to follow the English practice, and if it is final in England, it should be final here? Yes.

\* James Fotheringham, Chief Officer of the "Captain Cook," re-examined:—

- J. Fotheringham. 1985. *President.*] Have you a captain's certificate? Yes.
- 19 May, 1897. 1986. *Mr. Wilson.*] When we were on board the "Captain Cook," we asked you certain questions about the absences of the master from the ship, especially at night. I asked if you had any actual record of his absences from the ship, and you said you could not say. I asked you, "Is he on board four nights in the week on an average?" You said, "He may be; I cannot remember." "Are his absences frequent from the ship at night?" "Yes; I would sooner that you asked somebody else?" Well; about that remark of mine about asking somebody else; of course I am a subordinate officer.
1987. We carefully told you your duty, and that you were not to consider that, but you were to tell the Commissioners anything you knew. When you say, "I would sooner that you asked somebody else," what do you mean by that? I am Captain Creer's subordinate officer, and my answering those questions would make him think and other people think that I am trying to do him damage.
1988. But in this matter we told you very plainly what your duty was, and we must have an answer? Very good, sir.
1989. *President.*] All you have to do is to tell the truth; not to paint it one way or the other, but tell the truth just as you would before a Court of Justice.
1990. *Mr. Wilson.*] We told you that we would protect you in regard to anything you said. Now, did you keep anything back from the Commission;—is there anything you ought to have told us? There is nothing you asked me that I did not answer truthfully.
1991. We asked you if you were keeping back anything that you ought to tell? Not that I know of.
1992. You are quite sure? Yes, quite sure. How do you mean, sir; keeping anything back?
1993. It is your duty to tell the Commissioners anything you know which may be not correct on board ship; anything within your knowledge, it does not matter what it is nor whom it involves, whether it is the master or anybody else—we do not say there is anything in this? I did not mean much by what I said. Your asking me that about Captain Creer made it appear that I was trying to injure my superior officer.
1994. Is there anything that you have withheld? No.
1995. Nothing whatever? No.
1996. Is Captain Creer perfectly steady? Well, he does drink sometimes.
1997. Will you tell us a little more about it;—have you seen him drunk? I have seen him when he had been drinking, but I would not say that he was drunk.
1998. Are you quite sure of that;—you have seen him when he had been drinking, but have not seen him drunk? I would not swear that I had not seen him drunk.
1999. Have you seen him drunk on duty; this is a question in which it is not only your duty to answer, but it is a question in which men's lives may be at stake? Since you examined me on board the "Captain Cook"?
2000. I do not make any limitation—within the last twelve months? Since you were on board I have been left in charge of the ship. Captain Creer has gone up to town on duty with the launch, and when he has come on board he has been that way, but of course he was not on duty.
2001. He has been to town and come on board and been that way; when he puts his foot on deck does he take command? Yes.
2002. Supposing there had been rough weather, and there was a call for you to go outside, would he be in a condition to take command on these occasions? He has always gone on the bridge, and I have gone with him.
2003. That is not the question; suppose you are not there at all, would he be in a position to command the ship; suppose, for instance, he had suspended you from duty when he came on board, and there was rough weather, would he be fit to go outside and bring in a ship? I do not think he would be so bad as that; he would be able to do it alright.
2004. In rough weather? Yes.
2205. And the lives of these men would be to some extent at stake;—do not misunderstand what I mean? I do not mean to say that it is right.
2006. The question is, would he be in a thoroughly fit state to take command of the ship when he put his foot on the deck in the state you say he was in; would he be in a fit condition to take the ship out and to bring her in; put yourself in the position of the seamen;—suppose you were a seaman on deck, would you care to be in that position? I do not think I would.
2007. Do you think that when in that state he is quite fit to take that ship out and put a pilot on board? There are always more than one on board. There are the pilots as well.
2008. That is not the question; he is paid close on £500 a year to do a certain duty; was he in a fit state to do that duty—never mind if there are twenty pilots on board;—was he in a fit condition to be in command of the ship? I do not think any man, when he is in that state, is in a condition to take charge.
2009. You do not think he would be fit, and therefore he was not fit; and that was since Mr. Powell and I were down on board;—he has been up to town and come down in that condition? Yes.
2010. Have you taken any notes of his absences from the ship since we were down there? No.
2011. No special note? No; I know he was away, because it is usual. We are in dry dock now. We go down to the station again to-morrow.

John

John Lawrence, Clerk to the Harbour-master, Marine Board, sworn, and examined :—

2012. *President.*] Will you briefly describe your duties? My duties in the first place are in regard to pilots' certificates—harbour-pilots and sea-pilots. In the first place they come and book in the office for removal certificates, and I look after it. I look after the sea-pilot's certificates, and forward one-half to the Custom House and the other half to the Auditor-General. The Customs collect the money. J. Lawrence.  
19 May, 1897.
2013. And you advise the Auditor-General so that he may check the Customs? Yes; I receive the cash for all certificates issued by the Board—certificates for steamers or masters, foreign-going or coast trade, or for ballast licenses. I pay this cash to the accountant every night, and he pays it into the bank.
2014. You issue numbered receipts? Yes.
2015. Does the accountant check the receipt-book every day? He checks on the butts.
2016. You have no more to do with the money after you pay it to the Accountant? No.
2017. How much do you take in that way? About £2,000 last year, which was about the largest. I also have the revising of the requisitions from the out-stations, and readjust them. For instance, the Harbours and Rivers Department supply all paint for lighthouses. They generally come in on one requisition. I strike them off, and put them on another. We send some requisitions to the Stores and some to the Harbours and Rivers. When things are not in contract I have to ascertain from storekeepers what their charges are, and submit them to the Board, and make out the order. I have nothing more to do with it.
2018. Are there many goods ordered which are not in contract? No.
2019. Would there be £200 or £300 per annum? Not so much. I get the lowest prices I can and submit them. I can hardly tell you the work I have to do. I make out all orders for the Printing Office, and then I have the telegraph to attend to, sending orders or receiving messages from the out-stations. I have an ABC instrument which I work myself, connecting direct with the central station. I learnt the Morse system, but could not get a Morse instrument.
2020. Does this work occupy the whole of your time? Yes; writing letters and making specifications for boats, &c. I have been so long at it I can make out a specification for any boat.
2021. How long have you been in the Service? Thirty-two years and six months.
2022. Does Captain Lindeman give you orders? Oh, yes; he takes upon himself to give me orders.
2023. Do you mean to say it is not his proper duty to give you orders? In the first place I was appointed as clerk to Captain Hixson, who was then the harbour-master, and I have always looked upon him as my superior officer.
2024. You do not think it necessary to go to Captain Lindeman? I go to him, of course, as the duties of the office require.
2025. You are under Captain Lindeman? Yes, I suppose so.
2026. *Mr. Powell.*] Did you bring the order-book up with you? Yes.
2027. You had better show it to the Chairman. [*Order-book handed to Mr. Barling.*]
2028. That represents all the goods you order outside the contracts? Everything.
2029. Have you any assistance in your office? None.
2030. Who looks over your work, examines the books, supervises your work? There are no books to be examined. All the rest of the work goes out of the office.
2031. Does Captain Hixson visit your office? He comes down and looks over the order-book occasionally.
2032. *President.*] There are between thirty and forty orders this year;—are they all out of contract? No; there are some in contract.
2033. Do you not keep a book like that for orders in contract? No.
2034. You send the original requisition out? The requisitions go to the Treasury or the Harbours and Rivers Department, and they issue the orders.
2035. Can you tell me how many orders have been given this year under contract? I could not tell you unless I saw the requisitions.
2036. About how many do you get on an average—a requisition a day? May and October are the principal requisition months for out-stations, but occasionally they run short and we get a requisition.
2037. How do you check the requisitions? I have duplicates.
2038. Are the pilots ever checked;—suppose one of them asked for twice or three times what he usually ordered, could you detect it? Yes; by comparing with previous requisitions.
2039. And you know pretty well what their consumption ought to be? Yes; and if I think it is excessive I speak about it.
2040. *Mr. Powell.*] You know how much oil is used at every lighthouse? Yes.
2041. And you can check it? Yes; I have a monthly return of all that is consumed.
2042. Is the removal of vessels under your charge? Yes.
2043. Are vessels allowed to remove now without a harbour pilot? Yes.
2044. They go as they please? They are supposed to come and ask for permission from the harbour-master; but, as a matter of fact, they do not always do it, and go and shift unbeknown. I have no control over that whatever.
2045. You forward returns to the Board of Trade? Yes; casualties, wrecks, and such like.
2046. Is your telegraph work in connection with the signal-station at South Head? Yes.
2047. Where do you report to? To the central station in George-street, and they copy it on to the other instruments.
2048. Who telegraphs to the Flagstaff in Sydney? I do not know.
2049. Do they get reports by telegraph or by flags when vessels come in? By flags.
2050. Do you post the arrivals and departures at the Marine Board Office? Yes.
2051. And you receive all the pilot-logs? Yes.
2052. From the outports? Yes; the monthly reports.
2053. Have you any check on the accountant? The only check I have got is on the butt of the receipt-book.
2054. You only take his receipt;—you do not know what becomes of the money after that? No; other than I am informed it is paid in every day.
2055. *President.*] You do not look at his bank-book? No.
2056. *Mr. Powell.*] What amount of money was represented by the transaction with Weisel? This Weisel had an order for many years, and on one occasion some time ago he charged rather more, and what the accountant thought was high. I was asked by the Secretary about it, and said I supposed he had charged

- J. Lawrence. charged current rates, and he told me to mark "current rates" on the voucher. I did so, and they sent for the man afterwards, and he made a reduction.
- 19 May, 1897. 2057. How much money was represented by the transaction? Not much.
2058. £20? More than that.
2059. £100? I do not think so. It might be £100 or so.
2060. You had not many transactions of the kind? That was the only one we had. After that I went round to different parties and asked for tenders, and no one responded; and when we did get prices Weisel was the lowest.
2061. *Mr. Wilson.*] Have you any contract for coal? Yes.
2062. Are these orders for coal in contract? Yes.

FRIDAY, 21 MAY, 1897.

PRESENT:—

JOSEPH BARLING, Esq., J.P., PRESIDENT.  
 GEORGE ALEXANDER WILSON, Esq., J.P.  
 JAMES POWELL, Esq., J.P.

Thomas Robert Allt, Esq., J.P., Merchant, and Chairman of the North Coast Steam Navigation Company (Limited), sworn, and examined:—

- T. R. Allt. 2063. *President.*] We understand that you kindly appear here to assist us with some suggestions, which I have no doubt, will be very valuable to the Commissioners in framing their report;—what is your name?  
 21 May, 1897 | Thomas Robert Allt.
2064. What is your occupation? Merchant, and Chairman of the North Coast Steam Navigation Company (Limited).
2065. Among other things we have had under consideration the subsidising of steam-tugs in connection with the rivers and harbours of the Colony, and we are aware that you, as Chairman of the North Coast Steam Navigation Company, are fully seized of the facts of the case; and we wish to ask your opinion on the present system of hiring these tugs? The tug service has been most unsatisfactory for a long time. The tug service and the pilots do not work well together; they are antagonistic. The tug-master has a down on the pilot if he allows a vessel to go in without the tug; and we have an idea—I do not say it is an actual fact, for it is hard to prove anything of the kind—but in consequence of this antagonism and jealousy between the two the tug-master may say, "The pilot had no right to let you come in; there is not enough water on the bar." I think the proper way to get over the difficulty is to amalgamate the two—that is to say, the pilot should have full charge of the tug. This would be a boon, not only to the steam companies, but also to sailers. The tug could do all that is wanted, and could go out and sound the bar. At present there are lots of times when the tugs do not think it prudent to go out. The man to judge whether it is prudent to go out is the pilot himself. If he thinks it is unsafe to go out because there is too much sea on the bar, then I think the ship-owner would be satisfied. Now, to show you what a rotten system it is, here we have been at the Richmond for a considerable time absolutely without a tug—that is, a tug capable of assisting a steamer or a ship when it is really wanted. The "Protector" needed extensive repairs, and was sent away to Sydney; and now an abortion of a boat is put there for that service. If the thing was in the hands of the Government, or in the hands of a Board, or of a steamship company like ourselves, we would not dare to allow such a rubbishy boat to take the place. These things are plastered over by the Government. I do not know how it is arranged. Whilst the pilot and tug services are separate there will always be trouble on these rivers. My idea is that the Government should charge tonnage dues to all vessels in and out. It should be a small sum—10s. in and 10s. out. Then the tug could pilot a steamer or sailing-vessel or assist a sailing-ship. Some of our captains are so disgusted with the manner in which the tug service is conducted that they infinitely prefer to run the risk of going without. At the present time there is a deal of friction between the tugboat captains or owners and the captains of both steam and sailing vessels. The tugboat owner is jealous, because he is not taken by the steamer; and the captain of the steamer thinks he can go in as well as the tug, and he goes in. When difficulties do arise, you are made to pay, and pay exorbitantly. The Marine Board, in their wisdom, have settled the price to be paid. I think it is £20 or £25 per tide for assistance by the tug to a vessel in distress. That is a very large sum. I find that during the last five years we have paid the tug service £3,220. That is in addition to the enormous sums paid by the Government as subsidies. On the Richmond the subsidy is £1,700, and we paid on that river alone £2,036.
2066. *Mr. Powell.*] Last year? No; in five years. Last year we paid £1,025. Here are the figures put before me by my secretary. [*Vide Appendix 47.*] If the two services were amalgamated I am quite certain they would work better for all parties, and it would be more remunerative to the Government to take them in hand themselves. There are a pilot and four men on these rivers, and what on earth they do I do not know. Two-thirds of their time they are doing nothing. I look upon them as a terrible waste of money. The steamboat could be worked very cheaply, and would not require more than half a dozen hands, and you have five now.
2067. You would want an engineer? Yes, only one, and the men who are now boatmen could do all the work on board. In case of an extraordinary emergency you could easily get a man if required. The Government have been paying years and years for a most unsatisfactory service. I speak unhesitatingly. I have not a man in my employ but will speak in most condemnatory terms of the tug service.
2068. *President.*] Do you know how many boats are subsidised by the Government? I could not tell you; but there are supposed to be tugs at the Richmond, Clarence, and Bellinger, and one at Nambucca supposed to attend to the Macleay as well, and that is a most absurd arrangement. The other day I needed a tug there—in fact, if it were not for the appliances the company has got themselves they could not carry on. The tug-boat for the Macleay is the tug for the Nambucca, and if she is inside at Nambucca she often cannot get out; it is a bad place. I suppose these tugs are what might be called "according to the terms of the contract"; but the terms of the contract are very loose, to my mind. These boats are not powerful enough in many instances to assist us.
2069. You think the contract itself is defective in its terms? I do not think it is sufficiently stringent.
2070. You mentioned the "Protector" being taken away, and a tug utterly deficient in power being put in

in its place;—is there no clause in the contract providing for the substitution of an efficient tug in such a case? I do not know. All I can tell is that the public have had to suffer. This boat is there. T. R. Alt.

2071. You testify to the fact that while the "Protector" is away a most inefficient vessel has been put in her place? Yes. 21 May, 1897.

2072. The total amount of subsidy paid for the tugs is £6,000 per annum;—do you think it is desirable to provide tugs belonging to the Government, or that the Government should hire them? It would be more economical for the Government to have them themselves. They would have a better guarantee that they are always in good order. A chartered boat is not so satisfactory as a boat of your own. Then it is a question in my mind whether a paddle-boat would not be more serviceable on these rivers than a tug. It would draw less water. I believe a little boat would do for most of the Northern rivers. She should not draw more than 5 feet 6 inches when deeply laden, and the ordinary draught of water would be 4 ft. 6 in., and with that she could generally get across the bars; whereas most of these tugs are drawing 6 feet of water.

2073. *Mr. Powell.*] Built for the purpose? Yes; when there is a sea on the screw is half the time out of water, but a paddle-boat may be on the ground and yet go forward, as the paddles go deep down.

2074. She would have better steering-power? Yes.

2075. You think the subsidy is a very large waste of money? I do. It is a very unsatisfactory service. I am very strongly of that opinion.

2076. Have you any idea what would be the cost of the tugs required;—take the Richmond, that is where the most powerful tug is required? I think these tugs could be built for about £5,000 a piece, especially if you were building half a dozen. I am not speaking with a book to guide me; but from my experience I think a boat of 40 or 50 horse-power would be quite enough.

2077. *Mr. Wilson.*] Does that mean that the machinery would be imported or made here? Imported. It would cost too much if made here. Sometimes, in a small contract of £8,000 or £9,000, there is a difference of £3,000 between one firm and another.

2078. *President.*] You think a capital sum of £30,000 would provide all the steamers? You could get half-a-dozen good tugs for £30,000, but machinery must be imported to do this.

2079. Have you any idea what would be the cost of maintenance? Well, you want one fireman, one engineer, a pilot, and perhaps three deck-hands. I do not think the wages ought to come to more than £100 a month at the outside, and the consumption of coal would not be very great, because modern machinery is not very trying upon coal, and the Government get their coal very cheaply. I would not recommend them to convey their own coal to the stations unless, of course, they have a boat going. Schooners would carry it cheapest.

2080. £1,200 a year would pay the wages you say;—what would be a fair sum for maintenance other than wages—coal, stores, repairs, and so on? You would not use more than about 4 tons of coal a day. That would be about £90, and there would be the maintenance of the men. I do not think it would cost more than £300 a month, wages included.

2081. I should think you were very liberal in that? Yes; I should like to get £300 a month to do it, I will admit.

2082. What would be the life of these steamers? If well maintained, they will last almost any time.

2083. Still, you must write off 10 per cent. of the value each year for depreciation? Oh, no; 5 per cent. would be ample.

2084. And then you would allow 5 per cent. for renewal? You should write off 5 per cent. per annum.

2085. And that would provide for a new tug in twenty years' time? Yes.

2086. And that would provide for all the necessities of the case? Yes; I have steamers that have been running for over twenty years. That is 5 per cent. for depreciation, not for maintenance.

2087. What I mean is for the replacement of the capital? That is quite enough.

2088. Would you not want a new boiler every seven years? Not every seventeen years now. If you have capable men your boiler will last as long as you like. I have a boiler that has been working for over twenty years. Boilers to-day and boilers five and twenty years ago are different. When I was first introduced to steam the life of a tip-top boiler was ten years. I have seen in my experience boilers renewed in five years, but the march of improvement has been so great that boilers practically last twenty or twenty-five years. I think you might fairly estimate the life of a boiler at fourteen or fifteen years.

2089. Would that come in the 5 per cent. which would be put aside for renewal? No.

2090. Would it come in the £3,600 for maintenance? Yes.

2091. Can you think of any other use to which those tugs could be put? Yes. Looking after the river, seeing that the buoys are properly laid down, and looking after and buoying off shoal places. The rivers are always shifting in a marvellous manner. In one place there may be 15 feet of water now, and three months hence there may not be enough water to float the steamer over. All the rivers have been very shallow indeed for the last twelve months. They are a source of continual trouble. Here is what one of my captains says:—"I have known the pilot wish to sound the bar, and the tug-master to refuse him the use of the tug. I got my ship aground on The Manning crossing on one occasion with the tugboat towing me. The pilot warned me one way, and the master of the tug another, and there were no buoys."

[Those buoys ought to be laid down by the tugs.] "No buoys to give me any help as to which way to steer. On the Macleay River, when a tug is stationed there, it is just the same, and it is the same at the Richmond River, and has been for years past." [Vide Appendix 42.] Tonnage dues should be charged, and the pilot-boat should guide the steamer into the river, assuming the tug to be in charge of the pilot. It is only where the corners are sharp that the steamers want assistance from the tug at all. They are obliged to get the tug in order to enable them to get round quickly. The tug being shorter slows quicker.

2092. What tonnage rates would you suggest? About 10s. in and 10s. out, whether the tug is wanted or not. Every vessel should be charged in order to help to pay for the maintenance of the tug.

2093. It would be pilot dues practically? Yes.

2094. Do you think the shipping community, the owners of these little schooners, would object to that? I would not object to it, and I do not think they would. I do not think the masters of the little schooners would object, because it is far more to their advantage than it is to mine.

2095. You think that would be a sufficient charge for such a service? I think so. You must recollect that very frequently they are not wanted at all. I might go there for six months and not use the tug; but when I do want a tug it is right that I should pay for it, because she is there ready all those six months in case I do want her.

- T. R. Alt.  
21 May, 1897.
2096. Would you have any special charge when a vessel got into trouble? There might be some extra remuneration, but it should not be done in the bleeding manner in which it is done at present. It is by sanction of the Marine Board that this £25 is charged.
2097. Would it be very easy to find out what revenue the tonnage rates you advocate would produce? Yes. If that system is adopted there will be more vessels going to the river. It is the absence of a proper pilot service that prevents vessels going into the river.
2098. Is it the absence of a proper pilot service that prevents sailing vessels going in? It is prohibitory almost for sailing vessels. I saw a vessel lay on and off for two days at the Macleay recently before she could come in. In advocating as I do the amalgamation of the services, and getting it done at a fair and reasonable rate, I am really arguing against the interests of my own company.
2099. *Mr. Powell.*] I suppose you consider it desirable to have a stronger-powered vessel at the Richmond than at the other rivers? I daresay you would want a vessel with a little more power at the Richmond. I am basing my estimate of cost on a small vessel of about 40 horse-power. That is quite sufficient for all reasonable purposes.
2100. Boats of that class could be built here, and machinery imported? Yes.
2101. They would be better built here? Yes; I would sooner do that. Of course, you had better build six and have them all alike, and have a little more power. If you have six sets of engines, all on the same pattern, it is an enormous advantage to the builder and to the person employing the boats. All the duplicate parts fit each boat. They are made from a common pattern, and you would get them built cheaper by getting them all alike. That is rather a big order for an engineering firm here.
2102. Would they be content to take the work and import the parts? Yes; they would build the hull here right enough. My estimate is without elaborate fittings. Look at the elaborate fittings on board the "Captain Cook." You do not want to go to all that expense—common, plain, pine fittings would do. Fine fittings are an absolute waste. It is not the hull in our own steamers that costs the money; it is the fittings.
2103. Taking the cost of the tugs, and the expenses of the pilots and boat's crew, at the present time the Richmond River costs the Government over £3,000 a year? Yes. I tell you I do not know what the pilot does.
2104. He would have work to do under the proposed system? Of course he would. There would be no gardening done, nor would he be able to sow corn, potatoes, and so on.
2105. Would such a vessel be very useful for river work? Yes. I do not see why the Government should not do the river towing. The tug-boat gets it now. Why should not the Government do it, providing a fair rate was fixed without entering into competition with private individuals. The Government tug could do all the towing of punts.
2106. At the present time you are paying £1,025 in addition to the £1,600 paid by the Government. We may assume there is a revenue from Yeager's boats, and from the small schooners which are constantly running? There is a lot of work on the river, towing in and out.
2107. There were thirty-one vessels for January, February, and March, in and out; they take the tug as a matter of course, I suppose? I have three steamers going in and out a week; four steamers in the Clarence; but, of course, you would have to take the good with the bad in those tonnage dues. I consider that if the tug were stationed at the Clarence, notwithstanding the depth of water, and although you never use the tug, the charge should be made.
2108. Do you think it should be a fixed charge, or a maximum or a minimum, and regulate it on the tonnage? I do not know. I think I should have a maximum and a minimum charge—about 10s. in and out would be a fair thing. Boats from a company like ours should be paying £3 a week, whether we use the tugs or not.
2109. But that would be a great let-down for you if you are now paying £1,000 a year? I do not always pay that; I think that would be about a fair charge and a fair remuneration. I think the tug service, if amalgamated, would be a great saving to the Government.
2110. *President.*] Can you tell us about how long the tugs are employed;—are they engaged all day long;—would there not be days when they are not required at all? Yes.
2111. And such steamers would be available for the dredge service? Yes. It is only at flood-tide that they are of any use at all. At ebb-tide they cannot go in or out. None of the bar-harbours are supposed to be practicable except at flood-tide; in fact, we do not attempt it.
2112. *Mr. Powell.*] Do you think the Marine Board, as at present constituted, fairly represents the shipping interests of the Colony;—I do not mean the shipping interests of vessels registered only in the Colony, but the whole, the great shipping interests of the port? I think it would be better if some of the merchants who understand shipping were on the Board, and not all purely nautical men. In the past there has been, well, I will not say favouritism, but it is done by election, except the nominees of the Government. It does not work as satisfactorily as it ought. There is another difficulty,—you have to separate a man who is even indirectly mixed up with scammers or sailers. No doubt nautical men are the best men to settle matters of that kind.
2113. *Mr. Wilson.*] Nautical questions, no doubt? Yes.
2114. *Mr. Powell.*] Do you think a Court, presided over by a Judge or Stipendiary Magistrate, assisted by nautical men, would be more satisfactory? I think it would. It would be far better, although Captain Hixson is a very able man, I admit; at the same time I do not think he understands the legal aspect. They may give what is called a sensible decision, but it may not be a legal decision, and, therefore, if the Court were presided over by a legal functionary it might be more satisfactory.
2115. The Marine Board should deal with all the executive details? Yes.
2116. And questions involving property and life, and cancellation of certificates, and matters of that kind, should be dealt with by a court presided over by a Judge or Magistrate legally trained? Yes.
2117. With such assistance as he might require in each particular case—the assistance of men of engineering skill or nautical men, according to circumstances? Yes. We have seen a lot of money thrown away lately in lawsuits, points decided one day, and overthrown the next.
2118. *President.*] What should you pay to the captain of a tug—£15 a month? You would not want to pay the captain of a tug a very high rate. I think he would be entitled to £20, because he is captain of the tug and pilot.
2119. *Mr. Powell.*] The Tweed, Clarence, and Macleay pilots are getting £240 and £25 allowances as well—

- well—£265 altogether? The captain of those sailing ships going up and down the coast only gets £12 a month. We pay our captains from £18 a month.
2120. What is the highest you pay? £22 10s. These men getting £20 ought to be provided for or some allowance made. Of course, feeding men on board boats does not cost much. You can feed them very well for about 2s. 6d. each per day.
2121. *President.*] We have had evidence that we could do it for 2s.? There are not numbers enough. The fewer the number the higher the rate.
2122. *Mr. Wilson.*] There are two pilots at £403, and they range from £398, £393, and so on down to £275;—what do you think of that? I think £20 to £25 a month is fair. It is a responsible position, but at the same time I think it is a very easy one; but it does not do to kill ambition, and they are men, as a rule, very capable, and if you want capable men, there is no doubt you must pay them. It is no use trying to cheescpare men in that position, because it would be a great loss to the Service generally. I would rather advocate giving them an extra £10 a month, than taking off 10s., and if a man is pilot and captain, £30 a month would not be too much, although he is not always absolutely employed. There are times when he might have to be out at night and receive no extra pay.
2123. Of course the pilot is very much tied to his station? Yes; he is. He is very much tied. At the same time at some of these places it is easy. The men are obliged to employ themselves farming or something of the kind. You have to put a pilot in a place where there is, perhaps, very little work for him. There might be two or three ships in a day, or perhaps not one in a week, but he cannot be employed half his time. There should be a scale of pay adjusted to the requirements of the places. It would be hard lines to give a man a small pittance, and forbid him doing something else to supplement his income; he might have a wife and family.

T. R. Alt.  
21 May, 1897.

Francis John Thomas, Esq., Manager of the Newcastle and Hunter River Steamship Company, Limited,  
sworn, and examined:—

2124. *Mr. Powell.*] You have had a long experience in connection with shipping? Yes; over thirty year's experience as a manager of steamship companies, and during that time, I have, of course, had opportunities of observing the working of the Marine Board.
2125. Do you think from what you have seen and know, that the Marine Board as at present constituted represents, and gives satisfaction to, the shipping interests of the Colony generally? I do. I see nothing objectionable in the present mode of representation. A Bill was brought in lately, which I think rather objectionable, to extend the interests represented.
2126. That is more particularly with reference to the elective character of the Board? Yes; in fact it lessened the nomineeship and extended the representation to persons who are not amenable to the jurisdiction of the Board.
2127. Do you think you would be satisfied with the elective principle as it is now existing under the present Board? I think it fairly represents the interests, so as to do justice to all concerned. For instance, it may be said that the shipowners are the only persons who have voted in the election of the representatives who are not nominated by the Government; but, on the other hand, it will be seen that the shipowners have from time to time elected retired shipmasters. I think these retired ship-masters fairly investigate and represent the claims of the masters and officers of the vessels. Then again as far as the engineers are concerned, the Government have nominated Mr. Wildridge, an engineer, to the Board, acknowledging that the engineers had some right to representation on the Board, so that their cases should be fairly heard and investigated. So you may say the ship-owners, masters, and engineers, are represented; and, I think, about fairly represented.
2128. And the new Bill contemplates an extension of the principle? Yes, to persons who are not amenable to the jurisdiction of the Board. For instance, the Marine Board has no jurisdiction over the crew of the vessel, the seamen, firemen, trimmers, stewards, and so on.
2129. And it is proposed that the insurance interest shall be represented? I think the insurance interest is pretty fairly represented by the ship-owners; but I do not see anything objectionable in the insurance interest being represented if it is desired. I think that arose, however, more out of the proposal to have other interests represented. It was thought that if other interests were represented the underwriters also ought to be represented.
2130. Did it not appear to you as something of an anomaly that the great shipping companies, who have interests in vessels coming constantly to this port, should be wholly unrepresented, and that a few towing vessels or lighters or yachts should be represented on the Marine Board? That is a matter of legislation. I do not see any reason why all who come under the jurisdiction of the Marine Board should not be represented in some way; but perhaps it is thought that the Government nominees pretty well safeguard the other interests. However, the principle of owners voting might be extended with advantage to vessels coming from abroad. I have not thought much over that matter, nor how far they are concerned. We are more immediately concerned than they are, because they come here under the Board of Trade certificates.
2131. But the proportion of vessels registered in the Colony is infinitesimal as compared with the trade of the port by vessels not registered in the Colony? Yes, no doubt it is; but then, you see, the vessels which are registered in the Colony are the vessels that are principally surveyed by the officers of the Marine Board, and are more subject to their inspection and control.
2132. But the Board deals with all matters of collisions and wrecks, and cancellations of certificates, with all vessels, irrespective of where they are registered? Yes; they investigate and make a report; and, I suppose, with regard to Home vessels, they would report to the Board of Trade.
2133. They deal with them here, and report to the Board of Trade afterwards? Yes.
2134. I suppose you do know that the English practice is somewhat different to our own practice here, and that matters of the kind referred to are dealt with by a Judge or Stipendiary Magistrate, assisted by nautical assessors? I believe that is peculiar to London. I believe that in the outports they have local Boards, which deal with matters much in the same way as we do here.
2135. They have local Boards, but the matters are reported by them to the Board of Trade, and the inquiry is then held by a Judge or Stipendiary Magistrate, assisted by nautical assessors, nominated by the Board of Trade? No doubt you have all the information at your command; but I understood that

F. J. Thomas.  
21 May, 1897.

F. J. Thomas. the practice was that in London the inquiries were conducted by a Stipendiary Magistrate and nautical assessors; but in the outports, wherever there were local Boards, they were conducted in the same way as here.

21 May, 1897.

2136. I think you will find that a Stipendiary Magistrate conducts the examinations at Liverpool and all the large ports? I have not had personal experience of the practice in England. No doubt the members of the Commission are well informed respecting this matter.

2137. One of the most experienced magistrates in dealing with matters of the kind is Mr. Raffles, of Liverpool, whose name is almost a homeword in dealing with maritime difficulties? Yes.

2138. Do you think such a Board would be acceptable here;—the Marine Board to continue to deal with executive matters, and all questions relating to collisions, wrecks, loss of life, cancellation of certificates, abandonments, and damages should be dealt with by a competent court, presided over by a legally-trained man with the assistance I have spoken of? It might be accepted here if our legislators thought fit to make such an alteration, but I do not think it is necessary.

2139. Will you tell us something about the rate of wages paid by your company on the coast for masters, mates, firemen, and engineers? I shall be very glad to furnish the Commission with a return if they would let me know what information they require.

2140. Can you make any suggestion for the improvement of the pilot service? No; we have not much concern with them. Most of our masters are exempt. I would like to say this: That after all my experience with the Marine Board, which has been a long one, I have found that, as far as routine work is concerned, we have much less trouble now owing to the excellent administration of the Marine Board, than we had in the early days, that is to say with regard to the issue or extension of certificates, or anything that a ship-owner may require. We find that the Marine Board now-a-days are willing to meet us and do anything that is reasonable, at the same time safeguarding the interests of the public. I think the administration of the present Marine Board under Captain Hixson is excellent so far as all the routine work is concerned.

2141. The routine work is simply the work of the office? Yes; Captain Hixson, having had a long experience, and being disposed to meet the ship-owners in every reasonable way, has succeeded in giving general satisfaction so far as I can learn.

2142. It has not been your ill-fortune to have a case before the Board? Yes; I can speak without prejudice, for most of the cases recently decided by the Marine Board have been decided against us; but nevertheless I recognise that the Marine Board have always endeavoured to act impartially, and I think it is the fault of the persons who elect the retired ship-masters if they do not elect capable men.

2143. I do not think there is any desire to reflect on the members of the Board;—we speak of the Board as a whole? I have no feeling that any injustice has ever been done, yet we have never received any favour from the Marine Board.

2144. *Mr. Wilson.*] Have you ever given attention to the scale of salaries they pay? No; I have given some evidence before the Commission to inquire into the Civil Service with regard to the wages paid by our company at that time. My evidence is printed in the report. Some comparison was made at that time between the wages paid by our company and those paid on the "Captain Cook."

2145. Take the "Captain Cook." The master gets £416 a year, and 18s. a week for victualling;—what do you think of that salary? I think it is very large. Considering the services rendered, and the services rendered by the masters in our trade, I think the pay is very high.

2146. Take the man who has the care of the lightship down the harbour. He gets between £300 and £400 a year;—what do you think of that? I think that is too much. Still you must give what you consider a fair salary, so as to have a vigilant man in charge.

2147. Remembering that he is tied to his post there? Yes; of course, you should give more salary than the man would command in the open market.

2148. Is a salary of between £300 and £400 a year for the master of that ship high, in your opinion? I think it is rather high. Is he victualled as well?

2149. No; that includes everything? Of course, he is tied down there. I think about £300 would be ample remuneration.

2150. He is not tied down much; he has a boat's crew there, and can get up to town in the daytime? A man like that receives as good pay as one of our masters who has been many years in the service, and the only difference is that the master of one of our vessels is victualled as well; in fact, we pay some of our captains much less.

2151. The duties cannot be compared? No. In fact there is not much responsibility; it only requires a man to be faithful, sober, and vigilant.

2152. It does not require any professional knowledge? Not at all. He has only to keep his lamps and himself in order. Of course, it is better to be liberal to a faithful servant, but still I think the remuneration is high.

2153. Is it your opinion that with pilots, boatmen, the men on the lightship, and men in similar positions, the Marine Board should err on the side of liberality in the matter of salaries, and that they should be well paid within reason? Yes.

2154. Do you think that £416 a year and 18s. a week is too much for the master of the "Captain Cook"? Yes, I think so, considering what men of equal qualifications obtain in other services.

2155. What do you think is fair pay for a boatman? I have not much knowledge on that subject.

2156. If you had to employ a boatman to row about every day of the week, including Sunday, what would you pay? £2 2s. or £2 10s. a week. That is putting it down at the commercial level, you know. He would be considered pretty well paid at that.

2157. They are not victualled? I mean without victualling.

2158. As a matter of fact, they begin at £96 a year, and go up to £144? There is no necessity to pay extraordinarily high wages to those men, unless they have got extremely hazardous work to perform.

2159. Do you consider the work very hazardous? I do not know the nature of the work. I am speaking of an ordinary boatman in the harbour.

2160. This is a boatman in connection with pilot duties, putting pilots on board ship, and taking them off outside in the open sea? I think a man like that ought to be better paid than a man who is employed in smooth waters. My idea was simply for boatmen in the harbour.

John See, Esq., M.L.A., sworn, and examined:—

2161. *President.*] We understand that you are prepared to give us information which will be very valuable to us;—what is your name? John See.

2162. And your position? Member of the Legislative Assembly and merchant.

2163. I think you are prepared to give us some information about the subsidised tugs in connection with the Marine Board on the rivers? I think the tug service ought to be under the control of the pilots, and have always thought so. The object, no doubt, of these tug-boats was to assist sailing vessels and steamers, so that greater facilities could be given to the settlers on the various rivers. The intention was a good one, but I do not think it has worked satisfactorily, for the reason that the information which captains of steamers desire, and which they ought to have in the freest possible manner, is sometimes difficult to get, because the tugboats are not under the control of the pilots; so that, although the pilot can ask to be taken out to examine the bar, and that sort of thing, he has not anything like the control he would have if the tug were made part of his business. I have known cases on more than one of the rivers where the pilot and the captain of the tug were at variance, and consequently the captain of a vessel trading to the river could not get the information from the pilot or from the tugboat captain that he sought to get. These bars, particularly the Bellinger, the Nambucca, the Richmond, and the Manning are very treacherous, and they vary almost with each tide; and it is necessary that the captains of the vessels that go to those rivers should have the fullest information, and very often the captain of an ocean-going boat would be largely benefited if he could go on board the tug himself with the pilot to sound the bar for himself, and a great many accidents would be avoided if that were so. I am speaking with very great deliberation. I do not wish to charge the captains of these tugboats with neglect of duty, but I think the whole system is wrong in that respect on all the rivers that have a pilot and crew of four men. They have not got very much to do, because when it is rough the pilot cannot sound the bar, and when there is a lump of a sea on he cannot take his boat. The tugboats are built so that they can take the bar at any time, unless it is extremely rough. The principal work in connection with navigation is done by the tugboats, as they are the instruments used for sounding the bar. What I think ought to be done, and it would be a large saving, would be for the Government to provide an efficient tug on each of the rivers, and put the pilots now on those rivers in charge of the tugs, using the present pilots' crews to man the tugboats, for which purpose they would be ample. I am quite sure there would be a considerable saving, and a very much better service rendered to the ship-owners, and the greater the facilities afforded to the proprietors of steamers the more economically they can work their business and the cheaper they can carry the produce for the people.

2164. That would practically mean a help to the settlement of the Colony? Yes. There has been an enormous loss on these bars. It is a dangerous business, but a great many of the accidents could or would have been avoided if these tugboats had been worked on a proper system. I gave Mr. Alt an idea of the kind of evidence I could give, and he has already given you some of the information I asked our office to afford; but I would like to point out that, in addition to the Government subsidy of £1,750 at the Richmond, the North Coast Steam Navigation Company paid the tugs £1,025 in 1896. Some of that would go to the Government if they had control—not the whole, for the charges are excessive. It very often happens that steamers get ashore whilst in tow of the tugs, and the services which are rendered afterwards, such as laying out kedges, and various other things necessary to get the boats off, are all charged for at a very high price. The North Coast Steam Navigation Company paid £1,025 to the tug in addition to the Government subsidy, and there was also an amount from other people, the whole making a very large sum. The more we have to pay, the more we have to charge, and, therefore, it comes back to first principles, and the persons who patronise our boats have to pay more than they would under other circumstances. The system I propose would give us a better and more efficient means of ascertaining the state of the bar. I gave my cordial support to having the tugs on the rivers, because, unless the Government took it in hand, there is not enough work on any of these rivers to pay the tugboat without assistance. And, further, the tugboat would suffer, and a very much higher rate would have to be charged by the tugs; but if the pilot at each river had charge of the tug, and the latter were manned by the pilot's crew, I think the saving would be fully one-half. When I was Treasurer I mentioned this matter more than once to Captain Hixson, who seemed to think that the cost of maintenance would be larger than the subsidy which is paid for the tugboats. I do not think so. The life of a tugboat like that at the Richmond would be at least fifteen years, I think, for the original engines, boilers, and hull; but then, wooden boats would be more suitable than iron, and the only extra expense would be to copper them once in four or five years. Considering the sum the Government pay in subsidies, and the extra cost of maintaining a crew in addition to that, I think the Government could effect a very large saving, and give the public—the people interested—a very much more efficient service. I think the tugboats ought to be at the disposal of the captains of the various steamers or sailing vessels at any time it is practicable to use them; and, as these boats are made suitable for bar harbours, there is no danger whatever in taking the bar with them. They are short and have plenty of power. There is danger, however, in attempting the bar with a steamer like the "Tomki" or the "Burrawong." Of course pilots stationed at the Heads would confer with the captains of the steamers, and they would have a very much better knowledge as to whether it was prudent to attempt to even try to sound the bar when it was very rough. When it is shallow they cannot attempt getting out over these bars, because the wave would be from 3 to 4 feet, and the depth of water on the bar about 6 feet, and the steamer would only have about 1 foot under her. The very object of giving the subsidies was to give facilities to steamers to get into the rivers. I do not think the tug services as capable and efficient as they ought to be, unless they are absolutely under the control of the pilot, and then the pilot would be under no compliment to anybody for the tug, because practically it will be his boat. The captain of the tug gets the subsidy, but does not do the work. The pilot has no absolute power to say that the captain of the tug shall take him out to the bar, and when he asks, the captain may say, "It is not prudent to attempt it, and I am not going." In other words, this is a money-making business, and it ought not to be. The Government should make a charge; that is only fair. I am quite sure that, with what they save, and with the towages they would earn, the Government would make an enormous saving on the whole service. The proper way would be to provide suitable tugs for the various rivers, and there should be a capital account, from which so much would have to be written off every year for depreciation.

