SYDNEY AND NEWCASTLE:—		
Motion made ( <i>Mr. Dick</i> ) for Return respecting Vessels and Services of Pilots, 308; Return to Order, laid on Table, 392.		
PITT STREET (See "TELEPHONES").		
POINTS OF ORDER:—		
Reported from Committees, 403, 433, 512.		
RULINGS OF SPEAKER:—		
That motion for adjournment of House in reference to appointment of Select Committee or Royal Commission on the financial clauses of the Commonwealth Bill anticipated consideration of that Bill, and was out of order, 169.		
That the Franchise Extension Bill did not necessarily involve expenditure, and therefore did not require a Message from the Governor, 181.		
That discussion on Motion of Adjournment in reference to Administration of Land and Income Taxes must be confined to the subject of the Notice, 190.		
That motion to take 3 <sup>d</sup> of the Crown Lands Bill as matter of urgency before other business was in order, 256.		
That it be left to the House to decide whether the motion for the suspension of the Standing Orders to take 3 <sup>d</sup> of Crown Lands Bill as matter of urgency, was irregular, 257.		
That Totalisator Bill did not originate any tax or impost or appropriate revenue, and therefore did not require to be recommended by Message from Governor, 290.		
That Totalisator Bill did not contain provisions beyond the Order of Leave, 290.		
That motion relating to Reappraisal of Conditional Purchases and Leases would anticipate debate on Order of the Day already on the Paper, 309.		
That Liquor Traffic Local Option Bill was properly included amongst the Government Orders of the Day, having been introduced by a Minister, 317.		
That amendment, on motion, in reference to construction of railways through private land to apply betterment principle was not relevant, 323.		
That the Standing Orders only permitted the postponement of Orders of the Day, not being Government Orders (on Government days), from one sitting day to another, 341.		
That motion for adjournment in reference to the state of the roads of the Colony anticipated discussion on the Estimates or in Committee of Ways and Means, and was out of order, 363.		
That while upholding the ruling of the Chairman of the Committee of Supply against allowing a discussion on the constitution of the Works Committee or their fees or travelling expenses on the Vote "Parliamentary Standing Committee on Public Works" the items being fixed by statute the conduct of business of the Committee could be criticised in relation to another item, 403.		
That motion for adjournment of House relating to making of Dams and Weirs by the Water Conservation Branch of the Public Works Department was out of order, the matter having been fully discussed in Supply, 471.		
That Chairman was incorrect in ruling that the omission of the word "intestate" in the 12th line of the Probate Duties Bill was in order on the ground that it did not increase the area of taxation, because the effect would be an augmentation of the tax, 483.

<b>S</b>		
SPEAKER (continued):—		
RULINGS OF (continued):—		
That motion to take 3 <sup>d</sup> of the Crown Lands Bill as matter of urgency before other business was in order, 256.		
That it be left to the House to decide whether the motion for suspension of the Standing Orders to take 3 <sup>d</sup> of Crown Lands Bill as matter of urgency was irregular, 257.		
That Totalisator Bill did not originate any tax or impost or appropriate revenue, and therefore did not require to be recommended by Message from Governor, 290.		
That Totalisator Bill did not contain provisions beyond the Order of Leave, 290.		
That motion relating to Reappraisalment of Conditional Purchases and Leases would anticipate debate on Order of the Day already on the paper, 309.		
That Liquor Traffic Local Option Bill was properly included amongst the Government Orders of the Day, having been introduced by a Minister, 317.		
That motion to "read Orders of the Day" was obsolete in House of Commons and opposed to Standing Order 211, 274.		
That amendment on motion in reference to construction of Railways through private land to apply betterment principle was not relevant, 328.		
That the Standing Orders only permitted the postponement of Orders of the Day, not being Government Orders (on Government Days), from one sitting day to another, 341.		
That motion for adjournment in reference to the state of the roads of the Colony anticipated discussion on the Estimates or in Committee of Ways and Means, and was out of order, 363.		
That while upholding the ruling of the Chairman of Committee of Supply against allowing a discussion on the constitution of the Works Committee, or their fees, or travelling expenses on the Vote "Parliamentary Standing Committee on Public Works," the items being fixed by statute, the conduct of business of the Committee could be criticised in relation to another item, 403.		
That motion for adjournment of House relating to making of Dams and Weirs by the Water Conservation Branch of the Public Works Department was out of order, the matter having been fully discussed in Supply, 471.		
That Chairman was incorrect in ruling that the omission of the word "intestate" in the 12th line of the Probate Duties Bill was in order, on the ground that it did not increase the area of taxation, because the effect would be an augmentation of the tax, 483.		
That the decision of the Chairman of Committees, that a Member was not entitled in discussing the principles of the City and North Sydney Railway Bill on a proposed amendment in the Short Title, was correct, 512.		
That subject of motion of adjournment of House in reference to Sunday Trading had been discussed on a previous motion, 518.		
That the Minister in moving the reference of the Rosehill to Dural Railway to the Public Works Committee had complied with the Act 519.		
DISSENT FROM RULING:—		
Motion made ( <i>Mr. Copeland</i> ) for, in reference to opinion given respecting consideration in Committee of Draft Bill of Adelaide Convention, and negatived, 72.		
SPECIAL ADJOURNMENT (See "ADJOURNMENT").

STAMP DUTIES (AMENDMENT) BILL:—		
Message from Governor, 457; Ordered ( <i>Mr. Reid</i> ) that Bill be brought in founded on Resolution of Ways and Means, No. 10, presented and read 1 <sup>o</sup> , 465; read 2 <sup>o</sup> , committed, reported with amendments, 483; Order of the Day postponed, 473; Motion made ( <i>Mr. Brunker</i> ) for adoption of report, amendment moved to recommit, and amendment moved ( <i>Mr. Rose</i> ) to add words to amendment and negatived, amendment to recommit, passed, recommitted, reported 2 <sup>o</sup> with further amendments, Report adopted, 497; read 3 <sup>o</sup> , passed, and sent to Council, 499.		
STAMP DUTIES BILL:—		
Received from Legislative Council and on motion ( <i>Mr. Gould</i> ) read 1 <sup>o</sup> , 400; Order of the Day postponed, 451, 432.		
STAMP AND PROBATE DUTIES BILL:—		
Ordered on motion of <i>Mr. Reid</i> that Bill be brought in founded on Resolutions of Ways and Means (Nos. 4 and 5), Bill presented and read 1 <sup>o</sup> , 395; Order of the Day postponed, 448; Order of the Day discharged, Bill withdrawn, 459.		
Petition presented from Australian Mutual Provident Society against, 426	2	1243
STANDING ORDERS:—		
Sessional Order appointing Committee, passed, 13.		
Suspended as a matter of urgency to enable Bill to pass through all its stages in one day, 36-7, 302, 427-8.		
Suspended as matter of urgency to pass 3 <sup>d</sup> of Crown Lands Bill before other business, 257.		
Suspended to pass Bill through all its stages in one day, 378.		
Motion to suspend as a matter of urgency interrupted at 8 o'clock, 458.		
Motion made ( <i>Mr. Schay</i> ) for instruction to Committee to frame rule in reference to Limitation of Speeches, 147; Report brought up, 295	1	687
Motion made ( <i>Mr. Cunn</i> ) to refer question of balloting for Select Committees to Committee; amendment moved ( <i>Mr. Hogue</i> ), to except Committees on Private Bills and negatived—Motion agreed to, 197-8; Report brought up, 295	1	687
Motion made ( <i>Mr. Neild</i> ) to amend Standing Order No. 161, so as to make any decision of <i>Mr. Speaker</i> a ruling within the meaning of the Standing Order, and negatived, 337.

NEW SOUTH WALES.

HINDOOS IN THE TWEED, BRUNSWICK, RICHMOND,  
AND CLARENCE RIVER DISTRICTS.  
(RETURN SHOWING NUMBER OF.)

*Printed under No. 15 Report from Printing Committee, 12 August, 1897.*

[Laid upon the Table of this House in accordance with promise made in answer to Question No. 8 of  
8 August, 1897.]

Question.

(8.) HINDOOS IN THE TWEED AND CLARENCE RIVER DISTRICTS:—*Mr. Pyers*, for *Mr. Ewing*, asked the Colonial Secretary,—Can he state the number of Hindoos in the Tweed, Brunswick, Richmond, and Clarence River Districts, specifying the localities, as far as possible, where they are resident?

Answer.

*Mr. Brunker* answered,—This information will be prepared and laid upon the Table in the form of a return.

RETURN of Hindoos in Clarence, Richmond, and Tweed River Districts on 31st July, 1897.

Total¶	2,765	37,342	12,754	50,096	2,044	42,677	6,932	49,609

Note.—The published returns of New South Wales include creameries, which are not reckoned as separate establishments in Victoria, although the hands are counted; also stone-crushing works, which are included with quarries in Victoria. The figures for such establishments have, however, been eliminated for the purposes of comparison. In other respects the returns of the two colonies are, for the first time, believed to be on a uniform basis.

\* Including 2,470 hands in railway and tramway workshops in New South Wales, as compared with only 969 similar works in Victoria, where, however, only one railway workshop—at Newport—has been deemed worthy of inclusion in the returns.

† Including 950 hands employed on docks and ships.

‡ Hands employed in creameries, which are regarded as employees of butter factories; but the number of creameries, shown in brackets, were not included as factories.

§ Including 23 sugar mills, employing 1,475 hands; and 32 ice and refrigerating works, employing 1,047 hands.

¶ Including 22 smelting works, employing 2,076 hands.

\* Including, under hands employed, home workers chiefly in connection with clothing factories, viz., 1,087—166 males and 921 females in Victoria; and 785—117 males and 668 females in New South Wales.

CLASSED ACCORDING TO NUMBER OF HANDS EMPLOYED.

Factories Employing on the Average—	Victoria.		New South Wales.	
	Factories.	Hands.	Factories.	Hands.
Under 4 hands* ... ..	446	1,368	454	1,380
4 hands ... ..	320	1,280	374	1,496
5 to 10 hands ... ..	1,055	7,442	1,148	7,733
11 to 20 hands ... ..	422	6,273	475	6,825
21 to 50 hands ... ..	324	10,077	299	9,379
51 to 100 hands ... ..	116	8,155	99	6,837
101 and upwards ... ..	82	15,501	105	15,405
Home-workers (undistributed in New South Wales) ... ..				785
Total ... ..	2,765	50,096	{ 2,944 10† }	{ 49,609 231† }

\* Including only establishments using machinery worked by steam, gas, electric, water, wind, or horse power.

† Stone-crushing works which could not be eliminated in detail.

## MILITARY FORCES OF THE COLONY.

REPORT for the Year ending 30th June, 1897, by Major-General  
G. A. FRENCH, R.A., C.M.G., Commanding Military Forces.

To the Principal Under Secretary,  
Chief Secretary's Office,—

Sir,

I have the honor to submit the following Report on the Forces and Defences of the Colony.

### (A.) INTRODUCTION.

(1.) I arrived in Sydney from India on 25th April, 1896, and took over the command of the Forces at once. My predecessor, Major-General Hutton, had sent me copies of his Reports, and of the "Australian Federal Defence Scheme," and other documents bearing on defence matters, which I was enabled to study carefully on my way over, and this, with my previous acquaintance with Local Defences, enabled me to drop into work at once.

(2.) Having made a thorough inspection of the Defences at Sydney, Botany, Newcastle, and Wollongong, and of the Permanent Artillery at those places, I was in a position to make definite recommendations with regard to the command of that Force. This had been a burning question for years, and, for want of settlement, had produced a state of affairs anything but conducive to discipline or efficiency. I am glad to be able to report that the condition of affairs is now completely altered, and that in the near future there is the prospect of this Force being in every respect satisfactory, except, perhaps, in numbers.

(3.) I was anxious at as early a date as possible to visit the outlying districts of the Colony, and consequently commenced my inspections earlier than usual. During the year I visited the Clarence and Richmond River districts, Glen Innes, Armidale, Tamworth, Singleton, Newcastle, Wollongong, Camden, Picton, Bowral, Goulburn, Wagga, Albury, Young, Bathurst, and Mudgee, inspecting Corps at all the above places. I was also present at the Rifle Association Meetings at Sydney, Singleton, and Moss Vale. I hope during the current year to visit all other portions of the Colony where the Head-Quarters of Companies are located.

(4.) The Federal Military Conference that assembled in Sydney in October, 1894, recommended that a Military Defence Bill should be passed for all the colonies of Australia and Tasmania, and that it should be based on the Queensland Act of 1884 and amendments of 1891. Major-General Hutton, in his 1896 Report, strongly urged the adoption of a Military Act, adding: "It is impossible, with any regard to any sound military organisation, to postpone the adoption of such a Bill until a national emergency arises. The existing Volunteer Acts of 1867 and 1878, under which the troops of New South Wales are enrolled, are well known to be obsolete."

In view of the above, as well as the fact that I was Commandant in Queensland when the 1884 Act was passed there, I felt it incumbent on me to take action (though I should have preferred to have given my undivided attention to other duties), and consequently I framed an Act of the nature indicated. This was put into proper legal form by the Attorney-General, and I hoped might have been passed last Session. I trust that another Session will not be lost in the matter, as I can make little headway in the efficient and economic administration of the Forces till the existing Acts and the Regulations thereunder are materially modified.

(5.) Having now had full opportunities for seeing the greater portion of the Force, and going thoroughly into its working and administration, and having had some considerable knowledge of it prior to 1891, I would say, in the first place, that probably not sufficient credit was ever given to the late Major-General Richardson,  
C.B.,

C.B., for his exertions in forming the Force, *ab initio*—a feat which cannot be appraised at its proper value except by the few who have had to do similar work. The unending brain work involved in the organization of the complex military machine is little understood, and as little appreciated, by the general public. The reward too, even when successful, does not seem great; for although he raised and trained a Force where no Force existed before, and took a large portion thereof to the Soudan in 1885, a matter which has brought lasting credit to the Colony, his pension was cut down after his retirement, and his widow refused a pension after his death.

(6.) Major-General Hutton arrived at a time when, owing to the general depression expenses had to be cut down in every direction. The Military Estimates, as usual were the first to suffer, and during his tenure of command (nearly three years) he was never able to get the Force, or even a large part of it, into camp for combined training. He nevertheless carried out numerous improvements in the organisation and discipline of the Force generally, and specially as to mobilization for war. (His unceasing efforts in the direction of Australian Federal Defence are too recent and well-known to require remark from me.) Had half of his recommendations been carried out, the Force would be in a far better state than it is now; but year after year he had to make the same recommendations and find that no action was taken thereon; this was notably the case as regards the Permanent Artillery.

(7.) I will now submit *seriatim* the opinions at which I have arrived regarding all branches of the Force.

## (B.) PERMANENT ARTILLERY.

### (1.) "A" BATTERY, FIELD ARTILLERY.

(8.) I considered this Battery fairly efficient at period of my first inspection, the horses generally good, the Non-Commissioned Officers, Gunners, and Drivers well trained and of good physique. The Officers were not up to the regular standard in the matter of Fire discipline, and the results of actual practice were bad, though this latter may be largely qualified by the fact that practice was carried on with the old muzzle-loading 9-pounders. Hearing on my arrival that a Battery of 12-pounder B.L. guns had been ordered, and was probably shipped, I advised a cable being sent to inquire, and as they had not been, we were fortunately in time to order the new 15-pounder gun, with Cordite charges, the modern Field Gun for the Regular Army, and the one now recommended by the Colonial Defence Committee for all the Australian Colonies. These guns, with equipment complete, have now arrived out. The Battery is provided with an excellent lot of horses, which are also available for the instruction of Field Artillery, Cavalry, Mounted Rifles, and Classes of Officers, and also for a large amount of cartage of stores and camp equipment. I propose to increase their number, and reduce their cost by the simple expedient of turning most of them out to grass when not required. There is no doubt in my mind that with the thorough instruction that will be afforded to all ranks under Colonel Smith, R.A., this Battery will be in a much more efficient state by the time of my next Annual Report.

### (2.) PERMANENT GARRISON ARTILLERY.

(9.) The state of affairs in connection with some of the senior Officers of this Branch, which was alluded to in previous Reports of my predecessors, I do not wish to call attention to. From my point of view, it is not merely galling to Officers to have their demerits canvassed in public for matters for which the system is perhaps more to blame than the individual; but it is fatal to efficiency and discipline when senior Officers are held up as objects of derision to their juniors.

(10.) I sincerely trust that in future the shortcomings of senior Officers may be dealt with under the heading "Strictly Confidential," and that when such Officers have to be retired it may be carried out quietly but promptly in the interest of the Service generally.

(11.) From the above causes this branch of the Force has been at a great disadvantage; but a large number of the Officers have qualified at the School of Gunnery, Shoeburyness, and are well up in matters of coast defence. I advised the extension of this system to specially selected Non-commissioned Officers, and it is satisfactory to know that two so selected are likely to prove valuable instructors on their return here.

(12.)

(12.) As a further development of the Local Long Course of Instruction at South Head, the other Australian Colonies were invited to send Officers or Non-commissioned Officers of the Permanent Artillery to join a course commencing on 1st July, 1897, this Colony finding instructors and camp equipment free.

(13.) This has been well responded to, and at the present time the following are represented :—

	Officer.	Non-com. Officers.
Victoria ... ..	1	5
Queensland ... ..	...	2
West Australia ... ..	...	1

(14.) I hope to see this Course continued annually, even though it represents such a small instalment of Military Federation for Defence.

(15.) The Non-commissioned Officers and men of the Permanent Garrison Artillery are generally well trained. Many of the latter are too much employed, though none are supposed to be employed till thoroughly trained (and then put through a course of training every year). This will want watching, private convenience being sometimes considered before the public benefit.

(16.) More practice is required in firing at moving targets, firing with q.-f. guns, firing at night at targets lit up with the electric light. The first of these three is all that can be carried out for the present.

(17.) I expect to see much general progress in this branch during the current year. Colonel Smith is using every endeavour to make it thoroughly efficient.

#### (C.) PERMANENT SUBMARINE MINERS.

(18.) This small Force exists really to take charge of Submarine Mining Plant, to form a nucleus for submarine mining operations, and to act as instructors in that branch. At my inspection all stores were in excellent order, and practical operations were well carried out.

(19.) I am strongly of opinion that a Technical Branch of this sort should occasionally be thoroughly overhauled by a skilled expert of the Royal Engineers.

(20.) At the Conference of Commandants held in Melbourne last December, it was strongly recommended that an officer of the Royal Engineers should be employed by the Australian Colonies, but no action has apparently as yet been taken. At the present time there is no certainty that any of the several branches that come under the head of "Engineer Services" are in as efficient a state as they should be, and with the large interest that all these colonies have in forts, submarine mining stores, and electric lighting gear, there seems to be ample work for one skilled Superintending Officer.

(21.) Nine carefully selected Non-commissioned Officers and men were included in the detachment of the Permanent Forces sent to England this year, and went through courses of instruction with the Royal Engineers at Chatham. The cost was slight and the advantage obvious.

(21½.) Since August, 1896, correspondence has been going on with reference to a submarine mining steamer, but little practical headway has been made in obtaining one. The necessity for expediting the matter may be judged from the following extract from my letter of 20th July, 1897 :—

The country has, at a very large expenditure, procured the mines, stores, and appliances for a Submarine Mining Defence of Port Jackson, and a large sum is expended annually in maintaining and training the necessary personnel; there is a grave danger that when a national emergency arises, the equivalent result in the way of defence will not be obtained unless there is a reliable and efficient submarine mining steamer.

#### (D.) PARTIALLY-PAID FORCES.

##### (1.) MOUNTED FORCES.

(22.) *New South Wales Lancers.*—This Regiment contains a very large proportion of Officers and men of the right sort for a Cavalry Corps—excellent riders, plenty of go and dash, especially amongst the Country Squadrons.

(23.) *Cavalry Horses.*—The horses are, in many instances, quite below the standard for Cavalry work; and as such a statement may be something of a shock to Australians, I think it advisable to discuss shortly the required conditions.

(24.)

(24.) A light Cavalryman, with saddle, accoutrements, kit, arms, and ammunition, rides about 18 stone. It is evident that a horse that will work day after day, scouting, reconnoitring or carrying this weight along a road, must be one of good size and substance, even without considering the question of the "shock of impact" in the charge, when weight and speed must tell. Such horses are by no means plentiful in Australia, and are usually in demand by Indian buyers; consequently many men in the Lancers cannot afford to buy such. Possibly it is not generally known that the horses of all the Mounted Corps are in one sense "gift" horses; in fact, the Government only pay the mounted man the same rate as a foot man, the former finding both horse and saddlery for nothing. This in itself is an astounding evidence of the popularity of the Mounted Services; and I must confess that at my inspections, though I had frequently to find fault with the horses, I felt I only did so in a half-hearted fashion—it was difficult to "look a gift horse in the mouth."

(25.) *Mounted Rifle Horses.*—Here we have a totally distinct condition of affairs, as far as the horse is concerned. In this case the horse is merely the means of locomotion from time to time or from point to point. He is not used in the charge; he does not require much height or weight—in fact, preferably he should be small, so that men can readily mount and dismount. Instead of having to take his share in a charge at top speed, after perhaps several hours of work, he is relieved of the weight of rider, arms and ammunition, the Mounted Rifleman dismounting to do his part of the fighting. While, therefore, the Cavalry horse is scarce and expensive, horses suitable for Mounted Riflemen could be obtained here in myriads for nominal prices.

(26.) The Lancer is paid for twenty-five half days in the year. He is armed with a lance, sword, and carbine, and supposed to be instructed fully in the use of these arms, in addition to field drills. It is quite a supposition, because it is an impossibility; one or two of these weapons must go to the wall. It is usually the fire-arm. The true Cavalryman has commonly a fine contempt for fire-arms and villainous saltpetre generally, and no doubt both have detracted largely from the pleasure of being in that branch of the Service; but to do any good in modern warfare, we must be painfully up to date.

(27.) Now let us take the ideal Cavalryman, with the *arme blanches*: a first-rate, well-drilled man, a horse to match, and a sword or lance. Having got these, I would ask how much are we in advance of Julius Cæsar's Cavalry? But the catapult and balista have gone ahead since then, and the modern Archer and Slinger are not satisfied with a range of eighty yards. The main point for us to consider is, taking into consideration all the circumstances of *this country*, what form should our Mounted Forces take—"Cavalry" or "Mounted Riflemen"?

(28.) I have dealt with the horse portion of this question in the foregoing. I would now point out—

- (a) That the country along the coast, which must be the seat of war, is quite unsuited for the action of Cavalry in large bodies.
- (b) An enemy could not bring any number of Cavalry here, and horses so landed would, in many cases, be unfit for immediate service; consequently Cavalry will not be required to repel Cavalry.
- (c) The main reliance of an invading force must be in its Infantry, which can be carried in large numbers in modern vessels. Infantry have little to fear from Cavalry; but would be sorely pressed if mounted men with magazine rifles, and well able to use them, attacked them at pleasure in front, flanks, or rear.
- (d) Finally, we can turn out excellent Mounted Riflemen in thousands; but the number of properly trained and Mounted Cavalrymen would be few.

(29.) For the above reasons, I have no hesitation in advising that any extension of our Mounted Forces should be in the direction of Mounted Riflemen, and that every encouragement should be given for the formation of Volunteer Mounted Corps, in which the fire-arm would be the only, or at least the primary, weapon.

(30.) *Mounted Rifles.*—This Regiment consists of eight half-companies, scattered over the Colony from Camden to Tenterfield. It is to my mind the Force that compares most favourably with the similar branch in the Regular Service.

(The

(The Mounted Infantry are not exactly similar.) I have had every reason to be satisfied with the portions of the Regiment that I have seen, and was especially struck with the workmanlike way in which detachments from the various companies carried through the Mounted Competitions at the National Rifle Association Meeting. I should like to see this branch enlarged and extended, and have asked approval for ten extra men per half-company.

(2.) "B" AND "C" BATTERIES, FIELD ARTILLERY.

(31.) The term "Field Artillery" seems scarcely appropriate to apply to an aggregation of obsolete guns and cart-horses, even though the latter may be attached to the former by the usually recognised Field Battery means. If force of circumstances compels Artillerymen to use such horses, they at least should feel that if, by dint of spur, and whip, and strong language, they have got a gun into a suitable position, the labour ought to be repaid by seeing effective fire opened. This is scarcely possible with the present old muzzle-loaders, and the first step towards the efficiency of these two Batteries is to provide them with modern weapons.

(32.) The horsing has always been a troublesome matter. Hired horses are objectionable enough, even if otherwise suitable; but the style of horse usually supplied is of the clumsy cart-horse order, incapable of trotting any distance, rough, ungroomed, and anything but the sort of animal that men would take a pride in. The rates of hire paid are high enough, viz., 15s. for a whole day and 12s. 6d. for a half day. In Canada the Field Battery Drivers were farmers, and each brought a pair of his own horses to Camp. In this way, each pair of horses having been accustomed to work together, dropped at once into their places in a gun team under the hand of a man who knew all about them, and was interested in taking care of them. I carried out this system to some extent in Queensland; but the requisite conditions do not prevail here, and cannot while the headquarters of the Batteries are in Sydney.

(33.) The best suggestion that I can at present offer is: that, instead of paying large sums for the hire of horses, the Government should purchase horses for the gun teams at least, turning them out to grass when not required.

(34.) It seems to me so inconsistent that while all the Horse and Field Artillery in India are excellently mounted on "Walers," the horsing of a couple of Field Batteries in the Capital of New South Wales should only be a laughing-stock for those acquainted with the requirements of a mobile Artillery.

(35.) Further particulars regarding this branch will be found in Colonel Smith's report, Appendix "C."

(3.) ENGINEERS.

(36.) This Force consists of two Field Companies, one Submarine Mining Company, and one Electricians.

(37.) Up to 3rd September, 1894, this branch had the advantage of the supervision of specially-selected Officers of the Royal Engineers, and had attained a high standard of efficiency.

(38.) The Submarine Mining Company is commanded by Major Lee, an Officer who attained certificates of proficiency at Long Course of Submarine Mining at Chatham and Portsmouth.

(39.) Lieutenant-Colonel Walker and Captain Nelson look after the Telegraph and Electrician Company; and from their daily occupation in connection with such services, it is needless to say that this portion of the Force could not be in better hands.

(40.) The two Field Companies are commanded by Major Parrott and Captain Cansdell, and did good work at the Easter Camp; they require some further equipment.

(41.) The men of all the above are selected, as far as possible, from those trades and occupations in civil life which work-in most advantageously with their military duties.

(42.) Not long ago New South Wales, Victoria, and Queensland had officers of the Royal Engineers in their own employ; but since 7th May, 1896, all the Australian Colonies have been left without an officer of that arm.

(43.)

(43.) Last December, the Commandants in Conference, at Melbourne, strongly recommended that a Consulting Officer of the Royal Engineers should be engaged by the Colonies generally to supervise their Submarine Mining Defences, Electric Lighting plant, and Engineer work generally. No action has so far been taken in the matter; and in default of this being carried out, I would strongly urge that an inspection by a special officer of that Corps be made at least biennially: probably such an Officer could be obtained from India at a slight cost comparatively.

(44.) The importance of this portion of our Defences, and the great value of the material involved, seems to point to the desirability of occasional inspection by skilled experts.

#### (4.) INFANTRY.

(45.) The Infantry, comprising the 1st, 2nd, 3rd, and 4th Regiments, has been organised in Regiments of ten Companies, the first and 2nd having their Head Quarters in Sydney, the 3rd at Richmond, and the 4th at Newcastle. There are several Companies at the Head Quarters of each Regiment, the remaining Companies at other important centres, along a main line of rail usually. This seems a very suitable organisation, and difficult to be improved on.

(46.) Having had some previous knowledge of this Branch, I cannot say that I notice much advance; the fact is, that owing to there being no Camps for several years past, the Country Companies have had little opportunity for carrying out anything but mere Company drill. The difficulties of doing even this satisfactorily will be readily understood when the size of a Company is considered. This at full strength consists of three Officers and 57 men; but with recruits, men absent with leave, without leave, &c., &c., it often happens that not half the above number are on parade. I have had as few as 29 paraded for my inspection—an occasion on which every effort is made to obtain a good muster.

(47.) The first remedy I propose for this is to raise the strength by ten men per Company, or 100 men per Regiment; the second is to revert, as a regular thing, to the nine-day Camps, under which these Corps previously attained a high degree of efficiency.

(48.) I do not think that the interest taken in Camps by the rank and file of the Force is properly appreciated. Apart from the pleasure of meeting old comrades, there is the additional interest of work on a larger scale, of seeing other Branches of the Service, and joining with them in Field Manoeuvres, besides the very important personal one of performing the greater portion of the Annual Military Training in a very short consecutive period.

(49.) Comparing this portion of the Force with the Militia in England, we find that there the whole training is performed in twenty-one consecutive days, recruits doing twenty-eight. In Canada the whole training, including Musketry, was in my time carried out during Camp. The advantage of consecutive days training has been so impressed on me by long years of experience with Militia and Volunteers, that if offered nine days in Camp, or eighteen days throughout the year, I should have no hesitation in choosing the shorter period; and I am fully of opinion that if this Force is to attain a reasonable state of efficiency, we must revert to the nine-day Camps, and carry out a fair proportion of recruit and elementary drills throughout the year.

(50.) The Infantry Schools of Instruction have done much to improve this Branch of the Force. There is quite a large proportion of Officers and Non-commissioned Officers well up in Company drills, and to some extent in Battalion drill, though the chances for instruction in the latter are few and far between.

(51.) The physique is generally good, but in occasional cases very old men and young boys are to be seen in the ranks.

(52.) The training in Musketry, which ought to be the great aim and object of the Infantry, is not all that it might be. The Musketry Course is usually got through in two half days.

(53.) I was very much astonished to find that no prizes were given for Musketry, the Government apparently, though giving handsome assistance to encourage rifle shooting, taking no steps to see that the shooting of the Defence Forces was a matter of primary consideration. I have gone thoroughly into this matter, and my conclusions will be seen under the heading "Rifle Associations"; but I would here remark that  
thorough

thorough instruction in rifle shooting, under conditions as nearly as possible to "Service," is, to my mind, of the utmost importance, and that one of the best methods of keeping up the interest of all ranks is by a system of Company prizes, by which the men of every Company will have certain definite prizes to compete for annually, and which cannot be carried off by the outside professional "pot-hunters." To work this idea out, I have asked for a sum for "Musketry Prizes," and I sincerely hope that it may be viewed favourably.

(54.) I am not satisfied that the Infantry have all the advantages which this large portion of the Force should have. There is no one to look specially after their interests. If there was, it is difficult to believe that they would have been left all these years without any prizes for musketry practice. While the Artillery, Engineers, Cavalry, and Mounted Rifles have from time to time had special Instructors from the Regular service, the Infantry have been allowed to drift. Adjutants and Sergeant Instructors picked up locally, with little qualifications beyond barrack square drill, could ordinarily bring little military experience for the benefit of the Corps; and although good ones are often picked up in this way, the best must suffer from our baneful system of practically putting men into such billets for life. Major-General Hutton endeavoured to break this system down by the ordinary expedient of removing Staff Officers and others after being a certain number of years in their appointments, as in the Regular Service. It devolves on me to carry this system out; but before doing so, I should like to know where they are to be removed to? Failing that, unpopular though it may be, I feel bound to recommend that an occasional Adjutant and Sergeant Instructor be introduced from the Regular Service. There is no difficulty about their removal when their engagements are up. By these means, a portion of the Infantry will at all events be brought up to date.

(55.) The question of the removal of Instructors and others who are past their work, is not special to the Infantry. In every Branch there is a similar state of affairs, the cause being that there is no form of pension on retirement for any rank, and the want of this is sapping the foundations of the whole Force. It is all very well to say that the same state of affairs exists in the Civil Service; but I would point out that for the Military Service, active, smart men in the prime of life are a necessity, and that if the Force is to be a success, there must, as in the Regular Service, be a limit of age for all ranks. This can only become possible by retiring those who by age or infirmity are unable to carry out their duties properly. I have had to deal with some of the most extreme cases myself, but in the hope that Parliament may in due course provide some gratuity for them.

#### (5.) ARMY SERVICE CORPS.

(56.) Consists of a small Permanent Section of one Officer, and seven Non-commissioned Officers and men, and one Partially-Paid Company organised for Supply and Transport. I have recommended a slight increase so as to form two Companies—one for Supply and one for Transport.

(57.) This small Force would be readily expanded when necessary, and even now does excellent work in Supply and Transport.

(58.) Whoever arranged the pay of the Permanent Section has a good deal to answer for. A Driver in this branch, with one horse and set of harness to look after, no guards or night duties, gets just three times the pay of a Permanent Artillery Driver, who has to take his turn of guard and night duties, and look after two horses and their harness. This seems too absurd to last.

#### (6.) MEDICAL STAFF CORPS.

(59.) Consists of a small Permanent Section of one Officer and ten Non-commissioned Officers and men, and a Partially-Paid Company of three Medical Officers and 113 Non-commissioned Officers and men, the whole forming a nucleus readily expanded when necessary.

(60.) Surgeon-Colonel Williams, who has worked up this branch *ab initio*, is deserving of every credit for the zeal and attention shown, and for the excellent equipment of ambulance waggons and stores which he has gradually accumulated. I had every reason to be satisfied with my inspection of the Hospital and appurtenances, and with the turn-out and drill of the Non-commissioned Officers and men.

I think that in the matter of Ambulance Equipment, and general readiness for the development of Field Hospitals and attention to sick and wounded, this Colony is well ahead of the other Australian Colonies.

(61.) I attach some interesting extracts from the Principal Medical Officer's report. (*Vide Appendix "D."*)

#### (E.) VOLUNTEERS.

(62.) Since my arrival there has been a very extraordinary development of the Volunteer Force, the Establishments having risen from—Officers, 7; men, 193, on 31st March, 1896, to Officers, 100; men, 2,363, at present time.

(63.) Hitherto it must be confessed that Volunteers as such have failed repeatedly in various parts of Australia, and especially in New South Wales. This seems the more extraordinary in view of the great success of the Force in England. I, however, take great encouragement from the fact that two Companies of Scottish Volunteers, formed in Sydney some twelve years ago, are still in existence, and now compare most favourably with the best Companies of the Partially-paid Force.

(64.) I argue that if the Volunteer movement can be proved a success in one case over such a long period, there is no reason why it should not be an equal success in others, if similar means be employed. From a long experience, I am satisfied that one of the first conditions for success is in obtaining suitable officers, in touch with the men—not joining the Force for the sake of the rank they may get, but determined, whatever rank they may hold, that they will fit themselves for it by the necessary course of training, and thus obtain the respect and esteem of those they have to lead.

(65.) The next important condition is the selection of the rank and file. Too many Officers are apt to think that one man signing the roll is about as good as another. This is a grievous mistake. The man you want is the man who is likely to stay. Now, it is too much to suppose that the hard-worked labourer or artisan, who signs the roll in a fit of enthusiasm, is likely to stay. What have you to offer him? Pay would be an object to him, but you have none to offer, direct or indirect; but you can offer some considerable marching and exercise. This is scarcely what a man, who has put through eight hours hard physical work during the day, would look forward to as an evening or Saturday afternoon recreation. Clearly, then, the men to join a Volunteer Corps are those to whom pay is not a primary object, but physical exercise is. And these men must be selected from those whose ordinary occupations are indoors, and of a sedentary nature. To them the evening drill is a useful exercise and recreation, and such men are likely to remain in the Corps.

(66.) Rifle-shooting, Squads for drill and gymnastic competitions, &c., &c., do much in holding Corps together, and should be encouraged by every means.

(67.) I shall look forward with much interest to the development of these new Corps, and I hope that the Government will do their share in the matter. Men who serve for nothing naturally expect that the ordinary requisites for carrying on their drill and instruction should be furnished; and to give the Force a fair chance, it is imperative that Drill Halls, Orderly Rooms, and Armouries should be found without delay. Drilling at night a dozen men at a time in a public place under one gas jet, with a running fire of chaff from the ubiquitous larrikin, is not encouraging; but this leads me to one of the greatest blots in the previous administration of the Forces in this Colony.

#### (F.) DRILL HALLS AND ARMOURIES.

(68.) Throughout Victoria and Queensland (possibly in other Colonies) wherever a corps is established there is usually a drill-shed, armoury, office, and perhaps an instructor's quarters. This is the Head-quarters of the Corps. Here the recruits learn elementary drill, and all hands can parade in bad weather. Commonly some gymnastic apparatus is supplied, and social entertainments are given. How many of the above are to be found in New South Wales? There is no doubt in my mind that a social centre of this sort does much in holding the men together, and establishing a feeling of *camaraderie*, apart from the direct benefits of drill and training. I hope that early steps will be taken to supply this long-felt want at all military centres.

## (G.) ADMINISTRATION.

(69.) When Commandant in Queensland I was much struck with the extraordinary cost of the New South Wales Forces in comparison. In round numbers, a Force of 4,000 men cost £50,000 per annum in Queensland; but a similar Force of 5,000 in New South Wales cost five times that amount.

(70.) This excessive cost was subsequently officially inquired into, and wholesale reductions made. Unfortunately these reductions did not always take the form of cutting off excrescences and superfluities: the excessive Staff, the high rates of pay of officers who really had only a few days work in the year remained; but the fighting men were reduced in numbers, and this took its most objectionable form, by a reduction of over 100 men of the Permanent Force. At my inspection of the Forts I was astonished to find that some of our most powerful breech-loading guns were told-off to be manned in war-time by Partially-paid Artillerymen—that is to say, by men whose whole training for the year in all sorts of drills amounted to twenty-five half-days.

(71.) It is not generally understood how trained gunners are absorbed. When numerous guns in many scattered forts have to be manned, there are positions in which slightly-trained gunners, or even infantry, can be employed—hoisting shot or shell, &c., but you would not care to employ them in magazines, or where explosives were stored, in the heat and excitement of action, nor would they be fitted for any of the important positions connected with the direction or working of Coast Defence guns. All such posts must be taken by Officers, Non-commissioned Officers, and trained men of the Permanent Artillery; and thus it will be seen that, under present circumstances, even some of our principal guns cannot be fully manned by trained men. A reference to Colonel Smith's Report, paragraph 11 (*Appendix "C"*), gives his opinion on this point; and, in view of its importance, I have asked on the present year's Estimates for an additional ninety men.

(72.) I would also submit in this connection the opinion of His Excellency the Admiral Commanding-in-Chief on the Australian Station on the general question of the manning of the Defences, and at the same time point out that, as this is the base for the fleet, an additional responsibility is thrown on us in the matter.

(73.) The Navy is clearly our Offensive Force. The Admiral should never have any anxiety about the safety of his base, or think it necessary to leave one ship or one man to assist in its defence. The responsibility is clearly ours, and we must accept it. If, after this plain statement, our guns are left short-handed, I venture to submit that the responsibility cannot rest with either the Military or Naval Authorities.

[From *Sydney Morning Herald* of 15th March, 1897.]

INTERVIEW WITH THE ADMIRAL.—AUSTRALASIAN DEFENCE.—INSUFFICIENCY OF MEN.—SOME STRONG COMMENTS.

WHEN a *Herald* reporter saw the Admiral last night, the first question asked was in regard to the condition of the Defences of New Zealand.

"I can only say," he replied, "that the condition of the Defences in New Zealand is much the same as in all the other colonies—there is a very striking insufficiency of men. It is a very extraordinary thing to me, having observed the almost universal desire there is in these colonies that the money raised from the Colonial taxpayer should be spent in the Colony, to see how very large a proportion of the really considerable sums which the Australian colonies have expended on their Defences has gone into the pockets of manufacturers and contractors outside the limits of the colonies themselves. Of the total sum expended by Australia and New Zealand on their Defences—a sum which must amount to several hundreds of thousands of pounds—considerably more than half has probably been spent in the purchase of material that could be procured from only outside the colonies. This makes all the more remarkable the curious feature of the local Defences—that costly and elaborate passive fortifications have in several instances been provided without, one might almost say, an attempt having been made at arranging that an adequate number of men to man them should be available. What makes this so astonishing is that the really defensive wealth of these colonies—that is, their abundance of highly efficient fighting men—has been neglected. In Australasia, at this moment, there must be over half a million of fighting men, probably the best material for making efficient soldiers of any that exists anywhere in the world; and yet this abundance of supply has been largely neglected, and great sums have been expended on passive defensive material beyond anything like due proportion relative to the *personnel*. I am almost ashamed to say this over again; I have said it in possibly different words more than once; but the subject is too important a one to permit anyone in a responsible position to neglect it for fear of being charged with iteration."

"Your Excellency has not made any inference that war material should be manufactured in the colony?"

"I

"I do not mean to say that any material that has been purchased abroad could have been manufactured in the Colony; and I am confident that, so far as material is necessary, you will get it better and most likely cheaper in England; but what I do mean to say is, that in the distribution of the sums available an unduly large proportion has been devoted to passive material, leaving relatively an insignificant amount for the most important element of all—the *personnel*.

"The Defence Works which I have seen in New Zealand," the Admiral continued, "like those in all the colonies, are in admirable order. They are beautifully kept, and reflect the highest credit upon the people in charge of them. When visiting some of these really formidable, and at the same time well-kept works, one is perpetually haunted by the question—What is the good of all this if there are not enough of the proper men to man them?"

#### (H.) RIFLE ASSOCIATIONS.

(74.) I think I may safely say that the matter of the encouragement of rifle shooting has been deliberately handed over by the Government to certain irresponsible bodies called "Rifle Associations."

(75.) I admit that it is a great advantage to have all the work and worry necessary for carrying out Rifle Meetings done by Committees for nothing but the mere love of the thing; but, from close observation of the working of these Associations, I am compelled to inquire,—For what purpose does the Government hand over such large sums? And I assume that it is mainly for the purpose of encouraging and improving the shooting of the Defensive Forces of the Colony.

(76.) Being an old rifle shot myself, I probably have interested myself more than might seem necessary in this matter; but I am not sorry for having done so, as I feel certain I can now show good cause for the present system being considerably modified.

(77.) I find that Government subsidises these Associations as follows, viz.:—

National Rifle Association of N.S.W.	...	...	£1,000
Northern Rifle Association	...	...	250
Southern Rifle Association	...	...	250
Western Rifle Association	...	...	250

and in addition they get free ammunition valued at £882, and free railway passes valued at £675, viz.:—

National Rifle Association of N.S.W.	...	...	£405
Northern Rifle Association	...	...	90
Southern Rifle Association	...	...	90
Western Rifle Association	...	...	90

(78.) In no other form of sport that I know of, are such facilities provided by Government for its enjoyment. The "pot-hunter" is not an ideal sportsman in any line; but in the line of rifle shooting in New South Wales, he must have approached as nearly to the Pot-hunter's Paradise as is possible on this sinful earth. A paternal Government gives him a rifle to shoot with, free ammunition to use with it, a free railway pass to and from the shooting grounds, even if hundreds of miles from his own residence, and then very handsome cash prizes to reward his skill. Finally, if a master in his art, he may look forward to a trip to England on the simple condition that he takes the prizes, and some one else foots the bills.

(79.) I understand that at the last Association Meeting at Randwick, some of the competitors took as much as £100 in prizes. There is no pretence at handicapping; the same crack shots are allowed to enter match after match on equal terms with beginners; the consequence of all this being, that very few of the rank and file of the Defence Forces have much chance of obtaining good prizes. From all this, I infer that if it is the desire of the Government to bring up the general average of the shooting of the Defence Forces rather than furnish fancy prizes for a favoured few, it will be necessary to modify considerably the conditions on which grants are now given to Rifle Associations.

(80.) I trust that nothing in the above may be construed into my being opposed to Rifle Associations. They have done excellent work, and I hope will continue to do it; but I do not think their present system the best means of bringing up  
the

the general average of shooting. At the same time, anything which goes to encourage rifle-shooting in any shape or form is a distinct gain to Defence. I append some extracts bearing on this question.

*Army and Navy Gazette, 20th February, 1897.*

There is no doubt that by degrees the old Wimbledon "pot-hunters" are being lost to sight. The Council of the Association are beginning to recognise that to be of value the competitions at Bisley must be conducted more on Military lines.

Just at first, perhaps, receipts will fall off; but as soon as it is recognised that the Bisley Meeting is a Military gathering in the truest sense, its popularity will increase enormously.

At Wimbledon matters were conducted in the loosest way at times. Any "get-up," however extravagant and unsoldierlike, was permitted, and all ideas of Military regularity were set at defiance. As Volunteering became more of a serious business and less of a pastime, the members of the Force themselves kicked against such proceedings, and many of the best shots refused to support a gathering which they felt to be lowering to the Military status of the body in which they were enrolled.

By degrees, as the Council elbow out the "pot-hunting element," the National Rifle Association will come into favour again; but a firm stand will have to be made against the free-and-easy air which characterises a large portion of the provincial Volunteers.

They must be taught that at Bisley they are required to be soldiers first, and good shots afterwards. There is now such a thing as fire discipline, and a man who cannot be taught to salute Officers in uniform, or dress himself correctly, is a disgrace to the Volunteer Force, and ought not to be tolerated at a representative Rifle Meeting.

*Singleton Argus.*

As an example of how the public money is thrown about, the meeting of the Northern Rifle Association which is now being held here may be cited. We have no desire to decry the practice of rifle-shooting. It is, undoubtedly, to many a very excellent form of sport and amusement, and to some it may be instructive; but why the public should be called upon to provide a number of "pot-hunters" with the means of having a week's enjoyment, and, at the same time, provide a portion of the prize money, is a matter that is not easy to understand. For the purposes of this meeting, the Government granted the sum of £250, besides which several thousand rounds of ammunition and railway passes are also provided free for the competitors. How is it that free drinks and free accommodation are not also included seems incomprehensible in the face of the liberality of the Government in other directions. For this grant of £250 it is not unreasonable to ask what return does the country get. We fail to see that anyone benefits, except a few marksmen, who probably make a good thing out of rifle meetings of this character. No one can cavil at any number of persons promoting a shooting contest and awarding prizes to those who secure the greatest number of points, so long as the taxpayer is not obliged to pay for the fun which these gentlemen avail themselves of. . . . The specious arguments that are used about Rifle Associations forming an adjunct to the Defence Forces is all moonshine, and no one knows this better than the members of the Associations themselves. . . .

To this Mr. A. A. Dangar, the President of the Northern Rifle Association, replies:—

The idea of these local meetings is good—encourages young riflemen, encourages shooting in each of the towns; but they should confine themselves to their own districts, and thus add as main feeders to the main district and Metropolitan Associations, instead of coming into competition with them in the entries, as they do at present.

To resume: As to 'pot-hunters,' I regard them as excrescences that appear at all times and everywhere when the chance offers, and the fewer the entries and the weaker the Association the more they flourish. . . .

(81.) It was reserved for the Western Rifle Association, Bathurst, to show how little it was interested in the encouragement of rifle shooting amongst members of the Defence Forces. This Association actually arranged its meeting at Easter, and refused to alter the date, though it was pointed out that men of the Defence Forces from Bathurst and vicinity must necessarily be in camp at Sydney then.

(82.) The following figures are worth consideration:—Of 536 competitors at the 1896-97 meeting of the National Rifle Association of New South Wales, 147 belonged to the Land Forces; Southern Association, 18 out of 88; Western, 28 out of 157; Northern, 33 out of 109—making a total of 226 out of 890 competitors.

(83.) As there were 6,200 men in the Defence Force at the time, it will be seen what a fraction of the Force derives any benefit from the Association Meetings. Of the 890 competitors, 15 attended 4 meetings; 27, 3 meetings; and 54, 2 meetings.

(84.) From all the above, I have come to the conclusion that the Government should reconsider the conditions on which grants are made to Rifle Associations; and disapproving, as I do, of the manner in which these grants are applied, I think I may reasonably object to the Military Vote being made liable for the ammunition and free passes granted.

#### (I.) CAMPS.

(85.) A short course of training was carried out at Easter at Sydney. The only ground available for camping on was a portion of the old Rifle Range at Paddington—I say a portion, as a part has been cut off the top of this old Imperial reserve, another part off the bottom, and a road run through the balance.

(86.)

(86.) The troops have now no place on which to parade without the permission of the municipal authorities, or the Trustees of one or the other of the parks or reserves. In any case the Force has outgrown them all.

(87.) I should hope that, before it is too late, the Church and School Lands beyond Randwick, which still remain public property, may be reserved as a training-ground for our Defence Forces.

(88.) The numbers in Camp at Paddington were as follows :—

	Officers.	N.-C. Officers and Men.
Head-quarters Staff ... ..	9	4
New South Wales Lancers ... ..	8	65
Mounted Rifles ... ..	6	57
Brigade Division, Field Artillery ... ..	18	209
1st Garrison, Division Artillery ... ..	1	46
Field Companies, Corps of Engineers ... ..	7	107
Infantry Brigade Staff ... ..	3	2
1st Infantry Regiment ... ..	22	326
2nd Infantry Regiment ... ..	35	535
3rd Infantry Regiment ... ..	27	311
5th Infantry Regiment ... ..	3	113
Army Service Corps ... ..	5	57
Medical Staff Corps ... ..	5	82
Total ... ..	149	1,914

(89.) As the four days in Camp included the day of arrival and day of departure, as well as a Sunday, the net amount of training could not be much, especially with such raw men. As a matter of fact, from inquiries made, it was found that from 22 per cent. to 70 per cent. of the men of the 1st, 2nd, and 3rd Regiments had not been in a Camp before, owing to the number of years that have elapsed since Camps were held. These short Camps seem to be very extravagant affairs proportionately, as the expenses of bringing the men back and forward are as great as for nine-day Camps, and you really do not get three clear days work.