2165. How much would you say? About 10 per cent. We reckon the life of a steamer—a coasting boat—at about ten years, and I should not think a boat would pay unless I could write off 10 per cent. every year, because at the end of ten years she would want new boilers, and at the end of that time to put her

John See,  
M.L.A.

21 May, 1897.

John See,  
M.L.A.  
21 May, 1897.

her in good repair would cost about half her original cost. The steamboat business is not like any other business; every trip you make the boat is being depreciated; she is sinking under your feet.

2166. Do you think 10 per cent. would be ample? Yes. If you started this tug service with £20,000 worth of steamers and wrote off £2,000 per annum, you would make ample provision. I question very much if that would not even provide for the loss of a boat now and then.

2167. Mr. Allt told us 5 per cent. would be sufficient? You see these boats are not very hard-worked; but yet they might get a bump on the bar and you might have to copper it. It would be very prudent indeed to do that.

2168. Have you any idea what it would cost to maintain one of these boats? You would need an engineer; the pilot would be captain. You have four men, and one, or perhaps two, of these could be dispensed with, as, if you had the tug, you would not want the pilot boat, and its crew could be used on the steamer when wanted. I think £20 a month would cover the extra wages. Then there are the coals, which are not a great item, and the ordinary steamboat requisites, oil and so on. I should think the extreme would be £50 a month for everything, including all the extras. If the men who are now manning the pilot boat are not suitable for the tug, you could easily get men who could fire the boat and pull an oar whenever necessary. The men would be better off if they had something to do. It is an awful life to live there week after week and have nothing to do.

2169. Your idea is that if we get Government tugs the wages now paid to the men on the stations, the subsidy, and the receipts obtained from towage would far more than counterbalance the direct expense the Government would have to undertake in connection with the tugs? I think there would be a saving of 50 per cent. and a far more efficient service. All my captains agree that the value of the service is beyond doubt. These men speak from experience. They carry their lives in their hands. They know how necessary it is that they should have the best advice. In saying this, I am not complaining about the masters of the tug-boats. They cannot very well serve two masters. If I were one of them, I think I would try to get as much subsidy as I could and do as little as I could for it; and if there was any probable extra risk in sounding the bar, the chances are that I should put it off until the next day. Sometimes risks are taken which are not always advisable, and very often accidents happen as the result of taking that risk.

2170. What pilotage rate do you think would be fair? I should fix it as low as possible, because the lower, in reason, you make it the oftener the tugs will be used. Suppose I was the proprietor of a steamer. If you charged £10 for the use of the tug the chances are I should not take her unless I was compelled to do so; whereas if you charged me £2 or so I would use her every time, because I would not take the risk. Even if you do not put a rope on a steamer the tug is there to give a pull at the stem or the stern, as the case may be. When a vessel gets stuck on a bar the sand immediately begins to settle round it, and the waves get on it, but if the tug is handy she would pull the vessel off in a few minutes. The charge would have to be varied according to the size of the ship.

2171. You would charge a tonnage rate? Yes; I think so.

2172. What would be a fair tonnage rate? I really do not know, but I think about 2d. a ton, or something like that.

2173. That would be much better than a uniform rate, which would be levied on every kind of vessel alike? I think so. The cheaper, in reason, the charge is, the more likely it would be that the tugs would be used. It is not so much a matter of the charge as a matter of the convenience which would follow. When one of our steamers gets ashore we have to pay enormous sums for services rendered by a boat subsidised by the Government for the purpose of assisting steamers—services which ought to be included in the subsidy which the Government pays. When a man is in the water he does not stop to ask what is the charge for a lifebuoy—it is a matter of life and death—and so with the captain of a steamer when he gets in danger. It is only when it is all over that you find they are going to charge a stiff price. The Government will not want to make money out of people's necessities. If the tug is there it is only reasonable to expect that if a steamer does get into distress and wants a kedge that it will be done without any charge.

2174. Do you think that dissatisfaction is felt among all the sea-faring people;—do you think you are voicing the general experience? I am so far as this country is concerned, and while I have been connected with this company, which is for the last twenty years. Our captains all think it would be an immense advantage to them if the tug were controlled by the pilot. Here is a letter from Captain W. Nelson, master of the "Wyrallah":—

I beg to state that in no instance have I found the present system to work satisfactorily. There is always a certain amount of bad feeling between the two services. On one occasion I arrived off a bar. Another steamer was standing off and on, flying a signal for the tug. The tug came out with the pilot on board. The pilot hailed me, gave me the depth of water, and directions for inside channel. I, therefore, steamed in, and the tug lost a towage. This is the sort of thing that causes enmity between the two, and it is certainly against the best interests of the shipping that it should exist.

[*Tide Appendix 42.*] I have not seen any of these letters previously. When Mr. Powell asked me if I would care to give evidence, I thought the matter over, and came to the conclusion that I would be very glad to do so, and I asked the captains to give me their opinion about the present service. That letter is from the master of the "Wyrallah," Captain Nelson, a most capable man, who has been trading here for over twenty years. Here is another letter from Captain Wood, who has been a master on the coast for the last quarter of a century. He has been to the Richmond, Macleay, Clarence, Manning, and Port Macquarie. On all those rivers the pilot would not be liable to make a mistake if he had control of the tugboat. If a tugboat-master gets the captain of an ocean-going vessel into difficulty there is no inquiry into the tugboat captain's mistake, but the other poor fellow is dealt with. I would propose that there should be no tugboat. It would be the pilot-boat, and there would be no money-making business. One ship-owner would not have advantage over others. There would be no partiality at all if my rivals have the same facilities and rights as I. These rivers are peculiar. In the wet season the bars get cleared, but in the dry season they always shoal, and we have always got some difficulty, as at the present time. At the Macleay at the present time we have to get stuff in over the bar with a drogher—a shallow stern-wheel boat. There is the possibility of the tugs not keeping the best tackle, and if there is one thing which needs to be good more than another in this service it is the tow-rope, for if the tow-rope broke on a bar the boat would be in a fix.

2175. Do they ever have a spare tow-rope? I think so. Here is another letter from the captain of the "Electra." [*Vide Appendix 42.*] You see they all go to prove the same thing. Here again is a long  
one

one from the captain of the "Coraki," who trades to the Manning. He states: "In my opinion, the pilots ought to have full charge of the tug-boats on all the rivers." [*Vide Appendix 42.*] I want it to be distinctly understood that I am not opposing the owners of the existing tugs, but am speaking for the good of the people on the rivers—in the interests of the public.

John See,  
M.L.A.  
21 May, 1897.

2176. I can see that steam proprietors would rather lose by it than gain;—in some respects it would enable sailing vessels to compete with them on more even terms? There is no doubt that the tug service is intended to compensate the people to some extent for the disability they labour under by living on these rivers under difficulties. There is no doubt these tugs have done good service, but I am quite sure that a great deal more can be done.

2177. *Mr. Wilson.*] Is it true that a premium is offered these tug-masters to allow vessels to get into difficulties? I do not know.

2178. They would earn more? Yes, they would. I have never come into contact with a man who would be bad enough to do that.

2179. He would be a "wrecker," would he not? Yes, he would. Speaking as one of the largest proprietors and managing director of the North Coast Steam Navigation Company, I should not in the least object to pay for services rendered, because no price charged for towage would be anything like the penalty that would follow one of the vessels getting ashore. That is one of the greatest calamities that can overtake a ship-owner. They disappoint their customers and they lose their ship for a time. During the time I was ship-owning I think I lost £25,000 through strandings.

2180. If the pilots had control of the tugs they would be better able to attend to the sounding and marking of the channels? Undoubtedly. There is a lot of work on the rivers. Take the Manning for instance; they have a great deal of trouble between Taree and Wingham, and they have dredged out what they call a channel by taking out the shingle, and when there is a big rush of flood-water it sometimes spills those shingles into the channel again, and before anything can be done at all somebody has to go out and examine the river and sound it. The pilot is the right man to do that, and the tug-boat ought to be at his command without any conditions, whereas now he only gets it as a compliment. The captain of the tug may say, "I expect a vessel in to-day, and cannot let you have the tug for the work you want to do." The pilot should have the tug, and could arrange his work so as to go up the river when the tide was low, and come back and pull in a vessel when the tide was up.

2181. *President.*] Do you think a steam-tug owned by the Government could do a great deal of other work, such as marking the channels, fixing buoys, and helping dredges? I daresay she could. In one of the services one of these tugs is supposed to go to the Solitary Island with provisions once a month.

2182. What would be the wage of a captain of a coasting vessel? The average wage of a captain is about £20 a month and his food, but some of them get more.

2183. What would be the average wage of an A.B. P. £6 a month and his food.

2184. And an engineer? From £16 to £20 for first engineer, but they are paid according to the size of the ships. That is the wage rate on the coast.

2185. Have the seamen to assist in unloading the ship? Yes. When in port they are supposed to work eight hours. If they start at 6 they work till 4, with two hours for meals; and then if they work beyond that they are paid for overtime. At sea they work in four-hour watches.

2186. What do you think about the constitution of the Marine Board? I think that perhaps the Board should be a nominee Board entirely. Three men would be ample—a first-class nautical man, a first-class engineer, and a man something like one of our District Court Judges—a judicial man—as Chairman.

2187. And you would thus have every interest really represented in such a Board? You would get rid of all that trouble about ship-owners, sailors, engineers, and merchants electing men to the Board. After all it is the wish and intention of all right-thinking men that each accident or misfortune should be judged upon its merits, and not by way of bias or prejudice, and it seems to me that two men are as good as two hundred. You might as well say that you require two judges on every case.

2188. Do you think there are conflicting interests on the Board? Yes. It is the ship-owners' interest to get the best men they can to command their boats to protect their own interests, because the better the men they have the better they will succeed. It is to their interest that accidents should be minimised as much as possible by having proper discipline, by properly providing the ships with the necessary requisites. Then if an accident happens the Board want to know who is to blame. The inquiry is not for the purpose of punishing the ship-owner, but to prevent the recurrence of the accident. The inquiry may lead to an improvement in navigation, and thus prevent such an accident happening again. A nominee Board would remove the friction that has occurred from time to time about the election of members to the Board. If you had a man like Captain Edie, for instance, on the Board I do not think anyone would question what he did. There are others, but I mention Captain Edie as one, not for any special reason, but as a capable practical man. Then another representing the engineering department, and a judicial man, and I think you would have a Marine Board that would give satisfaction.

2189. Do you think that Board would obtain the confidence of the whole country? If you had a Board with sailors and owners and so on represented, it would be a sort of political thing. I take it that the Marine Board is not intended for that sort of thing at all; there ought to be no feeling, no partiality. I believe these men have done the best they can in the inquiries they have conducted, but the agitation that has been going on has created a lot of unnecessary feeling, and it would be better to remove the Marine Board from the possibility of any question of partisanship.

2190. Having these class representatives on the Board would appear to be subversive of all idea of calm judgment? If you had these representative seamen on the Board, you would not be likely to get unprejudiced judgment. The laws say that a ship-owner must have a certificated captain, engineer, and officers, and if there is neglect of duty the Marine Board have the power of punishing those in charge. The ship-owner is only an item after all, he is no more than the public who travel in his ships. If he is a sensible man, he knows it will pay him better to equip his ship in the best way. If the public believe that I am careful in the selection of the men in my steamers, and look after my steamers all I can, they will trust me; but it is just as much to the interest of every individual man that everything should be done fairly in the investigations, as it is to mine or the underwriters. Underwriting is a business, and I do not see why underwriters should not be represented, if there is to be all-round representation. Their interest is greater than that of the owners, if there is a loss. But I do not see why any special interest should be represented. There should not be the possibility of anybody having his sympathies influenced one way or the other.

- John See,  
M.L.A.  
21 May, 1897.
2191. It has been suggested that the judicial body should be a tribunal, apart from the Marine Board? I do not see why they should not constitute the Marine Board.
2192. It has been suggested that the Marine Board should confine itself to management, and that there should be a Judicial Court? That would be too cumbersome, I think. If there is a collision, the man in fault brings a big liability on his owner. Suppose a case came before the Marine Board, and they had to refer it to the Court, that might not settle it. It might go on again to the Supreme Court.
2193. Suppose the tribunal could move about and open an inquiry at any point? That would hardly be necessary.
2194. *Mr. Powell.*] The idea is to separate the judicial from the executive, and have a Board to deal with certificates of competency, examination, and so on? You must have all your officers. You have a man to put the various men through their facings. On the certificate of "Mr. Jones" that "Mr. Barling" has gone through his examination, and is fit to be appointed a captain, he gets his certificate from the Marine Board. You must have a man like that. You must have a man like Mr. Cruickshank. You must not lessen the stringency of examination, rather increase it. I think that every steamer, passenger or otherwise, ought to have a certificate. The law properly compels the owner to get a certificate twice a year that his vessel is fit to carry passengers. The anomaly is that a vessel carrying cargo need not undergo that examination, and can therefore go outside the Heads with bad boilers and bad engines. The sailorman's life ought to be considered quite as much as a passenger's life. There is no power to condemn such boats. They should be examined every year, and Mr. Cruickshank should be able to say to the captain, "Your boiler requires repairs." The inspector should be able to come and say, "Your masts are all wrong," and have them put right. That ought to be incorporated in any future Bill. No Bill will be effective unless it makes provision for all steamers to be under the supervision of the Government.
2195. The Board of Trade refer inquiries into wrecks, abandonment of vessels, &c., to a special tribunal, and the ordinary work of issuing certificates and examining seamen goes on under the Board of Trade? I do not see that there is any necessity to separate it. The President, or anybody appointed by the Government under the Act, would sign the certificates under the assurance that the examination had been gone through. That is a small matter. The most important thing is to get these inquiries conducted by impartial people.
2196. *President.*] For the judicial business you would have a District Court Judge as President, and two competent assessors; but for executive management you would have a man like Captain Edie in charge of the Department;—do you think that would gain the confidence of the whole community? Yes; before a man can get an engineer's certificate he must first be a mechanical engineer, and then must serve a certain time before getting a certificate as marine engineer. He must have a certain amount of practice before he gets his certificate. He must go through a certain course, just as you must go through a certain course to get a degree at the University. You do not want to impose unnecessary restrictions; but you do want to conserve life. There is a possibility now of an owner running his boat in such a condition as to put life in danger. All these things ought to be under Government control, not for the purpose of restricting and interfering with people, but simply to secure safety. Then, I think the effect of constituting the Marine Board in that way would be to get rid of the irritation that has existed from time to time. This party has wanted something, that party has wanted something, and there are discussions in Parliament. If I get up and advocate my opinion, it is at once said I am advocating the interests of steamship owners. If everything were done in a slipshod way, I should have no security myself. It is much more satisfactory to everyone if there is regularity. Then another man, representing what is called the Labour Party, gets up and says, "You are representing the interests of the shipowners; I must have my say." I think it would be absurd to have a Board composed of master, sailor, and engineer. It ought to be exactly like the courts of law—judicial. If a man commits a misdemeanour he is tried, and, if proved guilty, punished by the law. The Marine Board should be like that. There is a law to guide them, and the infringement of that law is to be followed by punishment, the purpose of which is to prevent others from making the same mistake. I have given this matter a good deal of consideration. This is a public matter entirely, and I have been glad to do this, not from personal motives, but for the good of all.

SUNDAY, 30 MAY, 1897.

[At the Lighthouse, Yamba, Clarence River.]

PRESENT:—

GEORGE ALEXANDER WILSON, Esq., J.P.  
JAMES POWELL, Esq., J.P.

Henry McAuley, Pilot at Yamba, sworn, and examined:—

- H. McAuley.  
30 May, 1897.
2197. *Mr. Powell.*] How many boatmen have you? Five—three at £126, that is McAuley, Quinn, and Freeburn; Carr at £106, and Law at £96.
2198. And each of the men is allowed £18 a year for value of quarters? Yes.
2199. I presume they all do the same kind of work? One is told off for the lighthouse work, that is McAuley. He also looks out.
2200. Is he alone in the lighthouse without assistance? Yes.
2201. Then you really have four boatmen, and they all do the same work? Yes.
2202. What is the reason for the difference in the salaries—the lowest is £96 and the highest £126? The £96 man only came lately, and has had no increase. The other men got increases up to the maximum.
2203. They entered at £96? No; one only entered at £96, the others were at it before.
2204. Law had the misfortune to come on when the increases were not allowed? Yes.
2205. And they all do the same work? Yes.
2206. Have you a lifeboat here? We have a whaleboat which we made into a lifeboat with plenty of cork and air-tight tanks.
2207. Has she been used? No.
2208. Has she been out for exercise? Yes.
2209. Do your boatmen man her? Yes.
2210. Do they receive anything for that service? No.

2211.

2211. Do you receive anything for the lifeboat? No.
2212. Would you consider it your duty to go in that boat if required? Yes.
2213. You have a tug here subsidised by the Government? Yes.
2214. The subsidy is £750 a year? Yes.
2215. Do you find her servicable for the work she has to do? Yes.
2216. What is her power? I could not say, but she is really a good tugboat.
2217. How long has she been here? Since the 1st of August.
2218. What boat was here previously? The "Dunniskey."
2219. How many hands are there on board that vessel? Three belonging to her.
2220. Describe them? Master, engineer, and deck-hand and fireman combined, the one doing both duties. The captain also has his sou there most of the time, but I do not know whether he is paid.
2221. Is that the whole of them? Yes.
2222. Do you know what wages they are paid? The captain and engineer get £10 a month and 5 per cent. on all she earns; the deck-hand £6 a month. There are, sometimes, another man or two, but I only know of the three men belonging to the boat.
2223. When a vessel has the services of the tug, the "Conqueror," do you charge pilotage? Yes, if the master is not exempt.
2224. And they charge for towing? Yes.
2225. What rates do they charge? Fourpence a ton in and 4d. a ton out.
2226. Do they charge those rates under the present Act? Yes.
2227. Are they authorised to collect tonnage rates or pilotage rates? A tonnage rate of 4d. a ton, and the river towage is extra on that.
2228. I thought they could charge only the pilotage, and you say they charge 4d. a ton;—do you charge 4d. a ton? No, 2d. a ton; but they still charge 4d.
2229. In and out? Yes.
2230. How many vessels had you in during the period since 1st January this year? Twenty-seven.
2231. How many of those employed the "Conqueror"? All.
2232. What would their tonnage be? There were thirteen inwards and fourteen outwards from the 1st January to date;—2,067 tons inwards and 3,157 tons outwards.
2233. Does that account for the brigantine up the river? Yes; that includes her.
2234. That is 5,764 tons? Yes.
2235. From that we can form an idea of the revenue they are getting? Yes; but that does not include the river towage.
2236. Do they tow far up? Mostly to Martin's Point.
2237. What do they charge as a rule? According to the size of the vessel—£2 or £3.
2238. £3 would be about the highest? Yes.
2239. Has it ever occurred to you that it would be better for the Service if you had a suitable tug entirely under your own control, belonging to the Government, manned by your own men; I do not mean a "Captain Cook," but a suitable, handy vessel of sufficient power, with an engineer under your command, and supersede the employment of these boatmen as boatmen, and utilise them on such a vessel as I have suggested? No; it has not.
2240. What do you think about it now at first sight;—of course, the vessel would earn something for pilotage, and such like, and would be very convenient for harbour purposes generally, for putting down buoys and moorings, and for sounding the bar? I do all that with this boat.
2241. But I am supposing that you had a boat under your own charge? I do not see why we could not work her with the station crew.
2242. You could work her;—you have been an old salt? I could work her.
2243. Do you think such a proposal advisable;—would it work? I really do not see why it should not. Of course, it will be throwing all the responsibility on the Government.
2244. When you act as a pilot all the responsibility is thrown on the Government? They are responsible for my action, but I do not know whether they would be responsible for the tug if anything happened at the time.
2245. But you are in charge of the tug at the time? She is in my charge and supposed to do as I order, but the master of the tug always handles his own boat; I do not handle her. He is supposed to be under my control and do as I tell him, but he steers the boat and works it; and, of course, if I give him an order he obeys it.
2246. Have you ever had any difference of opinion with this man? As regards working the boat, no.
2247. In any other way connected with the business? Yes; we have had a little difference.
2248. A little friction? Yes; he has been rather peculiar at times.
2249. Do you not think that would be all removed if you had this vessel yourself? Yes; all that would be removed.
2250. There is no reflection on you or your men when I say you are not fully employed now? No, sir; I wish we were. We would all be far better off. Time would go away very much better.
2251. If you had this boat under your control, and these men incorporated in that service, do you not think it would give them more to do, and they would take more interest in what they had to do? Yes; it would give them a lot more to do. For instance, we could keep the boat in nice trim.
2252. You think it might be attempted then? There is no question about it. It can be done all right by my crew, but the responsibility would come on the Government more. I do not see anything else.
2253. *Mr. Wilson.*] Would the Government have more responsibility than the present owners of the tug have?
2254. *Mr. Powell.*] No more responsibility than Mr. McAuley would have in his own boat.
2255. *Mr. Wilson.*] Are your boatmen satisfactory? Yes.
2256. Are they good men? Yes.
2257. *Mr. Powell.*] How long is the lightkeeper on duty? Well, the lamp burns pretty well all night when she is set and trimmed properly.
2258. Does he remain in the lighthouse? Yes. He is on duty pretty well all day, cleans the lamp in the morning, and keeps a look-out.

TUESDAY, 1 JUNE, 1897.

[At the Court-house, Ballina.]

PRESENT:—

GEORGE ALEXANDER WILSON, Esq., J.P.  
JAMES POWELL, Esq., J.P.

Robert Adie Fraser, Pilot at Ballina, sworn, and examined:—

- R. A. Fraser. 2259. *Mr. Powell.*] You are the pilot at the Heads, and you are also sub-collector of Customs, I believe? Yes, sir.
- 1 June, 1897. 2260. How long have you been here? Since 1st March, 1890.
2261. At what salary were you appointed? £150, with a stipulated increase of £10 per annum.
2262. And that increase you received up to £180? I received it up to £180. It was stopped in 1893.
2263. Then you have quarters? Yes.
2264. Valued at £25 a year? Yes, so I believe.
2265. What did you receive for your Customs work? £52 a year up to July last year.
2266. You have Parker;—he is down here as boatman? They all rate as boatmen.
2267. But Parker is the lightkeeper? Yes. I moved him from the boat to the lighthouse some years ago.
2268. Does he give the whole of his time to the boat? Yes, he is entirely there. He has two lights,
2269. There is Graham, the signalman;—is the whole of his time occupied as signalman? Yes.
2270. He is always on the look-out? Yes.
2271. Then you have four other boatmen at salaries varying from £126 to £106? Yes, three at £126, one at £116, and two at £106.
2272. I suppose they are all doing the same kind of work? The same kind of work, and they are the same class of men.
2273. And their quarters are valued at £18 a year? Yes.
2274. Do you find the trade on the river increasing? It has been of late, with steamers; but sailing vessels are decreasing, not in number, but in size.
2275. What draught of water can you get over the bar now? About 8 feet, but I think I would only get about 7 feet to-day. There is so much sea; it is shifting and changing continually. I shifted the beacons three times last week. We have had exceptionally heavy seas these last ten days. The channel is working north.
2276. Do you use the "Protector" for sounding? Yes; it is the subsidised boat.
2277. Is she an efficient boat for this particular work? Yes.
2278. She is all that is desirable? Yes, because you cannot get a deeper-draught boat with the same power.
2279. What is her draught? Six feet six inches.
2280. How is she manned? Four is the number she generally carries, master, engineer, fireman, and deck-hand.
2281. Have you any idea how they are paid? I think so.
2282. The master? £4 a week.
2283. The engineer? £14 a month.
2284. The fireman? And the sailor, I think, get £2 10s. a week. I am not certain about this; they do not come under me.
2285. And the deck-hand? Would be the same as the fireman.
2286. And do they all find themselves? I suppose so, but I am not sure of it.
2287. During the time the "Protector" was away what boat took her place? A little boat called the "Emma Pyers."
2288. When this "Protector" is working on the service, does the master work under your instructions? Only when I order, for sounding the bar. I have no jurisdiction over him as to towing vessels.
2289. Suppose you are in charge of the tug, bringing in a vessel as pilot? Then, of course, he follows my instructions.
2290. At other times he is free to do as he pleases? Yes.
2291. Do you know anything about the charges he makes for the service of the boat? Fourpence a ton.
2292. Is that the contract made with the contractor? Yes; I have a copy here. [Vide Appendix 43.]
2293. Is that the regulation? It is the regulation, not the contract.
2294. This regulation fixes the rate? Yes.
2295. Fourpence per ton each way? Yes; that is if they tow.
2296. And if the vessel has your services as pilot, the pilotage is in addition, I suppose? Yes; it was reduced lately.
2297. Have you any idea what the earnings of the tug are? I have a slight idea. In 1896 she must have got £1,500. That is outside of what she received from the Dredging Department; I do not know what she received from that.
2298. Other work? I do not know the charges for removing dredges, and so on. At one time I know they charged £10 for towing to the North Creek.
2299. How many leading lights have you got on the river? Eight pairs.
2300. By whom are those attended to? By people living on the farms near the lights.
2301. And they supply the oil? The oil only; we supply the wicks.
2302. Do you visit them? Yes; about twice a year I pick a time to go up and paint the beacons. I want to go up now.
2303. Do you ever hear any complaints about their not being properly attended to? Occasionally from some of the masters. They are only small lamps, and are apt to go out on a blowy night.
2304. I suppose the steamers do not require your services at all? The masters are all exempt.
2305. They never ask for your services? No. Some time ago, in 1891, I had a lot of piloting to do.
2306. I have a return here of three months' work taken from your own log, and I see that the sailing-vessel work was really very small? Very small.
2307. And they are all boats of small tonnage? There was only £148 last year for towing them, which the "Protector" did.

2308. You did not get anything at all? I got nothing last year; only about £5 for a launch that came from the Clarence. R. A. Fraser.  
1 June, 1897.
2309. Your salaries and contingencies, and one thing and another, go into about £3,300 a year? I suppose so. The leading lights are £39 a year each, and there are eight sets; that is £312.
2310. From the experience you have got since you have been here, do you think there would be any advantage in the Government owning their own tugs, putting you in charge as master, and utilising the services of the boatmen in connection with the vessel, which would be powerful and of light draught, suitable to the business;—did you ever have any friction with the tug-master? There is always a certain amount of friction.
2311. If all this were in the hands of the Government, do you think it would be better for the service? I am always there now at every tide—twice a day sometimes.
2312. I suppose your men are not fully employed? We could not do with any less.
2313. But if they were employed on a tug, the property of the Government, for which you would be responsible, their services would be better utilised? Yes.
2314. Have you given any thought to this as a proposal that might be made? Yes.
2315. What is the result of that, speaking generally? It would cost a big sum to begin with.
2316. For the last ten years the Government have spent more than £70,000 in subsidies; that would go a long way towards the cost of purchasing boats? There is no doubt about that.
2317. What do you estimate the value of the "Protector" at? She is an old ship. Here is the master's report, which came from Sydney last week. She is all patched and repaired. She was built in 1885, and has been twice renewed since then. [*Vide Appendix 44.*]
2318. Do you think a vessel equal to her in all respects could be built for £7,000? Yes, I think so.
2319. If a boat cost £7,000 she would be up to date, and have modern engines? Yes.
2320. The boatmen's services could be so utilised that there would be a considerable saving? Yes; but you would require a couple of men besides an engineer and a fireman.
2321. You have four men now, and employment might be found elsewhere for any who might not be wanted on the tug? Yes.
2322. Has the "Protector" been used much by the Government Departments other than the dredge service for towing? No. Some two or three years back we had a lot of punts come for the Government, and she has always towed them in, and she used to be employed in moving some of the big dredges, but now the Government have a powerful tug and use her.
2323. The class of vessel you want is to go outside? Yes; of course there is this to be thought of—the opposition. You would naturally make a stipulated price, and somebody else might come along and do it for less; though I do not think there is sufficient inducement for anything of that kind.
2324. So far, then, as you have given consideration to the matter, you think it would be an advantage to have boats of this description owned by the Government; it would be better for you and the trade? Yes.
2325. *Mr. Wilson.*] Mr. Powell asked you something about your relations with the tug-master;—you have had some trouble occasionally? I have never had sufficient to make a complaint; still there is always a certain amount of this, "All right, I'll be with you," and not doing it; never sufficient to report on.
2326. Has he refused to go out? I have frequently asked, and, of course, if there was a heavy sea on he would refuse.
2327. He, of course, looks after his own vessel? Yes.
2328. In your opinion, had you had charge of a good capable tug you would have gone out? I would have a look at it anyhow. It is some distance from here to the bar.
2329. Regarding this tug for £7,000, a vessel with modern engines would of course be very economical so far as coal is concerned;—do you happen to know what the saving per cent. would be in a modern steamer as compared with an old one? I do not know. The coal is a very small item. A vessel here would simply steam about three hours a day.
2330. A new vessel would be economical? Yes.
2331. Who is the owner of the "Protector"? A local man, Mr. Fenwick, was the owner, but he died last year.
2332. Have you anything to say regarding your own salary? I have been working here for a very small salary ever since I came here. I have lost £100 through that £10 per annum increase being stopped. I came in at £150 to rise to £275, but the increment stopped at £180.
2333. Did you come in with a special promise of increase up to £275? I did, sir.
2334. Is there any document to show that? The regulations.
2335. You contend that you had a special arrangement for these increases? I would not have taken the position but for that. I did, sir.
2336. *Mr. Powell.*] Were you in a steamer before? Yes; I have been in steamers since 1870.
2337. Have you any idea of what it would cost to work a boat like the "Protector"? I have never given that matter a thought, having no idea I would be asked about it. It would not take much to get a vessel of that stamp.
2338. There is insurance, and interest on the cost? The hawsers would be a big item—a 10-inch rope and a wire rope 3½ inches.
2339. I suppose the insurance on that boat would be pretty heavy? I do not think she is insured. The insurance would be 12 per cent., I think.
2340. That is why it goes badly with them to go out in bad weather—the boat is not insured? It is against her going out in bad weather.
2341. That is when she is most wanted? Yes.
2342. Well, if a boat cannot be used when she is most wanted, it detracts from her value, does it not? Yes.
2343. *Mr. Wilson.*] I understand that the Richmond River requires a steamer of a special class? It is a shallow bar. They have always had a paddle-boat, and they think they must have a paddle-boat. I think a twin screw boat would work it. In a paddle-boat the power is on top, while with a screw it is deeper.

[At the Office of the District Engineer, Harbours and Rivers Department, Ballina.]

Thomas William Keele, District Engineer, Harbours and Rivers Department, sworn, and examined:—

T. W. Keele. 2344. *Mr. Powell.*] The Government are paying £1,770 a year to the tug "Protector," and it is understood that the towage received by the owners in addition to that is about £1,500 a year; it is also understood that you employed this vessel occasionally, and paid an additional sum for towage;—could you give us an idea of what you paid during any period for towing to the "Protector"? Yes. I do not think we have paid more than £200 for towing since I have been here. That is for shifting the dredge during seven and a half years.

2345. Was she employed in any other way? No; we have our own tug here.

2346. *Mr. Wilson.*] Did you always have your own tug here? Not always.

2347. *Mr. Powell.*] The Government are paying the pilot and boatmen about £886 a year, and contingencies amounting to about £400, and the Commissioners seem to entertain the idea that it would be desirable to build special Government tugs for the pilot work, utilising the pilot as master and pilot, and using the boatmen, who are now not so fully employed as they might be, to man the tug;—it is thought that a better and more reliable service could thus be got, and at a less cost? I certainly think it would be more reliable.

2348. There is an idea that there is very often friction between the master of the subsidised tug and the pilot, and that such a state of affairs is very undesirable;—do you think that the sole control should be in the hands of the pilot? I do.

2349. A suitable vessel of light draught and proper power should be got? I have always been of the opinion that the tug service here should be conducted by the pilot, and that he should, with his men, control the tug. It would save all this friction, and you would certainly have a better service, and, I believe, a cheaper one. These boatmen are more than half their time doing nothing, whereas work could always be found for them on the tug.

2350. Do you think, from your own knowledge, that there has been friction? Yes; to my own knowledge. It is owing to Mr. Fraser being a masterful man that he has been able to hold his own. We will not stand any nonsense. He is a very good man. Fenwick had a good deal of influence, and used to threaten this man over and over again if he did not do so and so, he would shift him. Fraser often used to say to me that he did not know how far he might go, and asked me for advice about what he should do, and I told him to hold his end up, and he has generally come out on top. I think Mr. Fraser has shown a great deal of tact.

2351. So far as safety to lives and property is concerned, do you think the plan proposed is likely to be a good one? I think so, certainly. As it is now, in a case of emergency, he is the man to get them out of it. They certainly have a very good man on the tug, but he is not a trained seaman—he is a landsman. He is not a man trained all his life to the sea.

2352. There might be a difference of opinion, perhaps, about going out to sound the bar, and the master of the tug, representing the owner, might think it wrong to peril his owner's interests by sending the tug out, and the pilot might be of opinion that the tug could safely go out, but has no power to positively order? No; he has not.

2353. In the other case, with the command of the vessel, he would have all the responsibility and all the power? I have always been of opinion that that should be done.

2354. I suppose you have no idea of the cost of building these vessels? No; I have heard that the "Protector" cost £5,000.

2355. She is valued to-day at very much less than that? Yes.

WEDNESDAY, 2 JUNE, 1897.

[At the "Freemasons' Hotel," Lismore.]

PRESENT:—

GEORGE ALEXANDER WILSON, Esq., J.P.

JAMES POWELL, Esq., J.P.

J. F. O'Flynn, Esq., Mayor of Lismore, sworn, and examined:—

J. F. O'Flynn. 2356. *Mr. Wilson.*] We are a Commission to inquire into the management of the Marine Board. We understand you have some information to give us. Will you kindly tell us in your own way? My ideas are that, with a view to keeping the navigable waters of the North Arm, Bungawalbyn Creek, the South Arm, Lester Creek, and Cooper's Creek in a clear state for navigation, and to prevent the people from blocking the right-of-way with rafts of timber, that some officer should be appointed for the district, representing the Marine Board if you like, to see, when trees or snags drop in, that they are taken out at once, and not allowed to settle there and cause shoaling, involving much expense in dredging afterwards. It would answer our purposes if we had some officer of the Marine Board empowered to do that.

2357. Could you suggest any particular public officer? Of all the public officers I know here, Mr. Blakeney is the one who knows most about the duties. His duties as an officer of the Harbours and Rivers Department bring him here constantly. He is on this section of the river.

2358. Is he intimately acquainted with that section of the river? Yes; he has been here for about ten years. Most of his time at present is spent on the South Arm, doing some fascine work there. He knows all those places, and has assisted in snagging them all.

2359. The necessity for an appointment of that kind is that the pilot, who has to work from Ballina upwards, really cannot attend to this? He is never up here; I have never seen him once in fourteen years. His duties down there confine him to that place, and to looking after the buoys down there. No one can claim him. As Mayor of this town I never hear of shoal places in the river until they are sources of annoyance. Then we report it, either to Mr. Keele or to the Minister, and there is time lost; whereas, if this is looked to in its very beginning it will be much better.

2360. Is it possible that trees will block the place up, and that people will be blocked altogether from bringing their produce down? That has happened before now. A large tree would block any of those settlers.

2361.

2361. When that has happened, Mr. Blakeney, as an officer of the Harbours and Rivers Department, has been the man to be sent to remove it in all cases? In all cases. Those snags have been allowed to remain sometimes, no one reporting them, until they are really an obstruction and a perfect nuisance, and they have to be removed. If Mr. Blakeney were to do it at once it would save a lot of expense, as silt gathers round it, and they have to remove tons of stuff and drag it away with scoops, and have to get the dredge up here. There is a small dredge on the river. Those watercourses are well navigable now for the class of boats that go up there for sugarcane and other produce. We are very jealous that they should be kept navigable. I think it will be a saving of money if it be done. It cannot do otherwise than save money eventually.

J. F. O'Flynn.  
2 June, 1897.

2362. *Mr. Powell.*] If an officer having authority were appointed for such a service, I take it that his authority would be respected, and the obstructions would be removed promptly? Undoubtedly, I think so, if he had sufficient authority. The reason I mention Mr. Blakeney is his knowledge of the place, and his technical knowledge makes him the most suitable person I know for it.

2363. And if these obstructions were promptly removed the expenses would be small as compared with the present expenses? They would be minimised very much.

2364. The main river is looked after by the pilot to a certain point? I think up to about Woodburn or perhaps Coraki; but all the other navigable places have no one looking after them unless they become impassable, and then we have to report the matter to head-quarters, and it takes a long time to get it remedied. We simply want them to confer authority upon someone to do it. I think Mr. Hickson in the Harbours and Rivers Department was very anxious to get it done, but he failed to get the other Branch to do it. It was said that it would require an Act of Parliament to do what we asked for. In our correspondence we have never approached Captain Hixson of the Marine Board; we have dealt entirely with the other Department.

2365. *Mr. Wilson.*] If Mr. Blakeney were made an officer of the Marine Board, for the purpose of keeping the river clear, without interfering with his position in the Harbours and Rivers Department, would that be satisfactory? If you could get that done it would meet all that we want.

SATURDAY, 5 JUNE, 1897.

[At the "Australian Hotel," Tweed Heads.]

PRESENT:—

GEORGE ALEXANDER WILSON, Esq., J.P.  
JAMES POWELL, Esq., J.P.

William McGregor, Master Mariner, and Pilot at Tweed Heads Station, sworn, and examined:—

2366. *Mr. Powell.*] How long have you been pilot? Twenty-seven years and six months.

2367. You have five hands employed here under you? Yes.

2368. And one of them is the lightkeeper? Yes.

2369. Does he look after the signals as well? No; the signal station is not at the same place.

2370. Who attends to the signals? The other four take it in turns.

2371. Then you have four boatmen, one of whom attends to the signals, and the fifth man attends to the light at Fingal Head? Yes.

2372. There is a difference in the pay of these men; one, Shepherdson, gets £106, and the others get £126? Yes.

2373. Are they all doing the same kind of duty? Yes.

2374. And it is only the accident of the stoppage of the increments that leaves Shepherdson at £106? Yes.

2375. Is there a subsidised tug here? Yes.

2376. For which the Government pay £850 a year? I do not know.

2377. Is the service you get from that boat quite satisfactory in every respect? Yes.

2378. Is she ready at all times and in all weathers? Yes.

2379. Is she under your charge or command? No; she is only under my command when I tell the master I want her.

2380. Does he respect and act under your instructions? Always, sir.

2381. I suppose your men are not always employed;—they necessarily cannot be? No.

2382. There is a good deal of slack time? Yes.

2383. Looking at the cost of the tug, which I can tell you is about £850 a year, and the amount that is paid to your people in salaries, which is another £850 all told, bringing it up to about £1,700 a year,—do you think it would be possible to improve the service advantageously for the port, and for the benefit of ships visiting the port, if the Government were to have suitable tugs of their own at these bar rivers—vessels of good power, light draught of water, built specially for the work, placed in command of the pilot at the station, and manned by the boatmen or other men in their place—that is, using the boatmen where they can be used, and getting others where they cannot? I am afraid we would want more hands to put into the tug.

2384. How many hands has this tug? Three hands.

2385. She has a master? Yes.

2386. What pay does he get? I fancy it is £10 a month, and a percentage on all towing.

2387. What percentage;—10 per cent. is the usual thing at all the other places? I really could not say.

2388. And there is an engineer, I suppose? Yes.

2389. What does he get? I think he gets the same, but would not be sure.

2390. What other hands have they? A fireman at £6 a month.

2391. Is that all? That is all.

2392. That is £26 a month;—well, we are putting against that your four boatmen and yourself, so you see you have more men at your command than the master of the tug has;—he has only himself, engineer, and fireman? I may mention that I am always on board the tug myself, and take one man to sound.

2393. That is when you go out on sounding work? Yes.

2394. Ten years, at the present rate of subsidy, would mean that the Government paid £8,500, and this would pay for a first-class tug for your work nearly twice over. We are looking at it simply from an economical

W.  
McGregor.  
5 June, 1897.

- W. McGregor. economical point of view. You would have the tug entirely under your own charge, and manned by your own men—four men and an engineer, or three men and an engineer, according to requirements? Yes.
- 5 June, 1887. 2395. It would be suitable for harbour work, such as you have to do, and for soundings and such like. Now, the Commission ask you to think a little over that, and to give them the benefit of your knowledge and experience? If there were a little more room in the harbour I would say that would be right; but the harbour is so contracted that there are plenty of times when I have to man my boat and go to the assistance even of the tug. In bad weather it takes them all their time to look after the tug. If I were on board the tug I am afraid I should be in such a narrow place that by the time I got the tug in safety a vessel that might be in danger would be gone altogether. I call the man from the signal-staff when there is any emergency, because the three men are not enough for the boat. By the time that I could make the tug fast, if I had it, and man the boat with which to get at a vessel, it would be too late to do anything. What has to be done has to be done immediately.
2396. *Mr. Wilson.*] Then you must have your boat as a stand-by? It must be always in readiness.
2397. *Mr. Powell.*] That still might be? I will say this, that the only time I am taken now is in an emergency. I have got the place beacons and buoyed in such a way that they can actually see the road; and it is only when the nights are bad that they call for the pilot. I hardly get a chance to make anything now.
2398. That is the point—you are not wanted except when there is a difficulty? That is it. If there were a little more room, so that we could turn about anyway readily, it might be different; but in the sugar season, when the place is lined with vessels and punts, there are plenty of times when there is no room for the tug, and she must shift away.
2399. You could take the boat and leave a competent man in the tug? Yes.
2400. And you would have more men than that tug has got? Yes.
2401. *Mr. Wilson.*] If there were a competent man on the tug, with a fireman and a deck-hand, he could act as is done at present, and wait in attendance where he was wanted? Yes.
2402. *Mr. Powell.*] The main object is to put the tug entirely under the control of the pilot? Yes.
2403. In some of the ports we have visited there seems to have been a little friction? So I have here; but, fortunately, never much with them. I seem to have got along pretty smoothly. Occasionally there would be a few words; but, take it all through, I have got on very well.
2404. When there is an emergency I can quite believe that it is of all things most desirable that you should work in thorough concert, or that there should be one controlling influence? It is like this: when there is an accident everything is left wholly and solely to me. It is not so very long ago since a vessel got into trouble, and I manned the boat to go and see if my services were wanted; and I found the tug was in a difficulty, and went on board. I said, "Tom, you will be in a difficulty if you are not careful." I had to get both the tug and the schooner out of the difficulty, and all I got for it was 25s. In this narrow place it would be awkward for the pilot to have the tug.
2405. In moderately fair weather the tug goes out and earns the money, and you are not wanted at all, but when the difficulties come you have to go out and get a mere nothing, a 25s., and the tug is of no value to you? Yes.
2406. You know this vessel is making a good deal of money, in addition to this subsidy, in pilotage, none of which goes to the Consolidated Revenue, but to the proprietors;—do you know how much it is? No.
2407. But you know he is entitled to charge a minimum of 4d. a ton, in and out? Yes.
2408. And also 2s. 6d. a ton for whatever cargo he raises? Yes.
2409. All that is in addition to the subsidy;—it seems to me it would be far more economical for the Government to take the whole matter over, charge the towage, give the service, and let you have control? Would there not be more risk on the Government?
2410. *Mr. Powell.*] The risk will be the same as now, whatever that risk may be.
2411. *Mr. Wilson.*] The risk of wilful negligence, the same as there is now.
2412. *Mr. Powell.*] I never heard of any action being brought against the Government for any misdeeds on the part of a pilot in this Colony yet; and certainly, with the improved appliances that it is contemplated to place at your disposal, it seems to me that the chances of claims for accidents would be very much reduced? Yes.
2413. *Mr. Wilson.*] I think we might assure you that you would have the best boat for the purposes that money could buy? Yes.
2414. *Mr. Powell.*] Undoubtedly the best money can buy. Of course no person can be so well qualified to give an opinion as yourself, and those who have been occupied as you have at these bar harbours so many years.
2415. *Mr. Wilson.*] If you have not thought this matter out before, we might have a further conversation to-morrow morning about it? I have never thought of anything of the kind.
2416. *Mr. Powell.*] You have had this tug about twelve or fourteen years. It seems to be an actual necessity. It must be had if vessels are to get out of and into these rivers? There is one thing, the tugs are really serviceable.
2417. So would a tug under your control be really serviceable? I mean the tugs altogether. I have known vessels lying here for weeks and weeks, waiting for chances, but not getting them; but now they go away regularly.
2418. If you had the tug under your control, she would do a great deal of the work you are now doing with a great deal more ease to all concerned. I suppose they very rarely go out except to bring vessels in and take them out? Well, they have got to go out every day when it is possible, for the sake of sounding. The bar is continually changing. The leading marks are hardly ever left in the same position. Whenever there is any sign from the flagstaff of a change, I get away and sound at once to see if it is altering. Every day if there is a chance I go out, except Sunday.
2419. Perhaps you would like time to think it over? The only thing I see is the awkwardness of getting one fast, but you say that could be got over by appointing a man to look after the tug.
2420. *Mr. Wilson.*] Suppose there is a good man appointed, even getting the same wages as the man now in control—you might assume that this very man is appointed—but under your orders; there is a case in Newcastle now—the master of the tug has been appointed master of the "Ajax" there? Even the present master does what I tell him.
2421. The question is, is it workable in that way; suppose the Marine Board put a man, absolutely competent

competent and absolutely under your orders, in charge; you may make up your mind it would save a lot of money; would it work;—suppose the present crew were put in charge? I cannot see but that it would, in that way. W. McGregor.

5 June, 1897.

2422. You want sufficient strength to man the tug and work the boat? Yes; that is required in a place of this kind.

2423. Suppose the Marine Board gave you sufficient strength to man the boat, and put proper men in the tug, it would be workable just as it is now? Well, it is worked that way now.

2424. *Mr. Powell.*] With the disadvantage that all the benefit and profit goes to the tug? I do not know anything about that.

2425. That is all the Commission have to do, to suggest improvements in management with a view to economy? I was not looking at the figures, but at the working.

2426. *Mr. Wilson.*] They must be earning a good bit during the busy sugar season when there are a lot of vessels alongside? At a rough guess, I suppose they take forty odd towages a year. The steamers that take the tug when the bar is bad do not take the tug when it is good. That is forty in and out.

2427. What would they average? I think they would be above the minimum; but there might be a couple of schooners just on the minimum. When the bar is good steamers go without the tug.

2428. At any rate, the money going to the proprietor of the tug now would go to the State under this proposal? Yes; it is somewhere about forty, most of it during the sugar season. There would not be so many during the other half-year.

2429. *Mr. Powell.*] The wages on board this vessel now are very little over £300 a year? Yes.

2430. And they are receiving a subsidy of £850, with the towage in addition? Yes.

2431. While they are getting towage you are getting no pilotage? No pilotage at all. I used to do pretty well with pilotages before; they all took me. Until lately they were taking me, until I grumbled, and told them they were treating me unfairly, and only took me when it was bad.

2432. You are not bound to answer at all unless you like; at the Clarence we discussed this with Captain McAuley, and at the Richmond with Captain Fraser, and they both seemed to turn it over pretty much in their minds; but they came to the conclusion at last that they thought it would be very desirable to carry on the service without a divided responsibility? If the tug were manned in the way suggested by Mr. Wilson, as well as the pilot-boat, it would be the thing. I think it would be too much for the pilot to man the tug and the boat with the same crew.

2433. The two would go together? But I was thinking that if the pilot and his men had really to man the steamboat as well they could not do it.

2434. *Mr. Wilson.*] How many are there? Four and myself.

2435. To man the tug there would be three wanted? Yes.

2436. Would you still want the other five;—you would want three in the tug, and how many in the boat? Four. I would have to shift about and go between them both.

2437. You must also take into consideration that it is not always going to be such bad weather that you would want both; the tug would do the work in ordinary weather, would it not? Yes.

2438. It would be only under extraordinary circumstances that you would require both? Yes.

2439. So that the bulk of the time the tug would be under your command, and you would have the boat as a stand-by? Yes. With the exception of the work on buoys and beacons, and putting leading marks in order, the men would merely man the boat and stand by to come when the signal was given that anything was wrong.

2440. The tug would do all the harbour and river work that you want? Yes.

2441. And she would be ready for any emergency? Yes.

2442. In fact, the position would be very much like what it is at present, except that the service would be worked in a more economical manner? Yes. Well, if it were to be manned the same way as it is now, I do not see anything against it.

2443. The Government would have their own boat and get the earnings; and as against the cost of the boat would go the yearly subsidy they are paying now, and the revenue the tug is earning now? Yes.

2444. Suppose your tug cost £4,000, there would be interest on £4,000 and insurance and depreciation on £4,000, and to meet that there would be a saving of the subsidy and the earnings which this particular steamer would make? Yes; her towages.

2445. *Mr. Powell.*] Take the £4,000 at 4 per cent., the Government rate.

2446. *Mr. Wilson.*] That is high in these days; that is £160 a year; then there is depreciation at 10 per cent.—£400 a year; that is £560. Insurance—the Government never insure—still there is a risk? There is a great deal of risk indeed.

2447. *Mr. Powell.*] The subsidised tugs are not insured? I rather think they are.

2448. *Mr. Wilson.*] That has to be provided for? Yes.

2449. *Mr. Powell.*] What would be the rates for insurance? Somewhere about 12 per cent.

2450. Would 12 per cent. cover it, do you think? They will only take half the risk now, I think. I would not be sure. I think it is 12 per cent. I have never bothered myself about that part of it.

2451. If you had your own vessel you would bother about it? That is just it.

2452. *Mr. Wilson.*] You have never had occasion to look at the business aspect of it? No.

2453. *Mr. Powell.*] Then, looking at the general aspect;—if the boats you now have were kept ready to use as occasion might require, you think it would be the right thing for the Government to own their own tug, manned by your men, and placed under your charge? I do not see anything against it, if it is manned the same as these boats are, so long as the Government will take the risk.

2454. It is only like giving you a "Captain Cook" or an "Ajax"? I thought you wanted to man the tug with the same men as are here now.

2455. That was the idea at first? It would require more than that. It would require four men in the boat on an emergency and someone on the tug.

2456. *Mr. Wilson.*] Would you want three men in the tug always? You see they have two men and a boy now. I think it would be running too much of a risk to attempt to do it myself with the boatmen, even allowing that they are fit for the work. There would be too few to look after the two jobs.

2457. *Mr. Powell.*] There might be more men wanted at one port than at another.

2458. *Mr. Wilson.*] We must treat it as a whole;—there might be one or two wanted here more than at another place, owing to the exceptional difficulty of the bar? Yes.

2459.

- W. McGregor.  
5 June, 1897.
2459. If you did not want a man or two more here, it would not interfere with the general principle—in fact, it would appear to me to be just carrying out the present system, only the Government would own the boat instead of a private man? Yes.
2460. *Mr. Powell.*] In some cases there would be one pilot instead of two? Yes.
2461. *Mr. Wilson.*] Has the tug-master ever refused to go out when called upon by you? Never. All I have to say is, "I want the boat," and it is all right. There is not the slightest friction.
2462. *Mr. Powell.*] Have you had this same boat, the "Terranora," for long? Not very long. The first boat we had is away down in Queensland now.
2463. Who owned her? Buckle.
2464. You had no difficulty with her? None whatever; in fact, I think it has just been about as easy a worked boat as any of them.
2465. This is Corrigan's boat, is it not? Yes.
2466. Is she a screw? Yes.
2467. Do you think the screw is suitable for the work? Well, I never had a paddle-boat; but my own opinion would be that a paddle would be better than a screw; but as a number of others seem to think differently it is not for me, as one man, to say.
2468. For bar work you think a paddle would be better? I think there would be more pull than with a screw. There is a continual pull with a paddle-boat, though she would not be so good a seaboat as a screw.
2469. What about turning; would not a paddle-boat turn better? She would turn, but she would not run on the sea so well.

FRIDAY, 18 JUNE, 1897.

PRESENT:—

JOSEPH BARLING, Esq., J.P., PRESIDENT.  
JAMES POWELL, Esq., J.P.

Frederick William Jackson, Manager of the Union Steamship Company of New Zealand, sworn, and examined:—

- F. W. Jackson.  
18 June, 1897.
2470. *Mr. Powell.*] The Commission think that from your experience in shipping matters in New Zealand you may be able to give them some information in regard to the constitution and working of the Marine Board; the general idea we have proceeded on is, that perhaps it would be desirable to separate the judicial from the executive function of the Board—that is to say, let the Marine Board, somewhat differently constituted, deal with the details of harbour and shipping business, but let all questions of law be dealt with by a more competent tribunal such as is that in existence in Great Britain, and, I think, also in New Zealand; we would also like, generally, any opinions you may have formed about the work of the present Board? Well, our company does not come very much in contact with the present Marine Board, our only dealings with them being in connection with certificates which it necessary to get here for our passenger steamers. These vessels get certificates to run a certain period. I think all the Steamship Companies are with us in this respect. We have a grievance that, while in other Colonies a certificate is granted for twelve months, here it is only granted for six months, which means, of course, a stoppage of the running of steamers, interfering with their movements. They have to be taken out of the trade, put in dock and overhauled twice a year, as against once a year in nearly all the other Colonies. In New Zealand and Victoria the certificate lasts for twelve months. In New South Wales and Queensland it only lasts six months. We all consider that a grievance, not so much because of the fees we have to pay, although they have been increased, but because of the general stoppage of our business arrangements which causes considerable inconvenience.
2471. *President.*] Would you kindly say what the overhaul actually means? The delay is anything from three days to a week. We, as well as other companies, feel it very much because we, for our own sakes, keep our steamers in proper order. They are not allowed to get into a bad state. We do not want to court a break-down. The engineers on board are supposed to, and they do, keep the vessels in good order, under the supervision of superintending engineers; but according to the laws here we have to stop our ships every six months in order that the authorities may examine them, and see that they are in order. We do not think it necessary, because at any period in that six months the Government engineers at ports of call, and other authorities can go on board the steamers and satisfy themselves whether or not they are being kept up; and if they have reason to find serious fault with anything they can call upon the owners at any time to put the vessel into sea-going order.
2472. Do they examine the hull as well as the machinery? Yes.
2473. Do they need to dock the steamer? Yes. Then there is another matter which means an additional tax. Take our steamer the "Oonah," trading between here and Hobart. The fees used to be £4 for the work of surveying.
2474. *Mr. Powell.*] I think that was the maximum fee? Yes. Now it is increased in this way: an additional £1 is charged for every 300 tons or part thereof. That alteration was made on the 16th November, 1896. That is somewhat of a tax upon us. One steamer the other day cost us £10, or 10 guineas, instead of £4.
2475. Twice a year? Yes. That was the "Monowai." That seems to be a tax, because the money they get cannot pay all the expenses of the Board, nor do they seek that. If £4 sufficed for so many years, you would think it would continue to suffice, because there have been so many more steamers. I do not think it would require any more officials.
2476. I wonder that those interested allow these things to go through the Legislature without examination of the Bills? I know this was taken up by the Steamship Owners' Association. I think the Bill went through very quickly; I might say accidentally. We made representations to the Legislature, but the matter was not followed up.
2477. I spoke of the constitution of the Board; there are three nominee members and three elective members, and the voting qualification is limited to owners of vessels registered in the port;—I take it you are not represented, as your vessels are not registered here? No. That I look on as an injustice, that

that while all companies are subject to the Board, they have no voice in the election of officials to serve on it. It seems to me that it would only be a right and proper thing that companies like ourselves should have some say in the election of wardens or members to the Board.

2478. *President.*] There are something like 90,000 tons represented—that is, Colonial—and there is something like 1,250,000 tons unrepresented.

2479. *Mr. Powell.*] You must not lose sight of the fact that the nominee members are supposed to represent you.

2480. *President.*] And not only have the people who vote got elective representation, but they share in the ordinary Government representation.

2481. *Mr. Powell.*] If you were represented, then other interests would require representation? I do not say that our company should be represented, but I say that a large amount of tonnage coming here is practically unrepresented. In order to have a vote it would be necessary to register a portion of our vessels here. Companies do not care about that. They have a headquarters, and their vessels are always registered there. It seems to me that, in common with others, we should have a voice in things as they are now, but if it were altered, all the company would have to do would be to bow to the alteration.

2482. If the elective principle were abolished, and a Board presided over by a competent legal authority, placed over the Board in that part of its action, there would be no need for representation? None at all; and I should say that that would be a very much more satisfactory tribunal than the present one is or has been.

2483. *President.*] The idea is, that this tribunal would be presided over by, say, a District Court Judge, and that he should have power, with the sanction of the Governor, to select assessors in every case that might come up for decision? I believe that would give general satisfaction.

2484. That is to say, in one case he would want an engineer as assessor, and in another case a nautical man, and so on? I understand. I think that would give general satisfaction, as there have been so many changes in connection with the construction and arrangements of vessels generally, that unless a man has been on board as commander or officer during the last few years he is completely out of touch with the new arrangements.

2485. *Mr. Powell.*] This contemplates having competent persons—experts in every branch—as assessors. That appears to have answered well in New Zealand, where a Stipendiary Magistrate presides? Yes; I think that is the impression generally among those who have thought about it. I think what you have suggested covers the whole ground.

2486. Do you say that a Court presided over by a Judge or Stipendiary Magistrate, or other legally-trained authority, should deal with all matters of collisions, cancellations of certificates, loss of life and accidents, and that the functions of the Harbour Department should be discharged by a competent officer or officers, and confined to the executive details and business of the Board relating to marine matters? Yes; I think so.

2487. Are you willing to say that you think generally that the present Marine Board as constituted has not given general satisfaction to the whole of the business interests of shipping visiting and trading with New South Wales? Well, you see, while I may have that personal opinion my company has had no reason at all to complain. My personal opinion is derived from the reports I have seen in the newspapers.

2488. Do you think it would be better to alter the principle of election by making it wider and embracing all interests, or getting rid of it altogether? I think this proposal to have a Judge and two nautical assessors, or three, as the case may be, covers the whole ground. It removes the necessity of representation for the engineers, the firemen, and the seamen. They would get representation in the two nautical assessors.

2489. *President.*] You approve of that? Yes; the only thing I would point out is this, that the Judge would have to be very careful in the selection of the men to help him, because there are men and men, and it is not because a man is a shipmaster that he is necessarily an expert. There are many masters whose opinion I would not always care to accept. I have another matter I should like to say something about. Pilotage exemption certificates were formerly issued to any person holding a master's certificate who passed the necessary examination, so that chief officers holding masters' certificates who had been in and out of port three times as deck officers, were able to pass, but now they must be in actual command before the Board will allow them to go up for examination. I believe of late this rule has been made, more against the foreign-going vessels taking exemption certificates, but which militates against inter-colonial companies. To put the matter plainly—if we had to pay pilotage at every port we went in and out of it would require a huge expenditure, so that our own men must become exempt from pilotage and be able to bring our ships in and out of port without paying dues. As it is now, if an officer wanted to pass for an exemption certificate, he simply could not do so until he was in command of a ship; that means that we would be mulct in pilotage for the time being, while he was learning. Before he could go up he had to be in and out of the port three times as a chief officer. Now, a chief officer who has been in and out of the port three times, cannot go up until he is in actual command of a ship. If we have to pay pilotage for a vessel to be brought in by one of those men it acts against his being appointed to a command. We could not pay £20 for pilotage for putting him in command.

2490. *Mr. Powell.*] That is only a regulation of the Board—that a man must be in and out three times? We do not find fault with that. I should say a man could not fairly pass the examination before he had been in and out three times, as he would not know the marks. Our men must pass and become pilots, as we must avoid pilotage. If we had to pay pilotage in and out for all our vessels it would be a terrific sum.

2491. Are there any other points you can think of which you would like to mention? I have not taken note of any other things.

Captain F. Hixson, R.N., re-examined:—

2492. *Mr. Powell.*] The Commission, as you know, have been travelling north in connection with this inquiry, and at Lismore the Mayor called our attention to obstructions in the river. He says that trees frequently fall across the creeks in places and block the settlers from getting their cane down to Broadwater; the punts are obstructed, and it is a source of great inconvenience and expense, as they have no person

Capt. F.  
Hixson, R. N.  
18 June, 1897.

person to whom they can refer. Now it seems to the Commission that you have powers under the 19th section of the Navigation Act perhaps to give them some relief. You have "the preservation of ports, harbours, havens, and navigable creeks and rivers" within your jurisdiction, and if there is any officer there who can act for you to meet the wishes of those people, it seems to the Board it would be desirable to do so? There is a special provision in the body of the Act to meet cases of the sort, and we frequently do meet them, but it is a thing that is attended with a great deal of difficulty. "If any trees be felled on the bank of any navigable waters —"

2493. That is, if they are "felled"? But let me go on. "If any tree or trees be felled on the bank of any navigable waters so that any part of such tree or trees shall be in or over such waters, or within high-water or flood mark, and the same be not removed within ten days after having been so felled, the owner or occupier of the land from which such tree or trees shall have been felled shall incur a penalty not less than £1 and not exceeding £10 for every tree so cut and not removed, in addition to the actual cost of removing the same, such cost to be assessed by the Justice of the Peace at the time of imposing such penalty" (section 112, Navigation Act of 1871). That is the clause that gives us power, and, as I say, we frequently act in such cases, but it gives us a good deal of trouble.

2494. But this does not refer to timber that is felled; it is timber that is washed down in the creeks? Our remedy always is the pilots. We generally get their assistance to advise us in matters of this sort, and we invariably do what we can, but the case is surrounded with a great deal of difficulty.

2495. Would not the case be met if a local Marine Board were formed, with the assistance of the pilot—I do not mean a paid Board? My experience is, you no sooner get a voluntary Board fairly in order but they at once go for fees. They would not take any interest in it otherwise.

2496. The importance of these rivers seems to demand a direct and effective control? We often do control and do what we can. We get the assistance of the Harbours and Rivers Department, and also the Police.

2497. May we say that any matter of that kind brought under the notice of the pilot and communicated to your Board would receive attention? Yes, certainly.

2498. *President.*] The real difficulty is that you have not the money? Yes; that is the difficulty.

2499. Of course, you cannot trace falling snags to anybody? Very often people fell cedar so that it may be washed down by the first flood.

2500. But is it not the real difficulty that you have not the money? Yes; and if you deal with one of these creeks you have to deal with the whole lot.

2501. You would have to get a crab dredge and a crane, and it would mean an expenditure of thousands? Yes; the great remedy is a big flood.

2502. The pine logs sink, and become most dangerous? Of course, we are the conservators of the navigable waters, and if we had money to deal with the rivers of the Colony we could do so; but it would simply cause enormous expense.

2503. *Mr. Powell.*] Are your boatmen supplied with clothing? Certain of them.

2504. What clothing do they get? They get two suits a year. Those men carry the Governor about and do other official work about Sydney; two men at Newcastle are also supplied. There are eighteen in Sydney.

2505. Is there any particular reason for not supplying the Newcastle men? Yes; I think they are paid very well without it, and if we clothed them we would have to go all along the coast. We do not clothe these men in Sydney in order to relieve their purses. We do it so that they may look decent and shipshape.

2506. Are the seamen on the "Captain Cook" supplied? No; they have made a good many applications for it, and I have always refused it. The launch-men, eighteen in Sydney and two in Newcastle, are the only men employed in taking the Governor and Ministers and distinguished visitors about.

2507. Now about this increment matter, which has received some attention since we saw you last: taking the list furnished by the Marine Board of the salaries for the year 1883, and comparing that list with the salaries for the year 1896, there seems to be a large advance, a very considerable advance, although I think there was a 10 per cent. reduction on salaries generally? It did not reach these men that you speak of now. It was on people receiving over £200 a year, who do not come under the regulations.

2508. Were not those coming under the regulations reduced? No; their cases were met by the increment being stopped two or three years.

2509. I want to point out that the salaries of 1883 and 1896 differ to the extent of 30 per cent. or 35 per cent.—that is to say, they were 30 per cent. to 35 per cent. more in 1896 than in 1883? Does that mean in the aggregate, or on certain individuals? There have been increases in numbers since then.

2510. On certain individuals? Very likely. The arrangement with the pilots is that they enter at £250, and rise to £450, but they have to serve twenty years for that.

2511. Take the Newcastle pilots: in 1883 three pilots received a salary of £250; now those pilots in 1896 were receiving £353? Yes; I think you will find also that in the latter year the rent of their houses is deducted.

2512. I am giving you the actual amounts paid;—£250 as against £353, from 1883 to 1896—thirteen years? Well, an increment of £10 a year would make a difference of £130 in that time. Those are all precisely in accordance with the regulations.

2513. That is all due to the regulations? Yes.

2514. Does it not seem somewhat unfair that the great body of the Civil Service should be in a worse position with regard to their salaries than they were in 1883, and that this particular body of the Civil Service are in so much better a position? The explanation of that is that the people to whom you refer come in at a minimum rate. As I explained, the pilot in Port Jackson comes in at £250 a year. No one would say that these men's responsibilities were not very great, and that they were not underpaid at £250.

2515. I think they come in lower than that? No; the men at £150 are the second-class pilots at the bar harbours.

2516. Take the salary paid to Captain Lindeman: it appears that he was receiving in 1883 £400, and he now appears to be receiving £470; that is an increase of 20 per cent.? The Marine Board employees are peculiar and different from any other employees in the Government. A man once a pilot is always a pilot, and a man once a secretary remains in the same position. In other branches I know men who

joined

joined the Service when Captain Lindeman did who, by promotion, have got to twice his salary. The work of the office has largely increased since 1883. Capt. F. Hixson, R.N.

2517. That is more an argument why the service should be made part of the general service; I think the object of the Commission is to try to get information to enable the Government to deal with the Marine Board in relation to the Service generally? The Government, of course, can repeal the Act and pass a new Act. 18 June, 1897.

2518. It is only by repealing the Act? Yes.

2519. I see you have a messenger at £150;—does he receive any other emoluments of any kind? No.

2520. Is he a sober, respectable man—is he all that is desirable? He has been thirty-five years in the Department, and does his work all right. I have never seen him otherwise than sober.

2521. It is a very high salary for a messenger? You see it is by the regulation. He came in at £75. We have another messenger at £75.

2522. Are the lifeboats in Sydney and Newcastle under the control of the Marine Board in any way? They are under the control of the Marine Board.

2523. I see there is a sum of £1,000 voted by Parliament for that particular service, £600 for gratuities; that, I presume, is for the manning and working of the boats? Yes.

2524. And £400 for a steam-tug at Newcastle? Yes.

2525. And that tug is for lifeboat service? Yes.

2526. To whom is it paid? To J. and A. Brown. I wrote to the Government some time ago, saying that, as the "Ajax" is to be put on the pilot service at Newcastle, we should not require this tug, and six months' notice should be given to Messrs. J. and A. Brown of the discontinuance of the contract.

2527. Of course the money is paid as a retainer, so that a tug shall be ready at any time if required? That is so.

2528. I notice there are twenty-two boatmen at Newcastle, and they receive £12 each for lifeboat service:—is that so? Yes.

2529. We were informed by the harbour-master at Newcastle, Captain Newton, that this boat goes out four times a year for practice? That is so.

2530. Well, then, practically these men receive £3 each time they go out? Practically. In a lifeboat service a man almost carries his life in his hands, and we have had a great deal of trouble at Newcastle, and had difficulty in manning the lifeboat, and it has merged into what it is now, that the Government boatmen are paid, not for going into the lifeboat, but are given this additional money for volunteering for the lifeboat service.

2531. *President.*] If they are out on actual service, are they given anything extra? Yes; they receive 25s. each if they save life. The money is given them as a retainer. They are constantly in practice—constantly in the boats in and about the harbour. I do not think we could do better. If a catastrophe were to occur off Newcastle, and there were a want of readiness on the part of the lifeboats to go out, there would be such a fuss, and properly, that it is better to let things remain as they are.

2532. *Mr. Powell.*] Taking the Sydney lifeboat, according to the evidence we have got, things do not seem to be quite so satisfactory;—the Sydney lifeboat goes out for practice four times a year? There are no stated times. The lifeboat is sent out, whenever we tell them to exercise her, from the office. It might be four times a year. As a matter of fact, we send out when it is least expected.

2533. This vessel seems to cost £9 when she goes out? Yes. The lifeboat service in Sydney is very much less expensive than in Newcastle; but, as I said before, there has been such loss of life at Newcastle. We had very great trouble when the "Cawarra" was lost, and the difficulty is so great, and the necessity for a lifeboat so much greater than in Sydney, that the cost in one place is very much heavier than in the other.

2534. *President.*] I suppose it is not very likely to be required in Sydney? The fact is, the lifeboat service in Sydney is not nearly so likely to be required as in Newcastle, where there is a fresh setting out of the harbour and the oyster-bank there. There has been a great amount of heroism displayed in the lifeboat service in Newcastle.

2535. *Mr. Powell.*] At Watson's Bay they have not sufficient men to man the boat? No. We send them down a message to exercise the lifeboat, a signal is put up at the flagstaff, men are taken, and they exercise the boat.

2536. Captain Creer told us that he picked up the men at Watson's Bay—fishermen or any others he could get? Yes.

2537. Well, that does not seem to quite accord with perfect practice to pick up whomsoever he can get? He is wrong. We hoist a lifeboat signal at the top of the flagstaff. All the people about the Bay know what that means, and they rush to the lifeboat and offer their services.

2538. Well, we can only take the evidence given us; that is the statement:—"We require thirteen men for the boat. I pick up whoever I can get hold of, fishermen, and they get 10s. every time the boat goes out"? He makes a mistake. In place of his picking them up they run to him.

2539. Then it appears that Captain Creer gets £1 each time the boat goes out, but he does not go out at all? Yes, he is the organiser. If you want people to take an interest in anything of this sort you must pay them.

2540. He says that he follows them? Yes: in his steamer.

2541. He also told us that the lifeboat had not at any time been the means by which life had been saved in Sydney? He is quite right. Not in my time. We have rescued a good many lives, but we have never done it actually with the lifeboat; in fact, since the pilot boat has been there she has to a very great extent taken up the work of the lifeboat. She is there with her steam up any minute night or day, and her little boats, with which she puts the pilots on board vessels coming in, are such excellent little boats that they are much more handy than the big lifeboat.

2542. Do you not think that the pilot staff in Sydney is larger than the business requires; the whole number of vessels entering the port last year and leaving was 629 in all, and there are five pilots? Well, under the old arrangement, when you well know the pilotage was excessive, and the vessels did all they possibly could to avoid taking a pilot, I should agree with you; but latterly the pilotage certificates have been withheld, and we have had evidence already that the pilot service is becoming more active than it was. I am quite sure that before long in place of reducing the number of pilots we shall have to increase them.

2543. But all pilots are licensed? Certainly.

Capt. F.  
Hixson, R. N.  
18 June, 1897.

2544. Do you not think a smaller permanent staff would be sufficient for the port, with various glut pilots for emergencies? I think, if you attempt to disturb the pilotage arrangements of this port, you will create a great deal of disaffection and bad feeling in the mercantile community, because they insist upon having a pilot the instant they want one.

2545. That would give it to them? I think the public are very well satisfied with the present arrangements, and I really do not see how you could alter them.

2546. It is only a question of expense; the glut pilots would be additional men, who would be engaged when they were required? What scheme would you propound?

2547. It would be like the English practice? Sydney is a very peculiar place in that respect, for the services of pilots are wanted most unexpectedly. In early times we had great trouble. There was scarcely a paper you could pick up but had something about the inefficiency of the pilot service. Since we have had the steamer and the pilots on board there have been no complaints.

2548. I find that five pilots during March brought in thirty-six vessels—that is, seven vessels each—and they probably took the same number out;—does that not seem very little work to show for so large an outlay? It does, certainly; but then give us a busy month. You know that between March and June is the slackest shipping time we have in the port. This is a slack time, and I really do not see that we could reduce the expenses.

2549. That return was given to me? No one knows better than you that the pilot work has been reduced almost to a minimum in consequence of the excessive charges connected therewith; and you know now there has been a great change, and that this change will bring about more business in the service.

2550. *President.*] It has hardly had time to take effect? All the men who hold certificates will continue to use them, but there are very few issued now, while a few months ago men were able to get them without trouble. Now there is a maximum charge of £20 for pilotage, and the owners and everybody prefer that the official pilot should bring the ships in.

2551. *Mr. Powell.*] With foreign-going ships I have no doubt it will be so? Yes.

2552. It has been suggested from more than one quarter that the pilot latest on board should take command and be replaced as ships are boarded; of course, the master of the "Captain Cook" is a licensed pilot—in fact, no man could be in that position unless he is a licensed pilot; the suggestion is that the man latest on board should be master for the time being, he, of course, having a competent chief officer? This is the first time the subject has been mentioned to me, but I am averse to it altogether. The man in charge of the pilot steamer now down there is the head man in charge of the whole service; he controls everybody. We had great difficulty in working out this present arrangement, and it answers admirably as it is. I know that in some cases in the English Channel such a system prevails, and in Melbourne, but in these cases the pilots are not Government officers. They are all working among themselves; they are amalgamated together, and the vessel they are aboard of belongs to them. When we introduced this system we had a great deal of trouble to do so. The pilots were getting in fees from £800 to £900 a year, and they all worked as much as they possibly could against getting this steamer. They did not want to be kept on board a steamer for £350 when they had been earning £800 or £900 and going home every night. The arrangement has answered admirably.

2553. The chief officer would be competent to take command, I suppose? Yes. The chief officer should not be there unless he is a competent sailor.

2554. He holds a master's certificate? Yes; but there are men and men. Many men hold master's certificates, but when they come to carry out their practical work often fail.

2555. About the lightship, the "Bramble": it appeared to the Commission on their visit that while everything appeared to be satisfactory the sum expended for the service seemed to be very large—£800 per annum;—do you think there is any way in which that might be reduced? I do not think it could. On the English coast lightships they have always eight men on board. Perhaps not always, but I saw a case the other day where an English lightship foundered and her crew, composed of eight men, were all drowned. We have five here, and apart from the actual lightship they have to take care of two other lights.

2556. But there is not a very close analogy between a lightship on the Goodwin Sands and a lightship here? No; but I have known the lightship break adrift, and it has required a lot of men to take care of her. There is a cook, three men, and the master. The cook, of course, can go in the boat. Then you must consider the question of leave; you cannot keep men constantly on board the ship; they require a certain amount of leave, and you require men capable of doing the work in their absence.

2557. There is another question: after visiting these bar harbours, we find there is a very strong opinion formed and expressed in favour of changing the tug system and substituting more suitable vessels owned by the Government for the purpose—vessels controlled by the pilots and manned by boatmen or other suitable men not necessarily their boatmen, with an engineer in each case, &c.: now, if you have given any thought to that, will you kindly give us your opinion on the subject generally as to whether it would be a better service, whether it would be less or more economical, and whether it would be more effective for the purpose intended? I am averse to any changes in that respect. The fact is that in early days Mr. Stuart, afterwards Sir Alexander Stuart, told me he was going to put £10,000 on the Estimates for a tug for the Richmond River, and I told him I thought it would be far preferable that he should introduce the subsidy system, "because," I said, "if you give £10,000 to the Richmond River you will have to give £10,000 to every other river in the country, and you will create a most expensive and unsatisfactory Department." Well, he yielded to my arguments, and in place of providing the Government tug he agreed to subsidise one. The matter turned out successfully. Now, at the Richmond, which, I might say, is a very dangerous place, they have lost several tugs. This system extends all over the coast, and there have frequently been proposals to bring about a plan something like that you are shadowing forth. I think it would be a great mistake to introduce it. I am sure the expense would be very much larger than would appear on paper, and I think it is a matter where the Government should not further interfere. Private enterprise does the work quite as effectually as the Government ever could do it, and the expense is certainly on the decrease. I think the time is not far distant now, when, in consequence of the great changes which have taken place in the trade of the coast by steamers taking the place almost everywhere of sailing vessels, the cost will be still further reduced. It would be quite a mistake for the Government to own these vessels. In some places where the trade is almost altogether in steam and the expenses of the subsidised tugs so great, I should be inclined to recommend the Government not to continue the expense. For instance, the Tweed and the Clarence receive large subsidies for tugs, and there is really very little work for

Capt. F.  
Hixson, R.N.  
18 June, 1897.

- for them, because most of the trade of these rivers is done by steam. If you commence to make the tug service a Government service, I am quite sure the expenses will go on increasing until it becomes of enormous cost to the country, for every river on the coast would insist on having a tug. There are some places, too, where a tug does the work of two rivers, and these rivers will each insist on having a tug of its own. The tenders we have just called have brought a reduction of something like £1,200 under what it was previously, and I am sure the expenses will go down as we go on; but if they do not go down it will be a question whether the tugs should not be done away with altogether in certain places.
2558. As a matter of fact, almost every river now has its tug with the exception of two—the Nambucca and the Bellinger? The Bellinger has one itself. Where tugs serve two rivers are at the Tweed and Brunswick, and at the Nambucca and Macleay. Those are the only two. We have a tug at Wollongong too.
2559. Looking at it from a commercial point of view: from your showing, Sir Alexander Stuart proposed to put a tug at the Richmond at a cost of £10,000? Yes.
2560. How long ago was that? Fifteen years, perhaps—when Sir Alexander Stuart was Treasurer as Mr. Stuart.
2561. Say ten years; ten years' subsidy would be £17,000? Yes.
2562. The Government have paid more than £17,000 in subsidies to steamers during that period? That is right, sir.
2563. So that we have £17,000 against £10,000? Yes; but there was a very valuable tug lost—the "Francis Hixson." I am quite sure that if the Government had owned these tugs they would have had to pay much more than £10,000 additional to replace those wrecked and damaged.
2564. But these are all insurable risks? I believe, at the Richmond, that the contractor has to pay 12 per cent. for all that he insures.
2565. Take the subsidy paid to the contractor—£1,770 a year; it is estimated, we were told, I think, by Mr. Allt and Mr. See, that they paid for the services of the "Protector" between £1,100 and £1,200 in one year? Do they?
2566. Suppose we take an average of £800 a year? Yes.
2567. According to Mr. Cruickshank's estimate the expenses of working that boat are £2,460 a year for coal, ropes, bonus to the men, 12 per cent. insurance, 5 per cent. depreciation, and £30 for repairs to hull and machinery, and docking; all these matters seem to have been very carefully gone into by Mr. Cruickshank—that is, £2,460 against £2,570? Is that including the earnings?
2568. This leaves a small balance in favour of the ship; we will put the case the other way round now; what shall we say for the pilot—£20 a month? Yes.
2569. That is £240, is it not? Yes.
2570. Then what do you say for the engineer—£18? Yes.
2571. That is £216? Yes.
2572. Well, two firemen—£120 each? Yes.
2573. That is £240, is it not? Yes.
2574. We want two deck-hands; that will be another £240? Yes.
2575. That would be about the equipment? Yes.
2576. Then the maintenance on Mr. Cruickshank's estimate; take that at £150 a month—£600 a year? Yes.
2577. Add that up, and see what it would come to; it would be about £2,700 a year, would it not? Yes.
2578. Well, now, on the other side of the book, we have to take credit for the subsidy—£1,770? Yes.
2579. And the earnings—say, £800? Yes. I might say, though, I know the present tug proprietors have great difficulty in getting their earnings.
2580. But the Government have no difficulty in that direction? How would the Government get it?
2581. They would get paid? These men have not the money.
2582. But they give orders? I am told by Mr. Buckle he has lost a great amount of money.
2583. Well, this amount of money employs the men and employs the pilot, and you have the boat to the good? I have seen many of these schemes. It looks very well on paper; but it does not turn out well. This service appears to be self-supporting. I am very averse to the Government taking up a service of this sort, which would lead to enormous expense. You would require spare boats. For instance, there have been troubles with four different boats in six weeks. The wear and tear there is perhaps five times what it is in Sydney Harbour.
2584. We have heard a great deal about these tugs;—it appears to me that when they are most wanted they are not available? I never heard such a thing. I know a lot of the people in the districts have their own schemes, and want the Government to do this and that; but, you know, under the present system the men do not get their pay unless they render the service, and I must say complaints have been very infrequent in regard to want of attendance of the tug. I have been urged over and over again on the same points you are taking up, and several Members of Parliament advocate the system. I have talked it over with the Premier and Treasurer, and I am sure the expenses of the Government would be largely increased if you were to change the system.
2585. There is one case,—we have evidence that the master of the tug is actually a landsman—he is not a trained seaman at all? He must have a certificate.
2586. I assure you I got this upon very good authority? Is he inefficient in his work?
2587. He is said to be inefficient; he is not considered to be the right man for an emergency, and I take it if there is any time when a tug is required it is in time of emergency; and we find that there is a good deal of friction between the tug-masters and the pilots? That is at the Clarence, I suppose.
2588. I am not speaking of any place? There may be friction.
2589. There is not only friction, but the vessel is not under the charge of the pilot? We had a case reported only the other day. There had been very bad weather at the Richmond, and the pilot thought the bar had subsided, and wanted to cross in a certain position, and the master of the tug would not go that channel, but went another channel. It appeared in this instance that the pilot was right, and the following day he induced the master of the tug to go that channel.
2590. There are two masters in that case? Yes.
2591. That is unfortunate? I do not think so. The master of the vessel is in charge of her, and he controls her. In most of these places there is a most amicable arrangement between the pilots and the tug-masters, but there is difference of opinion occasionally.