(90.) Another small Camp was held at Newcastle on the 22nd to 25th May. Numbers as below, viz. :—

	Officers.	N. C. Officers and Men.
N. S. Wales Lancers ... ..	6	70
B. D. F. Artillery ... ..	1	17
4th Infantry Regiment ... ..	21	403
Medical Staff Corps ... ..	3	5
Total ... ..	31	495

(91.) An objection to these small Camps is that by the time all the Camp Guards and duties are told off there are so few men for parade.

(92.) The vicinity of Newcastle does not afford much suitable ground for camping or manœuvres, but it is a distinct advantage that the Troops should be acquainted with the ground that they are likely to have to defend; and it is therefore desirable that the Troops in the Northern District should occasionally be concentrated at or near Newcastle.

#### (J.) RAILWAY PASSES.

(93.) The necessity for paying at all times when Troops are carried by rail on Government Railways is not very apparent. In the adjoining Colonies, under such circumstances, men are always carried free. Taking money out of one pocket and putting it into another does not help the taxpayer much; but the Railway Commissioners insist that payment must be made when our men are carried under any circumstances.

(94.) I do not know anything more prejudicial to the training of the Forces than this. Infantry Companies within 20, 30, or 40 miles of each other, that might readily be brought together occasionally for combined training, are prohibited from doing

doing so because there is no money available. If a Rifle Club wishes to shoot a match with an adjoining Club, they are similarly blocked. We could only bring into Camp at Easter the Corps nearest to Sydney and Newcastle for like reasons; and, finally, for the Queen's Jubilee Parade, on 22nd June, all distant Corps had to be omitted. It seems somewhat paradoxical that while children are carried free to school every day in the week, men training for the defence of the Country cannot be carried free even once a quarter. I trust this system may be so amended that a paper credit, and not a cash one, may be sufficient for the requirements of the Commissioners in future.

#### (K.) THE QUEEN'S DIAMOND JUBILEE.

(95.) The invitation sent by the Secretary of State for the Colonies, with a view to the representation of our local Forces at the Queen's Jubilee, was heartily responded to. Lieutenant-Colonel Lassetter had for months previously been arranging for a strong team of his fine Regiment to visit England, and to take part in the Military Tournaments there; and when the invitation arrived, his men and horses were ready, and their expenses provided for by public subscription. Major Burns of the New South Wales Lancers promptly took steps to have his Corps represented, and, starting a subscription list with a handsome donation himself, had the satisfaction of seeing some 32 Officers and men embark by the 10th April. The Government did not see its way to carry out my original recommendation about having all Arms of the Forces represented, but eventually approved of two Officers and 50 Men of the Permanent Artillery and Engineers being sent, the whole cost for which was only about £1,500, and against which may be set the advantages which these men obtained by three months instruction in their own special branches.

(96.) I think it must have been very satisfactory to the people of New South Wales to read from day to day of the success of their representatives,\* and the golden opinions which they won wherever they went; and even that sensitive person, the taxpayer, I feel assured, will be satisfied that he had a fair return for his money when he understands that, for a cost of about £2,000, New South Wales was represented in London by a Force equal to all the other Australian Colonies combined.

(97.) The following numbers were present at the Jubilee Celebrations, in London, viz. :—

	Officers.	N.-C. Officers and Men.
N. S. Wales Lancers	4	28
Mounted Rifles	7	36
Artillery { Permanent Field	1	17
{ „ Garrison	2	26
Engineers (S.M.M.)	...	9
Total	14	116

(98.) The parade in Sydney on June 22nd was a highly satisfactory one. Although distant Corps were not brought in, on account of the expense (Railway), there were some 300 more on parade than on any previous occasion. The only real drawback was the comparatively small size of the ground on which they had to be formed up. The march through the City afterwards by the whole Force (some 3,800 men) was an imposing Military spectacle. As New South Wales took her full share, and rather more, in the Jubilee Celebrations, the following letter has a special interest for us :—

DESPATCH from the Secretary of State for the Colonies, to His Excellency the Governor and Commander-in-Chief.

My Lord,

Downing-street, 16 July, 1897.

The time has arrived for the departure from this country of the various component units of the remarkable military assemblage which has constituted one of the most striking features of the recent Jubilee celebrations; and I cannot allow the occasion to pass without expressing the great satisfaction of Her Majesty's Government, that such a unique and characteristic gathering of Her Majesty's Colonial Forces should have been so successfully brought about.

2. The Colonial Troops have attracted the marked attention, not only of the British public, but of military experts of all nations; and by their soldier-like bearing and appearance, and their discipline and general behaviour, both on parade and in quarters, they have won the highest opinions on all sides.

3.

\* The New South Wales Lancers carried off two of the seven Gold Medals offered at the close of the Tournament for competition amongst the highest prize winners from the Regular Army, the Volunteers, Yeomanry, and Colonial Troops.

3. Her Majesty's Colonial Forces, during their stay in England, have been treated in all respects as regular soldiers. They have readily and cheerfully conformed to every requirement of regimental and barrack discipline; and by an intimate association with their comrades of Her Majesty's Regular Forces have become acquainted with every detail of a soldier's life.

4. It has been a particular satisfaction to Her Majesty's Government that this great occasion has been the means of bringing together men of all creeds and of all races, who, although coming, as many of them have done, from widely separated portions of the Empire, are all united by one bond of allegiance as soldiers of Her Majesty the Queen Empress.

5. Her Majesty's Government feel that they are justified in hoping that the effects of the exceptional military gathering will be permanent, and that the Imperial and national interests which have been by this means so forcibly illustrated and brought home to the minds of all classes of Her Majesty's subjects, will now be realised in a manner that had been scarcely possible before. They can hardly doubt that the events of the last few weeks will have done much to knit closer the bonds of union between the Colonies and the Mother Country, and to this end the presence of the Colonial Troops will have largely contributed.

6. I will only add, in conclusion, the expression of my hope that the troops will carry with them to their homes pleasant memories of their visit, and that their stay in this country will have proved not only agreeable but instructive; and I feel confident that in years to come it will be a source of pride and satisfaction to those who are now leaving our shores to think that they have taken part in this great and important national demonstration.

7. I shall be glad if you will publish this despatch.

I have, &c.,

J. CHAMBERLAIN.

#### (L.) NAVAL BRIGADE AND NAVAL ARTILLERY VOLUNTEERS.

(99.) The above, consisting of over 500 Officers and men, have no vessel to train on, and are exercised on the shore with old obsolete guns for the most part.

(100.) To try and find some employment for them, a certain number have been told-off to man guns belonging to the Land Defences. I am not enamoured of this system, as the method of working guns afloat is totally different to that on shore. To catch the roll, and fire at the right time, is the great art of the seaman gunner. This would not apply to a land fort (except perhaps during an earthquake). For land service we wish to take all the advantages that science gives for practice from a steady platform. Any officers and men, therefore, employed in the forts should be trained on exactly similar lines to the Garrison Artillery.

(101.) At my request, His Excellency the Admiral was asked to have an inspection made of the *personnel* and material of these Forces. This was thoroughly carried out, and the Government now know the exact state of affairs. I think, therefore, that some definite policy should be laid down as to the future of these Forces.

(102.) I should very much like to see the Naval Brigade made a reality. Large numbers of the men are old men-of-war's men, and it seems to me that it would be more in keeping with the status of a free people if their contribution to the Australian Squadron took the form of men rather than money. With the difficulty that there ever has been to fully man the immense British Fleet in war time, I have little doubt that a contribution of men would be more appreciated. There are two spare cruisers for the Australian Squadron. In case of war, are Australians to wait until crews can be sent from England to defend them? If Australians are willing to wait, will the enemy? It is somewhat outside my line; but I confess I see little difficulty in working out a system by which this Colony should man one of the spare cruisers, and Victoria the other. His Excellency the Admiral in his Report speaks most highly of the *personnel* of the Naval Brigade. With this to start with, and certain special positions on board being filled from the Royal Navy, it would seem that a good fighting crew could be at once made available in war-time, especially if they did their annual training on board in peace time. I am further of opinion that this system need not entail extra expense, as I feel sure a proportionate reduction would be made in our money contribution to the Australian Squadron.

(103.) As it might seem that I am going outside my proper sphere in alluding to these matters, I should like it to be understood:—

(a.) That in my opinion the Naval Brigade or Naval Artillery Volunteers will not fit in readily with the land system of Coast Defence.

(b.) That such a double system of organizing our Naval Forces is needlessly expensive and cumbersome, entailing as it does two paid systems with duplicate Staff, Bands, &c., &c.

(c.) That considering the whole question of the Defence of the Colony, it is desirable that they should be drilled and trained afloat, for service afloat in time of war.

(M.)

## (M.) SUPPLIES.

## (1.) WARLIKE STORES.

(104.) The method of supply of warlike stores is, and has been, most unsatisfactory in all the Australian Colonies. The question was taken up at the Conference of Commandants held in Melbourne last December, and they made definite recommendations, which, as far as this Colony was concerned, were fully reported on by me last February; but, as I have heard nothing further in the matter, I presume nothing has been done.

(105.) The supply of small-arm ammunition is not, to my mind, at all in a satisfactory state. With the sound view of encouraging its manufacture in the country, certain of the colonies have entered into a contract with a private company to manufacture it; but, from what I make out, the manufacture pretty well consists in importing all, or nearly all, the parts from England, and putting them together out here. We could almost do this ourselves, I think; without the intervention of middlemen.

(106.) I am plainly of opinion that if such a prime necessity to us as small-arm ammunition is to be manufactured in Australia, it should be a Government affair. In that case, the first consideration of the officials so employed would be to make ammunition; with a private company, the first consideration is to make money. It may, of course, be objected that private companies in England make excellent ammunition; but it should be borne in mind that the British Government have ammunition of their own manufacture to compare contract supplies with; and, further, that they have specialists in their employ to watch the contract manufacture in all stages, as well as to test the finished result. We have neither one nor the other.

(107.) As an old inspector of warlike stores, I wish to give a plain note of warning on this most important point. If our troops were out on service, and 10 per cent. of the ammunition failed, as occurred here recently in a new supply of ammunition, what might the consequences be?

## (2.) RATIONS.

(108.) The question of rations for the Permanent Forces early engaged my attention. As the prices seemed high, I went into the matter, and was somewhat surprised to find that the Government was paying as high for meat bought by the ton as private individuals paid by the pound. I found, also, that instead of the ordinary common-sense system of contracting with a butcher to supply meat, a baker to supply bread, and a grocer to supply groceries, the contracts were so drawn up that a butcher would have to supply bread, groceries, vegetables, &c., and so on all round. I can conceive no advantage in this system, except to the "Universal Provider," or the lazy Government official. The former, of course, would have the advantage of having all competition choked off; and the latter, the advantage to him of having less work to do in dealing with one contractor instead of several; but I think it must now be satisfactory to the Government to know that the cost has been reduced nearly 30 per cent., and that there is every probability of a permanent saving of £3,000 per annum on this item.

## (N.) DEFENCES, THURSDAY ISLAND AND ALBANY.

(109.) From correspondence that has passed, the Government are aware that matters are not as they should be at these important Federal outposts. What is everybody's business is commonly nobody's. I venture to think, however, that New South Wales, as the principal partner, has a certain responsibility thrown on it, and that steps should be taken to insure that these outposts are, as regards material and *personnel*, in a state to carry out the services for which they were intended, and for which this Colony pays the largest share.

## (O.) UNIFORM.

(110.) The supply of uniform has apparently got into the hands of a few firms, who, I imagine from the prices charged and the class of goods supplied, will soon be able to retire with, at least, a competence.

(111.) At my inspections I have seen five men standing alongside one another supposed to be uniformly clad, but whose frocks were of five different shades of cloth.

(112.) The cut of the uniform is rarely satisfactory, and as the colour is not of a taking sort, it is not to be wondered at that the Infantry of all ranks were in favour of reverting to scarlet for full dress.

(113.)

(113.) A year ago I pointed out officially the advantage and saving to be effected by the Government manufacturing the uniform wanted. It took six months to get an answer to this, and as another six months have elapsed since my reply, I conclude that a change of system is not likely at that rate to occur in my time, so I propose devoting my attention to other matters.

#### (P.) EXPENDITURE.

(114.) For one who is interested in the efficiency of our Defensive Forces, I imagine twenty are interested in their cost. As previously stated, there is little doubt on my mind that the Force was extravagantly administered at one time, and that the reductions subsequently made were not in the direction of efficiency. A sum of £200,000 per annum was stated by Major-General Hutton as a minimum annual cost; this was a reduction of some £50,000 on previous years.

(115.) There is a popular fallacy abroad that Volunteers cost next to nothing; but, excepting the actual pay of individuals, all other expenses are as great, or greater, than in the Partially-paid Force. The *direct cost* of the Volunteer Force will be seen on reference to the Estimates (total, £24,974), and as almost the whole of this Force (2,913 officers and men) has been raised since my arrival, it must be obvious that a considerable increase is necessary on that account alone; but provision has also been made for an additional 500 men to the Partially-paid Force, an addition of 90 men to the Permanent Force, training for the whole Force for nine days in Camp and for three and a half days extra throughout the year, and for the gradual formation of a Reserve of *trained* men, &c., &c.; so that an increase on the above minimum is inevitable for the present.

(116.) I, however, see so clearly how and where expenses may be cut down when the necessary changes are made in the Act and Regulations, that I have no hesitation in guaranteeing that when fully carried out the annual cost will not exceed £200,000.

(117.) For this expenditure, I hope to see eventually :—

	Officers.	Others.
A Permanent Force of say ... ..	30	550
A Militia (Partially-paid), including Permanent Staff, of ... ..	275	5,000
A Volunteer Force of ... ..	115	3,000
A Trained Reserve of ... ..	50	1,500

Sixteen days drill for Infantry, 9 of which in Camp.

Twenty days drill for Artillery, Engineers, and Mounted Corps, 9 of which in Camp.

Musketry prizes for all Corps.

Artillery prizes for Field and Garrison Artillery.

#### (Q.) CIVILIAN CLUBS.

(118.) The attempt to work in members of these Clubs as Reservists for the Partially-paid Force has not proved much of a success. While in some Clubs members will turn out for occasional drills, in others they will not, even when Instructors are sent long distances, at much expense, to train them.

(119.) The Colonial Defence Committee has drawn attention to the serious objection to flooding the ranks of the Partially-paid Force with 40 per cent. of recruits at the outbreak of war—a fatal objection to my mind—and I am strongly of opinion that a Reserve, to be any use, must be a Reserve of men already trained. Most Commanding Officers hold this view also, and we should have little difficulty in forming one from those who have completed their time in the ranks, and for a small retaining fee annually would keep their names on the books. An occasional training or Course of Musketry would keep these men up to date, and in this way we could gradually create a Reserve that would be worth having.

(120.) Rifle Clubs should be given a free hand in carrying out their own work—the practice and encouragement of rifle-shooting throughout the Colony. Many of the best shots will gravitate towards the Defence Forces eventually, especially if the latter can offer them good prizes for skill in marksmanship. I am satisfied that there is little use in trying to dragoon the members into drilling whether they like it or not; and as we give them very little, we should not expect very much in return.

## (R.) A MILITARY COLLEGE.

(121.) War is supposed to be a science in modern days; and for elementary instruction in the science, such Institutions as the Royal Military College and Royal Military Academy exist. To enter these a good preliminary education is necessary. There is a course of instruction extending over a couple of years, and afterwards the graduates have a life-long training in practical work. I find a notion prevailing that in these democratic Colonies there is a specially-made Royal road to the attainment of Military knowledge. Thus an officer, who without any training in early life, or even the requisite education to avail himself fully of the instruction imparted, if he goes for a few months to England or India, comes back with the idea that for the rest of his natural life he has established a claim on his country for employment in the highest Military situations. Unfortunately, this style of claim is too frequently admitted, with the most baneful results on the Force at large. In Civil life no one would pretend to assert that a young man of scanty education, who passed six months or a year at a London Hospital, was fit on his return here to instruct in the Science of Medicine, or that, similarly, another was fit to instruct in Law; but those responsible for the proper carrying out of the duties pertaining to Law and Medicine take very good care that none shall instruct in either branch without having been thoroughly instructed themselves, and they have provided in the country the necessary schools and colleges for the purpose.

(122.) It seems obvious to me that for the Military Service a similar course must be pursued if we are to attain a reasonable degree of efficiency; and if a Military College is an impossibility for the Australian Colonies until Federation is an accomplished fact, we must, in the interim, occasionally obtain the services of an Imperial Officer for each branch of our Forces, to prevent the whole sinking to a state of helpless mediocrity.

(123.) I wish to write very plainly on this subject. It has been practically before me for the last quarter of a century in Canada, Queensland, and here. Canada solved the question by establishing a Military College over twenty years ago, and while rarely now requiring the services of an Imperial Officer, supplies officers in large numbers to the Imperial Service, and amongst them men who have distinguished themselves all over the Empire. When she does want an Imperial Officer, she obtains fresh out of the Imperial Service one of her own graduates, and after a reasonable period of employment returns him thereto, and obtains another up to date. Compare this with our pitiful system of employing a half-trained officer for local or political reasons, and supporting him for the rest of his life, unless his unfitness becomes too obvious; and in this case his friends will probably consider he should have a pension for "services rendered to the State."

(124.) Even where we have been fortunate enough to pick up good officers locally, the system works out in a most extravagant fashion at times. Thus we have twenty-five Submarine Miners commanded by a Major, though a small command for a Lieutenant. This Officer must ere long become a Lieutenant-Colonel, with all the pay and allowances thereof.

(125.) We have a four-gun Battery under a *Regimental* Lieutenant-Colonel, though only two-thirds of a Major's command; Adjutants with the pay and allowances of Majors, doing exactly similar work with others who are Lieutenants, &c.

(126.) I see no way out of this difficulty, except by the rigid enforcement of the rule limiting employment to a specified term, and to carry this out a small sum would be required annually as half-pay for Officers temporarily unemployed.

I have the honor to be,

Sir,

Your obedient Servant,

G. A. FRENCH, Major-General,

Commanding N.S.W. Military Forces.

Head-Quarters, Sydney, 24th September, 1897.

## APPENDIX A.

RETURN showing the Establishment and Actual Strength of the Partially-paid and Volunteer Forces at the end of each year from 1888 to 30th June, 1897.

Year.	Establishment— all ranks.	Actual strength— all ranks.	Wanting to complete— all ranks.	Percentage short— all ranks.	General remarks.
1888	3,114	2,657	457	14.67	Camp held at Paddington Rifle Range.
1889	4,337	3,973	364	8.39	" " National Park.
1890	4,229	4,062	237	5.81	" " "
1891	4,660	4,397	263	5.64	" " Campbelltown.
1892	4,667	4,268	399	8.54	No camp held.
1893	4,418	4,070	348	7.87	" " "
1894	4,418	4,169	249	5.63	Short camps held locally.
1895	4,637	4,372	265	5.71	" "
1896	6,228	5,447	781*	12.54	" "
1897 to 30 June.	6,873	6,232	641*	9.33	" "

\* The formation of new Regiments, whose establishment is not yet complete, accounts for shortage in 1896 and 1897.

G. A. FRENCH, Major-General,  
Commanding N.S.W. Military Forces.

Head-quarters, Sydney 24th September, 1897.

## APPENDIX C.

REPORT of the Officer Commanding the New South Wales Artillery Forces.

Sir,

Artillery Staff Office, Victoria Barracks, 5 August, 1897.

I have the honor to forward a report on my Command:—

(1.) The various subjects are dealt with in a general manner; a more detailed report will be submitted later, if required.

## BRIGADE DIVISION, FIELD ARTILLERY.

(2.) The armament of "A" Battery is about to undergo a much needed change, the 15-pounder B.L. equipment having at length arrived in the Colony. This change will greatly enhance the efficiency of this Battery. Its present armament of 9-pounder R.M.L. I propose to pass on to "D" or the Cadet Battery, relegating the old bronze guns, with which the latter are armed, to obscurity.

(3.) I consider it advisable to gradually increase the strength of the Permanent Battery, both in men and horses, so as to ensure, in time of trouble, that at least a good solid ground-work of a capable Battery may be available to do justice to the excellent equipment that is now being placed in their charge. Of the general increase that it is proposed to apply for, for the Permanent Artillery, I would suggest allotting 8 men to this Battery, namely, 4 Gunners and 4 Drivers; also that the number of horses be now raised to 60. The advantage gained in time of peace will quite balance the small extra expense. The addition of the men will ensure a better care of the harness and equipment than has previously been the case. It will enable all 6 guns to be exercised in Battery, instead of only 4 as heretofore—a change which is essential, 6 guns being the fighting establishment of the Battery.

The increase of horses—a subject which is further dealt with below—will afford a fair nucleus of trained horses of the Battery when raised to war strength, and enable in time of peace the combination of two Batteries for ordinary parade work without having recourse to the very expensive "hire" system for short parades of this description. I may here mention that it is now universally accepted that the unit of Field Artillery is the Brigade Division, and that our local Officers have at present little or no experience of the drill or working of such unit.

(4.) A Practice Camp was formed near Narrabeen, which lasted ten days, and a great deal of instruction and experience was gained by "A" Battery. Unfortunately, although a range for shooting was available, still it was not a range suitable for thorough instruction in shooting and observation of fire.

The openness of the ground (sea beach) on which the targets had to be placed was liable to give officers and men a false idea of the difficulties which would be met with on service in observing the effect of their fire. A still more serious drawback was, that the ground precluded movement on the part of the guns; and, to my mind, it is most essential that tactical movements should be combined with firing.

(5.) With regard to the Partially-Paid Batteries, "B" and "C," the *personnel* is all that could be desired, and men and officers are keen to learn; but under present conditions, with the paucity of parades allowed them, it is quite impossible that they should really become efficient, and I should be only conveying a false impression if I did not emphasise the fact that at present they are not efficient (through no fault of their own). Each Battery joined the abovementioned Camp for one day, and fired some competitive practice, the result of which, though indifferent, was instructive. More parades during the year, concluding with a good Camp, in a suitable country, are essential before these Batteries can be fairly reckoned on as being part of the real defensive strength of the Colony.

(6.) The horsing of these Batteries is also unsatisfactory. Probably in time of national emergency better horses may be available than are now procurable on the "hire" system. Horses of the stamp of the omnibus horses are required, not the dray species. These latter are terribly slow, generally unfit to manœuvre at the trot, usually too big for the harness allotted, difficult to control, and would be useless on service, besides being very expensive.

(7.) I think it very desirable to consider some plan of largely increasing the existing establishment of Artillery horses, and after a preliminary training keeping them out at grass till required, thus reducing the expense of "keep." At the present contract rate, each hired horse for a nine days' camp would cost about £7, making for the two batteries, at the lowest computation, about £500 a year for the supply of indifferent horses, and on the conclusion Government have nothing in the matter of horse-flesh to show for it, though the value of the horses to the owners is in many cases greatly enhanced.

(8.) The Cadet or "D" Battery is a purely Volunteer Battery, and is at present not a very satisfactory organization. I would suggest that it be termed the "Volunteer Depot Field Battery," and that no drivers be borne on the establishment. The time at the disposal of the men forming this Battery could be fully utilised at the ordinary gun drill and fire discipline, and vacancies in the Partially-Paid Batteries would be filled from it. Sending this Battery out mounted occasionally is doubtless a pleasant recreation, but it is not of any national importance; besides, none of the Officers now belonging to the Battery can by any stretch of imagination be termed horsemen.

## 1ST GARRISON DIVISION.

(9.) The 1st Garrison Division has now been organised into three distinct Companies, and the Officers and men have been redistributed accordingly.

(10.) The present strength of this Division, which forms the Permanent Garrison Artillery, is only 348, which is quite inadequate, including as it does, bandsmen, trumpeters, artificers, &c., &c.

(11.) The present advanced state of the science of Artillery, the complicated nature of guns and mountings in use, and the large number of scientific adjuncts required in connection with the fire control of a modern coast defence fortress, necessitate a number of highly-trained men. The necessary amount of training for the more important positions cannot possibly be acquired by the Partially-Paid Troops under existing system, although there are a number of duties which can be fulfilled by men with moderate military training. The duties of gun captain, gun-layer, telephonist, range finder, dial numberers, &c.,

all

all requiring special knowledge and special training, cannot be properly fulfilled by other than men who are being perpetually trained at them. In this connection, I desire to recommend strongly that 90 extra men be added to the Permanent Artillery, also that in future the term of service of the Permanent Artillery be increased from five to seven years for the first period of limited engagement; further, that only Non-commissioned Officers, Artificers, or other specialists be re-engaged after that period.

(12.) *Conduct.*—The general conduct of the men is good. The principal serious crime is desertion, and to this, in a stationary and local Force such as this is, we shall always be liable. I consider that some of this desertion might be avoided if some scale were introduced by which a man could purchase his discharge for a reasonable sum; the present fixed sum of £20 is only a premium on this crime.

With five years' engagement, I would suggest a reduction of £4 each year; or, if engaged for seven years, a reduction of £2 the first year, and £3 a year after.

(13.) The privilege of allowing men to wear plain clothes, though popular, has not worked satisfactorily throughout. The men get into debt with tailors, bootmakers, &c., to turn out in smart mufti, although they will not spend anything to keep their uniform in a similar smart condition.

(14.) *Courses.*—Each Company has been through a Special Company Course for a fortnight under the Company Officers, concluding with competitive practice.

In this practice, No. 2 Company shot very satisfactorily, getting eight hits out of sixteen shots, and gaining a second prize.

(15.) The Long Course this year has been extended so as to last about five and a half months instead of four as in previous years. The other Colonies have been invited to send men to this Course, and Queensland, Victoria, and Western Australia have accepted such invitation.

(16.) I consider some steps should be taken to establish a Military School to improve the educational standard, and fit men, otherwise efficient, for the higher ranks of Non-commissioned Officer and Warrant Officer.

#### 2ND GARRISON DIVISION.

(17.) The present number of parades allowed to this Partially-Paid Branch is quite insufficient to render the men efficient as Coast Artillerymen.

If the Government cannot see its way to largely increase the number of parades, I would point out that a smaller number, more highly trained, would be of far greater value than the present number, insufficiently trained.

(18.) The four Companies comprising this Division carried out competitive practice from the four 80-pounders, forming the Practice Battery. Two Companies obtained a third-class prize, getting four hits out of sixteen rounds.

#### GENERAL.

(19.) The office of the Officer Commanding Artillery has been re-organized from the 1st August, the principal point being the abolition of the Brigade-Major; it remains to be seen how the new organization will work.

(20.) I would like to bring to notice the recommendations in the Report of Major-General Hutton in 1896, *re* the Naval Artillery Volunteers.

(21.) Another important point is the "retirement scheme" in the same Report, at page 10. The authorities should not be allowed to lose sight of this important point.

#### FORTS, ARMAMENT, &c.

(22.) The principal points now under consideration are—

- i. Some improvement in the loading and firing arrangements of the 10-inch 25-ton guns at Middle Head, which at present are most unsatisfactory.
- ii. The 10-inch R.M.L. guns at South Head to be placed close together near the position of the lower one.
- iii. The construction of a battery for the three 6-inch Q.-F. guns, which are due from England, near the site of the upper 10-inch R.M.L. at South Head.
- iv. The completion of the authorised portion of cartridges and projectiles for the various guns of the defences. (This appears in a requisition for warlike stores.)
- v. The construction of a battery to take three 6-pounder Q.-F. on the site of the present 80-pounder Minefield Battery at South Head.
- vi. The supply of suitable mountings for the 6-inch Q.F. guns due from England.

(23.) All the guns now mounted, with their ammunition and stores, are in good condition and fit for service.

(24.) The mobilization stores are in good condition, and complete.

I have, &c.,

S. C. SMITH, Colonel,  
Commanding Artillery.

G. A. French, Major-General,  
Commanding N. S. Wales Military Forces.

Head Quarters, Sydney, 24th September, 1897.

Attendance on Officers, their wives and families. Warrant Officers, Non-commissioned Officers, trumpeters, and men, their wives and children.

There were 54 attendances on officers, 11 on their wives, and 45 on their children. There were 196 attendances on "daily sick" at the Garrison Hospital, in addition to cases admitted for treatment. This number was made up from Warrant Officers, Non-commissioned Officers, trumpeters, and men.

Fifty-three attendances on their wives and 72 on their children, either at the Garrison Hospital or at their own residences or quarters within the Head-quarters District.

In addition, as in previous years, cases requiring special or surgical treatment were admitted under my care into the St. Vincent's Hospital.

#### 2. Recruits.

Permanent Services.

Ninety recruits presented themselves, of whom 70 were passed as "fit," and 20 rejected as "medically unfit" for military service. Of those accepted, 25 were re-engagements, and 3 had seen service other than the New South Wales Military Forces.

For their distribution and physical averages, see Appendix No. 1.

Partially-paid Services.

The number of recruits who presented themselves, together with all particulars, is given in Appendix No. 2.

#### PLANS.

- Plan I.—Port Kembla—showing the proposed Deep-water Harbour.  
 Plan II.—Port Kembla—approximate area of land proposed to be resumed.  
 Plan III.—Part of South Coast of New South Wales—showing sites of proposed Harbours.  
 Plan IV.—Illawarra Harbour and Land Corporation (Limited)—proposed Works at Lake Illawarra.

## PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

### CONSTRUCTION OF A DEEP-WATER HARBOUR AT PORT KEMBLA.

## REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a deep-water harbour at Port Kembla," have, after due inquiry, resolved that it is expedient the proposed work be carried out by constructing the eastern breakwater only; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

#### DEPARTMENTAL DESCRIPTION OF THE PROPOSED HARBOUR.

1. As placed before the Committee by the Department of Public Works, the scheme for the construction of a deep-water harbour at Port Kembla embraces two proposals—one, the building of a breakwater 2,800 feet in length—referred to in the evidence as the eastern breakwater—in a northerly direction, from Kembla Point, east of the Mount Kembla Coal Company's jetty, which would provide what is termed a sheltered coast harbour, sufficiently protected to enable vessels of all sizes to be loaded with coal; and the other, the construction of two breakwaters—the second or northern structure 3,530 feet in length—which, together, would form a close or still-water harbour suitable for the landing of cargo from, as well as the shipment of coal into, sailing vessels as well as steamers. The one breakwater would afford protection to an area of 126 acres, having a depth of 24 feet and over at low water, and the two would enclose an area of 260 acres, with 24 feet at low water and 30 feet over half the area when dredged out. In either case vessels would lie safely, for though by constructing one breakwater only there occasionally would be a certain range or swell coming in from the sea, any difficulty in loading operations from that cause would be met by holding the vessels off to buoys. It is proposed to construct the breakwaters of blocks of rough stone tipped into the sea, the height above high water to be 15 feet in the case of the eastern structure and 8 feet in that of the northern, the width at the top 16 feet, increasing to 20 feet at the outer end, and the batter or slope  $1\frac{1}{2}$  to 1 on the sea face and  $1\frac{1}{4}$  to 1 on the harbour side. Sixteen hundred feet of the eastern breakwater would be upon a reef. The scheme contemplates the purchase of the existing jetties at Port Kembla, and the construction of an additional jetty and a wharf, the reclamation of land, and the erection of cranes, lighthouse, signal station, &c.

OFFICIAL

## OFFICIAL ESTIMATE OF COST.

2. It is estimated that the eastern breakwater could be constructed for £158,300, and the northern for £121,120. Other items in the full estimate submitted are—

Timber wharf, 1 mile long	...	...	...	...	£44,000
Ballast wall, at back	...	...	...	...	10,000
Sidings and coal lines	...	...	...	...	4,000
Dredging and reclaimed land	...	...	...	...	25,000
Coal-shipping jetty	...	...	...	...	35,000
Cranes, lighthouse, signal station and quarters, engineering and supervision...	...	...	...	...	42,580

These figures make the estimated total cost of the larger, or close harbour, scheme, exclusive of the purchase of land and private rights to existing jetties and lines, £440,000; but this estimate, as also that of constructing the eastern breakwater only, will be considerably less, if suitable stone be obtained from quarries adjacent to the site of the eastern breakwater, which, as far as an examination of the locality has gone, appears very probable. Should this stone be obtained it will mean a reduction of 9d. per ton, or a saving of £23,745 in the case of the eastern breakwater, and £22,710 in that of the northern.

## REASONS FOR CONSTRUCTING THE PROPOSED HARBOUR.

3. The construction of the proposed harbour has been advocated for the following reasons:—

- (I) That a good port, safe and accessible for large vessels in all weathers, is absolutely necessary for the development of the coal trade of the district, which has been retarded and hampered for want of such a port.
- (II) That the coal of the district is coming into increased favour, and all that is necessary to enable the collieries to greatly extend the export trade is a suitable shipping depot for the whole district.
- (III) That it would induce the establishment of manufactories in the district.
- (IV) That the harbour at Wollongong is altogether inadequate to the requirements of the district and incapable of enlargement, except by an unjustifiable outlay.
- (V) That a safe harbour would also serve as a place of refuge in bad weather.

## THE INQUIRY.

4. The inquiry which the Committee have carried out with reference to the proposed work is as complete as a careful consideration of all important aspects of the matter can make it, and includes a visit to the Illawarra district by a Sectional Committee. Owing to conflicting opinions a large number of witnesses presented themselves for examination, and plans other than those of the Department were submitted for consideration, thus extending the scope of the inquiry beyond the Departmental proposals. Plans and other information, supplied by the Department of Public Works, were before the Committee, with reference to harbour improvement proposals in relation to Bellambi and Wollongong.

## THE DOMINANT QUESTION IN THE INQUIRY.

5. The dominating question in the inquiry for the present is that of the export of coal, although it appears probable that the construction of a good port in Illawarra would bring into existence a considerable import trade in sulphide ores, &c.

It therefore becomes necessary to consider—

- (I) The extent, quality, and value of the coal-measures in the Illawarra district.
- (II) The present means of disposal.
- (III) The present and prospective output.
- (IV) Effect of a suitable shipping port adjacent to the coal-measures.
- (V) Effect of port on coal under Crown lands and upon railway returns on  
South Coast Line. Other

Other matters for consideration are—

- (vi) Import trade.
- (vii) Location of port.
- (viii) Rival sites.
- (ix) The harbour proposed to be constructed by the Illawarra Harbour and Land Corporation (Limited).
- (x) The present railway connection with Kembla.
- (xi) Zone to be defined.
- (xii) Port at Jervis Bay.
- (xiii) The outlay necessary in connection with the construction of a port at Kembla Bay, and the probable return.

## I.

### THE EXTENT OF THE COAL-MEASURES IN THE ILLAWARRA DISTRICT.

6. Wollongong may be regarded as holding a central position between the sites which have been suggested as suitable for the construction of a port. From Wollongong to Darling Harbour is about 50 miles by rail, and since the facilities for loading coal at the latter place are likely to be at least equal to those at any port on the southern coast, it appears probable that no great quantity of coal from Helensburgh or north of that place will be shipped from any port in Illawarra.

Nominally there are six seams in the Illawarra coal-measures, but only the upper, known locally as the Bulli seam, is at present regarded as of commercial value.

Although the Greta seam probably exists in the district, it is presumed to be at too great a depth to be worked in competition with the more easily-won coal.

Between Helensburgh and North Clifton the coal-measures are practically unexplored. Professor David and the Government Geologist state that no coal of commercial value for export purposes has been discovered south of Mount Kembla.

For the purposes of this inquiry therefore the coal-measures in Illawarra may be said to be bounded on the north by North Clifton, on the south by Mount Kembla, and are limited to the upper or Bulli seam, and within these boundaries and from this seam Professor David is of opinion that it is reasonable to expect 326,400,000 tons of coal will be won.

### QUALITY OF ILLAWARRA COAL.

7. Illawarra coal is, for the manufacture of gas and for household purposes, inferior to Newcastle coal, but it is a first-class steam-generating coal, and suitable for smelting purposes.

For steaming purposes it is contended that it approaches in excellence the best Welsh coal.

It is at present used by the—Orient S.N. Co.; P. & O. S.N. Co.; Messageries M. Co.; North German Lloyds; Japan Mail Line; British India S.N. Co.; Gulf Line of Steamers; E. & A. S.S. Co.; Port Lines of Steamers; Aberdeen Line of Steamers; China Navigation Co.; Shire Line of Steamers; H.M. Navy; Canadian-Australian S.S. Co.; A.U.S.N. Co.; Melbourne S.S. Co.; Huddart, Parker, & Co.; J. Patterson & Co.; Adelaide S.S. Co.; McIlwraith McEachern; Intercolonial S.S. Co.

### VALUE OF THE COAL.

8. The local value at the port of shipment of all the available Illawarra marketable coal would, at present prices, be about £100,000,000. A large proportion of this coal, it has been shown in evidence, lies in unalienated lands, and therefore would be subject to the payment of a royalty to the State.

## II.

## PRESENT MEANS OF DISPOSAL.

9. The present means for disposing of the coal is by local consumption, by railway transit direct to Sydney, and by shipping from jetties at Coalcliff, Bulli, Bellambi, Wollongong, and Kembla.

The quantity of coal which during the twelve months ending 30th September, 1896, left Illawarra by railway was 36,000 tons, and the cost when carried in Commissioners' trucks was approximately 2s. 9d. per ton, and 2s. if carried in owners' trucks. The freight and extent of the trade from the different shipping places will be dealt with subsequently.

## III.

## PRESENT AND PROSPECTIVE OUTPUT OF THE COAL MINES IN THE ILLAWARRA DISTRICT.

10. The total output of the coal mines in the Illawarra district within the previously specified area, in the year 1874, was 137,062 tons.

Since then, although at times there has been a temporary decline, the annual output has increased, and the average for the years 1891 to 1895 was 700,000 tons.

Therefore it is reasonable to estimate the output for the immediate future, with present shipping facilities, at 750,000 tons per annum, having a local value approximating a quarter of a million sterling.

The construction of a deep-water harbour with additional shipping facilities should greatly increase these figures.

It is conjectured that a large quantity of coal, at present regarded as lying too far westward from the existing pits' mouths, will, when the more accessible coal has been worked out, also find its way to the seaboard; but the limit of 5 miles laid down by Professor David appears to be sufficiently distant for the present. With reference to those areas within which the coal is regarded as inferior, or commercially valueless, later discoveries in these localities may augment the estimated extent and value of the field.

The exhaustion of the better coal may eventually force inferior coal into use; but the Committee believe it is wise to limit any definite statement to the marketable coal of the Bulli seam.

## IV.

## EFFECT OF A SUITABLE SHIPPING-PORT ADJACENT TO THE COAL-MEASURES.

11. The cost of carriage of coal from Illawarra to Sydney is about 2s. 9d. per ton by rail and not less than 2s. 6d. per ton by sea.

Therefore, a portion of the 2s. 6d. per ton, less nominal charges for short haulage and port dues, might be added to the price at which it could be sold were it possible to load direct at a local port, and the loss from deterioration, consequent upon extra handling, would be saved to colliery proprietors and purchasers.

It must, however, be borne in mind that a large portion of the coal raised in Illawarra will not be diverted from Port Jackson by the construction of the proposed port, because coal required for use in the metropolis for bunker purposes, or for transshipment in Sydney harbour, would still be carried by small colliers loading in the port of Wollongong, or from jetties connected with the mines; but even to these boats a secure port would be of great advantage, for during boisterous weather they could proceed to the proposed local port and load there, thus saving time and removing the uncertainty which is so inimical to trade.

It is scarcely probable that the great mail-boats, time being of supreme importance, would alter their present process of loading bunker coal in Sydney, and many of the intercolonial steamers would continue their present practice in  
order

order to avoid the delay of proceeding to and returning from the local port. To some of the intercolonial steamers that now load in Sydney it would be convenient as well as economical to make the four hours run were there a secure port in Illawarra in which they could coal, and whence they could return to their berths in Port Jackson; or they might enter the port for coal during their trip, if assured of quick despatch.

The whole question is one of cost, and if the saving of at least 2s. 6d. per ton more than compensated for time lost by coaling direct at a local port this method would be adopted; but the increase of trade from this source cannot be even approximately estimated.

At present, sailing vessels of sufficient tonnage to engage in profitable foreign trade will not venture into any port in Illawarra, and insurance companies do not accept the risk.

Direct over-sea export, therefore, is possible by steamers only, and is subject to uncertainty. Relieved of the 2s. 6d. per ton freight to Sydney, and saved from the cost and deterioration consequent upon extra handling, Illawarra coal could freely compete for the foreign trade, as the selling price would be the quotation at the local port instead of at Sydney.

Competent witnesses were unanimously of opinion that if it were possible to save the freight to Sydney, Illawarra coal would obtain a much increased sale in the markets of Singapore and the East, and secure an extensive trade on the American coast.

## V.

### EFFECT OF PORT ON COAL UNDER CROWN LANDS AND RAILWAY.

12. Immediately west from the present workings, which are in private property, there is a great area of Crown lands containing coal.

Taking into consideration the probable thickness of the seam, there would be won per acre not less than 5,000 tons upon which the Crown would receive royalty.

It is not possible to estimate accurately the extent of land towards the west which can reasonably be thought to include areas that will eventually pay royalty, but it is considerable, and the royalty must represent a very large sum.

The Committee were informed that there are nearly 10,000 acres of accessible Crown lands between Bellambi and Kembla alone, the royalty upon which, calculated at 6d. per ton, will eventually produce a large annual revenue.

## VI.

### IMPORT TRADE.

13. The presence of a large quantity of easily-won coal in Illawarra has already been availed of for the establishment of smelting-works. If a safe port were constructed there can be but little doubt that sulphide ore in large quantities would be imported, and an impetus given to the development of the full resources of the district.

The site chosen for the first smelting-works is adjacent to the shore of Lake Illawarra; the distance from Sydney being 58 miles. The greater part of the cost of the carriage from Sydney would be saved if the ore could be landed at any port in the Illawarra district.

## VII.

### LOCATION OF PORT.

14. From the foregoing it will be seen that the extent and value of the coal-measures in Illawarra justify the Committee in recommending an expenditure to provide adequate means of shipment. The next question requiring consideration is the location of the port.

## POSITION OF PORT FROM THE STANDPOINT OF THE TRADE OF 1895.

15. Taking the sum of the total output (680,000 tons) for 1895 (there not being full information for 1896) as being represented by 680, the proportionate quantity won from each mine can be thus compared:—

Austimmer represented in 1895	...	...	17
Bulli	..	...	5
Bulli Steam Coal	..	...	4
Bellambi	..	...	10
Coal Cliff	..	...	18
Corrimal	..	...	111
Mount Pleasant	..	...	69
Mount Kembla	..	...	151
Osborne-Wallsend	..	...	78
South Bulli	..	...	167
South Clifton	..	...	50
Total	...	...	680

The output for the year 1895, west and north from Bellambi in comparison with that to the south of that place was as 271 to 409.

The output west and south from Wollongong is 298 against 382 to the north.

The output west from Port Kembla is 151 against 529 to the north.

In view of the statements made with regard to the proximity of the coal to the various ports, the Committee have deemed it advisable to present the position in detail, but the amount of coal already won has little bearing on the question of port construction unless it can be demonstrated that the proportion is likely to be sustained in the anticipated increased output.

Professor David and the Government Geologist informed the Committee that the best deposit of coal in Illawarra lies south from Corrimal. North from that place, although there are considerable areas of good coal, the measures are deteriorated through faults and volcanic dykes.

The port of Bellambi lies practically east from the northern end of the best coal; Kembla about east from its southern limit. The case for Bellambi is that coal (although the measures are not so uniform) will be won north from Bellambi; but this fact is neutralised by the larger deposit of coal between Keira and Mount Kembla, which will find readier outlet towards Port Kembla.

Coal in quantity can be hauled at  $\frac{1}{2}$ d. per ton per mile. The question of haulage for an extra mile or so is not, therefore, very material.

The Committee are of opinion that with regard to accessibility for the future coal-output of Illawarra the port of Wollongong occupies the first position.

Between Bellambi and Kembla there is not sufficient difference in location to be commercially appreciable, but, all other things being equal, Bellambi may be regarded as more central; upon this point, however, the evidence is contradictory.

If coal be won south from Kembla, as is confidently anticipated by some witnesses, it will improve the position of Port Kembla; but no evidence as to the existence of any deposit of commercial value for export was furnished which could justify the Committee in disregarding the evidence of Professor David and the Government Geologist.

Talavera Point, on Lake Illawarra, occupies a less favourable position than any of the other sites, being about 6 miles south from the junction with the railway of the tram lines going direct to Port Kembla, which junction is a distance of about  $\frac{1}{2}$  miles to Port Kembla.

PRESENT

## PRESENT RELATIVE IMPORTANCE OF SHIPPING-PLACES.

16. The quantity of coal shipped at the various ports in Illawarra during 1895 was :—

Bulli	...	...	...	...	...	5,000
Bellambi	...	...	...	...	...	178,317
Kembla	...	...	...	...	...	233,438
Wollongong	...	...	...	...	...	178,317
Total						595,072

Coalcliff has not been included, not being at present connected with the Government railway line.

It will be observed that fully twice as much coal is shipped south of Bellambi as from Bellambi and the jetties to the north, more than one-third of the total output of the district being now shipped at Port Kembla.

## VIII.

## CONSIDERATION OF RIVAL SITES.

17. It has already been stated that the ports of Bellambi and Wollongong are quite as well situated as, if not somewhat better than, Port Kembla with reference to the coal-measures of Illawarra.

Therefore, it becomes necessary to consider whether the extra haulage to Kembla will be justified by reason of its superiority as a shipping port.

## THE PORT OF BELLAMBI.

18. It may be conceded that if Port Kembla were not in existence a fairly satisfactory port could be constructed at Bellambi; but it is necessary to consider the case comparatively. The cost of an eastern breakwater at Bellambi, according to the departmental estimate, would be £208,000, and the cost of the necessary wharfs £75,000, giving a total of £283,300. The length of the eastern breakwater would be 2,800 feet. The area of—

36 feet deep and over, at low water, would be	28 acres.
30	45
24	58
18	80
12	104

The total area bounded by the breakwater, the margin of the shore, and an east and west line drawn from the outer end of the breakwater would be 150 acres. To increase this area so as to make it equal to that of Kembla would involve a very heavy cost. The harbour is partially protected from the south by the Bellambi Reef, which has the effect of breaking the force of the seas coming from a southerly direction; but the anchorage is inferior to that at Kembla. There would be no serious danger of the silting of the harbour.

Material for the construction of the breakwater, although not obtainable in the immediate vicinity, would, in all probability, be found within a few miles. Plans prepared by a gentleman of considerable local experience were placed before the Committee. Under this proposal the site is placed some distance south from the headland selected as the root for the Departmental breakwater, and a considerable portion would be ineffective, as the end of the breakwater would be at a point almost due east from the northern jetty. Easterly seas or any seas north from east would sweep unimpeded into the northern portion of the bay, as well as into the suggested dock which it was proposed to construct in Bellambi Creek some distance north from the northern jetty, and the area protected would be somewhat less than that protected by  $\frac{1}{4}$ ths of the length of the proposed Departmental breakwater. The proposal to connect the outlying reef with the main land might be viewed

viewed favourably if the Committee were of opinion that Bellambi furnished opportunities equal to Kembla for harbour construction. There would be resumption of land at Bellambi as at Kembla, with the exception of 100 feet of reservation which the Committee were informed exists on the foreshore of Bellambi Harbour.

#### THE PORT OF WOLLONGONG.

19. The port of Wollongong is more centrally situated than Port Kembla to the coal-measures of Illawarra, and in connection with it there is already in existence a shipping basin of a depth of about 14 feet. Coal-loading appliances have been erected, and one line of Government railway connects the main coast line with the port. Material suitable for a breakwater is not likely to be obtained within a reasonable distance; and to construct a sufficiently deep harbour would necessitate very expensive operations. Already there has been a great outlay, and the same expenditure at Wollongong as proposed at Kembla would give but one-half the harbour accommodation with far less satisfactory results.

The Wollongong Harbour Trust created by Act of Parliament on 1st October, 1889, after expending a considerable sum of money and incurring liabilities under a contract since cancelled, has been dissolved. Local feeling and interests have merged in a general agreement that all further expenditure should be incurred in giving effect to the Departmental proposal in connection with Port Kembla.

#### THE PORT OF KEMBLA.

20. The Bay of Kembla is protected and sheltered on the south, and partially towards the east and north-east, by the Five Islands. The protection from the south is very considerable. The southerly seas being broken by the islands do not seriously affect the southern portion of the bay in which the two existing jetties are situated.

The proposed eastern breakwater would be practically an extension northward of the headland which now protects the bay, and the result will be a capacious and secure harbour in all weathers. Without the northern breakwater it is possible that, at times, unloading may require to be temporarily suspended, but the loading of coal could be carried on without intermission. Not only is the bay better protected and sheltered in the quarter from which the worst weather is to be expected than any of the rival sites, but the bottom of the bay affords excellent holding ground.

The area of the proposed harbour having a depth of

36 feet and over,	at low water,	will be	66 acres.
30	"	"	97 "
24	"	"	126 "
20	"	"	156 "
12	"	"	178 "

At low-water mark there will be an area of 223 acres.

Kembla has a great advantage over harbours at the mouths of rivers, as there are no flood deposits to contend with. From the set of the currents as described by the Department it appears highly improbable that there will be any serious deposit of sand.

An abundant supply of stone can be obtained from the hill to the south, about half a mile from the foot of the proposed breakwater. The proximity of this stone enables a reduction of £23,745 to be made in the original estimate for the eastern breakwater.

Port Kembla as a harbour site is greatly superior to either Wollongong or Bellambi. In view of the experience afforded by Wollongong Harbour—which port no doubt provided ample accommodation for the trade at the time of its construction, but is valueless except for small coasting vessels—the fact is emphasised that a port, to be of permanent value, should be constructed not only to meet present trade requirements, but with a full recognition of the possibilities of future alterations in marine architecture.