- Capt. F. Hixson, R.N.  
18 June, 1897.
2592. There is a great deal of friction, and the pilot has not that control which it is desirable he should have. Going on to another matter, which I have left until last, and which I go into with the full consent and desire of Mr. Wilson, who visited the outports with me. About the matter of the "Captain Cook"; we seem to think from the evidence we have got that the sum of £3,300 per annum is a large sum for so small a service; I think you yourself are of opinion that it seems a large sum? Yes.
2593. The impression left on the members of the Commission who visited the "Captain Cook" was that nothing short of a very complete and thorough reform was necessary in the conduct and management of that vessel. I do not know, but I suppose you know pretty well everything that is going on;—do you think that that vessel, from information supplied to your office, was only about thirty-eight hours away from her moorings during the whole month of March? Very likely.
2594. That is according to the returns furnished? Yes.
2595. Well, then, do you know that the master seldom passes a night aboard that vessel? No.
2596. You are not aware of that fact? I was not aware of that fact.
2597. Do you not think that the master should be on board, of all other times, at night? I do not know. I do not think that he should. I do not think that human nature could stand a man being always on board ship at night.
2598. They all go to sleep on board—they all turn in? Yes; but if a man has his family on shore in a service of that sort he should have some time with them. I quite admit that he should be on board more than on shore. If it is fine weather, and he has his officers on board, I do not think he should be called upon to be on board ship every night.
2599. We do not say every night? He should live on board his vessel, as a rule; but, if a man has his house and family close to, it is very hard that he should not have a night ashore occasionally.
2600. And you think that generally the ship should be his home? Yes. This vessel is called by me at night, and is frequently rendering service. The fact is, that the vessel bears a high character for efficiency. If we ask anybody about the port if the people on board are asleep, I assure you, the general report would be in their favour.
2601. All I say, or may say, is based entirely upon the evidence given by the people on board; the evidence is, that the master is not always on board the ship? I think you had better send for the master. The man, I told you some time ago is over 70 years of age, and is on the list for retrenchment, and he is going.
2602. You remember giving evidence about a Mr. Hay? Yes.
2603. And that man said that the captain was never wholly sober—he said that? He simply said what was not true. I tell you that this man Hay was only on board the ship for a short time. He had been captain of a big ship. He was on board our ship a short time, and knowing his character I am not surprised at his saying anything.
2604. Are you aware that Captain Creer's habits are such as to render him an undesirable person to be even in nominal charge of the "Captain Cook"? No.
2605. I presume that, having said what I have, the matter will engage the attention of the Marine Board? If we are going to discharge the man, what is the use?
2606. I mean to say his habits? The man's age is 71. He does not look more than 50 or 55. No man about the harbour, in or out of the Department, bears a higher character than Joseph Creer does, and I deny altogether that he is a drunkard.
2607. We only go by the evidence; that evidence is of such a character that we should be wanting in our duty if we had not taken notice of it? I have known this man for over twenty years. More than ten years ago there was trouble between him and one of the pilots about drink; but that, until now, is the only rumour that ever I heard against his sobriety, and I must really again ask you to look at the man. He is 71 years of age, and does not look a drunkard.
2608. I have seen him—it is not my opinion—it is what is sworn to in the evidence? Well, you have sworn me, and I assure you that Joseph Creer is not a drunkard. He is a man who is as much respected in the Port of Sydney, as any sailor man about.
2609. *President.*] About the "Protector"; there has been evidence given to us here that when the "Protector" has been removed for repairs a very poor substitute has been sent; of course, I have not seen the contract;—does it provide that a vessel equal to the "Protector" should be sent? It does not say "equal"; it says "substitute." What you say is perfectly right. Not long ago she had to go to Sydney for repairs, and her place was taken by an inferior vessel, but you cannot always have exactly what you want. The rumours going about the coast are sometimes absurd. A vessel was lost at the Bellinger, and the public were up and expected that a vessel would drop from the clouds to take her place at once. The "Emma Pyers" is not the best boat in the world, but the owner of the tug had to put a boat on at once.
2610. How long would that substitute last? I think the "Protector" was away about a month.
2611. And that, I suppose, would occur about two or three times a year? Not so often as that. The "Protector" did not leave her station until this last time for several years.
2612. Speaking about the tugs being owned by the Government: I think that you admitted the financial aspect of the case on paper would tell in favour of the Government continuing the tugs? Yes, if the present value of the tugs were taken, but if the Government were to supply tugs, I am certain the people at the Clarence would insist on having a tug as good as that at the Richmond, whereas the present one at the Clarence is very much inferior to that at the Richmond.
2613. Your objection to it is this: that if the Government take upon themselves the responsibility of supplying the tugs there would be an instant demand for a larger number of tugs? That is it.
2614. That is to say, the rivers which have now no tugs would press to have one? Yes.
2615. *Mr. Powell.*] They all have? I have given you three that have not, and there are others.
2616. *President.*] So that from your view the number of tugs that would be required would not be the same as are now used, but that plus tugs for the rivers that now have no tugs? Yes. On the other hand, the system that is in vogue now is on the wane. For instance, the last time we called tenders we saved £1,200. The prices are going down, and the day is arriving when we need not supply tugs at all. We supplied them when it was sailing-vessels which could not get in or out without them; but now, take the Tweed, there are only steamers plying there.
2617. *Mr. Powell.*] The steamers are the best customers on the Richmond? At the Richmond—yes; at the Clarence they seldom take the tug. If you want to exercise economy take the tug off the Clarence River

River, because there is really no necessity for it. If you put Government tugs on you put them on in perpetuity. I am only giving you my opinion. I am not attempting to dictate.

2618. *President.*] Suppose the Government owned the tugs, could not they be used by the Works Department in the dredging works on the rivers? I do not know whether they could.

2619. *Mr. Powell.*] It is the opinion of the people on the rivers generally? It would be, for instance, in a place where the traffic is regular.

2620. *President.*] Would you kindly look into that matter with Mr. Darley and have a talk with the Works Department about it, and, perhaps, give us a little more information on that point? Yes.

2621. You would use the pilot to man the tug, and you must take into account the fees earned in cases of distress. You do not know the amounts the tugs are receiving? No; I know that at Port Macquarie there is a private tug sent up to compete against the Government tug.

2622. *Mr. Powell.*] There is a commercial side to that as well? If we could do all the Government work in the river by the tug, there would be something in that; but then there is another point to consider: those extensive works at the Clarence and the Richmond will only last a short time.

2623. *President.*] They will be always dredging? —

2624. *Mr. Powell.*] By the look of it, it may be some years before that is finished at the Clarence and the Richmond? When the tugs are at work down at the Heads the scheme might be worked in. I may say these tugs do not come under the Marine Board Act whatever. They have been taken on by the Government without any reference to the Marine Board, and latterly they have been put on our Estimate. We did not father them. It was brought on by the agitation of Members and the Press.

2625. *President.*] It is something like this: the people say, "You are spending a lot of money on the railways, and you should do this to open up our rivers"? Yes; the people about there are very unreasonable indeed in forcing claims on the Government.

2626. *Mr. Powell.*] Your man at the Richmond is not the man to put up a signal to come in or go out when it is not safe; he kept two steamers there the other day; I pified them? Well, if a steamer is lost he is responsible, and I expect he had reasons for acting as he did.

2627. *President.*] The pilot's only object is to relieve himself of responsibility? He is only human; but if he does not let a vessel come in he will hear of it all over the district, and these men try to do their best for the trade and commerce of the district.

Henry Pettit, Harbour-master of Sydney, sworn, and examined:—

2628. *President.*] You are senior harbour-master? Yes; I have two assistants.

2629. Who are they? Captain Bracegirdle and Captain Thompson.

2630. *Mr. Powell.*] What is your age? I was born in 1830.

2631. Then you are 66 years of age? Yes.

2632. What salary do you receive? £356 a year, and pay income tax on that.

2633. Are there any other emoluments? No.

2634. The Departmental return is here at £371? That is, perhaps, not allowing for the deduction of the Superannuation Fund, to which I pay 4 per cent.

2635. That is salary also; that is an investment; you will get a *quid pro quo*. Then your salary is £371? That must be correct then, sir.

2636. Will you say what your duties are in connection with the harbour? Removing every third ship. I take my turn with the other two regularly, and look after beacons and buoys, and see that the fairways and approaches to the different wharfs are kept clear.

2637. There are three officers charged with that duty? Yes; the principal duty is removing these large ships.

2638. The removal fees paid during late years appear to have fallen off very much;—how do you account for that? There has been an alteration. At one time the sea-pilots in taking these ships to sea used to be charged for. A ship, for instance, going to Newcastle from the wharf at night to sea, there used to be removal charged, and it was discontinued; and if they have not the services of the harbour removal officer, they were not charged for it, and now they do it because they find it is not compulsory, and they avail themselves of the privilege.

2639. That is to say, they remove without the harbour-master's consent? Oh, no; they come in and apply, but they move a ship if they feel themselves competent.

2640. And you have no means of preventing that? Not that I am aware of. If they do it legitimately—that is, if they have that privilege—I do not see how we can prevent that.

2641. How many vessels do you think you remove in the year—the three of you? I suppose on an average about sixty ships a month. That is taking the busy time with the slack time.

2642. That is for three harbour-masters? Yes; three of us.

2643. That would not go one a day for each of you, would it? There are the Saturday afternoons and the Sundays taken off.

2644. That would be rather less than one a day then? Yes.

2645. In accounting for the reduction of the dues—all the vessels do not go to Newcastle that go at night? It is principally the Newcastle vessels that go at night.

2646. But there must be very few of these. That cannot affect the removal dues very much? No; but as I say, they have the privilege of removal, and remove them themselves.

2647. Is it a fact that the sea-pilots now come up to the wharf and take vessels right away to sea from the wharf? Yes; even a home-bound ship. If the captain wishes to go direct to sea from the wharf, there is no removal given, and the sea-pilot takes the ship from the wharf right to sea, and no removal charged for it. If he dropped his anchor there might possibly be a charge, but if he is ordered to take the ship from the wharf to sea he frequently does it.

2648. Is not that trenching on your duties as harbour pilot? It would be if it were compulsory for those ships to take a harbour pilot. The sea pilot does that duty. I never heard it questioned.

2649. Do you not think that in the ordinary practice of pilots the sea pilot should take the vessel in sea pilot waters—that is, from Fort Denison? That was the old rule which used to be enforced, and if the sea pilot did the harbour pilot's work it was charged, although no certificate went into the Customs for the removal.

Capt. F.  
Hixson, R.N.

18 June, 1897.

H. Pettit.

18 June, 1897.

- H. Pettit.  
18 June, 1897.
- removal. The officer who had to do with that work used to sign the certificates for vessels handled by the sea pilots, and they were signed by the harbour-master, and went in to the Customs. That is how it used to be arranged until very lately.
2650. You will admit that the sea pilots' and harbour pilots' water was accurately defined, and the line was drawn at Fort Denison? That was understood in the early times.
2651. Now the sea-pilot, by taking the vessel from the wharf, prevents you from charging the harbour pilot's removals? Quite so.
2652. That is how you account for the loss of revenue, and for your having less work to do than you otherwise would have to do? That is it; and these people have the privilege to move their ships if they can do so. The mail-boats, for instance, go right from the wharf to sea, and now those which are exempt from sea pilotage take the harbour pilot and move into the stream, and in the same way with the vessels coming in; we take them from the fair-way.
2653. Have you known of the harbour pilot taking a vessel direct to sea, or taking her below Fort Denison? Oh, yes; we have only got now Neutral Bay and Bradley's Head to take a ship to.
2654. Do you take them round Bradley's? No.
2655. Have you ever heard of such a case? I have not done so, unless I have gone on board a mail-boat that has been docked and overhauled.
2656. The question has been raised that the harbour pilots have sometimes taken vessels direct from the wharf, not exactly to sea, but they have taken them down the harbour beyond Bradley's? Well, I have never done that, and I think I can answer for my two assistants. They may have taken them down a little further if the captain has requested them to do so, but I do not think they have taken them below Bradley's.
2657. An exempt master might avail himself of that service? Yes.
2658. *President.*] You are satisfied with your assistants, Thompson, Bracegirdle, and Sangster? Sangster is not under me; he is a new man.
2659. Do you not know anything about his duties? I know he has to supervise the cargo.
2660. He is not under your orders at all? No.
2661. With regard to Captains Bracegirdle and Thompson, are you satisfied with them? They are most efficient officers.
2662. You are perfectly at liberty to make any remarks you like if there is anything you think may be of help to us in our investigation? I do not think that I can say anything.

Frederick Bracegirdle, Assistant Harbour-master in Sydney, sworn, and examined:—

- F.  
Bracegirdle.  
18 June, 1897.
2663. *President.*] How long have you held that position? Twelve and a half years.
2664. And you were taking vessels into the Clarence River before? Yes; fifteen and a half years in that.
2665. What is your age? I have been giving in the wrong age. I am 62 years of age, and I have been saying that I am 64. I have a paper here to show that I am 62. I was born in 1835.
2666. *Mr. Powell.*] Will you be good enough to describe your duties? The principal duty is removing ships; this is our principal work. Of course, we have to go about and sound the different new wharfs, after the dredging, in places we have to take them to.
2667. Have you ever kept any account of the number of ships you remove? Yes.
2668. How many did you remove last month? That is our slack time. I moved sixteen in April and sixteen in May, and the pilotage amounted to £70 in one instance and £72 in the other.
2669. It is the harbour-dues that you charge, not pilotage? I mean the removal-dues.
2670. You removed sixteen in April and sixteen in May? Yes.
2671. Do you consider that as a fair average of the work? No, it is for winter-time; but that is the slack time.
2672. What would be a fair average, taking the year through? For the first five years I moved 1,372, the next year 220, the next 260, the next 295, the next 136, the next 156, the next 168, and last year I moved 191.
2673. How do you account for the falling off? They are larger-sized vessels. The average tonnage was only 1,700 for the first five years, and for the last year it is 3,492.
2674. Is this 191 vessels for one year? Yes; for last year.
2675. *President.*] As ships increase in size they decrease in numbers? Yes.
2776. Have you anything to say on the subject of our inquiry? I do not think there is anything I could say, except that I do not like to see these ships that are not exempt moving about the harbour themselves occasionally.
2677. *Mr. Powell.*] You want an alteration in the Act of Parliament to settle that; have you been trading to the bar rivers at all? Yes.
2678. Which rivers? Port Macquarie, Clarence, Richmond; but principally to the Clarence.
2679. You have been to the Richmond? Yes.
2680. Were the tugs working in your time? Yes.
2681. What do you think of those tugs;—do you think they were working well? I did not like it in one way. I think the pilot should have more control over them.
2682. We know there is some friction going on? Sometimes, when the pilot wants to go out and sound the bar, there is a doubt about the water; and, of course, the captain of the ship wants to look after his owner's interest, and not run any risk with it, and says there is not enough water there, and you can hardly make him go. Otherwise, I do not think that there is any risk. We never had tugs at the Clarence; we always went in and out at all hours. I have been over the Clarence bar 1,368 times.
2683. From what you have seen, and knowing that there is sometimes a little friction, do you not think it would be far better if the Government had tugs of their own, and put the pilot in command? Yes; I should think it would.
2684. Employing the boatmen on the vessel and having an engineer, and a more suitable vessel for the work built under proper inspection for the Government, and placed in charge of the pilot;—do you think the public would be better served? I think so myself.
2685. Such a tug would be available for sounding the bar at any time, for looking after moorings, and for looking after buoys? Yes; and also built to suit the particular place.

2686. Each place has some speciality, and requires some special consideration? Yes. If a tug draws more than the vessel she is towing, although she could not get out the vessel might.
2687. Do you think if the Government had tugs of that kind the public generally would avail themselves of their services? I think so. Of course there would be bound to be a lot against it. I think it would be better for the vessels themselves, no doubt.
2688. And better for the pilots? Yes. They would feel that they could go and do their duty without being obliged by the captain of the tug.
2689. They have no power to take the ship? No.
2690. The pilot, if he had charge, would be the best judge of the safety of going out and the safety of the vessel? Yes.

F.  
Bracegirdle.  
18 June, 1897.

Thomas Robertson Thompson, Assistant Harbour-master, Sydney, sworn, and examined:—

2691. *President.*] You are assistant to Captain Pettit? Yes.
2692. How long have you been employed? I have been eleven and a half years in this position; twelve years' service altogether.
2693. *Mr. Powell.*] What is your age? I am 40.
2694. And your salary? £281.
2695. That is including allowances? Including everything.
2696. Your salary is £250? The salary now is £281—that is, including allowances.
2697. *President.*] Do you pay to the Superannuation? Yes.
2698. Does that include what you pay? Yes.
2699. £281 is the gross salary? Yes.
2700. *Mr. Powell.*] Will you please tell the Commission what your duties are? To remove vessels about the harbour from stream to wharf or wharf to stream by the different tugs, and place them in the docks; and I have sometimes been called upon to go and inspect vessels in the absence of the inspectors.
2701. That is only occasionally? That is occasionally; about once in six months. It is not reckoned as part of my duties, but I am sometimes called upon to do it.
2702. How many vessels do you remove in the course of a year;—can you tell how many you removed last year? In a rough way, I moved about 209 or 210.
2703. Have you been in command on the coast here? No; I was chief officer in the Bulli boats before I joined the service.
2704. You have been on the coast then? Yes.
2705. But you had nothing to do with the Harbour Department before you joined? No; not the Harbour Department. I had great experience with the colliers in the present work I have got to do. I was in and out three or four times a week.
2706. Did you ever trade to the bar harbours north? No; I have never traded there. I would like to say something about my salary. Our work now up the harbour is considered by all the shipmasters we have anything to do with as having much more work attached to it than the sea-pilots have to do. They say now, by the way the steamers come in, and also by the way the sailing-vessels tow in, that the work required most is the harbour work; and we are the poorer paid.
2707. *President.*] Your salary is less than the sea-pilots? Yes.
2708. You have more work to do? Yes; and our responsibilities are more. We have more liability to do damage to ships than the sea-pilots have.
2709. *Mr. Powell.*] You are there not to do damage to ships? We have the liability. I think our record is a pretty good one. I would like that to be adjusted. I have been in the Service twelve years, and there are three or four servants that I am senior to who are getting £400 a year.
2710. Are not the vacancies on the sea-pilot staff filled up from the harbour staff? No; I applied when I came here, and I was told that I was doing my duty, and they did not want to make any more changes. I was in a class under the Civil Service Act of 1884 then, and the sea-pilots were not in that, and they said if they sent me there, they would put me out of the Service.
2711. *President.*] We will take a note of that matter.
2712. *Mr. Powell.*] You are not killed with work? Not at present. Our work comes during one six months in the year, in the wool season. Very often then we have to get up early in the morning and stay late at night. We have to take the work as it comes. I have done as many as four vessels in a day.
2713. *President.*] What is supposed to be your own time? It is supposed to be from sunrise to sunset, but the wind gets up in summer time, and it is dangerous to move these ships in a strong wind.

T. R.  
Thompson.  
18 June, 1897.

Alexander Sangster, Inspector of Shipping, sworn, and examined:—

2714. *President.*] How long have you been in the Service? Five months.
2715. You have been appointed temporarily pending the result of this examination? Yes.
2716. Just give us more particularly your work, and under whose instructions you act? What I have had to do since I have been there has been very varied in a number of cases—that is, inspecting shipping generally.
2717. For what purpose;—you do not, for instance, inspect the engines? Principally the loading and equipment.
2718. The spars? Spars, rigging, and in fact everything in connection with the shipping except her engines and hull.
2719. Before the ships go away do you inspect the load line? Yes.
2720. As a matter of fact, every ship before it leaves is inspected by you? No; most of them are, but not all.
2721. What are the exceptions? Ships that we cannot see through so many leaving at the same time. But we generally see them on or before sailing.
2722. Is it in pursuance of the requirement of the Act of Parliament that you do that? Yes.
2723. Do you give a certificate? No.
2724. Under whose orders do you act? Captain Lindeman, the Secretary.
2725. You receive orders direct from Captain Lindeman? Yes.
2726. You have nothing to do with Captain Pettit? No.

A. Sangster.  
18 June, 1897.

- A. Sangster. 2727. *Mr. Powell.*] When you say you receive your orders from Captain Lindeman, what kind of orders do you refer to? We go in in the morning and inquire if there is anything particular to do, and then we have a list of all the shipping that is leaving the port that day, and see them and go round the wharfs inspecting other ships, going on board, seeing their lamps and rigging and boats and life buoys and life belts and everything. I have taken a note of all the duties I have done since I started.
- 18 June, 1897. 2728. Are those passenger ships you are speaking of? Yes; passenger ships and ships that have no certificate.
2729. You are a ship-master, are you not? Yes.
2730. How about this load-line—that is fixed by the owner;—you have nothing to do as an official with fixing the load-line? Yes.
2731. Under what Act? Under the Merchant Shipping Act, I think.
2732. Here is the Act;—it is the owner's business to mark it? We do not mark it. We only work out what she is allowed.
2733. *President.*] It is the safety load-line;—if the ship is loaded beyond a certain depth she renders herself liable to danger and to accident? Yes.
2734. *Mr. Powell.*] You recommend the place for marking the line? Yes.
2735. About going on board those ships, what does that mean;—does it mean a critical investigation into their condition, or does it mean a mere cursory view? In our instructions we have to go on board all ships coming to the port at any time, and inspect their lamps and gear generally.
2736. Are we to understand that you examine every ship that comes into Port Jackson thoroughly, and see that she is thoroughly found? Not all ships.
2737. What ships then? Principally the intercolonial steamers and colliers.
2738. Well, the intercolonial steamers are mostly passenger-boats? Yes.
2739. Do you examine them with reference to their passenger fittings? I have nothing to do with that, but I have assisted the shipwright surveyor in that.
2740. Have you anything to do with the boats? In ships that do not require certificates, and in ships that have had their certificate for some time, I take notice if the boats are still in their places, and all their appliances, such as life-lines and davits, and see that they are not jammed up with cargo.
2741. Do you see them put in the water occasionally? No.
2742. Who does that? The shipwright surveyor.
2743. He comes under the Imperial Act and the local Act? Also the Merchant Shipping Act.
2744. Do you find yourself fully occupied with what you are doing? Yes.
2745. Is it a work of any importance;—do you not think that a man of your position in the mercantile marine should have something better than that—going on board ships and seeing that boats are all right? I did when I first joined; I thought that I would have more important work to do.
2746. Do you feel yourself capable of taking the position of pilot? Yes. I was five years in command of a large sailing ship.
2747. Into this port? Yes; I was running to this port for seventeen years.
2748. And do you go down about all these wharfs in Sussex-street? Yes; I know them pretty well.
2749. About the colliers—they are not passenger-boats? No; but they have to be watched pretty carefully in lamps and boats. I find they want more watching than any others. The shipwright surveyor does not go through them.
2750. You are a kind of an assistant to the shipwright surveyor? Yes; I have assisted him in most of his emigration measurements since I have been on.
2751. You measure for the cubic space? Yes.
2752. You are termed a water-bailiff;—do you know what that means? No; I do not.
2753. You have an office, and you do not know what it means? Since I have been there I have asked on several occasions what water-bailiff means.
2754. It is not very satisfactory to hold an appointment and not to know what it means? No; it is not.
2755. Then, generally the work you do is more in the nature of assisting the shipwright surveyor? That and the inspection of shipping. Our principal duties are in watching the deck cargoes of ships, overloading of ships, and loading below the load-line.
2756. Inspection is a very vague term? There are a great number of things to do. We are sent out nearly every morning. There is always something to do. I have had things to do which I thought were not quite in keeping with my calling, such as delivering circulars.
2757. It seems a big salary to pay for a duty of that kind? —
2758. *President.*] Do you mean to say that you act as a messenger in the office? Not as a messenger, but I have been delivering circulars.
2759. And what other work have you done that you think you ought not to do? I could not say that there is any other work that I thought I ought not to do.
2760. I mean work you did not expect to do? I thought when I joined the Board that my work would be principally surveying ships, and seeing their condition at the time.
2761. Did you do that? Yes.
2762. And something else? There are lots of things. I could not tell you at the moment, but I have taken a note of the principal duties I have done since I have been there.
2763. Are you fully employed? Yes. We do lots of things. When we are not very busy we go round the wharfs, and see that ships have proper gangways and nets under them; but you have got to have a good sea-faring knowledge to go on board and speak about anything to the captain.
2764. Have you anything you would like to suggest to the Commission? Only three things. I was very much disappointed on leaving my former employment that I only got temporary employment, and I was very much disappointed with my salary. I thought I was to get £99 more than I did get. I was six weeks attending the Marine Board before I got any pay.
2765. That is to say, you were appointed and not allowed to go on? I attended there every day for six weeks before I got any employment.
2766. *Mr. Powell.*] It is not the fault of the Marine Board that the appointment was temporary.
2767. *President.*] It means that it was pending the finding of this inquiry? I was very much disappointed at it being temporary after giving up a good ship, and the salary being less than I expected. I was told I was to get £299, and now I only get £200.

2768. *Mr. Powell.*] Have you heard any reason for that? No. I asked Captain Lindeman why the wages were so low, and I asked if I could get the wages for the six weeks, and he told me he did not know. I asked him if I should apply to the Board, and he said I had better not. I have not seen Captain Hixson. I have met him, but I have not spoken to him since I have been on the Marine Board Service. I gave up going to sea, because my wife did not care about it. I am very thankful for the position I have got, but I expected it would be better.

A. Sangster.  
18 June, 1897.

2769. *President.*] Do you think you are as fully employed as you might be? If we do all the work there is to do we will be fully employed. If we carry out the Navigation Act thoroughly we will have plenty of work to do. I have never got any instructions since I have been there, only from Captain Newton, the other inspector. I have been sent by Captain Lindeman several times to look at a ship when any complaint has come in, such as inspecting the ship's fore-castle when the seamen have complained.

2770. You are immediately under Captain Lindeman? Yes.

MONDAY, 28 JUNE, 1897.

PRESENT:—

JOSEPH BARLING, Esq., J.P., PRESIDENT,  
GEORGE ALEXANDER WILSON, Esq., J.P.  
JAMES POWELL, Esq., J.P.

Bruce Baird Nicoll, Merchant and late Steamship Owner, sworn, and examined:—

2771. *President.*] You are a merchant and owner of steamers? I am now out of the shipping trade.

B. B. Nicoll.

2772. But you were a shipowner? Yes, for more than twenty years.

2773. So you are intimately acquainted with the requirements of the northern rivers in respect to the pilots? Yes; I have had practical experience. I can give you a good deal of information as to the working of the Marine Board and the pilots, and the constitution of the Board as it affects shipowners.

28 June, 1897.

2774. I think we had better give you a free hand in giving us the benefit of your opinions? I have been of the opinion for years, and am sure all shipowners, and persons who have had to do with the Marine Board, are agreed that it is really obsolete and unsatisfactory, and quite unfit for the work and duties it is supposed to carry out. I say that emphatically, because I have had experience to prove it. One reason is that some of the members have business interests connected with shipping. One particularly is engaged in a very large business, supplying ships and steamers with all sorts of requisites from a needle to an anchor, and is also a director of a very large industry established in the port. It seems to me unfit that he should sit in judgment upon cases in which his customers may be interested. There is another gentleman, a marine engineer, a very good and estimable gentleman, but he may also be employed by shipowners and companies in his professional capacity. These gentlemen are very estimable; I say nothing against them, but against the system. Then I could name another gentleman who is interested in coal mines, and is a shipowner, and he really should not sit on the Board. Then, besides those three, there is another who is interested in shipping, and this may possibly come into conflict with his duties on the Board. About the other gentlemen composing the Board, of course, there is nothing to say, because they are out of business, except that they are hopelessly out of touch with the requirements of the present day. This is known not only to me, but to thousands of people in the Colony. This wants remedying very much. Another thing is, that the gentlemen who compose the Board at present are out of date, not up with the times. Some of them went to sea twenty or thirty years ago in old sailing ships, and they really have not got up to date knowledge of the improvements in steam-ships, and in navigation. They are very far behind, and they are totally unfit to adjudicate upon cases coming before them—some of them cases requiring a great deal of experience of a late date. There are also very numerous complaints by the public about the harbour traffic, the harbour regulations, and the obsolete and old fashioned shipping regulations, and there is no doubt, take it all round, that the Marine Board is very unsatisfactory to the shipowners, the seamen, and the community as a whole. It wants altering completely. The elective and nominee system is a mistake altogether. I do not know that you want a Board at all. In England they have a Judge and two nautical assessors. Of course, these men would be removed from all associations, as they would not be shipowners, nor in the employ of shipowners. They would not be men going to sea. They would be totally unbiassed and unprejudiced. They would be men of experience, and capable of assisting the Judge in nautical matters. That system should be adopted here, and it would work very well. I am sure that cases of shipwreck, certificates, and all matters dealt with by the Marine Board would be better dealt with by a Judge and two assessors in this way than by the Board, and with more satisfaction to the public, the shipowners, and the seamen. I have been in Liverpool, England. I judge from the experience of ship-owners and captains in the old country the system gives satisfaction and works harmoniously, and there is not the same friction that there is here. Go where you will, if you speak to a sailor or to an officer, no matter who it may be, there is nothing but complaint against the Marine Board. That has been going on for the last fifteen years to my knowledge. I do not think the Marine Board is necessary at all. If you had this system it would be less expensive, and certainly more satisfactory.

2775. How would you propose that the nautical assessors should be selected? I am sure there are plenty of men who are quite suitable for the position. You could get men who had been to sea for a number of years, a commander of one of the large steamers running out of Sydney, and one who had been employed on the coast for a number of years.

2776. Would you leave the selection of these assessors to the judge? I should leave that to the Government.

2777. *Mr. Wilson.*] I think in New Zealand these assessors are registered;—if it is an engineering question an engineer is selected? Yes. I should recommend that the Government should have the appointment of these gentlemen. I do not think the Judge would be the proper person to appoint them. I do not think he would have the knowledge. I think the Government would have better knowledge.

2778. *Mr. Powell.*] Do you not think a panel should be selected from year to year, nominated by the Government, from which the Judge could select the particular assessors he wanted? You could have a regular panel, like a jury. That would act very well indeed.

- B. B. Nicoll. 2779. They could sit with the Judge as assessors? Yes. That system of selection would be better, as it would give a larger scope.
- 28 June, 1897. 2780. *President.*] If done in that way it would meet the general improvements that took place in shipping? I think that would be a good idea, certainly.
2781. Then let the Judge select them from time to time from the panel? Yes, according to the particular case which might come before him. A case involving engineering knowledge would require an engineer, and if it was a nautical matter a nautical man would be selected.
2782. *Mr. Powell.*] It is very likely the Judge would be in agreement with both sides in the selection of the experts? Yes; I think that would be a wonderful improvement on the present system.
2783. *President.*] Now could you give us any information about the subsidised tugs? I will come to that presently. I am only speaking now about the general disaffection to the Marine Board, and I could give cases, but I do not think it is necessary. I think it is pretty well public opinion that the Marine Board is unsatisfactory.
2784. *Mr. Powell.*] Will you give us your general opinion about the detail working of the Marine Board, whether it could not be as well performed by a chief clerk or a Harbour-master? I was going to say that if you have the Judge and assessors, which would be an excellent thing, I do not think it is necessary to have the cumbersome machinery of the Board. You could make this a branch of the Customs. It is simply a matter of carrying out details, and I think it would be quite sufficient, instead of having a Marine Board, to put it under the Customs or a Harbour-master.
2785. *President.*] Do you mean a general Harbour-master for the whole of the Colony as head of the Branch? Yes; that would act very well.
2786. *Mr. Powell.*] He would supervise the pilots, and lights, and harbours? Yes. The work is merely carrying out the Act. The rest would be dealt with by the Judge and the assessors. I am sure that would meet all requirements. There is one thing I would like to give details of. The Marine Board have a trip once a year to see the lighthouses, and sometimes they do not visit six of the whole lot. Often they cannot land at the bar harbours because the bars are bad. Sometimes the tug will take them over, and they stay an hour or two hours and go away again. That is the whole of the inspection for twelve months. I think there should be one man, an inspector of lighthouses and pilot stations, to go north and south, right along the coast. They want looking to occasionally. I think these places should be visited more than once a year.
2787. They should be visited at uncertain times? Yes. When the Marine Board goes there everything is ready to meet them—everything polished, and the lights right. There should be an inspection throughout the year right from Cape Moreton to Cape Howe. There is no Departmental action by which they are properly inspected. They are left to take their chance for once a year.
2788. Are the leading lights properly attended to on the rivers? When I was in Parliament I managed to get new lights put on some of the rivers. They were inefficiently looked after.
2789. People are paid £36 a year for looking after those lights? I have been on these rivers, and they are very seldom lit at night, and navigation is very dangerous. I know on the north arm of the Richmond River they are never lit. I think it would be a very good thing to light up the rivers at night, and a great improvement.
2790. Then you say generally that the leading lights are not properly attended to now? I am speaking of the inland navigation. I say certainly to my knowledge they are not attended to, and it would be a good thing if they were properly looked after.
2791. *President.*] And you think the appointment of an inspector to periodically visit these places would result in more effective management? There is no control at all at present. The thing is a farce as far as supervision is concerned. It is left to look after itself. Then about the tugboats and the pilots. I believe I lost thousands of pounds through want of control by the pilots. It is a standing evil. The pilots at all these rivers, north and south, where there are subsidised tugs, are generally at loggerheads with the masters of the tugs. The pilot has not the slightest control over the tugboats, and very often the pilot may want to go out and see the depth of water on the bar, and because it is rough the tugmaster will point blank refuse to go out. The result is that vessels may be kept two or three days through not knowing the depth of water on the bar. I used to pay the tugboat at the Richmond about £1,500 a year for towages, and I suppose the North Coast Co. paid as much. That is £3,000, and the subsidy used to be £3,000, yet, with ten sailing vessels and two or three steamers bar-bound at that river the tugmaster would refuse to go and sound the bar with the pilot because he said it was rough. I have also seen ten or twelve vessels waiting to go out of the Richmond, and one or two steamers, and the tugboat has actually gone out and taken two sailing vessels in and taken them right up to Lismore, a distance of 65 miles from the heads. For this they get about £25, and the other vessels would have got out while they were away through the bar being smooth; but the next day a heavy sea has come up, and these vessels would be kept another week with live stock, produce, and passengers on board. The pilot has no control at all. This is a case that has come under my own knowledge.
2792. How long is that ago? That is about four years ago. I do not think there has been any change.
2793. Do you say that similar things happen now? I believe it is the same now. Of course there are so many more steamers and not so many sailing vessels. The Richmond bar is a very uncertain bar. Sometimes a tug is required to guide the steamers out on account of the zigzag channel, and a strong sea running in. It is dangerous to go without a tugboat. They require the tug's power and their own to keep them in the channel. I have had complaints from captains that their steamers have been ready to go out, and the tug has actually gone out and brought vessels in and taken them up the river, and not assisted the steamers out. The captains have often gone to the pilot and said they wished to be towed out, and asked if it was safe. He would say "Yes," but the tug would go out over the bar, and bring a vessel in and take her up the river, and then a sea would come up and they could not get out for a week.
2794. What do you propose as a remedy? If the tugs are to be subsidised they should be under the pilot's control. The best plan would be for the Government to own the tugboats and have them under the control of their own officers. I brought the matter up in the House once or twice, and Sir George Dibbs said it would be too expensive, but I do not think it would be any more expensive than the present system; but if Parliament objects to that the next best thing is to call for tenders under the arrangement that the pilots have the control of the boats.
2795. The Government would then practically charter these vessels? Yes; the pilot is the responsible person.

person in all these bar harbours. He knows the state of the bar better than any other person there. The tug-boat owner could have his own captain, but the pilot should have control of the boat, and take it out when he required. I am sure he would never take any risk, and he is always an experienced man. I am sure that no insurance company would object to insure the boats if the pilots had control, nor do I think it would increase the cost in the tenders. B. B. Nicoll.  
28 June, 1897.

2796. *Mr. Wilson.*] The companies would prefer it probably? Yes; I think so. The pilot knows the channel best. Any gentleman who has had experience in shipping knows that this is the cause of great trouble throughout the North and South Coasts, and I am sure there is often loss of property through this want of control by the pilots.

2797. *Mr. Powell.*] Can you form an idea of the cost of a tug to suit the Richmond? Do you mean, built here or in Scotland or England?

2798. I mean built here? It costs fully 33 per cent. more to build here than in Great Britain.

2799. Suppose they were built here, and the engines and boilers imported? Would you have wooden boats?

2800. Yes? If you built the hull here, and imported the machinery, I think you could build a tug suitable for all the requirements on the Richmond for £8,000. It would have cost a good deal more some time ago.

2801. That would be in all respects suitable? Yes; efficient and suitable. Her horse-power would not be less than 100 to 120 nominal.

2802. Would you require a boat of equal power for the other rivers? No. The largest tug is required for the Richmond. You should build a boat with no special ornamentation, but just suitable for towing. The machinery for that boat could be imported for about £4,000, and the hull should not cost more than from £3,000 to £4,000. Of course she should be coppered. A steel boat would cost about £11,000.

2803. Looking at it from a commercial point of view, and with the knowledge that in eleven years the Government have paid in subsidies £66,000, do you think it would be a good thing for the Government to have their own boats, even at the expense you have named? I think it would be cheaper all round. The cost of the crew would not come to the cost of the subsidy. With the pilot's crew in the boat it would be much cheaper.

2804. The pilot would be master? Yes.

2805. *President.*] Do you think, if the Government were to call for tenders for that service for five years, that it would be worth while for private persons to build tugs? It would not pay them if under ten years. They would have to lay their money out on vessels that might be unsaleable at the end of the contract. It is a risk, and they have to write off about 5 per cent. for depreciation every year. I think that as an inducement to lay out their money it should be ten years.

2806. *Mr. Powell.*] Do you not think that anything in the shape of divided responsibility would be bad? There always will be friction between the pilot and the master of the tug if responsibility is divided.

2807. Would it not be better that the control should be only in the hands of the pilot? I must say that it is the general opinion that it would be better for the pilot to have the control; it would be better in every way. I think the Government should do it even if it were at a small extra cost.

2808. You must not lose sight of the fact that there would be the earnings? Yes; they would have all that.

2809. A moderate sum in charges would go a long way? Yes; it would help expenses. You say £66,000 was paid in eleven years. I think that seeing the pilot and crew would be utilised and only engineers and firemen required, and taking the earning power of the boat into consideration, it should cost no more than now, if not less.

2810. What would be the life of a tug of that kind? The boiler would last ten years, and the hull twenty years. With two boilers she would last twenty years. The machinery would last the whole time with care.

2811. *President.*] You must take in the risk of possible loss during that time? You must insure the vessel, and charge insurance to the cost. The Government are spending so much money on the bars now that the risk will gradually get less and the insurance get less. The Clarence bar is an easy bar now, and the insurance there would be low.

2812. Have the works at the Clarence improved the bar? Very much. On the Clarence and the Richmond they have done a large amount of good. The Richmond is not so dangerous now. The entrance is very much better, and as the breakwater progresses no doubt it will be a splendid and safe bar harbour.

2813. *Mr. Powell.*] I suppose, from your knowledge of the Northern rivers, the shipowners would not object to pay reasonable rates for the service of the Government tug as they do now? Oh, no; it has cost me over £1,500 a year for one river alone, and I must say that the shipowners would be only too glad to pay a reasonable sum for towage. Some of the bars are much better now, and, of course, the steamers do not require to pay so much for towage, as they do not take the tug so often. Sailing vessels must take the tug in and out.

2814. What do you think would be a minimum rate? All the captains trading to these rivers are exempt from pilotage. Would you make that compulsory?

2815. They only need pay for work;—if they want the service the boat is there? In that case you should charge the ordinary scale.

2816. We know what the scale is, but we do not know what they charge for special services? They charged me for towage 1s. a ton each way on our registered tonnage.

2817. That must come pretty heavy? Yes; it was very expensive. One of my boats cost me over £100 a month for towage when the bar was bad.

2818. *President.*] Are they charging that now? I do not know what the scale is. Mr. Fenwick used to charge as much as he could get. The pilot had no control, and there was no remedy. They could put you ashore if they liked.

2819. *Mr. Powell.*] Do you not think a reasonable charge should be made by the Government, and that almost all vessels would avail themselves of it? I am sure they would if it were a reasonable charge—say, 6d. a ton.

2820. With a minimum of 40s.? Yes, certainly. The rate is a matter of arrangement as the bar gets better or worse. Charge what is a fair thing.

2821. *President.*] And a minimum rate for steamers? I think a minimum of £5 would do. Of course, it would be a Government boat, and should not make a profit. 2822.

B. B. Nicoll. 2822. The idea is to make the charges cover every possible risk, without making a profit? Yes, certainly. There is another matter. Some of the pilots own lands, and set the boatmen to work them. At a Northern river the pilot employs the boatmen to dig and hoe and pull corn. I can bring evidence to prove that they have actually been kept until 12 o'clock at night, shelling corn. This has been going on for years. The men complained to the Marine Board.

28 June, 1897.

2823. Is that same pilot still in charge? Yes. One man who was discharged I know well. There was no complaint against him particularly. I took him to Captain Hixson, and there was some trifling complaint that he had said something to the pilot while in the boat, which he denied. He was discharged simply to make room for the pilot's son.

2824. Is the pilot's son still employed? Yes. Captain Hixson promised to give him future employment. I do not know whether he has got it yet or not. This man was employed until 12 o'clock at night, in the barn, shelling corn. He is a good man. He has a captain's certificate, is thoroughly steady, and does not drink. I can vouch for him as thoroughly reliable. I have seen coops of poultry on board steamers, addressed to the members of the Board, from the pilots. It seems to me that the whole thing is a happy family sort of business. As long as these men keep right with Captain Hixson and the Board it is all right. There seems to be no supervision; they are not bothered about anything. Some of them have been there for a great many years, and are too old. That is a very bad state of affairs. The men in the pilot service have no place to send complaints to; but perhaps you will recommend that these men be given a status. They have no status now.

2825. If it were made a Government Department they would be Civil Servants? These men have no redress at all. They are generally hardworking men, who have been sailors.

2826. If an inspector, such as you propose, were appointed he could look after this? He would remedy this evil of working the men on the land.

2827. And if the pilot were in charge of the steamer there would be plenty of work to occupy the men's time? Yes; this man, I am told, makes a couple of hundred a year out of the land.

Alfred William Meeks, Merchant, and President of the Chamber of Commerce, sworn, and examined:—

A. W. Meeks,

28 June, 1897.

2828. *President.*] I think you are one of the principals of Gibbs, Bright, & Co.? Yes; and President of the Chamber of Commerce.

2829. We think you can give us some valuable information with reference to this Commission, and we leave you to put it in your own way? Do you wish as to the present constitution of the Marine Board?

2830. Yes? I think the present constitution is wrong in principle. As I understand it, there are seven members, three of whom are elected by owners of locally-registered boats. These locally-owned boats may be mere lighters and small coasting boats, and need not necessarily be vessels of any moment, while the harbour contains a large number of sea-going boats.

2831. The local vessels are about 90,000 tons, and the foreign-going, 1,500,000 tons? And that 1,500,000 tons are practically unrepresented on the Board. The question arises in my mind whether you want a Marine Board at all to carry on the administration of the Department. The administration is really in the hands of the President and Secretary just as the Collector of Customs administers his Department, and the principal reason for having the other gentlemen on the Board is for inquiries about disasters, casualties, and such like. I have for some time been of the opinion (and I must say, after very careful inquiry of very experienced shipping masters, that they bear out my own view of the matter) that it would be far better if we had an inquiry Court—that is to say, a Court with a Judge or Chief Magistrate as Chairman, and two nautical assessors or more as the case might require. Now that we have a Public Service Board, it should be left to them to appoint the assessors, because they would be free of all political influence, and free of all badgering for office which must necessarily occur if the Minister had the appointment. Now, we require to-day, owing to the alteration which has taken place in the construction of steamers and machinery, and the advance in navigation, that these men should be up to date, and the only way to get them is to take advantage of the men who come off the sea from time to time, and appoint them on an assessor's roll from which the Court might be made up. Those are my views with regard to the inquiries. This would overcome all the difficulties of the present Board, which, being elected, must give dissatisfaction to a number of people. You know now the seamen, firemen, and stewards want to be represented on the Board. They do not want it just for the sake of representation, but for the sake of the inquiries. I should oppose an officer of a boat being tried by men who had not the necessary qualification by training, nor the knowledge necessary to obtain a master's certificate. Cases where certificates are handed in to be dealt with, and which may end in more serious charges in case of loss of life by collisions, should be tried only by those who are most competent, and not by stewards, seamen, or firemen. The assessors should not be appointed for a number of years, and the list should be altered at intervals, and advantage taken of any fresh men coming off the sea, so that the roll should be as complete as possible.

2832. To whom would you give the selection of assessors to try any particular case? I have not given that serious thought. I am rather disposed to have a formal panel, and take them in rotation, but if the Judge thought it a special case, I should be disposed to allow him to increase his advisers; he might have four.

2833. Do you think it would be advisable to give the Judge power to nominate his assessors, subject to Executive approval in any particular case? I do not think it would be necessary. The roll would be so good, in my opinion, that as a rule, with the men running in rotation, it would be perfectly fair. I think it is a little awkward to call upon a Judge to select his assessors beyond saying, "I want four for this case." I have no objection to that. If he had to say, "I want Captain So-and-so and Captain So-and-so" it would be putting him in an invidious position, to which he would object. In certain cases it might be right to give the right to challenge to this extent,—that if a captain were engaged in anything connected in any shape or form with one of the companies he could be objected to on that account.

2834. *Mr. Wilson.*] Would you give the parties the right to lodge objections to any particular assessor up to a certain time? Yes; it might be done beforehand. Lists might be sent to those who had to appear, stating that the case would come on on a certain day, and the assessors would be selected from a list enclosed. They should then have the right to write to the Judge and object to any assessor, giving their

their

their reasons. I do not want to say a word against the present President of the Marine Board. I have a very high opinion of him. I do not think we need a Board at all, as the President and the Secretary really administer the Department. It is really administrative work. A. W. Meeks.  
28 June, 1897.

2835. *President.*] Do you know anything about the subsidised tugs on the rivers? No; I do not. Those are my views after residence in three colonies and very close attention to shipping and mercantile matters in two colonies particularly, and I have been President in the Adelaide Chamber of Commerce.

Alfred Settrec, merchant, and owner of sailing ships trading to the northern rivers, sworn, and examined:—

2836. *President.*] How many years have you been connected with the shipping trade to the rivers? About twenty-five years. A. Settrec.  
28 June, 1897.

2837. We think from your long experience in connection with this trade that you may be able to give us valuable information? I have always been of the opinion that the Marine Board is not constituted as it should be. I am a ship-builder as well as a ship-owner. There should be on the Marine Board a ship-builder, or a man who has had some experience of building shipping. I also think there should be an engineer there in the same way.

2838. If one interest is to be represented others will want representation;—what interests do you think should be represented on the Marine Board? I think there should be a ship-builder there, who, as soon as he goes on board a ship, would know her construction and weak points at once. I think also there should be an engineer on the Board; and a seaman should be appointed to look after his portion, because if I, as a ship-builder only, went on board a ship I would not know that portion of it.

2839. You think that all interests that come under the operation of the Board should be represented on it? I really do.

2840. Do you think that by that arrangement you would have a good judicial Court? I really do.

2841. Do you not think that there would be a clashing of interests under such a system? I do not know how you are going to avoid that in any case.

2842. Suppose you had an independent party, say a Judge of the District Court, assisted by two assessors, appointed as a Marine Board Court? I know the general feeling among the shipping is that there should be a mechanic of each sort on the Board. They send men to inspect our ships, and they do not know anything about it.

2843. What you are referring to now is the administration of the Department, the surveying of ships, and so on? Yes.

2844. But what I am referring to is the Court constituted to try a case of accident;—do you think such a Court should be representative in the way you propose? Most decidedly I do; if they are in the right place in one position, it follows that they must be so in every case.

2845. Would it not come to this: separate the judicial functions from the executive functions, in which a knowledge of ship-building might be very necessary;—do you not think a Judge of the District Court, assisted by two nautical assessors, would compose a Court which would obtain the confidence of the whole of the shipping community? In that case I really do not.

2846. Then we come to the executive functions: if we had in the Department a qualified person who would be an engineer, and another a ship-builder, do you not think that would give satisfaction? I believe that would give satisfaction, I really do, in conjunction with practical nautical men. The thing has been mooted here for years and years among us ship-builders. I know we are very dissatisfied sometimes when these people come on board our vessels. I really do not think they know anything about it.

2847. Who is the shipwright now? Mr. McRitchie, but he does not touch our vessels at all.

2848. If there were a shipwright on the panel of assessors it would give you all the satisfaction you require? Yes, for sailing-vessels, but not steamers.

2849. Now take the matter of the subsidised tugs—I shall be glad if you will give us your views;—we want to know whether it is working satisfactorily to the public? I must say in the first instance a lot of dissatisfaction is caused by the boat being stationed at the Bellinger River while there is nothing going in or out of that river. I suppose I get 75 per cent. of what comes from that river, and there is not one cargo a month coming out. There is a tug waiting on that one boat a month, while there is only one tug to do the Nambucca and the Macleay towages.

2850. Are you the agent of the boat running there? No; I am the agent for the mill at the Bellinger.

2851. *Mr. Powell.*] As a matter of fact, there were seventeen sailing-vessels and eighty-four steamers visited the Bellinger last year;—this is a return from the Marine Board, and the cost of the tug is £746? There are the Nambucca and the Macleay with one boat to do the two rivers, which it cannot do, and is the cause of some dissatisfaction.

2852. What do you think is the reason? Considerable delay to vessels waiting at the Macleay sometimes for days for the tug to come from the Nambucca, and the contractor has been threatened more than once for keeping the vessels behind the bar.

2853. *President.*] You are interested in the Bellinger River yourself? Yes; in the timber business.

2854. I suppose these vessels trading to the Bellinger bring other produce than timber? No; very little. The North Coast Company gets nearly all of it but timber and firewood.

2855. Do their steamers go to the Bellinger? Occasionally. I think there should be a tug at the Macleay, and let the other boat do the Nambucca and the Bellinger.

2856. You think the Macleay has sufficient business to employ one boat? I do.

2857. And then the Bellinger and the Nambucca could well be served by one boat? I think that would give satisfaction.

2858. Do you know anything about the management of the tugs themselves;—are you aware whether the present management gives satisfaction? I do not know whether you are aware of it, that I and two others have put a new boat at the Hastings River, simply because we were not satisfied with the treatment we were getting. We have all the tug work there now, because we have most of the trade.

2859. You have all the timber from the river? Yes.

2860. What other produce comes from there? Not much. It comes in the steamers. We were dissatisfied and complained, and no notice was taken, so we built this boat.

- A. Settree. 2861. What complaints did you make? None; but my skipper used to say he wanted to go out, and they would not take him out. They would tell him to wait till morning.  
 28 June, 1897. 2862. Are you aware whether the pilot had anything to do with that? He had nothing to do with it.  
 2863. Do you know of any case where the pilot advised that the tug could go out and the master refused? I do not.  
 2864. Do you know of any friction between the pilots and the masters of the tugs? No.  
 2865. You say that the tug-boats will not go out when you want to? Our skippers complained continually about it, and we got the boat, and the tug has done no work since. It is not paying us to keep the vessel there, but we have done it because we are not satisfied with the present arrangements. We get quicker despatch for our vessels.  
 2866. How many vessels are you running to Port Macquarie? All of us are now running eight.  
 2867. All these eight vessels are now served by your tug? Yes.  
 2868. Do you think that if the tug were under the control of the pilot that the cause of dissatisfaction would be largely done away with? I do not. I think it is better in private hands.  
 2869. Do you think that the subsidised tugs along the rivers might be withdrawn altogether? No because there is not sufficient to pay the boats without it.  
 2870. How do you propose to remedy that then? The present state of things is all right, if there were better supervision and more notice taken of complaints.  
 2871. You think the Marine Board do not take sufficient notice of complaints? No.  
 2872. You suggest a better administration, and not an alteration of the system? Yes; there is a great soreness about the Macleay and the Bellinger business.  
 2873. It is quite open to you to offer your boat to the Government;—you can enter into a contract with the Marine Board at Port Macquarie? This gentleman has it for six months in any case.  
 2874. It is open to you to send in a tender when it is made vacant? I see. We are not satisfied with the boat, the "Thistle." She draws too much water for the place, and she cannot take a vessel when she should take her, and then when they attempt to lighten her up to (say) 5 ft. 6 in., she has not sufficient grip of the water. When she has a good grip she tows well, but when she is lightened she has no power. It is not a suitable boat for the place.  
 2875. *Mr. Powell.*] As a matter of fact, it appears by this return that there are more vessels entering and leaving Port Macquarie than any other of the northern rivers? I think there are. I think there are no more vessels, but they make better trips. As far as we are concerned, we are quite willing to offer our boat to the Government for so much a year. We cannot run the boat without a subsidy. We put on our own boat because we were dissatisfied with the present arrangements.  
 2876. *President*] Then the reason for dissatisfaction is that the boat is unsuitable? Yes; we have put a good boat there with good machinery.  
 2877. I suppose it really pays you to keep her there? We are making no money out of it. With a small subsidy we could do it.

Alfred Langley, Merchant and Owner of sailing-vessels trading to the northern rivers, sworn, and examined:—

- A. Langley. 2878. *President.*] We shall be glad of any information you may be able to give us with regard to the Marine Board—first about the constitution, and then about the management? So far as the constitution of the Board is concerned I do not profess to know much about it. As far as we are concerned we have always got satisfaction.  
 8 June, 1897. 2279. How many vessels have you trading to these rivers? Five altogether.  
 2880. And to what rivers do they trade? Two to the Manning, one to the Nambucca, and two to the Tweed. They go to wherever they can get loading.  
 2881. Are you connected with any of the mills on the coast? My brother has a mill on the Manning, and I am his agent.  
 2882. Can you give us any information about the tugs? Sometimes they do not take vessels out when the masters think they can go. The captains of the vessels sometimes say they can get out, and the pilot and the master of the tug say they cannot get out. Some people think the tugs should be under the charge of the pilots, but I do not think so.  
 2883. Why not? Very often the captain of the tug and the captain of the vessel will make up their minds and take her in or out against the advice of the pilot. They often risk it against the wish of the pilot. If the tug were solely in charge of the pilots the vessels would not, in my opinion, get out so often as they do now.  
 2884. Your experience is that the captains of the tugs are more willing to risk things than the pilots? Yes; the crew of the pilot station are very handy, and of great assistance when vessels get ashore. We had a vessel ashore on the Manning recently, and the tug got ashore, too; and if the pilot's crew had not rendered assistance by laying out anchors I do not think we could have got the vessel off.  
 2885. So far as your experience goes you do not think any improvement could be made? I do not say that; but we can get along all right when the bars are good. Of course, we cannot get along well now in day tides; but that is because the bars are very bad.  
 2886. Can you suggest no improvement in the management of these subsidised tugs? I do not see that they can be improved on now. I think they might go out a little oftener at night. Very often we can get out at night with the vessel, as there is often better water at night than in the day; but we cannot make them take us out. If it were made a part of the contract that they should take us out at night if necessary, and if conditions were favourable, it would be an improvement. (*Vide Appendix 48.*)

George de Fraine, Shipowner and Timber Agent, sworn, and examined:—

- G. de Fraine. 2887. *President.*] To what rivers do you trade? I have five vessels bar-bound at Nambucca now—to the Bellinger, Camden Haven, and the Nambucca.  
 28 June, 1897. 2888. Is that the total fleet you are interested in—five vessels? We have nine or ten vessels running constantly for the mills for which we are the agents.

2889. We shall be glad of any information in your possession regarding the management of the subsidised tug-service? I do not understand exactly what you mean. Do you want it managed more cheaply, or what? G. de Fraico.  
28 June, 1897.
2890. Is the present system giving satisfaction? I do not see how you could improve on it.
2891. Are you interested in any of the subsidised tugs? I am the owner of one.
2892. Where? At the Camden Haven.
2893. What do you get for that? £19 10s. a month; and I make what I can out of the ships.
2894. Have you any experience of the tug-service on the other rivers? Yes.
2895. You do not think the present system can be improved upon? I do not think so. There is one great objection to the pilots taking the tugs, and that is that if an accident happened to the tug while the pilot was in charge, who is there to go to her assistance? The tug often gets into difficulties, and the pilot has to help her.
2896. You think the pilots are required in addition to the tugs? Yes.
2897. And if the pilots took command of the tugs various interests would suffer, because there would be no one to help the tug if she got into difficulty? Yes; I had charge of a tug myself for ten years on these bars, and I have often been in difficulty with a vessel coming in, and both vessel and tug have gone ashore, and the pilot has rendered assistance.
2898. You think the pilot's crew is absolutely required to render assistance both to the subsidised tugs and to the vessels which the tug may be towing? Yes.
2899. And you can think of no improvement in the management of the tug-service? No; I am interested in no other tug. There is one thing I would suggest,—I think that when calling for tenders for the service, it should be for three or five years.
2900. Do you think three years would be sufficient? No; I think five years would secure a first-class service, and it would be done a good deal cheaper.
2901. A good deal cheaper? Yes; a boat suitable for a bar harbour tug is of no service to earn a living in Sydney, and a man will not build one suitable for that service except he has a contract for a certain time.
2902. You have been on a tug for some years? Yes.
2903. Do you consider that you are under the orders of the pilot? I have always done what the pilot has suggested.
2904. If the pilot said it was safe to go out would you interfere and say, "No, I do not think it is safe"? I worked under one pilot for nine years, and we always worked together. As far as the service has been conducted, I do not think there has been any complaint.
2905. There is not likely to be complaint in your case, because you are the owner or the agent for all the shipping going there? Yes; nearly all.
2906. There is no reason why you should not be a happy family;—there is no divided interest? No.
2907. *Mr. Powell.*] You said that if the time were extended to five years, it would enable persons tendering to supply a more suitable boat? In some instances it would.
2908. A more suitable boat? Yes.
2909. And you think Sydney boats, as a rule, are not suitable? No.
2910. Do you think the boats now employed, taking them all round, are suitable for the work for which they tender? I think they are, because they have been over the bars.
2911. You told us you were receiving £19 10s. a month? Yes.
2912. Is that for 1897? Yes.
2913. Did you tender in 1896? Yes.
2914. What did you receive then? £19 10s.
2915. I do not quite understand that? I think the tenders were called last June.

THURSDAY, 1 JULY, 1897.

PRESENT :—

JOSEPH BARLING, Esq., J.P., PRESIDENT.  
GEORGE ALEXANDER WILSON, Esq., J.P.  
JAMES POWELL, Esq., J.P.

Cecil West Darley, Engineer-in-Chief for Public Works, sworn and examined :—

2916. *President.*] You are Engineer-in-Chief for Public Works? Yes. C. W. Darley.  
1 July, 1897.
2917. The Commission would be glad if you would give them the benefit of your experience in any matters relating to the Marine Board, which you think may be of use in this inquiry;—in your capacity of Engineer-in-Chief you have a long acquaintance with the Department, especially in regard to the harbour works, and have made many visits to all parts of the coast? Under the present Marine Board Act some trouble has arisen in the control of the inland navigable waters. That Act makes it unworkable to properly control those waters. I think the protection of inland navigable waters should be vested in the Public Works Department.
2918. You mean the parts that are not pilot waters? Yes, up the rivers.
2919. *Mr. Wilson.*] Snags get into the stream above Lismore, and there is nobody there who is under the Marine Board, and yet the Marine Board has to be consulted before anything can be done? In the year 1862 an Act was passed, called the Navigable Waters Protection Act. The working of that Act was entrusted to the Public Works Department. It was to regulate the discharge of ballast, and to prevent any obstruction being put into navigable waters. Its working was extremely simple. Any person could lay an information, go to the court, take out a summons, and get summary jurisdiction. Under that Act we frequently had men summoned and fined £10, £20, and £100, for carelessness in discharging ballast or wilfully throwing ballast into Newcastle Harbour, and into harbours on the coast. We very often had officers out at night watching to catch men discharging ballast into places where it was illegal. This Act worked extremely well, and kept a wholesome check upon these people. If a man felled a tree we could summon him at once and have him punished. The Marine Board Act then came into force, and, although the old Act was not repealed, the Supreme Court has decided that the Marine Board

C. W. Darley. Board were made the custodians of the navigable waters. We summoned a man for throwing ballast into the harbour. The point that the Marine Board alone had jurisdiction was raised, it was taken to the Court, and decided against us on those grounds. From that day to this I am not aware of any prosecution for throwing trees or ballast into navigable waters. Mr. Keele has complained very much about this, that we have to maintain an expensive staff to take snags out of the Richmond, the Tweed, and the Clarence, and their tributaries; that the farmers tumble trees down across the rivers and we have to send men up to take them away. We have frequently reported this to the Marine Board, but we have found their system so cumbersome and troublesome that it was not worth the trouble. It is unworkable. A few words should be put in the Act giving the public or the police power to prosecute so that summary jurisdiction can be taken without appeal to the President of the Marine Board. The police frequently write down and report that a tree is across a river and say what it will cost to remove it. They often help us in that way. There is also another difficulty growing up on the Richmond River, and that is the rafting of timber. It is a great source of danger. In the Act there ought to be power to make by-laws to regulate the size of rafts and the manner of handling them, putting them together, and conveying them down the river. Coming down the river a log frequently drops off and it is not worth while going back for it. Going up the Tweed River the other day I saw two or three. They are called "floaters," and are very dangerous; they would sink a steamer. They are 17 or 20 feet long and 2 or 3 feet in diameter. Something ought to be done to regulate that. We have to maintain a staff of men to clear the rivers of obstructions that ought never to be there, and the cost of removing the obstructions ought to fall upon those who cause them.

2920. *President.*] There is another thing—the Marine Board have not the staff at their command to take prompt steps? They have the pilot at the heads, but as a rule he is not a fit man to do it. It is too far, and he could not get up there with only a rowing boat. Regarding the tugboats I think a change could, advantageously to the Government, be made if the Government owned them instead of renting them. Mr. Portus was approached by Captain Hixson as to whether we could do it with our tugs. That is out of the question. We are not using many tugs along the coast now. At most of the rivers we have sand-pump dredges which do not require tugs. The silt is pumped ashore.

2921. That is a mistake. What we wanted to put before you was this: If the Marine Board had the tugs, would they be of any use to you? On the rivers where we have boats they are working about 20 miles up the rivers. It would be in many ways an advantage to us if the Government had their own boats, because we could often make use of them for moving about on the coast and doing things which we are now debarred from doing because it takes too long. For instance, if I want to send an officer to Coff's Harbour it takes something like five or six days to go there and back to attend to a little matter. If the tugboat could be used he could get there and back the same day. Then I must call attention to this, that while, on some of the rivers, there are most active and efficient pilots and men who, if they had charge of the tugs would get good work out of them, there are other places where the pilots have got sun-dried, and the very nature of their occupation, sitting there on the sand waiting for vessels, makes them indolent and lazy. If the pilots were in charge of the tugboats they would have to be energetic. Of course the boat now attending the Macleay, Bellinger, and the Nambucca must be worked with a great amount of energy. That boat should be under the charge of the pilot at one station, and run down to the others when vessels are expected. These ports are all in the one bay, practically. The eight-hour system could not be worked there; they would have to work long hours when necessary. At the Richmond it would work very well; the pilot is very energetic. But the Tweed pilot has seen his best days.

2922. Could you oblige us by giving us a carefully-prepared estimate of the cost of (say) two classes of steamers—one for the Richmond, which requires a much higher-powered steamer, and then another class which would do for the other rivers; simply making them suitable for the work, without fitting them up elaborately. And also an estimate of what it would cost to work these steamers, making an allowance for wear and tear, &c. We have some information on that point, and we want now a carefully-prepared return to show exactly the cost. You should let us know how many men would be required, the amount of fuel, and say 5 per cent. for depreciation? I think it would be 10 per cent. or 15 per cent. (*Vide Appendix 46.*)

2923. Would you want 10 per cent., taking into account the very careful way in which you maintain your tugs? Yes, I think so.

2924. That would mean a new steamer in ten years. You know we have had the "Thetis" for twenty-five years, and it is still a good boat? She has had new boilers and new engines in her.

2925. Is there anything else you can tell us;—anything in connection with the lighthouses? No. I think they are managed very well. We attend to the structural repairs and maintenance. We supply the paint, and the light-keepers paint them themselves, and take a pride in keeping things bright.

2926. Speaking about the pine-log rafts, do you think the Public Works Department should have the power to make regulations, and to see them carried out? I think the Public Works officers could point out the regulations that are necessary. We saw three logs the other day in the Tweed. They are very formidable things to hit. I instructed my officer that at the first opportunity he could possibly spare he was to go up the river with the boat and hook on to them and tow them to his wharf and tie them there, and if anybody claimed them, he was not to let them go until the cost was paid.

2927. Is it not a fact that these logs eventually sink? Yes.

2928. And then become more formidable still? They collect sand and form a bar. A log of that kind is very often the commencement of an island in the river. On the Richmond River we also met a considerable number of them floating about. It is really a danger to river navigation at present.

2929. You would recommend that power be given to the Public Works Department and the police to frame regulations to control the way in which these rafts are made? Yes.

2930. And also to take immediate action in case of trees being felled across the river? Yes. I think you might go so far as to make farmers responsible for the trees on the banks of the river. They ought to be cut down and burned by the owners of the land. In Mr. Keele's last monthly report he said that in half a mile of the river they took out 540 snags.

2931. The meaning of that is that the settlers fell their timber into the river, and the Government have the expense, practically, of clearing their land for them? Yes.

Mr.

Mr. Henry Selfe, Engineer Surveyor to the Marine Board, sworn, and examined:—

2932. *President.*] Are you a salaried officer of the Marine Board? Yes.
2933. You have forwarded us a letter in which you recommend that the Sow and Pigs should be lighted by electric cable from the lighthouse? I did. [*Vide Appendix 49.*]
2934. Will you just elaborate the scheme you proposed? It requires very little detail. You would merely need an armoured cable under the water.
2935. But a tower would be required on the reef? Yes.
2936. What would that cost? It would not cost much.
2937. Have you gone into it at all? I have not gone into the details.
2938. Would it cost £500? About that. If it is wanted done cheaply you could just put in four hardwood posts.
2939. Still, at the most extravagant estimate, it would not exceed £500? Not the tower,
2940. What would you do then? Carry a cable down to the tower. I should imagine you would require to cut a small channel out of the rock so that the wash would not affect it, and leave it in that until it got into 6 or 7 feet depth, where it would be out of the wash, and then it could go straight away. It would have to be an armoured cable inside a lead pipe, with iron round the outside.
2941. Would there not be danger of a failure now and then through no one being in charge? I do not think there would be the slightest danger. Of course it would be possible for a vessel to pick up the cable with her anchor. The east channel is deeper than the west channel, and it is only pilots and exempt masters who come up that channel. It would be easy to put a small light on the shore where the cable lands, so that at night vessels would know not to anchor in a line between the two lights. It is the same at Dawes Point and at Cockatoo, where the water-pipes run across; they have lights up, and a notice cautioning people not to anchor between the two lights.
2942. Supposing the cable were to give way? You might have a cylinder of compressed gas there, to be turned on in case of failure.
2943. Would that be turned on from the shore? No.
2944. Would you want a man on the watch? No. You have the "Captain Cook" there. If that happened the lighthouse people would know at once. Suppose it were out for half an hour, what would it matter. They are all exempt people who come in without a pilot.
2945. *Mr. Powell.*] Would it be in view of the lighthouse where the power was derived? Yes.
2946. *President.*] What experience have you had in electrical matters? None. I am no authority on electrical matters. It has been suggested by my general experience.
2947. Do you know of any place in the world where a light in mid-harbour is managed in that way from the shore? I cannot say that I do. I have not hunted the matter up at all. You need not look for a precedent in these matters. It is strictly a mechanical problem.
2948. We know it is practicable, but in case of accidental failure there might be serious consequences;—you know the electric is very often an uncertain light;—you see the light on Sydney station die down and perhaps go out occasionally, and, although there is no inconvenience there, it would be a serious thing at this light in the harbour? There is more chance of failure in the arc light than with the incandescent light. The arc light could not be used there because it would dazzle the eyes of shipmasters coming up the harbour. You want a subdued light there, so that you could see even a miserable little coaster coming up with an oil light.
2949. *Mr. Wilson.*] The danger of interruption would not be so great where there is simply one light as where there is a large distribution to shops and so on? No. The filament of an incandescent light would last 1,000 hours, whereas the carbon in an arc light must be renewed every day.
2950. *President.*] It might be done in another way, by having a double cable? It would be better to have it in duplicate. I spoke to my brother. Mr. Norman Selfe, and Mr. Fitzmaurice about it, and they saw no difficulty.
2951. *Mr. Wilson.*] Would that apply to other harbour lights? Yes; to all the lights.
2952. *Mr. Powell.*] You could extend it to the Hornby light, too? Yes.
2953. And if any accident happened, the man at the lighthouse would know at once? Yes.
2954. *President.*] And he could send assistance at once to put it right? Yes.
2955. *Mr. Powell.*] From the "Captain Cook"? Yes. It occurred to me once when I went on board the lightship. It took me back to something far beyond my boyhood's days—the old crab-winch and the three-eighths chain and block.
2956. *President.*] It costs £800 per annum? Yes.
2957. One expense will settle the whole thing? Yes; it is a matter that a man wants to go into carefully to get the best way to go about it. I imagine the separate circuit system would be better than the continuous circuit, but these are matters for the electricians to go into.
2958. How many lights would that effect in the harbour—the Sow and Pigs, the Hornby Light, the Pile Light, and the two leading lights on the shore? I think there is another further down.
2959. *Mr. Powell.*] There is one at Shark Island? I am almost sure there is.
2960. *President.*] Is that quite your idea? Yes, it is quite my own idea.
2961. I think you are deserving of great credit in bringing it forward. Is there anything else you would like to say? I have been seventeen years in the Government Service, and am really not as well remunerated as I was in the employment I gave up to come here. I never made less than £400 a year as chief engineer. Now I get £371 a year. Mr. Marshall and I were both chief engineers before we got the appointment, and we got it in competition with a number of others. It takes £6 or £7 a month more to live on shore than on board ship, so I am not getting as good pay as a chief engineer on a mail steamer; and Mr. Marshall is not getting as good as a second engineer. The General Manager of the Union S.S. Co., who is interested in Messrs Briscoe, Drysdale, & Co., sent to me and made me a distinct offer some time ago of a three years' written agreement of £400, £500, and £600 a year, to take charge of the machinery department at Briscoe, Drysdale, & Co. I thought the matter over and consulted with Mr. Cruickshank, who agreed that as the Land Boiler Bill was before the House there was every chance of an improved position. I refused it, as it was a new line to me.
2962. What are your duties? Surveying steamers. If I go on board a steamer and say, "The bottom has got to come out of this boat," there is next to no appeal—the bottom must come out. When the Manly Beach Co. were running against the opposition, I compelled them to spend £6,000. They must do it.

H. Selfe.  
1 July, 1897.

H. Selfe. I could not help it. The boats would not have been safe without it. That was the "Fairlight" and "Brighton." These people had every confidence in me. They never appealed against it. The same with the North Coast Co. I had boilers taken out of their boats last year. We have enormous power under the Act. I am the assistant engineer; but, when I survey a steamer I have to do it on my own account, there is no assistance in it. Mr. Marshall receives £24 12s. a month. He was chief engineer on the "Zealandia" before, getting £25 or £26 a month, and found, and where the wear and tear of clothes was nothing to what it is now. We are always crawling about the boilers and ships bilges. Yesterday I was over the "Miowera"; I had five hours of it. I was completely played out.

Captain Francis Hixson, R.N., re-examined:—

- Captain Hixson, R.N.  
1 July, 1897.
2963. *Mr. Wilson.*] This is a plan of the Newcastle Harbour (*putting it before Captain Hixson*), and this is the south part. Vessels coming in cannot tell when vessels are going out, nor can vessels going out tell when vessels are coming in. Captain Williams has suggested having a signal, which would cost very little money, to show vessels going out whether other vessels are coming in, and *vice versa*. There is a large building on the point, which shuts off the view; will you tell us what you think of this proposal? I am against the proposal. In the first place, if a collision occurred about here they would try to prove that the signal was wrong, and if it could be proved that it was wrong we should be placed in an awkward position.
2964. Would you be more responsible for the man in charge of the signal than you are for your pilots? Perhaps not. If a man is entering Newcastle Harbour he cannot look about for signals; he has to look after his vessel. There is no such thing known in the British Dominions, and it would be expensive.
2965. The expense would be immaterial? I do not know that. You would require people on the lookout from daylight to dark, and what about thick weather, and at night-time, when navigation is most dangerous?
2966. They have people already there? My impression is that the proposal is a fad, and the generality of nautical men would be against it. I assure you I would guarantee to say that not one man out of ten who bring their vessels into Port Jackson looks to see whether she is signalled in or out. The signal is not put there for the use of vessels; it is put there for business people to see. The master of a vessel has quite enough to do to navigate his ship. Even in the "Orlando" nobody would heed signals on shore; the whole attention of the officers would be directed to the navigation of the vessel.
2967. *Mr. Powell.*] What are the leading lights for? To show the only channel that can be navigated. The master's whole attention is taken in navigating his vessel, and he gets his leading lights in line for that purpose. I assure you that the members of the Marine Board in Sydney laughed at the thing, and so far as I know the members of the Board in Newcastle laughed at it.
2968. They did not seem to laugh at it to us? Captain Cross, the chairman, and Captain Newton, have laughed at it to me.
2969. It was advocated by Captain Brooks? He is not a sailor; he is a carpenter.
2970. *Mr. Wilson.*] Captain Williams said, "The reason why they refused to accede to our request, was that in the event of a collision occurring they would be responsible"? The very point I take. The Marine Board rules for the navigation of the harbour are most excellent, and if these rules are attended to no collision can occur. We have an additional rule in both Sydney and Newcastle reducing the speed, and the true safety of the navigation of both Port Jackson and Newcastle harbours is to go easy and observe the rules.
2971. I do not see that there is any harm in having this signal? No; except that they would try to put the responsibility of accident on the signal.
2972. I am not expressing any opinion at all. It is carrying out very much what is already in existence on the railways? The trains go on railway lines.
2973. This proposal is very similar in principle to the railway signals of in-coming and out-going trains? It would not do a bit of good and it might lead to the Government becoming responsible for a collision. There are already rules, most comprehensive, most excellent, to guide the ship in every possible way, and when one ship sees another they both of them know what to do to keep away from collision. When I say it might not do any harm, I am quite sure that if men look away to seek for signals harm will come of it. The master of a vessel has no business to do anything else but look ahead and see to the navigation of his vessel.
2974. *President.*] You are unquestionably of the opinion that this should be put aside? Certainly.
2975. *Mr. Powell.*] There were plenty of experienced people like yourself there who had ample opportunity to ridicule it, but they did not? No?
2976. I can assure you that it was received with acclamation? You call half a dozen shipmasters without prejudice at all and ask them about it.
2977. *President.*] You think they would endorse your view of the case? I am pretty sure they would. I am quite sure every captain would say he had quite enough to do to navigate his ship, without looking about for signals. If there is any doubt whatever they have steam-whistles to call one another's attention. I would like to call your attention to the immense traffic in Sydney Harbour, and the few collisions that happen. Is not that all due to the rules, and to the careful navigation of the masters?
2978. *Mr. Wilson.*] Is there not something to be said for this particularly narrow channel? I think, sir, the narrower the channel the more necessity for the captain never looking away from his ship's head.
2979. He does not require to look away from the ship's head;—as he looks down he can see if a ship is signalled;—the signal is straight ahead? If the signal is exhibited in a certain place, the man faces it in one instance and backs it in another.
2980. If a man is going towards the signal it is before him each way? They are compelled to whistle going down the harbour. The regulations also provide that the vessels must always hug the shore on their starboard side.
2981. *Mr. Powell.*] I think your evidence goes to show that all signals are useless? To tell a man how to navigate his ship, most certainly. The signals of the present day are ample, and I am sure that this scheme would not do any good, and would very likely do a lot of harm.
2982. *Mr. Wilson.*] The room was full of people, some of them the captains of vessels then in the harbour, and they applauded it? With all respect, I do not care what they did.

2983. *President.*] How often are the pilot stations inspected in the course of the year? We only do it when we go on the regular yearly inspection.
2984. Are the pilots not inspected except then? Unless there is a disturbance, the regular inspection is once a year only.
2985. Are they left to themselves all the other time? Yes; but if there was anything wrong we would soon hear about it.
2986. Have you no inspector whose business it is to visit them periodically? No.
2987. A proposition has been put before us to light the Sow and Pigs by electricity from the lighthouse. Does that commend itself to you? I have never thought the matter over, but the present light does very well. They had an electric light at Dungeness, but they had to do away with it because it was so close to the water, and sent such a glare about that all the masters objected to it. Electric lighthouses are never used except on a high elevation.
2988. *Mr. Wilson.*] Cannot that glare be reduced? Yes. For instance, we have reduced the glare of the electric light at the South Head by putting brown curtains round it on the land side.
2989. *President.*] The lightship costs £800 a year. If you could put a small tower, or even piles there, with a light on top, operated from the lighthouse, would it not save a large expense? It might. We have quite enough to do with the power we have at the Macquarie light to run that light. We have no spare power there.
2990. If it could be done it would be worth while having fresh power? It is an idea. I suppose a tower could be built and a foundation found.
2991. The foundation is there now. £500 would do? I do not think that. It is possible, but I do not know what the cost would be.
2992. *Mr. Powell.*] Would not that do for the Hornby light as well? I think the best thing there would be gas—it is pretty close by.
2993. *President.*] You would want a man there? Yes; I do not think it would do to have a turning light without a man there, because whenever an accident happened there would always be an attempt to prove that the light was wrong.
2994. *Mr. Wilson.*] Supposing the light failed, there would have to be a reserve of gas there that the man could light? Yes. I daresay economies could be effected in some of the lights. I think that would be worth considering. There is one feature in this proposed light—it would be necessary to put it in about 4 fathoms of water, because the ships round it. You could not put it on the rock. It should be in 24 feet of water. I will mention it to the Marine Board; and then there is the matter of sounding the gong in foggy weather. We have Mr. Cruickshank and Mr. Wildridge, and in them as good men as can be found.
2995. *President.*] Perhaps you will consult them, and give us some information? Yes. You know there is a deal of difficulty in the harbour arrangements. It is altogether different from people coming at 9 and going away at 4. These people of ours are on duty all night, Sundays and holidays, rough or fine, so even if the service appears to be extravagant there is reason for it. If this tower is small the man would have to go to and from the shore, and in rough weather it would be difficult. The Sow and Pigs lightship has very rough times indeed in easterly gales. She broke adrift once, and the men had a bad time. I happened to be on the alert, and I got a steamer and towed her into safety. All these nautical matters are attended with more difficulty than ordinary shore matters. The light is the rounding-point, and you must have it right out in 4 fathoms of water, and the tower must be conspicuous, to be seen in thick weather.
2996. Mr. Darley has brought under our notice the cumbersome method of summoning people who fell trees into the rivers, or streams falling into them. When the Navigable Waters Protection Act was in force it was easy to take proceedings, but it is much more difficult now, because you have to specially authorise people to conduct the prosecution, and it is rather difficult to set the thing in motion, and the consequence is that people escape? It is a pity that Act was repealed.
2997. It was not actually repealed? It is obsolete. Our Act answers very well for navigable waters, but it is faulty for that sort of thing.
2998. In fact, you have no staff? No.
2999. Your staff is just concentrated at the heads and the harbours, and so on? Quite so, sir.
3000. So you entirely agree with Mr. Darley in that respect? Yes. I think the other Act was far better than the present one in some respects, and it is a pity that the old one is lying dormant.
3001. You think that, although you might still be the conservators of the navigable waters, powers might be revived under the old Act, so that the Police and the Public Works Department's officers could take action? Yes; I think so.
3002. You quite believe in that? We always authorise both the Police and the Harbours and Rivers Department to prosecute; in fact, we often put them in motion in the first instance. Still it is too cumbersome a plan.
3003. Supposing that it was determined that it was desirable that the Government should own these tugs, would any men other than the pilot's crew be needed to man the steamers? No. I should think the pilot's crew would be sufficient, but you would want an engineer and fireman.
3004. The reason I ask is this, that one of the witnesses here said that, in case of accident, you would want, not only the crew of the steamer, but the crew of the pilot-boat as well? It is very desirable. The practice is, that the tug tows the vessel in, and the pilot is in the channel to tell her to go right or left, as the case may be. I would never advocate the pilot's being put on board the steamer. I told you of a case where the vessel and the tug were stranded, and, but for the pilot's crew, eight lives would have perished.
3005. That would tell as an argument against the pilot manning the tug with his crew? I am very much against it. I have studied the system thoroughly, and I say we are getting rid of the expense as things go, but to attempt to establish the Government as the owners of the tugs would lead to very great cost, and I am pretty sure that if a Government tug towed a vessel ashore, it would lead to the owner suing the Government. You asked me last time whether the Harbours and Rivers Department's vessels would do, but I find they are not suitable. They are only made for harbour work. They are long and narrow, with open hatches, and would not stand the sea on the bar.
3006. What we wanted to know was, if you had the steamers, could the Harbours and Rivers Department use them? Mr. Darley was out of town, and Mr. Portus said, "No, it could not be done," and I asked him to put his ideas in writing. He has given me this letter. [Vide Appendix 45.] 3007.

Captain  
Hixson, R.N.  
1 July, 1897.

- Captain Hixson, R.N.  
1 July, 1897.
3007. What we want to know is, if you had the steamers, whether the Harbours and Rivers Department would not find them useful, and Mr. Darley has told us they would be useful, and he instanced taking an engineer from Trial Bay to Coff's Harbour? We could do that now, by arrangement.
3008. *Mr. Powell.*] Is that in the tug-owner's contract? No; but he is there, and it could be done.
3009. *President.*] If Mr. Darley would communicate with you, you could arrange that for him? Yes.
3010. In connection with the tug that is now stationed at the Bellinger, and the tug stationed at the Macleay and the Nambucca, we have had evidence here that the Macleay is the river that should have the tug to itself, and the other tug should serve the Bellinger and the Nambucca? There is not much in that. I think the Bellinger is the place where there is the majority of the work.
3011. It has been said that the pilot at the Macleay has been employing the men on a 200-acre farm, hoeing, ploughing, and shelling corn? Something of the kind has been reported, but this is news to me. I think they should complain to the Marine Board first, and then, if they get no satisfaction, come here.
3012. Would there be much danger if this proposal for the light at the Sow and Pigs were adopted, of the cable being dragged by vessels? They might let go an anchor on it. That is really a point. If the light is there it must be there always. If it is out an instant it would mean trouble.