The

The Committee are of opinion that all needed requirements can be satisfied at Kembla Bay, and although the opinion has been expressed by the Department of Works that the construction of the northern breakwater will be necessary to afford absolutely still water, there is sufficient evidence to show that such a work need not be contemplated at present.

Port Kembla is well protected by the islands and headland, and with the shelter which will be afforded by the proposed eastern breakwater, will doubtless be sufficient for many years to come. The proposed breakwater will furnish ample protection for loading operations, and it will be possible to discharge cargoes in the bay.

## IX.

### THE HARBOUR PROPOSED TO BE CONSTRUCTED BY THE ILLAWARRA HARBOUR AND LAND CORPORATION (LIMITED).

21. The managing director of the Illawarra Harbour and Land Corporation stated that Parliament had by their Act already practically dealt with the question submitted to this Committee, as the port proposed to be constructed under such Act was intended to provide for the coal trade of Illawarra; and it was regarded by the company as a breach of faith on the part of the Government to construct another harbour in competition with that projected by them. This contention ignores the comprehensive works designed by the Wollongong Harbour Trust, and is quite untenable, although the Engineer-in-Chief thought that had a good harbour been constructed at Lake Illawarra, Port Kembla might not have been required. It then became necessary to inquire as to the transactions of the company and the progress which has been made towards the fulfilment of their undertaking.

#### HISTORY OF THE ILLAWARRA HARBOUR AND LAND CORPORATION.

22. It appears that this corporation was formed about the year 1888. In 1890 an Act was passed by Parliament empowering the company to construct a harbour at Lake Illawarra, and conferring other rights. In 1895 an extension of time was granted under an Act which specified that the proposed works must be completed by the 20th December, 1897, but that if £10,000 were deposited in the Treasury by that date, an extension of one year would be granted in which to complete the work.

A brief statement of the transactions of the Illawarra Harbour and Land Company will not be out of place.

The corporation owns the Lake Lands Estate and a large coal-mining property on Dapto Creek.

These properties (representing £90,000), with the concession under the Act, in the first instance, formed the total assets of the company.

They have expended £39,000 on a railway from Talawera Point to their coal property, and about £3,000 on works and surveys in connection with the harbour, of which amount £1,200 was spent in the partial erection of a tie-bank near Windang Island.

The railway, which has been constructed for a distance of  $7\frac{1}{2}$  miles to their coal property, would be a useful work if the coal obtained there were of commercial value. The Committee, however, are definitely assured by Professor David and the Government Geologist that the coal is not suitable for export, and it is conjectured that it would be more profitable to a company engaged in smelting to use the well-tested Bulli seam than to endeavour to smelt with the inferior coal of Dapto Creek. This is an important factor in connection with the enterprise for opening the lake entrance and dredging a deep channel to Talawera Point.

If the evidence given by the Engineer-in-Chief for Public Works be correct, that "it will take five to seven years to construct a harbour at Lake Illawarra," the construction of a railway to Talawera Point might well have been delayed till the completion of the harbour scheme. Loss of interest on the capital invested in its construction, and also the great deterioration consequent upon exposure to the weather for

for a number of years, would have been avoided, had the construction of the harbour preceded, as it should have done, the building of the railway, but this latter work became indispensable in order to save the company's Act of Parliament from lapsing.

The smelting works now being erected near Lake Illawarra are substantial, and the foundation of a hopeful enterprise appears to have been laid. The managing director of the company claims that the corporation is entitled to special consideration, as it is owing to the instrumentality of his company that these works have been erected.

The expenditure, however, of but £1,200 on harbour works during a period of six years out of the proposed cost, £177,060, and the carrying out of the project being dependent upon the flotation of bonds in London, do not inspire confidence in the assurance by the company's engineer and contractor that the work can be carried out within the time specified in the company's Act of Parliament, viz., by December, 1898; the Engineer-in-Chief for Public Works informed the Committee that from five to seven years would be necessary, and that the cost would be not less than £280,000.

Apart from the untenable assumption by the corporation of an obligation by the Government not to construct a rival port, the Committee regard the success of the corporation's enterprise as doubtful. This, in conjunction with the fact of the great delay in carrying out the corporation's harbour works, which apparently stagnated until the Government made the present proposal, prevents the Committee from recommending any delay in dealing with the proposal referred to them by Parliament, and they feel constrained in considering the question of a good port for Illawarra to disregard the corporation's contention, and to base their recommendations solely upon the respective merits of the sites inspected.

## X.

### THE PRESENT RAILWAY CONNECTION WITH KEMBLA.

23. The distance from the main South Coast railway line to Kembla is about 4 miles. The Southern Coal Company has constructed a line with a 4-ft. 8½-in. gauge from their jetty to the Government railway, and there is also in existence a line on the same gauge from the Kembla jetty to the South Coast line. The construction of the proposed line of railway *via* the Mount Keira line and along the coast, following the eastern side of Tom Thumb Lagoon, would effect a saving of about 2 miles; but it becomes a question for consideration whether such a saving in haulage would justify the carrying out of this line at present.

The coal to be shipped at Port Kembla from all the mines at present being worked in the Illawarra district, with the exception of Mount Kembla, would probably be carried by this railway. The cost of the line is estimated to be under £20,000. The time for commencing its construction may be left to the Government as a matter for their consideration.

It is probable that the Committee would have recommended the construction of a line by another route, turning off to the south of Wollongong station, and following either the east or west margin of the Tom Thumb Lagoon; but the difficulties likely to be experienced in removing the heavy grade to the north of the Wollongong station would probably more than counterbalance any advantages to be gained by adopting that route.

## XI.

### WAY-LEAVE THROUGH THE WENTWORTH ESTATE.

24. The Mount Kembla and the Southern Coal companies have the right of hauling coal over the lines constructed through the Wentworth Estate for a period of fifty years on payment of a way-leave of ½d. increasing to 1d. per ton.

It may be wise not to interfere with this right, in view of compensation claims, but those portions of the Mount Kembla and Southern companies' railway lines lying within the boundaries of the land proposed to be resumed should be acquired by the State.

The Committee are of opinion that delivery of the coal coming by these lines could be taken on the boundary of the resumed land, and the agreement with regard to way-leave would then remain unimpaired. This and the questions incidental to resumption of jetties and alteration or duplication of railway lines in connection with the port should be left to the Government to be dealt with as the breakwater progresses.

## XII.

### RESUMPTION OF LAND.

25. Sufficient land should be resumed to secure the stone required for the construction of the port, to provide hereafter space for all shunting operations and approaches to the jetties and wharves, and for the erection of the necessary buildings, and to furnish an elevated site for a signal station.

The area defined on the map herewith, and embracing 660 acres—subject to alteration as investigation in detail may render necessary—will be sufficient for all these purposes. It would be possible to have resumed isolated blocks, and thus to have covered the quarry sites and signal station, but in each instance roads of access would require to be provided, which might create claims for severance.

In the opinion of the Committee it will be wiser to have the resumed lands in one block.

The land in question is inferior in quality for grazing. The water frontage is valuable for coal jetties only, which cannot be erected without State authority.

Taking into consideration the betterment to the residue of the estate by the construction of a port at Kembla, the cost of resumption should not be very great.

## XIII.

### PROFITS FROM THE PORT.

26. Apart from the railways and jetties the Committee were informed by those at present engaged in the coal-mining industry that 4d. per ton would not be an unreasonable charge for the benefit afforded by the construction of the eastern breakwater, and one for which they would be freely recompensed by the extension of trade. The total yearly income from this charge upon the moderate estimate of 500,000 tons would be £8,333, which represents at  $3\frac{1}{2}$  per cent. a capital of £270,000.

The total cost of construction of the port, resumptions, and all works incidental thereto, should not exceed £200,000.

It will be seen that without taking into account any import trade such as sulphide and other ores for the smelting works now, or hereafter to be, established, Port Kembla should be self-supporting from the amount which will be earned from the shipment of coal alone.

As the port develops it is probable it will be necessary to have pilots' and boatmen's quarters, buoys, and other mooring appliances which constitute a continuous annual cost in all harbours; but the increase in the trade which justifies their being provided will also furnish revenue from which the cost of them may be met.

## XIV.

### PORT AT JERVIS BAY.

27. Jervis Bay is a capacious natural port, distant about 17 miles from the present railway terminus. Evidence was given concerning the existence of coal, iron ore, and low-grade ores within a reasonable distance, but as Jervis Bay is 60 miles

miles from the centre of the coal-measures at present being worked, it could not be availed of by the Illawarra Colliery proprietors, whose coal is carried by collier to Sydney for 2s. 6d. per ton, and by rail for about 3s. per ton. At present rates, as laid down by the Commissioners for Railways, there is no probability of any appreciable quantity of coal north of Kembla being forwarded to Jervis Bay as a port of shipment.

## XV.

### FINDING OF THE COMMITTEE WITH REGARD TO THE NECESSITY OF A PORT IN THE ILLAWARRA DISTRICT.

30. The Committee are of opinion that—

- (i) The Illawarra coal-measures are of sufficient extent and value to justify the construction of a safe port.
- (ii) Such a port would materially increase the output of the collieries, thus providing remunerative occupation for a large number of miners and surface hands. It would be an advantage to the vessels engaged in local trade; benefit steamers employed in intercolonial trade, and assist, by lessening the freight of ores, the operations of any smelting-works which may be established; and it would stimulate the foreign trade of the Illawarra district.
- (iii) Eventually a revenue in royalty will be derived from coal mined on Crown lands.
- (iv) Port Kembla is the most suitable and convenient site for the construction of a deep-water harbour, and the revenue from the port should cover interest on outlay as well as maintenance.
- (v) The land resumption recommended may be made without eventual loss to the State.

### RESOLUTION PASSED BY THE COMMITTEE.

31. The following extract from the Committee's Minutes of Proceedings of 4th and 5th February, 1897, shows the resolution passed and the division upon it:—

Mr. Lee moved,—

“That, in the opinion of the Committee, it is expedient the proposed Construction of a Deep-water Harbour at Port Kembla, referred to the Committee by the Legislative Assembly, be carried out by constructing the eastern breakwater only.”

The motion was seconded by Mr. Fegan, and passed on the following division:—

Ayes, 9.

Mr. Ewing,  
Mr. Humphery,  
Mr. Hoskins,  
Mr. Roberts,  
Mr. Trickett,  
Mr. O'Connor,  
Mr. Clarke,  
Mr. Lee,  
Mr. Fegan.

Noes, 4.

Mr. Hassall,  
Mr. Black,  
Mr. Wright,  
Mr. Farnell.

THEOS. EWING,  
Chairman.

Office of the Parliamentary Standing Committee on Public Works,  
Sydney, 10 February, 1897.

# PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## MINUTES OF EVIDENCE.

### CONSTRUCTION OF A DEEP-WATER HARBOUR AT PORT KEMBLA.

WEDNESDAY, 28 OCTOBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASPALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee proceeded to consider the proposed Construction of a Deep-water Harbour at Port Kembla.

Robert R. P. Hickson, Esq., Under Secretary for Public Works and Commissioner for Roads, sworn, and examined:—

1. *Chairman.*] Do you desire to make a statement with regard to this proposal? Yes, I have prepared a statement for the information of the Committee which, with their permission, I will read. It is as follows:—

R. R. P.  
Hickson, Esq.  
28 Oct., 1896.

*Proposed Deep-water Harbour for the Illawarra District.*

So far as can be ascertained from available papers, the earliest action taken towards constructing a harbour for the Illawarra District was during the Government of Sir George Gipps, when a small basin, or boat harbour, was excavated at Wollongong by prison labour.

In July, 1858, during the Governor-Generalship of Sir William Denison, a petition was presented by the inhabitants of Wollongong and the northern portion of the district, asking for a better harbour, and the late Mr. Moriarty, then Engineer-in-Chief for Harbours and Rivers, was instructed to prepare plans and report on the best way to provide suitable shipping accommodation. Mr. Moriarty's report was laid on the Table of the House, and ordered to be printed, 16th February, 1859. In it he recommended the construction of an inner basin and breakwater, and estimated the cost at £26,892.

The papers disclose that the size of the basin first proposed was subsequently much enlarged when it was found to be needed for coal-shipping.

On the Estimates for 1860 a loan vote for £26,892 for Improvements to Wollongong Harbour was taken, and the works were started.

In the same year we find Messrs. Robson & Co. applying to Parliament and obtaining an Act, intitled "Mount Keira Tramroad Act of 1860," dated 23rd August, 1860, authorising them to construct a tramway from the Mount Keira Coal-mine to Wollongong Harbour.

In the year 1862 two Bills for colliery railways in this district were passed by the Legislature, both dated 17th December, 1862, 26 Vic., the first known as "Taylor and Walker's Railway Act." This Act empowered the South Bulli Company to construct a railway from their colliery to "the projected public dock or harbour works at Bellambi Harbour."

The second Act was known as the "Mount Pleasant Tramway Act of 1862," 26 Vic., and authorised the construction of a tramway from Mount Pleasant to the harbour at Wollongong. This tramway was subsequently purchased and is now owned by the Government.

About the same time that the construction of Wollongong Harbour was asked for, the papers disclose that there was a claim for a rival harbour at Bellambi, and Mr. Moriarty submitted a design for a harbour at Bellambi with a report dated 20th July, 1859. He recommended a small basin, with an island breakwater to protect it. The survey then prepared is a valuable record, showing that no change of any consequence has taken place in the bay.

The first coal-shipping appliances at Wollongong were apparently laid down by private enterprise, for the Government did not commence to erect staiths or sidings till the year 1865.

The construction of the Belmore Basin, or inner harbour of Wollongong, was proceeded with and completed about the year 1868, although expenditure on the construction of a breakwater, new and larger coal staiths, cranes, &c., was almost continuous up to the formation of the Wollongong Harbour Trust.

This Trust was called into existence on 1st October, 1889, by the "Wollongong Harbour Trust Act of 1889," 53 Vic. No. 19: "An Act to provide for the improvement, management, and regulation of the Port of Wollongong and certain portions of the Tom Thumb Lagoon, and for other purposes connected therewith."

Soon after its formation the Trust invited the late Sir John Coode to furnish a design and estimate for an outer harbour, and on the 13th January, 1891, he forwarded his report and estimate, together with three sets of drawings to illustrate his scheme.

R. R. P.  
Hickson, Esq.  
23 Oct., 1896.

The area enclosed within the breakwaters proposed by Sir John Coode was as follows:—		
Area at low water .....		107 acres.
Area with depth of 6 feet and over .....		91 "
"    12    "    .....		81 "
"    18    "    .....		69 "
"    24    "    .....		48 "
"    30    "    .....		23 "
Estimated cost:—		
East breakwater, 2,400 feet long .....		£345,500
North    "    2,550    "    .....		191,600
Total .....		£537,100

This estimate, it will be observed, included no portion of the "internal works," which were designed by Sir John Coode on an extensive scale.

In a subsequent report, dated 17th June, 1891, estimates and plans for the internal works are supplied as follows:—

Southern coaling depôt, three jetties, including cranes, hydraulic machinery, railway sidings, &c., each £152,200 .....	£456,600
Seven acres of reclaimed land and formation .....	32,300
Western coaling depôt, three jetties, including cranes, hydraulic machinery, railway sidings, &c., each £152,000 .....	456,000
Twenty-six acres of reclamation and formation .....	73,000
Ballast quay .....	78,600
Removal of portion of Fairy Reef .....	19,800
	<hr/>
	1,116,300
Breakwater works as before .....	537,100
	<hr/>
Total estimate .....	£1,653,400

It was never intended that the whole of this large scheme for internal works should be proceeded with at once, but Sir John Coode recommended that the reclamation and one only of the southern jetties should be first carried out, and then added to as the trade developed.

Early in 1892 the Trust applied to the Government for power to borrow a sum of money to enable a commencement being made with the works, and the Colonial Treasurer referred the matter to the then Engineer-in-Chief for Harbour and Rivers (Mr. Darley) for report on the scheme and its probable financial prospects. The report, which is with the papers, dealt fully with the question, and as the financial portion of it deals with a subject that must necessarily be seriously considered when investigating any scheme for a southern coast harbour, it is desirable to here quote the following these extracts:—

"The next question is, —Will the probable future trade of the port pay the interest on this debt, which may be taken as one and three-quarter millions sterling? To do so at 4 per cent. would require a net annual revenue of £70,000. It is quite clear that the present trade from the whole of the southern coal-fields would not pay this interest, and as it is hard to say what the trade is likely to develop to, the best way to look at the matter is to see what trade would be necessary to raise such a net revenue.

"At Newcastle the trade is taxed 4d. per ton for shipping. Assume that the rate charged at Wollongong might be as high as 6d. per ton—and this is, I think, the maximum that the owners are likely to pay—at least one-third this sum, or (say) 2d. per ton, would have to be deducted for port and shipping charges, which would include cost of working and maintenance of all the hydraulic plant and cranes, salaries of officers, wharfingers, and general port maintenance charges, dredging, &c. This would leave but 4d. per ton net income, at which rate to collect £70,000 would require an output of 4,200,000 tons. I do not think the most sanguine advocate for the improvement of the port of Wollongong can anticipate such a trade as this, seeing that the whole output of all the northern and southern mines taken together only amounted to 3,691,000 tons for the year 1891 (see Report of Department of Mines). The total output from all the southern mines for 1891 only amounted to 828,933 tons, of which quantity only 155,335 tons were shipped from Wollongong Harbour, the balance being shipped from the numerous coast jetties at Port Kembla, Bellambi, Bulli, Coal Cliff, and North Illawarra, and some going by rail direct to Sydney.

"I do not think it at all probable that the port of Wollongong, if improved and made a really safe harbour, can count upon drawing all the southern trade there. Some will undoubtedly go direct to Sydney by rail, and a large quantity will continue to be shipped from private jetties, which in many cases are close to the collieries, the proprietors thereby saving the expense of long haulage, &c.

"I therefore think that the utmost trade likely to be drawn to Wollongong for many years to come will not exceed 750,000 tons, or (say) five times the present output. Taking only 3d. per ton net profit on this quantity, as the expenses would be proportionately heavier on the smaller output, the proceeds would amount to £9,375, which would represent 4 per cent. interest on £234,375. This, it seems to me, is the greatest amount of capital which could be expended with any prospect of a return of interest, and seeing the opposition that is certain to be met with by railway carriage and private shipping jetties as already referred to, I have very great doubts whether the Wollongong trade will ever reach these figures, even if the port is made a safe one for shipping.

"I am aware some revenue has been derived from wharfage dues, rents, and pilotage, which I have not before taken credit for, but I think the whole of these collections may be left out of the question, as the cost of maintaining the lighthouse, crane repairs, tug maintenance, rocket apparatus, &c., &c., has about absorbed all the collections thus made, and I do not think that, with the railway in opposition, it will be reasonable to look for any very large additional revenue from this source. . . . "I am satisfied that I have taken the most liberal view of the possible trade to be drawn to Wollongong, seeing the opposition that must always be met with from the numerous private shipping places along the coast. In this respect, Wollongong is most unfortunately situated as compared with Newcastle, where the bulk of the northern coal trade must always be centred, there being no other place adjacent where coal can be shipped to interfere with the trade of the port.

"I regret, therefore, to have to conclude with the opinion that there is no prospect whatever of the trade of the port of Wollongong ever being able to pay interest on the cost of constructing an outer harbour, even on the modification of Sir John Coode's plan."

Authority to raise a large loan not being granted, the Trust let a contract for the execution of a smaller scheme to improve the shipping accommodation, and the contractor had completed a considerable portion of the contract when, for various reasons, it was considered necessary to cancel the contract and thus stop the work.

The Wollongong Harbour Trust was shortly after this dissolved by proclamation in the *Government Gazette*, No. 804, dated 2nd December, 1895.

Prior to the formation of the Harbour Trust the Government had expended in construction, maintenance, and management of Wollongong Harbour, shipping appliances, such as staiths and cranes, jetties, lighthouse, quarters, dredging, &c., the total sum of £116,090 9s. 5d.

The Trust during the period of its existence expended a further sum of about £25,950, but left outstanding liabilities to the extent of probably some £15,000, or in all the sum of about £41,000 may be added to the first-named sum, making the total expenditure at Wollongong to date about £157,000.

The next step towards obtaining a south coast harbour was taken by a private company, who obtained an Act, intitled the "Illawarra Harbour and Land Corporation Act of 1890." This company has in view the opening of Lake Illawarra, by constructing certain breakwaters and training walls at the entrance, and dredging a deep-water channel across the lake, and forming a shipping place on the western shore of the lake. The time originally granted by Parliament for commencing the work having been exceeded without any progress being made, an amending Act, intitled "The Illawarra Harbour and Land Corporation Act Amendment Act of 1895," was passed, which extends the time for completing the harbour works to 20th December, 1898, and the time for completing the first railway to 20th December, 1896.

The railway has been completed, but the harbour works have not yet been started. The cost of forming a suitable shipping harbour in Lake Illawarra—opening the entrance, dredging, &c.—is estimated by the engineer to the company at about £140,000.

Almost

Almost concurrent with the partial abandonment of Sir John Coode's large scheme by the Wollongong Trust, the question of providing a large, deep-water harbour for the Illawarra coal trade was prominently brought forward, for on the 6th December, 1894, a deputation, representing the Bellambi Harbour Committee, waited upon the Minister for Public Works to urge the construction of a breakwater at Bellambi.

R. R. P.  
Hickson, Esq.  
28 Oct., 1896.

Mr. Young then promised that he would obtain a report from the Engineer-in-Chief for Harbours and Rivers; and, subsequently, on the representations of Mr. Nicholson, M.P., he approved of an examination being also made of Port Kembla, and Mr. Darley was instructed to report upon that place as well.

Shortly afterwards, viz., in February, 1895, as the result of a meeting held at Wollongong of the supporters of the rival claims of Wollongong, Bellambi, and Port Kembla, a further deputation waited upon Mr. Young, and requested that an officer might be appointed to report on the most suitable site for the harbour. They stated that the advocates of the various sites had agreed to leave the decision of the matter in the hands of the Department.

The reasons which have been urged in favour of the construction of the proposed harbour are as follow:—

- “(i) That a good and central shipping port, safe and accessible for large vessels in all weathers, is absolutely necessary for the development of the coal trade of the district, which has been retarded and hampered for want of such a port.
- “(ii) That the coal of the district is coming into increased favour, and all that is necessary to enable the collieries to compete with the northern district in the export trade is a central shipping depot for the whole district.
- “(iii) That it would induce the establishment of other manufactories in the district.
- “(iv) That the present harbour at Wollongong is altogether inadequate to the requirements of the district.
- “(v) That a harbour, if constructed, will also serve as a harbour of refuge for vessels driven away from Sydney by stress of weather.”

The surveys necessary in order to enable a report to be made were then undertaken, and on the 26th of November, 1895, Mr. Carleton, the Principal Assistant Engineer for Harbours and Rivers, submitted a preliminary report which showed, from an engineering and nautical point of view, Port Kembla was by far the best site. He stated that an expenditure of £158,300 at that place would construct a breakwater which would protect an area of 126 acres, having a depth of 24 feet and over at low water, or a cost of £1,256 per acre; while at Wollongong it would cost £193,875 to give an area similar in depth of only 54 acres, or £3,405 per acre; and at Bellambi it would cost £208,300 to give 58 acres, or a cost of £3,557 per acre. He stated that the surveys showed that the anchorage at Port Kembla was better than at Bellambi or Wollongong, and that it was also sheltered from the south and south-east by the Five Islands. He pointed out that the coal already shipped at Port Kembla at the companies' jetties was very much in excess of the Wollongong output, and greater than the shipments from Bellambi; and assuming that the output at Port Kembla, if a harbour were constructed there, would reach the output estimated for Wollongong when the works at that place were completed according to Sir John Coode's scheme, viz., 750,000 tons, a revenue of 3d. per ton would pay interest on the outlay. He estimated the cost of the works at the three places as follows:—

<i>Port Kembla.</i>		
Cost of breakwater.....		£158,300
Purchase of existing jetties, construction of additional jetties, and loading appliances .....		75,000
		£233,300
<i>Bellambi.</i>		
Cost of breakwater .....		£208,300
Wharfs, &c. ....		75,000
		£283,300
<i>Wollongong.</i>		
Cost of breakwater .....		£193,875
Wharfs, &c. ....		75,000
		£268,875

In submitting this report, I (being then Engineer-in-Chief for Public Works) pointed out that although Port Kembla was no doubt the best site for a harbour, from an engineering and nautical point of view, I was not in a position to say whether it was the best situated as regard the collieries, and I thought this was a matter which would be better inquired into by the Public Works Committee, and it was then decided to refer the matter to that body. I also pointed out that, in view of the powers which had been given to a private company to construct a harbour at Lake Illawarra, it was a matter for consideration whether a large expenditure should be entered upon to compete with that company.

Mr. Darley, who has since succeeded me, has also submitted a report on the matter. He concurs in the selection of Port Kembla as a harbour site in preference to Bellambi or Wollongong, but he points out that it is situated wholly on private property, and that a large resumption of land would be required, not only in connection with the harbour, but to gain access thereto, and that the purchase of existing rights to railways and jetties to abolish any monopoly would be a costly matter.

A report obtained from Mr. Deane, Engineer-in-Chief for Railway Construction, as to the best route for connecting Port Kembla with the main South Coast railway system, shows that this would be best effected by constructing a light line from Port Wollongong in extension of the branch line from Mount Keira, crossing Tom Thumb's Lagoon, the cost of which is estimated at £14,613, exclusive of land.

The following figures relating to the shipment of coal from the district have been furnished by the Customs authorities at Wollongong:—

	Northern Jetties, Bellambi, and Bulli.	Port Kembla.	Belmore Basin, Wollongong.	Total.
	Tons.	Tons.	Tons.	Tons.
1894 .....	168,372	185,792	156,419	509,983
1895 .....	175,506	220,388	153,981	549,875
1896 to 30th April .....	69,120	80,975	50,499	200,594

According to the report of the Department of Mines, the output of coal from the mines in the southern district during 1894 and 1895 was as follows:—

	Quantity	Value.
1894 .....	863,125 tons.....	£225,258.
1895.....	910,124 „ .....	239,035.

In submitting designs for Port Kembla, Wollongong, and Bellambi, Mr. Darley points out they may be termed sheltered coast harbours, as distinguished from close, or still-water harbours. In the former there must always be more or less swell when there is any sea running outside. For shipping coal or minerals this is not always seriously objectionable, as a vessel can be held off to buoys whilst being loaded from shoots, but for landing goods any swell at a wharf makes it a difficult matter. Should it be decided to construct a harbour at Port Kembla, or any other of the possible sites on the South Coast, as submitted to the Committee, there is nothing to prevent a second breakwater being constructed hereafter, and thus converting it into a close or still water harbour, although the cost of doing so may vary in each case.

A design and estimate for such a harbour at Port Kembla has been prepared, and can be laid before the Committee. The northern breakwater, in this case being in a more sheltered position, is not made so high or heavy as is necessary for the eastern breakwater.

The

33. There are ports in which an enormous trade is done upon less than 100 acres of water? Yes; the trade is carried on in docks in many places. That is so in London; but there you have many miles of sheltered water in the Thames before you come up to the docks, and it is the same with Liverpool.
34. Is there any competing port north of Bellambi, say at Bulli or Coalcliff? No.
35. What competing ports are there to the south;—will Lake Illawarra compete? A company has the right to make a harbour there by opening the entrance to the lake. The time for the completion of the work is December, 1898.
36. Has any work been done there? Nothing to speak of. A small bit of a bank has been made approaching the breakwater, and nothing has been done since.
37. Do you know the details of the scheme? Yes. The company propose to construct a northern and a southern breakwater, so as to fix the entrance to the lake a little north of Windang Island. The entrance will then be largely under the shelter of the island. Inside the lake they propose to dredge a channel right across to Talawera Point. The present average depth of the lake is 10 feet.
38. Do you know what expenditure is necessary to complete that work? I have lately taken out an estimate for myself, but I have not made it known. The engineers informed me that the company have let a contract for the construction of the harbour for about £140,000.
39. Are you able to inform the Committee what it will cost to keep the mouth of the lake permanently open? I think that if the breakwaters are constructed as proposed, the scour that will be created will be sufficient to maintain a permanently deep entrance.
40. What depth will there be between the two dykes? At present the depth varies from nothing to 19 feet; but there is nothing to prevent a scour taking place to a depth of 24 feet and more.
41. What is the width of water between the dykes? 400 feet.
42. Is that enough? It is perhaps rather narrow; but I may mention that Sir John Coode proposed to have an entrance only 290 feet wide to Lake Macquarie. That struck me as altogether too narrow, and the width was increased to 400 feet at my suggestion.
43. You believe that the flow of water will be sufficient to keep the channel open? Yes; the scour will be very great.
44. The dykes are not to be connected with Windang Island;—they will run out to sea north of the island? Yes.
45. If these works be carried out, will the lake be accessible in almost any weather? I think so, if tug-boats are used; of course, no large ship will attempt to sail in.
46. The entrance would not be so good as that you propose at Port Kembla? No, not nearly.
47. Do you think it is possible to do the necessary work at Lake Illawarra for £140,000? I hardly like to speak upon the point; but I have a letter from the engineers saying that the contract has been let for that amount. I am informed that dredging is included.
48. Do you regard Lake Illawarra as a strong competitor with the proposed Government port? If the Lake Illawarra scheme is carried out it would be impossible for any other scheme to pay expenses. There is not enough traffic there to support two harbours. If the contractors start now, I think they could complete the work within the time allowed by the Act, and then there would be nothing to justify the Government in opening another harbour.
49. *Mr. Humphrey.*] How many acres of harbour would the expenditure of £140,000 at Lake Illawarra make available? It is only proposed to make a channel across the lake leading up to a dock. There is to be no harbour area.
50. *Chairman.*] Can Kiama be a competitor to the proposed harbour? No.
51. Could Shellharbour or Gerringong? No.
52. Or Shoalhaven? No.
53. What about Jervis Bay? Jervis Bay could be made a good harbour.
54. But it is too far down the coast? Yes.
55. Do you know anything about the coal-measures at the back of Jervis Bay? I do not. I have here a statement of the distances along the coast, measured from Sydney:—

*Distances, South Coast of New South Wales.*

Sailing distances, in nautical miles, from Sydney Heads to—

Botany Bay	...	...	12 miles	Jervis Bay	...	...	82 miles
Port Macking	...	...	17½ "	Ulladulla	...	...	103 "
Coal Cliff	...	...	31 "	Bateman's Bay	...	...	129 "
Bulli	...	...	36 "	Moruya River	...	...	139 "
Bellambi	...	...	37 "	Montagu Island	...	...	155½ "
Wollongong	...	...	41 "	Tathra, Bega River	...	...	186 "
Port Kembla	...	...	44 "	Eden, Twofold Bay	...	...	208 "
Lake Illawarra	...	...	49 "	Green Cape	...	...	217 "
Kiama	...	...	56 "	Cape Howe	...	...	232 "
Shoalhaven River	...	...	69 "				

56. Have you the railway distances? No; I will furnish that information.
57. Do you regard Jervis Bay as a safe port? With proper lighthouse arrangements it could be made a very safe port.
58. Is it a good port inside? A very good port.
59. The difficulties you have to contend with in the work of this kind proposed are the currents and the strength of the waves? Yes.
60. How does the current run at Port Kembla? There is a littoral current, travelling south, a little way off the headland, but in Port Kembla Bay, as in most bays which open to the north, there is a northerly current washing round the bay. That current is not so marked at Port Kembla as at Byron Bay, because as you come south you are more under shelter of the headlands; but still it is very marked, and I feel sure that it would prevent any silting of the harbour. The tendency is for the current to split, and go west and north.
61. If there were only one breakwater, would it not have a tendency to trip up the current and bring into existence a strong set round the bay to the north west? It would tend to increase the scour; the current

C. W. Darley, Esq.  
29 Oct., 1896.

current would set to the north. Wollongong, for instance, has never filled up at all. The sand-spit at the mouth of Tom Thumb Creek affords a good indication of the way in which the current acts upon that part of the coast. North-easterly weather would have a tendency to bring sand in; but the normal tendency of the current would be to keep sand out of the bay.

62. You have about 4 miles of sandy beach between Port Kembla and Wollongong? About that.

63. Does the diagram before the Committee show the entrance to Tom Thumb Creek as it is at present? The survey was made a year ago. I cannot say that the condition of the creek at the present time is exactly as is shown on the map.

64. With a northern breakwater there would be no danger of silting? None whatever. The breakwaters will go out into deep water, beyond the limits of bottom disturbance.

65. The remarks you have made about Port Kembla with regard to the likelihood of silting would apply to Wollongong and to Bellambi? Yes.

66. Do you like the straight breakwater devised for Wollongong by Sir John Coode? I think he had to make it straight because of the reef.

67. How do you propose to make the proposed breakwater at Port Kembla? I have not had sufficient time to sufficiently explore the district yet. I know that rock can be obtained in different places, and at present I am having a shaft sunk on a hill close to the eastern breakwater. There we have struck some very good diorite. I have given a sample of it to the Government Geologist for him to report upon. It is a horn-blende diorite, and we are now 12 feet into hard stone. The hill is south from the breakwater.

68. Does there appear to be a large amount of this stone? Well, it is only about a fortnight ago that I got authority from the Minister to go on with this scheme, and to send men down to explore for stone. I have had the country examined, however, and I know of two or three possible sites.

69. No place could be more satisfactory than where you have your bore, providing that the stone is good? Yes, and so far it promises very well. The hill is about 100 feet above high water, and we struck rock very close to the surface. Before the inquiry ceases I hope to be able to bring in a report upon the various quarries in the district.

70. Where would you get the stone for Bellambi? I think we could get stone in the ranges, near the Bulli Pass. The estimate before the Committee allows for a considerable amount of haulage.

71. Then are we to infer that the work may be carried out more cheaply than the estimate? If we can get this stone from the hill to which I have alluded, it will make a considerable difference in the estimate. I based my estimate upon the cost of getting stone west of Unianderra.

72. That would mean a haulage of 8 or 10 miles? The estimate was based upon a haulage of 10 or 12 miles.

73. Would you save 5d. per ton if the place you speak of turned out to be satisfactory? We would save from 9d. to 1s. a ton.

74. How many tons will be required for the eastern breakwater? 633,200 tons.

75. So that the saving would come to between £30,000 and £40,000? Yes.

76. Before comparing Port Kembla with Bellambi, it would be fair to ascertain whether a similar reduction could not be made there? I will have a closer examination made at Bellambi. With regard to the breakwater at Port Kembla, I propose to carry the eastern breakwater about 15 feet above high water, and the northern breakwater about 7½ feet above high water. The breakwaters will be 16 feet wide at the top, and will have a batter of 1½ to 1 on the sea face, and I have allowed for a batter of 1½ to 1 on the harbour face, though the slope there may average 1 to 1.

77. The eastern breakwater runs out along the reef for a considerable distance? The first 1,600 feet would be on a reef. The depth increases from nothing to 30 feet.

78. What is the depth 800 feet from the shore? Twenty-three feet.

79. What is it 400 feet from the shore? Sixteen feet, and 100 feet out it is 6 feet.

80. How far is it from the end of the reef to the end of the breakwater? 800 feet. The depth at the end of the breakwater would be about 49 feet.

81. Is there a sandy bottom there? Yes.

82. Would the jetties now existing at Port Kembla interfere with your design for a closed port? No. I propose to use the wharfs along the shore for inward shipping. The coal would be loaded from the jetties.

83. Would you have more jetties running out? Yes, that is what I would recommend.

84. I suppose there is plenty of room? Yes.

85. Is the Port Kembla jetty in a good state of preservation? I cannot say.

86. What is the tonnage of the largest boats that have loaded there? Some large ships have been there; but I cannot give you their names. In my estimate for a closed harbour, I have taken no notice of the existing jetties, though I have put down £35,000 for the erection of a new coal-shipping jetty with a number of shoots.

87. Would there be any objection to first-class boats going to an open port? I daresay the insurance companies would fix a certain rate for such ports, but I think they would allow vessels to go to them. Where there was a closed harbour, vessels could go at the lowest harbour rates.

88. *Mr. Trickett.*] What would be the object of constructing the eastern breakwater first? To keep out the heavy weather.

89. I thought the place was comparatively sheltered on the south? Yes; but there is not enough shelter to keep big seas from rolling round the bay.

90. *Chairman.*] About seven-tenths of the gales come from the south and south-east? Yes.

91. Although the coast-line is some protection, it is not a complete protection to this place? It is some protection, and will make the work of constructing the breakwater easier, but it does not render a breakwater unnecessary.

92. *Mr. Trickett.*] Will the port be available in heavy weather before the northern breakwater is constructed? Yes, because you do not get very heavy seas from the north-east. Even now the jetties are fairly well sheltered from a north-easter.

93. *Chairman.*] It is essential that the southern breakwater be carried out first? Yes.

94. Would you consider it wise to put the first part of the northern breakwater upon piles to allow of a sweep of the current? No. I think the current will always trend to the north.

95. Will there be any danger of heavy seas rolling in at the entrance to the harbour? No; the waves will spread out immediately they enter the harbour.

96. This place will be different from Newcastle where there is a narrow neck? Yes. The seas running in will spread out like a fan. C. W. Darley, Esq.

97. *Mr. Trickett.*] There will be no necessity for wave-traps? No.

98. *Chairman.*] Have you taken into consideration the competition of private jetties? My impression is that the companies owning private jetties at Bellambi, Bulli, and Clifton will use those jetties in fine weather. Some of them have their own steamers. I think there will be great difficulty in concentrating the whole of the trade permanently at one port. Of course, the larger class of vessels will not readily be induced to go to these exposed outlying jetties; but a great amount of trade is now done at Bellambi and Bulli, and I do not think we shall be able to draw it away.

29 Oct., 1896.

99. Can you give us any idea as to what it costs these companies to maintain their jetties? No.

100. What is the life of a jetty? With reasonable management, about thirty years.

101. Is the borer bad on the south coast? Turpentine piles stand fairly well in salt-water; but in a bay, where there is not much sand travelling, sheathed piles can be used.

102. Are the existing jetties constructed of turpentine? I think that they have unsheathed turpentine piles.

103. Will there be any concrete work in connection with the breakwaters? No. They will be like the breakwaters at Newcastle and on the northern rivers.

104. There will be no large blocks of concrete at the ends? No; but I will pick out some large stones for the heads of the breakwaters.

105. Is any work being done at Wollongong now? No.

106. Does the little red mark on the plan of Wollongong Harbour indicate the work that has been already done? Yes.

FRIDAY, 30 OCTOBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Cecil West Darley, Esq., Engineer-in-Chief for Public Works, Department of Public Works, sworn, and further examined:—

107. *Chairman.*] Do you produce a plan showing the harbour works at the entrance to the Gippsland Lakes? I produce a set of maps which I got from the Director-General of Public Works a few years ago. They show Sir John Coode's design for the work, with an entrance of 250 feet. C. W. Darley, Esq.

30 Oct., 1896.

108. *Mr. Lee.*] Do you wish to supplement the evidence you gave yesterday? There were two questions asked yesterday which I can answer to-day. Mr. Wright asked a question with regard to dredging Lake Illawarra. The estimated cost of dredging 100 acres of Lake Illawarra to a depth of 24 feet at low water, the average present depth being taken at 10 feet, at the rate of 3d. per ton would be £38,115. I was also asked a question with regard to the distance by railway to certain points. The distance by rail from Sydney to Nowra is 92 miles 32 chains. The distance of the proposed line from Nowra to Jervis Bay is 18 miles 46 chains, making a total distance from Sydney to Jervis Bay of 110 miles 78 chains.

109. *Mr. Hoskins.*] With regard to dredging 100 acres, will that apply to continuous dredging or would it be only the first cost of dredging? That is the estimated cost of dredging; it does not include maintenance.

110. *Chairman.*] With regard to Trial Bay, would it be possible to let the Committee know what the present buildings have cost? I can supply the Committee with that information. However, the present buildings there were put up on a much more costly scale than they would have been if we had known the class of prisoners that have since been sent there. Originally those buildings were put up with stone cells, for long-sentenced prisoners, and it is a stone prison. That purpose, however, has been abandoned. The cells are never shut and the prisoners sleep in huts in the yard. The original scheme was to have an ordinary convict establishment there for long-sentence prisoners. I have no hesitation in saying that the work now proposed at Port Kembla can be carried out much more cheaply for the country with free labour than with convict labour.

111. *Mr. Humphery.*] What is the total area of Lake Illawarra? 9,000 acres, that is the water area.

112. *Mr. Lee.*] Are we to understand that Port Kembla has been decided upon by the Department as the most suitable place on the South Coast to spend money upon in order to make it a sheltered harbour? Yes.

113. The Department does not propose it now as a harbour of refuge? No, you can hardly say that it is wanted as a harbour of refuge.

114. Do you propose it solely for the purpose of giving an outlet to the trade which has gradually developed on the South Coast? Yes, that is the real object.

115. Have you taken into consideration whether the mines are so situated that they could be profitably connected by railway with the proposed port? I think so. It is quite as convenient to the coal-field as any other port. The coal reaches south of Port Kembla. The field is known to exist very much south of Port Kembla.

116. Is it anticipated that if the port be constructed it will attract most of the coal traffic so far as the deep-water trade is concerned? There is no doubt it will.

117. Is it supposed to do that? Yes, that is what is hoped.

118. For the simple reason that it would afford accommodation for large sea-going ships? Yes.

119. At the present time are sailing vessels loaded in the open roadstead with a great deal of risk? Yes, in some weather they run considerable risk. In fine weather they can go there safely enough. At present I do not think any sailing vessels do go there, only steamers.

- C. W. Darley, Esq.  
30 Oct., 1896.
120. Will your proposed works enable sailing vessels to lie in there? Undoubtedly, with perfect safety.
121. In the event of severe gales from the south-east and south, will they be able to lie with safety at the pier if the proposed works are carried out? Quite safely.
122. Will there be a range there? Yes, if it is only an open harbour—that is, if there is no second breakwater.
123. I am speaking of the proposal now before the Committee? There will be a certain amount of range especially in easterly weather.
124. Would that not somewhat imperil the safety of sailing vessels lying at the pier? No, they would haul off to the buoys. There would be only a swell. Once the place became established as a port of any size, there would necessarily be a tug-boat there.
125. What would be its condition in all weathers, and could sailing vessels, as well as steamers, go there with safety? Yes; for coal shipping, sailing vessels could go there safely and load.
126. You know that a large quantity of coal is conveyed by sailing vessels, and that of the total tonnage of Newcastle at least one-half consists of sailing vessels? Yes.
127. Is it reasonable to suppose that if there is an over-sea traffic in southern coal it will be largely conducted by sailing vessels? Yes; very likely.
128. Would it be safe for those vessels? Yes; with a breakwater there, ships could safely load—that is, under the original proposal.
129. If the time came when the work could be carried out in its entirety and a regular harbour made, would it be safe for any craft in any weather? Yes.
130. With reference to your statement the other day that there would be no justification for the construction of a harbour at Port Kembla and another at Lake Illawarra, would you kindly explain how the public requirements could be met if we were confined to Lake Illawarra, which it is proposed to open up in order to carry on the company's own business? I do not understand that the proposal is to carry out that work for one coal company. I understand that it is a harbour company. They would not be catering for their own coal, I presume they would cater for the whole district.
131. Has not the harbour company become incorporated with the mineral company? I think not. I understand that the mineral company is a distinct one, and that it simply bought a portion of the harbour company's estate. I know nothing of the working of the companies; but I understand that the Smelting Company of Australia is quite distinct from the harbour company. The harbour company would cater for the district. That is what they aim at, I believe.
132. First of all, admitting that they carried out their work according to their Act, would they be able to give accommodation sufficient to secure the traffic which would otherwise go to Port Kembla? They could offer such competition that it would be impossible for Port Kembla to earn interest on the outlay. There is no doubt that they could offer such competition that there would be nothing to warrant the Government in constructing a second harbour.
133. Is one of the chief reasons for incurring the outlay the desire to give proper accommodation to enable this large traffic to be carried on? I presume that the company, in their own interests, would cater for that, and would enlarge their works as the trade grew. There is nothing to stop them from going on dredging, in order to increase the basin area. They are not tied to any limits in the lake.
134. In order to obtain a basin area sufficiently large to carry all the coal traffic that will be concentrated at that point, how many years would it take to carry out the work? Not necessarily many years. Every year you could dredge a considerable area to provide for extra ships.
135. Does not the coal business require a lot of shipping, and would not a lot of ships have to wait to get their cargoes? Yes; of course the company would aim at giving them quick despatch.
136. Do you think it would be possible for the Illawarra Company to make a harbour sufficiently large to accommodate the shipping required to carry on the coal traffic? Quite so. It is only a matter of expense.
137. That is to say, if it is in their interest to do so; it is possible from an engineering point of view? Yes, it is quite feasible.
138. That being feasible under private enterprise, do you favour the idea of the Government taking up this work at Port Kembla? Not if the Illawarra Company opened up Lake Illawarra. I would say that there would be nothing to justify the Government constructing a second harbour. The company have only two years to complete their scheme, unless Parliament grants the company an extension. If they fail to complete the harbour, or to comply with the Act, and it is decided that a harbour is to be made there, my recommendation to the Government is to make one at Port Kembla in preference to Lake Illawarra.
139. You advise the Government to wait in order to see the result of the operations of the Lake Illawarra Company? I have expressed that view before in reports to the Government. It seems to me to be necessary that the Government should wait for a short time. It would be impossible for the company to comply with its Act unless it made a start very soon. If they do not start within six months, it would be impossible to comply with the Act. The Act only gives them up to the 20th December, 1898, to complete the work; that will be very little over two years. Even with an enormous amount of energy it would be as much as they could do to carry out the work in the time.
140. If they set to work in six months, would they have time to comply with their Act? Yes, if they commenced in a month or two. Their Act only compels them to make a harbour 15 feet deep. If they make an entrance so that a ship drawing 15 feet can pass in they will have complied with their Act. The Act does not state that they shall have jetties and all that sort of thing. I believe it is the intention of the company to make the entrance 24 feet deep, but they need only make it 15 feet. They can take as long a time as they like after the 20th December, 1898, to do the other work, but unless they start work within a very few months it will be practically impossible for them to comply with their Act. On the 20th December, 1898, their Act lapses.
141. Is it not possible for them to make a start early in 1898, and then come down to Parliament as they did previously, and ask for an extension? That is a matter of policy. If the country becomes involved in another harbour scheme, I doubt whether Parliament would grant an extension.
142. How would it affect your policy in this Departmental proposal? My idea is that if the Government decide to enter upon this harbour scheme the company's Act should not be extended. It should be allowed to lapse and the Government should enter upon the work as a national one.
143. That is to say, that if they do not proceed at once, the Government should consider that the company does not intend to carry out the work and the Government should proceed with the construction of Port Kembla? Yes.

144. Do you strongly advise the Government to wait a few months to see what action the company will take? Yes, that seems to me to be necessary. If the Government started this work the company might put them in a very awkward position by completing their harbour; but I think two or three months ought to set those doubts at rest. This proposal has been going on for years with regard to Lake Illawarra. Every time I see the company's engineers I am told that in a week's time they expect to get a telegram from England telling them to go on with the work.
145. Supposing we find that, in consequence of the action taken by your Department at present, the Illawarra Company, seeing their scheme in danger, might set to work within the next few months;—under those circumstances, would you recommend that the Government await results before proceeding further? I think that would be necessary. The Government should stay action as far as entering upon actual construction is concerned for at least three months. After that I think the Government might give a final decision. If the Illawarra Company's work is not started within three months, I do not think it will be possible for them to complete it within the time.
146. If they do not start to work in a proper manner within that time, must it be taken that they do not intend to comply with their Act? I think so. They would require to start and carry out the work with very great energy in order to comply with the Act.
147. You could not carry out your breakwater in two years? No.
148. The point will then arise, even supposing they are willing to make Lake Illawarra a port, and the Government allow them to ship from there, will that meet the commercial necessities of the coal proprietors on the southern coast? I think it will do fairly well. It would involve a little further carriage.
149. *Chairman.*] Can you make a definite statement as to what that further carriage will be, taking it for granted that the coal is north of Unanderra? I will supply it.
150. *Mr. Lee.*] Do I understand that the Department has proposed this work with the view of imposing a charge which it is estimated will pay the annual interest on the outlay? Yes.
151. In other words, the work has not been proposed merely for the benefit of the community without making a charge? We will try to make the work self-supporting.
152. I see that Mr. Hickson in his evidence states that 3d. per ton on 750,000 tons would pay interest on the outlay;—do you know whether there is any provision for maintenance in that amount? That does not include anything for maintenance.
153. Would maintenance be a material item in connection with the breakwaters? I do not think so. Then a large import trade is also expected which would bring in a revenue.
154. Do you think that there will be an import trade if the entire scheme is not carried out? No; you would have to carry out the whole scheme in order to establish an import trade.
155. Supposing it is found desirable to carry out this work at Port Kembla, and that the Illawarra Harbour works are practically put on one side, so that this would be the port for the coast, would you recommend the Government to undertake for the present the construction of the breakwater only, or would you advise them to undertake the complete scheme for the harbour? I would commence with the breakwater, and watch if there was a tendency for the trade to develop. That would not interfere with the construction of the whole work. I would prepare everything for the construction of the whole work, but for the time being I would only proceed with the eastern breakwater.
156. If this breakwater be carried out, will it necessitate any dredging? No; if the breakwater only is made.
157. Will there be sufficient water to enable all the traffic to be carried on without any costly dredging? Yes.
158. Will dredging only be necessary in consequence of putting wharfs there? Yes; in order to increase the area. Of course we will perform the dredging and reclaim the land at the back by the one operation.
159. Have you any idea as to how much land will have to be resumed and for what it will have to be resumed? The matter of resumption ought to be looked into with a little care; but I would recommend a very liberal resumption.
160. For what purpose? To give plenty of room for offices and buildings and in order to allow the Government to reap the benefit of some of the expenditure. I do not see why the Government should have to incur all this expenditure in order to enhance the value of private land.
161. As far as your Department is concerned, would it be necessary to make some slight resumption for office purposes, and possibly for railway extension? Yes; you would have to make considerable resumption for railway sidings and approaches to the jetties and wharfs. That would necessitate 300 or 400 acres at least.
162. If it became necessary to lay out a township there, that would be a matter for the Department of Lands to deal with, and they would have power to exercise their right to resume land; but that would not affect your Department, and would not affect the cost of this proposal? Yes.
163. Therefore, the resumption would have to be made in connection with this work? Immediately in connection with the work only a limited area would be required.
164. Would a portion of it be re-sold? Yes.
165. Might a considerable profit be expected upon that? I think it is only right that the Government should resume a liberal area, and get a profit on the improved value. After it was ascertained what the Government required for carrying on the works, the balance could be sold.
166. Will there be any necessity to erect a lighthouse on the breakwater? There will be a leading light on the breakwater, and a lighthouse on the headland. That is included in the item of £75,000 in the estimate submitted to the Committee. The whole thing will only amount to £2,000 or £3,000.
167. Will the same light answer all purposes if the harbour works are carried out in their entirety? Yes.
168. Has this preliminary portion of the work been advised as portion of the whole? Yes.
169. Can it be carried out at any time, or be deviated from, if necessary? The whole thing could be laid out as one scheme, and then be carried out by degrees.
170. *Mr. Wright.*] What is the set of the current into the bay? There is very little current in the bay. Whatever there is is westerly and northerly. It sweeps round the bay from the east.
171. Is there any possibility of the breakwater acting as a catch? I think not. The tendency of the breakwater would, perhaps, be to slightly increase the scour to the west and north.