William Newton, Inspector and Surveyor of Shipping to the Marine Board, sworn and examined:—

- W. Newton.  
1 July, 1897.
3013. *President.*] Under whose immediate orders do you work? For the principal part of the work under nobody, that is for the inspection of shipping; but I get things requiring to be attended to from the office from Captain Lindeman.
3014. Are you not under anyone other than Captain Lindeman and Captain Hixson;—are you an independent officer under them? Yes.
3015. What are your duties? Principally inspecting shipping in everything with the exception of boilers and engines.
3016. Has Captain Sangster to do work similar to yours? Yes.
3017. Is he under you? He is not an assistant, but he does the same work. The only difference is, that I have been longer in the service.
3018. He holds the same relation to you as Mr. Selfe would to Mr. Cruickshank? Yes; with the only difference that he is not gazetted as an assistant.
3019. Are you a captain? Yes, and a shipwright also.
3020. Are you fully occupied? Yes.
3021. Is there anything you would like to tell us with regard to your work, or any suggestion you wish to make? I have thought that more could be done in inspecting shipping. There are a lot of small coasting vessels, and it is full employment to keep going round them. They are all over the harbour. If we were afloat all the time we could do more of them, and do it much better. The launches are not always available; but in any particular case we can always get one.
3022. You think a launch ought to be going about continually with you? There might be a small launch always on the harbour for the use of the inspectors only. When we want to see a vessel at the Pymont wharf, we have to walk right over through the city.
3023. Are there not sufficient launches to enable you to do that? There are so many of us to use them, the engineer-surveyors and the shipwright-surveyor. As a rule there are two and three engaged. The Post Office authorities and other people outside the Department use the launches.
3024. What people outside the Department, other than the Post Office use them? Not much outside the General Post Office. The Stock Department used to use them, but now they have their own.
3025. The Post Office using the launches prevents you doing your work as effectually as you would like? In some cases.
3026. Does that occur often in the week? No.
3027. The objection is not a very great one? No.
3028. If you had a row-boat at your disposal, would not that do? The question would arise whether it would not be a cheaper arrangement to have a launch and one man.
3029. If you had a boat, could you not row yourself about? It would mean rowing all day.
3030. Would you not be engaged an hour in each vessel? Yes.
3031. And the vessels would be pretty close together? Not in all cases.
3032. When you had to go a distance you could get a launch, but would not a row-boat be an advantage to you? It would; but it would take longer to row round to Pymont from the Quay than it would to walk.
3033. You could make several inspections on the way? Yes; but it would take a long time, that is all.
3034. *Mr. Powell.*] Tell us what you mean by inspection? The general inspection of a ship to see whether she is in a seaworthy condition in every sense.
3035. Do you tell me that every vessel that comes into and leaves this port is inspected in that sense? No, sir.
3036. Under what conditions;—is there any special rule or any special time? No.
3037. Does inspection mean a mere casual looking at at any time to see that all is right, and the loadline right? Yes, in some cases; and in other cases more than that. If we have any suspicion that a ship is aged, it would mean condemning it. We have condemned some.
3038. Under what Act do you do it? The Navigation Act.
3039. That gives you permission to go on board of any ship. Are you required by the Board to do this. Do you receive instructions to go on board the "Saucy Jack" or the "Lively Susan" to see that she is in proper order and well found? No; not unless there is a complaint made about the ship.
3040. You appear to have a general roving commission;—you go on board every ship? Yes.
3041. That is not required by this Act. Do you get instructions from the Board to do this? In some particular cases.
3042. But not generally? No; we do not report to the Board in these general cases.
3043. Suppose a vessel is overloaded;—have you to do with that? Yes.
3044. Very well; you know when a vessel is going to Brisbane or to Melbourne? Yes.
3045. You go down and see what her deck cargo is, do you not? Yes.

3046. How long does that take ;—you know in five minutes whether she has too much deck cargo? Yes; but those ships are advertised to go away at 5 in the evening, and— W. Newton.  
 3047. They do not go away till 9. But you do not stay till that time? Not always. We go back 1 July, 1897.  
 sometimes. If there is no cargo there that would be deck cargo we do not go back, but if there is timber and fruit, that would be deck cargo, we go back.  
 3048. It is ordinary work? Yes.  
 3049. Well then, you do not trouble these little schooners trading coastwise, do you? Yes.  
 3050. You do not go to see their cargo? No.  
 3051. Then what do you go for? To see that they are seaworthy.  
 3052. You are not required to do so by the Act? We always have done.  
 3053. From whom do you take your instructions? Any instructions we get, we get from the secretary.  
 3054. Does he instruct you to go to these small vessels? Not unless there is a complaint made.  
 3055. Have you any printed instructions? No.  
 3056. When you took that duty, you learned it from the man who was engaged in it? Yes.  
 3057. Do you ever see Captain Hixson on these subjects? No; I have seen Captain Hixson on some occasions.  
 3058. Only Captain Lindeman? Yes.  
 3059. You know nothing about the Board as a Board, except through the secretary? No.  
 3060. Mr. Wilson.] Are any of the launches used by the Naval Brigade? I do not know.  
 3061. Do they ever get the use of your launches when the launches are required for Marine Board business;—have you ever known it to be so? I cannot say that I have. I would not know.  
 3062. Mr. Powell.] How long have you been an inspector? I was a pilot for three years, and I have been inspecting for seven years. I was on the Richmond River before.

SATURDAY, 3 JULY, 1897.

[At Custom-house, Wollongong.]

PRESENT:—

JOSEPH BARLING, Esq., J.P., PRESIDENT.

JAMES POWELL, Esq., J.P.

Andrew Thompson, Pilot and Harbour-master at Wollongong, sworn and examined:—

3063. President.] What position do you occupy? Pilot, harbour-master, head light-keeper, signal- A. Thompson.  
 master, and everything connected with the port. 3 July, 1897.  
 3064. Have you any assistance? Two men; one by day and one by night.  
 3065. What is your salary? £215.  
 3066. With quarters? Yes, sir.  
 3067. What do your men get? £12 a month.  
 3068. Mr. Powell.] They are classed as boatmen? Yes.  
 3069. President.] Do they get any quarters? No, sir.  
 3070. What is your particular work? We have a lot of work to do about the shipping that may not be reckoned as work, letting go lines until sometimes up to 12 o'clock at night.  
 3071. You act as harbour-master? Yes.  
 3072. Mr. Powell.] There is nothing here now? This is an exceptional day.  
 3073. President.] What is the cause of the quietness? I could not say. It has been the same at the jetties along the coast.  
 3074. Are you fully employed? When there is shipping here we sometimes work from early morn till late at night.  
 3075. Do you require two men here? We do.  
 3076. You could not do without them? No. It would be a hard matter--because if there were no man in the lighthouse at night, and bad whether were to come on, and the danger signal was not put up, it might cause loss of property and life.  
 3077. Is it an oil light? No. Some twelve or thirteen years ago it was turned to gas. The gas-pipe is in a dangerous place, and bad weather may break the connection; but the oil lamps are standing ready trimmed to be lighted when wanted.  
 3078. Then one of the assistants is up all night long? Yes.  
 3079. Do ships go out and come in at night? Yes; and the man is there and takes the lines or lets lines go just the same as we do in the day.  
 3080. Are there any harbour dues here? Yes; I think it is 5s. for the small vessels.  
 3081. Mr. Powell.] Who collects that money? The Customs officer. I think the larger ships pay ¼d. per registered ton.  
 3082. President.] Do you know what the revenue is? I do not know.  
 3083. How long have you been in the service? Nine years.  
 3084. Is there any improvement in the management of the harbour, in the regulations, that you can suggest? No.  
 3085. How often are you inspected here? Once a year, but we were for five years under the Harbour Trust, when we were never inspected by the Marine Board. Before the Harbour Trust came we had not to attend at night-time, but they laid down rules requiring us to attend at night, to take and let go lines for the vessels. It saves a lot of time for them.  
 3086. Is it your business to bring vessels in and out? Yes, when they require my assistance.  
 3087. Do they pay anything for that? They pay the ordinary pilotage, the same as in Sydney.  
 3088. Is that collected by Mr. Potts? Yes.  
 3089. Mr. Powell.] Is it a large amount? No; the last vessel I took was the "Queen Adelaide," and as she was too large for here I took her to Kembla.  
 3090. Are there harbour dues charged for Kembla? No.  
 3091. Have you a subsidised tug here? Yes.  
 3092. Is she always here? Yes.  
 3093. What subsidy is paid? About £28 a month. 3094.

- A. Thompson. 3094. Is she at your disposal? Yes, at any time; when I require to go off to a vessel or to do anything else. I am never refused her.
- 3 July, 1897. 3095. Is steam always up? Yes; they have always from 30 lb. to 40 lb. of steam ready.
3096. If she were required to go out now could she go? She could be ordered out in less than seven minutes.
3097. Is she frequently employed? Not very frequently lately.
3098. Is she frequently required by yourself? No.
3099. Can you tell us any time in the present year that you have had occasion to take out the tug for your own public purposes? Not this year.
3100. Whenever she has gone out this year she has gone out to be privately employed towing in or out? Yes.
3101. So far as the Public Service is concerned she has rendered no benefit or advantage to you except that of being always ready in case of emergency? That is it, sir. At any moment I want her I can get her.
3102. What is the distance to Port Kembla? About  $3\frac{1}{2}$  miles by sea.

Edmund Potts, Customs Officer at Wollongong, sworn and examined:—

- E. Potts. 3103. *President.*] Can you give us the revenue that is derived here from tonnage dues, and so on? I have only had the tonnage dues since the 1st of last August. It has been about £168 for seven months.
- 3 July, 1897. 3104. What are the total collections from all sources here? After taking out the tonnage rates there is very little left. We have only had two cases of pilotage in this port for the last two months. When I came here, six years ago, there was a fair revenue, but the Harbour Trust drove it away with all sorts of charges and annoyances. They used to make all over-sea vessels shift for the steamers, to which there was great objection, but now it is first come first served, and when a vessel gets alongside she is not shifted to make way for a steamer. We get very little harbour and light dues here, because most of the coal-vessel owners have agents in Sydney, and they pay the dues there. The rate is 4d. per ton per half-year.

MONDAY, 5 JULY, 1897.

PRESENT:—

JOSEPH BARLING, Esq., J.P., PRESIDENT.  
 GEORGE ALEXANDER WILSON, Esq., J.P.  
 JAMES POWELL, Esq., J.P.

Thomas Martin Davis, M.L.A., sworn and examined:—

- T. M. Davis, M.L.A. 3105. *President.*] We shall be glad if you will kindly give us any information which may have come under your notice, and which will be of use to us in our inquiry into the Marine Board? Of course you are aware that in two separate Parliaments I have tried to bring about some reformation in the Marine Board, or the closest approach to reformation in its construction that I could get. In the first place it seems to me that its mode of election is altogether faulty. Only one interest, the shipowners, is represented, whereas no other body of the people interested, neither the underwriters, the Chamber of Commerce, nor firemen, nor seamen are represented. To alter that I was going on the Melbourne plan of a representative Marine Board. I carried my Bill in the Assembly, but it was always objected to in our local House of Lords, and the great objection raised against it was one with, no doubt, a great amount of force in the argument, and that objection was that it should always be made a cardinal principle that no British captain should be tried for his certificate by any but his peers. That was really the difficulty, and seemed to be insuperable under a representative Marine Board. In England they have the Vice-Admiralty Courts and local Boards, and wherever a wreck takes place, or wherever a captain's certificate is challenged, the case is always tried by a Judge with two nautical assessors. That meets the Judicial aspect completely, and I think would meet the case here. In fact it would be better—much better. I have had pretty close intimacy with the coastal trade for the last twenty years, and was secretary to the seamen's organisation for five years, and during those five years I had dealings with all the shipowners on the coast. I was also general secretary to the whole Federation of Seamen's Unions of Australasia, so that I had dealings with the shipowners of every colony. It has become almost proverbial that a case of collision in our Courts has become simply a case of hard swearing. It is a question of who can get the most to swear in evidence. One man gets his people to swear that he had the red light on the port bow, and the other swears that it was a green, and that he did not see this and did not see the other, when, as a matter of fact, both of them were then asleep. Not many years ago a case of collision occurred in the harbour, and one vessel belonged to a company which was supplied in ship-chandlery by a member of the Marine Board, while the other got its ship-chandlery stores in New Zealand. Suppose the whole thing hinges on a vote, and that one vote carries it in favor of the local company? Here is a man elected on the Marine Board, and engaged in a business which brings him in tow with a great many of those who elect him. Is it not simply a travesty on justice? What I am saying I have said to Captain Hixson, to John See, and I have said to others, and there is no doubt about it. There was one case of ferry collision brought up in the House time after time, where a man sat on the Board and gave judgment who was a big shareholder in one company, and then, when it was brought to the Supreme Court, the ruling was upset. The whole thing is simply a farce. Our Marine Board is simply a mockery, and if you did no other good, in my opinion you would do good if you simply got rid of it. You could not possibly set up one worse if you tried. There is not one of the Judges that I would not give my cause to sooner than the Marine Board if I had one to give; or if I had a certificate brought into question I would sooner take a Judge's impartial dealing than have it bandied about as a question for vote by people interested. Have two nautical assessors who will give to the Judge a proper nautical outline of what is right and what is wrong; to cross-examine witnesses and bring out the truth, and let both of them sum up, and let the Judge decide on the points of law. The assessors can do the technical work between them

them, and let the Judge do the legal. Now with regard to the executive functions—at Home they have the local Boards of Trade, with representatives of the various bodies. There is a representative of the seamen on about eight or nine of these Boards throughout the United Kingdom. There is one at Glasgow, one at London, one at Liverpool, and one at Hull. I think the local Board should be an honorary one. Let the representatives be elected, and let the position be honorary, the same as the position of alderman. They can have a clerk to do the correspondence and records. Considering that the population here is not very great, I think an executive officer, appointed by the Government, directly responsible to the Government, and not appointed for any term of seven years, to hold office during good behaviour, might do. I do not mean that he should be under any political control from one side or the other, but that he should just carry out his duties in an impartial manner, looking after the interests of life as well as property. In my opinion that would be a long way better than the present system. The present Board are simply a body of men who for various reasons are not fit. Many of them are obsolete, and many of them have not commanded. They had to send the case of the "Austral" Home; it was an unfathomable mystery to them. They had to say that they knew nothing about the ships. When the captain got into the witness-box and explained about the different bulkheads and the boats that passed them, they did not know anything about it. They had the divers and the carpenters up before them, and they had to give it up in despair and send it Home as something too big for them. It was within a mile of the office, and they could go and see it. Captain Hixson gave evidence, that you ought to see, on a Select Committee moved for by Mr. Kelly in the 1894 Session. The evidence is pretty voluminous. Captain Hixson said there was not the slightest doubt that the Board would have to be modernised and brought up to date. There are many things in it you will find very valuable. It would be just as well to compare that evidence with what you have taken here. Captain Hixson said then that the Board was out of date. Say an engineer of fifteen years ago has been living ashore since then, away from his business entirely, do you think you would like to trust him, or yourself with him, on a boat with modern engines, with the latest patents, with a host of auxiliary engines. He would be completely out of touch. I think this proposal would be an immense improvement—a benefit to all classes. I unhesitatingly say it would be much better than the present Board. It will be less expensive and it certainly cannot give less satisfaction. I am certain that it will give far more satisfaction to the general public, and when the general public come to understand that the interests of all taken *in toto* are put in front they will be quite satisfied.

3106. Then you recommend the complete severance of the judicial functions from the executive? Most decidedly.

3107. You think it would meet with the approval of everybody if a judge, with two competent assessors, were made the judicial tribunal? Yes; and if they wanted to they could appeal to the Supreme Court.

3108. And the executive functions should be entrusted to an officer subject to the Treasurer, and holding office during good behaviour; an officer of high repute? Yes; and independent of any influence from one side or the other. I can tell you this: that when the Government were about to appoint an engineer to the Board, the Steamship Owners' Association sent a deputation and passed a resolution asking the Government to appoint Mr. Wildridge. I say nothing against the man's capabilities, but it is not the right thing for the body that has all the representation, the only body that really had direct representation, to go out of their way to use all their influence with Mr. McMillan, who was the Colonial Treasurer at the time, and of whose sympathies they were pretty well assured, to get him to go out of his way to appoint this man; and he did appoint him, there is no doubt about that. I was one of a deputation that brought forward Mr. Dickson, the President of the Engineers' Association, in opposition.

3109. In other words, you have conflicting interests represented on a Judicial Bench where there should be the calmest consideration? Exactly. You have people there with shares in ferry companies, another with a business that affects all the companies. The very case I have cited to you has been quoted to me by ship-owners, and held up to me by them as something simply scandalous and a travesty on justice.

3110. *Mr. Wilson.*] Would you be in favour of an executive Board, entirely nominated? I would not have a Board, I would have an executive officer. If there were a Board at all—that is, a number of persons representing interests, I should certainly go in favour of an elective Board, but make the positions honorary. On the other hand, it is very hard to get people to perform the duties when it is honorary, and the Board might fall through. The executive functions should simply be left in the hands of a trusty officer, just the same as the interests of other great sections of the community are left in the hands of other officers. You have the travelling public completely left in the hands of the Railway Commissioners. Of course we do not want Commissioners, but one trusty officer to do the executive work, and to be responsible to the Treasurer.

3111. *President.*] Which means directly responsible to Parliament, which represents public opinion? Exactly, that is the whole thing. That man will then be practically in direct touch with the public through an indirect channel.

3112. *Mr. Powell.*] Then you suggest going back to the system that prevailed many years ago here when the Superintendent of Pilots and Harbour-master was the principal executive officer of the Department now known as the Marine Board? Yes. The chief executive officer could take up all the functions and be responsible, of course, having certain officers under him. He could very well do the work if the judicial functions were separated.

3113. That is to say, you would make it a branch of the Treasury, as it certainly is now, although the Marine Board intervenes? I would make it a branch of the Treasury as you say.

3114. You propose to eliminate the elective principle altogether from the Navigation Act? Yes, I should take the elective principle altogether away from it. I find the opposition is so strong, and as the Upper House is likely to last a considerable time longer than I care to look forward to, and as they are so strong in their contention (which is a strong argument), that no captain should be tried by any but his peers, I think it is just as well to drop the elective principle altogether, and let the Government take the judicial functions away so that they cannot cavil. They dare not open their mouths in objection, because they have been living in clover.

3115. You have generally advocated the elective principle, and its extension? Yes. I did not want a quasi-representation; I wanted full representation. I wanted the sailors and engineers represented also. I thought the interests of the public would be looked after by the President, nominated by the Government, and also by those who had to travel with them—the sailors, the crew of the ships.

3116. *President.*] If interests are to be represented at all, all interests should be represented? Yes; I said

T. M. Davis, M.L.A.  
5 July, 1897.

said I did not want quasi-representation, but full representation. It is simply a scandal to say that the Marine Board exists, and when one comes to look at the manner in which it is elected it is simply ridiculous. They are paid £2 2s. each a meeting for doing little or nothing. Even when they go a trip once a year to inspect the lighthouses and pilot stations, they cannot keep to themselves as a judicial body to look after the interests of the public, but they allow men who are drawing big subsidies from the Government to travel in the same vessel with them. That does not look well, especially when the vessel is chartered and paid for by the Government. They allow men like Buckle and others to go with them. A person is judged by the company he keeps, and, as a matter of fact, it is the company they keep that causes people to talk. When they have persons travelling with them, who are drawing large sums for services performed, it does not look well.

3117. *Mr. Powell.*] The elective principle, as it now operates, only represents a very small section of the community? Yes.

3118. And the great bulk of the vessels? Are not represented at all. It is only the small locally registered vessels, registered in Sydney, that are represented. When you come to consider that about nine-tenths of the coasting steamships—the intercolonial steamships—that come into this port are registered in other ports besides Sydney, you then come to see that all the interests of these large companies are left without their having a voice in the election of the Marine Board, and if one of their ships happens to touch one of those who are represented on the Board, they have to go back.

3119. *President.*] The tonnage represented is 90,000, and the tonnage unrepresented is 1,500,000? That is more than I have said. I said one-tenth, and it is one-fifteenth.

3120. *Mr. Wilson.*] In recommending that the executive function should be carried out by one officer, have you considered the inevitable growth of the port? Well, the functions need not be carried out by one officer. There is no doubt the port is growing at a very rapid rate. The functions that will pertain to that officer are different to those of a Commissioner of Railways. They have to consider the question of making the different lines pay; they have to consider the question of differential rates, and they have to consider various interests that come into conflict. What would the chief executive officer of the Marine Department have to look after? There are the lighthouses. I reckon he would have time to make two trips a year, and then look over them better, and even quicker, than they are looked over now. They have the lighthouses, then, and they have something that I intend to speak about—something that I think they should not have; they have the pilot crews and the pilot-boats on the rivers, from the Tweed to Gabo Island; they have a few steam-launches in the harbour, and some of the wharfs; they have got the Woolloomooloo wharfs and the Circular Quay wharfs. Captain Jackson has plenty of time left to himself to look after all the wharfage, and the other duties are practically nothing. They have surveyors and engineers to examine vessels for their certificates, and for many years to come the chief executive officer will have less to do than any one of the Railway Commissioners.

3121. Would it not be desirable that an executive officer like that should have a small board to advise him, composed of such men as Captain Edie, who is a Government officer? Why should he not have a Board, the same as the Railway Commissioners have a staff committee at Eveleigh. Let him have an executive Board for advising him—for giving advice all round. Suppose he had Captain Edie, Mr. Cruickshank, and several other well-known men.

3122. An advisory Board? Yes.

3123. There would be an advisory Board, and the president would have executive functions? Most decidedly. That would be better still, because it would strengthen his hands and keep him in touch with every Department. The duties of the chief executive officer would be neither so heavy as those of one of the Railway Commissioners, nor those of one of you gentlemen.

3124. *Mr. Powell.*] Speaking of the division of the functions of the Board, and having a judicial Court, composed of a Judge and two assessors, would not such a Court travel from port to port if necessary. The Marine Board at present confines itself entirely to Sydney and Newcastle. It could deal with collisions on the rivers, for example. The Judge and his assessors could open a Court at any place in the Colony, and at any time? That would be a great advantage, most decidedly. Three people would simply go to the nearest point to the place where the disaster occurred, the best place to obtain evidence. They would be on the spot in no time after an accident, whereas the people now scatter before they can be got to Sydney.

3125. There are collisions on the Murray, and there is no Court to deal with them? Yes.

3126. *President.*] Even then that Court would not have much to do? No; taking the total number throughout the Colony. That last easterly wind drove four ketches ashore in Trial Bay. Of course they simply parted from their anchors and went ashore and were beached. The men scrambled ashore as best they could. They told their story, and it was over in five minutes. We have not had anything like a serious collision for some time.

3127. So the Judge would really not have heavy work to do? No, he would not have heavy work to do. It would give much greater satisfaction, because he would be able to transport his Court right there and then to the spot.

3128. *Mr. Powell.*] As a matter of fact, there are not more than ten or twelve inquiries in the year? Not more.

3129. *President.*] Perhaps it might even be added on to the duties of some of the District Court Judges? Yes; it should be tacked on to the Judge for the district in which the accident happened. It might be down the coast at Bega, or up on the Tweed, the Richmond, or the Clarence. If any accident occurred on the Murray the inquiry could be conducted by the Judge there.

3130. Are there any other matters you would like to mention? The pilots have a crew of five men, drawing from £9 or £10 up to £14 a month. The Government subsidise a steamer wholly and entirely for themselves, paying a very large sum of money. In one case they pay no less than £1,850 a year. That is on the Richmond. As a matter of fact, the pilot is always on the tow-boat, for if there is any sea on, his own boat could not go out at all. The master of the tow-boat is the better pilot of the two, and he takes the steamer out. The pilot only goes on board as a matter of form, and the master of the tug pays no attention to him, but takes the steamer right out, gives the vessel a tow-line and tows her in. Why, the pilot does not go on board the vessel even, he has got to be on board the tow-boat, because if she happened to take a wrong course over the bar nothing in the world would save the vessel. I brought this under the notice of the Committee when I moved for the reduction of the subsidy, and Mr. Young, who

who is an old officer of the P. & O. Co., and was at one time the owner of vessels trading to these rivers, said there was a great deal in the contention of Mr. Davis, and that it was a matter that would no doubt have to receive consideration. They are paying £7,000 a year. If the Government are going to subsidise these boats, why not specify that the captains of these boats shall be certificated pilots, and any one of them could get the certificate for the application, because they are the true pilots. Captain Fenwick went over the bar when no pilot would go, and saved the "Chingtu." Then they say, "Who is to look after the buoys on the bar?" Well, in the very fine weather the pilot goes out, and this is the only practical use the boat's crew is put to. After a gale of wind they go out to sound the bar and see whether the crossing has altered. The pilot will sound the bar and take his bearings, and perhaps alter the bearings ashore. Could not that work be done just as well by the master and crew of the steamer as by the pilot and his crew? The whole thing is a farce. I can understand having the pilots, and boats, and crews where there are no subsidised steamers, but here we have steamers on all the rivers, and the amount of money that is paid to them is quite sufficient for more duty than they are doing. They simply tow in across the bar, and they drop them the moment they get in. The pilot at the heads has simply to pilot them over the bar—he has nothing to do with the river at all. The captains of these steamers should be the pilots. Either that or the Government should own the steamers and their own crews. Either have Government tow-boats, or specify in the tenders that the captains shall be certificated pilots for the place approved of by the Marine Board, and that they shall also look after and maintain at all times in proper position the buoys, and report to the Board, by wire, the loss of any buoy. That would save about £20,000 a year.

3131. *Mr. Wilson.*] You would do the whole business by contract with the owners of the subsidised steamers—you would include the pilotage? Exactly.

3132. *President.*] How about the signals? Oh, keep the signal-master there. You must have him there just the same as the lighthouse-keeper. The pilot has nothing to do with the signal-master. The pilot simply says, "There is danger," and the signal-master puts the signal up. Well, the tug-master would be there—he would be the pilot, the superior officer—and would advise whether to hoist the danger signal or not, and would, in fact, undertake the present duties of the pilots. It is well-known that the worst bar on the coast is the Richmond bar. Do you know that the position of pilot there was practically vacant for three weeks, and that there were any amount of vessels taken in during that time, and who was it did it? The captain of the tow-boat, who is the real pilot. The man who holds the position of pilot has a sinecure. I will tell you another thing: they often get at loggerheads. What do you think the crew do in their spare time? They go catching and curing fish for the pilot. They brush his verandah; they work in his garden; and they go working like a lot of jimmy-ducks round his yard. It is a fact. They go chopping loads of wood for the pilot, and those that will not do that will very soon get shifted out. They are regular little self-governing colonies.

3133. Do you know they are only inspected once a year? Some of them not at all. There is any amount of room for improvement. Get evidence from people who will give you the truth without bias. The Members for these districts have to look after the pilots; they pilot them through at election time. Give this further consideration, and, if you go and get evidence quietly from the master of one of those small craft trading up the rivers they will make it clear that no pilot goes on board of them.

3134. That is pretty clear now? You are satisfied of that. Then these tug-owners get more than a private company would pay for the same class of boat.

3135. *Mr. Wilson.*] I think the pilots admitted that they did not go on board. They said they could be of more use on the tug. "Sometimes," they say, "we can save both the vessel and the tug."

3136. *Mr. Powell.*] The pilots are not called upon to go on board the vessels;—they are mostly commanded by exempt masters, and, therefore, the pilots are not required;—if they take the tug, they take it at their own cost, and they do not want the pilot;—he only gives his services when those services are required and paid for, and we know that they are very seldom required simply because most of the masters are exempt; so there is no reflection on the pilot? I am not reflecting on the pilot, but the system.

3137. The tug does the work? The tug does the work, and the only work done by the pilot's crews is done in the fine weather, and that work could be just as efficiently performed by the crew of the steamer which the Government subsidise.

3138. *Mr. Wilson.*] It would have to be under very heavy bonds or securities, because they would not be under the Government? There are only three or four buoys to look after, and a couple of sticks painted white on a line.

3139. What about the beacons up the river;—who is going to look after them;—the pilot does it now, you know? The steamers could do that too. Up the river they do not often change. The bar is the principal thing. The river has its course set out, and it is very seldom that a change occurs. If there is one department more than another where there is any amount of room for drastic improvement it is this Marine Board. They have been living a very easy existence.

3140. *President.*] Do you think it would be advisable for the Government to supply the tugs themselves, and take up the whole of the services? Yes; they manage other services. They manage to do the dredge service, and to do it very effectively; and they keep other boats for towing out to sea—the "Thetis" and the "Ajax." They could do it just as well, but I do not think they would do it more cheaply.

3141. You think it would be more economical to have these subsidised boats? When the Government goes into a thing they always want to do it a little bit better than anyone else would do it. Of course, the vessels have to be made real special things. The flag of New South Wales would never do to fly over anything of a common kind. I think you would find it more costly.

3142. *Mr. Powell.*] Have you looked at the figures;—if the Government had the boat, the pilot would become the master, the hands would man the vessel, and the whole of that would be saved, and the position would be exactly as you have described—the pilot boat would do all the work? I say it can be done. The same thing would be obtained the other way, as the pilots and their boats' crews would be done away with.

3143. Then you would have to make the masters of the vessels Government officers;—there is no hope for that? Well, very good, that would absorb the pilots. It is easy to specify in the contract that the master of the vessel shall be a Government officer.

3144. *President.*] That has been done in the Public Works Department? Steamers are chartered here now from Home, with Colonial crews on board, but the owner always has his captain aboard. Now, on

U. M. Davis, the other hand, the Government say, "We will put the captain; you will put the crew." That would  
M.L.A. get over the difficulty.

5 July, 1897. 3145. *Mr. Wilson.*] How would it do for the Government to simply charter the ship and find the crews and the captain too;—it would save the large capital cost of the steamers? It would. Take the Richmond: I am in a position to know that the "Protector," which was specially built for that bar, cost £11,000. They tried iron boats—the "Francis Hixson," an iron boat, was lost on the bar. The "Protector" has been built of double strength; she is of enormous strength. If you built a boat now you would go to all that expense, whereas if you hired her you could get her at less than the interest on the cost of a new one, because she is older; but she will work for many years.

3146. *President.*] The Government would have to pay the insurance? It is always in the contract to charter that you are to insure the vessel.

3147. *Mr. Wilson.*] You would have to make a contract for five years? Well, Fenwick has always had three or five years' contracts. I think that would be much better than paying the full subsidy rate for crews and steamers. The only thing then is the manning. It does not follow that if you make the vessel a Government boat that you give her a double crew. Find out what she has carried, and see that putting a Government captain on board does not mean doubling the pay.

3148. *President.*] I think you represent a constituency that is specially interested in shipping? Yes.

3149. So that you stand especially as a representative man in the shipping interest? I stand as representing the shipping interest to a greater extent than any other man in the House.

3150. So that, in fact, any opinions expressed by you come with double weight? I have thought it out well, and I have spoken of things that I know are the opinions expressed by my vast section of the seafaring community.

3151. And you are satisfied that in speaking thus you are voicing the opinions of those who have a right to express an opinion on the subject? Certainly; people who know something about it. I have given all these matters due consideration, and I say with regard to the Marine Board and its position in New South Wales that it has been nothing but a farce and a disgrace to the Statute Book, and the pilot stations have been simply self-governing colonies.

FRIDAY, 9 JULY, 1897.

PRESENT:—

JOSEPH BARLING, Esq., J.P., PRESIDENT.  
GEORGE ALEXANDER WILSON, Esq., J.P.  
JAMES POWELL, Esq., J.P.

Robert Rowan Purdon Hickson, Under Secretary for Public Works, and Commissioner for Roads, sworn, and examined:—

R. R. P. 3152. *President.*] You have had a long experience in connection with marine matters as affecting New  
Hickson. South Wales? Yes, on the North Coast; but I know very little of the South Coast.

9 July, 1897. 3153. You have visited nearly every harbour in New South Wales? Every harbour on the North Coast.

3154. In your capacity as late Engineer-in-Chief? Yes; and as Assistant Engineer for Harbours and Rivers.

3155. For how long have you been acquainted with these harbours? For the last sixteen years—since 1881.  
3156. And they have been almost daily under your observation in connection with the Harbours and Rivers Department? Yes; with the exception of the time when I was Commissioner for Roads from 1889 to 1895.

3157. We shall be glad if you will now give us the benefit of your experience in Marine Board matters; we will leave you to put it in your own way? The only matter I can speak about is in connection with the pilot and tug service of the ports. I think there is a report of mine to Mr. Moriarty in existence now that I made many years ago. I have always held that there was a very large unnecessary expense in connection with the pilotage and the tug service of those ports. In the first place, at some of the ports—one especially, Lake Macquarie—I do not think there is any occasion to have a pilot service at all. I am very intimately acquainted with Lake Macquarie, having had to go down there about twice a week for many years when the works were in progress. There was a pilot station there then. I presume it is there still. There was a pilot and two boatmen, and the whole pilot retinue, yet the whole traffic of the place was confined to two ketches, the captains of which were both exempt from pilotage. What that man does for the country I could never find out. With regard to the northern rivers, it is of course necessary to have a steamer, but I think the steamer and the pilot service ought to be amalgamated. What takes place with a vessel coming into these ports is this: In nine cases out of ten the pilot cannot get out, and he is inside in a boat waving flags to the vessel coming in, and it is the tug-master that is to all intents and purposes the pilot for the port. My idea is that where the tug-boats are required they should be placed under the charge of the pilot, and have only the one service.

3158. Would you recommend that the Government should subsidise the tugs, or that they should supply the tugs themselves? I think it would better for them to supply the tugs themselves. I am quite satisfied that the service could be kept up at the present cost of the pilot service alone if the pilots had the tugs.

3159. *Mr. Wilson.*] Plus the cost of working the steamer? No, because you would have a less number of hands. There is now a pilot and four men, and you only want three men on the tug.

3160. The engineer would require to be paid more than the man? I do not think you would require to pay him more. I think you could work nearly all those tugs with a captain, an engineer, and a young man on deck—that is three, whereas now you have five.

3161. Could you do that on the Richmond? Yes; I believe you would save money there, as there is a very large subsidy paid at the Richmond.

3162. *President.*] You would also have to take into account the depreciation of the plant? Oh, yes; but that is not very heavy.

3163. Do you think we could hire or charter boats, to be manned by a Government crew? That is practically the same thing. I object to the present system because whenever there is likely to be a bad  
bar

R. R. P.  
Hickson,  
9 July, 1897.

bar or any risk the captains of these subsidised tugs take very good care to be out of the way. It was common rumour on the Richmond that that has been the custom, and that they do not come on the scene until it is almost a case of salvage, so that they can practically levy blackmail on the ships. That is not an uncommon thing. I am quite sure the present system is wrong and expensive.

3164. *Mr. Wilson.*] What you are aiming at is undivided control by the pilot? Yes, either as a Government boat or as a boat hired, but under the pilot's control.

3165. *President.*] We should like to know whether you think it would be a practical arrangement to charter a boat, putting it under the charge of the pilot? Yes.

3166. Have such cases come under your observation in connection with the Harbours and Rivers Department? Yes.

3167. And has it been satisfactory? Yes; so long as the boat is by hire or by ownership directly under the pilot all will be right.

3168. Do you think it would be a good plan to test the thing first by just chartering the boats before the Government undertake the responsibility of providing boats of their own? Perhaps it might. The boats are there, and they might be hired on reasonable terms. It would be worth trying, at all events.

3169. You think that would be a better system than the present? Undoubtedly; I do not think you could have a very much worse system than the present.

3170. Evidence has been given by one or two witnesses that in case of emergency the pilot and crew have been very useful in rendering assistance to the tug when it has got into difficulties? I do not know of a case.

3171. You do not think there is much in that contention? I do not see how it could be, because, under those circumstances, I do not think the pilot could get outside to give assistance.

3172. When they have got on a sandbank the pilot has been of assistance in throwing ropes and so on? That might be.

3173. You do not think the advantage of that would be sufficient to obviate the ill results that flow from the present system? No.

3174. Have you not had considerable experience in the other colonies in these matters? Yes, in South Australia and at home. I was harbour-master as well as engineer to a harbour board for some years, and I had the tug and pilot service under my control for some years.

3175. What place was that? In the north of Ireland.

3176. So that you are particularly qualified to give an opinion on these matters? I think so; I have had a very large experience.

3177. Is there anything else that you would like to tell us that would be of use in this matter? No; I do not know of anything else in connection with the working of the Marine Board except the pilot service and the subsidised tugs.

3178. *Mr. Powell.*] Any system by which the control of the tugs would be placed in the hands of the pilot would receive your recommendation and support? Yes; that is the main thing.

3179. *Mr. Wilson.*] So far as that is concerned, it does not matter whether the tugs are owned by the Government or chartered? No; it is simply a matter of which way is more economical. There is a difficulty in working subsidised tugs with divided control, because there is friction caused by it.

3180. *President.*] Mr. Hickson, you have been giving us some evidence about Lake Macquarie, and I now hand you the official log for the period of three months ending March, 1897, for that port;—will you kindly state what that log discloses? In the month of January, 1897, the arrivals were ten, and I suppose the departures would be the same. There were only three vessels, and between them they went in ten times. In February the same vessels went in twelve times, and in March the arrivals, the same vessels, were nine, and I think you will find that the masters of these vessels were exempt from pilotage, and did not retain the services of a pilot.

3181. *Mr. Powell.*] I dare say you know there is an open jetty there where a large trade is done, and there is no pilot? Yes; that belongs to a private company.

3182. The pilot and tug there cost nearly £900 a year, and that has been going on for twenty years? The pilot has not been stationed there twenty years. I think the pilot was stationed there since I went to Newcastle, about 1882.

3183. That is fifteen years? Yes.

3184. *Mr. Wilson.*] Do you see the "Remarks" there, "Two days clearing up the boat-shed"? Yes; I can tell you a little more about that, too. The Harbours and Rivers Department had to start the works there, and the marking of the channel had to be done by the dredgemen, the pilot's men were too busy to do it, and would not attend to it.

3185. Have you any men there? No; there are no men there now.

3186. The marking of the channel, and that sort of thing, ought to be done by somebody? I do not think so. I do not think there is any change in the channel. It is always in the same place.

3187. *President.*] Do you think that a periodic inspection is all that is required? Yes; the ketch-men do that sort of thing themselves.

3188. *Mr. Wilson.*] "Shifting the buoys in the river";—that ought to be done? I think an inspection now and then from Newcastle would be all that was required.

3189. Could the marking of the channel and the placing of the buoys be done from Newcastle? Quite easily.

3190. *President.*] Perhaps you would kindly consult with Mr. Darley as to the returns he is getting up, so that we might have the benefit of your help also? Yes, certainly.

MONDAY, 12 JULY, 1897.

PRESENT :—

JOSEPH BARLING, Esq., J.P., PRESIDENT,  
 GEORGE ALEXANDER WILSON, Esq., J.P.,  
 JAMES POWELL, Esq., J.P.

Francis Buckle, sworn and examined :—

- F. Buckle. 3191. *President.*] You are a member of the Water and Sewerage Board of Sydney, and a merchant? I am not a merchant. I am a lighterman and steam-tug proprietor.
- 12 July, 1897. 3192. You have come, at your own request, to give evidence in connection with this inquiry into the Marine Board, and we are very much obliged to you for the trouble you have taken to come? The reason why I came is this—that I have been connected with the rivers for many years, and I know you have had evidence that has been very conflicting, and I thought I could give you a little information which would help you.
3193. We will give you your own course, so that you can put before us what you like, and then we can ask any questions we think necessary? I suppose what you first want to know is a little about the rivers?
3194. We are anxious to get any information we can, so we leave it to you to put it in any way you think best? I have had tugs at as many as five rivers at one time, but I have only three now. Of course, you are aware that those rivers are not so good now as they were, as there are not so many vessels going there; and we have been troubled with bad bars; and at the Nambucca the river has been closed altogether for some time. This is the first time I have known the rivers so bad since I have had anything to do with the tug service, and it is no criterion to go by. The rivers, as a rule, have been good for the last fifteen years, and the cause of the trouble of the last few months is the want of rain.
3195. Will you tell us the three rivers you are connected with? The Bellinger, the Nambucca, the Macleay, and Port Macquarie. I have also had experience with the Tweed and at Wollongong. I know, by hearsay outside, that you are inclined to recommend the taking over of the steamers. It has been so reported by the Marine Board.
3196. I do not think anybody is justified in saying that, Mr. Buckle; but we have evidence in support of that? I went into the figures, and I may tell you that you could get the present steamers for about £18,200, perhaps less. That is including the Richmond River boat as well, and she is the most costly boat of the lot. That is what I reckon the value of the boats.
3197. How many boats would that be? Ten boats.
3198. Can you tell me the names without much trouble? I cannot tell you the names of all, but I can tell you the rivers:—The Tweed River—I do not know the name of the boat—"Terranora"; the Richmond, "Protector"; the Clarence, "Conqueror"; the Bellinger, "Alert"; the Nambucca and Macleay, "Volunteer"; the Hastings, "Thistle"; Camden Haven, "Unique"; Cape Hawke, "Marion Mayfield"; Wollongong, "Carbine"; the Manning, the "John Gollan."
3199. You have missed Lake Macquarie? No; there is no boat there.
3200. And you think those boats can be bought for £18,200? I think so. Can you tell me the subsidies for the lot?
3201. About £7,000 a year? Well, I suppose those ten rivers each average £40 a month in towage earnings, and that is £4,800 a year, and with the £7,000 in subsidies, is £11,800 a year altogether. That is the income of those boats costing £18,200. Of course, if you are going to get new boats they will cost you a great deal more money. The principal expense of those boats is the docking. The cobra is very bad, and if there is a bit of copper knocked off, the cobra pretty soon gets in. The machinery wants looking at about once in three years—it stands very well. The principal thing is the cobra. If a bit of copper comes off she will want to go into dock at once.
3202. There is a dock at the Macleay? Yes. I have always found that when they have come to Sydney to be docked, the engineer says there is very little wants to be done to the engines; but, before they have finished, it costs a lot of money. The Marine Board engineers come on board, and they must have the least thing that is wrong set right to please the Marine Board, and the engineers are very strict. We have to do anything they want. I do not think they go outside their duties, or farther than they ought to go. I think they do just what they think is right, and it is better for the owner that they do that, for they cause many a thing to be done now that the boat would have to come back again in a few months to have done; and, although it seems very hard, I think it is quite right to make a man put his boat in proper order. I know a good deal about the Marine Board. I have gone down in many trips down the coast. It is certainly no pleasure for them. If there was any pleasure it was I who would have it, because they took me to many places I would not have gone to otherwise. I had a free passage, of course, and paid for my food, and went down to see my boats—to see if the engineer found fault with any of the boats. I think it is very judicious for the engineer to go and see these boats, and see that they are kept in proper order, because there may be many times there is something wrong that will run on and ruin the engines. At the time I went, I had five boats on the rivers. I can give you a good deal of information about the Marine Board. I know them all very well, but they are no friends of mine. There was a race here, and boats were cautioned from going to the race. I went, with a few of my friends, on one of my boats, and so did others, but I was the only one summoned, and there is no friendship about that. I know they are all honest men, and, if their own brothers were interested, they would not give a wrong decision.
3203. So far as you can see, you would not suggest any alteration in the present constitution of the Marine Board? I do not think I could suggest any alteration, because if they were not good men I would say so.
3204. You think the Board is well constituted now, and serves the public rightly? It is a very hard case, a Marine Board case. They are not the same as a judge and jury at all. One man gets up and swears it is white, and another gets up and swears it is black, and the Marine Board have to use their judgment to see what is right and what wrong.
3205. Of course these actions are civil, not criminal? Yes. When a captain of a ship comes before the Marine Board it is for an error of judgment. We all err in judgment many times. They do the same,  
 and

and have a collision, and one of them is, certainly, wrong—perhaps they are both wrong—but it is a mistake when there is an accident, and there is some one to blame for it, whether it is the captain, or the chief officer, or the second officer, or the third officer. Someone is wrong, there is no doubt of that; they should have kept clear, at least, if they had been keeping a good lookout and things had been done right. The Marine Board have to use their judgment, and their nautical experience, on the evidence they have got. I have often heard the evidence, and it is as I say, one ship swears it is white and the other swears it is black. Both are right—they are never wrong—and it is a hard case to decide which is right, and nobody but a nautical man should sit on that Board, that is my opinion.