C. W. Darley,  
Esq.  
30 Oct., 1896.

- C. W. Darley, Esq.  
30 Oct., 1896.
172. Are there two currents—an outlying current and an inlying current? The inlying current is due to a disturbance of the littoral current. It is caught in some bays, and it gets a reverse action.
173. What is your past experience of breakwaters acting against the southerly set—for instance at Nobbys? At Nobbys we do not get the littoral current; that is thrown off by Port Stephens. There is an outside northerly current at Newcastle. It is created there in quite a different way to what it is at Port Kembla; but it is of the same nature. The littoral current passes down the coast by Port Stephens. The direction of the current draws the water out of the Newcastle Bight, and it makes a current which goes north and east.
174. Is that current assisted also by the flow of the Hunter River? Yes; but in flood times all drift in the water from the Hunter takes a northerly set—north to north-east—out of the harbour.
175. At Trial Bay, have you any experience of the effect of the breakwater? There the current is decidedly like what it will probably be at Port Kembla—that is, west and north.
176. Is there any sign of sand-drift coming in? No.
177. Are we justified in concluding that the construction of the breakwater will not accumulate sand, and make the water shallow? I do not think there is any risk of that.
178. If the breakwater were constructed, and the jetties extended, could vessels lie there in all weathers? Almost in all weather, I think.
179. Could they in south-east gales? I think so.
180. Do you think they would have good holding ground there? Yes.
181. Is there any doubt about the holding ground for ships? Everyone I have spoken to has assured me that there is very good holding ground.
182. Could ships haul out from the jetties and hold to their anchors? Yes. People of long experience there have told me that they have known ships to ride out strong gales and hold on to their anchors the whole time.
183. Do you know the output of coal in the Illawarra district at the present time? The output for 1895 was 910,000 tons.
184. Do you contend that the output from this port would be largely increased? I think so without doubt, because sailing vessels would go there and take coal, which they are debarred from doing now.
185. Is Port Kembla the most central point which you could select for shipping coal? It seems the most central for the southern coal-field, because the coal-field is being developed. I have been informed by mining experts that there are indications of the field being worked out further north, except in some of the deeper mines. They are meeting with a lot of burnt coal.
186. Is that in the Bulli district? Yes.
187. In the event of the construction of this breakwater, do you not think that the people at Bulli and Coalcliff will prefer to ship the coal in ordinary weather at their own wharfs, instead of sending it down to Port Kembla? Yes, that is the case as long as the wharf's last. The question will be whether it is cheaper to construct another jetty or to send the coal to this port. We must anticipate that they will use their own jetties as far as they can in fine weather. After the jetties are worn out, I think it is likely that they will send their coal to the new port, knowing that there is a certainty of shipping it, and that they can develop a larger trade by getting larger ships there.
188. Do you think that if the output of coal be quadrupled there will be enough revenue to pay interest on the cost of constructing a railway? I do. Between the coal revenue and the import trade, I think sufficient revenue will be obtained. I feel very sanguine about the growth of an import trade there.
189. Shall we derive any benefit from an import trade; for instance, do we charge anything at Byron Bay, Wollongong, or Kiama? There is no import trade along the coast.
190. We get no revenue? No; there is only coastal trade. Those places are only outlets for local produce. But if there is a large amount of goods brought into the place, there is no reason why they should not pay a considerable amount for wharfage.
191. You do not contemplate that with a breakwater you could make anything like a still-water harbour of this place? Not with one breakwater; but it will be a sheltered harbour.
192. With an opening of 800 feet, do you think you could succeed in producing a still-water harbour with a double breakwater? Yes; it would be quite still water.
193. Do you think that with two breakwaters you would break any sea? The only sea that would enter would be from the north-east, and that would be only a chopping sea. On account of the shape of the breakwaters the sea will spread out on entering the port.
194. Do you think that the sea would be broken before it got any distance inside? Yes; it would not reach the shipping.
195. To make it a perfect port, do you think both breakwaters are required? Yes.
196. Do you advise the construction of one breakwater at first in order to see how it will answer? Yes.
197. If the result of that justifies additional expenditure, do you propose to make it a perfect harbour? Yes, if the trade develops. If there is every evidence of an import trade being developed, I would recommend the construction of the second breakwater.
198. What amount of land would be reclaimed under the double breakwater scheme? I will furnish particulars later on. All the land is low-lying, and we should have to raise it. There is one question which I might answer. I was asked yesterday if I knew of any large steamer which had entered the port. I received a communication by mail this morning informing me that the steamer "Indrani" visited the port last week. She is a vessel of 4,994 tons register. She entered Port Kembla with 6,400 tons of cobalt and nickel ore on board. She loaded 1,200 tons of bunker coal. The statement furnished to me did not give her draught, but I have calculated it at 28 feet 6 inches. She is a large vessel, 412 feet long, 48 feet beam, and 32 feet deep. She took in coal from the Southern Coal Company's jetty at Port Kembla, and sailed direct for Glasgow.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and examined:—

- H. McLachlan, Esq.  
30 Oct., 1896.
199. *Chairman.*] Are you prepared with any information respecting the work under the consideration of the Committee? The Commissioners only heard of the matter to-day, and I have not had an opportunity of speaking to them at length on the subject. I mentioned to them briefly that the Committee would be likely to want some information, and they said they would not like to go into it until they knew something more about the scheme. At present they are quite unaware of what is proposed. They would like to have some details of the scheme. I will be prepared to give some evidence on a future date.

TUESDAY, 3 NOVEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL TEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Cecil West Darley, Esq., Engineer-in-Chief for Public Works, Department of Public Works, sworn, and further examined:—

200. *Chairman.*] Have you anything to add to your former evidence? I have gone into the calculation again, and I find that the exact area of Lake Illawarra is 9,040 acres. The area of Jervis Bay is 27,253 acres. The area to be reclaimed at Port Kembla, as shown on the map by a tinting of red, is 33 acres, though, as there is a good deal of low-lying ground back from the shore, we could go on reclaiming to a much greater extent. The amount spent upon buildings, &c., at Trial Bay is £56,347 15s. 3d. C. W. Darley,  
Esq.  
3 Nov., 1896.
201. On completion of the harbour works there there will be no further use for these buildings? No.
202. *Mr. Hassall.*] Would the breakwater at Bellambi run out along what is known as the inner reef, or would it be outside it? The breakwater would be constructed along the line of reef.
203. How far does the reef run out? About 800 feet.
204. Does not the inner reef run out for a distance of something like 1,800 feet? There is a small island a little to the east, and a rocky bottom all the way across.
205. What depth is the reef below the surface? About 28 feet at the furthest point from shore.
206. I have been informed that for some distance it is only 4 feet 6 inches below the water? No; at a very short distance from shore you get a depth of 10 feet, and the depth increases as you go out.
207. Was the survey shown on the map prepared for Mr. Carleton's report? No; it was prepared under my instructions about fifteen months ago. Bellambi and Port Kembla were surveyed about the same time.
208. Is Port Kembla better sheltered than Bellambi? Yes; it is better sheltered naturally.
209. *Mr. Roberts.*] Were you instructed to prepare plans for a harbour for the shipment of coal or for a harbour of refuge? For a harbour for the shipment of coal.
210. I suppose Jervis Bay would fulfil the requirements of a harbour of refuge? Yes; fairly well.
211. If the proposed works at Lake Illawarra were carried out, would you consider this scheme necessary? No; I do not think anything would warrant the Government in making a second harbour on the south coast.
212. Lake Illawarra, if improved, would meet the requirements of the south coast for many years to come? Yes.
213. What period has to elapse before the proposed works at Lake Illawarra must be completed? They must be completed by the 20th December, 1898, if the powers given under the Act are to be saved.
214. Have the necessary works been commenced yet? A small bit of wall leading to the breakwater was commenced, but the work was stopped, and nothing has been done since.
215. Is it regarded as impossible that the proposed works can be completed within the time named? If they were started now, and proceeded with very energetically, I do not know that they would not be completed to the extent named in the Act—to give an entrance 15 feet deep—within the prescribed time.
216. Then is it not premature to consider a scheme of the kind before the Committee;—what prompted the Government to submit this scheme? Local pressure was brought to bear, I presume. I have, on two or three occasions, pointed out the difficulty of deciding upon any scheme before it was definitely known what would be done at Lake Illawarra. Of course, even if the Committee reported favourably upon the scheme before them, it would be eight or nine months before the money necessary to carry it out could be voted by Parliament, and in that time something definite will be known in regard to the Lake Illawarra scheme.
217. Do you regard the construction of two breakwaters as absolutely necessary at Port Kembla to provide for the shipment of coal? No, one breakwater would give a very good shelter if the place were to be used only for the shipment of coal.
218. Then you would recommend the eastern breakwater? Yes.
219. It would cost about half the estimate for the whole work? Yes.
220. Have you personally inspected these different harbours? Yes.
221. You had no hesitation in deciding upon Port Kembla? None at all.
222. *Mr. Black.*] Are you aware if the Illawarra Land Corporation have sufficient money to carry out their harbour project? I do not know anything about that; but I presume that if they had the money they would start the work.
223. Have you heard it reported that they are trying to raise the money elsewhere? It has been reported that they are trying to raise the money.
224. Should they fail the scheme will lapse? Yes.
225. In that case could the smelting works on Lake Illawarra be connected by railway with Port Kembla? Yes. The connection would be a very easy one to make.
226. Have you made any examination of Jervis Bay in connection with this proposal? No.
227. Why was Jervis Bay not thought of? Because it is too far away. It would be quite 50 miles further south.
228. And an extension of the present South Coast railway would be necessary to connect the southern coal-field with Jervis Bay? Yes.
229. *Mr. Hoskins.*] How long will it take to carry out the proposed works at Port Kembla once they are commenced? Do you mean the whole scheme or only one breakwater?
230. The whole scheme? From three and a half to four years.
231. You recommend that the work should not be proceeded with until it is seen whether the Illawarra Land Corporation will carry out their project? Yes. 232.

- C. W. Darley, Esq.  
3 Nov., 1896.
232. In that case the public will not have the advantage of a harbour at Port Kembla for the next six or seven years? Yes. This scheme might be commenced within three months, because if the Illawarra Land Corporation are not then hard at work upon their scheme, they may be considered to have abandoned it.
233. *Mr. Humphery.*] Is it not a condition that the Land Corporation must lodge £10,000 with the Government by the 20th December, 1897? Yes.
234. And the work must be finished within a year from that date? Yes.
235. So that it can be ascertained at any rate by the 20th December of next year whether the corporation intends going on? Yes. I might explain that the public can use the Kembla Harbour in its present unprotected state, and every six months, if the works are gone on with, will make it more protected. The public will not have to wait until the whole scheme is completed, in order to derive the benefit anticipated from it.
236. *Mr. Hoskins.*] If the work were only half done, could the place be used as a harbour for loading coal? Undoubtedly. There is a fair amount of coal shipped from there now. Within a year or eighteen months of the starting of the works, a very fair amount of protection would be afforded to shipping there.
237. *Mr. Humphery.*] At the present time, under favourable conditions, ships of 4,000 and 5,000 tons can load at Port Kembla? Yes. Some large ships were there last week.
238. *Mr. Hoskins.*] Would there be any great difficulty in connecting the smelting works on Lake Illawarra with Port Kembla by railway? I think that it would be perfectly easy to make a direct line from the site of the smelting works to Port Kembla, but the Engineer-in-Chief for Railway Construction could give you more information upon that point.
239. What is the distance? I think a good line could be got within 5½ miles.
240. *Mr. Humphery.*] As a matter of fact, these smelting works are connected with Port Kembla now? Yes, though in a somewhat roundabout fashion. The distance by rail now is about 12 miles.
241. *Mr. Fegan.*] Did you give evidence before the Select Committee which inquired into the Illawarra Land Corporation Bill? Yes, on the 11th December, 1889. I was chiefly asked about the wording of the Act. I went to protect Government interests.
242. You did not give any opinion as to the advisability of allowing a private company to take up the frontage to Lake Illawarra? No.
243. As a rule, is not your opinion asked where a private company is likely to come into competition with Government wharfs and so on? It might be, if the private company were interfering with the vested interests of the Government; but here the Government had no vested interests.
244. Your evidence seems to be that there is no room for a private scheme and a Government scheme? There is not room enough for both.
245. Do you think the corporation will carry out the work in the prescribed time? It will be very difficult to carry it out now.
246. Do you think that the Government should hold its hand until the prescribed time elapses? The Government need not wait more than three months.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and further examined:—

- H  
McLachlan,  
Esq.  
3 Nov., 1896.
247. *Chairman.*] Have you any statement to make? No; but I am ready to give any information that may be required from me.
248. *Mr. Wright.*] What are the rates for hauling coal to Newcastle? The coal brought to Newcastle is practically all carried in owners' trucks. We have a shunting charge of 6d. per ton for a couple of collieries which are near the harbour. For collieries within from 1 to 4 miles of Newcastle the rate is 9d. per ton; within 4 to 7 miles, 10d.; and within from 7 to 10 miles, 11d. a ton. Those are the rates that generally apply, and they include the cost of the crane service.
249. Have you any rate for coal carried 24 miles? Yes, 1s. 5d. per ton, including the crane service.
250. What distance is the Metropolitan Company's coal-mine from Sydney? Twenty-nine miles.
251. What do you charge to bring coal to Sydney from there? Two shillings a ton. They use our waggons.
252. What do you reckon as the charge for waggons? There is no fixed scale. The charge depends upon circumstances.
253. Then how are the rates arrived at? To some extent in an arbitrary way. It is considered what the traffic will bear, and what would be a fair charge to make upon it.
254. Is 5d. a ton a fair charge to make for the use of coal waggons? Yes, I think so.
255. In the case of waggons coming from the Metropolitan Coal Company's mine, that would be 4s. 2d. a trip? Yes.
256. How many trips would they make? I do not think they would make more than one a day.
257. What do these trucks cost? I think about £150; but I have not the figures with me. If we had a regular traffic all through the week it would be different.
258. But the traffic from the southern lines is the same as the Newcastle traffic? Yes, the coal traffic is always fluctuating.
259. Would the Newcastle rates apply to any other district? They never have been applied to any other district.
260. Has the Department of Railways anything to do with the coal coming from the southern district? The coal from the Clifton and Metropolitan Company's mines is carried in our waggons to Darling Harbour, and we also bring a small amount of the Corrimal Company's coal to Sydney. They, however, generally run with their own engines and trucks to Port Kembla, paying ¼d. per ton per mile as a way-leave or royalty for running over our lines.
261. Is not the coal shipped at Wollongong carried there in waggons belonging to the mines? Most of the coal shipped at Wollongong comes from Mount Keira. That company uses its own engines and rolling stock, and runs over part of our lines. A quantity of coal is shipped at Wollongong from Corrimal, though most of their coal goes to Port Kembla. In the year ending 20th September last, 105,000 tons of coal were carried to Port Kembla from Corrimal.
262. In the event of Port Kembla being made a harbour, I suppose the Railway Commissioners would find cranes and make all arrangements for the shipment of coal there? That will all depend upon the action taken by the Government.

263. If they did so, I suppose the same rates would apply as apply at Newcastle? I think so.
264. What distances are the various southern mines from Sydney? The Austinmer mine comes in between 39 and 40 miles from Sydney, the Bulli mine between 41 and 42 miles, the Bellambi mine between 43 and 44 miles, Corrimal 45 miles, Mount Keira and Mount Pleasant between 47 and 48 miles, and Mount Kembla and the Southern Company's mines 50 miles.
265. That is the furthest distance south from Sydney at which they are working coal? Yes.
266. What distance are the stone-quarries from Sydney? It is about 60 miles to Bombo.
267. What is the distance from Port Kembla by rail to Nowra? 41 miles on the main line.
268. What is the distance by the surveyed route from Nowra to Jervis Bay? About 18 or 20 miles.
269. That would make the distance from Port Kembla to Jervis Bay about 60 miles? Yes, something like that.
270. Will you have a return prepared showing the rates of haulage for coal from the various southern mines? Yes.
271. *Mr. Roberts.*] If large quantities of coal were shipped at Port Kembla, would it seriously decrease the revenue of the Department of Railways? I do not think so. At the present time we get none of the coal which would go to Port Kembla. It must be remembered, that the various companies on the south coast have most of them their own jetties at which they can ship their coal for nothing, and the question is, would they be ready to pay to have their coal shipped at a Government wharf at Port Kembla? Then, too, it must be remembered that if there were a very large traffic to Port Kembla we could not work it on a single line.
272. None of the coal that would be shipped at Port Kembla now goes to Sydney by rail? 75,000 tons out of every 100,000 tons shipped at Darling Harbour come from the Helensburgh mine, and no doubt that coal would continue to come to Sydney. Last year we got 27,000 tons from the South Clifton mine, but practically the Metropolitan Company's mine is the one that sends to Sydney.
273. Would it not be possible for the Commissioners to get more of the trade by making branch lines? There are already branch lines running directly from the pit's mouth to the various shipping places upon the coast, and, except in rough weather, I think coal would always be shipped at the private jetties. The Commissioners own a branch line running to Wollongong, over which the Mount Keira coal is sent, but we only get a  $\frac{1}{2}$ d. a ton for that coal.
274. Does that leave much profit? They are working the line themselves with their own rolling-stock.
275. That is the only Government branch line down there? Yes.
276. Which mine is furthest south from Sydney? The Southern Coal Company's mine and Mount Kembla—they are close together.
277. What is charged for the carriage of coal from Helensburgh to Sydney? Two shillings a ton in truck-loads. That includes shipment. Last year we carried over 74,000 tons. The charge is nearly 1d. per ton per mile.
278. *Mr. Black.*] If all the southern coal companies are provided with jetties of their own, it is fair to assume that they would not use the proposed harbour at Port Kembla, except in rough weather? Yes, or when they wished to load coal into some large vessel which could not lie alongside their jetties.
279. So that the proposed harbour works would only benefit the collieries in their immediate neighbourhood? Yes, though the Corrimal coal goes there to a large extent.
280. Do you think the Government is justified in making an expensive harbour to benefit only a few persons? I do not know anything of the local considerations; but I do not think there is any prospect of the work paying.
281. *Mr. Humphery.*] Would it not be practicable for other collieries to use the proposed harbour in order to load large ocean-going vessels? Yes, they might use it for that purpose.
282. When you spoke of shipping coal at their own jetties, you meant into the small colliers which come to Sydney? Yes.
283. If the proposed scheme were carried out, Port Kembla would be very much in the same position as Newcastle. The object of the work is to create a perfectly safe harbour there. Viewing the matter from that standpoint, do you think that the Commissioners would derive an appreciable return from the carriage of coal to Port Kembla from the various collieries now shipping at their own jetties? Personally, I cannot see how the project can ever pay. I am not very sanguine that there would be any big increase in the traffic over our line.
284. At the present time the Illawarra Smelting Works contemplate obtaining coal from their own collieries to the west? I have seen that stated.
285. But it is probable that their ore, instead of coming by rail to Sydney, will be landed at Port Kembla? That is if Lake Illawarra is not opened up.
286. I am putting my question on that assumption;—would the unloading of ore at Port Kembla interfere very materially with the present earnings of the railway in regard to the carriage of ore from Sydney? At present no ore is being sent from Sydney.
287. Well, we will say the prospects of the railway? Of course, we would get more gross revenue and more profit, if there were any profit to be obtained at all, by carrying minerals from Darling Harbour instead of from Port Kembla. It is difficult, however, to say what would be the better for us. For the short haul from Port Kembla we might be able to charge a rate which would pay us better than a rate for the haulage from Darling Harbour. I understand that only low-grade ores are to be sent, so that I imagine a very low rate would have to be imposed.
288. Have the Commissioners quoted any rate? I do not think that they have quoted anything lower than their present charges. They have a rate of  $\frac{1}{2}$ d. per ton per mile; but that is not intended to meet a case like this. The ordinary charge would be about 5s. 3d. a ton, or a little over 1d. a mile.
289. As a matter of fact, anything less than  $\frac{1}{2}$ d. per ton would not pay expenses, unless you had back carriage? No; or unless we had a very heavy traffic which we could work quickly.
290. According to the last report of the Commissioners, the average earnings of the railways are about 1 $\frac{1}{2}$ d. per mile? 1 $\frac{1}{4}$ d. per mile.
291. Is there any class of traffic which you could carry for  $\frac{1}{2}$ d. per mile without back haulage? I do not think there would be any profit in such a rate. Of course, we carry grain and flour and other things at a lower rate.
292. Could you carry grain and flour at the present rates if you had no back carriage? I do not think there would be any profit in it.

H.  
McLachlan,  
Esq.  
3 Nov., 1890.

- H. McLachlan, Esq.  
3 Nov., 1896.
293. What quantity of coal did you bring to Sydney last year from the southern mines? 74,000 tons from the Metropolitan Company's mine, and 27,000 tons from the South Clifton mine.
294. And what was the rate? 2s. 6d. a ton from the latter place.
295. What would be the rate from South Clifton to Port Kembla? About 1s. 8d. a ton.
296. That is a difference of 10d. a ton? Yes, though there would not be that saving.
297. Is the South Clifton coal conveyed in the Commissioners' trucks? Yes.
298. If there were a great deal of traffic to Port Kembla it would be necessary to duplicate part of the Illawarra line? Yes; say, from Bulli. Of course, we have the line duplicated as far as Waterfall now.
299. Are there any heavy cuttings or costly tunnels between Bulli and Port Kembla? No.
300. The line is nearly level? Yes.
301. What would be the cost of duplication? I would put it down, roughly, at about £50,000; but, of course, it is an engineering question.
302. *Chairman.*] How much coal could you take over a single line in a day? That would depend upon the facilities for crossing and other circumstances. They speak about handling 300,000 or 400,000 tons.
303. You think a duplication of the line would be necessary? Yes. I may add that estimates prepared before hand are very misleading. Just before the Commissioners took office very strong pressure was put upon the Government to obtain the resumption of a branch line leading to Wollongong Harbour. All sorts of estimates were given as to the probable traffic upon that line, but, as a matter of fact, there is no more traffic upon it now than there was when we took it over.
304. How much coal is taken over that line? 85,000 tons were carried last year. Of that quantity, 63,000 tons came from Mount Keira, but they only pay us  $\frac{1}{2}$ d. per ton for the way-leave.
305. How much did the line cost the Government? We paid £7,500 for it, and we have spent about £2,000 in making a loop. Altogether it has cost about £10,000, and the total earnings are about £200 a year.
306. *Mr. Trickett*] If the proposed harbour were constructed, would it result in a gain or a loss to the railway system of the Colony? If we had to pay interest upon the cost of construction I think it would result in a loss.
307. Is very much coal brought to Sydney from below Clifton? No; practically none.
308. All the coal from collieries further south is shipped at Wollongong and the various jetties, and brought to Sydney by sailing vessel or steamer? Yes.
309. Does most of the coal coming to Sydney from Newcastle come by steamer or does it come by train? It comes by sea.
310. If the proposed port were constructed, most of the southern coal would come to Sydney by sea? Yes, as it does now.
311. *Mr. Clarke*] I suppose very little coal comes from Helensburgh since they have lost the railway contract? The mine is not so brisk now, but we did not consider that coal in our returns. We took delivery of it at the collieries.
312. Do you think that the construction of the proposed harbour will not benefit the railway? I do not think it will be any great gain.
313. I suppose the only traffic to the proposed port would be coal? Yes.
314. Do you think Bellambi and the other collieries would send their coal to Port Kembla? No; I think they would continue to use their own jetties.
315. *Mr. Lee.*] Have you been consulted by the Department of Public Works as to the probable cost of cranes for the proposed harbour? Not to my knowledge.
316. If a coal trade of 1,000,000 tons per annum were carried on at Port Kembla, would the erection of cranes be necessary? I do not know what appliances they have at Port Kembla now; but if there were 1,000,000 tons of coal to be handled they would require extensive arrangements.
317. Do you know the cost of these cranes? No.
318. The Commissioners have control of the cranes in Newcastle? Yes.
319. You are aware that it is intended to concentrate the coal traffic at Port Kembla as much as possible? Yes; I understand so.
320. If the various private lines on the south coast were resumed, I suppose you would be chargeable with their capital cost? Yes.
321. Are they of a temporary character? I have not been over them, but I think they are fairly substantial.
322. Are you aware whether they carry leasing rights or anything of that kind? No.
323. *Chairman.*] Can you tell me how much is paid for hauling, and how much is paid for shipping the coal at Newcastle? Some time ago, when a calculation was made, it was considered that 5d. per ton would pay interest upon the cost of sidings, cranes, and everything connected with the appliances necessary for the shipment of coal at Newcastle, together with the wages of the persons employed. Of course, if only a small quantity were shipped, the cost might be much larger. At Newcastle we ship practically 2,000,000 tons a year. With a small quantity there would be a certain saving in sidings and in general appliances; but the cost would probably be greater per ton.
324. Do you think it would be possible to load coal at Port Kembla for less than 5d. a ton? No; I think the cost would probably be larger than that.
325. In Newcastle, for distances up to about 7 miles, you charge about 1d. a ton for haulage, but for greater distances you charge less? Yes. Beyond a certain distance the basis of the rates is  $\frac{1}{4}$ d. a ton per mile.
326. Why did you abandon the zone system at Newcastle? It has not been abandoned, though the zones are altered from time to time to meet circumstances.
327. What is the objection to putting all the mines in the same zone? The mine-owners nearer the port think they ought to get some advantage over others further away, and, of course, it costs us more to haul 7 miles than to haul 1 mile.
328. The policy that obtains in Newcastle would be likely to obtain at Port Kembla if the proposed harbour were constructed? Yes.
329. *Mr. Humphery.*] What is the greatest distance from which you bring coal by rail to Newcastle? Greta, which is about 32 miles from Newcastle.
330. What is the next colliery? East Greta is 22 miles from Newcastle.

331. Is much coal brought more than 20 miles? A considerable quantity is brought more than 20 miles.  
 332. *Mr. Fegan.*] What is the distance from the Metropolitan Colliery to Port Kembla? About 26 miles.  
 333. And from South Clifton to Port Kembla? About 20 miles.  
 334. So that it would pay the railways as well to take that coal to Port Kembla as to take it to Sydney? 3  
 We would get about the same rate; but I think that coal would always go to Sydney.  
 335. What does the Hetton Colliery pay? Sixpence per ton. It is within a mile of Newcastle.  
 336. Is the southern coal trade on the increase, or on the decrease? Recently it has been on the increase.  
 337. That is chiefly because of the Newcastle strike? Yes, I believe so.  
 338. Why does not the Government charge the Keira Company a higher rate for running on the Wollongong line? The rate was fixed by Act of Parliament when that line was resumed by the Government.  
 339. Have you represented to the Minister that the present rate does not pay? No.  
 340. Do you not think that something should be done in the matter? I do not know what the views of the Commissioners are, but I do not think it would be equitable to alter the Act?

H.  
McLachlan,  
Esq.  
Nov., 1895.

WEDNESDAY, 4 NOVEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

David McCulloch, Esq., Statistical Clerk, Department of Mines, sworn, and examined:—

341. *Chairman.*] I understand that you have brought a statement showing the output of the southern collieries for some time back? Yes; I have here a statement showing their output from the 1st January, 1891, to the 31st December, 1895. It is as follows:—

D.  
McCulloch,  
Esq.  
4 Nov., 1896.

4,397,551		1,314,615	11	8

342. Is that all the information you have with respect to this matter? Yes. This year the output may be a little greater, owing to the strike which occurred at Newcastle. We do not get the returns until the end of each year. The figures are supplied by the coal-mine proprietors on forms which we send to them.

John Harper, Esq., Goods Superintendent, Department of Railways, sworn, and examined:—

J. Harper,  
Esq.  
4 Nov., 1896.

343. *Chairman.*] I presume that you have discussed this proposal with the Secretary for Railways and with the Commissioners? Yes.

344. *Mr. Fegan.*] Are you acquainted with the scheme? I know nothing about its details.

345. Have you brought the statements which were promised by Mr. McLachlan yesterday? Yes. I have here a statement showing the quantity of coal and coke carried to Newcastle for the year ended 30th June, 1895, hauled in owners' trucks by Commissioners' engine, crane charges being included on all coal shipped from Bullock Island:—

Colliery from.	Tons.	Colliery from.	Tons.
Carried 1 mile—		10 to 12 miles—	
Wickham and Bullock Island .....	222,417	Northern Extended .....	35,024
1 to 4 miles—		Pacific Co-operative .....	89,594
A. A. Company .....	1,599	Young Wallsend .....	124,618
Hetton .....	201,487		
Ferndale .....	5,042	14 to 17 miles—	
Lambton Company .....	136,869	Northumberland Company .....	1,177
	344,977	Seaham Colliery .....	88,117

J. Harper,  
Esq.  
4 Nov., 1896.

I have also a further statement based upon similar lines showing what the rates would be under certain conditions on the Illawarra line. It is as follows:—

## RATES for Carriage of Coal, Illawarra Line.

Carried in Commissioners' trucks.		Carried in Owner's trucks.	
1 to 10 miles .....	1s. 3d. per ton.	Over 1 mile .....	6d. per ton.
11 to 12 ,, .....	1s. 4d. ,,	1 to 4 miles .....	9d. ,,
13 to 14 ,, .....	1s. 5d. ,,	4 to 7 ,, .....	10d. ,,
15 ,, .....	1s. 6d. ,,	7 to 10 ,, .....	11d. ,,
16 ,, .....	1s. 8d. ,,	10 to 12 ,, .....	1s. ,,
17 ,, .....	1s. 9d. ,,	12 to 14 ,, .....	1s. 1d. ,,
18 ,, .....	1s. 10d. ,,	14 to 17 ,, .....	1s. 2d. ,,
19 ,, .....	1s. 11d. ,,	17 to 20 ,, .....	1s. 3d. ,,
20 ,, .....	2s. ,,	20 to 23 ,, .....	1s. 4d. ,,
30 ,, .....	2s. ,,	23 to 26 ,, .....	1s. 5d. ,,
31 to 40 ,, .....	2s. 6d. ,,	26 to 29 ,, .....	1s. 7d. ,,
41 to 48 ,, .....	2s. 9d. ,,	29 to 32 ,, .....	1s. 8d. ,,
49 to 56 ,, .....	3s. ,,	*32 to 35 ,, .....	1s. 9d. ,,

These rates are for when the coal is shipped. Small coal allowed 20 per cent. reduction.

\* Distance between 35 and 56  $\frac{1}{2}$ d. per ton per mile in addition to the rate for 35 miles. Small coal allowed 20 per cent. reduction.

346. According to your figures, the rate of haulage over the 30 miles when the Commissioners' trucks are used is 2s. a ton, and when the owner's trucks are used, 1s. 8d.—a difference of 4d. Does it pay the Commissioners to let out their waggons at 4d. a ton for 30 miles? I presume it does; if it did not they would not have fixed the rate.

347. What do you charge for your waggons in the northern district? The charge is precisely the same in both districts, but in the northern district almost the whole of the coal is carried in owners' trucks; we have only about 100 waggons in the northern district.

348. What colliery uses them? They are spare waggons which we send wherever they are required.

349. Would the construction of a harbour at Port Kembla interfere with coal coming to Sydney from the southern district? I can scarcely say; so much depends upon the circumstances; freight does not govern the thing exclusively. I fancy that large passenger boats like the P. and O. steamers would continue to coal in Sydney under any circumstances; but it is very hard to say what the big ocean tramps would do.

350. Would it make any difference to the railways if the coal from the Metropolitan and Coalcliff mines were taken to Port Kembla instead of to Sydney? I do not think it would affect them materially. Only a very small quantity of coal is sent to Sydney from those mines. We only carried 74,000 tons altogether during the year ending September last.

351. Are you acquainted with the Lake Illawarra scheme? Only generally—from what I have read in the press.

352. Have you seen the railway which the Illawarra Land Corporation have constructed? Yes.

353. Is not that line partly under the supervision of the Commissioners? It has been passed by the Commissioners as fit to carry their rolling stock.

354. Do you think there would be room for a harbour at Port Kembla, and another harbour at Lake Illawarra? I should not think so, considering that the total output of the southern collieries is not much more than 750,000 tons per annum.

355. But it is increasing year by year? I do not think it is. According to the figures in the "Wealth and Progress" the output in 1894 was 70,000 tons less than the output of 1882.

356. But if you compare the output of 1894 with the output of 1885 you will see that great strides have been made? The output almost doubled in that time, but in the interval the South Clifton and other collieries have come into existence. Their coal has been largely used for locomotive purposes.

357. Is it probable that an increase in production will continue? That would be impossible for me to say.

358. Is it not a fact that during the recent Newcastle strike a number of vessels which would have loaded at the southern collieries were driven away by bad weather;—if the conditions had been more favourable there, would it not have been a greater output? Well, the favourable conditions then meant the continuance of the strike at Newcastle, which I would not like to anticipate as an occurrence of the future.

359. There was no strike at Newcastle in 1893 to interfere with the coal trade there? I could not say.

360. On comparing the output for 1893 with that for 1891, I find that there was a large increase in the production of coal in the southern district? That may be accounted for by the working of the Metropolitan Company's mine. We have no figures as to the output of the different collieries which would enable us to challenge any statements as to the total output.

361. The Railway Commissioners have charge of the loading appliances at the port of Newcastle? Yes.

362. You would think that they would be consulted in reference to the shipping arrangements at the proposed harbour at Port Kembla? I should expect that they would be. As a matter of fact, if the scheme were approved of by the Committee, the Commissioners would have to be consulted in regard to any railway arrangements.

363. Besides coal what other traffic is there that would be likely to affect the proposed harbour? I do not

Coke conveyed from Mount Kembla to the undermentioned stations for the twelve months ended 30th September, 1896:—

J. Harper,  
Esq.  
4 Nov., 1896.

381. In your opinion, would a harbour at Port Kembla serve the district better than a harbour at any other place on the coast? I would not be prepared to say that.
382. Do you think the companies owning private jetties would send their coal to Port Kembla to be shipped? I do not think so, except under certain conditions. If a large ship were prepared to take in bunker-coal at Port Kembla at a rate which would suit any particular colliery, no doubt the coal would be sent there; but the coasters would probably continue to take their supplies from the jetties. The Mount Keira line was acquired by the Government on strong recommendations which were made before the Commissioners took office. It was spoken of as essential to have a connection with the coast at Wollongong. The only collieries that have used that line, however, have been the Corrimal colliery, which has used it to a small extent, and the Mount Keira colliery, to the proprietors of which the line originally belonged.
383. Have you any knowledge of the country between the Government line and the proposed port? I only know it generally.
384. You cannot tell us whom the property belongs to? No.
385. You would not expect any traffic from the northern Illawarra collieries to Port Kembla? No.
386. Do you think the Corrimal coal would go there? Yes, it goes there now.
387. Would the Mount Pleasant coal go there? No. The Mount Pleasant and the Keira coal would continue to go to Wollongong.
388. That leaves only the Southern Company's coal and the Mount Kembla coal? Yes.
389. And any traffic that may be developed by the opening up of mines further south? Yes.
390. Though, in regard to the latter traffic, it would probably go to Lake Illawarra, if a harbour were made there? Yes.
391. *Mr. Roberts.*] Does it appear to you that if a harbour is to be made on the south coast, Port Kembla is the place where most traffic would go? I do not think that the private companies that own jetties would cease to use them. The figures which I have put before the Committee indicate that Corrimal is the most northerly mine from which coal is taken to Port Kembla, though part of that coal goes to Wollongong. The only other collieries that I think would send to Port Kembla are Mount Kembla and the Southern Coal Company's colliery.
392. How far is it from Corrimal to Port Kembla? It is 6 miles to the junction of the Mount Kembla line with the Government line, and 10 miles to Port Kembla.
393. What would be the cost of sending coal from Corrimal to Port Kembla, including shipping? That would depend upon the length of the connection between the Government line and Port Kembla. If the coal were hauled in the Commissioners' trucks, and by the Commissioners' engines, the cost would be 1s. 3d. a ton, whether the distance was 7 or 10 miles. If the coal were hauled in owners' trucks, the rate would be 10d. for 7 miles and 11d. for 10 miles.
394. Is there any mine from which coal is carried 56 miles by rail? Yes; Dulwick Siding is 56 miles from Newcastle. Blackwall is 55 miles, and Rix's Creek is 53 miles. The rates are charged according to the zone in which the colliery is situated. I have here a list of the distances of the Illawarra coal-mines from Sydney. The North Illawarra mine, Austinmer, is 40 miles from Sydney; the Bulli mine is 43 miles; South Bulli, 45 miles; Corrimal, 46 miles; Mount Pleasant and Mount Keira 49 miles; Mount Kembla, the Australian Coal Co.'s mine, and the Southern Coal Co.'s mine 52 miles. Those are the mileages on the Government railway.
395. Have you any figures to show the probable revenue that would be obtained by the Department of Railways in the event of the construction of the proposed harbour? No, I cannot give you any information on that point.
396. *Mr. Lee.*] Can you tell us what amount of coal is obtained annually at Corrimal, Mount Kembla, and the Southern Coal Co.'s mine? No, we have no means of knowing how much coal is sent over private lines. I gave the Committee the figures in regard to the Corrimal coal.
397. *Mr. Wright.*] Have you any knowledge of the Illawarra district? No special knowledge of it.
398. I suppose you cannot tell us anything more about the coal-mines there than we have in evidence? No.
399. Are you in a position to speak as to the commercial prospects of the district apart from the coal? Well, the district is a comparatively limited one. Its mineral and dairying resources are all it has to rely upon.
400. Can you give the Committee any information as to the volume of traffic from Sydney down to Illawarra? It is really a quantity which you can scarcely reckon with. The best traffic—that is, the traffic upon which the highest rates should be put—is, and I suppose always will be, carried by the steamers. The volume of traffic carried by the railway is very small, apart from the passenger traffic and the dairy produce. I do not think that the imports of the district would have much effect upon the trade of the proposed port.
401. If wharfage were charged, the revenue obtained would not go very far to meet the interest on the cost of construction? No. And if high wharfage rates were charged the traffic would be sent back to the railway. I cannot conceive of any direct importation to any port on the south coast.
402. You cannot see that there is any traffic apart from the coal traffic to justify the construction of a harbour there? No.
403. Do you think that a very large traffic is likely to be developed in this district? It is very hard to say

J. Harper,  
Esq.  
4 Nov., 1896.

- say what development may take place in the district in connection with the treatment of ores, and so on.
404. What distance is Bulli from Sydney? Forty-one and a half miles.
405. And from Port Kembla? Fourteen miles.
406. Do you think ships would go down to Port Kembla to take in coal—that is, big ships, which might have to employ tugs to move them from the wharf—when they could have it brought to them by train? I consider it very doubtful. I also doubt if the Bulli Company would send its coal to Port Kembla.
407. Would there be any danger of competition between the proposed harbour and the railway? I do not think so. I think we have reached the bounds of competition.
408. You do not take a very hopeful view of the prospects of the proposed port? No.
409. You do not see any mercantile advantage in it, except for the shipment of coal? No.
410. Do you attach much importance to its value as a port for the shipment of coal? I daresay it would be comparatively valuable for the use of large ships.
411. Do you think it would be worth £300,000? I have not gone into that question.
412. *Chairman.*] Do you know what is the actual cost of shipping coal? No; and I do not think that the contractors have discovered that yet.
413. It has been put down at 5d. a ton? It depends upon what charges are included.
414. *Mr. Black.*] Are there any collieries south of the Southern Coal Co.'s mine? No; though of course the coal-bearing strata extend further south.
415. *Chairman.*] Your combined charge for carrying and shipping is 6d. per ton for a distance of a mile? Yes; we pay 1½d. to the contractor for handling the coal, and then there are all the terminal charges.
416. What is the actual cost of shipping? I could not tell you; but I take it that the rate fixed by the Commissioners covers the whole cost. As a matter of fact, we get no more service from waggons which are used to haul coal 1 mile than from waggons which are used to haul coal for 10 or 15 miles.
417. What becomes of the Illawarra coal at present? It is used greatly for bunker coal.
418. A large proportion of it is brought up to Sydney and then lightered over the ship's side into ocean-going vessels? Yes.
419. Do you know what that costs? No.
420. A good port at Illawarra would save that expense in many cases? Yes.
421. The rate for coal from Unanderra to Sydney would be 3s. a ton? Yes.
422. If that coal could be put into the ships at Illawarra, there would be so much saved? No, because certain charges would have to be paid for the delivery of the coal from Unanderra to the port. The saving effected would be the difference between the cost of putting coal into a vessel at Illawarra and the cost of hauling the coal to Sydney and shipping it there. Then, too, the cost of taking a vessel to Port Kembla would have to be considered, and a comparison made with the cost of lighterage.
423. The saving would be the cost of conveying the coal from Illawarra to Sydney? Yes, less the cost of taking it to Port Kembla.
424. It is useless labour to carry coal 40 miles when you need only carry it 8 miles? Yes; and on the other hand, it might be shown that if there were no obligation to pay interest upon the capital cost of 40 miles of railway, the rate would be less than 3s. a ton. If in one Government work the cost of construction is not considered, neither should it be in another Government work, that is, if you want to make a comparison.
425. I suppose your rates on the Illawarra line have been fixed in recognition of the fact that there is sea competition? Well, the same rates apply on the northern line.
426. If it were possible by shipping the whole of the coal output of Illawarra at a port on the south coast to save 2s. 6d. a ton in freight, the total gain would be something like £190,000? It is impossible to say what the net gain would be from a port on the south coast, because there are so many other circumstances to be taken into consideration. As a matter of arithmetic, no doubt the calculation is correct.
427. You doubt if the proposed harbour, when constructed, would get a considerable portion of the trade of Illawarra? Yes, that is my personal opinion.
428. *Mr. Humphery.*] It is your view that even if a safe harbour, such as is proposed, were constructed on the south coast, a large portion of the coal produced in the district would be shipped from the present small jetties, though a considerable quantity might be placed on board ocean-going vessels at the proposed port? Yes.
429. There will always be a large demand for southern coal in Sydney? Yes. That is the evidence of our figures.
430. Is it probable that the total output will ever be shipped at Port Kembla? No.
431. Since the smelting company established themselves at Lake Illawarra, has there been a large increase in the railway traffic? Nothing very marked.
432. Assuming that the expectations of the company are realised, would it be necessary for you to make other provision than now exists for the traffic? No, because I understand that the ore is to be brought to Lake Illawarra by sea.
433. But we have been told that the harbour works at Lake Illawarra may not be completed for some time, and that in the interval the ore will be sent to Sydney, and brought from there by rail;—in that case would it be necessary to make further provision for the traffic? No, I do not think so, because that traffic will only be temporary. If it became permanent the question of duplicating the line would have to be considered. We have arranged rates with the company for the temporary conveyance of the ore. The company has given us certain figures which they expect to work up to.
434. If those figures are realised, there will be a considerable increase in the traffic on the Illawarra line? Yes.
435. *Mr. Hoskins.*] Would not that necessitate the duplication of the line? If the anticipations of the company were realised, we should have to duplicate parts of the line; but not necessarily the whole length.
436. What is the largest-sized vessel that can be unloaded at Wollongong? I have no idea.
437. If a vessel of 500 tons could be unloaded there, there would be no great difficulty in conveying the ore from Wollongong to Lake Illawarra? No; but if there were a large quantity of it, portions of the line would have to be duplicated.
438. If the harbour works cannot be completed for two or three years, cannot the smelting company have their ore unloaded at Wollongong? I think the ore will be brought round in large vessels, and the more economical plan would then be to have it discharged at Darling Harbour, and sent from there direct to Lake Illawarra.

TUESDAY, 10 NOVEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

George Skelton Yuill, Esq. (Messrs. G. S. Yuill & Co, Limited), sworn, and examined:—

439. *Mr. Humphery.*] I believe you have a statement to make to the Committee? Perhaps if I make a statement it may help to shorten the inquiry. My view is that there is no immediate need for the construction of the proposed northern breakwater at Port Kembla. Our experience is that loading there is very rarely interrupted except by bad weather from the south. The eastern breakwater would protect us from this, and also from any easterly gales. There is no need for increased coal-loading facilities. The two jetties now being utilised for this purpose are capable of loading at the rate of 400 tons per hour each at a pinch; but taking half this quantity, say 400 tons per hour between the two, we have a loading capacity of over 3,000 tons per day of eight hours, or 900,000 tons per annum. When the port reaches this amount of coal export, it will be time enough to increase the coal-loading facilities. A small expenditure will be necessary to fit the present jetty appliances for discharging work. The Illawarra smelting works will, I believe, treat some 200,000 tons of Broken Hill ores, and for this purpose may have to import, besides the ores, a very large quantity of flux. If, as is to be hoped, their operations prove successful, then the probability is that the industry will be largely increased, especially in view of the fact that, being in close proximity to the coal and seaboard, the district is peculiarly adapted for industries of this character. The sites round about the port are eminently suitable for such industries, and, unlike the land further back, are of comparatively little value for dairying or agricultural purposes. It has been stated that the proposed harbour would compete with the Lake Illawarra scheme, but, as a matter of fact Port Kembla in its present condition would do so. The trouble in connection with the Lake Illawarra Scheme is that there is this natural port in close proximity. Lake Illawarra will never annex the coal trade that now goes to Port Kembla, and if the port is made a closed harbour it will not only retain its present steamer trade; but also secure a sailing ship trade and a general discharging trade, in which case there will be no need for a second harbour on the South Coast. Another difficulty which occurs to a non-expert is the difficulty of keeping clear in a sea way a channel 30 feet deep, and the great cargo carriers of the present day, the vessels which take away 7,000 and 8,000 tons of dead weight require quite that depth when allowance is made for the swell of the sea. The trade of Port Kembla is at present confined to steamer trade to intercolonial and over sea ports. One of the developments which would naturally follow the improvement of Port Kembla would be a sailing ship trade to over-sea ports. At present the place is not recognised by the underwriters as a risk for sailing ships; but if it were improved by the construction of the eastern breakwater a sailing ship trade would spring up which one might hope would in time approach the sailing ship trade at Newcastle. It is recognised by all who have to do with steamships that the Newcastle and southern coals are totally different in quality. The southern coal is sought by ocean going steamers for bunker purposes. It is preferred to Newcastle coal on account of its steaming qualities and because of its closer stowage. It stows about 40 feet to 45 feet of Newcastle coal. Therefore, we may consider that there is no real competition between the two classes of coal. The southern coal has been sought after for export to Singapore and the eastern ports, which may be said to be coal depôts for the great ocean lines which cross the world. Recently the Japanese coal has cut it out; but it is rumoured that the Japanese Government are getting somewhat alarmed at the rapid depletion of their coal measures and have some view of moderating the exportation, in which case the southern coal trade will again look up. But in any case cheaper loading facilities would bring the southern coal into competition with the Japanese coal, and would result in a very largely increased trade. The third development and source of revenue which would result from the improvement of Port Kembla is, I consider, the discharging trade which would follow. I have already referred to the Illawarra smelting works and their probable development. We hear too of possible developments in the iron industry, and of suggested works for treating ores brought from New Caledonia. To my mind the district in the neighbourhood of Port Kembla, which is close to the sea-board, and has a plentiful coal supply, is the most advantageous site for the construction of large treating works. Port Kembla would then require facilities for the discharging and loading of cargo.

440. *Mr. Hoskins.*] They have no limestone in the district of which you are speaking? No. I have already suggested that the fluxes will have to be brought over sea, and therefore a harbour for discharging cargo will be necessary. Another source of revenue will be the general harbour work which naturally follows increased population. It has been pointed out that the land round Port Kembla is in the hands of private holders. At the present time, however, that land is of very little value. It is sour land, and worth nothing to speak of, and it seems to me that the Government would make a very handsome profit by at once resuming the land, and selling it in town lots after the completion of the harbour works.

441. *Mr. Hassall.*] Do you think it essential that a safe harbour should be provided on the south coast? I think such a harbour would be an immense advantage to the district.

442. In the event of Port Kembla being improved, would the colliery proprietors to the north send all their coal there, or would they continue to ship it from their own jetties? If they were sending to Sydney they would ship at their own jetties; if they were sending oversea they would ship at Port Kembla.

443. If a vessel came for a big cargo of coal it would be shipped at Port Kembla? Yes.

444. Port Kembla is not recognised by the underwriters as a safe port? Not for sailing vessels. They take the risk with steamers. Steamers go there regularly.

445.

G. S. Yuill,  
Esq.  
10 Nov., 1896.

G. S. Yuill,  
Esq.  
10 Nov., 1896.

445. Do ocean steamers go there? Yes. Some of the largest steamers that come to the Colony have loaded there. 7,000 tons of coal have been loaded there in one shipment. The following vessels have loaded there: The "Armidale," 5,000 tons; the "Barmen," 4,000 tons; the "Gulf of Mexico," 4,500 tons; the "Gulf of Lyons," 4,000 tons; the "Gulf of Bothnia," 5,000 tons; the "Gulf of Anend," 4,000 tons; the "Sonneburg," 7,000 tons; the "Stassfurt," 5,000 tons; the "Indrani," 7,500 tons; the "Echuca," 4,000 tons; and the "Port Phillip," 4,000 tons. Besides these there have been the ordinary coasting vessels.

446. The vessels you named have had no difficulty in loading at the port? None whatever.

447. They can go there in any state of the tide? Yes. It is a very good roadstead.

448. And fairly safe? Yes, with an excellent holding ground—a beautiful blue clay.

449. You say that the Illawarra coal is preferred to the Newcastle coal for bunker purposes? Yes. All the mail boats which trade here, both foreign and English, take nothing else.

450. How do the prices compare? They do not ask the Newcastle companies to tender. They will not take Newcastle coal.

451. They can take the Illawarra coal without any great trouble? Yes.

452. Do they take Port Kembla coal or coal from collieries further north? A great deal of coal comes down to Port Kembla from collieries further north. Half the coal shipped at Port Kembla comes from collieries lying on this side of Wollongong.

453. What collieries would those be? Chiefly Corrimal and Bulli.

454. Does coal go to Port Kembla from as far north as Coalcliff of Bellambi? No. I do not think the Bellambi mine is getting out much coal just now. The great difficulty with all these mines is that they have no waggons for running over the Government lines. The railway arrangements do not permit them to send to Port Kembla.

455. Are there no arrangements whereby the Commissioners will provide rolling stock? Yes; but the rates are prohibitive. They are far above the Newcastle rates, or the rate for coal going towards Sydney. Besides, sometimes the Government waggons will not fit the screening appliances.

456. In the event of the harbour being improved, either a separate line, or different rolling stock would be necessary? The line and the rolling stock are all right, but the screens would have to be lifted a bit. That would not cost very much, but the mine owners do not care to go to any trouble now, because at the present time the railway rates are prohibitive.

457. Are we to understand that the Japanese coal is going out of favour? I did not say that. I said that it was reported that the Japanese Government were alarmed at the depletion of their coal supplies.

458. You think there is a good probability of the eastern trade coming back to Illawarra? That is the indication. Of course if the rumour were correct, a very large trade would spring up.

459. Do you think that a more central position than Port Kembla could be obtained for the South Coast district? I think that Port Kembla is the very best place for a harbour there. The top coal seam—the Bulli seam—is getting exhausted as you go north, while the lower seams get better as you go south. Port Kembla is midway between both. A mine is being opened up now on the range due west of Port Kembla to supply the smelting works, and we know that coal exists a good deal further south than that.

460. Has the land been tried any great distance further south? The coal has not been opened up, because it is not required.

461. Do you think Lake Illawarra will ever be a harbour for the use of large ocean going vessels? That is more a matter for experts. I do not see how the scheme can be a financial success, because of the close proximity of Port Kembla. Steamers will always go to a free port rather than to one where they have to pay dues.

462. Now they can go to Port Kembla practically with safety and can load there almost whenever they like? Yes, and they do.

463. Do you think the expenditure of a large sum of money would be justifiable to improve what is a good natural port? I think the construction of the eastern breakwater would be a very great improvement. The port could then be used for discharging and loading sailing vessels. It is said that the smelting works will take about 250,000 tons of ore and flux a year.

464. Will they not bring it to Lake Illawarra so as to get it delivered as closely as possible to their works? It would not pay to make Lake Illawarra a harbour simply for that trade. They can very easily bring the stuff from Port Kembla. There is a railway between the two places now.

465. Do you think it necessary to carry out the eastern breakwater 2,800 feet? For loading and discharging sailing ships I should think it would be desirable to carry it out as far as possible.

466. But you think the northern breakwater unnecessary? As the trade of the port increases, it may be a good thing to make the northern breakwater, but you have to see your way to make it pay first.

467. Do you know on what tenure the jetties at Port Kembla are held? No; but they would have to be resumed.

468. In the event of the proposed improvements being carried out, the Government would have to resume the jetties at Port Kembla, together with the land surrounding the port? Yes.

469. Have you any idea of the value of that land? It is of very little value.

470. Its value is small either for agricultural or grazing purposes? I do not think it is used at all.

471. You think it would be desirable to resume this land before operations are commenced? It would be advantageous to do so, otherwise the Government would be enhancing its value by their own expenditure.

472. *Mr. Roberts.*] Would Port Kembla be a more convenient place for a harbour than either Wollongong or Bellambi? I dislike both Wollongong and Bellambi, because of the rocky nature of the bottom there. At Port Kembla you have excellent holding ground—2 or 3 feet of sand, and then solid blue clay.

473. But Port Kembla could be made still deeper if necessary? Yes.

474. Do the steamers which you have mentioned go regularly to Port Kembla to load coal? The steamers I mention are over-sea vessels, which only come occasionally. The "Indrani" loaded at Port Kembla last year, and she loaded there again the other day.

475. Would the intercolonial boats be likely to load coal at Port Kembla, if the harbour were improved? A great deal of coal is loaded into intercolonial boats there now.

476. That is, when the weather is suitable? Yes; but the weather is rarely otherwise.

477. Do you think that the development of the coal trade of the district is being retarded through the want of a safe and accessible harbour? I think so.

478. Is it more with a view to enable sailing-vessels to go to Port Kembla, that you would like to see the proposed works carried out? Yes, and to enable discharging operations to be carried on there.
479. What cargo would be likely to be discharged at Port Kembla besides the ore for the smelting company? I do not know of anything that would come in large quantities.
480. But the inwards traffic would develop as population increased? Yes; it would develop with the requirements of the district.
481. Can you tell the Committee what a steam-ship saves by loading at Port Kembla instead of in Sydney Harbour? 2s. 6d. per ton, at the very least. The freight is 2s. 6d. per ton, though they generally charge 3s. a ton.
482. *Chairman.*] What class of boats would it suit to coal at Port Kembla? That is a difficult question to answer. As a general rule, the coasting steamers cannot spare the time to go away from Sydney to coal. The New Zealand boats might go around to Port Kembla. They occasionally go to Newcastle now for their coal.
483. How much coal would a New Zealand boat take? They might take 1,200 tons; but those boats come in the category of coal-carrying boats, because coal forms a large part of their cargo. It would not pay a passenger-vessel to go to either Newcastle or Port Kembla simply for bunker-coal.
484. You do not think it likely that many of the intercolonial passenger boats would coal at Port Kembla? No; they would have no time to go there specially for coal, and they could not call at a coaling port with passengers on board.
485. Do you think that if the eastern breakwater were made a larger number of intercolonial vessels would coal at Port Kembla than coal there now? I do not know that there would be any great increase in the colonial trade. That trade is steadily increasing now.
486. *Mr. Roberts.*] Where would you expect the increase to come from? From the exportation of coal by steamers and sailing ships over sea. The great business of the port of Newcastle is the loading of sailing ships.
487. You think that if Port Kembla had anything like the facilities of Newcastle she would get a fair share of that trade? Not a share of the Newcastle trade. The coal that would be sent from Port Kembla would be coal for bunker purposes. Newcastle coal is used to feed locomotives, and for purposes of that kind.
488. Where would the Illawarra coal be sent to? Singapore, Hongkong, Manilla, San Francisco and, in fact, all over the world.
489. Have you any idea as to what quantity of ore would be discharged at Port Kembla? I think it is estimated that the smelting company will take 200,000 tons a year.
490. Would that ore come principally from Broken Hill? It would all come from Broken Hill.
491. Do you look upon Wollongong Harbour as inadequate for the requirements of the district? Certainly.
492. Do you regard Jarvis Bay as out of the question? Yes; it is too far from the coal-bearing land.
493. Is it regarded as a useful harbour of refuge? It is very rarely that a steamer goes there.
494. Would Port Kembla be of any service as a harbour of refuge if the eastern breakwater were constructed? Well, steamers can generally look after themselves. I do not know that they want very much of that sort of thing.
495. You do not think that it would be worth while to construct a breakwater there merely to provide a harbour of refuge? I do not think so.
496. At the present time it is not safe for sailing ships to go to Port Kembla? No.
497. How much per ton could the Government charge steamers going to Port Kembla if the proposed breakwater were constructed? I think 6d. a ton.
498. Is that what is now charged at Newcastle? I believe so. There is a consolidated rate at Newcastle.
499. Would that rate compare favourably with the rates you are in the habit of paying at other ports? I think so.
500. From what mines would the coal go to Port Kembla if the proposed works were carried out? Well, at the present time about 250,000 tons of coal are shipped from Port Kembla in the year. The jetties there are not used half the time, because they can only load steamers.
501. Do you know if new mines would be opened up if the proposed works were carried out? Well, there is a new mine being opened up now—the mine I have already referred to.
502. Do you think the Bellambi jetty would be used if the proposed harbour were constructed? Yes.
503. From how far north does coal now come to Port Kembla? The Corrimal Pit supplies most of the coal shipped at Port Kembla; but coal has been taken from as far north as Bulli. Mount Kembla and Corrimal supply most of the coal.
504. What is the distance between Bellambi and Port Kembla by sea? I should think about 10 or 11 miles.
505. Is the Bulli jetty largely used? It is used for the shipment of Bulli coal.
506. Would that coal come to Port Kembla if the proposed works were carried out? It would come down to load sailing ships. The whole district would supply coal to load sailing ships. The southern district at the present time has a steamer trade which is probably as good as the Newcastle steamer trade; but it has no foreign sailing-ship trade.
507. It is the sailing-ship trade that you wish to develop? That is where I would expect a great development.
508. You say that that trade can only be developed by the construction of the eastern breakwater? Yes, or by the making of some other harbour.
509. You look upon Port Kembla as the best site for such a harbour? Yes.
510. *Mr. O'Connor.*] Whatever may be the natural advantages of Port Kembla, the place would be much more secure if the proposed harbour works were carried out? Certainly.
511. Upon the occurrence of bad weather it is impossible for the steamers to remain at any of these southern coaling places? Yes.
512. In your judgment Port Kembla would be the best place for a south coast harbour? Yes.
513. *Mr. Hoskins.*] Do you think that the smelting works at Dapto could be managed as advantageously and as profitably if the flux and ore required for treatment were discharged at Port Kembla as if it were discharged at Lake Illawarra? Well, the smelting works are situated right alongside Lake Illawarra; but the haulage from Port Kembla would be very little.

- G. S. Yuill,  
Esq.  
10 Nov., 1896.
514. What work has been done with a view to making Lake Illawarra available as a shipping place? I do not know. I am not in a position to give you any information on the subject.
515. Can you tell us how long it would take to carry out the scheme if they set vigorously to work? No; that is an engineering question. I should think it would take a long time.
516. Do you think the operations of the smelting company should be inconvenienced by any delay in carrying out the Lake Illawarra scheme? The smelting company would not be much inconvenienced. They would only have to pay a little more for the carriage of their ore from Sydney.
517. Do you mean to say that ore would be taken to Sydney instead of being discharged at Port Kembla? At the present time there are no appliances for discharging ships at Port Kembla.
518. Do you consider that by the construction of the proposed eastern breakwater a sufficient area of water would be enclosed to enable sailing vessels to be loaded and unloaded and moved about with facility at Port Kembla? I think so.
519. Do you think it necessary to make a second breakwater there in order to entirely protect vessels from the swell of the ocean? It would be an advantage; but there is the question of expense to be considered. In commercial transactions we always cut things as fine as possible to start with.
520. Do you think it would be advisable for the Government to incur expenditure in offering additional facilities for the loading and unloading of vessels at Port Kembla? I think so.
521. If the Illawarra Harbour scheme were carried out, and if Port Kembla was improved, where would you prefer to send a vessel to? To Port Kembla.
522. *Mr. Humphrey.*] Do you say that the construction of the proposed eastern breakwater would give all the protection necessary for sailing ships? I think that one breakwater would be quite enough to start with.
523. Do you think that you could ensure sailing vessels going there if there were only one breakwater? I think so.
524. Would it be possible for oversea sailing vessels to discharge and load at Port Kembla without the northern breakwater? I think so.
525. Therefore, at present you would not recommend the expenditure of more money than was necessary in order to construct the eastern breakwater? I do not think I would recommend the construction of the northern breakwater unless the dues received were sufficient to pay interest upon the expenditure.
526. Do you think it desirable to construct the whole of the proposed eastern breakwater, or only part of it? I think the further you carried it out the better.
527. You do not think the proposed work too extensive? No.
528. Do you think that interest could be paid upon an expenditure of £158,000? Yes.
529. Until the opening of Lake Illawarra or the improvement of Port Kembla the ore and flux required by the Illawarra Smelting Co. must be discharged at Sydney, and conveyed thence by train? Yes.
530. That is a great advantage to the Railway Commissioners? It assists the railway revenue.
531. If that ore were discharged at Port Kembla the railway returns would be lessened? Yes; but they would gain in the increase of the coal traffic to Port Kembla. The whole of the traffic from the mines north of Port Kembla would come over the Government line.
532. The only steamers that now call at Port Kembla are steamers employed in the export trade? Yes.
533. Would there be any change in this condition of things if Port Kembla were improved? It is hard to say; but it is probable that there would not be a great deal of change. A great many of the steamers which do their bunkering in Sydney could not afford to call at Port Kembla.
534. Did the Orient boats ever go down there for coal? No. They could have done so; but we could never be certain of the weather beforehand, and we had to make our arrangements a year ahead.
535. Do steamers go to Newcastle for bunker coal? I do not think so.
536. If the Lake Illawarra scheme is carried out, will not the coal obtained at the new mine to which you referred be shipped at Talawera Point? I suppose it will.
537. It is not desirable to have two harbours close together? No. Port Kembla is a natural port, and the Illawarra Harbour scheme will not take the steamer trade from Port Kembla, whereas if Port Kembla be improved it will get the steamer trade and the sailing-ship trade too.
538. If the Illawarra Harbour scheme fails, the only suitable harbour on the south coast will be Port Kembla? Yes.
539. Is it desirable to proceed with the improvement of Port Kembla before we know whether the Illawarra scheme will be carried out? I do not think it would be commercially desirable to carry out the Illawarra scheme with Port Kembla right alongside.
540. You are of opinion that Port Kembla is a better harbour site than Lake Illawarra? I think so, especially as it is partly a natural harbour.
541. The land around Port Kembla is of very little value, and would only be rendered valuable by the construction of the proposed harbour works? Yes.
542. That land is owned by the Wentworth family? Yes.
543. Are there any other owners? I do not think so.
544. Are not the proprietors of the jetties lessees of the Wentworth trustees? They have to pay royalty to the trustees. I think they pay so much per ton.
545. Do you think there would be a large trade developed by the back loading with coal of vessels bringing ore from Port Pirie? I do not think there would be much development of the trade, because a great deal of coal is carried to South Australia now. Some of the steamers take a certain quantity of Newcastle coal, and then call in at Port Kembla to complete their loading. The coal trade may develop with an increase of mining operations at Broken Hill.
546. The Broken Hill ores will not all come to Lake Illawarra? No.
547. Do you consider that the trade of the place will give a return upon the expenditure necessary to afford facilities for it? Yes.
548. *Mr. Trickett.*] Besides the 6d. per ton harbour dues to which you refer, would not pilotage and light dues have to be paid? Yes; but they would not come to a great deal.
549. Would there have to be a tug service at a place like Port Kembla? I do not think so.
550. With regard to what you said about the Japanese coal trade, I suppose that is only a rumour? Yes.
551. You do not make it a very strong feature of your argument? No

552. The estimated cost of improving Port Kembla is about £240,000. Interest on that at 4 per cent. would be £9,600. To produce that return by means of tonnage dues of 6d. on the ton you would require a trade of 384,000 tons? Yes. The present export trade of the port is 250,000 tons.

G. S. Yuill,  
Esq.  
10 Nov., 1896.

553. Is all that coal sent oversea? It is all used for bunker purposes. Some of it is sent up to Sydney, and some of it goes oversea, and to the other colonies. 134,434 tons of coal were shipped at Port Kembla during the first six months of this year. Last year 227,357 tons of coal were shipped there.

554. Steamers loading there now keep up steam all the time? Yes.

555. It is rather risky work? Yes.

556. Do you think that coal will be sent from Bellambi and Bulli to be loaded at Port Kembla for foreign trade? Yes; that is being done now to some extent.

557. If they could get plenty of tonnage, the coal-mine proprietors might be induced to send more coal to Port Kembla? Yes, especially if the sailing-ship trade developed.

558. *Mr. Clarke.*] Do steamers carrying coal as cargo to intercolonial ports call at Port Kembla? Yes.

559. Many of them? Yes.

560. It would not pay steamers to call there simply for their bunker coal? It sometimes pays cargo boats to do so; but not generally passenger boats.

561. The Union Company's boats generally go to Newcastle for coal? Yes; but they take half a cargo of coal there.

562. Would not the same thing be done with regard to Port Kembla? Yes. The "Innamineka" goes down there now. She takes in half a cargo of coal, and then comes back to Sydney for the rest of her cargo, and for passengers.

563. What is the distance from Port Kembla to the Illawarra smelting works? Very little; but I cannot tell you the exact distance.

564. In the event of the Illawarra Harbour scheme not being carried out, ore could be landed at Port Kembla, and carried by rail to the proposed smelting works? Yes; if the harbour were improved.

565. Is not most of the coal sent from Newcastle taken away by sailing ship? About half the coal is taken by steamers and half by sailing ships.

566. Do you think it would be advisable to make the proposed eastern breakwater in order to enable sailing vessels to load at Port Kembla? Yes; I think it would be advisable to make both breakwaters if necessary.

567. If Port Kembla were improved, would coal-mine proprietors continue to use the other southern jetties? I think so. The rates over the Government line would always be more than it would cost them to ship at their own jetties.

568. *Mr. Egan.*] What coal does the Gulf line of steamers take? From Port Kembla mostly Corrimal coal, I think.

569. Are you sure that they do not take Metropolitan Company's coal? Quite certain.

570. Has it not been usual for those steamers to load coal at Woolloomooloo Bay and Darling Harbour and to take the Metropolitan Company's coal? Yes.

571. Why have they discontinued that practice? They have gone to Port Kembla only when they have been chartered to take coal from there.

572. The change has nothing to do with the firing of coal cargoes? I do not think so.

573. Can they load at Port Kembla in all weathers? No; sometimes they cannot load.

574. I believe that a large number of vessels which went there at the time of the Newcastle strike had to come away because they could not load within the specified time? I have not heard of that. There may have been occasional delays of a day or two. Vessels are frequently stopped from loading because of the rough weather.

575. They cannot unload at Port Kembla? No.

576. Was not the large output of southern coal last year the result of the Newcastle strike? That may have contributed towards it.

577. Can you tell us why the trade for the first half of this year was proportionately greater than the trade of last year? The southern coal is preferred by steamship owners for bunker purposes.

578. On account of its cheapness? No; but because it is better, and stows better.

579. What is the price at the present time? Six shillings and sixpence is supposed to be the ruling price. The price of Newcastle coal is about the same.

580. What prospect has Port Kembla of paying? I think the development of trade there would make the place pay.

581. You said that very few steamships are loaded at Newcastle;—can you supply the Committee with information which would support that assertion? I referred to oversea steamers, and I have no doubt that the statistics of the Newcastle Custom House would support what I say. I did not refer to the intercolonial steamers.

582. I suppose you know that a great deal of coal goes from Newcastle to San Francisco? Yes; but I do not know two steamers that have loaded coal for San Francisco within the last ten years.

583. Or for Valparaiso? I do not know a steamer that has loaded coal for Valparaiso.

584. Does much coal go to Melbourne from the southern district? A good deal.

585. Can you tell us how much? No; but I can get you that information.

586. Do you not think that the people of the southern district would be very much handicapped, as compared with the people of the northern and western coal districts, if they had to pay port dues and pilotage and light charges? I do not think they would be handicapped at all if they had a sailing-ship trade.

587. You rely upon a trade which does not exist at the present time to make this harbour pay? Yes, a trade which would result in the development of the district and the importation of ores.

588. Would the construction of the eastern breakwater make any material difference, so far as the creation of a safe harbour at Port Kembla was concerned? I think so.

589. What is the difference in the insurance charges between loading at Sydney and loading at Port Kembla? There is no difference.

590. Would the majority of people be satisfied with the construction of the eastern breakwater? That is a matter for the sailing-ship owners and the underwriters to settle.

591. I suppose that if the Government had to purchase the land surrounding Port Kembla it would have to pay a very high price for it? It would only be a matter of valuation.

- G. S. Yuill, Esq.  
10 Nov., 1896.
592. You consider that the people on the South Coast have as much right to a harbour as the people on other parts of the coast? Yes.
593. *Chairman.*] Is there any other port on the South Coast besides Port Kembla where oversea trade can be done? There is no port where it is done now.
594. If the proposed eastern breakwater were constructed, would all the oversea trade of the southern district be done at Port Kembla? It is all done at Port Kembla now.
595. Therefore it is reasonable to infer that if Port Kembla were improved it would still be done there? Yes.
596. What is the difference to a coalfield between having a port at which boats can load regularly and a port which can be only used intermittently? That is a very difficult question to answer. I have known of a boat going to Port Kembla twice, and having been unable to load there. Of course that throws out the whole work of the coal-mine. It is impossible to say what the loss to the mine-owner is, but it is very heavy, and there is also the loss to the steamer.
597. Would it be worth 3d. a ton to the mine-owners to have the proposed eastern breakwater carried out? I should think it would be worth a great deal more. Where you have the sailing-ship trade, you can go on loading all the time, because whenever there are no steamers waiting you can load into the sailing-ships. Where there are no sailing ships, however, you are idle a great part of the time. I consider that it would be worth more than 3d. a ton to mine-owners to be certain that vessels would be able to load when they said they were coming.
598. What does it cost to ship coal once it is on a jetty? I should think 1½d. or 2d. a ton; but I can get you the information.
599. Will the underwriters insure a sailing boat going to the South Coast? No.
600. Will they allow any steamer to go alongside the jetties at Port Kembla? Any steamer that does not draw too much water.
601. A steamer drawing 25 feet? Yes. Steamers have been there which draw 27 feet. Port Kembla is recognised as one of the ports of call. I do not know whether oversea underwriters charge the owners at home more for allowing ships to go there; but our underwriters do not charge a penny more.
602. Would the underwriters allow a boat like the "Oruba" to go there? I think so. It is a safe place for any steamer so long as the weather is ordinarily favourable.
603. What is the cost of shipping coal? The cost of shipping coal at Port Kembla varies from 1½d. to 2d. per ton.
604. What would be the value of an eastern breakwater to the mines under present circumstances? Rough weather along the coast means an entire stoppage of loading at all the mines on the South Coast. Sometimes southerly gales may continue for days, and on occasions they follow each other so as to create vexatious interruption to the trade. Every day's stoppage of the mines caused thereby means a loss to all concerned, except, perhaps, the salaried officers. The men lose their wages, the owners lose the standing expenses of the mine, besides any profit on their operations, and in too many cases they lose good business, because sometimes steamers cannot wait indefinitely for favourable weather, and suit themselves otherwise. If the steamers have no option but to wait, there is also the daily demurrage loss to them. The prospect of such demurrage always weighs as a handicap with owners against taking southern loading under the present circumstances. It is difficult to place an absolute valuation upon all these various losses, but it must be, in the aggregate, serious for all concerned in the southern coal trade, and consequently also for the district.

WEDNESDAY, 11 NOVEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	}	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.		CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.		JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.		THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.		GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Archibald Campbell, Esq., M.P., sworn, and examined:—

- A. Campbell, Esq., M.P.  
11 Nov., 1896.
605. *Chairman.*] Do you desire to make a statement to the Committee? Yes. It appears to me that the starting point in connection with this matter is one of population. There are fully 20,000 people directly or indirectly concerned in this scheme, that is, in a local sense, and altogether apart from the national aspect of the case. From Helensburgh to Ulladulla, and right round in the direction of Robertson and Wingecarribee, almost to Moss Vale, there are, I should think, 25,000 people, more or less, all of whom are interested in this scheme; but, as I prefer to be under rather than over the mark, I will put the number down as 20,000.
606. Do you include the people at Helensburgh? The people at Helensburgh are not so much interested as the people further south; but the proposed harbour would be of advantage to them. They would use it to a certain extent though I believe that in all probability the greater part of the Metropolitan Colliery Company's coal will always go to Darling Harbour. As, however, the grade to Port Kembla is better than the grade to Sydney, it is not unlikely that a good deal of that coal will go to Port Kembla. The only up grade going towards Port Kembla is a pinch of 1 in 40 between Stanwell Park and Clifton.
607. *Mr. Roberts.*] How do the distances compare? Helensburgh is 29 miles from Darling Harbour, and the 51-mile peg on the Illawarra railway is just opposite Port Kembla, so that Helensburgh is rather nearer to Port Kembla than to Darling Harbour.
608. *Mr. Humphery.*] How far is Port Kembla from the Illawarra Railway? Four miles at present; but the Department of Railways propose to make a connection which will considerably shorten the distance. It has

has been recommended that a deviation should be made leaving the main line on the north side of Wollongong, and proceeding down by what is called the Mount Keira line, which was resumed by the Government some years ago at a cost of £7,000, and thence over almost dead level country from Belmore basin to Port Kembla. Such a deviation would cut off a very considerable curve from the coast, that the Illawarra line makes by going in the direction of Unanderra.

609. *Mr. Roberts.*] Would it be a fair thing to call the distance 25 miles? Yes, I should think that would be about it. On the Loan Estimates which have just been passed, there is a vote for certain expenditure which has been required ever since the first settlement of the district to construct a road *via* the Macquarie Pass, to connect the high lands with the low lands. While the people of the high lands are almost within gunshot distance of the people of the low lands the steepness of the mountains has kept them almost as much apart hitherto as if they were living in different countries. When the proposed road is made, the people of Robertson will be able to come direct down to the coast, as they should have been enabled to do years ago, and the produce they will bring will help to increase the harbour traffic. The road I speak of will run from the head of the Macquarie River to Robertson. Between that very populous and fertile locality and what is called the Jamberoo Mountain road there is a mountain range running from 700 or 800 feet to 1,300 feet high. The people on the northern side of that range have been cut off from the Jamberoo route almost as effectually as they would have been if that route had been as far south as Shoalhaven. This new road, however, will enable them to bring their produce—and they grow large quantities of potatoes and other things—down into the Illawarra district. That will mean a very large traffic. I make this explanation in order to render clear my reference to the upland people when speaking of the number of persons concerned in the proposed scheme.

610. Do you expect that any produce will be shipped at Port Kembla? There could not be a large population settled there, and a large coal trade, without trade in other things springing up. Illawarra is a very fertile district, and is capable of producing almost anything. It is not, as is unfortunately the case with many other districts in this Colony, a place where there are abundant mineral deposits, but where the land is of very little use for agricultural purposes. In Illawarra it is the very reverse of this, and many persons who own valuable plots near coal-mines regret that they are unable to turn their land to a profit in an agricultural sense. However, the profits of coal-mining more than compensate them for that. I have with me some diagrams prepared by the Department of Railways, which show the grades upon the Illawarra line.

611. In your opinion, the line from Helensburgh to Port Kembla being 4 miles shorter than the line from Helensburgh to Sydney, and the grade being better going south, the Helensburgh coal will find its way to Port Kembla? Well, the distance you may regard as practically the same, and I believe that most of that coal will always go to Darling Harbour; but, considering the steep grades that there are against traffic going towards Sydney, I think it is likely that some of the coal will, like water, seek the lower level, and go to Port Kembla. The favourable grades which exist going south may induce some of the coal to go from Helensburgh to Port Kembla. At this juncture I might, perhaps, read the following letter which was sent by several of the southern colliery proprietors to myself and other Members representing the south coast district:—

To Messrs. Nicholson, Archibald and Alexander Campbell, Morton, Milliard, Clarke, and Wood, Esqrs., M.S.L.A. for the Southern Electorates.

Gentlemen,

Sydney, 1 October, 1896.

For many years the southern, or Illawarra collieries, as well as the general trade of that district, have suffered severely from the want of a properly-protected harbour, at which deep-sea or ocean-going vessels could load and discharge cargoes.

Of late years, on account of the changes in our trade, the want of such a harbour has caused great loss and inconvenience to the district.

At present we are deprived from doing a very large coal export trade with foreign markets on this account.

The competition of foreign mines has of late become so keen that we are totally unable to compete in many important markets, compelled as we at present are to convey our coal at great expense to Sydney Harbour, and there to discharge it into ocean-going vessels,—this not only destroys the condition of our coal, but the expense of conveyance, of discharging and re-loading the same is prohibitory.

About two years ago, on the failure of Wollongong Harbour to afford the desired facilities, the combined interests of Illawarra met, and agreed to make a joint representation to the Minister for Works to have particular surveys, and a report made by his accredited officers, of the various sites proposed for a harbour.

The plans and report of the Engineer-in-Chief for Harbours and Rivers have now been in the possession of the Government for many months, but nothing, so far as we are aware, has been done.

In view of the great increase of trade that would assuredly come to the southern collieries, and the impetus it would give to the erection of works and manufactories in the district, that would employ large numbers of workmen; if protection to shipping were provided—were as colliery owners, and otherwise largely interested in the development and prosperity of the district, trust that you will exert all the influence you possess with the Ministers to have this all-important question of a harbour for the South at once submitted to the Public Works Committee for their consideration and report.

The matter is, we assure you, of extreme urgency to the coal-owners, miners, merchants, and inhabitants generally of the important district that it will so greatly benefit.

We remain, &c.,

E. VICKERY, Coal Cliff Colliery.

JAMES R. M. ROBERTSON, South Bulli Colliery.

HERBERT JEFFERSON, Manager, Metropolitan Coal Co., Ltd.

JOSEPH VICKERY, Mount Kembla Coal Co., Ltd.

J. H. BRACKENBURY, Sec., Southern Coal Co. of N.S.W., Ltd.

CHARLES J. BYRNES, Mt. Pleasant Coal and Iron Co., Ltd.

H. Y. OSBORNE MACCABE (Attorney for FRANK OSBORNE), Osborne Wallsend Colliery.

Mr. Jefferson's signature goes to show that the Metropolitan Colliery is to some extent interested in this matter.

612. Are all the southern colliery proprietors represented by the signatures which you have read? The South Clifton Colliery is not represented, neither is the Bulli Colliery, which is owned, I believe, by Mr. Adams of Consultation celebrity. I believe that the names I have read are the names of those who compose the Southern Coal Owners Association. Leaving out the Metropolitan Colliery there are eleven collieries in the South Coast district, all of which are within range of the proposed port and would be able to get to it on a down grade of railway. Fully £1,000,000 must have been expended in connection with these eleven collieries, in buying the various properties, in opening the mines, in making tramways and obtaining rolling stock, and in procuring all the appliances necessary to the working of those concerns.

613. During what period? I suppose it is forty years since the first colliery—the Mount Keira Colliery—was opened. In the early days of the coal trade, the hope of the district for a port was centred

A. Campbell,  
Esq., M.P.  
11 Nov., 1896.

centred in Wollongong, and the Government was urged time after time to carry out harbour works there to afford facilities for the shipment of coal. After many years, what is called the Belmore Basin was constructed there; but it has proved a poor substitute for a harbour. Previous to the construction of the Belmore Basin a coal-mine was opened and partly worked at Woonoona, and there being then no Government railway in existence, there was no alternative but to erect a jetty at Bellambi. Had a Government railway been in existence then as now, doubtless the trade of the district would have been concentrated at Wollongong, but in the absence of such line, and inasmuch as the seashore was easily reached, a good deal of coal was shipped from Bellambi.

614. *Mr. Humphery.*] Was not the Bellambi jetty swept away? I think it rotted away. After the people of the district found that the accommodation at Wollongong was inadequate, and that only small instalments could be obtained from the Government for the purpose of enlarging the harbour, they turned their attention to the question of railway communication. Eventually, the Illawarra railway was constructed, but the heavy grades have practically prevented coal from the southern district going to Sydney. The rates charged for haulage have also proved an obstacle to any development of the coal trade by means of the railway. The next step taken was for the establishment of a Harbour Trust. The same difficulty existed on the south coast that presented itself at Newcastle. For twenty or twenty-five years only small sums of money were voted for the improvement of the harbour, and consequently the Government officers in charge of the place were prevented from carrying out any very large works. On one occasion, £60,000 was voted for expenditure at Wollongong, and with that amount the present basin was practically constructed. The people of Wollongong, seeing that there was no hope for the improvement of the harbour by the expenditure of small sums upon it, asked for the creation of a harbour trust, hoping that such a trust would be able to raise money by the issue of debentures with which to carry out larger works. The trust was formed, and they thought that they had better follow the lines which the Government had been following in dealing with the harbours of the country, and they accordingly instructed Sir John Coode to design a harbour for Wollongong. Sir John Coode thereupon made a design for a very elaborate scheme. I should mention that from the formation of the trust Mr. McMillan, who, as the Colonial Treasurer of the day was the Ministerial head of the trust, invited the members of the trust to come to Sydney for a consultation, and he gave them to understand that he would endeavour to have passed through Parliament any amendment of the Act which, in their opinion, might be required to enlarge their powers and to give facilities for carrying out the work entrusted to them. By these promises and representations the Commissioners were induced to go much further than they would otherwise have gone, because they considered that they had the Government of the country at their back in regard to any change or alteration that might be required in the law, and they were also given to understand that they would get assistance from Mr. McMillan in floating a loan. Moreover, when they required an engineer they obtained a pupil of Sir John Coode. The only money they had to work with, however, was an endowment of £5,000 a year, the proceeds of dues at 3d. per ton upon coal, and a little money obtained from wharfage rates. They had to pay out of this the whole expenses of the harbour, including the dredge service, the pilot service, and the making good of any damage that might be done to the coal-staiths or the basin. The whole cost of maintaining the harbour, which had previously devolved upon the Government, was thrust upon the Harbour Commissioners, and in this way fully £3,000 out of an income of £5,000 per annum was swallowed up. Consequently the trust had only about £2,000 per annum to expend in any way.

614½. *Mr. Roberts.*] How much per annum did they collect in dues? I do not remember, but it was not a very large amount.

615. Were you a member of the trust? Yes; I was a member of the trust all through.

616. *Mr. Wright.*] About 80,000 tons of coal are shipped from Wollongong every year? Yes, about that. Either the year before the trust was created, or two years before, £9,000 had been voted for expenditure upon harbour improvements at Wollongong. Of this amount £3,600 remained unexpended when the trust came into existence. It will thus be seen that towards the first year's endowment of £5,000 to the Trust the Government actually had £3,600 in hand in the unexpended balance mentioned, thus reducing the real cost to the Treasury of the first year's endowment to £1,400, instead of £5,000, as otherwise would appear. A great deal has been said to the effect that money was squandered by the Wollongong Harbour Trust; but those who make such remarks know nothing of the real facts of the case. For fully a year before the trust came into existence, and practically ever since—a period of about eight years—the port of Wollongong has cost the Government practically nothing. The only vote granted in that time was one which was passed the other day for an expenditure of £1,000 to repair the breakwater.

617. *Mr. Roberts.*] The total expenditure of Wollongong up to date is estimated by the Government at about £157,000 altogether? I suppose in that estimate the estimate of liabilities includes the claim submitted by Mr. Hungerford. During the time that the trust was in existence tens of thousands of pounds were spent upon harbour works in other places. As Wollongong stands next to Newcastle, so far as the importance of its trade is concerned, it is reasonable to suppose that a very large amount would have been voted for the improvement of the Wollongong Harbour had it not been for the existence of the trust. In all probability £100,000 would have been voted for that purpose within the period referred to. If there were no trust in existence, no Government could have resisted the just claims of the Illawarra district for such expenditure. But instead of £100,000 being granted, the only money expended was the £25,000 paid to the harbour trust, and the greater part of that money went to pay for the ordinary maintenance of the port, which would otherwise have had to be borne by the Government. There is a population of over 3,000 at Wollongong, but after the harbour trust failed to be successful they became tired of these peddling attempts to give proper accommodation there, the only result from which was very inadequate, while large ocean-going steamers were able to load at Port Kembla without the assistance of any harbour improvement. Therefore, notwithstanding the fact that Wollongong is a Government port, and that all the Government institutions are there, the people of Wollongong came to the conclusion that they would throw in their lot with the people of other parts of the district, and allow the Government officials to decide which was the best place for a harbour. I live in Wollongong, and my interests are mainly centred there, but rather more to the north of it than to the south. Personally, it would suit me best if the Wollongong Harbour could be made to answer all purposes, and the next best thing for me would be to have Bellambi Harbour made; but, in the interests of Illawarra, I was willing to join with Mr. Nicholson, the hon. Member for Woronora, and other people of the district, and ask the Government to send its officials to make a survey of the coast, and to report upon the best place for a port. A survey has been made,  
and

and Port Kembla has been chosen. For myself, I never thought that any other competent recommendation was possible. Any person with one eye open who looked at the place would see that nature had done far more for Port Kembla than for any other place on the coast. To show that from the very earliest days of the Colony this place has presented itself to persons connected with the sea as a place of shelter, I would like to read a few lines from Bennett's "Australian Discovery and Colonisation." One hundred years ago Bass and Flinders voyaged down the south coast in the "Tom Thumb," a boat 8 feet long, and the first place that struck them as being likely to afford shelter was the place where it is now proposed to make a harbour. Mr. Flinders says:—

We were constrained to pass the second night in the "Tom Thumb," and dropped our stone anchor in 7 fathoms under the lee of the point.

That is exactly the spot where it is proposed to make the harbour. Bass and Flinders had no local axes to grind. They travelled down the coast when the country was in its virgin state, and they anchored in that spot because, in their opinion, it presented the safest shelter. The following day they went southward round the point and entered what was unquestionably Lake Illawarra, and they came back in the evening and anchored again under the lee of one of the islands. Not only is there deep water at Port Kembla, but on the mainland to the south of it there is a high ridge which shelters the basin in southerly weather. Some men from the Harbours and Rivers Branch of the Department of Public Works are down there now testing the place for stone. There appears to be enough stone there to build a dozen breakwaters. I believe that the first Government settlement on the south coast was made at Port Kembla. The land in the neighbourhood was granted to the late Mr. David Allan in 1817, and some years later a Government settlement was established at Port Kembla. In 1835, the late Mr. Charles Throsby Smith was granted about 300 acres at Wollongong, and whether it was because it was found difficult to cross Tom Thumb Lagoon from Port Kembla, to get to Sydney, or because Mr. Smith was able to bring some influence to bear, the whole encampment was soon afterwards shifted from Port Kembla to Wollongong. The Government township laid out at Wollongong was a little south of the present town, Wollongong being built upon what was Mr. Smith's property. The first jetty erected at Port Kembla—the eastern jetty—was erected by the Mount Kembla Coal Company about twelve years ago, or more, and some years later—about seven or eight years ago—the other jetty was built. The second jetty runs into deeper water than the first jetty, and it is there that the large steamers load.

618. Is it substantially built? I am not an engineer; but I believe that it is a fairly strong jetty.

619. Did it cost more to construct than the eastern jetty? The eastern jetty has been very much strengthened since its erection, and there are now two levels on it. On one level the waggons run in one direction, and on the other level they run in the other direction. I should not think there was much difference between the values of the two jetties. The steamer "Indrani," which loaded at Port Kembla the other day, had 7,400 tons of nickel ore on board at the time, and she took away 1,200 tons of bunker coal.

620. If large steamers can load at the port now, why should we spend money in improving it? Whilst large steamers are able to load at Port Kembla in fair weather, they have to be ready to clear out at any time in the event of the weather changing. In a memorandum which I obtained from the Southern Coal Company, and which is dated the 29th August this year, they say, after referring to a number of large ships which have loaded at Port Kembla, "This satisfactory record has been achieved in the face of difficulties, which would be removed by the erection of a breakwater protecting the port from the southerly weather that occasionally compels loading operations to be suspended for days together. A case in point may be instanced: The "Gulf of Bothnia" and the "Rakanoa" were to load some 5,000 tons during the present week, but the sudden south-westerly gale has compelled both steamers to wait, entailing considerable loss." This would have been obviated by a breakwater.

621. Do you know of any case where a steamer, having come alongside the jetty, has had to suddenly leave because of southerly weather coming up? I have known of many such cases. When the question of improving Darling Harbour was before the Public Works Committee in 1892, the Hon. Ebenezer Vickery gave this evidence in reply to a question by Mr. Ewing:—

What do you believe is the best way of dealing with the coal on the south coast? An immense amount of money has been spent at Wollongong in the erection of wharfs, breakwater, and jetties, and if the facilities at Darling Harbour are increased the effect will be to injure the port of Wollongong very much. At the same time, I do not think that Wollongong is the right place for the shipment of southern coal. Had the subject been looked upon in an unprejudiced light by competent persons, I am confident that Port Kembla would have been selected. By an expenditure of from £50,000 to £100,000, a harbour might be made there for the shipment of southern coal quite equal to that of Newcastle, and quite as safe as Port Jackson; and it would not only be a harbour for the shipment of coal, but also a harbour of refuge in stormy weather. Port Kembla is the place where vessels often run for shelter in severe weather.

I have obtained from the Custom House officer at Wollongong a summary of the shipping operations at Port Kembla during the last five and a half years. It is contained in the following table:—

Number of Vessels.	Foreign Bound and Coasting.	Registered Tonnage.	Tons Coal Shipped.	Tons Coke.	Number of Vessels.	Foreign Bound and Coasting.	Registered Tonnage.	Tons Coal Shipped.	Tons Coke.

A. Campbell,  
Esq., M.P.  
11 Nov., 1896.

A. Campbell, Esq., M.P. 622. You regard Port Kembla as the most suitable place on the south coast for the construction of a harbour? Yes; and the Government officials having reported in favour of it, the people of the district, of whom I am one, are willing to abide by their report.

11 Nov., 1896.

623. Are the people of Wollongong content to have the harbour constructed at Port Kembla? Yes.

624. What about the people of Bulli? I understand that several of them would like to see the harbour made at Bellambi, though I cannot understand how it is that prominent people in that locality are departing from the arrangement which was made to abide by the decision of the Departmental officers. That was the understanding come to by the representative people of the three localities principally interested—Port Kembla, Wollongong, and Bellambi.

625. You know that dissatisfaction has been expressed in regard to the report in favour of Port Kembla? Dissatisfaction has been expressed by a few individuals at the Bulli end; but I am not aware to what extent they represent public opinion there on the subject.

626. Have you heard people interested in the coal trade say that they would not use Port Kembla if harbour works were carried out there? I have not heard anybody directly interested in the collieries say that, though the manager of the South Bulli Colliery has expressed himself strongly in favour of Bellambi.

627. There are private jetties both at Bulli and Bellambi? Yes.

628. Do you think it likely that coal would be sent to Port Kembla from the vicinity of Bulli and Bellambi? Large vessels cannot load at those jetties, so that whenever there are large vessels to be loaded the coal will have to be sent to Port Kembla. At the present time as many as four or five collieries sometimes contribute towards the loading of a large vessel. The Corrimal Colliery, which is situated some distance north of Wollongong, pays about £3,000 a year to the Government for the use of the line. They use their own waggons and locomotives, and pay  $\frac{1}{2}$ d. a ton for the coal hauled over the line.

629. But small vessels would continue to load at Bellambi and Bulli? In all probability, while the jetties lasted; but I am strongly of opinion that it would be found more expensive to maintain the jetties and to pay all the incidental expenses connected with the work of loading there than to send direct to Port Kembla. As far as Bellambi is concerned, it is doubtful if a jetty would have been erected there in the first instance, had there been a railway to Wollongong. The anchorage is bad both at Bellambi and Wollongong. The largest vessel that ever put into Wollongong was the "Royal Tar," the ship which took the New Australia people away. She was a 900 tons vessel, and nearly blocked up the basin. About eighteen months ago, when a steamer was lying in the basin in very rough weather, the captain considered it necessary to scuttle her in order to save her, and did so.

630. What sort of anchorage is there at Port Kembla? I am told by captains of vessels, the pilot at Wollongong, and other people capable of giving an opinion, that it could not be better. The anchor goes down into a good clay, and would hold for all time.

631. Have you any information to give us in regard to the Lake Illawarra scheme? That is a private concern. Powers were given by an Act of Parliament to enable a private company to open the entrance to Lake Illawarra, and to dredge a channel across the lake as far as Tallawera Point. The company obtained their powers seven years ago, about the time that the Wollongong Harbour Trust was formed; but so far little has been done. At the same time it was never intended that they should be looked upon to supply the harbour requirements of the south coast. They have a large property adjoining Lake Illawarra, and they have power to make the best use they can of it, and if they can make a harbour there, I say—and I believe the general public would say—God speed them.

632. Had they not to construct a railway within a certain time? Yes, and that work was completed just before the time expired. If it had been a question whether the Government or a private company should convert Lake Illawarra into a harbour, the public, and I as one of the public, would have sided with the Government against the private company; but as it was a question whether a private company would make a harbour there, or whether there should be no harbour at all, there was no objection to a private company carrying out the work if they would do so. If, within the last seven years they had carried out their proposed work they would have had a strong case in assuming that the construction of a harbour at Port Kembla was unnecessary; but inasmuch as they are no further forward than they were seven years ago in regard to harbour construction, I think it comes with bad grace from them to try and block the Government proposal.

633. Do you know that they have any desire to do so? I have read in the newspapers that they have sent a letter to this Committee objecting to the proposed work.

634. Are you aware that the time within which they have to carry out their proposed work does not expire for two years? Yes. Instead of doing anything practical in the way of harbour works within the time available to them, they asked for and obtained an extension of time. A good deal has been said about the quantity of coal-land in the southern districts owned by private individuals; but this map of the County of Camden which I produce shows that the largest coal-owner in the district is the State. The State owns an area of coal-bearing land many times greater than the whole area held by private individuals.

THURSDAY, 12 NOVEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.,

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Archibald Campbell, Esq., M.P., sworn, and further examined:—

A. Campbell, Esq., M.P.

11 Nov., 1896.

635. *Mr. Roberts.*] When the Committee rose yesterday afternoon you were making some explanations in regard to a map of the County of Camden? Yes; I was making the statement that, although it has been represented that the proposed harbour would benefit private owners to a very great extent, if not wholly, the real fact is that the great coal-owner in the southern district is the State. Immediately

Immediately back from the summit of the Illawarra Range the watershed dips northward and westward, so that the margin of the Sydney water reserve comes right to the top of the range. The whole of the coal in that reserve belongs to the Government, and for every ton of it that is taken a royalty of 6d. must be paid to the Treasury.

A. Campbell,  
Esq., M.P.  
12 Nov., 1896.

636. *Mr. Hoskins.*] How far is that land from the railway? It is immediately behind the summit of the Illawarra Range, which at no point is more than a few miles from the railway, and some of the Illawarra mining companies are now working part of that coal. I believe that the Mount Keira Company takes some of the coal, and others of the colliery companies in the district have secured permits to mine there. The coal will be brought out through the present openings, and will be taken to the railway and to the proposed harbour by the existing tramways. I do not say that the whole of the coal in this reserve, or even half of it, will be worked from the eastern side. The reserve comprises an area of 354,000 square miles, and I cannot say how much of it would be worked from the eastern side. But the coal is there, and a lot of it has already been secured by means of permits, for which an amount of £64 a year is payable. It only requires very simple arithmetic to ascertain what royalty will be obtained from the coal underlying this ground.

637. *Mr. Wright.*] What is the thickness of the seam? There are four or five seams. One seam, taking a very low average, has a thickness of 5 ft.

638. *Mr. Hassall.*] Is that the Bulli seam? Yes; the top Illawarra seam. That is the seam which the collieries are working now, but at Dapto they are testing some lower seams. The Department of Mines reckons that every foot of coal per acre means 1,000 tons, so that a seam 5 ft. deep would give 5,000 tons, and pay a royalty of £125 an acre. The sooner facilities are offered for the exhaustion of the private coal supply the better it will be for the country, because then for every ton of coal that will be worked the State will receive a royalty of 6d. a ton, or £125 from every acre of only a 5 feet seam. Only recently there has been a lawsuit between the representatives of the late Mr. Henry Osborne and the old Bulli Coal Mining Company. The representatives of the late Mr. Osborne contended that the old Bulli Coal Company had been working into their land, and they tried to prevent the company from going into liquidation. They put in a claim for £11,250 for 14 acres 1 rood and 5 perches of coal-land which they said had been worked; but afterwards they asked permission to increase their claim to £45,000. I am not aware what the end was, but I am under the impression that the plaintiffs got a very substantial verdict. They claimed that 8 feet of coal had been worked, and they made no allowances for faults or anything of that kind. I refer to this case to show the value of the State coal property. It would not require many acres to be worked for the royalty to be sufficient to pay interest even upon £500,000.