F. Buckle.  
12 July, 1897.

3206. Of course, as you are aware, in case of any appeal, a Judge really has to settle the case in the end? Yes, and a Judge has many times given a verdict against the Marine Board's finding, but even then the Judge is not a nautical man.

3207. Still, as a matter of fact, it has now to be settled by a Judge in case of any appeal? They can appeal to the Supreme Court, but that is no reason why a Judge is right. Those appeal cases often happen, and very often the verdict has to be altered, but I tell you the Marine Board have got to judge between the two. One or the other is telling lies, and they have to judge from their experience which is right and which is wrong. They have a very hard job—very hard. Every man thinks he is right in a collision case. There is very hard swearing in those cases, and, as you say, it often goes to a Judge, and sometimes the Judge gives a different verdict; but my experience is, that the Marine Board have always done to the best of their judgment.

3208. Do you think your objection could be got over if a Judge of the District Court were appointed and had nautical assessors acting with him? Even then they could appeal to a higher Court just the same, and these men (the Marine Board) sift out everything. They are all old men, and they have worked their way up; they have not come in at the stern window.

3209. Do you not think it would do away with a good many of the objections you seem to have against a court constituted on legal lines if two nautical assessors were associated with such a court? I do not know. Of course, the Judge would be a very good man at taking evidence, but he would really know nothing about the case. He might be a very good man to pick out evidence from the witnesses, and might have a better idea of the man who was telling the truth and the man who was telling lies, but he could not tell anything about a ship.

3210. Would not that difficulty be got over by having trained nautical assessors to get out the technical part regarding the ship, and the Judge to look after the technical points of law? I have always found Captain Hixson a very straight, straightforward man. I think Captain Hixson is a man who has tried to do the very best he could in every possible way.

3211. No one has ever impugned that; that stands out conspicuously? I do not know that you can get a better man than Captain Hixson. I do not think a Judge would be better than Captain Hixson, from the very fact that it is a nautical man that is required for the position. A Judge might be better at picking out the evidence, and about who is telling the truth and who is telling lies, but it really wants a nautical man there. Of course, the Judge is better up in the law than, perhaps, some of the nautical men would be.

3212. Now, with regard to the tugs; I am expressing no opinion whatever, but supposing a three years' arrangement were made, the Government chartering the boats so that they would be entirely at the disposal of the Government;—do you think such a system could be worked? I do not think so. I do not think chartering would ever do any good. I do not think the owners would care about chartering, and I do not think the Government would ever get satisfaction. If there were any accident on the bar the owner would say to the Government, "I want that boat in dock," and while the boat was in dock the bar would be idle.

3213. What is the case now? I have a spare boat. If a boat had to come to Sydney, I would send a spare boat down. I have had a boat in the Clarence dock, and got satisfaction there.

3214. Would not the same resources that are open to you in such a case be open to the Government? Yes.

3215. Mr. Wilson has pointed out to me, would it not be almost casier for the Government to meet an emergency of that sort, because they have boats of their own? Quite right. If the Government had all the ten rivers they could do with a spare boat. If one boat wanted an overhaul in Sydney you could send the spare boat up. You could go through all the ten boats once a year, and then the spare boat could come to Sydney, and be employed in the harbour or laid up.

3216. Would not that work in very well with the boats of the Public Works Department? They have a very large number of boats? Yes.

3217. *Mr. Wilson.*] On the Clarence and Richmond Rivers the Government have boats which would do on an emergency? Yes.

3218. *President.*] Would it be an impossible thing to charter these boats? I would charter mine.

3219. Would you for three years charter your boat at the same rates as now, you taking the possibility of loss? I would have to go into that before answering.

3220. Without trying yourself, just think about it, and say whether you would? We could come to terms. Would you find everything?

3221. Yes; crews and everything? Some rivers you would, and some rivers you would not. There are some of the rivers that do not pay.

3222. Would not that take the difficulty off your hands if the Government took your boats;—do you not think it could be done for the same money that is paid now? There is one thing to be looked at. You have ten boats; you do not want to insure for ten boats. The insurance on those tugs is 10 per cent., which would allow for the loss of one boat a year out of the ten. If I had ten boats, I would not insure one of them; I have only three boats, and so I have to insure.

3223. Does not that show that the Government could do it on very advantageous terms? You would save 10 per cent. on £18,200 every year. It would provide for a new boat every year. If I had ten rivers, I would not insure a boat belonging to me, but with only three it is too much of a risk. I do not know whether you could not do it cheaper by calling for a whole tender in one sum, but the public might turn round and say you were giving a monopoly.

3224. *Mr. Wilson.*] Alternative tenders for the whole or any particular rivers? I might not tender for the lot and I might. If I had the ten boats I would not insure one. The boats must be built to suit the rivers.

- F. Buckle. rivers. They are of very light draught; they are not made for speed; they are made for towing, and they are not good for anything else.
- 12 July, 1897. 3225. *President.*] Does not that all point to the conclusion that it would be advantageous to the Government to take the whole thing into their hands in that way, chartering the vessels? Yes; I think it would. I am speaking against myself, but I will speak the truth.
3226. The Government could charter the whole ten, and do it then under very advantageous terms? You would have to get a driver in each boat, not an engineer, a man with a third-class certificate, because an engineer, if he does any damage, says, "I do not care, I have a certificate; I can go somewhere else and get work."
3227. *Mr. Wilson.*] Would there not be some objection to the Government employing a man who had not a certificate? No; he would have a third-class certificate, a harbour certificate. I had a second-class certificate man once, and he simply ruined the boat. He allowed a small drip to fall down among the ashes, and that drip ate a hole away in the boiler. I had the boat down to Sydney, and got a patch in the boiler, and shortly after she had to come in again, as there was another leak in the front of the boiler that had eaten the boiler away. I took it out, and put another new boiler in. I would not patch it again.
3228. *President.*] The capital cost of the tugs now would be £18,200? That is the estimate.
3229. What would you think would be a fair thing for a plant of that capital sum to be chartered to the Government for? It would be according to the time of the charter.
3230. For three years? Well, you would never get much out of three years' chartering? A five years' charter would be best.
3231. What would you think they should be chartered for at five years' charter? I do not know what time she is wanted. There are the coals to be found, and oils and waste.
3232. The Government to find all labour and material? What about insurance?
3233. Alternative proposals, the Government taking the risk or the owners taking the risk? If you will leave it for a couple of days I will bring it up to you.
3234. We are giving no opinion at all; we are just simply waiting to see which way the weight of evidence goes? I can quite understand that.
3235. *Mr. Wilson.*] I do not know if you could express any opinion as regards the Government owning the steamers as against their chartering them. There are three courses. The present course of subsidising the steamers, you finding the crews and everything; there is the other course of buying the steamers, and the third course of chartering the steamers? I myself never believe in chartering a vessel; I either buy or not at all; still, if you give me time to look into it I might be able to tell you more about the chartering. It never came to my mind, so that I could give no opinion at the present time as to what it would cost to charter. I will consider all this case, because it matters little to the owners whether you charter their boats or whether they run them themselves, so long as they get fair interest on their money.
3236. You think three years too little? Yes. You would get the boats in good order, and, with the exception of the cobra, they would last well. If you have good engineers in them they will last well. A man who neglects his boat ought to be dismissed at once. Let him go at once; he is no good.
3237. If the boats were chartered, the Marine Board's engineer or deputy could periodically overhaul them? Those men know all about it; they know just what the boats want.
3238. *President.*] If you would come again with that information we would be very glad? Yes. If I had ten boats I should not insure one farthing, because you would have a new boat every twelve months; I would put the 10 per cent. away and have the lump sum in hand at the end of the twelve months.
3239. No doubt that would be right. However, you might put it alternatively, as to the Government taking the risk and the owners taking the risk? Yes. I do think that by calling for tenders for the lot you would get more satisfaction, because you would then have one man to look to, and that one man would always have a spare boat, he could not possibly do without. At the Nambucca and the Macleay the people who have the mills and the agents are kicking up an awful row. I have a boat at the Macleay and the Nambucca got blocked. A man came to me and said, "Send the Bellinger boat there." I sent her and she got blocked there, and in the meantime three boats got blocked there at the Bellinger and could not get in. Then there were complaints to the Marine Board, as of course I ought to have got permission from the Marine Board. I was doing what I could to satisfy the people. It cost me more money than I got. I only got 30 shillings for the tow, and it cost more than that for coals and wages and wear and tear of the machinery. I know they are agitating to get another boat there. You see if there is a vessel to go out of the Nambucca this morning she goes out on the top of highwater, and when she gets to the Macleay the tide is down and she cannot get in. To-morrow there comes a high sea, and you cannot get the vessels in. I am going to give it up. Those people who were blocked at the Bellinger were poor people and it was a serious thing to them, and when they did get in they were blocked for a fortnight and could not get out.
3240. *Mr. Powell.*] Do you think it is necessary to continue the boat at the Clarence;—do you think she is wanted there? Well, I had a boat there, and I never made anything out of it.
3241. Do you think she is required there? She is sometimes.
3242. Would you recommend her removal? I would not like to say that. It might be worked with the Richmond River boat; she used to do it before.
3243. They have a boat at the Clarence now—the "Conqueror"? Yes.
3244. Is it necessary to keep that boat there, or have a boat there, or have a boat there in connection with any other river? I think the other river boat would do it very nicely, because they are all large vessels that go there.
3245. Then you think it is necessary to have the boat there? Yes; I think the Richmond River boat should do it.
3246. You think it is necessary for the Clarence that a boat should be there for some time? I do not say she should be there all the time.
3247. You think a boat is necessary? Yes; and I still think the Richmond River boat should do it.
3248. *Mr. Wilson.*] Would she not be prevented from going round? If they were prevented from going round they could not get into the Clarence either. When they cannot get out of the Richmond they cannot get out of the Clarence; and the Richmond River boat does not do much now. It is a very poor river now.
3249. *Mr. Powell.*] That is to say, the earnings are very poor? I know the boat has lain there for months, and has not done a tow.

3250. You would not recommend the taking away of the boat from the Clarence? I do not know what to say there. I have had as much as two months there without a ship. I believe there have been more vessels going there lately. I would not like to say you should not have a boat there, but I do think there is a far better chance of the Richmond River boat doing the Clarence and the Richmond than there is of the Nambucca boat doing the Nambucca and the Macleay, as there is about the same distance between the two places, and there are far more vessels going to the Macleay than to the Richmond. There are three or four boats a-week to the Macleay, and sometimes now there is not one to the Richmond.
3251. In answer to Mr. Barling I think you said that these ten boats were worth about £18,200? Yes.
3252. And that you would go pretty near the same rates in renewing the charters? Yes.
3253. I am speaking now of a possible three or five years' charter;—have you taken into consideration the earnings of the boats, which are about £4,500 a year;—you would not be prepared to forego the earnings;—you would not charter them to the Government for this sum of £6,300 a year, not participating in the earnings;—you would have to add the earnings to the present charter money? If I charter, that money—the Government would do what they liked with it. If you charter that boat you pay all the expenses and you take all the revenues.
3254. *Mr. Wilson.*] You are relieved of the working expenses? Yes. If I charter this boat the Government ought to get the towage money.
3255. *Mr. Powell.*] Take the "Alert." You are receiving as charter under your tender £732 a year; and according to your own showing you earn about £40 a month on the average of the whole number; that would add £480 to the amount, which would be then £1,200 a year;—would you charter to the Government on the basis of the £732 you are now receiving, losing that £480, or would you expect to get more than the £732? Nothing; I think not.
3256. At present the £480 is added to the amount you receive from the Government? Yes.
3257. Then you would make the Government a present of the £400, and would still be content to charter your boat to them for the £700? If you paid the wages and coals.
3258. The wages do not come into this question? I would take far less than that £700.
3259. You are satisfied with the sum of £730; are you putting the wages against the earnings? Yes; do you mean would I take the balance after deducting the wages from the £730?
3260. Would you take a lower sum than you are taking now because of the wages? Yes; but you see the balance is a bad one, and it is a hard job to get a boat to go there at all. I only went for it this time because I had a spare boat. The Government will have to run the risk and not the man who charters his boat. If the Government charters the boat it matters little to the man where you put it; he wants so much for the boat and you do what you like with it. If you get £1 or £120 you pay the same charter money. If you intend to keep all the rivers going with boats some will pay you well and some will not pay you well.
3261. In chartering under the possible conditions of the Government taking your boat, would you expect to put somebody on board to watch your interests? I would not want anybody on board to watch my interests. I would hand her over in good order, and would expect to get her back in good order fair wear and tear excepted.
3262. The subsidies have got very low? Yes; there is something in it or they would not have it.
3263. I suppose it is not all loss? We cannot stand all loss.
3264. You can answer this question or not as you think fit. Is it a fact that you personally have lost a great deal on these charters? I never lost anything on them; I would not run them at a loss. I have made a lot of money with the charters. I have always kept the boats in good order.
3265. You have opposition at Port Macquarie? Yes; I am getting about £31 a month there. The boat went out after that bad weather and hit a wreck of some sort, and got the stern clean knocked out of her. I have made a lot of money at Port Macquarie. Those fellows who have the opposition tug now, one of them has an agency for a mill and another man has vessels sending up for girders, and there is another man who has a bit of timber. There is nothing in it.
3266. *President.*] We shall be glad if you will let us have that information as soon as you can? Do you want me to give what I think of other people's vessels as well as my own?
3267. *Mr. Wilson.*] Suppose you owned those vessels;—you tell us what you would charter them for, you handing the boats over and we doing the rest? Very well.

WEDNESDAY, 14 JULY, 1897.

PRESENT:—

JOSEPH BARLING, Esq., J.P., PRESIDENT.  
 GEORGE ALEXANDER WILSON, Esq., J.P.  
 JAMES POWELL, Esq., J.P.

Francis Buckle, re-examined:—

3268. *President.*] When you were here last, Mr. Buckle, you kindly promised to give us some further information as to the Government providing tugs of their own, or as to their chartering them? I have carefully considered it, and I can see there are only two courses to pursue. I am afraid that chartering would never suit. There are so many complications in it that you would never get a charter-party to suit both parties. It is different from chartering a ship to go from here to a port and back again, and the only way I can see is for you to keep it as it is, or to have boats of your own. Then, with reference to the question asked by Mr. Powell, I think that the Clarence River could be worked with the Richmond boat. I intended to bring with me a memo. of the amount that I made on the Clarence, but I forgot all about the thing.
3269. You think the one steamer could serve the Richmond and the Clarence? Much better than the Nambucca and the Macleay are served by the one boat, although it makes no odds how well you serve them—there will be complaints always. The people are always dissatisfied. Most of the pilots on the stations have come out of the steamers. The Marine Board always took my good captains from me. They are all good hands. If you have a bad man a ship is no good to you. You must have a good man there to do the work.

3270.

- F. Buckle. 3270. Then you think you cannot recommend chartering? I certainly could not recommend chartering. I know it would be very complicated, and there would be a good deal of disagreement. If anything happened to the ship the Government might say, "That is what you have got to do," and the charterer might say, "You have got to do it," and there would always be wrangling over it.
3271. *Mr. Wilson.*] Could not that be well defined in the contract? I am afraid not. I considered it all yesterday and last night, and I know there would be a lot of trouble with it. Chartering those boats would not do. Chartering a ship is a different thing altogether. He has got his own crew, his own ship, and everything; and he goes backwards and forwards at so much a month. It is very seldom you will find a vessel chartered without a crew, &c.
3272. *President.*] Have you thought whether it was desirable for the Government to own the vessels and carry on the work of towing themselves? That is for you to decide, not for me.
3273. Have you no information on that subject? I know what I would do in the matter. Mr. Powell asked me if I lost money on the boats. I did not keep boats that did not pay. They have always paid me very well, until just now with the opposition I have got at Port Macquarie. Of course, just now the bars have been bad, but that only happens once in twelve years. This is the second time since I have had these rivers that the Nambucca has been bad. It was closed about two years ago for a month, the same as it is now.
3274. Of course, it is well known that it is the want of rain that makes the rivers so bad? If I were there I would do something to it. They are too lazy. It is on the crossing. Here is a headland coming in here; and a bar out here; and this is the river in here; and a sandy spit coming in here. I said, "You get a grappler and put a bit of light chain on it, and have two ship's boats with four men in them each, and let them run this grappler out as far as there [*indicating*], and then let the tug tow it back, and it will loosen the sand and the water would wash it away. It only wants the sand moving and away it will go. They are so lazy, they would lay there all their lifetime sooner than go to work and do this. The last time the bar was blocked Mr. Portus came to me about it—to see what I would charge for the boat. I said, "Look, it is as much to my benefit as it is to the ships', I will charge nothing. If you think it is worth anything you can give it to me." They did nothing. It has never been tried.
3275. I think it has been tried on the Manning? Yes; it was not the crossing that was the matter with the Manning, it was the bar. This is the crossing,—it is all smooth water inside of it. The tug could not get over that crossing, but she could get to the end of it. They should get a grapple and stir the sand up.
3276. You mean a sort of harrow? Yes; that will loosen the sand, and it will be washed away. There were nine boats there lying idle.
3277. Why did not the captains try such a scheme as this? None of them would do it. They have no push—no energy. They go there and come back. All is well if it goes right, and if not the boat lies there.

TUESDAY, 20 JULY, 1897.

PRESENT:—

JOSEPH BARLING, Esq., J.P., PRESIDENT.  
GEORGE ALEXANDER WILSON, Esq., J.P.  
JAMES POWELL, Esq., J.P.

Angel Cooper Turner, Managing Director of the Illawarra Steam Navigation Co., sworn and examined:—

- A. C. Turner. 3278. *President.*] You are anxious to give us some information which you think will aid us in carrying out our inquiry. We shall be glad if you will give us the views you entertain with the utmost freedom? I will start with the Marine Board. In my opinion, backed up by the opinions of others outside, that is a body that is nearly obsolete now. They are all men whom we think a lot of personally, individually; but collectively we think they are not up to the times, and that we should have a Board constituted somewhat after the lines they have in the old country and in many other countries. Where the certificate of a master or a mate is to be dealt with we think that should be dealt with by two nautical assessors—men experienced in marine matters—presided over by a Stipendiary Magistrate, to assist them on any legal point upon which they might require his assistance. I think, and many others think, that that should take the place of the present Marine Board. We feel that the Marine Board is composed of persons who are all more or less interested in business—some ship-chandlers, some marine surveyors, others on Boards of steamer companies, and such like, which we think must clash with the proper working of the Board, and, therefore, we think that the Marine Board, as it exists now, should be supplanted by a Board such as I have said. Touching the lighthouses—the inspection is almost a farce. The people at all the lighthouses know a month before that there is going to be a picnic, and, of course, everything is got in order for the inspection. It should be done as it is in the other colonies,—the superintending engineer goes round occasionally when he is not expected, and he sees things as they are, and not as they are got ready to be for inspection by the Marine Board. That is a very essential thing, for the lights are things that have to be kept in order, and should be looked after. We think the inspection should not be made in the way it has been made in the past. There would have to be a secretary, of course, to the Pilot Board, which should be a distinct Board from the Marine Board. How that is to be constituted I am not here to say.
3279. Would you see any objection to the gentlemen who form this Pilot Board being officers of the Government? No.
3280. You think that the shipping community would not raise any objection to that? No; certainly not; I think they would rather like it.
3281. If proper men were appointed you think the shipping community would show confidence in them? They would have more confidence in men like that, independent altogether, and having nothing to do with any shipping interest or surveying, or business.
3282. In other words, you would have all the judicial and executive functions completely separated from anything like the commercial work of the Colony? Certainly.
3283. And you think that would tend to more impartial judgments being given, and would gain the confidence of the community? Yes; but of course, we do not impute anything to the present Board—they are like Cæsar's wife, we may presume—but, on principle, we want a Board more apart from business.
3284. I understand your objection is on principle? Yes, on principle. 3285.

3285. You have no objection, personally, to the members of the present Marine Board, but, on principle, to the Board itself? Yes.

3286. Are you aware of how often the Marine Board inspect the pilot stations? They have been in the habit, for the last twenty years, of going round annually. I know so well because they have always chartered one of our steamers to go in. I believe this last year the Government thought they were rather extravagant and stopped it, sending the "Thetis."

3287. You think that if this picnic, as you call it, were used for sending an inspector round there would be better results than at present? There is no doubt about it. The objection that I have heard to that is that at times there are quarrels amongst the men, and the Marine Board go down and settle these little quarrels, which generally originate with their wives. I think a man like Mr. Cruickshank, for instance, is quite as capable of settling such a squabble on the spot as the Marine Board. I do not think it would be half the expense to take the inspector round as it is for the Board.

3288. How many years have you been employed as manager of the Illawarra Steam Navigation Company? I have been manager twenty-two years, and I have been in the Illawarra Company since 1859.

3289. So that there is hardly any person in the Colony who would have more knowledge of the marine matters, the requirements of the Colony, than yourself? I think I ought to know. I think what I have said is in perfect accord with the public feeling outside. Of course, some people would say you must have a Marine Board to issue certificates, but I say, "Not at all." At Home there is the Secretary to the Board of Trade, and here we have the Secretary for Finance and Trade, who, I presume, would have the same responsibility. We have examiners against whom nothing can be said, and if an examiner grants a certificate it is very easy for the Treasury to issue it.

3290. *Mr. Wilson.*] The signing is a mere matter of form? Yes.

3291. *Mr. Powell.*] Capt. Bedford's or Mr. Cruickshank's certificate ought to be enough? Quite enough; they are both very sound. There is one matter I would like to touch upon, and that is the granting of certificates to vessels. In New South Wales they are granted for six months, and that used to be necessary with the old boats that we had which were very rotten in the old days; but now, owing to the competition, an owner cannot allow his boats to get into disrepair. It is to the owner's interest to keep the boat up to good running. We find it rather irksome opening everything up every six months, and we think it is unnecessary. They do not do it in Melbourne, or in New Zealand, or in England. That would ease down the surveyors' work considerably, and therefore another man would not be required in the engineering branch to assist in the work of surveying ships while Mr. Cruickshank was away (say) inspecting the lighthouses.

3292. *Mr. Wilson.*] The surveyor should still have the power to inspect vessels, even though the certificates were issued for twelve months? Yes; but as I said before, the competition is so keen that we cannot afford to let a steamer go back a bit. The present boilers have to be looked after carefully, we cannot afford to let them scale a bit, they would collapse if we did. We would not mind an inch of scale in the old boilers, there was so little pressure.

3293. *Mr. Powell.*] Of course, it is very necessary and desirable, and the Act gives power to examine vessels when the officer thinks fit? In New Zealand, Victoria, and Queensland the Act requires the examination of the vessels every twelve months, I think. I know the A.U.S.N. ships used to go to Melbourne on purpose to get the certificate, because they got it for twelve months.

3294. *President.*] There is an idea abroad that it is so? I think Mr. Cruickshank had the same idea.

3295. Mr. Jackson thought so, too;—however, your idea is, that the interests of the owners are so imperative in that respect that it requires no other restriction than that which obtains in the natural order of things? Just so. The ships themselves are built of steel now, and you have to look after them very carefully, or they will corrode and give way much quicker than the old iron vessels.

3296. Of course, having the steel you get better flotation? You have better flotation, but you have not so much thickness.

3297. You have to make up for the loss of stability in getting better flotation by excessive care? Yes.

3298. Have you any opinion about the pilot service? We have one pilot at Wollongong and a boat's crew, and they are required at Kiama. There is one man looks after the lighthouse. His duties are not very severe.

3299. Have you any opinion as to the principle that is now adopted of subsidising tugs for the pilot service? It is a very good thing for the owners of the boats. We used to have to pay in the olden days, and now the Government are good enough to step in and pay the subsidy, and so reduce the towing expenses. No private individual would do that.

3300. Of course it may be desirable for the Government to do this to develop trade? The ships will go wherever there is trade. Wherever the farmer can get anything out of the soil the boats will go to get it. I have seen vessels behind the Richmond bar six weeks, and the Government never sent us any assistance to get out. We had to wait until there was water enough

A. C.  
Turner.

## APPENDICES.

	PAGE.
1. Opinion of the Attorney-General re powers of the Public Service Board with regard to Officers of the Marine Board .....	115
2. Opinion of the Crown Solicitor upon the effect of the repeal of the Imperial Act, 17 and 18 Vic., c. 104, upon the provisions of sections 87 and 88 of the Navigation Act of 1871 .....	115
3. Return of the number of Inquiries held by the Marine Board at Sydney concerning wrecks and other marine casualties from 1887 to 1896 (both inclusive), showing the number of vessels and total tonnage for each year....	117
4. Return of the number of Inquiries held by the Marine Board at Newcastle concerning wrecks of vessels and other marine casualties from 1887 to 1896 (both inclusive), showing the number of vessels and total tonnage for each year .....	117
5. Return showing the total Revenue of the Marine Board Department for the year 1883, under the several headings, viz., Pilotage, Harbour and Light Rates, Removal Dues, Fees, Licenses, Charges, &c. ....	117
6. Return of the Total Expenditure of the Marine Board Department for the year 1883, showing the amount paid for contingent expenses, the amount of salaries and fees paid to Members of the Board, and the amount of salaries and allowances paid during that year .....	117
7. Return showing names, &c., of present Members of the Marine Boards, Sydney and Newcastle. ....	118
8. Schedule. Place and mode of conducting elections of Wardens of the Marine Board .....	118
9. List of Officers and Employees of the Marine Board Department, 1896-7, showing position, salary, age, and duties performed .....	120
10. Comparative Tables, showing ages of Officers of the Marine Board.....	124
11. Marine Board Rules and Regulations, dated 13th August, 1885 .....	127
12. Coast Chart of New South Wales .....	Face 128
13. List of Home and Out Stations .....	129
14. Regulations for Steam Pilot Service of Port Jackson .....	129
15. Return of Steamers and Launches belonging to the Marine Board, showing the primary cost of each vessel, and the cost of maintaining the service in which they are employed .....	130
16. Returns showing the amounts collected for each year, from 1887 to 1896 (both inclusive), for Pilotage Rates, Removal Dues, and Harbour and Light Rates—	
(a) At Sydney.....	130
(b) At Newcastle .....	
(c) At Out-ports.....	
17. Return showing the time occupied by each of the Inquiries held by the Marine Board during the last five years	131
18. List of books kept in the Marine Board Department .....	132
19. Duties performed by Mr. F. Rule, Accountant to the Marine Board. [See Appendix 9.] .....	120
20. Duties performed by Mr. W. D. Cruickshank, Engineer-Surveyor, Marine Board .....	132
21. Extract from a letter received by Mr. Cruickshank from Mr. Robert Major, Engineer-Surveyor, Port of Cardiff, England .....	133
22. List of persons entitled to vote at election of Wardens of the Marine Board .....	133
23. Return of vessels registered at Sydney and Newcastle on 31st December, 1896 .....	135
24. Return showing number of votes held by owners of vessels registered at Sydney and Newcastle .....	135
25. List of vessels registered at Sydney in the names of John Broomfield, Benjamin Jenkins, and Archibald M'Lean	136
26. Statements made by two representatives of firemen on board the "Captain Cook" .....	136
27. Statements made by pilots Sweet and Morris at Newcastle .....	137
28. Statements made by boatmen Adams, M'Kinnon, and M'Leod at Newcastle .....	137
29. Statements made by boatmen at Ballina .....	138
30. Report of a Deputation representing the Chamber of Commerce, Newcastle, upon the urgent necessity for a steam pilot-boat .....	138
31. Report of a Deputation representing the shipping and commercial interests of Newcastle, upon the urgent necessity for a steam pilot-boat .....	140
32. Letter from Captain Newton, Harbour-master, at Newcastle, re want of accommodation for shipping .....	142
33. Copies of correspondence and plans re entrance signals, Newcastle .....	142
34. Letter from the Secretary, Chamber of Commerce, Newcastle, re entrance signals.....	143
35. Extract from Pilot's Log, Richmond River .....	143
36. Extract from Pilot's Log, "Captain Cook" .....	144
37. Return showing the number of vessels reported inward and cleared outward during the year 1896, attended by sea-pilots, and charged the usual pilotage rates for such service .....	144
38. Return of steamers subsidised by the Marine Board, showing tonnage, nominal horse-power, when built, owner, location, subsidy, and period of contract .....	145
39. Return showing the amount of subsidies paid for steam-tug services, 1886 to 1896 .....	145
40. Return of vessels entering harbours served by subsidised tugs during the year 1896 .....	145
41. Letter from Mr. W. D. Cruickshank, Engineer-Surveyor, submitting estimates of cost of tugs .....	146
42. Letters from Captains of the North Coast Steam Navigation Company's steamers re tug service .....	147
43. Conditions of Contract, Steam Tug Service .....	148
44. Extract from <i>Richmond River Times</i> of 20th May, 1897 .....	148
45. Minute by Mr. A. B. Portas re combining duties of Dredge Service Tugs and Pilot Tugs.....	149
46. Minute by Messrs. C. W. Darley and R. R. P. Hickson re tugs for bar harbours .....	149
47. Return showing amounts paid by the North Coast Steam Navigation Company (Limited) for towage at the northern rivers .....	150
48. Communication from Mr. Alfred Langley in connection with his evidence .....	150
49. Letter from Mr. Henry Selfe, Engineer-Surveyor, re lighting Sydney Harbour at the Heads .....	150
50. Letter from Captain Hixson, R.N., President of the Marine Board, re lighting Sydney Harbour at the Heads ...	150

## 1.

Attorney-General's Department, Sydney, 3 July, 1896.

## OPINION OF THE ATTORNEY-GENERAL.

Subject:—Officers of the Marine Board.

It seems to me that the Public Service Act does not apply, and was not intended to apply (see the debates in *Hansard*, 10th December, 1895, in the Legislative Council), to the question of appointments in connection with the Marine Board. The Navigation Act provides that "the Marine Board may recommend for the Governor's approval appointments, &c." The Public Service Act neither expressly or impliedly repeals that Act, and I am therefore of opinion that any appointments under it must be recommended by the Marine Board and submitted to the Governor for his approval. But with the exception of the question of *appointments*, the officers of the Marine Board do come within the scope and control of the Public Service Act.

J. H. WANT,

Attorney General.

## Copy of Minute.

Marine Board, 6 October, 1896.

Read the Attorney-General's opinion regarding the affairs of the Board and the Public Service Board, in which he says that the power of recommending appointments still rests with the Board, but that when once appointed they do not come within the scope and control of the Public Service Board.

F. HIXSON.

## 2.

REFERENCE.—Effect of repeal of 17 and 18 Vic., c. 104, on 35 Vic. No. 7.

THE Navigation Act of 1871, 35 Vic. No. 7, sec. 87, empowers the Marine Board of New South Wales to investigate cases of alleged incompetency and misconduct of or on the part of any master, mate, or engineer, and directs that "such investigation shall be conducted and the results thereof reported in the same manner and with the same powers in and with which formal investigations into wrecks and casualties are directed to be conducted and the results thereof reported under the provisions contained in the eighth part of the Imperial Act seventeenth and eighteenth Victoria chapter one hundred and four."

Sec. 88 empowers the Marine Board to cancel or suspend the certificate of any master, mate, or engineer (sub-sec. 11) "if upon any investigation conducted under the provisions contained in the eighth part of the Imperial Act seventeenth and eighteenth Victoria chapter one hundred and four . . . it is reported that the loss or abandonment of or serious damage to any ship or loss of life has been caused by his wrongful act or default."

Sec. 88, sub-section v, declares the Marine Board "to be a Court for the purposes mentioned in the two hundred and forty-second section of the Imperial Act seventeenth and eighteenth Victoria chapter one hundred and four."

Sec. 89, sub-section III, provides that "no certificate shall be cancelled or suspended . . . in the case of investigations conducted by Justices or a Stipendiary Magistrate unless one assessor at least appointed in manner directed by the four hundred and thirty-fourth section of the Imperial Act seventeenth and eighteenth Victoria chapter one hundred and four expresses his concurrence in the report."

The Imperial "Merchant Shipping Act, 1894," repealed the whole of 17 and 18 Victoria, chapter 104.

The opinion of the Crown Solicitor is desired as to whether the repeal of the Imperial Act, 17 and 18 Vic., c. 104, would affect any action taken or thing done in New South Wales under the provisions of sections 87 and 88 of The Navigation Act, subsequently to the date of such repeal.

Sir,

Crown Solicitor's Office, Sydney, 2 April, 1897.

I have the honor with reference to the question submitted by your communication of 29th ultimo, viz., whether the repeal of the Imperial Act, 17 and 18 Vic., c. 104, would affect any action taken or thing done in New South Wales under the provisions of sections 87 and 88 of the Navigation Act of 1871, subsequent to the date of such repeal, to advise as follows:—

The Imperial Merchant Shipping Act of 1894, which repealed the 17 and 18 Vic., c. 104, does not contain any provision saving or continuing any local enactments passed under the authority of the latter Act, consequently the Navigation Act of 1871, so far as it incorporates the provisions of the 17 and 18 Vic., c. 104, by reference only, is, in my opinion, inoperative, and has been so since the passing of the Act of 1894.

Where, however, the provisions of the earlier Imperial Act have been reproduced in the local enactment, the repeal of the former by the Act of 1894 does not, I think, affect the Navigation Act so far as those particular sections are concerned, nor does it touch those provisions which do not in any way depend on the Imperial Act.

I am of opinion, therefore, that section 87 of the Navigation Act remains in full force and effect, with the exception of that portion relating to the holding of investigations before two Justices or a Stipendiary Magistrate.

It is provided that "such investigation shall be conducted and the results thereof reported in the same manner and with the same powers in and with which formal investigation into wrecks and casualties are directed to be conducted, &c.," under the provisions contained in the 8th part of the Imperial Act, 17 and 18 Vic., c. 104.

The repeal of the Act mentioned has put an end to the machinery thus provided, and no investigation can in my opinion be now held under that portion of section 87.

Section 88, with the exception of sub-section II, is, in my opinion, still operative, as the powers of investigation conferred on the Board are contained in the Act itself independently of the Imperial Act.

If however such powers are insufficient in an investigation under section 88 (v), without the aid of those contained in section 242 of 17 and 18 Vic., c. 104, the sub-section in question must also be treated as inoperative, but it appears to me that such is not the case.

I am therefore of opinion that any action taken by the Marine Board under sections 87 and 88, subsequent to the repeal of 17 and 18 Vic., c. 104, is not affected unless done under the latter portion of section 87 or under section 88 (11).

I take the opportunity of enclosing a copy of an opinion given by me in November, 1895, as to the applicability of the Imperial Merchant Shipping Act of 1894 to this Colony, which may possibly be of some assistance to the members of the Commission.

I have, &c.,

GEO. COLQUHOUN,

Crown Solicitor.

The Secretary, Royal Commission on Marine Board.

## OPINION OF CROWN SOLICITOR.

In the matter of the Imperial Merchant Shipping Act of 1894.

1. I am of opinion that the Imperial Merchant Shipping Act of 1894 does repeal the previous Imperial Merchant Shipping Act and relative Acts, so far as this Colony is concerned. The Act of 1894 consolidates all the previously existing Acts, and re-enacts and takes the place of the Acts which it repeals. The repeal of the previous Acts, however, saves and continues any Acts or proceedings under the repealed Acts (secs. 735 (2), 745, 746). The present law in this Colony, therefore, so far as it depends on Imperial legislation, is contained in the Act of 1894; but the whole of this Act is not applicable to New South Wales.

2. Part I, dealing with the registry of ships, is by express words applicable to and in force in this Colony. Sec. 91. Part II deals with "Master and Seamen," and is in force in this Colony with regard to—

(1.) All sea-going ships registered in the United Kingdom, and to the owners, masters, and crews of such ships. Sec. 261.

(2.)

(2.) All sea-going British ships registered out of the United Kingdom, and the owners and masters and crews thereof, so far as regards the provisions relating to the rights of seamen in respect to wages; to the shipping and discharge of seamen in ports abroad; to leaving seamen abroad, and to the relief of seamen in distress in ports abroad; to the provisions, health, and accommodation of seamen; to the power of seamen to make complaints; to the protection of seamen from imposition; and to discipline in all cases except where the ship is within the jurisdiction of the Government of the British possession in which the ship is registered—sec. 261 (*et*)—that is to say, secs. 155-163, 117, 124, 186-189, 190-194, 198-210, 211, 212-219, 220-238. Therefore, as regards ships registered in the United Kingdom, the whole of Part II is in force in this Colony, and applies to such ships in the same manner as it does in England—that is, of course, where it can be applied in this Colony, for the Part contains numerous provisions which cannot possibly apply in New South Wales.

With regard to British sea-going ships registered at places out of the United Kingdom, other than New South Wales, the sections enumerated above (2) apply to such vessels when in New South Wales; but it will be seen that though declared by the Act to be applicable, a good many of these sections can have no practical application in this Colony. Ships registered in New South Wales are governed by the provisions of the local Seamen's Laws Consolidation Act of 1894 whilst they are in New South Wales. (See *ex parte* Johnson 14, N.S.W., L.R., 537).

By sec. 264 the Legislature of any British possession is empowered to apply or adapt to any British ships registered at, trading with, or being at any port in that possession, any provisions of Part II which do not otherwise apply in such possession. The whole of Part II applies in all British possessions to British sea-going ships registered in the United Kingdom; so that this section can have no reference to such ships. It therefore only empowers Colonial Legislatures to extend those provisions of Part II not made applicable by the Act to all registered British ships, whether sea-going or not, which are registered out of the United Kingdom.

Part III deals with passengers and emigrants, and reproduces the Imperial Passengers' Acts. It applies to emigrant ships, as defined in sec. 268, from the British Islands to this Colony (sec. 364), and is in force in this Colony with respect to all ships carrying steerage passengers on a Colonial voyage, as defined by the Act; but the provisions of secs. 309, 310, 320, 321, 322, 323, 324, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 361 do not apply to Colonial voyages; and where the duration of a Colonial voyage, as defined in section 270, determined under section 366, is less than three weeks, the provisions of secs. 291, 303, 304, 305, and 327 do not apply to such voyages; and the provisions contained in secs. 295, 296, 297, 298, except those relating to the issue of water, do not apply to any steerage passenger who has contracted to furnish his own provisions. Sec. 365.

Part IV.—This part of the Act deals with fishing-boats, and by sec. 272 does not, there being no provision for such application, apply to this Colony.

Part V.—This part deals with "Safety," and reproduces the provisions formerly contained in Part 4 of 17 and 18 Vic., c. 104, but does not re-enact sec. 291 of that Act, which provided that Part IV should apply to all British ships. Part V of the 1894 Act, however, applies, except where expressly excluded, to all British ships in this Colony or elsewhere, and the application of each particular section to this Colony must largely depend on the circumstances of each particular case in which it is sought to be applied. It may, however, be said generally that Part V is in force in New South Wales, but the rules made under the authority of the local Navigation Act, 35 Vic. No. 7, are not to be deprived of their effect. Sec. 421-(1).

Part VI deals with "Special Shipping Inquiries and Courts." It takes the place of Part VIII of the Merchant Shipping Act of 1854, 17 and 18 Vic., c. 104, and incorporates some of the provisions of Part III of that Act. This part of the Act contains no application clause, but from the phraseology of sec. 464 it seems that this part only applies in its entirety to the United Kingdom, though by sec. 478 power is given to Colonial Legislatures to legislate with respect to certain matters dealt with in this part. That portion of this act which relates to Naval Courts is in force in this Colony. (Sec. 486.)

Part VII deals with the "Delivery of Goods," and only applies to goods imported into the United Kingdom—sec. 492—and is not in force in New South Wales.

Part VIII deals with the "Liability of Shipowners," and is in force in New South Wales. (Sec. 509.)

Part IX deals with "Wreck and Salvage." Secs. 511, 512, 513, 514, 515, 516, 517 only apply to vessels wrecked, stranded, or in distress at any place on or near the coasts of the United Kingdom (sec. 511), and are not in force in New South Wales.