639. *Mr. Roberts.*] How far would the land you speak of be from the Port Kembla? About an average of 10 miles.

640. Is there a railway anywhere near it? The Mount Kembla Company, after they shall have worked out their own land, will work into the Crown land, and I believe the Mount Kiera Company and the Mount Pleasant Company intend to do the same. Not only will the State receive a royalty of 6d. per ton, but there will also be a return from the haulage of the coal over the railways; and should there be shipping dues and so forth paid on it, the Government will get fully 1s. a ton for it.

641. *Chairman.*] What royalty do the private companies pay to private coal-owners? I think the usual royalty is about 9d. a ton, and they are glad to get coal at that price. I believe they have sometimes to pay as much as 1s. a ton.

642. *Mr. Roberts.*] Are you in favour of the construction of two breakwaters at Port Kembla, or do you think that the eastern breakwater will be sufficient? The construction of the eastern breakwater would protect the place very much from the sea.

643. Do you think it would be necessary to carry it out 2,800 feet? I favour the construction of both breakwaters, and I think that the present jetties should be used at first as much as possible for the shipment of coal, a small portion of the long wharf proposed being constructed at which one or two fair-sized vessels could discharge. If only the eastern breakwater were constructed it would be desirable that it should be lengthened rather than shortened. Beyond the construction of such a wharf at which vessels could discharge, I would leave the rest of the proposed inner arrangements over for the future development of the port. The whole of the wharfage accommodation proposed by the engineers is not now required, nor is it likely to be required, even under the most favourable circumstances, for some time to come.

644. If both breakwaters were constructed, do you not think it probable that the whole of the improvements would be necessary? The construction of both breakwaters would take five or six years, perhaps ten years, and there is no saying what development may not take place in that time.

645. Do you think it would be better to construct the eastern breakwater first? Yes, I think it should be carried out first. With regard to the discharging wharf, it might be put between the two jetties, or it might be made on the west side of the harbour; but its location is a matter upon which I am not capable of expressing an opinion.

646. Do you think that if the eastern breakwater were constructed a large number of sailing ships would go to the port to load coal for foreign parts? I am informed so by people who understand the trade.

647. Do you disagree with Mr. Yuill's evidence? I would not take exception to his evidence on these points, nor to that of any gentleman who understood the shipping trade of the place. Mr. Yuill is a very high authority on the subject, and I take it for granted that what he said was correct.

648. Can you tell us anything about the probability of ores coming to Port Kembla, should the harbour be constructed? The smelting-works at Dapto seem to be proceeding very well; but the local manager has complained to me about there being no unloading appliances in the district, and consequently I wrote to the Department of Public Works upon the subject. Everything that they have ordered from over sea has had to be brought from Sydney.

649. Would there be any large shipment of agricultural produce from the proposed port? There would be some, but the percentage would not be very large. There will always be a considerable amount of produce shipped where there may be a large trade connected with a fertile and populous district. The "Indrani," when she went to the jetty the other day, had 7,400 tons of nickel ore on board, which she was taking from New Caledonia to Glasgow. Undoubtedly, when we get appliances for discharging cargo on the south coast, a great deal of that ore will be treated there.

650. *Mr. O'Connor.*] That vessel had no difficulty in getting into the port? No, because the weather was fine. If the weather had been rough she would not have been able to enter; and if it had come on rough after she got there she would have had to go away before completing her loading. Any vessels that came to the port with ore or any other cargo would be likely to take coal away.

- A. Campbell, Esq., M.P.  
12 Nov., 189
651. *Mr. Roberts.*] Would the resumption of the land near Port Kembla be a costly matter? No, I think not. It is very poor land, though the land in other parts of the estate is fairly good. It would be necessary to resume land to take in an area for a stone quarry to the south of Port Kembla. Probably 200 or 300 acres would have to be taken. The present market value of that land would be, I should say, £8 or £10 an acre.
652. Do you think it would bring that? Part of it would not; but the whole of it might average that. I am speaking of its value apart from the probable construction of this harbour. Considering the additional value which the harbour works would give to what was left, I think the State might expect to get what it resumed practically for nothing.
653. Do you think that this is a case where the betterment principle should be applied? Yes, decidedly. I am rather opposed to the application of the betterment principle where the holdings affected are small; but where there are large portions of land, I am strongly in favour of the principle being applied. The land that would have to be resumed is part of an old grant, which is bordered on the east by the ocean, on the north by Tom Thumb's Lagoon and part of Allan's Creek, and on the south by a line running across from Lake Illawarra towards Red Point.
654. *Chairman.*] There appears to be an area of something over 2,000 acres? Yes; 2,200 acres. The date of the grant is 24th January, 1817.
655. *Mr. Roberts.*] The owners of this property might give the land wanted by the State, and they would obtain full compensation because of the increased value which the State expenditure would give the rest of the land? Yes. If the estate were mine, I should be very glad to give the Government 200 or 300 acres of it free. The harbour improvements would render what was left more valuable than the whole estate is now.
656. I think you said there was a quarry on part of the land? There is a large quantity of stone there, in a ridge extending eastward and westward right through the estate, and within half a mile of the proposed harbour. I do not think many harbour works would exhaust the stone supply.
657. Is equally good stone obtainable at Bellambi? I do not think so. Stone for Bellambi would have to be obtained from the Illawarra Range either about Clifton or nearer Sydney. There is plenty of free-stone between Waterfall and Helensburgh, and there is good stone about Clifton, but it is somewhat difficult to get at. Near the South Bulli Company's mine there is some basaltic stone, but I am under the impression that it would be difficult to work.
658. Would the jetties at Port Kembla cost much to resume? A gentleman representing the owners of the eastern jetty has stated more than once that his company would be ready at any time to dispose of it to the Government, either on condition that the shipment of their coal from it should not in the future cost them more than it does now—which, in my opinion, is a proposal which should not be entertained, because it is so very indefinite—or at such a figure as may be determined upon by arbitration. Mr. Senior, of England, who represents the interests connected with the other jetty, is in the Colony now, and, I am informed, is in a position to deal with the matter absolutely.
659. How many new jetties would be necessary at Port Kembla? I think that these two would be sufficient for some time to come.
660. Do the islands opposite Red Point afford a good shelter to Port Kembla from the south-east? Yes; from the south and south-east. Before leaving Port Kembla, I should like to refer to its advantages as a harbour of refuge. At the present time there is not a single place where a vessel can take refuge between Sydney and Jervis Bay, a distance of nearly 100 miles.
661. Do you think that a harbour of refuge is necessary there? I think so. At the present time a vessel might become disabled between the two places with very disastrous consequences.
662. But you do not look upon this as a special reason for carrying out the proposed works? No; I only put it as an incidental advantage. The Marine Board, in making a cruise down the coast recently, put in to Port Kembla, and I thereupon wrote to them to ascertain what they thought about the place. This is the reply I got,—

Sir,

Sydney, 14 October, 1896.

In reply to your letter of the 8th inst., I have the honor, by direction of the Marine Board, to inform you that they made a cursory inspection of Port Kembla on their late tour along the coast, and were certainly impressed with its capacity as a coal-shipping place. If a breakwater of 2,800 feet is run out, as proposed, the place will be much improved. It will then afford greater convenience than at the present time, and would, moreover, give excellent shelter to ships in difficulties in the neighbourhood.

I have, &c.

GEO. S. LINDEMAN.

Secretary.

Archibald Campbell, Esq., M.P., Parliament House.

The captain of a very large vessel recently told me that his last shovelfull of coal was in the furnace when he got into Sydney from the southward, and that he was afraid all along of the supply running out. He was a stranger, but knew that there were places along the coast where coal could be obtained, but he did not know how he could get into them, neither could he with the large vessel he had.

663. Do you think it would be wise for the Government to go on with the proposed work until it is seen what the Illawarra Harbour Company intend to do? I am of opinion that the Illawarra Harbour Company should not be taken into consideration at all in connection with the Government responsibility to the coal trade of the southern districts.

664. Do you mean to say that there would be trade for Port Kembla even if the Lake Illawarra scheme were carried out? I believe that there would be a very good trade even for the two harbours; but the Lake Illawarra people have given no practical indication that there is anything more to be hoped for from them in the future than there was in the past.

665. Has any work been done at the entrance to the Lake? A bank of stone has been laid along from Windang Island. Lake Illawarra would be useless as a harbour of refuge because of its narrow entrance.

666. Would it not be more convenient for the Illawarra Smelting Company to have its ore landed at Tallawera Point than to have it landed at Port Kembla? I have scarcely referred to the ore traffic at all. I regard that trade and the possible export of produce as only incidental to the coal export trade. Even if their ore were brought to Tallawera Point they would still have some distance to take it to get it to where the works are.

667. Does it not appear to you that it would be useless to carry out the Port Kembla works if the Illawarra scheme were completed? That is not my opinion. I believe that there will be sufficient trade to Port Kembla in any case. The great want of the district is facilities for the loading of the largest vessels,

vessels, and in my opinion it is not probable that harbour works are likely to be carried out, that will enable very large vessels to get into Lake Illawarra. The company say that they are going to dredge a channel 25 feet deep; but in their Act they only specify 15 feet.

668. A fair sized steamer would be able to get up a channel 25 feet deep? Yes; if the works were carried out. I contend that the Illawarra scheme should not be allowed to stand in the way of the Government scheme at all. It would be just as reasonable to allow the omnibus companies to oppose the construction of the George-street tramway. I have here an extract from a return made by Mr. Joseph Barling, before the Parliamentary Standing Committee on Public Works—in the course of evidence being taken relating to proposed harbour improvements at Newcastle.—20th March, 1895.

A. Campbell,  
Esq., M.P.

	*£1,124,480	14	4

\* Since then a further sum of £147,000 has been voted on the recommendation of the Public Works Committee, for Harbour Improvements at Newcastle, thus increasing the expenditure in connection with that port from £1,124,480 14s. 4d. in 1894, to a total of £1,265,480 14s. 4d. in 1895.

I should also like to hand in some extracts from the Annual Report of the Department of Mines for the year 1895. When it was proposed to submit the matter of a port for the south coast to your Committee, some people spoke of it as being ridiculous to make a harbour for the exportation of only 900,000 tons of coal. At Newcastle, however, I desire to point out by way of illustration that the exportation last year was only a little more than twice that tonnage.

*Newcastle Harbour (the Principal Coal Port of the Southern Hemisphere), and its Facilities for Shipment.*

Newcastle, in the county of Northumberland, the trade of which is second only to that of Sydney, owes its great commercial importance to the different coal-mines which have been opened out close to and within 32 miles of the harbour.

On the south or town side of the harbour there is a continuous line of wharf, 3,607 feet long, belonging to the Government, 2,130 feet of which is occupied for cargo berths for deep-draught vessels; 500 feet reserved for Sydney passenger steamers; and the remaining 977 feet is used as a general cargo wharf, including a lumber berth for loading vessels with timber. The whole length of this wharf is lit with gas.

At Bullock Island, on the western side of the harbour, a substantial timber Government wharf, 7,760 feet in length, and four ballast jetties, each 50 feet long and 200 feet apart, has been constructed along the face and around the south end of what was formerly known as the Ballast Dyke; at present 5,550 feet of this wharf is set apart chiefly for the shipment of coal. The loading is performed by hydraulic cranes, of which twelve are erected, capable of shipping 1,000 tons of coal each in twenty-four hours—six being 15-ton, four 9-ton, and two 25-ton cranes, the latter for discharging heavy machinery, &c., and three 15-ton steam cranes. The remainder of the wharf and the ballast jetties are used by vessels discharging ballast or waiting their turn to load. Ships of the largest class can load under the hydraulic cranes, and proceed direct to sea through deep-water channels recently dredged. It is proposed to spend immediately £150,000 to further increase the shipping facilities at Bullock Island. This wharf is now lit by electric light, which greatly facilitates the loading of coal at night, and is one of the finest systems of electric lighting in existence, consisting of fifty large arc lamps, each 5,000 candle power.

A branch double line of railway connects the wharf with the Great Northern Railway, and along the back of the wharf is laid a very extensive system of sidings and standage room for working coal traffic.

A sand-dredge is reclaiming the foreshore in front of the hydraulic engine-house, where 2,000 feet of wharf will be erected as a commencement of a 90-acre basin inside the present wharf, which basin it is intended to dredge to a depth of 25 feet, where vessels will be able to lie in slack water, and the whole will be lit up with the electric light.

At Stockton, on the northern side of the harbour, there is a Government wharf 600 feet long with a shoot capable of shipping 1,000 tons in twelve hours. A sand-dredge is also reclaiming the foreshore at Stockton.

In addition to these Government cranes, the Australasian Agricultural Company have three large private shoots capable of delivering 2,000 to 3,000 tons of coal per diem. Vessels loading from them can discharge their ballast on to the company's ballast wharf, lying alongside at a draught of 18 ft. 6 in. and upwards. Vessels drawing 22 feet can load at the company's shoots. The Waratah Company also have a shoot at Port Waratah capable of shipping about 50 tons per hour, and Messrs. J. and A. Brown have two shoots on the Hunter River, at Hexham, 10 miles from Newcastle, capable of shipping 100 tons per hour.

*Newcastle Facilities for Shipment of Coal.*

The present estimated capabilities for shipment of coal at the abovementioned places in Newcastle Harbour are about 24,000 tons per day by the Government hydraulic cranes, and about 4,800 tons per day from private shoots.

*Coal shipped from Newcastle Harbour, the Principal Coal Port of the Southern Hemisphere.*

The quantity of coal shipped in 1895 to foreign and intercolonial ports was 1,920,378 tons, valued at £678,217; and the largest quantity of coal taken by a steamer (May 30, 1895) was 5,235 tons, by the "Port Stephens," and by sailing vessel, 4,558 tons, by the ship "Royal Firth, on June 14, 1895,

Illawarra

A. Campbell,  
Esq., M.P.

12 Nov., 1896.

*Illawarra District, and its Facilities for Shipment of Coal.*

The Wollongong Harbour and Basin is situated 45 miles south of Sydney Harbour, and at low tide there is a depth of 13 feet of water at its entrance and alongside the wharf, where there are three cranes capable of shipping 1,800 tons of coal per hour.\* The Belmore Basin has a depth of 17 feet of water at its eastern side, where there are four shoots, each capable of shipping 100 tons per hour; but as only two vessels can load there at the same time, the largest quantity of coal shipped by them is 200 tons per hour, or 2,000 tons per day. The largest steamship which has coaled at the harbour drew about 15½ feet of water, and carried about 900 tons of coal; and the largest sailing vessel has taken away about 700 tons of coal.

*Coal shipped at Wollongong Harbour, the Jetties, and sent by Rail, &c.*

The coal raised in the Illawarra and Southern districts in 1895 was 910,123 tons, valued at £239,035.

\* The cranes referred to have never been used for coal shipping, all such loading being done by the shoots.

669. *Mr. Black.*] Do you consider that the construction of a harbour at Port Kembla would be a good thing for the Government? Eventually it will be, especially when the State coal land comes to be worked.

670. The proposed harbour if constructed as projected will cost £440,000. In addition to that there will be the cost of purchasing existing lines of railway, and of resuming a considerable quantity of private land and two jetties. Will it not also be necessary to make a new railway connection? It will be necessary to make about 4 miles of railway over level country, most of it being Crown land.

671. Do the colliery owners down there think that this will be a good thing for the Government? I leave them to tell their own tale.

672. How is it that if the construction of this harbour would be such a good thing these shrewd business men do not carry out the work themselves? The Government are one body representing the whole community, whereas there is a great number of different interests in the Illawarra district.

673. Do these gentlemen believe in private enterprise? Not in regard to harbour works such as that proposed, I presume. They may have quite enough to do to carry on their own mines.

674. They believe in private enterprise when they see a certain profit, and when they do not they believe in Government enterprise? Well, I will leave them to answer that question themselves.

675. You think that if both the Lake Illawarra scheme and the Port Kembla scheme were carried out, Port Kembla would get the trade? Probably each would get some trade.

676. Lake Illawarra would not be shut out by the competition? Not if the company's terms and conditions were not exorbitant. One reason why a Government harbour should be constructed is that it may not be within the power of a private company to extort the last penny from the trade of the district.

677. You do not think that if both harbours were constructed, there would be a great outcry against Government interference with private enterprise? Not unless it was from those associated with the Lake Illawarra scheme.

678. As the distance between Helensburgh and Port Kembla is only 2 miles less than the distance between Helensburgh and Sydney, it is not probable that coal would be sent from Helensburgh to Port Kembla except to be loaded into steamers requiring fuel for their own consumption? Yes, or into vessels taking over-sea cargoes. They would never send coal from Helensburgh to Port Kembla to be taken again by sea to Sydney.

679. Did you say that the coal shipment at Newcastle only exceeded that of Port Kembla by 100 per cent.? The coal sent away from Newcastle last year was only about 100,000 tons more than twice the output of the Illawarra district.

680. Are you aware that the trade of Newcastle does not depend wholly upon the coal shipments? Yes.

681. Newcastle is, to a large extent, the port for the northern districts? Quite so.

682. Do you think that Port Kembla is likely, in the near future, to become a port for the reception of general goods, such as Newcastle is? It has not so large a district behind it, as Newcastle has; but it is difficult to say what developments may not take place in the future. Authorities consider that the mineral deposits of the Illawarra district are capable of great development, and it is possible that as much trade may result from that development as results from the pastoral and agricultural industries in the northern district.

683. Do you consider that in the event of a large dairy produce trade with foreign countries, Port Kembla will be the port of shipment? I regard the shipment of dairy produce as only incidental in its significance. I believe that most of the dairy produce would come to Sydney, though, of course, the vessels trading to Port Kembla would require supplies.

684. Do you not think it would be possible to so construct the proposed breakwaters at Lake Illawarra as to allow vessels to enter in safety even in bad weather? I do not think so. The breakwaters would not be out very far from the shore, and the worst swell always prevails in the shallow water near the shore.

685. One of your objections to the Lake Illawarra scheme is that the entrance would be too near the shore? I say that a vessel would be very fortunate to be able to get into such a narrow entrance in safety during bad weather.

686. Do you think it would be possible to make the entrance to Port Kembla safe in all weathers? I do, because it will be right out in the open sea in deep water.

687. The entrance would have to be wide? I should think that the 800 feet proposed would be wide enough; but that is a question for engineers and nautical men to decide.

688. The wider the entrance the rougher the water inside? Possibly.

FRIDAY, 13 NOVEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Frederick Augustus Franklin, Esq., Memb. Inst. C.E., sworn, and examined:—

689. *Chairman.*] What are you? A civil engineer.

690. Have you had considerable experience in this Colony? About thirty-two years.

691. Have you a knowledge of the South Coast? A great knowledge of a portion of it.

692. And the proposal before the Committee? I have inquired into it and I know a great deal about the locality from observation extending over a long period of time.

693. You have had an opportunity, as far as necessary, of seeing the plans? Yes.

694. You know the proposal? Yes, from the plans here.

695. Will you make a general statement in regard to the proposal before the Committee? I wish to make a statement to show in what manner I am acquainted with the rise and progress of the trade in the south, and to briefly give my reasons for thinking that some improvements should be made to assist the increase of that trade. In the first place, I may say that I was present at the opening of the Belmore Basin, Wollongong, in 1868. Provision was then made for a better system of shipping the coal output from two mines—Mount Pleasant and Mount Keira. The provision was simply by means of staiths fixed on the side of the Belmore Basin. The trade steadily increased over a period of ten years, and in 1878 the existing companies commenced a complete change in their system of working, the Bulli Company, by the construction of a branch railway on a new footing, and the Osborne Company by changing a 3 feet gauge line into a standard gauge railway, and reducing gradients of their line by taking out an incline, and so laying themselves open for a largely increased trade. Immediately following that, in 1879, the Government carried out great improvements in the Belmore Basin, adding more staiths capable of tipping 6-ton hopper waggons, and discharging 6-ton trucks of coal. The corners of the existing dock were cut off and portions recessed, in order to allow turning space for vessels of larger tonnage. This work went steadily on with some alterations (for carrying out the coastal trade there) to the Illawarra Company's jetty, and the construction of a T jetty, and a system of lines and approaches, for a projected and proposed large increase of trade. Owing to certain defects in the machinery it was never made use of, until the Trust came into existence. The Trust was formed in 1889, and they commenced their business without any well-defined design on which they were to work. Immediately after, they submitted data for Sir John Coode to base his calculations upon for a port of large dimensions—a port capable according to the information supplied to him of carrying out the entire trade or the coal output of the Colony, and I should think that his design was based on such operations. The Trust continued their work up to the time of their dissolution on 2nd December, 1895, under, I must admit, extraordinary difficulties. The proposal laid before them was impracticable. Their collateral security was not sufficient to admit of their obtaining funds on fair security and the result was that their labours were trammelled from first to last.

696. *Mr. Trickett.*] Would you mind in a few words telling us what that proposal was? I do not think anybody could tell you that fairly. I think that the proposal on which the Act was based, was not very much more than a picture which you might take from a glove-box. To show how very preposterous the proposal was, I may say that it was to cut a channel a little short of a mile to the Tom Thumb Lagoon, and starting from the inner basin at Wollongong. I think that channel was to carry a sufficient depth on the sill for nearly the largest vessels we have. It was to be cut through a sand formation from Wollongong Harbour to an unknown number of chains where a rock-bar existed. Beyond that the formation is silt deposited for a considerable depth. I do not know what rock there might be in that, but the proposal to cut that channel to give a depth and also slopes that would stand up naturally would mean an excavation equal to 15 acres of water surface with 30 feet draft on the sill—equal to the largest floating basin in Liverpool, England. After arriving at the Tom Thumb Lagoon, a distance of about a mile, a system of excavations to the same depth was to be carried out, and the excavated material deposited over the area of that lagoon—one of the most expensive systems—changing the direction of road and lays that could ever have been devised. That excavation alone was estimated at the time and at the lowest rate would have approached nearly £1,000,000. Supposing the excavation was to have been done in that friable material, then retaining walls would have been required. Those retaining walls never entered into the calculation—the nature or the character of them—and unless retaining walls to that large basin were finished the approaches from all parts would be on raised staiths for shipping purposes. For that reason I consider that it was perfectly impracticable. The lagoon itself is influenced at the entrance by a hard drift. When a sand drift forms at the mouth of the output of Allen's Creek this water rises. It is extremely shallow. Excepting one or two defined channels there is very little water even at high tide in the sea, so that nature has done little or nothing in the way of excavation. The lagoon may have a clay formation; there is a great deal of clay formation at certain depths. I am not prepared to say from any observation of borings, but the surface is drift silt. The Trust then received a modified plan from their engineer and approved of it, in order, if possible, to make a berth for deep-sea vessels by projecting a breakwater northerly from the limit of the existing breakwater. That work was very carefully carried out so far as it went; but it was evidently undertaken with very limited means, and it resulted, as I suppose one might have expected. The work remains to-day unfinished, but what has been done has been substantially and well done. However, in doing that work a great deal of the then existing work was dismantled, and on the closing of the Trust those dismantled appurtenances that were formerly established have been left in a state of

of ruin. Therefore, if claims that are now brought against the Government are added to the absolute expenditure the total will make approximately over £8,000 a year over a period of five years for which we have derived no practical benefit. Previous to the establishment of the Harbour Trust, we had an expenditure over the time of the first Vote, thirty-six years, of about £116,000. That produced very excellent working appliances for a very moderate output of coal. That would make an expenditure over that period of about £3,222 a year; but when I come to consider that we have always boasted that that was the third port of New South Wales, I do not think that that was a very large expenditure, or one likely to encourage the participation of other mines in the operation of coaling at that port. Therefore, the general desire was that better facilities should be provided and that all the mines should work on equitable terms in putting out the coal of that district. The largest boat we ever attempted to coal there, the "Black Hawk," grounded in going out with, I think, about 900 tons dead weight.

697. *Chairman.*] What is a fair amount to say Wollongong is up to? She cannot do more than 350 or 400 tons.

698. *Mr. Wright.*] What water is in the basin? I am not prepared to tell you that exactly. I have not had the advantage of soundings; I can only speak from observation. The engineers will doubtless be able to tell you more correctly, and I should not like even to give you approximate figures. I think that Captain Howard's plan is the only one that will give you accurate information. I want to point out that from about 1878, the time when the Government began to make some very excellent improvements in the basin there, in regard to fixing new bollards, extending the wharf, and making a new jetty, the output of the coal has increased as regards the number of mines and has gone on from that time. In 1885 the Bellambi Mine was valued and purchased from the Osborne Estate. I valued that line and pit for purchase, and I also saw the result of the life of the jetty. I am speaking now of what is known as Taylor and Walker's first Bill. I estimated that line. I took it in all its detail and on examining the jetty I found it really had no value, so that taking the period from the time of its erection up to that time it seemed that twelve or fourteen years was the life of a jetty. I mention that to show you the cost of the maintenance of those sea jetties. The cost of that jetty I could not ascertain. It had been built a number of years. Many of those works were carried out by myself, so that I have an intimate knowledge of what I am speaking of, for instance the Bulli Railway and the Osborne Railway. The valuing of the coal mines and the untouched coal are also things I have dealt with there. For instance in the Mount Pleasant, which is only one of our coal mines, and which stands within a very short zone of the scene of all this consideration, has 635 acres of untouched coal within its boundaries. Taking that at two-thirds bulk for the 6-foot seam it gives over 4,300,000 tons of coal yet untouched to work from that one mine alone, and in considering the mines in the neighbourhood of Wollongong, whether north or south, it may be considered the centre of the present untouched coal in the southern district. Taking what we know to be within the boundaries of Keira, and taking also what we know lies between the northern boundary of the Kembla and the southern boundary of Keira, there is an area of coal that will last for a time we do not need to calculate now, and without going a very great depth back, even though we calculate for an output of three times the quantity we are doing now. South of Kembla I have no evidence as to developed coal. I know that a series of coal leases exists from Kembla South, almost as far as Jamberoo, but I am not personally aware that any coal has been developed on that line. Beyond certain difficulties that are well known to exist between Kembla and the north, we are pretty certain that we have a very large face of coal yet untouched. I do not know that I can say any more generally with regard to that. I should like, if possible, to offer an opinion with regard to the proposal at Kembla. I should like to call attention to the fact that in 1864 I reported to the Chamber of Commerce, at Colombo, Ceylon, upon making Colombo a port. I am now looking at a copy of that report. Why I speak of Colombo now is because the features of the two places are essentially the same. I was asked also to make an alternative scheme to use the lake at Colombo. Those gentlemen who have visited Colombo know that there is a very large lake close to the shore in a position similar to that of Lake Illawarra. The proposal is set forth in that report with very full particulars, but I will merely state that the reason why a lake was suggested as an alternative to the breakwater there was, that in making a tidal basin there we got 203,000 cubic yards of excavation done by nature in the lake, and the rest is a material that can be easily dredged, and the bottom—a formation of what is locally called "kabook"—is easy of removal. When that proposal was made Point de Galle was the principal turning-point of the world for harbour use, and the people of Point de Galle said it was ridiculous to make a port at Colombo; but the breakwater has been carried out, and we have one of the finest harbours in the world there.

699. *Mr. Hassall.*] What you wish to illustrate is that what can be done at Colombo can be done here? Yes. I know it may be said that we should not ask for a Government or State work at Kembla, because there is some proposal by a private company. Their proposal is a magnificent one, I think, in all its proportions, equal to all that has been done at Newcastle.

700. *Chairman.*] You are speaking of the Lake Illawarra proposal? Yes; I consider that is a magnificent scheme.

701. Why did you not use the lake at Colombo? They found that the difficulties were too great to make an entrance there. They thought that the channel would possibly silt up, and they gave other reasons; but that was many years ago, and I cannot now remember them. They submitted the two proposals, first of all, to Sir John Hawkshaw, and, later on, to Sir John Coode, and he undoubtedly approved of the breakwater.

702. The difficulty in opening an estuary, such as you had at Colombo, is greater than making a port in the open sea? Yes.

703. Were the difficulties in constructing a port at Colombo greater, or less, than at Kembla? Greater than at Kembla.

704. What is your inference in comparing Port Kembla and Colombo? Well, at Colombo the only protection from the south was a projecting point, the same as the Red Head Point you have here. They have a point projecting at Colombo which they call the Custom House Point; but the bay there is open to the Indian Ocean. There is nothing at all to protect that open bay, and from the Lighthouse Point to an indented bay, similar to Kembla, the sea came in without the slightest obstruction from the Indian Ocean on the western side. The system of loading coffee, at that time, into lighters was carried on by swiveling the load from the yard of a ship to a standing mast in the lighter, and during that operation

operation ships rolled to their gunwales in the water. The breakwater was carried out two-thirds of a mile, in the same direction as at Kembla, enclosing 500 acres of water, and now, even in very heavy weather,—and the sea is very rough there at times,—there is no motion inside the breakwater, but there is a very heavy break on the breakwater itself. The water, however, soon steadies itself on passing over the breakwater. Now the port is so secure that the most frail vessel they have,—the “catamaran,”—may safely go from the wharfs to the ships. I may say that before the construction of the breakwater there was a large town on the bay called Mutwal, a native town, and frequently the ships were thrown high and dry on that beach by the force of the sea.

F. A.  
Franklin, Esq.,  
M.I.C.E.  
18 Nov., 1896.

705. *Mr. Hoskins.*] The vessels do not lie alongside the wharfs at Colombo? No; they discharge into lighters.

706. *Chairman.*] What material was used at Colombo? It was very difficult to construct the Colombo breakwater owing to the distance at which they had to quarry and carry the stone. The nearest stone for the breakwater at Colombo was obtained at a distance of 18 miles. The breakwater was made by forming a berm of coarse rubble, and the upper tiers were formed with very large masses of concrete laid in zig-zag fashion from the root to the outer end. I wish to convey the idea that that breakwater was put out into an open sea-way of the roughest nature,—nearly as rough as Madras, and I am told nearly as rough as the Gold Coast,—and it is doing its duty well. At Colombo it is only a very moderate protection which nature has provided by the point forming that bay. I think that at Kembla we have a very much greater protection against the southerly sea than at Colombo. If you take the trend of the coast-line northward you will find with an offset of a mile east to Red Head Point, and another offset to those connected islands you have at Kembla practically two miles of safe anchorage in the bay. From observation, I have found that there is a safe anchorage there for certainly 1,500 acres of safe mooring in a southerly gale, but during the southerly gales there is a very heavy set in on to the beach, intervening between Allen Creek and Wollongong, but the break is never so great between the proposed site of the Kembla port and the entrance to Tom Thumb Lagoon as from Tom Thumb Lagoon to Wollongong, in a measure caused by the position of the two islands standing a little north of east opposite the site. During the late southerly gale, which was not an excessively southerly one but a very good fresh gale, several ships were moored off the site proposed for the Kembla harbour waiting their turn at the jetties and they took their loading during that southerly gale. They were not interfered with during the southerly gale last week. I wish to show that this natural protection gives unusual facilities to those two jetties, and I think that the interruptions throughout a year here cannot be compared with the interruptions, delays, and demurrage at Newcastle in the ordinary way of shipping there. No vessel need go to Kembla until she knows she may be loaded within a few hours at any rate. I examined this site very critically. In 1885, I examined the whole of this site in order to report upon it to the directors of the Southern Coal Company. The Southern Coal Company was then contemplating the construction of a large jetty and the carrying out of some very large works. I have the report before me. I have made extracts from it which I think will suit this enquiry. This report deals in detail with everything in connection with jetties, moorings, lines, screens, and the workings of the pit. With regard to the value of this place as a site for a harbour my notes are: that the piles of that jetty were freely driven to a depth of 14 feet for a distance of 1,000 feet out from the shore. The jetty consists of an approach of 900 feet, an inclined approach on timber staiths, and then proceeds another 1,000 feet supported on three piles, all of these driven from 14 to 16 feet into very fine driving indeed—a thing scarcely expected to be found in a place like that—which goes to prove that the original formation has been very little disturbed by silt or anything of that sort. The total length of that jetty is 2,350 feet.

707. *Mr. Hoskins.*] Do large vessels lie up at that jetty and load? Yes; the jetty projects that distance of 2,350 feet in an isolated bay, self-protected inside the two miles protection from the south. Both those jetties existing there have a local protection from the southerly gales of 2,800 feet beyond the projection of the jetties. The point immediately east laps the jetties sufficiently to give a protection of 2,800 feet from a southerly gale.

708. Is there no protection from a easterly gale? There is nothing to protect from an easterly gale except the two outlying islands which are nearly abreast of that place and somewhat break the continuity of the sea. A long wave would be broken by those two islands which would reduce its force considerably. That large jetty fitted with all the modern appliances that could be devised was put up for about £21,000, the tenders for the work at the time ranged from £23,000 to £28,000.

709. *Chairman.*] When was it completed? I do not know the date of its completion, but I am speaking of the time it was in progress, in 1885.

710. Was it completed in 1886? It was completed about 1886. With regard to the bay itself, the test of the value of the place for mooring was found by laying the quarter-line moorings of the ships. In nearly every case it was found to be a very tenacious clay, and where that did not exist of course they used heavier anchors. No fault can be found with the place as a safe anchorage. I think that the proposal as to the 260 acres would afford ample accommodation for a largely increased trade there. The largest of those jetties will load a vessel from 6,000 to 7,000 tons, and about 600 feet in length, on the outer end, and inshore there is room for smaller vessels; but I do not think they have loaded smaller vessels nearer than where they have their appliances fixed; but in their first design they proposed to load smaller vessels inshore.

711. You have already stated that in your opinion the life of a jetty is about twelve or fourteen years? Yes.

712. If that statement be correct, is it right to infer that the sinking fund for a jetty would be about £1,500 a year? I do not want to fix their value, because I did not build any of those jetties; the cost of their repair should be a charge against the output. I take it that in this year's operations we shall approach a quarter output of the Colony from all mines.—that is, taking it on the basis of last year, 700,000 tons. So far as we have ascertained, up to the present time I think that 1,000,000 tons will be the output of the southern collieries this year. At a moderate wharfage of 3d., that should give us £12,500, or 4 per cent. on the capital of £312,500. That will be £79,000 in excess of your estimated cost of this breakwater. I think that 3d. a ton would be a small charge for the advantage of using a good Government wharf there. My figures assume that if equal facilities were given to all the mines to get deep-sea loading, and if with that advantage we were to increase the output there to 1,000,000 tons, that is something like the revenue you would derive at 3d., without port charges. I do not know what the port charges are.

F. A.  
Franklin, Esq.,  
M.I.C.E.  
13 Nov., 1896.

713. Before the coal can be shipped at Port Kembla it has to come a certain distance along the railway line, and there is also some expense in shipping it—is that 3d. for outside services rendered? I do not consider the haulage on the main line at all. The metropolitan coal has to be drawn a distance of 27 miles, and then pay wharfage.

714. Is that for outside services rendered—is it a levy because the port is constructed? I consider that is a levy that should be made for the use of the port, outside any charges for the railway. They have spent so much money for the line and jetties, and the interest on the cost must be so much per ton output; but as I could not ascertain what should be sunk for the maintenance of those works, I should not like to say. However, I consider that a simple charge for shipment would be better than the maintenance of those large works of our own.

715. That is your opinion, although you can give us no figures on which you base it? I think that would be much better, combined with the advantage of being able to compete with those people who are now loading large cargoes. I think the existing sea-jetties would be used for small loading during all their life, notwithstanding the facilities of a port; but I think that that port would wonderfully increase the bulk of our trade and the quality of it.

716. Is it your opinion that after the jetties had served their purpose, and after their life had run out, the proprietors of them would build new ones? I do not think they would, if they had a good port with shipping facilities, on equal terms.

717. Is it your opinion that all future developments in the Illawarra district would come down to the port, and that they would cease to build jetties? Yes; I think that they would consider that the State provided a proper and safe means of getting rid of their produce.

718. You believe that all new developments will come to the new port? Yes.

719. And you believe that they will use their jetties until their life runs out? Yes. We think that the coaling at this port would develop our trade to a very large ratio indeed. I have a very high opinion of the position from its natural shelter.

720. *Mr. Lee.*] Supposing a coaling rate of 3d. per ton is charged at these works, would that have the effect of driving shipping away to some of the existing jetties? No; the ships that would load at this proposed port could not go alongside existing jetties.

721. Would the proprietors of those jetties be in a position to offer terms that would attract them? No existing jetty outside that position at Kembla could compete at all with the trade done either by the Southern or the Bellambi Company at the present time. There is no place in the southern coal measures where such trade could be carried on, as by those two existing jetties in the Kembla port.

722. You are very clear about that? Quite clear. I do not mean to say but what the Southern and the Kembla Company load small vessels, but they have facilities for loading the deepest vessel. The "Indrani," a vessel of 6,000 or 7,000 tons displacement received her cargo a fortnight ago there, and that is the trade we require. If you make Kembla a safe port the small ships can go to the available sea jetties that exist, but the large trade would be not only with steam but also with sailing vessels. There is a class of steamers that would not be allowed under their insurance to approach ordinary open sea jetties, but those two in Kembla Bay are excepted. On the other hand it would be impossible to take anything but a vessel relying on steam propulsion in to those sea jetties as they exist. We have known sailing vessels to be driven ashore and wrecked at the site of those jetties. Sailing vessels cannot do any business except in Wollongong Harbour. They cannot go to the open-sea jetties. At Wollongong we load into the very smallest vessels and they are so accustomed to the port that they know its dangers and difficulties. At Kembla Bay, as I have shown, the natural protection from southerly gales is so great that any sailing vessel could gather in her sails and be towed into the port at any time if this proposal were carried out. Kembla is an exceptionally fine place for a port protected by an eastern breakwater.

723. *Chairman.*] Will you give us your comparison between Port Kembla and Bellambi? I am not sufficiently acquainted with Bellambi. I know Bellambi has a most wonderful protection in the way of a projecting submarine reef—a long reef extending to the eastward.

724. You are not prepared to express an opinion in detail in regard to Bellambi? I could not compare Bellambi with a port I have known to be successful elsewhere.

725. As an engineer which port do you consider is the better port, Kembla or Bellambi? I consider Kembla is the most sheltered place along that coast.

726. *Mr. Hoskins.*] Is there not good holding rock at Bellambi? I do not know. But I know Kembla to be an exceptionally good anchorage.

727. Will you give us an opinion with regard to Lake Illawarra? In regard to the Lake Illawarra scheme all I know is that by an Act dated 1890, extending to five years a concession was given for the carrying out of the work of opening the mouth of the lake, constructing a breakwater, and deepening a portion of the lake as a channel up to a loading point, and I know that in December, 1891, by permission of the Government, the Company were allowed to reduce a portion of Windang Island—an island standing eastward, opposite to the entrance to the lake and having an area approximately of 8½ acres—for the purpose of getting 350,000 cubic yards of stone for the breakwater, and in March of that year that work absolutely commenced. Some work was done in excavating for the purpose of making a tie bank between that island and the mainland, and all I know is that that was for some reason discontinued. The Act was amended in 1895, giving an extension of two years for the completion of those works and I believe that the cost of the proposed harbour was stated to be estimated at £140,000. I am not quite sure as to that, but I know that there are two years remaining in which to complete the work.

728. Do you know the mouth of Lake Illawarra? I have never been there. But for the purpose of comparison I will take the two zones. Supposing we take Lake Illawarra which would make a very grand harbour if all the difficulties were removed, and its mouth and everything else made equal to deep-sea loading. Then the zone from Clifton to Port Kembla would be 16½ miles and to the lake 23 miles; from North Bulli or Austinmer 12½ miles to Port Kembla and 19 to the lake; from Bulli 9½ miles to Port Kembla and 16 to the lake; from Woonoona 8 miles to Port Kembla and 15 to the lake; from South Bulli or Bellambi 7 miles to Port Kembla and 14 to the lake; from Corrimal 6½ miles to Port Kembla and 13 to the lake; from Mount Pleasant 5 miles to Port Kembla and 10½ to the lake; from Mount Keira 4½ miles to Port Kembla and 10 to the lake; from Kembla 4½ miles to Port Kembla and 6½ to the lake. I have no data or plans before me. I have simply the county map but I do not think that those figures would have to be altered very much. I wish to say in connection with the Kembla scheme that the

the existing line of railway and loop from the main line at Wollongong, being already Government property, cover three-quarters of a mile of the approach to Kemplab port and a deviation near the gaol or near to our port would traverse I think fully three-quarters of the distance on Crown lands. In the first place this proposal would give a central safe shipping port accessible to over-sea ships of every class which is now impossible. It would prevent what I think would be the destruction of the town of Wollongong which has hitherto been regarded as a port of the third magnitude in this Colony. It would give all the mines facilities for loading large vessels on equal terms. Although it would appear to divert the trade from Wollongong port proper it would create a larger trade, Port Kembla and Wollongong being then in juxtaposition to the dyke and Newcastle. Anything which the Government has done lately has not improved the town of Wollongong but the carrying out of this proposal would very much improve Wollongong.

F. A.  
Franklin, Esq.  
M.I.C.E.  
13 Nov., 1896.

729. What is the distance from the nearest jetty in Kemplab to the town of Wollongong? About  $4\frac{1}{4}$  miles to the township.

730. *Mr. Black.*] Do you not think it is likely that a town would spring up at Port Kembla? No I do not. Since the establishment of this business at Kemplab with improved appliances there has been no effort to build anything like accommodation for the coal-trimmers there. The coal-trimmers have to wade breast deep now every time they pass to and from their work at those jetties—they have to go through the Tom Thumb lagoon entrance. There is no punt or bridge there and several lives have nearly been lost there. I consider that Wollongong would benefit through doing the ordinary sea-port trade for the increased shipping at Port Kembla just in the same manner as it does business now with the distant miners. All the miners in that district look upon Wollongong as a sort of depôt for their ordinary supplies, and I am sure that with only a slight foot-bridge Wollongong would immediately come into touch with the shipping at Port Kembla. In supplying meat, vegetables, milk and other things to the ships a large business would rapidly grow up and increase. The Wollongong people cannot reach the shipping at Kemplab now on account of the physical difficulties that now intervene between Wollongong and that port.

731. *Mr. Lee.*] If that port became so important as you contemplate, is it not likely that a town would spring up there? No, I do not think so. Wollongong is singularly well supplied with every establishment necessary for a very fine depôt, we have excellent business places there, and also all the necessary places for the administration of the law. There is not a thing which you could suggest which Wollongong would require and which she has not now even if her shipping trade were doubled or even quadrupled, and by the carrying out of this proposal I consider that Wollongong would be saved. According to the assessment made for municipal purposes we formerly had in Wollongong and a small surrounding area property estimated to be worth £1,500,000. What I mean by saying that the carrying out of this proposal would save Wollongong is that it would protect vested interests in Wollongong, that town being, as regards Kemplab, in the same position as Newcastle is to the Dyke, but a shorter distance away from Kemplab than Newcastle is from the Dyke, and Wollongong will be a convenient depôt for the shipping requirements of Port Kembla, Wollongong being already furnished with every necessary establishment for a seaport depôt. The carrying out of this proposal would also create an export trade, as the pastures in the district are eminently suitable for fattening stock for exportation. It would also re-establish the value of real property which, as I have already said, was formerly estimated at £1,500,000, but is now much depreciated by failure to provide improvements in the port. On the construction of the jetty and the short line of railway, revenue would at once commence, as a slight interruption by stress of weather is small compared with the demurrage and charges at Newcastle. The next reason in favour of this proposal is that the zone system on the inter-Illawarra portion of the main line could be adjusted on equitable terms to suit each mine, and create a large and profitable traffic on the railway. Kemplab is the natural centre of the untouched coal in the district. Port Kembla would be a safe harbour of refuge in southerly and easterly weather, the existing protection from the reef and promontories forming Wollongong, and from the islands, being sufficient to render any weather from the north-east perfectly harmless. Owing to the extent of the island point eastward, and the set of the current inshore, the harbour is not liable to silt. The immediate formation in the neighbourhood is granitic, and offers unusual advantages, with a very short haulage, for getting material for cheaply constructing the breakwater. Owing to the existence of the present jetties the cost of landing timber, as in the case of those jetties themselves, would be reduced to the minimum. The great national value of the southern coal would be demonstrated on equal terms in proportion to the northern trade. Although the present sea jetties may be used to the extent of their lives for small craft, it is believed that all the mine proprietors are desirous of participating in the deep-sea trade from which they are now debarred owing to physical difficulties. The establishment of such a port will in every way benefit the whole community—mining, mercantile, and agricultural—in a district more highly improved and more densely populated than any area of similar character of country in New South Wales. The construction of these works, beyond their national importance, would be but simple justice when compared with the large expenditure on the northern ports and rivers. The people of Illawarra should not be punished for the failure of the Illawarra Harbour Trust to carry out the work under their own direction when the Harbour Trust were working under an unwieldy and unworkable Act. Most of the mines have already loop connections with the main line. The loop line and the railway connecting with Wollongong Harbour to the proposed point of deviation towards Kemplab port, are already Government property. The short line proposed for the port would traverse nearly four-fifths of Crown land on level grades. The sand reclaimed there already has become permanently grassed over, and might be made available for this line of railway without interfering with the boundary in any way.

732. *Chairman.*] In your opinion, will the erection of such an obstruction to the current as is proposed by means of the eastern breakwater in Kemplab Bay, cause the bay to silt? No; I have already said that those bays do not silt, and that the trend of that eastern breakwater would be such that the inshore current would set along and do exactly what it does now. The site of your present proposal does not silt. We have no evidence of a similar construction ever having silted.

733. You believe that the altered condition of the bay, caused by the erection of such works, would not cause it to silt up? I do not think there is current there to do it.

734. *Mr. Black.*] You have told the Committee that you think the people of Illawarra are entitled to a good harbour, and you think such a large expenditure as the carrying out of this proposal would involve, would recommend itself on the score of the return that would be made to the Consolidated Revenue? I do not know what expenditure you allude to—I do not know for what purpose you mean, whether for breakwater, jetty, or what.

F. A.  
Franklin, Esq.,  
M.I.C.E.  
13 Nov., 1896.

735. You have been recommending the construction of a breakwater have you not? Yes; I will keep to that.

736. And I think, from the trend of your remarks, you would like to see a double breakwater made? Indeed, I have never suggested it. I said that at Colombo for many years they have carried on their work without a northern breakwater.

737. You also said they were constructing another breakwater? I said that after fifteen years they have thought of spending more money.

738. Then, if your comparison between Colombo and Kembla is a good one, and if it would be necessary to have a second breakwater at Colombo, it would also be necessary to have a second breakwater at Kembla? No; I have told you that Kembla is far more naturally protected than Colombo. Having examined the two places thoroughly, I consider that Kembla has more natural protection than Colombo.

739. Which breakwater would you suggest should be made at Kembla;—the eastern one? Yes, the eastern breakwater.

740. You think there is no danger of storms from the north? If you had an excessive storm such as we have seen at Madras, but Madras is notoriously the most boisterous coast in the world. The breakwater there was turned right over.

741. Are there no strong northerly gales on the Illawarra coast? No. The northerly wind does not affect us anywhere.

742. Artificial protection is necessary from the east? Yes.

743. Natural protection is already partially afforded from the south? Yes; so much so that during the last week's gale loading operations were carried on. That was essentially a southerly gale.

744. Do you think it is likely that the company that has commenced works at Lake Illawarra are likely to complete them? If they succeed as well as they have done hitherto, I think it would be very much to their advantage to complete them.

745. Do you think that if they go on and complete their harbour works at Lake Illawarra it would be a good thing for the Government, as a matter of finance, to construct a competitive harbour at Port Kembla? If the Government could make themselves perfectly certain that the mines would take their coal all those additional miles to ship, I should say that it would be better to let private enterprise do it, but I have not heard that Lake Illawarra is to be used for the output of the coal for the southern district.

746. Do you think that Lake Illawarra would not be a suitable place for the shipment of coal? I do not say that. There is nothing impossible in engineering now.

747. Then what is your reason? I have stated clearly that Kembla is in the zone of the greatest bulk of the coal for our future business.

748. Do you think that a few miles extra haulage that would be entailed with coal coming from the north and going to Lake Illawarra would tend against that place as a shipping port? I do not think so at all. I am only speaking in regard to the present developed trade. I am not aware that that port was designed for the purpose of diverting the trade of the coal already being won. I should not think that that would be part of their project. As a port of entry to a large area suitable for a vast number of industries it is of very great value, as instanced by the great works now being erected there, but I have never heard that it was likely to be used for the shipping of our coal.

749. But you have no reason to think that that harbour company would have any objection to the utilization of their harbour? No; I give them great credit for their business capacity. They will take all the trade they can get, and if they can compete on better terms than the Kembla new port, well and good.

750. You acknowledge, then, that there is some risk, if the Illawarra scheme should succeed, of diverting at all events some portion of the traffic that would otherwise go to Kembla? I have not considered that at all. What I have considered is that omitting the refinements you have proposed for Kembla and doing only what is absolutely necessary, you would get a very cheap and safe port for our present purposes. We do not know the extent to which that company may go, or whether they may make provision for embracing the Illawarra trade as a natural part of their business, but what we do know is that legally they have only two years left to carry out their works. I have tried to make it understood that immediately on the construction of a short line from Wollongong to the jetty, your revenue may commence. Your breakwater construction would be a tedious operation which might go on for all time—at any rate the expenditure on that would cover a long period. All the other part could be developed in one year if necessary. I do not wish to place this in opposition to that great bold scheme of Lake Illawarra. With the large area lying around the lake it is capable of becoming the Birmingham of New South Wales.

751. Supposing the Lake Illawarra Company were to place it in opposition, what then? Let them do it by all means. I like to see competition. We would go on improving our port at Kembla immediately. But I do not think that the present state of affairs, considering that we are putting out a quarter of the output of the coal in the whole of the Colony, is to stay for an indefinite time until some work which has not been practically commenced is finished. I do not know what evidence you have, but my opinion is that the construction of those works must cover a long period of years.

752. Do you think there would be sufficient trade there to warrant the existence of two ports in such close proximity? Our port would have nothing to do with that port, this being I consider a port constructed by the State for State purposes. I myself have read that your Government tell people in other countries "we have a magnificent asset here in our wealth of coal," and I know it to be lying in the Illawarra district and I want to know why it should not be developed. I do not think that it should be left to private enterprise at all. This is a great national wealth, we have monopolies growing up here, and when mines are restricted like that, they cannot progress.

753. Do you refer to the monopoly of the harbour business? I say that I would rather see the control of the port and shipping directly under the State. I am sorry the State does not own the coal.

754. I thought that perhaps you referred to the national ownership of coal mines? I was not referring to that. I should however like to see the output of that coal as much under the direction of the Government as the output of State products should be.

755. *Mr. Hoskins.*] It is estimated that the eastern breakwater would cost about £240,000 and that to complete the works as designed by the Engineer-in-Chief for Harbours and Rivers would cost in round numbers £440,000; do you think that the Government would be justified in expending either of those large sums of money, if a private company were to give largely increased accommodation for the shipment of

of coal and produce a few miles further south, without calling on the Government to expend a penny? If I could see the work at Lake Illawarra progressing towards completion, I should say decidedly not.

756. Do you know how much work has been carried out there? I do not.

757. Therefore as far as you know the company may be going on actively with the work now? You may put it in that way. I might know indirectly, but I do not know.

758. You have expatiated at some length on the advantage you thought would result from the proposed improvements at Port Kembla; do you think, if the company at Lake Illawarra carry out their scheme as they say they intend to do, that equal advantages will be offered to the shipping trade, the coal trade, and the trade of the district generally by the carrying out of the Lake Illawarra scheme as you think would result from the carrying out of the Port Kembla scheme? I admit it is possible to make at Lake Illawarra the grandest harbour in the world; but I do not know whether it will suit the existing trade to go so far over so many miles of the inter-system of railways to ship coal there. I cannot see how it would be in the interests of the coal-mining industry to wait for the possibility of Lake Illawarra producing all those advantages. If I had seen the work at Lake Illawarra progressing up to this time of inquiry I should have said that it would have been a most unfair thing for the State to set up direct opposition against such private enterprise, but of my own knowledge I do not know how much has been done.

759. Can you say of your own knowledge whether there are any extensive coal-fields further south than the Mount Kembla or the Southern Coal-mining Company's schemes that are now being worked? I do not know. I know intimately the southern boundary, I know the limit of the coal at that point, but further south I do not know.

760. Then you are not prepared to say from your own knowledge whether the Lake Illawarra Company have an idea of working coal seams further south? I have an idea from information in the public press that that is their future hope. They hope to open up coal mines in the vicinity of the lake.

761. However, I take it that I may assume from your evidence that in consequence of the extra distance for haulage from most of the mines in the southern district which would be involved from shipping their coal at Lake Illawarra, you prefer that works should be carried out at Port Kembla? Most decidedly.

762. Even although the Government might be acquiring land by purchase and laying out a large sum of money at the same time that a private company a few miles south might also be expending a large sum of money to meet the shipping requirements in that district? I cannot give you any evidence as to what they are doing.

763. But supposing that the company are proceeding expeditiously or with moderate expedition with their work—and they are under bond to do so;—do you think that the Government under such circumstances would be justified in expending large sums of money in improving shipping facilities at Port Kembla? I do not know; I cannot enter into that political part of it. All I say is that for the existing vested interests throughout that place now, the amount of money that has been expended, the town established, and the expenditure for public buildings, the facilities we have for making a depôt for that trade, concentrated as it is, should be protected. We do not know the value of the coal still undeveloped. We do not know when that harbour will be finished. We do not know if it will be constructed in two years; it is only a matter of time, money, and men.

764. This Committee have had this evidence from the Engineer-in-Chief for Harbours and Rivers—that he does not think that the Crown would be justified, or that he would recommend or approve of a large expenditure on two coal shipping ports on the southern coast, because he thinks one would suffice for the work;—are you of that opinion? All I say is that if the work must be done by the Lake Illawarra Company within the limit of the time granted to them they will have to display unusual energy in doing it, and when that is done it will not serve the coal industry of Illawarra as much as this port would. The existing business and interests will be best served by making a depôt at Port Kembla, although it is rather hard on Bulli, Ballambi, and Corimal, as it gives them a larger zone and they can now get more quickly to a port.

765. Do you think that the Government, having expended large sums of money in the southern district on so-called harbours, would be justified in expending a much larger sum on work of a similar character if facilities for shipping produce and coal were afforded by works constructed independently of the Government only a few miles south of it? If you allude to spending the maximum amount estimated for Port Kembla, I would not recommend that. I minimise my remarks to the breakwater and a general jetty which would be available to the general public.

766. But we have it in evidence that to ensure affording proper facilities for sailing vessels loading coal at Port Kembla, and to ensure there being moderately still water enclosed within the breakwater, it would be necessary to carry out the full works, although coal might be shipped as the works progress;—are you of that opinion? I think coal could be shipped from the time the jetty was ready under the same conditions as are now enjoyed by those two best favoured jetties in existence. You would place all the mines in the same position, and I think the small expenditure that would produce that result and from which you could get a revenue almost immediately and even before the eastern breakwater was made, would be justified under the circumstances.

767. This Committee had given in evidence by a gentleman very largely interested in the shipping business of the colonies a statement that what is required in the southern coal district is a port to which sailing vessels could be sent—unfortunately, he says, that cannot now be done—and the proposal of the Government is by the expenditure of the large sum of money I have named to give moderately smooth water so that sailing vessels could load within the two breakwaters? I assume you mean the northern breakwater I do not believe in the extra refinements of wharfs and jetties. I do not wish to condemn anybody's project, but merely to say what I know to be a fact, and that is if you wish to carry out a moderate work for the protection of a much larger trade than we are doing, you would give us a breakwater protecting from the eastward and you will give us a jetty that will last sufficiently under such protection, and be for the use of all the mines alike.

768. Then your scheme appears to be a more moderate one than we have listened to? Yes, I would not recommend you to go in for all those refinements of excavations, wharfs, and so on. I approve of the eastern breakwater, and of a Government jetty between the two existing jetties.

769. If those improvements were carried out the Government would have to resume the two existing jetties? No, I think the two companies would work out the life of those jetties. I do not think the Government would use those jetties.

770. You know the locality very well? Yes.

F. A.  
Franklin, Esq.  
M.I.C.E.

13 Nov., 1896.

F. A.  
Franklin, Esq.  
M.I.C.E.  
13 Nov., 1896.

771. Could the Government carry out such improvements as you suggest without being compelled, in consequence of private jetties being in the way of their works, to purchase the private jetties, or to purchase land forming the approaches to the private jetties, or in point of fact being compelled to purchase a large area of land? I think that all that would be necessary for communication with the Government jetty would be a rearrangement of the lines and the approach to that jetty. The approach to the jetty that might be erected by the Government would have to be arranged in connection with the present approaches to the existing jetties. I think that there would be sufficient space between the two private jetties to carry out the proposal without interfering with these operations.

772. And therefore increased facilities could be given at Port Kembla, on that large sheet of water, without the Government being compelled, in consequence of blocking or interfering with the working of private jetties, to purchase those private jetties or to acquire possession of any large amount of land? I do not think that would be at all necessary.

TUESDAY, 17 NOVEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Tannatt William Edgeworth David, Esq., B.A., Professor of Geology and Mineralogy, University of Sydney, sworn, and examined:—

T. W. E.  
David, Esq.,  
B.A.  
17 Nov., 1896.

773. *Chairman.*] You have had an opportunity of discussing with the Government Geologist the question of the southern coal-measures? Yes, and I have also personally examined them.

774. Was the geological map on the wall prepared under your supervision? Yes.

775. Will you make a statement with regard to the coal deposits in the Illawarra district south of Helensburgh? There are two series of coal-bearing formations in the Illawarra district—an upper and a lower. The location of the upper series is shown on the map to which you have referred by a dark brown band, and is generally known as the Bulli-Newcastle series. This series is being worked at Newcastle on the north, at Bulli and various places down to Mount Kembla on the south, in the Eskbank and Lithgow district on the west, and at Mittagong on the south west. This series contains a considerable number of seams which are of varying thickness; but so far only the uppermost seam, which is known as the Bulli seam, has proved to be workable over large areas. This seam varies in thickness from 2 feet to as much as 12 feet. It has been proved at Helensburgh to have a thickness of about 12 feet, and from Helensburgh going south it has a thickness of not less than from 5 to 6 feet until about the latitude of the Southern Coal Company's mine.

776. Does the uppermost seam of the upper series cease to be of commercial importance south of Unanderra? That is my present opinion. I am of opinion that, at or about the position of the Southern Company's mine, the Bulli seam has so lost in thickness, and has so much deteriorated in quality partly because of the destructive action of volcanic rocks, which are very much developed further south, and particularly in the neighbourhood of Kiama, that it ceases to be workable over large areas. At the same time, I would not like to state definitely that there were no workable patches of coal along the eastern line of outcrop; but wherever I have seen the coal, and I have seen it in a good many places, it is not workable, having either thinned too much by contemporaneous erosions, or because it has been spoilt by the heating action of the volcanic dykes. This is notably the case near Kiama and in the Cambewarra Range, near Nowra. The Bulli seam is limited southwards, so far as I know, by the Cambewarra Range. I have not had an opportunity of closely exploring the country in the immediate neighbourhood of Jamberoo. I have been told that there is workable coal there; but I have never seen workable coal in the uppermost seam—the Bulli seam—from a point commencing at the Southern Company's mine down to the Cambewarra Range, and I have been over the greater part of that country.

777. The area of country in regard to which you are unable to express an opinion will be limited in extent? Yes.

778. There can be no great coal deposit on the south coast of which you have no knowledge? That is so. With regard to the depth of the Bulli seam at Camp Creek, near Helensburgh, it was found to be 846 feet below the surface in the diamond drill bore. Going south it rises gradually, until it comes out at sea-level at Coal Cliff. Continuing to rise it outcrops at Jamberoo and in the Cambewarra Range at from 1,600 to 1,800 feet above sea-level; so that there is nothing to prevent its being worked so far as depth is concerned.

779. How far does the seam go west? So far as I know, no evidence has been obtained by means of the sinking of shafts, or by boring, as to the quality of the coal at any considerable distance west of the outcrop in the coast range; but it outcrops in the neighbourhood of Mittagong, Moss Vale, and Bowral. We find the same seam recropping at Nattai Creek and in other rivers, so that the upper coal measures must be continuous westwards from the coast range to Mittagong.

780. What is the quality of the coal there? Slightly inferior to that of the Bulli coal. There is rather more ash in it. Still there are patches of payable coal near Mittagong.

781. *Mr. Fegan.*] The coal you speak of is very brittle? Yes, brittle and splinty, and the ash percentage is very high. I should consider that on the whole the Bulli seam would slightly deteriorate going westwards. At the same time there would be a very large area of good workable steam coal west from the coast-line, between the latitudes of Helensburgh and the Southern Company's mine.

782. How far west is Nattai from Bulli? About 25 miles.

783. Is it reasonable to infer that the deterioration you speak of is gradual? Yes.

784. So that 10 miles west from Bulli we might get pretty well the same class of coal as at Bulli? Yes. Near Mittagong and Berrima the coal-measures are close to what were high ranges, and under these circumstances

T. W. E.  
David, Esq.,  
B.A.

17 Nov., 1896

circumstances we always find that the coal deteriorates rapidly, because the ranges supplied coarse sediment to the swamps where the coal is forming. It has been my experience in the northern district that where the coal deteriorates by reason of a high percentage of ash, the deterioration comes about very suddenly, just as you approach the edge of the coal-basin. One sees that notably at Greta, where in three or four miles you pass from good workable gas and steam coal to an almost worthless coal. The Bulli seam consists of thoroughly good steam coal, and I should think that a minimum thickness of 6 feet could be reckoned upon all over the area to which I have been referring.

785. How many tons per acre would there be in the Bulli seam? Roughly speaking, a cubic yard of coal weighs a ton. Taking the average thickness of the seam as 6 feet, that means 9,680 tons of coal to the acre. From that you must deduct one-third for waste and working, the pillars left, and so on. That leaves 6,450 tons of marketable coal, of which about one-fourth would be small coal and the remainder, 4,838 tons, large coal.

785½. How far is it from a point 5 miles south of Helensburg to Cambewarra? Nearly 50 miles.

786. How far is it from Port Kembla to Cambewarra? Thirty-three miles.

787. Is it reasonable to infer that all coal lying 5 miles west from the face of the Bulli seam will, if worked, be brought down to the seaboard? I think so.

788. Would it pay to haul the coal 5 miles along underground workings? That is a question a little out of my province. The Inspector of Collieries or the Government Geologist would be able to give you information upon the subject.

789. The distance between Coal Cliff and a point on the outcrop of the coal measures due west from Port Kembla would be 17 miles. Taking a strip of land 5 miles wide between those two places, you have an area of 85 square miles, or 54,400 acres. Allowing 6,000 tons of coal to the acre, that gives 326,400,000 tons of workable coal. Is it reasonable to suppose that that quantity of coal would find its way to the seaboard from the upper series? I think so.

790. Have you any information with regard to the other seams in the upper series? I have examined them at many places; but I have not observed that they are anywhere workable. There are no seams of any commercial value below the uppermost seam.

791. Now what about the lower series? This series is known as the Greta series. It crops out at Greta and West Maitland, where the thickness of the seam varies from 17 feet to 30 feet. From West Maitland it dips down to a great depth, being about 7,000 feet below Sydney. Gradually rising as you go south it comes out at the surface at the head of the Clyde River, south-west from Jervis Bay. At the southern development of this series, the seams are not nearly so thick as they are at Greta and West Maitland. The total thickness of coal as measured by me at the head of the Clyde River was 6 feet 8 inches. In that thickness there was one layer of good coal, 3 feet thick. The rest of the thickness was made up by thinner layers, which, however, probably come together further north, making one seam of a thickness of about 6 feet.

792. If it were accessible would that be valuable coal? It is of commercial value.

793. At the present time? No, I think not, considering the difficulty of access to the place.

794. *Chairman.*] The coal is good, but difficult of access? Yes.

795. If that coal occurred in the Illawarra or Newcastle district would it be worked? It is a little questionable whether it would be worked at the present day; but it is a seam which will be worked when the thicker seams come to be more worked out.

796. How deep would the Greta series be at Wollongong or Port Kembla? At Wollongong it would probably be at least 3,000 feet below the surface. Even at Nowra or Jervis Bay it would be a little over 2,000 feet below the surface.

797. What is the deepest coal-mine in the world? The Belgian mines are about the deepest. I am afraid to say what depth they are, but I know they are a good many hundred feet over 3,000 feet deep. It is very good coal that they are getting, and more easily worked coal is becoming scarce there. With regard to what I said about the Bulli seam having deteriorated south of Port Kembla, I wish that statement to apply only to the eastern portion of the coal-field. I do not wish it to apply to the whole area as far west as Mittagong or Berrima, though my remarks would apply to a strip of country at least 5 miles wide.

798. *Mr. Humphery.*] Would you include the Saddleback and Jamberoo? Yes. The Saddleback is about the centre of the volcanic disturbance.

799. *Chairman.*] Is Jamberoo the only place where any large deposit is likely to be found? There is an outcrop at the Fitzroy Falls.

800. Is not the Illawarra Land Corporation's colliery within the locality where you say the coal has been spoilt? I think that if there is good coal there it will be limited in area. I have followed the range right along, and I have examined various tunnels and shafts in the district, and the coal all seems to me to have deteriorated. On Mr. Biggar's land the seam is only about 2 ft. 6 in. thick. The coal has very much deteriorated along the outcrop south-west from the Dapto Railway Station. If there is any workable coal at the place you name, I should say that it is only a patch coming down from the main field to the north, and it would not extend southwards for any distance.

801. May there not be a considerable area of coal land? Not in proportion to the area of the whole field. It is either an isolated patch or a tongue coming down from the main field.

802. *Mr. Wright.*] Have you personally inspected this country? I have personally inspected a great part of it. I have followed the seams round from Cambewarra towards the Saddleback, and I have examined them at the Saddleback and on the property of the Hon. J. H. Watt and along the Wongawilli Ranges.

803. Your deductions are made from personal observations? Yes.

804. *Mr. Fegan.*] You would not say that the Greta seam has deteriorated? No.

805. *Mr. Humphery.*] Have you seen the 12-ft. seam belonging to the Illawarra Harbour and Land Corporation? No, I have not.

806. You have heard, I presume, that the corporation have a seam of anthracite coal 12 feet in thickness, giving about 12 per cent. of ash, which they have penetrated for a distance of about 60 feet? No.

807. How long is it since you inspected this part of the south coast? I made the chief inspection in 1890.

808. If this seam has been discovered, will it lead you to change your opinion as far as the character of the coal south of Port Kembla is concerned? Not if the coal is part of the Bulli seam. If it belongs to a lower seam that has not been much tested elsewhere, the fact would modify my opinion.

809. It may belong to the uppermost seam? Yes, or it may be one of the lower seams which have improved in quality at that spot.

- T. W. E. David, Esq., B.A.  
17 Nov., 1896.
810. *Chairman.*] Supposing it belongs to the uppermost seam? That would not modify my opinion, because the uppermost seam has been proved at so many places to have thinned down or to have been damaged by dykes.
811. *Mr. Humphery.*] This would be one of the patches to which you have referred? Yes.
812. Are you prepared to express an opinion as to the probable extent of this patch? No, but it cannot extend very far south, because it would soon reach the northern end of the land at Wongawilli, where the uppermost seam has a thickness of only 2½ ft.
813. At any rate an inspection would be desirable, assuming that the extent justifies further exploration? I think so.
814. *Chairman.*] Do you think that the total amount of coal extracted from the Illawarra mines forms any great proportion of the total amount of available coal? Do you mean within the 5 miles' strip.
815. Yes? It is very doubtful whether 26,000,000 tons of coal have been sent away from the district. I should think that not one-twentieth of the available coal has been taken.
816. *Mr. Humphery.*] If the Illawarra Harbour and Land Corporation's coal belonged to a seam other than the Bulli seam that would largely increase the probable store? Yes.
817. And it might then be of very great extent? I hardly think so, because I have seen several of these lower seams exposed to view both to the north and to the south of this ground.
818. *Chairman.*] Are we justified in believing that there is no accessible coal having a commercial value, adjacent to Jervis Bay? Yes. The nearest coal would be 2,000 feet below the surface. A bore was put down between Jervis Bay and the Clyde River, and the Greta coal was only reached at a depth of 1,331 feet. The coal there was not of good quality. You will find a report of the bore in the annual report of the Department of Mines for 1890.
819. *Mr. Hoskins.*] Have you ever given any attention to the question of providing appliances and conveniences for shipping coal;—have you studied this question in connection with the ports of Great Britain and Wales? No, I am not a mining engineer at all. I have concerned myself purely with the geological features of coal mining—the distribution of coal seams, the points of outcrop, the depths, and so on.
820. *Mr. Trickett.*] Is it not probable where an upper seam is found to be affected by volcanic action that the lower seams will be of inferior quality? As the volcanic rock comes from below, the lower seams generally have to bear the brunt of the onslaught. Therefore the coal does not usually improve in quality as you go down. If you find that the upper seams are burnt, you generally find that the lower seams are burnt to a still greater extent.
821. Is not the good coal in the Illawarra district superior for steaming purposes to any other coal in New South Wales? Yes, it is a very superior coal for steaming purposes.

WEDNESDAY, 18 NOVEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Edward Nassau Senior, Esq., General Financier, and Representative of the London Board of Management of the Southern Coal Company of New South Wales (Limited) sworn, and examined:—

E. N. Senior, Esq.  
17 Nov., 1896.

822. *Mr. Humphery.*] You represent English investors in Australia? Yes, very largely. I suppose I represent between £3,000,000 and £4,000,000 of capital invested here. I have come out to Australia every four or five years for the last twenty years.

823. Are you familiar with the various ports south of Sydney and with the southern coal mines? Fairly so. I do not consider myself a coal expert.

824. Have you brought a statement? I have here a short statement, which I will read:—

I represent the English shareholders in the Southern Coal Company, which owns the largest jetty at Port Kembla. Before we decided to build the jetty we made careful inquiries as to which was the safest and most suitable place on the coast for the shipment of our coal. In coming to a decision we were largely assisted by the advice of the late Sir John Coode, who, being a personal friend of the chairman of the company, gave us the benefit of his advice unofficially. We decided that Port Kembla was the most suitable place, being the nearest approach to a natural harbour on the coast, and also from the fact of the coal being traced many miles south of it, it seemed to us that it would occupy the most central position eventually. He advised us strongly at the time to erect a breakwater to protect shipping from the south-east and easterly gales, but we did not then think the position of the southern coal trade of New South Wales justified such a large expenditure of money. This position is now entirely changed, the trade in southern coal having increased now to almost 1,000,000 tons per annum. About one-fourth of this is shipped at Port Kembla, and, were we now thinking of erecting a jetty, the importance of the trade would fully justify the expense of a breakwater. Experience has shown us that a harbour safe to load at in all weathers is the one thing remaining undone to fully develop the trade in southern coal. The best of it is within 7½ per cent. of the very best English and Welsh coal for steaming, and, if there were a harbour on the south coast where vessels (especially sailing ships) could load in all weathers, the future of southern coal in the eastern ports would indeed be bright, and the cheap Japanese coal, which is inferior in steaming qualities, could not compete with it.

I am informed that it is laid down by experts that it would require 400,000 tons shipped at Port Kembla, upon which a levy of 6d. per ton was made, to pay 4 per cent. interest upon the cost of the eastern breakwater. I am very confident that, at the very least, 400,000 tons would be shipped within the first year after the breakwater was made, which would annually increase considerably. At the present moment there are some 220,000 to 250,000 tons shipped at Port Kembla alone, and, if this is done regularly when there are many days in the year that steamers cannot load, the inference is only fair that, when steamers can load there all the year round, the amount shipped by steamers must increase.

Experience has shown at Newcastle that the foreign sailing ship trade takes away from that district about the same amount that the steamers do—this points to a similar result following in the south, so that we may fairly expect that when once sailers can coal there we might expect a similar result to Newcastle which would double the quantity now shipped from the southern district. The whole of the sailing trade must come to the safe harbour.

It must also be borne in mind that in bad weather the harbour would be utilised by all the collieries in the district, as the weather would be too rough for them to load at their own private jetties. The value of this increase would naturally be dependent on the weather.

I have very little doubt that, when once a breakwater is built at Port Kembla, many large English shipowners, who at present regard the port as a somewhat uncertain roadstead, will regularly send their ships to load there. E. N. Senior,  
Esq.

There is another source of revenue to be confidently expected when once Port Kembla is made into a regular harbour—I refer to imports. I am informed that the Smelting Company of Australia expect to deal with some 200,000 tons of Broken Hill ores and some 40,000 to 50,000 tons of flux—this would bring in a handsome revenue. I am also very confident that, if a safe harbour is made on the southern coast, other industries of a character similar to the Smelting Company must be established; in short, in my opinion the southern district has now improved its position so much that I think it has a right to expect a sum of money to be expended in forming a safe harbour, especially so when a revenue more than covering the interest on the loan can be looked for with the greatest confidence. As a commercial affair I would have no hesitation in recommending people in England to put their money into a company to erect this breakwater, were it possible for a private company to make a levy of 6d. per ton upon everything imported and exported at the port. 18 Nov., 1896

It may be contended that no such harbour is required, as all the appliances are in Sydney, but I would point out that the expense of sending coal from Mount Kembla to Sydney is something like 3s. 9d. per ton for railway carriage. This is a simply prohibitive tax, and the southern coal could never compete for the steam coal trade in the eastern ports if it were handicapped with this prohibitive charge. Indeed, the policy of the Railway Department has been hitherto to stifle local developments in the southern district, and to divert everything to Sydney.

If it can be proved that there is a better or more suitable harbour on the south coast than Port Kembla, by all means let that harbour be chosen. All that I (representing a large sum of money already invested in the southern district, and possibly more to come) ask, is for a safe harbour to be made.

825. Before you selected Port Kembla for the shipment of coal were you interested in any of the coal mines? No. Our first idea was to buy a coal mine, provided we could see our way to ship the coal from a safe harbour close at hand.

826. In your statement you refer to a conversation which you had with Sir John Coode upon the subject? I have had a great many conversations with Sir John Coode upon the subject.

827. Did those conversations take place before you acquired any interest upon the south coast? Yes.

828. How long, subsequent to that, did the investors whom you represent acquire an interest? I should say two or three months afterwards.

829. What led to your acquiring an interest in the Southern Colliery? It was represented to us that the coal trade in Australia was likely to increase; that the coal in the southern districts was very good, and that all it wanted was to have capital put into a harbour to increase it. I was out here in 1886, and several things were mentioned as being good. Finally a property was offered to us; but we said, "No, we will not take that property unless we can obtain a safe harbour for which to ship the coal. We then considered Bellambi, Lake Illawarra, and Port Kembla, and, after a good deal of consultation we decided that Port Kembla was the best place for a port of shipment.

830. You then acquired a coal property in its vicinity? Yes.

831. Have you any objection to state the nature of the interest which the investors acquired. Did they buy one coal mine or several? They bought a coal property at Mount Kembla, consisting of about 750 acres freehold, and a good deal of money was spent in building a pier at Port Kembla, and in making a railway from the coal property down to the pier.

832. Was that coal property been a success? No, it has not. We only went for one seam—the Bulli seam, which is what all the collieries there are working—but we found that the coal was burnt. There are other seams on the property; but we thought it better, instead of prospecting them to take Corrimal which was offered to us on a royalty. Having commenced operations there, we have been going on regularly ever since, and now our output is about 100,000 tons a year. We have constructed two railroads; a railroad from the Southern Coal Company's property to the Government line, and from the Government line to our pier at Port Kembla, and another from Corrimal to the Government line.

833. Had you constructed the jetty previously? No; the whole of the work went on simultaneously.

834. How did you acquire the right to construct a jetty? I think we bought it from people who had an Act of Parliament.

835. Have you a lease in connection with the jetty, or do you pay royalty? I think we pay royalty.

836. You cannot remember what royalty you pay? No.

837. Who are the property-owners to whom you pay royalty? I cannot remember.

838. What has been your expenditure in connection with the jetty? I should say approximately £25,000.

839. And what on the railway? Approximately another £25,000.

840. How much did you expend in testing the property which you are not working? I could not tell you off-hand; but we spent a good deal of money over it.

841. Many thousands of pounds? Yes, a good many.

842. What is the length of your line from the Government line to Port Kembla? It is over 2 miles.

843. What water is there at the end of the jetty? Over 30 feet.

844. I suppose the largest vessels can lie alongside the jetty? Yes. I believe that the largest carrier in the world but one—the "Indrani"—has been there.

845. Is it your opinion that two breakwaters are necessary in order to make Port Kembla a safe harbour for sailing vessels? No. Personally I should try one first. My opinion is that the eastern breakwater would be sufficient.

846. Have you had any experience in connection with breakwaters? No; but I have had money put into a good many, some of which have been a success, and some not. I am not an expert in any way. If I was managing a private company that intended to carry out the work, I should erect the eastern breakwater first, in the hope that it alone might be successful.

847. Before you decided to construct a jetty at Port Kembla did you consider the possibilities of Lake Illawarra, Wollongong, and Bellambi? Yes. Our reason for deciding against Bellambi was that the holding ground was not good, the bottom being rocky. Sir John Coode did not advise us to go into the Illawarra scheme. His idea was that constant dredging would be necessary there, and that a large expenditure would be necessary to make a good harbour there.

848. Did Sir John Coode fully explain to you his reasons for not liking the Lake Illawarra scheme? He advised against it mainly on the ground that it would require a great amount of dredging, and that the lake was not deep enough to take really large steamers.

849. Were you influenced by Sir John Coode's advice in determining upon Port Kembla? Very much so. If Sir John Coode had not advised me to decide upon Port Kembla I should not have taken up the idea.

850. What is the present position of the company. Is it a going company? We are just about paying our way now. I suppose that this year we shall do a little more than pay our way.

E. N. Senior  
Esq.  
8 Nov., 1886.

851. Is there any intention of abandoning or of selling the property? Not the slightest.
852. Is there sufficient encouragement for you to continue operations there? Certainly.
853. Is there another mine close to Corrimal in which you are interested? We have leased a bit of property from Captain Osborne which we work in conjunction with Corrimal.
854. Do you know anything about the coal-measures below Port Kembla? Only from hearsay. I do not believe that they have ever been thoroughly tested, though I believe that Mr. Howell is now testing them for the Smelting Company of Australia.
855. Looking upon the construction of breakwaters at Port Kembla as a commercial enterprise, would it offer any encouragement for the investment of capital, supposing that the investors were permitted to charge a rate of 6d. per ton upon the imports and exports of the place? I would willingly join in forming a company to construct a breakwater if the company were given power to make such a levy.
856. That would be a general levy upon exports and imports? Upon all coal shipped away, and upon all imports. I expect that if a breakwater is made, the imports there will be large, on account of the close proximity of the smelting-works.
857. When you refer to a charge of 6d. per ton, that would be exclusive of railway charges? Yes; that would be simply a shipping charge.
858. Assuming that 900,000 tons are now sent away from the Illawarra district annually, do you expect that if a breakwater were made at Port Kembla at least 1,000,000 tons would be sent from that place alone every year? The experience of Newcastle would lead one to believe that if a safe harbour were made at Port Kembla the export would be doubled, because sailing ships would take away as much as the steamers take.
859. Therefore, nearly 1,000,000 tons of coal would be sent away from Port Kembla annually, exclusive of what was shipped from the other jetties? Yes.
860. In addition to that, there would be the imports, which you estimate at about 250,000 tons? Yes.
861. That would make the trade of the port 1,250,000;—is that an unreasonable estimate? I do not think that it is, judging by the experience of other places.
862. With regard to the Lake Illawarra harbour scheme, the company's Act provides that a channel should be dredged through the lake to a depth of 15 feet;—in your opinion, would that depth be enough? No; you ought certainly to allow a depth of 30 feet. Nowadays it is no use making a port unless you make it large enough to take in the biggest vessels.
863. Unless the lake were dredged to a much greater depth, it would not be able to accommodate the class of vessel which you would expect at Lake Illawarra? That is my opinion. I should not dream of putting money into the Lake Illawarra scheme unless provision were made for the accommodation of vessels drawing at least 26 feet. I should think the depth ought to be 30 feet.
864. Is it your opinion that the ores and flux required by the Smelting Company of Australia would be brought to Port Kembla, and not to Sydney? I should say so. The steamers would save a journey of 40 miles going and coming, and they would be able to take in coal while they were putting out the ore.
865. The vessels bringing ore would need coal for back loading? Naturally.
866. So that, apart from the saving in haulage, because of the shorter distance to Port Kembla, it would be a great advantage to the vessels engaged in the trade to go to Port Kembla? I should think so.
867. Will you state the extent to which those whom you represent are interested in the south coast? As regards the Southern Coal Company, we have something like £160,000 expended. As to the other companies which I represent, I should have to look over the list of investments before I could give you the information you desire.
868. Would the other companies to which you refer be affected by the proposed scheme? No. The only company affected by this scheme with which I am connected, so far as I remember at present, is the Southern Coal Company.
869. In your opinion, the proposal before the Committee is the only proposal for the construction of a safe harbour into which it would be safe for investors to put their money in the hope of getting a return? That is a very large question. It is the scheme that I personally prefer.
870. If the proposed work were carried out, would you be prepared to hand over your jetty to the Government? I should be uncommonly sorry to do so.
871. Upon reasonable compensation, or would you prefer to continue to work your jetty? I should prefer to continue to work our jetty.
872. Would it be reasonable for the Government to undertake an expenditure of the kind proposed without some contributions from you? I think it would be quite reasonable. The Government would make their own profits out of the work.
873. In what way? If they made a levy of 6d. a ton upon all exports and imports, and the breakwater only cost them £150,000 or £160,000, they would make an uncommonly good thing out of it.
874. Would there be any objection on your part, or on the part of other owners circumstanced like you, to paying such a charge? I do not think so. The construction of the breakwater would increase our trade enormously, and in that way we could get a *quid pro quo*. I do not ask the Government to resume our jetty. All I ask is that the Government will give us a safe harbour.
875. And you are quite willing to pay for it? Yes.
876. *Mr. Hoskins.* In regard to the Lake Illawarra harbour scheme, would it not be necessary to dredge a great deal more than a mere channel across the lake;—would not a large basin be necessary for the reception of shipping? I think you could get better information on that subject from a naval expert.
877. If sailing vessels were taken there, it would be necessary to have room to move them about in? I think it will be a long while before we have sailing ships in Lake Illawarra.
878. You are of opinion that there will never be an extensive sailing-ship trade to Lake Illawarra? That is my opinion. I should be very sorry to put money into the Lake Illawarra scheme.
879. If you simply dredged the channel across the lake you could only deal with one vessel at a time? I do not think that follows, because you could make wharfs for the accommodation of several vessels at a time. I have not seen any plans, so that I do not know exactly what is required at the lake.
880. Could the Smelting Company of Australia discharge vessels at Port Kembla at the present time? No; not while there is no breakwater.
881. What is the area of land leased by the Corrimal Company? I could not say offhand. I cannot remember all these particulars

882. Do you anticipate that if the Government carry out the proposed improvements at Port Kembla, that place will be used for the shipment of coal from other mines besides those which send there now? Certainly; so far as sailing ships go, the whole trade must come to Port Kembla, or wherever a safe harbour is made. At present there is no sailing-ship trade on the south coast.

F. N. Senior,  
Esq.  
18 Nov., 1890.

883. Would your company be able to work their jetty while the breakwater was in course of construction? Yes.

884. *Mr. Trickett.*] You spoke of the coal upon your Mount Kembla property being burnt;—did you make any investigation to ascertain whether there was not better coal lower down? We went on with the seam a long way; but we did not test the other seam. At present the only seam which is in demand is the Bulli seam.

885. You had no bores put down to test the other seams? No.

886. The reason being that it paid you better to make other arrangements? Quite so. The leased block is 12 or 14 miles from Port Kembla, while our purchased block is close to Mount Kembla, and about 5 or 6 miles from the port.

887. Is your coal brought down to Port Kembla over the Government railway? It is first brought over our own lines, then over the Government lines, and then over our own line again.

888. Is it an extensive seam that you are working at Corrimal? I think it is about the average width of the Bulli seam.

889. Do you intend to leave your purchased block unused for any length of time? We are cutting our coat according to our cloth, and are waiting until we have some spare funds before further developing the freehold block.

890. The southern coal is a good marketable coal? The Corrimal coal is.

891. Where is the chief market for that coal? We have contracts to supply various ocean-going steamers, and a certain amount of coal goes to Singapore and up that way.

892. There is a large demand for this coal in the East? Yes, and I think there will be a still larger demand in the future. It is not enough known yet. To my mind it is only a question of time when the southern coal trade will be very largely developed in the East.

893. You have dwelt considerably upon the necessity of making a harbour at Port Kembla for the accommodation of sailing ships? I do not pin myself to Port Kembla. I have been speaking of the necessity of having a safe harbour for sailing ships upon the south coast.

894. Do you think the days of sailing ships are likely to continue? There will always be a certain number of sailing ships employed, though the number of sailing ships does not increase so fast as the number of steamers. Of course, the more steamers increase, the more coal will be required in the East.

895. But steamers can come to Port Kembla in safety in any weather? No; there are certain days in the year when they cannot load there. That is the experience of every jetty upon the coast. We constantly telegraph to Sydney to say that it is no use for a steamer to come down. It would not suit us to have our pier bumped away. There is no open pier in the world at which vessels could load all the year round.

896. Therefore, the necessity for the breakwater exists, even if only steamers are to be employed? I do not say that it is so vitally necessary for steamers, because they can load there during most of the days of the year. But it upsets the whole of our colliery arrangements when we have to stop loading for two or three days.

897. You say that your company originally contemplated constructing a breakwater? Sir John Coode advised us to make a breakwater, because he said that it was the only way to provide for the loading of sailing ships.

898. If you had made a breakwater, would you have sought to get special rights in connection with the port? We did not see our way to make a breakwater, because we did not see that we could get our money back again. If we had the right to make a levy of 6d. a ton upon all exports and imports we should be willing to make a breakwater to-morrow.

899. Is not 6d. a ton a high rate? Well, I spoke of 6d., because I have heard that rate talked about. If the Government could make it less than 6d. so much the better.

900. *Mr. Clarke.*] In your estimate of the future trade of the port, did you include the Metropolitan Co.'s coal? No; that coal goes to Sydney by rail.

901. Would the mines which now send to Clifton, Bellambi, Bulli, and other jetties continue to ship there if the proposed work were carried out? I think so, whenever they could. They would only come to Port Kembla during bad weather.

902. Or to load large vessels? Yes; they do that now sometimes. If we have a big steamer at Port Kembla, which we cannot load ourselves at once, other people often help us.

903. These jetties do not last very long, so that it might be cheaper for them to send to Port Kembla than to incur the cost of maintenance? Our jetty was built in 1888, and everything that has been required to properly maintain it has been done at once, so that I do not think it is any worse now than it was the day it was built.

904. It is not a fact that the foreign coal trade is nearly all done by sailing vessels? Pretty well.

905. The trade to California, Chili, Peru, and South Africa? Well, I do not know about South Africa.

906. Sailing vessels cannot use Port Kembla in its present state? That is so.

907. A large quantity of coal is now shipped at Wollongong;—do you think that that coal would continue to be shipped from there, or would it be brought to Port Kembla? That would depend a great deal upon the contracts. If they got small contracts in Sydney, they would probably ship from Wollongong; but if they got big contracts, for the supply of big steamers, they would probably send to Port Kembla.

908. *Mr. Lee.*] Do you think the prospective trade of Port Kembla—1,000,000 tons a year—could be shipped from the existing jetties there? I should be sorry to answer that question offhand.

909. If the output of coal increases, will not the owners of the jetties at Port Kembla have to make a charge for the coal shipped from them? At present we make a charge for all coal going over our jetties.

910. Would not additional appliances be required for the shipment of a much larger quantity of coal? I think that is a question for a practical man.

911. Would your company offer any serious objection to the resumption of its jetty by the Government? That is a thing which I have not considered. As regards the question of appliances, I think that is a matter

- E. N. Senior, Esq.  
18 Nov., 1896.
- for experts. As to the question whether we should offer any objection to the resumption of our jetty by the Government, I take it that the Government have absolute power to resume that jetty if they choose.
912. Supposing it were found necessary to resume these jetties, the mere fact that they belong to the Government would not interfere with your business as coal exporters? Not a bit.
913. *Mr. Wright.*] You have spoken about the probable development of the coal trade at Port Kembla; have you any knowledge of the coal trade generally? I have bought a great deal of coal, and I have sold a great deal of coal for ships; but I am not a coal expert.
914. You cannot double the trade of a place unless there is a market;—what probability is there of the market for Australian coal increasing? I think that our southern coal would be very largely used in the eastern ports—Singapore, Hong Kong, and so on. I think that the cheap Japanese coal will be knocked out entirely.
915. Is the southern coal better than the Newcastle coal? It is better steaming coal. Steamers prefer it when they can get it on equal terms.
916. You think that a large increase of the steamer fleet of the world will mean a large increase in the consumption of this coal? I go further. The steam-coal of England is not going to last for ever, I am afraid. Mr. Price Williams, who is supposed to be an authority, has, I believe, stated that the steam-coal of Wales will not last more than 100 years.
917. Are you familiar with the eastern waters? No; but I have sold coal to go out there.
918. I believe that there are large coal-beds in China and Japan? Yes; but I understand that the coal is very gasy.
919. Still that coal will enter into competition with our coal? Yes; and we want to be in a position to meet that competition. If you have the best article it is wrong of you to let other people beat you.
920. *Mr. Egan.*] Has your company ever approached the Government and pointed out the necessity for this breakwater? Never, that I am aware of.
921. As far as your company is concerned, it does not matter whether the breakwater is constructed or not? I do not say that. It is everything to my company, and to everybody interested in the southern coal trade to have a safe harbour made.
922. You are only speaking for the Southern Coal Company? Yes.
923. You say that about 200,000 tons of coal are sent away from Port Kembla now;—a tax upon that coal would not repay the Government the cost of constructing a harbour at an expenditure of £300,000? Certainly not.
924. You look for the expansion of the sailing-ship trade upon the construction of this breakwater? Yes, chiefly.
925. You do not think that the construction of the breakwater would be in any way detrimental to the interests of Newcastle? It would not affect Newcastle in the slightest degree.
926. It is chiefly to the eastern trade that you are looking? The eastern and the Californian trade.
927. Did it ever occur to you to ask Parliament for the right to construct a breakwater? I never thought of such thing, because I never imagined that Parliament would give us the right. If the Government asked us to find the money for this work, and allowed us to charge 6d. a ton upon all exports and imports. I should certainly consider their proposal. I would do more, I would put my own money into the scheme.
928. You say that the time has come when the security of the southern coal trade should be considered, as the security of the northern coal trade has been considered? Yes.
929. *Mr. Hassall.*] You do not know anything of the coal south of Mount Kembla? No.
930. If the coal-seams extend south of Mount Kembla, Port Kembla would be very centrally situated to the various collieries which may be opened? Yes.
931. Is the Illawarra coal equal to the Welsh coal? It is from within 7½ to 10 per cent. of the best Welsh coal.
932. The cost of rail carriage practically prevents you from sending your coal direct to Sydney? Yes; and the handling spoils the coal. The southern coal is inclined to be brittle, and the less handling it gets the better.
933. You spoke of this coal taking the place of Japanese coal? I think our coal is better than the Japanese coal, and ships coming out here would be glad to take coal as ballast to the eastern ports.
934. Have any efforts been made to develop any of the seams besides the Bulli seam? I do not know. I have made several inquiries; but I have had no definite answer.
935. Do you know whether any test has been made of the quality of the coal in the other seams? I have not heard of any; but as long as people can work the Bulli coal, they will not try any other.
936. Would your company and other coal shipping companies be able to pay a charge of 6d. a ton on all coal shipped, if a safe harbour were provided? I think so.
937. You would not raise any objection to such a charge? No.
938. *Mr. Roberts.*] If the contemplated works at Lake Illawarra were carried out, would you regard the construction of a breakwater at Port Kembla as necessary? No. If Lake Illawarra could be made a safe harbour that is all we should want.
939. Are you able to say if Lake Illawarra could be made a safe harbour for sailing ships? I have my own opinion upon the matter, but I am not an expert.
940. Do you not think it would be necessary to construct the northern breakwater at Port Kembla in order to protect the place from black north-easters? There are a good many headlands to the north, which, I think, give enough protection. Personally, I should prefer only to carry out one breakwater at first.
941. *Mr. Black.*] Sixpence a ton upon 1,000,000 tons would give a return of £25,000, or about 8 per cent. upon annual expenditure of £320,000. Against that, however, there would have to be set the interest, working expenses, and the capital sunk in resuming land and purchasing private rights to existing jetties and railways lines? I think that if the Government made only 4 per cent., or even less upon their total expenditure, they should make a port in the southern district.
942. Even if it involved a loss of from £20,000 to £25,000 per annum? I do not admit that there should be a primary loss at all; but even if there were a small loss I think the work should be carried out.
943. *Chairman.*] Do you ship 100,000 tons from your jetty at Port Kembla? Yes.
944. Is it reasonable to suppose that you could ship 200,000 tons a year from that jetty? Yes.\*

945.

\* NOTE (on revision):—The quantity of coal shipped over the Southern Coal Company and the Mount Kembla Company's jetties at Port Kembla during the first nine months of the current year is as under:—Mount Kembla Company, 107,164 tons; Southern Coal Company, 115,472 tons; total 232,636 tons.

The Hon.  
E. Vickery,  
M.L.C.  
18 Nov., 1896.

Besides the ordinary regular steam-coilers belonging to Sydney, carrying up to 750 tons of coal, numerous large vessels from 2,000 to 7,000 tons each have loaded at Kembla, but with some risk both to jetties and themselves when heavy weather came on; and from inability to load sailing ships with safety the company has been compelled to decline trade with Bombay, Madras, Singapore, Shanghai, Colombo, and America.

Mr. Darley's whole plan would undoubtedly provide a harbour as safe as Port Jackson and serve for all time; but I am of opinion that his proposed eastern breakwater would answer present purposes, and should immediately be undertaken. There is abundance of stone to be had at Red Point, and also an immense quarry of bluestone 5 miles distant with a railway already constructed from Red Point right up to the face of the quarry, and these can be shown to the Committee on the spot, so that the work can be carried out cheaply.

As regards the cost, from information I am of opinion that the eastern breakwater could be built well within Mr. Darley's estimate, and I consider the district has a good claim for the expenditure as a national and necessary work. I suggest that the Government resume either the whole or at least 1,000 acres of the Five Islands or Wentworth estate for resale and settlement. The whole of the cost of the breakwater would probably be recouped thereby.

It is a work upon which many of the unemployed could be engaged.

There is not only the output of the Mount Kembla and Southern Coal Companies, now equal to 250,000 tons per annum, but I believe the port will be largely availed of by six or seven other coal-mines as far north as South Clifton and even by the Metropolitan, as all these mines are already connected with Port Kembla by their own railway sidings and the Government line of railway.

No expenditure for the railway purposes will be required.

The smelting works at Dapto are also already connected by railway with Port Kembla.

As regards Wollongong and Lake Illawarra, my conviction is that they never can be made to suit large vessels or be adapted to the bulk of the coal trade of the district, and I doubt whether capital will be available to carry out the Lake Illawarra scheme, and if it were carried out the existing collieries could not afford the cost of railway traction and shipment there. It would be of little use to them.

Lake Illawarra has only 10 feet of water, and it cannot be made deep enough for vessels as large as those that have already loaded at Port Kembla without any dredging. The entrance to the lake could not be made safe enough for vessels to enter in rough weather, and could not leave during north-easterly weather. The Illawarra Act only compels the channel to be dredged 15 feet deep, which is insufficient for the existing steam-coilers.

There is an enormous quantity of coal at the back of the present mines, which will have to be shipped during the centuries to come, as also at Coal Cliff, South Clifton, North Illawarra, and South Bulli mines.

The operations of the collieries have so far been limited to what is known as the top or Bulli seam, but it is well known that there are five other seams underneath proved to exist, so that there is little fear of the coal running short for shipment.

At the present rate of output the Mount Kembla from top seam only will last 200 years, and the South Bulli 100 years. Keira and Pleasant will probably last as long.

The collieries can afford to pay the same rates for railway traction and shipping as are paid at Newcastle.

The collieries could pay a shipping rate that would return interest upon outlay. There would also be revenue derivable from wharfage on cargo discharged at the port to industrial concerns, which will assuredly be started contiguous to the coal with a good harbour and upon land rendered available by resumption for the erection of various works.

THURSDAY, 19 NOVEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY MASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Charles Edward Rennie, Esq., Chief Draftsman, Department of Lands, sworn, and examined:—

C. E. Rennie,  
Esq.  
19 Nov., 1896.

948. *Chairman.*] You produce some plans? Yes; I produce two plans which have been prepared in accordance with the wishes of the Committee. One shows the tenure of land within 10 miles of Jervis Bay, and the other the tenure of land within 10 miles of each of the southern coal ports and of Lake Illawarra. The tenure of land within 10 miles of Bellambi Harbour is—Freehold, 45,300 acres; conditional purchase and conditional lease, 2,750 acres; reserves, 42,500 acres (including 4,120 acres held under mining tenures); Crown lands, 3,650 acres. Within 10 miles of Wollongong there are—Freehold, 55,180 acres; conditional purchase and conditional lease, 1,630 acres; reserves, 25,430 (including 4,914 acres held under mining tenures); Crown lands, 8,480 acres. Within 10 miles of Port Kembla there are—Freehold, 65,400 acres; conditional purchase and conditional lease, 340 acres; reserves, 11,040 acres (including 4,754 acres held under mining tenure); Crown lands, 105 acres. Within 10 miles of Lake Illawarra—Freehold, 118,850 acres; conditional purchase and conditional lease, 7,880 acres; reserves, 55,830 acres (including 15,640 acres held under mining tenure); Crown lands, 3,015 acres. Within 10 miles of Jervis Bay—Freehold, 61,180 acres; conditional purchase and conditional lease, 20,470 acres; reserves, 28,070 acres; Crown lands, 28,380 acres; there are no mineral leases in force within this area.

Of course, these 10-mile limits overlap in places, because some of the ports are less than 10 miles apart.

949. Is there any Crown land immediately at Bellambi? No, not immediately adjoining Bellambi Harbour.

950. What about Wollongong? There is no Crown land immediately adjacent to the port of Wollongong,\* but a little to the south, extending from the beach to Tom Thumb's Lagoon, there are about 1,400 acres.†

951. Is there any Government land at Port Kembla? No; the land all around Port Kembla for some considerable distance back is freehold.