Secs. 518, 519, 520, 521, 522 relate to "Dealing with Wreck," and only apply to vessels, &c., wrecked, &c., within the United Kingdom, secs. 518, 519, 521 (2), and are not in force in New South Wales.

Secs. 523, 524, 525, 526, 527, 528, and 529 deal with "Unclaimed Wreck." Sec. 523 provides "Her Majesty and Her Royal Successors are entitled to all unclaimed wreck found in any part of Her Majesty's Dominions, except to places where Her Majesty or any of Her Royal Predecessors has granted to any other person the right to that wreck." This section is a legislative recognition of the prerogative right of the Crown to all unclaimed wrecks within the Crown's dominions, which form part of the revenue of the Crown. (See 2 Stephen's Com., 542 *et seq.*)

By section 50 of the Constitution Act, 18 and 19 Vic., c. 54, all the revenues of the Crown within the Colony of New South Wales from whatever source arising, are surrendered to the Government of New South Wales in return for a Civil List. The title of the Government of New South Wales to unclaimed wrecks within the Colony is dependent on the title of the Crown, and I therefore think this section is in force in New South Wales. Secs. 524, 525, 526, 528, 529, are I think inapplicable, and therefore not in force in this Colony.

Secs. 530, 531, 532, 533, 534 relate to the removal of wrecks, and are reproduced from 40 and 41 Vic., c. 16, and 52 and 53 Vic., c. 5, which are confined in their application to the United Kingdom—there being no words to extend their provisions to places outside such kingdom—and, therefore, I think these sections are not in force in New South Wales.

Secs. 535, 536, 537 are not in force in New South Wales.

Secs. 538, 539, 540, 541, 542, relating to "Marine Store Dealers," must, I think, in the absence of any words extending their application to places beyond the United Kingdom, be considered as applying to the United Kingdom only, and therefore not to be in force in New South Wales.

Sec. 543, relating to "Marking of Anchors," is, for the above reason, not in force in New South Wales.

Secs. 544, 545, 546 relate to "Salvage." Sec. 544 is in force in New South Wales. Sec. 546 is expressly confined to the United Kingdom, and is not in force in New South Wales.

Secs. 547-565 seem, from the language of sec. 547, to be applicable to salvage in New South Wales; but the procedure established with regard to claims for salvage appears not to be applicable to places outside the United Kingdom.

Sec. 566 deals with the "Appointment of Receivers of Wreck." Secs. 567, 568 deal with "Fees of Receivers of Wreck." None of these sections are in force in New South Wales. The remaining sections of this part, secs. 569, 570, 571, are not in force in New South Wales.

Part X relates to "Pilotage," and is not in force in New South Wales. (Sec. 572.)

Part XI relates to "Lighthouses," and is mostly confined in its application to the United Kingdom. Secs. 671-675 are, however, in force in New South Wales.

Part XII relates to the "Mercantile Marine Fund," and is not in force in New South Wales.

Part XIII relates to "Legal Proceedings," and, except where otherwise provided, is in force in New South Wales. Sec. 712.

Part XIV contains "Supplemental Provisions." The only section of this part in force in New South Wales are secs. 723, 727, 735, 736, 739, 741, 745, and 746.

3. No portions of the Act require to be applied to this Colony by proclamation. By secs. 366, 367 the Governor of this Colony is empowered by proclamation—

1. To determine the length of a colonial voyage.
2. To fix dietary scales for steerage passengers.
3. To declare what medical stores shall be deemed necessary.
4. To make rules for determining the number of steerage passengers to be carried in emigrant ships proceeding from one colony to another.
5. For determining on what decks, &c., steerage passengers may be carried.
6. To declare that ships intended to pass within the tropics from any Colonial port may convey steerage passengers, being natives of Asia or Africa, after the rate of one for every twelve superficial feet of the passenger decks, &c.

Every such proclamation shall take effect from the issue thereof or such other day as may be named therein. These provisions are similar to those contained in the repealed Passengers Acts, under which proclamations have been issued in this Colony; but, by an oversight, no provision has been made in the 1894 Act to continue or give validity to proclamations issued under the repealed Acts, and I accordingly advise that it is necessary, under the 1894 Act, to issue fresh proclamations.

Sec. 478 empowers Colonial Legislatures to authorise Colonial Courts to inquire, in certain cases, into shipping casualties and the conduct of officers. Similar provisions were contained in the repealed Acts, 17 and 18 Vic., c. 104, and 45 and 46 Vic., c. 76, and under such provisions various sections of the local Navigation Act of 1872, 35 Vic. No. 7, were enacted. The repeal of the previous Imperial Acts referred to has not saved or continued any local enactments passed under the authority of the repealed Imperial Acts, and it is very doubtful whether some of the provisions of the local Navigation Act are not *ultra vires*.

It appears to me that, at all events, sec. 88 (2) of the local Navigation Act should be amended.

15th November, 1895.

GEO. COLQUHOUN,  
Crown Solicitor.

## 8.

[SUPPLEMENT to the *New South Wales Government Gazette*, Wednesday, 18 March, 1896.]

The Treasury, New South Wales, 18 March, 1896.

HIS Excellency the Governor, with the advice of the Executive Council, has been pleased to appoint Francis Buckle, Esquire, J.P., to be Returning Officer for the Election of Wardens of the Marine Board, to fill the vacancies which will occur by the operation of the 8th clause of the "Navigation Act of 1871."

G. H. REID.

The Treasury, New South Wales, 18 March, 1896.

## THE NAVIGATION ACT OF 1871.

HIS Excellency the Governor, with the advice of the Executive Council, under the authority contained in the 8th clause of the "Navigation Act of 1871," is hereby pleased to fix the place and mode, as per annexed Schedule, of conducting the Election of Wardens to the Marine Board, to fill the vacancies which will occur, by the operation of the said clause, on the first Monday in the month of April now next ensuing.

G. H. REID.

## SCHEDULE.

*Place and Day of Election to fill up the Vacancies in the Office of Warden of the Marine Board.*

1. The election of three Wardens to the Marine Board to fill up the vacancies which will occur by the operation of the 8th clause of the "Navigation Act of 1871," shall take place at the Exchange, Sydney, on Monday, the 6th day of April, 1896.

*Returning Officer Appointed by Governor in Council.*

2. The Governor, with the advice of the Executive Council, shall appoint a Returning Officer, who shall notify in the *Government Gazette* and in one or more of the daily papers, at least ten days before the day of election, the time and place appointed for holding the said election.

*Nomination of Candidates.*

3. The election of a candidate to the vacant office of Warden shall be conducted in manner following:—Any two electors duly qualified to vote under the Navigation Act of 1871 may nominate a candidate for election, by delivering to the Returning Officer, seven clear days at least before the day appointed for the election, a document signed by such electors, containing the name in full of the candidate they may wish to nominate, setting forth also the occupation and residence of such candidate, and also similar particulars respecting the two electors so nominating; and the Returning Officer, at least three clear days before the day appointed for the election, shall cause such nominations to be published for general information in one or more of the daily papers.

*Proceedings thereupon.*

4. At 10 o'clock in the forenoon of the day appointed for the election, and at the place aforesaid, the Returning Officer shall publicly read the names of candidates so nominated, together with the names of their nominators; and if it shall be found that the number of candidates does not exceed the number of Wardens to be elected, the Returning Officer shall thereupon declare such candidates to be duly elected, and shall immediately thereafter certify the same under his hand to the Colonial Treasurer; but if the number of candidates so nominated shall exceed the number to be elected, then a poll shall be taken as hereinafter provided: Provided also that it shall be in the power of any individual so nominated, by a notice in writing signed by him and addressed to the Returning Officer, and delivered to such Returning Officer at any time, being at least one clear day before the day appointed for the election, to withdraw from such candidature.

*Election, if contested, to be by Ballot.*

5. The election, if contested, shall be by ballot, and the voting at such election shall commence at 11 o'clock in the forenoon, and shall finally close at 4 o'clock in the afternoon of the same day.

*Appointment of Polling Clerk.*

6. At such election the Returning Officer shall appoint a Polling Clerk for taking the poll.

*Substitute for Returning Officer.*

7. In case the Returning Officer shall be prevented from attending to any of his duties by illness or other sufficient cause, he may, or in case of his refusal or inability, the Colonial Treasurer shall, by writing under his hand, appoint a substitute to act for such Returning Officer; and such substitute shall thereupon for the time being have all the power and authority of the officer for whom he has been so substituted.

*Scrutineers.*

8. Every candidate for election, or in his absence any two of the electors by whom he has been nominated, may appoint one person at the polling-place to be a Scrutineer at the election.

*Declaration*

*Declaration by Returning Officer, Poll Clerk, and Scrutineers.*

9. The Returning Officer, Poll Clerk, and Scrutineers shall, before acting, make, and subscribe before a Justice of the Peace or a Commissioner of the Supreme Court, or in the case of any Scrutineer, before the Returning Officer, a declaration in the Form A annexed.

*Power of Returning Officer to preserve Order, &c.*

10. The Returning Officer shall have power and authority to maintain and enforce order and keep the peace during the election or polling, and for that purpose to cause to be arrested and taken before any Justice of the Peace any person reasonably suspected of knowingly and wilfully making a false answer to any of the questions hereinafter mentioned, or of personating or attempting to personate any voter, or of attempting unlawfully to vote more than once, or wilfully entering or remaining in a polling-room or compartment, or who shall cause a disturbance at the election; also to cause any person to be removed who shall obstruct the approaches to the polling-room or shall conduct himself in a disorderly manner. And all constables and peace officers shall aid and assist such Returning Officer in the performance of his duties.

*Balloting-room.*

11. At the polling-place there shall be provided and set apart a separate ballot-room or compartment into or in which no person may enter or remain except electors while preparing their ballot-papers as hereinafter provided, but no longer; and the Polling Clerk shall cause pencils or pens, ink, and blotting-paper to be placed in the said room or compartment.

*Ballot-papers.*

12. Before, and in time for the election, the Returning Officer shall cause to be printed or written ballot-papers according to the Form B annexed, and shall, on the morning of the day of poll, have in his possession, and prepared ready for use, so many of such ballot-papers, signed by himself on the back thereof, as shall be fully equal to the whole number of the votes of the electors contained in the list of persons entitled to vote.

*Ballot-box.—Mode of Voting.*

13. The Returning Officer shall provide for the polling-place a ballot-box, the front of which shall be of glass, and on the top of which there shall be an opening sufficient to receive the ballot-papers folded as hereinafter mentioned. And such box, being previously locked by the Returning Officer with a key which shall be kept by himself, and of which it shall be unlawful for any other person to possess a counterpart, shall be placed upon a table before the Returning Officer. And every elector, on applying in person, if entitled to record one vote, shall receive one of the ballot-papers signed as aforesaid; and if entitled to record two or more votes, shall receive a corresponding number of the ballot-papers as aforesaid; and shall in the ballot-room aforesaid, without leaving the same, strike through the names of all persons named in such ballot-paper or ballot-papers, as the case may be, except the name of each person for whom he intends to vote, and shall then fold up the paper or papers so as to conceal the interior and disclose only the Returning Officer's name so signed upon the back, and shall then return to the polling-table, and there openly in the presence of the Returning Officer, Poll Clerk, and Scrutineers present, deposit such ballot-paper or ballot-papers in the ballot-box: Provided that in the case of any elector who if blind or cannot read, the Returning Officer shall, in the presence of such of the Scrutineers as may then be in attendance, strike through upon such ballot-paper the names of all persons so nominated, except such as the elector shall declare his intention of voting for: Provided also, that before any ballot-paper shall be deposited in the box, the Returning Officer or Poll Clerk shall, upon a certified copy of the list of persons entitled to vote write his initials against the name of the person then voting, which initials shall be *prima facie* evidence of the identity of such voter with the person whose name shall be so initialed on such list, and of the fact of his having voted at such election: Provided further, that if any elector entitled to two or more votes fail to record all his votes on his first application, it shall not be lawful for him to vote a second time.

*What Votes Void.*

14. If any elector shall suffer to remain upon his ballot-paper a greater number of names not struck out than the number of Wardens to be elected, the vote given on and by such paper shall be void and of no effect.

*When Returning Officer to Vote.*

15. Except as hereinafter provided, the Returning Officer shall not vote: Provided that in the event of any two or more candidates of whom one or more is to be elected being found to have obtained an equal number of votes, the Returning Officer shall have a casting vote, and shall state in writing which of such candidates shall be declared to be duly elected.

*Questions to Voters.*

16. No inquiry shall be permitted to be put to any person applying to vote, except by the Returning Officer at the request of a Scrutineer; and such inquiry shall be limited to the questions following:—

(1.) Are you the person whose name appears as A.B. on the list of persons entitled to vote for the election of Wardens of the Marine Board?

(2.) Have you already voted at the present election?

No person who shall refuse to answer such questions, or who shall fail to answer the first of such questions in the affirmative and the second in the negative, shall be permitted to vote at such election.

*Ascertainment and Declaration of the Poll.*

17. The Returning Officer, immediately after the close of the poll, shall, in the presence of the Poll Clerk and such of the Scrutineers as may then be in attendance, open the ballot-box and examine the voting-papers, and thereby ascertain the result of the election; and he shall then publicly announce the state of the poll, and immediately thereafter shall officially declare in writing, under his hand, addressed to the Colonial Treasurer, the names of the candidates who have been duly elected: Provided if from any sufficient cause it should be found impossible to examine the ballot-papers and ascertain the result of the election on the same day that the poll has been taken, the Returning Officer may adjourn such examination until some hour on the next following day: And such ballot-box and ballot-papers shall remain until the time of such examination in the custody of the Returning Officer, or in such custody as he may appoint, but shall be further secured by the seals of the Returning Officer and any one of the Scrutineers then present.

*Ballot-papers to be transmitted to the Colonial Treasurer.*

18. The Returning Officer shall forthwith, after the declaration of the result of the poll, seal up all the ballot-papers and any other documents connected with the election in one or more parcels as may be found convenient, and shall cause the same to be delivered to the Colonial Treasurer, to be by him safely and secretly kept for six months after such delivery, at the expiration of which time the said Colonial Treasurer shall cause such ballot-papers and documents to be destroyed.

## A.

*Declaration of Office for Returning Officer, Scrutineer, Poll Clerk.*

I, A.B., duly appointed Returning Officer (or Scrutineer, or Poll Clerk) at this election, do hereby solemnly declare that I will faithfully act and assist in such office, and will not attempt to ascertain for whom any elector shall vote, nor by any word or action directly or indirectly aid in discovering the same, unless in answer to any question which I may be legally bound to answer, or in compliance with the provisions of the Navigation Act of 1871.

## B.

*Ballot-paper.*

v. q. Value of quarters.

\* Leading lights, Port Jackson.

† Leading lights, Newcastle.

‡ Dismissed, 18/3/97.

r. o. Telegraph operator, Point Stephens

## APPENDIX A.

*Work carried out by Secretary and in his office.*

- Takes down depositions at inquiries, and reads correspondence to the Board.  
 Writes up minutes and special minutes.  
 Receives reports, letters, and telegrams from out-stations, and deals with same under direction.  
 Opens general correspondence, and has same registered for Board.  
 Drafts some, and writes all, letters.  
 Attends with President daily, and carries out instructions received.  
 Examines all applicants' papers for necessary service, &c., for masters; issues mates', engineers', pilotage, and other certificates and licenses, under the Navigation Acts.  
 Drafts and writes reports of all inquiries into shipwrecks and other casualties, circulates same, and sends duplicate proceedings, including evidence, to the Board of Trade, and to other colonies interested.  
 Supervises, signs, and forwards to Board of Trade all wreck and other casualty returns.  
 Supervises and initials all vouchers of expense incurred in Department; receives declarations and reports from surveyors and inspectors, and instructs them, under direction, generally; also master of pilot steamer and other officers when necessary.  
 Receives all requisitions for stores, stationery, &c., &c., from home and out stations, supervises and corrects same, and forwards to the Treasury.  
 Signs and forwards all requisitions for the printing office.  
 Attends to people who daily visit the office on shipping business.  
 Receives and deals with all notices for survey of steamers for docking, passenger, emigration, and load-line certificates, and for the adjustment of compasses.  
 Makes out all returns asked for, including alphabetical list of steam certificates half-yearly, alphabetical list of masters, mates, &c., half-yearly, alphabetical list of steamers trading to New South Wales ports.  
 Makes out certificates to passing applicants, steam certificates, and all licenses and other certificates under the Acts.  
 Attends the Board on their annual tour of inspection of lighthouses, &c.; also local visits of inspection to South Head lighthouse, Macquarie lighthouse, lightship, Fort Denison, South Head signal stations, and pilot steamer.  
 Attends two telephones: No. 1, for city generally; No. 2, through which the business at the boatshed and signal stations is regulated.  
 Indexes all books.

## 11.

## MARINE BOARD.—Rules and Regulations.

The Treasury, New South Wales, 13 August, 1885.

His Excellency the Governor, with the advice of the Executive Council, has approved of the following Rules and Regulations setting forth, in conformity with the provisions of the 7th section of the "Civil Service Act, 1884," the conditions of employment in the Marine Board Department (applicable to all persons except officers classified under the said Act).

H. E. COHEN.

Rules and Regulations setting forth, in conformity with the provisions of the 7th section of the "Civil Service Act of 1884," the conditions of admission, examination, promotion, classification, salaries, and retiring allowances in the Marine Board Department.

*Applicable to all Persons, except Officers classified under the said Act.*

No person will hereafter be admitted to the Marine Board Department over thirty-five years of age, nor unless he is in vigorous bodily health and free from colour-blindness or other defective eyesight. The

The candidate must produce testimonials of sobriety and fitness for the particular office he applies for, and in the case of pilots and other seafaring persons, he must submit certificates of a grade not lower than the position he seeks.

When vacancies occur in the Department, promotion will depend on length of service, good conduct, and the qualifications necessary to fill such vacancies.

Any person who shall absent himself from duty must, not later than the following day, report in writing the cause of his absence. If such absence be caused by sickness, and extends beyond two days, he must apply for sick leave, and forward a medical certificate. Sick leave can only be granted for a limited period.

A conviction of drunkenness, neglect of duty, or disobedience of orders by the Marine Board, will subject the offender to dismissal.

The employees under these Regulations shall also be subject to the provisions of Part III of the "Civil Service Act, 1884."

Nothing hereinafter contained shall apply to those persons who are only partially employed in the service of the Marine Board.

Pilots, light-keepers, inspectors, mates, boatswains, signal-masters, engineers, and electric operators shall be entitled, without diminution of salary, to two weeks' leave of absence in each year, at such time as may be deemed most convenient; and if they shall not take such leave in any year they shall be entitled to it in any subsequent year, in addition to the leave for such year, but no such accumulated leave shall exceed six weeks. In cases of illness or other pressing necessity, leave of absence may be granted by the Governor, on the recommendation of the Marine Board, approved by the Minister, to any official for a period not exceeding three months, on full or any less salary as may be deemed fit, and such leave may be renewed on the same or any other terms; but in all cases of illness the request for leave, or for renewal thereof, shall be accompanied by a satisfactory medical certificate. In cases of pressing necessity, the circumstances must be stated in writing; and if such leave shall extend to one month, such officer shall forfeit his right to his next ordinary annual leave or any portion thereof, as above provided.

On special application, leave of absence may be granted by the Governor, on the recommendation of the Marine Board, approved by the Minister, to any official above-named of twenty years' service, for a period of twelve months on half salary, or six months on full salary, or to any official of ten years' service, for a period not exceeding six months on half salary, or three months on full salary; or, in case of pressing necessity, to any official whatever, but such last-mentioned leave may be deducted from the leave hereinbefore provided.

Leave of absence for the period of two weeks in each year may be granted any employee other than those above-mentioned, at such time as may be found most convenient.

A deduction of 4 per cent, per annum will be made from the salaries of all persons employed in the service of this Department, to entitle them to the allowances and gratuities provided under Parts 5 and 6 of the Civil Service Act.

Time served in one branch of the Department will be allowed in cases of transfer to any other branch.

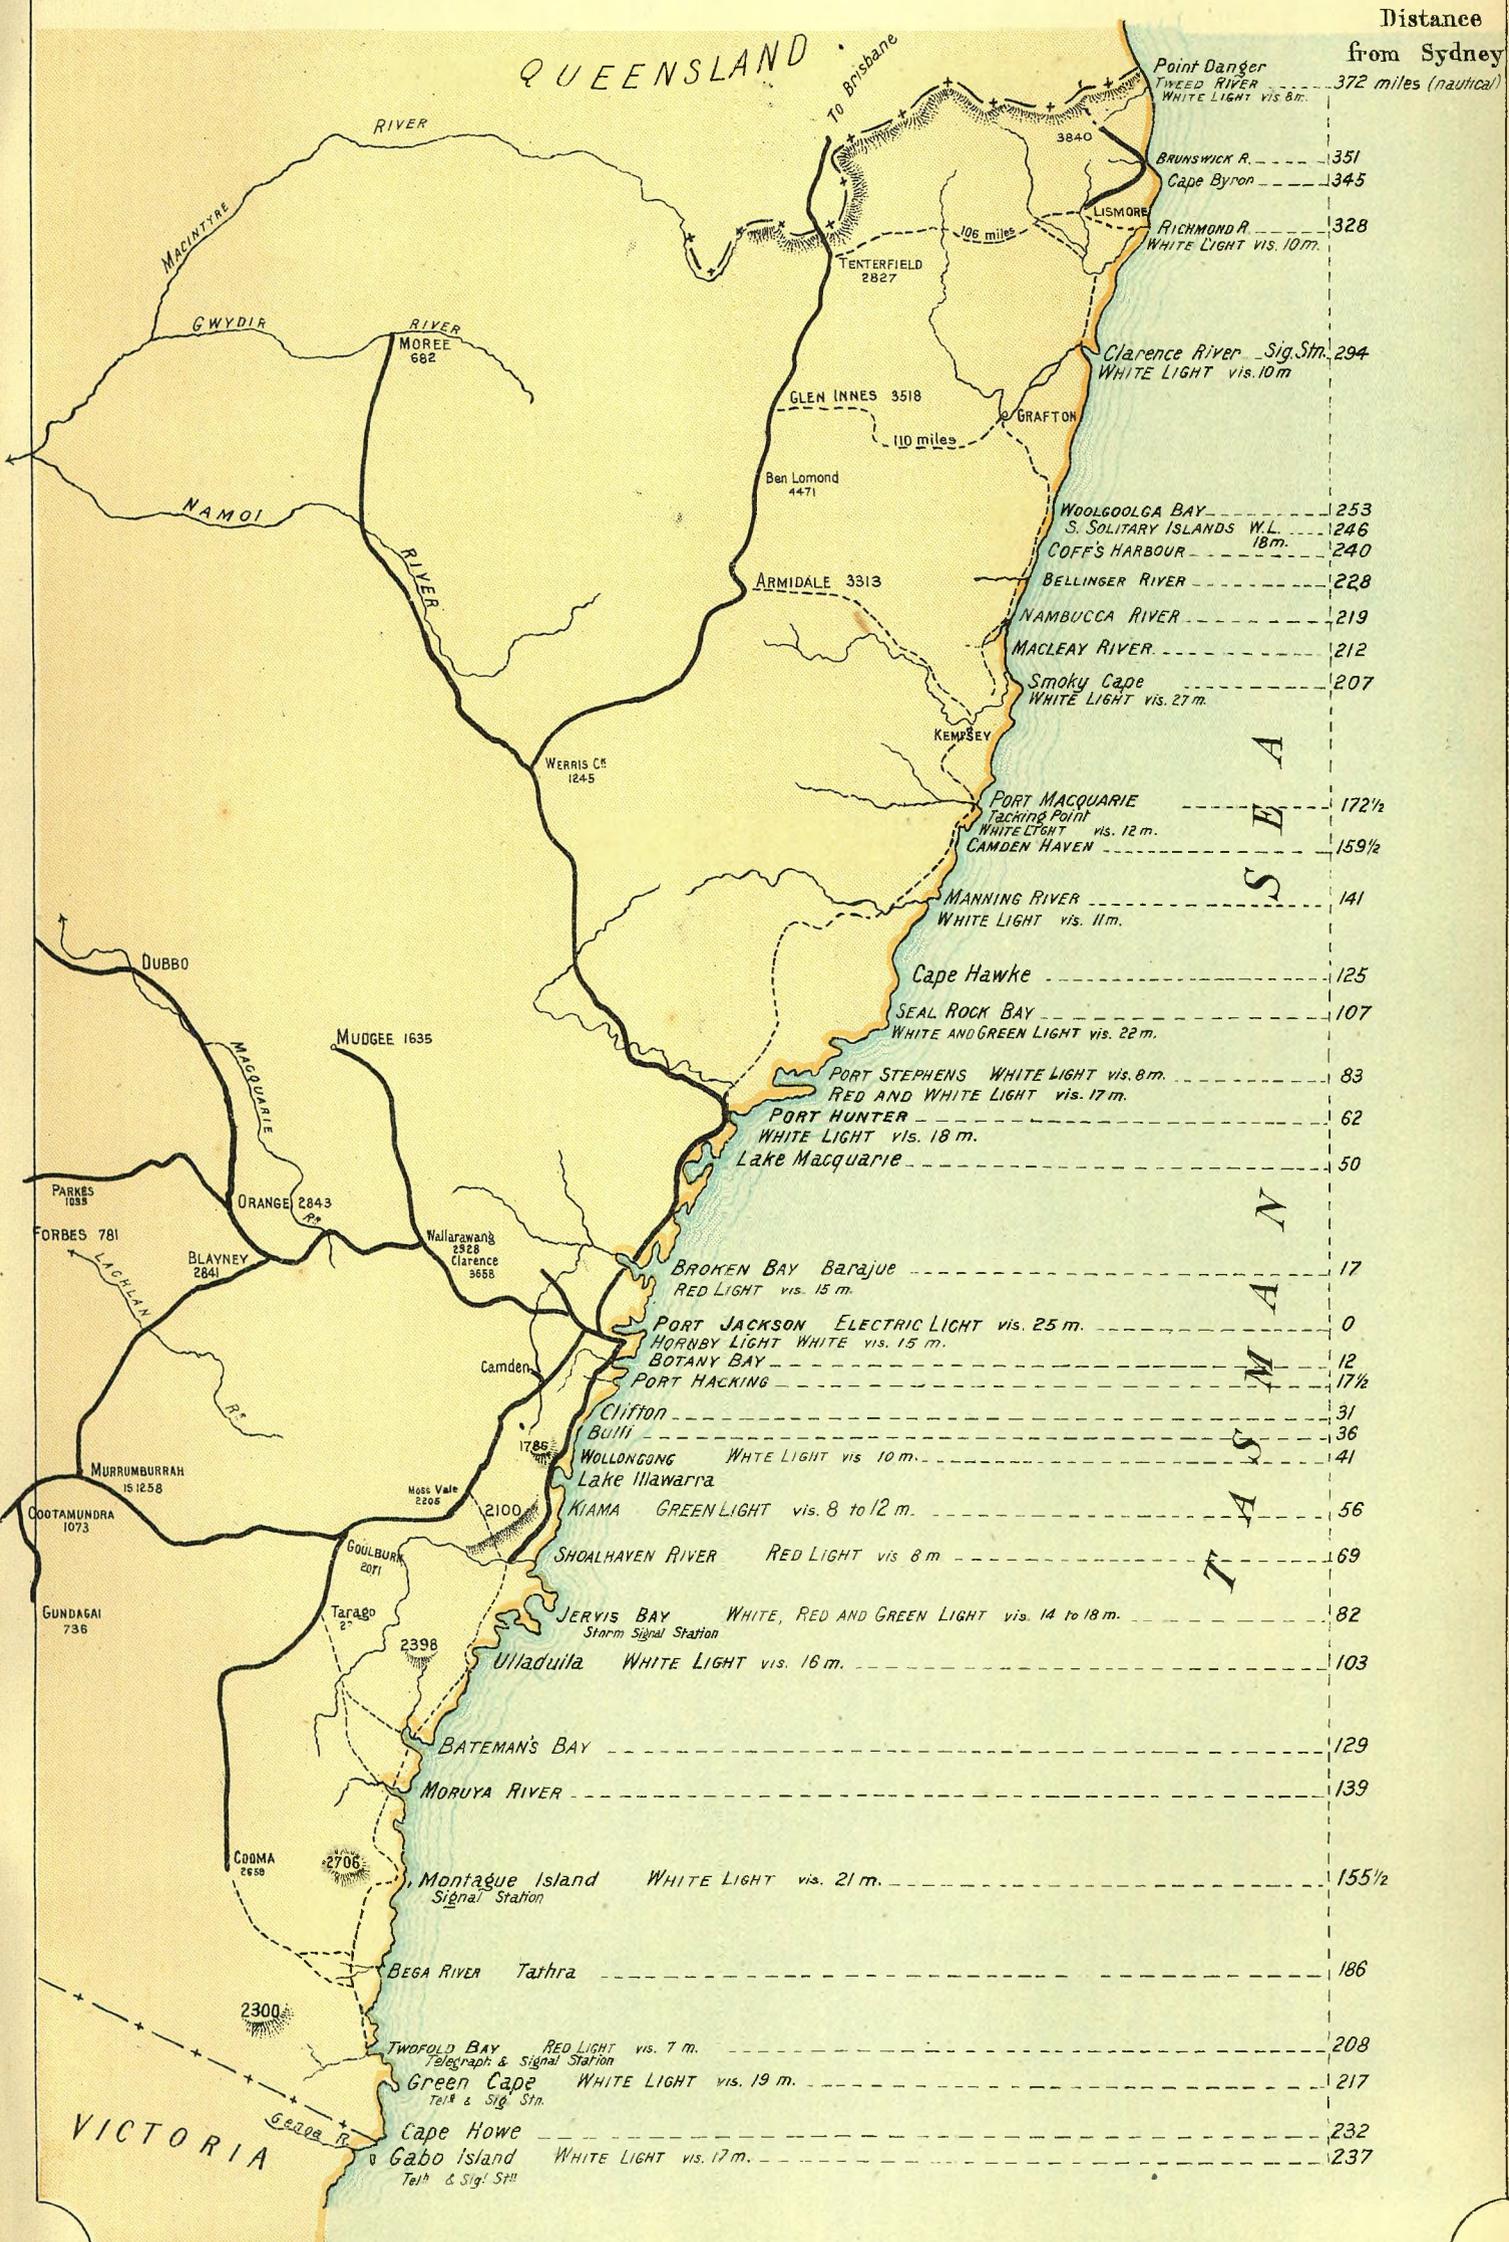

The following shall be the scale of classification and remuneration of the different grades in the service of the Marine Board:—Maximum salaries to be obtained by yearly increments, as set forth under their respective heads, until the highest rate shall have been obtained, provided that where the full increment would exceed the maximum, only such proportion shall be added as will bring the salary up to the said maximum.

The right to receive any annual increment shall depend on the good and diligent conduct of the person concerned, and shall only be granted on the recommendation of the head of his Department.

## STEAM PILOT SERVICE OF PORT JACKSON.

It having been determined that the present system of performing the Sea Pilot Service of Port Jackson, in whaleboats, shall be discontinued on the last day of the present month, and that a Steam Pilot Service shall be substituted therefor, which shall be commenced on the first proximo.—His Excellency the Governor, with the advice of the Executive Council, has been pleased to approve of the following Regulations for the conduct of the said Steam Pilot Service,—which Regulations have been made by the Marine Board of New South Wales, under the provisions of the Navigation Act of 1871.

JOHN ROBERTSON.

Office of the Marine Board of New South Wales, Sydney, 11 October, 1875.

## REGULATIONS FOR THE STEAM PILOT SERVICE OF PORT JACKSON.

*General.*

On and after the 1st December next the present system of performing the Sea Pilot Service of Port Jackson in whaleboats will be discontinued, and a Steam Pilot Service introduced.

Under this arrangement the pilots will become salaried officers, and they will be required to perform their duties in conducting ships in and out of the port, &c., in rotation, or as they may be specially appointed.

*Pilots.*

Two pilots will be stationed on board the steamer for outside service, and the remainder will be retained in Watson's Bay for the up-harbour work, the look-out at South Head, and the relief of pilots shipped from the steamer.

When a pilot is shipped, the pilot on turn at Watson's Bay is to take his station on board the steamer with all reasonable despatch.

A pilot having taken charge of a vessel must not leave until she is safely anchored, or given a proper offing, as the case may be, without the written permission of the master, or the usual pilot's certificate.

All vessels must, as heretofore (except those having powder, which are to be taken to Neutral Bay), be brought up as near to Sydney as practicable; and they will not be considered out of Sea Pilot's waters until anchored above a line between "Careening Point" and "Garden Island."

Pilots are bound to the strictest observance of, and will be responsible for carrying out, the Quarantine and other existing laws and regulations.

*Pilot Steamer.*

The steam pilot vessel will be under the entire control of the master, who will use his utmost endeavours to intercept all vessels requiring pilots at a reasonable distance from the Heads; he will also be a licensed pilot, in order that he may act in that capacity if necessary.

In thick weather, when signals cannot be seen from the look-out station, the steamer is to take up a position outside the Heads best adapted, in the opinion of the master, for intercepting ships that may require pilots.

In clear weather, when signals can be seen, the steamer is to be kept at her buoy near the South Reef, with fires banked, ready to proceed on signal from look-out station.

The responsibility of the steamer's movements will rest with the master, who will be expected to use his judgment for the efficiency of the service, and always take care to lower the boat in a convenient position for shipping pilots.

In the event of the weather being too bad to lower a boat outside, the pilot steamer is to lead the vessel inside, and ship the pilot when practicable.

In addition to shipping, the steamer and her crew will have to perform the duty of landing pilots from outward-bound vessels, and also of bringing reliefs off.

A constant look-out is to be kept on board the steamer; any laxity in this respect will render the person charged with the duty liable to instant dismissal.

After having shipped a pilot the steamer will proceed in for a relief, unless there should be still another ship requiring to be served in the offing, when she will provide the second pilot before coming in for the relief.

In the event of one pilot only being shipped during the night, the relief can be taken on board the steamer on the following morning. If the second pilot is shipped the relief is to be made as soon as circumstances will admit.

A log containing full particulars of the movements of the vessel, the state of the weather, the hour and minute at which pilots are shipped, and that at which reliefs come on board, is to be kept by the mate under the direction of the master, who will forward a copy weekly to this office.

The steamer is not to come above the line of George's Head and the Bottle and Glass without permission from the office, unless she should be towing.

Special regulations for towing will be issued for the guidance of the master of the steamer.

In the case of a vessel requiring a pilot coming in without being intercepted, or any other important event occurring, the master of the steamer is to send a written report of the circumstance to this office.

*Look-out Station, South Head.*

A constant look-out is to be kept at the Signal Station. From sunrise to sunset the establishment will be under the charge of the signal-master, and from sunset to sunrise under that of the pilot on watch. These officers will be held responsible for the proper performance of the duties of the station.

A complete log of all important occurrences is to be kept, noting the times when signals from ships are first seen, the times at which the signals to proceed are made, and the times and bearings and estimated distances at which pilots are shipped. The times at which the steamer leaves and returns to her buoy are also to be recorded, and the movements of the up-harbour steam launch or boat are to be noted.

The

The usual telegram is still to be forwarded, showing the position in which pilots are shipped; any unusual movement on the part of the steamer is also to be reported.

When a pilot is shipped, notification is immediately to be sent to his relief, in order that he may be ready to take his station on board the steamer. Notification by signal or otherwise is also to be made to the coxswain of the up-harbour boat or steam launch.

*Up-harbour Boat or Steam Launch.*

The coxswain of the up-harbour boat or steam launch will be held responsible for the efficient performance of this duty. He will take care to ascertain by signal or otherwise when his services are required. Whilst engaged conveying a pilot to or from a ship, he will be under his direction. When the pilot has left the boat, it will be the duty of the coxswain, unless he should still be required for up-harbour service, to return with all despatch to his station at Watson's Bay.

In the event of the pilot steamer being unable to perform her duty from absence or otherwise, the up-harbour boat or steam launch will temporarily perform the duty of the outside service.

No. SEA PILOT'S CERTIFICATE.

*Any complaint against the Pilot is required to be lodged in writing at the office of the Marine Board within seven days of the occurrence.*

I certify that Mr. \_\_\_\_\_ piloted the  
the Harbour of Port Jackson, and performed his duty to my satisfaction.

## EXHIBIT H.

Royal Commission on Marine Board, 27th April, 1897.

DUTIES of Mr. D. Cruickshank, Chief Engineer, Surveyor, and Examiner, &amp;c.

Has the general supervision of the steam marine of New South Wales.

Examiner in Engineering for five grades of certificates, which are recognised all over British Empire as being equal in value to those issued by Board of Trade in London.

Have to check all drawings of new machinery—engines, boilers, ships, &amp;c. Have to calculate all stresses and strains on the various parts, issue certificates for all new work, which has also to be supervised and tested.

Survey from 500 to 600 steamers yearly, besides machinery in public institutions; also Government ferries, buoys, moorings, &amp;c. A large percentage of the out-door work is done by my two assistants, Messrs. Selie and Marshall, two highly-trained experienced engineers, whose work and responsibility are poorly paid, especially Mr. Marshall, his salary being less than some of the chief engineers of the steamers he surveys.

Personally have a large technical correspondence, and do most of this at home. All abstract questions in general and marine engineering in this and the other Colonies are usually referred to this office, and I draw up all rules and formula which govern local engineering practice. Surveying modern steamers is hard, dirty work, carrying large responsibilities, and requiring considerable knowledge and experience, while the machinery, engines, boilers, electric-lighting, hydraulic, refrigerating, ventilating, and other appliances are much more complex than in former years. The Act gives surveyors very large powers, but this is safe-guarded by the number and character of the examinations he must pass to qualify for the position. The examination of vessels in dock entails a lot of work, embracing hulls, screws, shafting, holds, tanks, bunkers, &amp;c. In cases of break-downs, flaws in engines, boilers, ship collisions, sea-worthiness, extent of repairs, &amp;c., many calculations, sound judgment, and considerable tact is required, and during my twenty-three years of office, have fortunately earned the entire confidence of the shipping people, and during all that time no decision of mine has been questioned.

To show my position is authoritative, have been called in many times by different Ministers, the decision of most important engineering questions being left entirely in my hands. Also by the past and present Railway Commissioners, in cases where fatal accidents have occurred, and where special knowledge and experience was required. During the great strike of '90 was unanimously chosen as Chairman of Conference by ship-owners and engineers: formulated agreement which lasted six years, and all disputes during that time I have settled, my decision being final. Was also asked to fill same position during late strike, and it was my personal action and influence which practically settled the strike. Have been President of the Engineering Association of New South Wales several times, and have published several works on engineering, which have been favourably received throughout Australia and in the Old Country.

Attached is extract from letter, which shows how Board of Trade Surveyors are treated and paid in the Old Country.

EXTRACT from a letter received by Wm. Cruickshank from Robert Major, Engineer Surveyor to the Board of Trade, in the Port of Cardiff, England.

In answer to a letter sent to him in May, 1895, Mr. Major supplied the following, dated September, 1895:—

“Now about the information you require re staff of the English Board of Trade. The heads of our Department are given in Whittaker's almanac, with salaries appended, and also the names of the staff are given, but not their services.

The following is the scale of pay, classes, &c:—There are three classes of surveyors. At entry a third-class engineer surveyor is started with £200, rising by yearly increments of £10 to £300, when it ceases to advance until he gets promotion into second-class, which usually takes about fourteen years. A second-class surveyor gets £315 first year, and increases by yearly increments of £15 to £400, when he stops until promoted to first-class, which generally takes place about eight to ten years. A first-class surveyor's salary rises by £20 increments to £500, which is the highest pay for a surveyor in this class. The Surveyor-in-Chief (Mr. Trail) has £800, and £300 per annum for testing chain cables, &c. The Principal Surveyor (Mr. Moore) for tonnage, £700; Surveyor for iron ships (Whensard), £600; the Chief Examiner of Engineers (McFarlane Gray), £500. There is a principal officer at each district, of which there are nine in the United Kingdom, each receiving £700 or £600, according to the importance of their district. Four of the principal officers are engineers, the other five are nautical men.

First, second, and third-class surveyors are entitled to twenty-eight days leave of absence each year, besides all bank holidays. Each member of the Department is entitled to a pension, in accordance with the Civil Service scale, which allows  $\frac{1}{10}$ th of the salary received at the date of superannuation for each full year's service, so that a man retiring at 60, which is the minimum age at which he can retire with twenty years service, will be entitled to one-third of his salary.

We have altogether seventy surveyors, and four are first-class, seventeen second-class, the remainder being third-class.

The examinations we have to pass are rather stiff, and are getting worse. I think altogether I had five to pass before finally being made a Board of Trade Surveyor.

Mr. Trail (Chief Engineer Surveyor) is retiring from the Service shortly, about the end of the year, also McFarlane Gray, the Chief Examiner, and, I believe, the Principal for tonnage.

The Board have resolved quite recently to enforce the age limit for superannuation, which is sixty-five years. This was much wanted, because of promotion being almost stagnated.”

## EXHIBIT I.

Royal Commission on Marine Board, 27th April, 1897.

List of Persons who are entitled to Vote at the Election of Wardens, in accordance with the Navigation Acts, 35 Victoria No. 7, 36 Victoria No. 30, and 43 Victoria No. 13.

Name.	Residence.	No. of Votes.
Adams, George .....	Sydney, New South Wales .....	2