952. To whom does the estate belong? The original grantee was a Mr. Allen. I do not know who the present owner is.

953. Is there 100 feet reservation at each of these places? I do not know; but I will find out.

NOTE.—The above areas are approximate only.

\* NOTE (on revision):—It should have been added that there is a narrow strip of land extending from the northern boundary of C. T. Smith's 300-acre grant along the harbour frontage; thence along the coast to the northern boundary of the show-ground—comprising about 100 acres, forming part of the Wollongong "Harbour Trust Lands." The control of this land was taken over by the Government on the dissolution of the Harbour Trust by proclamation in *Government Gazette* of 2nd December, 1895.

† NOTE (on revision):—Should read, "About 400 acres, embracing the recreation-ground, show-ground, racecourse, permanent and temporary commons, and part of the Wollongong 'Harbour Trust Lands.'" A lithograph marked "X" shows the land referred to in notes (\*) and (†).

The Hon. Ebenezer Vickery, M.L.C., sworn, and further examined:—

954. *Mr. Hoskins.*] You are in favour of the recommendation of the Harbours and Rivers Branch of the Department of Public Works in regard to Port Kembla? Yes, I think that the best place for a harbour on the southern coast.

955. You approve of the eastern breakwater being constructed? Yes.

956. While it is in course of construction will it interfere with the working of the private jetties? Not in the least. It will facilitate loading at the jetties.

957. Will the construction of the wharf interfere with the jetties? Not in the least.

958. Could the Government ship coal from the proposed wharf without interfering with the operations of the companies using the jetties? Yes.

959. I suppose the Government would not require a very large area of land as an approach to the breakwater? No. I think that if they resumed 100 acres that would be quite sufficient for present purposes; but it would be a great mistake not to resume more, because the Government expenditure will add largely to the value of the land. By resuming a large area and reselling it, the Government might recoup a large proportion, if not the whole, of the cost of the eastern breakwater.

960. To whom does the land belong now? To the Wentworth family.

961. What would be the value of 1,000 acres of that land? It has an increased value because of the royalty which the companies pay to the Wentworth estate for running their coal over it.

962. What would be a fair price for the Government to pay for 1,000 acres of it? If I were asked to buy the land, without taking into consideration the income derived from the coal companies, I should say that it was not worth more than £10 an acre; but because of its position, and because of the income from way-leave, I think its value might be £20 an acre.

963. How would the Government be recouped by the sale of this land? A considerable population would want to settle round the wharfs, and the land could be sold in allotments to people connected with the shipping. Then, too, if there were a port, other industries, such as chemical works for example, might be started. The place is peculiarly adapted for manufactories, because of the nearness of the coal.

964. What is the distance from Port Kembla to the smelting works? About  $4\frac{1}{2}$  miles in a direct line, or about 8 miles going round by the railway.

965. If a direct line of railway were made, through whose land would it have to be taken? It would go through part of the Wentworth estate, and I think through part of the Jenkins estate.

966. Do you think that if such a line were made, ore could be landed at Port Kembla and taken to the smelting company's works? Undoubtedly. In my opinion, if the eastern breakwater is constructed, the seas which come from the south-east will be thrust on to the beach a long way to the north of Port Kembla, with the result that the water inside the breakwater will be quite smooth, and vessels will be able to lay alongside a wharf there and discharge their cargoes almost as easily as at Circular Quay. Lake Illawarra has been mentioned in comparison with Port Kembla; but, in my opinion, it is idle, and trifling with a great public industry, to speak of Lake Illawarra as adapted for the shipping of coal to any great extent. A harbour only 15 feet deep would not suffice for the present colliers. The lake is a beautiful place for boating, fishing, picnicking, or anything like that; but, regarded as a coal port, it is a delusion. To show the bad state of the entrance, I may say that I have driven across to Windang Island in a cart. At Port Kembla, on the other hand, you have deep water within a very short distance of the beach, and a splendid anchorage. I have been there when it has been blowing a black north-easter, and the waves have been rolling with tremendous force against the jetties; but vessels have been able to ride out the gale at their anchorage, although I almost quaked for their safety.

967. How long is it since the Mount Kembla Company's jetty was erected? Our first jetty was washed away. The present jetty has been there for, I think, about nine years.

968. What does it cost annually to keep the jetty in repair? The cost is something considerable, because the waves at times do considerable damage, and piles have frequently to be renewed. We watch the jetty very carefully, and, perhaps, every two or three months, we put down a few new piles.

969. Could ore be landed at Port Kembla as it is at present? Not easily; though of course we have landed a good deal of stuff there. We have landed heavy machinery there; but it is rather troublesome work. If any large quantity of ore were to be landed there, it would be necessary to provide further accommodation for the shipping. To land stuff at our jetty you would require to make a lower stage. The jetty, as it stands at present, is about 25 or 28 feet above the water.

970. Port Kembla will not be available for the shipment of ore until the proposed improvements are carried out? Until the eastern breakwater is constructed no large quantity of ore can be landed there; and I am sure that no large quantity of ore could be taken into Lake Illawarra. The other day a vessel came to Port Kembla bringing a very large cargo of ore from New Caledonia, and she loaded 1,200 tons of coal at the southern jetty. To talk about taking a ship like that into Lake Illawarra is, in my estimation, absurd.

971. Do you think that a channel and a dock could be readily made at Lake Illawarra for the accommodation of sailing vessels? Of course, with money you can do almost anything; but I do not believe that the £500,000 which it is proposed to expend in making breakwaters and in cutting a channel across the lake will anything like meet the cost.

972. In addition to the channel across the lake, there will have to be a basin or dock for the reception of vessels? Yes. I believe that the dock is to be made deeper, so as to enable vessels to load there at any time and go out with a high tide.

973. The channel alone would not be sufficient? No, you must have a dock.

974. If the proposed improvements were made at Port Kembla, would the directors of the coal companies shipping there object to pay harbour dues? I do not think so.

975. What do you think would be a fair charge for the Government to make? I think that 3d. a ton inwards and outwards would be a fair charge, supposing the eastern breakwater were made.

976. Would that provide for the maintenance of the works and pay interest upon the expenditure? I apprehend that the trade and population of the place will increase so largely that such a levy would pay interest upon the cost of the breakwater. My opinion is that the breakwaters could be constructed for less than the sum stated by Mr. Darley, because an enormous quantity of basalt is procurable just at the base of it.

977. Do you think it could be done for £120,000? I think so. The stone would simply have to be quarried, and run out into the sea. Then at 5 miles from Port Kembla, along the Mount Kembla railway, there

The Hon.  
E. Vickery,  
M.L.C.

19 Nov., 1896.

The Hon.  
E. Vickery,  
M.L.C.  
19 Nov., 1896.

there is a very fine bluestone quarry, where blocks of immense size could be quarried. This quarry was opened by the contractor to get blue-metal for the railway. Port Kembla is naturally more sheltered than it appears to be from the plan I am now looking at.

978. Do you think that the estimate of the Department will more than cover the cost of the Port Kembla breakwater? Yes. I should be very glad to undertake a contract for the amount stated.

979. Do you consider that the proposed works will yield a fair return? I do not know what might be considered a fair return; but I think that the work should be carried out apart from the question of profit. The district has been neglected far too long. While the Government have been spending scores of thousands of pounds elsewhere they have spent nothing in this district and while the public have done nothing for themselves at other places along the coast, in Illawarra we have spent scores of thousands of pounds in trying to make ports. The various jetties at Coalcliff, Austinner, Bulli, South Bulli, and Port Kembla have cost at least £140,000, besides maintenance.

980. Do you think that if the proposed improvements were carried out it would lead to a great expansion of trade? Yes. The mines down there have been crippled for the want of a place at which sailing vessels could be loaded. The southern coal has been pronounced by many persons to be equal to the best Welsh coal. The Messageries Maritimes Shipping Company have said over and over again that they would rather have it than the Welsh coal, and ever since their ships came here they have refused to take anything else. The P. and O. Co. will have nothing but southern coal, neither will the German Australian Co. The Adelaide Steamship Co. also uses it, and so does a great number of other shipping companies. For steaming and smelting purposes it is a very superior coal. It does not make a very large quantity of ash; it does not clinker; it has little or no sulphur and phosphorus in it; it packs into a smaller compass than most other coal, especially than Newcastle coal; and it does not throw off sparks like the northern coal. The northern coal has its advantages for domestic purposes and for gas-making, and it is a good steam coal; but it is nothing like so good a steam coal as the southern coal.

981. Has the Mt. Kembla Company been constrained to refuse orders because of the poor accommodation for shipping at Port Kembla? Yes. They have not been able to receive sailing ships, because the company is not strong enough to take the risk of having its jetty knocked down by a sailing ship bumping against it.

982. Would the Mt. Kembla Co. be disposed to carry out the proposed harbour improvement if they were empowered to levy harbour dues upon all vessels coming to the port? There was a time when they would have done so; but when the Southern Coal Co. erected their jetty the Mt. Kembla Co. determined not to go on any further. The Mt. Kembla Co. had the place sounded and plans prepared for the construction of a breakwater; but the coal trade has been so unprofitable that we have had no encouragement to spend large sums of money, even if we had had the money to spend.

983. Will the breakwater give any protection to the place as the work proceeds, or shall we have to wait for its completion for the contemplated benefits of the scheme? It would probably take four years to carry out the whole scheme proposed by Mr. Darley, in which provision is made for a mile and a half of wharfage. I think, however, that the only wharf required would be one inside the eastern breakwater; and I do not think that the breakwater should take more than twelve months to construct, because of the facilities for getting stone there. Every 20 feet of breakwater will improve the harbour, and indeed our company have at times had in contemplation the purchase of old hulks to fill with stone and sink off the point in order to give some protection to the jetty.

984. Could the wharf which you speak of be made at the same time as the breakwater? Yes.

985. And when the breakwater is completed and the wharf erected there will be no obstacle in the way of unloading ore at the place? None whatever.

986. Are you acquainted with Bellambi? The coal which is shipped at Bellambi is chiefly my coal.

987. I understand that the anchorage at Bellambi is very bad? No; Bellambi would make a very good port indeed. It would suit me better to have Bellambi improved than to have Port Kembla improved, because I have more interests in Bellambi.

988. Why do you like Port Kembla better? Because it has a larger area of deep water, a magnificent approach, and a splendid anchorage. There is clay underneath the sand; but I do not know that there is clay under the sand of Bellambi.

989. Is there better shelter at Port Kembla than at Bellambi? Any difference between the two places is decidedly in favour of Port Kembla. Port Kembla receives a great deal of shelter from the Five Islands.

990. *Mr. O'Connor.*] It would be a great advantage for the Committee to see these places for themselves? Yes.

991. And the inspection would not take very long? No; and the colliery proprietors would be glad to do what they could to facilitate the work of the Committee.

992. *Mr. Clarke.*] You recommend the resumption of 1,000 acres of land in the immediate neighbourhood of Port Kembla? Yes; some of the land would be required for additional sidings. There is already a large amount of siding accommodation there; but if a great number of mines sent coal to the place, additional siding accommodation would be required.

993. That is very inferior land? Yes; but it has a special value because of its position. Apart from its position, I do not think it would be worth £2 an acre.

994. I suppose the water-frontage helps to make it valuable? No doubt. In itself it is only inferior coast land.

995. I think you stated that the coal companies paid royalty for the permission to erect their jetties? No; we obtained Acts of Parliament authorising us to erect our jetties. We pay royalty for the permission to lay down railways and carry coal over them.

996. Would the Mount Kembla Company be willing to hand over their jetties to the Government for reasonable compensation? Yes, quite willing.

997. And the railway as well? Yes; if the Government would resume it at cost price and allow us to send our coal over it at the ordinary rates.

998. What would your jetty cost? The present jetty has cost us about £18,000, while the original jetty cost about £10,000. We have spent upon the two jetties, the railway and sidings, and including £1,000 or £2,000 for driving into the mine, £72,000.

999. Is Port Kembla a safe harbour for sailing vessels? No. We have often been asked to take sailing vessels, but we never run the risk. Of course small sailing craft have gone there with timber.

The Hon.  
E. Vickery,  
M.L.C.  
19 Nov., 1896.

1000. I suppose the insurance companies would not insure a sailing vessel going there? No; though they will insure the steamers.

1001. I suppose it is safe to load at the existing jetties, except in very bad weather? We can load there with comfort in 250 days out of the year; but when heavy weather comes on suddenly the steamers have to cut and run, sometimes with only half a cargo, or perhaps before they have commenced loading at all. Sailing vessels would not be able to get away quickly enough.

1002. Would the construction of the eastern breakwater make it safe for large sailing vessels to load there? I think so. We can load more rapidly at our jetties than they can load with the cranes at Newcastle, and we have put 300 tons on board in an hour. Of course the ships could not take that quantity every hour, but we can pour the coal into them as fast as they can trim it.

1003. I suppose if sailing vessels could go there a large amount of coal would be taken by them to various parts of South America? Yes; and to Colombo, Shanghai, Madras, Bombay, and other places. We have had offers from those places, but we always have to reply that we cannot load sailing vessels.

1004. A great deal of the trade of Newcastle is done by sailing vessels? About half of it. Then, too, if the eastern breakwater were constructed, more steamers would go to Port Kembla than go there at present. Some captains are very timid, and have no confidence in the place until they have been there two or three times. After that they say that they would as soon go there as anywhere else.

1005. You say that 3d. a ton would be a fair charge to make upon the shipping? Yes. The companies could afford to pay such a charge, and I think that it is all the Government should ask.

1006. The inward shipping would be very small unless ore were brought from Broken Hill? Yes. Of course it will not be necessary to wait for a direct line of railway to convey ore from Port Kembla to the smelting-works, because there is at present railway communication between the two places.

1007. There would not be much inward cargo at present? Certainly not.

1008. Then, do you think that a charge of 3d. a ton would reimburse the Government the cost of making the breakwater? I have not thought the matter out; but I am of opinion that the Government should not wait until they can see their way clear to get a sufficient return to pay interest upon the expenditure. I think that the claims of the southern district and the importance of the coal trade should be a sufficient inducement, even supposing a charge of 3d. a ton would not pay interest upon the amount expended.

1009. You think that, taking into consideration all that has been spent by the Government in harbour improvements at the Richmond, the Clarence, and in other places, some consideration should be shown to the people of Illawarra? I think so.

1010. Even if only a little revenue was obtained from the expenditure? Yes. If the Government had not spent a great deal of money at Newcastle, Newcastle would not be what it is to-day.

1011. Mr. Senior stated yesterday that his company would be willing to pay harbour dues to the extent of 6d. a ton? I think that that rate should not be exacted. At the present price of coal it is almost more than the companies could afford to pay.

1012. Do the vessels of the Navy use the southern coal? Yes.

1013. They generally use the Metropolitan Company's coal? They are now using the Metropolitan Company's coal; but it is all from the same seam.

1014. *Mr. Lee.*] Do you think that Mr. Senior's estimate of the coal output will be reached in the near future? I think you may reckon upon the shipment from Port Kembla being doubled almost immediately. At present about 250,000 tons are shipped there annually. The mines to the north—Mount Pleasant, Mount Keira, and South Bulli—will always send coal to Port Kembla to load sailing vessels. At the present time they cannot take orders to supply sailing vessels.

1015. What quantity of coal do you think would be shipped annually at Port Kembla if the eastern breakwater were constructed? I think about 500,000 tons a year for certain, and very likely the output would go beyond that. Small vessels will of course still go to Wollongong, and to the other jetties.

1016. Do you expect a large over-sea trade in sailing bottoms? Yes; that is what is wanted.

1017. You think that what has happened at Newcastle will happen at Port Kembla? Yes.

1018. Newcastle was a very poor port thirty years ago? I can remember it since 1849. There was a very poor port there then.

1019. The output of coal at Newcastle has increased as the port has been improved? No doubt. As the place has been more adapted for shipping, the shipping has increased there. If the whole of Mr. Darley's scheme were carried out, you would have a better harbour at Port Kembla than at Newcastle; but I think that the construction of the eastern breakwater will be sufficient for the present.

1020. Taking into consideration what has happened at Newcastle, and remembering the quantity and quality of the southern coal deposits, is it not fair to assume that an increase in the output will follow any improvement at Port Kembla? Yes; and without doing any damage to the Newcastle trade, because the two coals are altogether different. If you came to the south for gas coal you would not get it; but you would get good steam coal, and good smelting coal.

1021. Do you think that the existing jetties will be sufficient for the export of 500,000 tons of coal a year? Yes. I know that the Mount Kembla jetty could ship 300,000 tons of coal a year quite easily, and the other jetty will take larger vessels than we can because it is higher and goes out further into deep water, though they cannot ship as quickly as we can. I believe that the two jetties could easily dispose of 500,000 tons of coal annually.

1022. The Government propose to put a wharf between the two jetties? Yes. That would do very well for the landing of cargo; but it would necessitate a certain amount of dredging. If the wharf were put inside the breakwater you would get deep water without any dredging at all.

1023. But would there not be a risk of the surf breaking right over the breakwater? That would seldom happen, and it would be harmless if it did.

1024. An import trade could not be carried on unless wharfs were erected? No.

1025. Looking at the matter from a national point of view, are you of opinion that if the Government carried out these improvements, they should resume the existing jetties and railways? I am not sure that the Government ought to resume the jetties, because I think that they would be managed better by private individuals than by the Government. At the same time the Government might fairly make a charge for the protection they provided. So far as the Mount Kembla Company is concerned, I do not think that they would object to the resumption of their jetties or of their railway by the Government.

1026. Supposing the Government put you in the same position as the Newcastle mine-owners, charging so much

The Hon.  
E. Vickery,  
M.L.C.  
19 Nov., 1896.

- much for haulage, and so much for shipping? All the southern colliery proprietors would be very glad to be put in the same position as the Newcastle mine-owners in that respect. Although all the colliery proprietors in the district may think that one port is better than another, so far as their interests are concerned, they have all agreed to accept whatever port the Government select after a survey of the coast.
1027. I suppose that wherever the port is made there the shipping will concentrate? No doubt.
1028. Would the Bellambi jetty continue to be used if the proposed improvements were carried out at Port Kembla? In fine weather all the companies would use their own jetties and railways.
1029. But only to load small steamers? Yes.
1030. Sailing ships would all have to go to Port Kembla? Yes. I think it very likely that even the Metropolitan Company would send coal to Port Kembla to fill sailing-ship orders.
1031. You think that for some time to come it would be unnecessary for the Government to construct another jetty at Port Kembla? Yes.
1032. A new jetty could be constructed whenever the requirements of the trade warranted it? Yes. I do not think that there is any necessity for a new jetty at the present time.
1033. Supposing the Government did not resume the railways and jetties, might not difficulties arise between the various colliery proprietors? Of course the other colliery proprietors would have to pay way-leave before sending coal over our railway.
1034. Under all the circumstances, do you not think that it would be better for the Government to resume the railways and jetties and have a fixed charge for every one? I think so. I should prefer that as the simplest plan.
1035. What rights have been conferred by the owners of the land in respect to these railways? The Mount Kembla railway runs through freehold, with the exception of that portion which passes through the Wentworth estate. Of that we have fifty years' lease, and pay  $\frac{1}{2}$ d. a ton royalty. I think the Southern Coal Company has a similar lease. At the present time the two railways run side by side, with only a dividing fence between them, so that if the Government resumed them both they would have a double line of rail, and could use one as a return line.
1036. Would it be safe to impose an average charge of 8d. per ton for the haulage and shipment of coal, basing the rates upon the Newcastle rate? I think so.
1037. Is one half-penny a ton all that you pay to the Wentworth estate? Yes; that is for the privilege of bringing coal over the railway, and for the use of 30 acres of land near the port, together with the right to build four cottages for the accommodation of the people connected with the wharf. They would not allow us to start a settlement down there. They fixed a limit as to the number of cottages that we could build.
1038. Do you think that the Mount Kembla jetty is in fair order at the present time? Yes, it is in splendid order.
1039. *Mr. Wright.*] Can you tell the Committee what revenue is derived from the Wentworth estate? I fancy that they are getting £300 or £400 a year in royalties, and a similar amount for grazing rights.
1040. Do you think that they would be justified in asking £20,000 for 1,000 acres of that land? I do not think that the land is worth that amount; but it would be better for the Government to resume it at that price than to allow it to remain in private hands.
1041. What does your company pay the estate annually? I cannot remember; but I should say about £300 a year. I have been told that the Southern Coal Company pay 1d. a ton royalty.
1042. What is your honest conviction as to the probable expansion of the southern coal trade, in view of the fact that there is always active competition at Newcastle, and that you are likely to meet competition from China and Japan? I think that the trade will double in seven years.
1043. Do you think that the output of coal from Japanese and Chinese mines will not interfere with you? No. We have more to fear from strikes. They annoy our foreign customers, because of the delay and inconvenience which are caused. The frequent strikes have been most detrimental to the Colonial coal trade.
1044. You are aware that the recent discovery of coal in Victoria, and the action of the Government there in offering a bonus for its production, has decreased the importation from New South Wales? Of course it has influenced the importation from New South Wales, but Victoria cannot supply her own demands.
1045. I understand that the railway authorities of Victoria have contracted to take 280,000 tons of the Victorian coal;—supposing other colonies adopt a similar policy? They will have to find the coal first. I do not think that all the Victorian mines will be able to supply the Government with that quantity of coal.
1046. You see no reason to doubt that the output of coal from the southern district will steadily increase? I am convinced of it.
1047. *Mr. Egan.*] How long have you been connected with the coal trade? Between twenty and thirty years.
1048. From the beginning you have heard these dismal cries about other countries knocking out the New South Wales coal? Not all the time; but I have heard them of late years very frequently.
1049. Is it not a fact that prior to the last strike we were supplying Victoria with as much coal as we ever supplied her with before the discovery of Victorian coal? Nearly as much, I think. That has been partly owing to the fact that the steamship companies have lowered their freights very much. Of course the Victorian mines cannot supply the demand.
1050. Is not their coal inferior? Some of it is inferior; but some is very good.
1051. Where does the good coal come from? I cannot remember the names of the various coal-mines in Victoria.
1052. The great proportion of the Victorian coal is inferior to the New South Wales coal? Yes; their coal is patchy, and, I believe, costly and dangerous to mine.
1053. What objections have you to the making of a port at Bellambi. None whatever. Next to Port Kembla, it would make a splendid harbour. There have been two or three vessels wrecked on a reef just outside Bellambi; but I have not heard of any vessels being wrecked outside Port Kembla.
1054. Vessels have been wrecked at the entrance to Port Jackson? Bellambi would make a very good port; but it is not equal to Port Kembla. While my interests are mostly centered at Bellambi, I am convinced that Port Kembla is the best place for a harbour. The extent of either place would make a sufficiently large harbour for any possible trade for years to come.

The Hon.  
E. Vickery,  
M.L.C.  
19 Nov., 1896.

1055. Would it cost as much to make a breakwater at Bellambi as at Port Kembla? I think so. There is not so much stone at Bellambi as at Port Kembla, and I do not think there are any quarries close to the place.
1056. Is not Bellambi more centrally situated? It is right in the centre of the coal district; but some wise people say that good coal is to be found south of Mount Kembla. No such coal has been discovered to any extent; but if it is discovered, Port Kembla will be centrally situated.
1057. Have the coal companies ever asked the Government to construct a harbour for them? I do not think so.
1058. Then how has this proposal originated? The inhabitants of the district, from Bulli to Dapto, have been asking for a harbour. Wollongong wanted a lot more money spent there, but the Government did not see its way clear to such an expenditure, and common sense justifies that view. The Bulli people have been asking for a harbour at Bellambi.
1059. There is a difference of opinion among the residents of the district as to the best place for a harbour? No. They must all think that Port Kembla is the best place for a harbour, but there is a difference of interest.
1060. Did not the people of the district agree to abide by the decision of the Government officers? I believe that that was the determination of the inhabitants of the district. I know that a resolution to that effect was arrived at by the colliery proprietors.
1061. Can you supply the Committee with a copy of the estimate you received for the construction of a breakwater at Port Kembla? No; I have been unable to find those estimates. We intended to start from the same point as the proposed Government breakwater; but we should have curved in a little more, and would not have gone out so far. We would have followed the line of rocks.
1062. Do you remember what the estimate was? I did not believe in the estimate. It was too low. We did not intend to go out more than 1,100 or 1,200 feet, and the estimate of our engineer was £23,000, while the estimate of another engineer was £50,000. I preferred the higher estimate.
1063. Do you think that the southern coal trade is likely to interfere with the northern coal trade? I do not think so.
1064. You think that any increase of trade will be new trade? Yes.
1065. The construction of this proposed harbour will not interfere with Newcastle? No. I think we have more to fear from Newcastle competition than they have to fear from our competition. The Illawarra coal is splendid coking coke, and the works at Newcastle use some of it to improve their own coke.
1066. If the Lake Illawarra scheme were carried out, would you need a harbour at Port Kembla? There is no room there for two large harbours; but my contention is that you can never make a suitable harbour for large ships at Lake Illawarra. I do not think that they would ever carry the scheme out. I was asked to join it originally, but I declined, because I did not see anything in it.
1067. You were not asked to appear before the Select Committee which took evidence in regard to the proposal? No. When I was asked to join the enterprise, I said, "Look at Port Kembla, and you will see that there is no comparison between the two places."
1068. What is the difference between the price of coal at Newcastle and in the southern district? There is not very much difference—free on board. The price of the southern coal will compare with the price of the best Newcastle coal. There are some inferior coals at Newcastle which are sold very cheaply.
1069. It is rather on account of the quality of your coal than because of its cheapness that you expect to get trade? Yes.
1070. What seams have you in the southern district? I know of five or six. The top seam is what is known as the Bulli seam.
1071. How thick is it? At the Metropolitan Company's mine, I think it is 12 or 14 feet thick. At Bulli it is between 6 and 7 feet thick, and about the same at Mount Pleasant, Mount Keira, and Corrimal, and in a great part of Mount Kembla; but it narrows towards the south.
1072. Is its average thickness 7 feet? It would be if you included the Metropolitan Company's mine. Not including that company's mine, I would say that its average thickness is about 6 feet.
1073. You have four seams under the Bulli seam? Yes. At Mount Kembla we worked a seam of kerosene shale for a time; but it did not pay us. Then, we have a 4-foot seam, a 16-foot seam, a seam of anthracite, and another seam.
1074. Trebling your present output, I suppose the coal would last 400 or 500 years? My opinion is that at the present output the Mount Kembla coal will last 200 years, and the South Bulli coal 100 years—that is, using the one seam.
1075. But using all the seams there would be a supply for 300 or 400 years, even trebling the output? I cannot say as to that. I am quite content to have a 200 years' supply. There is an immense area of coal land extending right back to Mittagong.
1076. Would the coal-owners of the southern district object to the construction of the proposed breakwater if they had to pay the same shipping rates as are charged at Newcastle? I think they would gladly pay the same rates as are charged at Newcastle.
1077. Up to the present time private companies have done a great deal more for the south coast than the Government has tried to do? The Government has done next to nothing, while private companies have done a great deal.
1078. And you think that the colliery proprietors in the southern district have as much right to ask the Government to make a harbour for them as the northern colliery proprietors had? Yes, undoubtedly they have.
1079. This will not only be a harbour for the shipment of coal, but it will lead to the creation of new industries, and thus give work to a large number of people? Yes. It will also provide a harbour of refuge, which I think is needed in the southerly weather. Vessels have often taken refuge at the place as it is at present, and they can always get out again. I do not believe that a vessel could get out of Lake Illawarra while certain weather continues.
1080. I suppose you would want 30 feet at any wharf at Port Kembla? I think 26 feet would be enough.
1081. Therefore some dredging will be required if the wharf is put where the Government propose to place it? Yes.
1082. You think that some of the Metropolitan Co.'s coal would come to Port Kembla? I think some of it would.
1083. What charge do the Railway Commissioners make for the use of their waggons down south? I cannot say, because both the Mount Kembla mine and the South Bulli mine use their own waggons.

The Hon.  
E. Vickery,  
M.L.C.  
19 Nov., 1896.

1084. *Mr. Hassall.*] The principal coal shipped at Port Kembla comes from Corrimal or Mount Kembla? Yes. The Mount Kembla Co. ship about 150,000 tons a year, and the Corrimal Co. about 100,000 tons. Occasionally the Mount Pleasant mine and other mines send coal to Port Kembla; but the bulk of the coal comes from two mines.

1085. What return would be necessary to cover the interest upon the cost of the eastern breakwater and the resumption of jetties, and so forth? I have not made a calculation; but I think the Government should carry out the works whether it paid them or not. It is a national undertaking, and there is a very strong claim for the construction of a safe harbour there.

1086. What interest has the Government in the place as compared with private owners? What interest had the Government at Newcastle; they do not receive a great deal for their expenditure there.

1087. Is it reasonable to ask the Government to suffer an annual loss for the benefit of private individuals? It is not only for the benefit of private individuals, but for the benefit of the Colony, because increased trade supports a larger population, and adds to the railway revenue.

1088. Do you think that the coal trade will be sufficiently large for a charge of 4d. a ton to pay interest upon the cost of constructing these works? It would be very easy to make the calculation.

1089. Would you be willing to pay 6d. a ton? No, not if I had to ship the coal myself, and to keep my own railway and jetty in order. I think it would be unfair to ask us to pay so much. I am not the proprietor of Mount Kembla mine; I am only a shareholder, and one of the directors. Sixpence a ton is too much to ask us to pay, considering the present price of coal.

1090. Will your company be willing to pay 4d. a ton? I think so; but I believe that 3d. a ton would be a fairer charge.

1091. *Mr. Roberts.*] How would you place Port Kembla, Wollongong, and Bellambi, considering them as ports of shipment and harbours of refuge? Judging by points, I would give Port Kembla 100 points, Bellambi 95, and Wollongong about 40.

1092. You look upon Wollongong as out of the question? Yes.

1093. And Lake Illawarra also? Yes.

1094. Lake Illawarra would not be suitable for sailing vessels? If you could get sailing vessels in there it would be all right, because the lake is thoroughly sheltered; but no company would spend the money required to give accommodation for large vessels there. It would cost as much for dredging as is allowed for the whole work.

1095. You mean to dredge to the depth fixed by the Act of Parliament? That is only 15 feet, which I think is ridiculous.

1096. Will there be much ore landed at Port Kembla or Lake Illawarra? I can only judge by the representations made by the smelting company.

1097. Would it be more convenient for the smelting company to get their ore at Lake Illawarra than to get it at Port Kembla? It would be more convenient to land it at their wharf at Lake Illawarra.

1098. You have some doubt about the Lake Illawarra scheme being carried out? I have very grave doubts about it. It will never pay to make Lake Illawarra a harbour for large vessels. The age requires the employment of vessels of very large tonnage.

1099. In order to make a perfect harbour at Port Kembla would it not be necessary to construct both breakwaters? The harbour designed by Mr. Darley would be everything one could wish; but I think that the eastern breakwater will be sufficient for some years to come.

1100. If that breakwater were constructed, would it be difficult to land ore at Port Kembla? If the wharf were erected inside the breakwater you would get still water.

1101. When a vessel is discharging cargo, she must be fastened alongside the wharf? Yes, and the water at Port Kembla is quiet enough for that in ordinary times; but we have not proper jetty accommodation for unloading general cargo.

1102. Do you not require perfectly smooth water for unloading cargo? You will get sufficiently smooth water by the erection of the eastern breakwater.

1103. Do you not think a large amount of money would be saved by carrying out the whole of the work proposed by Mr. Darley, instead of doing things piecemeal? I do not think it would make any difference.

1104. You do not regard the northern breakwater as absolutely necessary at the present moment? No. Of course I do not speak as an expert, though I have a good knowledge of the locality.

1105. *Mr. Black.*] I gather that you are interested in other coal properties besides Mount Kembla? Yes. I am interested in Mount Kembla as a shareholder, and in the South Bulli and Coalcliff mines as proprietor.

1106. Are you interested in any of the other mines? No.

1107. I believe that, as a rule, you do not believe in Government interference with private enterprise? As a rule, I do not.

1108. Do you not think that in a matter of this kind, where there is a number of colliery proprietors who imagine that the construction of a breakwater would greatly benefit their enterprise, they could combine in carrying out this work themselves? They have not the right to do it.

1109. Do you not think that they could acquire the right to do it? I do not know if Parliament would grant it. There are far more mine-owners in Newcastle than are on the south coast; but they did not combine to improve the port of Newcastle.

1110. It strikes me as a very peculiar argument to say that because there has been a heavy, and possibly wasteful, expenditure in one locality there should be a similar expenditure in another locality? What I say is, that at Newcastle private enterprise has done little or nothing.

1111. Should we not rather learn from the errors of the past than repeat them? I do not say that the expenditure at Newcastle was an error.

1112. Do you think the cases of Newcastle and Port Kembla analogous? I think they are.

1113. Was there not a larger number of people at Newcastle when the harbour works were begun there than there are at Port Kembla? I remember when there were not so many people in and about Newcastle as there are now on the south coast.

1114. Is that when the Government began to construct the harbour? Yes; and they have gone on improving the place ever since.

1115. Have you any special reason for thinking that settlement would spring up near Port Kembla if a harbour were made there? Wherever a large number of men is employed settlement is likely to take place. If the land at Port Kembla were resumed by the Government a lot of it would be taken up and built

built upon, though I do not think that that would hurt Wollongong any more than the works at Dapto will hurt the place. Wollongong Harbour is adapted for vessels of a certain size, and such vessels will continue to go there in fine weather.

1116. Would not the Government be very unwise to go to the expense of making a breakwater and constructing jetties, if they permitted privately-owned jetties to compete with them? I think it would be better for the Government to resume the existing jetties and 1,000 acres round the foreshores.

1117. Do you think that during the 250 fine days which you say there are in the year the proprietors of private jetties would send coal to Port Kembla? I have said that the proprietors of private jetties will use them in fine weather; but at the present time vessels going alongside these jetties often have to run away with only part of a cargo, which is very damaging to the trade. For instance, a vessel may come from Adelaide to take a cargo of coal, but, bad weather springing up, she may have to go on to Sydney, and lie there for a day or two before completing her loading. That adds to the price of the coal.

1118. If a vessel were loading alongside Bellambi, and rough weather came up, she could go down to Port Kembla and finish coaling there, supposing the breakwater were made? No doubt it would be a great advantage if vessels could run down to Port Kembla and finish loading there during rough weather.

1119. But if that is done, the output from Port Kembla will be so small that the return to the Government would be infinitesimal as compared with the cost of construction? I do not say that all the jetties on the coast can ship coal during 250 days of the year. I do not suppose that at Coalcliff or at the North Illawarra jetty you could load during more than 100 days in the year, while at the Bulli jetty you could not load during anything like 250 days in the year.

1120. Still you acknowledge that the owners of private jetties will not send to Port Kembla during fine weather? I think they will prefer to use their own jetties whenever they can, though some of them are not using them now. The North Illawarra jetty is not being used.

1121. Is the North Illawarra colliery still working? No. If there had been a safe harbour I daresay that company would be in existence still.

1122. If in addition to the proposed harbour works you put the cost of resuming 1,000 acres of land, and of compensation for private jetties and railways, the cost of this harbour improvement will be very large? My contention is that £150,000 or £160,000 will pay for the eastern breakwater.

1123. Will no new jetties be required? Not until the trade increases.

1124. I understand that the life of a jetty is thirteen or fourteen years? If a jetty is not properly maintained it may last only thirteen or fourteen years. Jetties require constant attention, and when they become weak new piles must be put in. Under proper management they will last thirty, forty, or even fifty years.

1125. At what would you estimate the necessary expenditure at Port Kembla? That is more a question for an engineer; but I should think £150,000 would pay for a breakwater, £10,000 for the land resumed, and £30,000 for the jetties and approaches.

1126. Say £200,000? Yes.

1127. With a harbour charge of 3d. a ton the Government will get an annual return of £12,500;—would that be sufficient? That would be a return of 6½ per cent. upon the outlay. I do not think more than 2½ per cent. would be required for maintenance, and that would leave 4 per cent. to go towards meeting the interest. I contend that the Government should not expect to receive as much as 4 per cent.

1128. When I spoke of maintenance, I meant the cost of management and control? Yes, I include that.

1129. You recommend this as a great national work? Yes, I do so with great confidence.

1130. Why do you value the land at Port Kembla at £10 an acre;—I understand that it is inferior sandy land? It is inferior land, and, if before the Mount Kembla mine was opened I had been asked to value it, I would not have valued it at more than £1 an acre. The traffic over it, however, has increased its value. The Mount Kembla Company showed the importance of Port Kembla, and its proximity to that place would give the land an increased value.

1131. Is there any demand for land there at such a price? No.

1132. Do you know what the land has been assessed at by the land valuers? No; but that would give no idea as to its real value.

1133. If it had been assessed at less than £10 an acre, I suppose the owners would not stick out for £10 an acre? I do not know; but I think they would expect to get full value.

1134. I understood you to say that at one time the Mount Kembla Company intended to build a breakwater, but abandoned the idea because of the advent of a rival company? The Mount Kembla Company intended to construct a breakwater; but we could not raise sufficient capital, and while we were thinking about it an opposition company started.

1135. You do not fear the opposition which might follow the construction of a breakwater by the Government? No.

1136. *Chairman.*] What does it cost you to ship coal once you have it on the jetty? I do not think it costs us more than 1d. a ton.

1137. What does it cost per ton per mile to bring coal from Mount Kembla to the jetty? When we are at full work I think that 3d. or 4d. a ton is the whole cost of maintaining the railway and shipping the coal.

1138. What distance have you to bring the coal? Seven and a half miles. We use our own waggons.

1139. What does it cost you a year to maintain the jetty? That I cannot tell you. We include the cost of maintenance in the shipping charge.

1140. They charge, 3d. or 4d. a ton, everything included? Yes. My main desire in advocating the construction of this breakwater is to increase the trade of the port. If the trade of the port were increased the mines in which I am interested would be able to turn out more coal.

1141. Threepence or 4d. a ton would not be an exceptional charge for the Government to make? No.

1142. *Mr. Trickett.*] What are the largest vessels that have been to Bulli and Bellambi? The Bulli jetty has recently been enlarged; but I do not think they can take a vessel of much over 1,000 tons there. At South Bulli we can load a vessel of 1,750 tons. There are two jetties in Bellambi Bay—one belonging to the Bellambi Coal Company, and the other to the South Bulli Coal Company.

1143. Are these local traders or foreign-going vessels? Melbourne and Adelaide steamers. We sometimes get vessels to load for Fiji.

1144. But vessels do not come there to load for the east? No.

1145. If the Port Kembla harbour were constructed, all foreign vessels would come there to load even in fine weather? All the trade done by large vessels would be done at Port Kembla.

The Hon.  
E. Vickery,  
M.L.C.

19 Nov., 1896.

FRIDAY, 20 NOVEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

John Barnes Nicholson, Esq., M.P., sworn, and examined:—

J. B.  
Nicholson,  
Esq., M.P.  
20 Nov., 1896.

1146. *Chairman.*] Do you desire to make a statement to the Committee? Yes. The great reason to be adduced in favour of the construction of a safe harbour on the south coast is the great increase of the coal trade which has taken place in the past, and which is likely to be even greater in the future. The coal output of the south coast increased from 370,000 tons in 1886 to 910,000 tons in 1895—about 150 per cent. in ten years; and with good facilities for loading deep-sea vessels, the quality of our coal for steam purposes will guarantee a still further increase from year to year. The twelve collieries on the south coast, at the present time, employ underground somewhere about 1,400 men, with facilities for an output sufficient to employ 4,000 men; besides the number of hands employed in our coke industry, saying nothing of the prospects of the iron industry opening up in the near future, which would greatly increase imports and exports. We have also at Bulli, already started, a pottery and tile-works, paying heavy freights by rail to Sydney; and the fact that we have eleven collieries within a radius of  $7\frac{1}{2}$  miles north and south from Bellambi, where, allowing the approximate increase in our coal trade for the next ten years, 1,500,000 tons of our total coal trade would be secured for Bellambi. If any need for new collieries arise, there is almost unlimited scope from Bellambi, north to Helensburgh. Steamers have frequently loaded at Bellambi when unable to do so at Wollongong or Port Kembla. The cost of construction and resumption combined would be fully three times as much at Port Kembla as at Bellambi, for the following reasons, viz.:—1. Two private jetties exist at Bellambi, both built under lease from the Crown, and both terminable in 1899, so that before a breakwater could be constructed both of said leases would fall in; hence the saving on cost of resumption No. 1. At Port Kembla two private jetties also exist, both built under special Acts of Parliament, with powers for all time to construct new jetties, piers, &c., both jetties being good substantial structures, and thoroughly equipped with latest improvements for loading. The vested interests of the two companies would amount to a large sum. 2. The length of railway to resume at Bellambi would not necessarily be more than  $1\frac{1}{4}$  mile, as against 10 miles at Port Kembla. 3. Land necessary for sidings, roads, &c., would in like proportion be in favour of Bellambi. The Government plan of last survey at Bellambi shows (conclusively, to anyone acquainted with the port), the site for breakwater considerably inside the inner reef,—thus much curtailing our area of water; and what is still worse, occupying the deepest water, where our jetties and loading-berths ought to be, which fact also materially increases the cost of construction. I am of opinion that if a survey were made on the inner reef at Bellambi, undoubtedly the best site on which to build a breakwater, the depth of water would be decreased to much below that of Port Kembla and Wollongong,—so that the cost of construction at Bellambi would be reduced much below the cost estimated for any of the three sites, as per Mr. Carleton's report. Moreover, Bellambi is sheltered on the north and north-east by the natural contour of the coast, and to a certain extent on the south by the outer reef, so that if the inner reef were capped by a breakwater its full distance out, viz., 1,800 feet, we should have a harbour to which the captain of any ship would come for loading with the greatest confidence, owing to its safe entrance in almost any weather; it being also the centre of the known workable coal-measures of Illawarra; and upon this all-important point alone the claims of Port Kembla or any port south of Wollongong, as a coal-loading port for the south coast district, are ignominiously thrust aside, for not only is Bellambi the most central for all the mines from Mount Keira to Clifton, but it is absolutely nearer to the main coal-field of Kembla mine than is Port Kembla itself; therefore Bellambi is most centrally situated, requires least cost for construction and resumption, and must therefore be most suitable. I have several plans here, one of them being a tracing of the survey made in 1859, three years prior to the time when the sum of £10,000 was voted by Parliament for the construction of a harbour at Bellambi. That money, however, was never applied to the purpose for which it was voted. In my opinion the Departmental scheme for Bellambi is either the result of a mistake or it is very unfair. The Government proposal is to put in a breakwater in what is absolutely our deepest water, and to take up a space where jetties should be placed for the accommodation of shipping. The breakwater should, as a matter of fact, be constructed further to the east, along the top of the reef. In that way you have only two-thirds of the depth, and you increase the area of the protected water. Personally, I cannot see the necessity for carrying out the breakwater 2,800 feet.

1147. *Mr. Trickett.*] Do you consider it necessary that a safe harbour should be made upon the south coast? I do.

1148. What advantages has Bellambi as a port of shipment? In the first place, it is the best natural harbour on the south coast, and has been ever since the opening of the Illawarra coal-mines in the very centre of the southern coal-field. There are eleven collieries within  $7\frac{1}{2}$  miles of Bellambi. The collieries extend from Clifton on the north to Mount Kembla on the south. It is not at present known if there is workable coal south of Mount Kembla.

1149. Of these eleven mines, how many are now working? All of them with the exception of Bulli "B" Pit and the North Illawarra mine. Both these collieries are to the north of Bulli.

1150. Why are they not working? Because of the want of trade and the inequality, or rather the lowness, of the seam.

1151. The coal there is not as good as the coal in the mines which are being worked? In the Bulli "B" Pit they have from one-third to two-thirds of burnt coal, and the good coal is too thin to make the working profitable. More than that, they have no facilities for getting the coal either to the Government railway

or

J. B. Nicholson, Esq., M.P.  
20 Nov., 1896.

- or to the water. They have to pay 4d. a ton to the Bulli Company for permission to run over their line.
1152. Putting these two mines out of the question, is Bellambi in the centre of the coal-field? Yes. The two mines to which I refer are two of the smallest collieries on the coast. One of them before shutting down was employing about forty men, and the other something like twelve or sixteen men.
1153. If a port were made at Bellambi, would any land have to be resumed there? We estimate that 370 acres would have to be resumed. I believe that the owners of that land valued it for taxation purposes at £5 per acre; but for resumption purposes we have valued it at £7 10s. per acre. That, I think, is its outside value.
1154. Do you recommend the resumption of that land? Yes. It is an even piece of land, having a frontage to the bay, and would in all probability be required for the erection of workmen's houses, and to give room for sidings, and for other purposes. There is a road going down to the bay now, the lower part of which has never been formed; but it would not be a very costly thing to finish it.
1155. The cost of the land would not come to more than £3,000? Something under £3,000.
1156. What wharfage accommodation is there at Bellambi? We have a very good jetty belonging to the South Bulli Company. At the end of that jetty there are 24 or 25 feet of water. A little further to the north is the Bellambi Company's jetty, which is shorter than the South Bulli jetty, and runs out into about 18 or 19 feet of water.
1157. Those jetties are only used to load vessels of a limited tonnage? At the South Bulli jetty vessels with a capacity of nearly 3,000 tons can be loaded.
1158. Where does the coal go to;—does it go oversea, or is it taken to intercolonial ports? A great deal of it goes to intercolonial ports. It is generally allowed that the southern coal is 7 or 7½ per cent. better for steaming purposes than any other coal in the Colony. Steamers take it to Hobart, Adelaide, and other places in the Colonies, and a great deal of it is loaded in Sydney into foreign-going steamers.
1159. But there is no direct foreign export trade from Bellambi? No, though indirectly there is a good deal of coal taken by ocean-going vessels.
1160. If the harbour at Bellambi were improved, do you think that large ocean-going vessels and sailing ships would come there to coal? I am sure of it.
1161. What depth of water would there be in the place which it is proposed to protect by a breakwater? There would be about 42 feet at the end of the proposed outer jetty, and about 34 feet at the end of the proposed inner jetty.
1162. That would be a sufficient depth for all purposes? I think so.
1163. Why do you propose to put your breakwater south of the Government breakwater? From considerations of cheapness and of ease of construction. Mr. Carleton, in his report, regrets very much that at Wollongong they have no shoal water in which to construct a breakwater; but the Department when it came to deal with Bellambi, instead of proposing to make the breakwater in shoal water, has looked out for deep water.
1164. How does your proposed site compare with the Government site? We propose to construct the breakwater along a line of reef which has only two breaks in it. These we call the boat-channels, and they have, in my opinion, formed a natural scour for the harbour. That is proved by the fact that the soundings recorded in 1859 scarcely vary from the soundings obtained recently. The depth of water in which our breakwater would be constructed commences with 7 feet at the shore, and runs out into 14 feet, 17½ feet, 21 feet, 19 feet, 12½ feet, 15½ feet, 20 feet, 17½ feet, 19½ feet, 23 feet, 21 feet, 22 feet, 24 feet, 25½ feet, 27½ feet, 28½ feet, 34½ feet, 33½ feet, 31½ feet, 40½ feet, and 41½ feet. The variation in the depth is accounted for by the bumps on the top of the reef. I understand that the reef is 400 feet wide, with a uniformly level surface.
1165. Your proposed breakwater is about two-thirds of the length of the Government proposed breakwater? Slightly less than two-thirds.
1166. *Mr. Black.*] Are the depths you have just quoted the depths on top of the reef or alongside it? The depths on top of the reef.
1167. *Mr. Trickett.*] What are the soundings along the line of the proposed Government breakwater? 8 feet, 15 feet, 17 feet, 22 feet, 23½ feet, 10½ feet, 15 feet, 20 feet, 27 feet, 21 feet, 22½ feet, 25½ feet, 24½ feet, 28½ feet, 51 feet, 43 feet, 44 feet, 45 feet, 48½ feet, and 50½ feet.
1168. What area of water would be protected by your proposed breakwater? I cannot say, but I think at least one-fourth more than would be protected by the proposed Government breakwater.
1169. How far would the proposed new jetties run out? I have here the particulars and estimates of cost in regard to the construction of the two breakwaters, the erection of jetties, the resumption of land, and in fact for the completion of the work. They were drawn up by one of our local engineers. He proposed, in addition to the breakwater of which we have been speaking, to run out a short protecting breakwater still further to the south, connecting the mainland with a small rocky island shown on the plan. This breakwater is referred to as Breakwater No. 1, and the longer breakwater as Breakwater No. 2.

*Bellambi Harbour, Breakwater No. 1.*

Construction:—First-class blue-metal rubble placed at a batter of 1½ to 1 on the outer slope, and 1½ to 1 on the inner slope; width on top, 30 ft.; height of top, 8 ft. above low-water mark.

Calculation—Two tons to cubic yard, less ⅕ for voids; price, 5s. per ton.

Section.	Length.	Depth of water.	Contents in cubic ft.
1 ... ..	600 ft.	2 ft.	270,000
2 ... ..	500 ft.	6 ft.	502,500
3 ... ..	100 ft.	16 ft.	171,000
4 ... ..	100 ft.	10 ft.	129,000
			1,072,500

1,072,500 cubic feet = 40,000 cubic yards, at 2 tons per cubic yard = 80,000 tons—less ⅕ for voids = 64,000 at 5s. per yard = £16,000.

*Bellambi*

Nicholson,  
Esq.; M.P.

*Bellambi Harbour, Breakwater No. 2.*

Construction.—First-class rubble sandstone placed at a batter of  $1\frac{1}{2}$  to 1 on the outer slope, and  $1\frac{1}{4}$  to 1 on the inner slope, width on top 16 ft., height of top 20 ft. above low-water mark. Calculation 1.75 tons to cubic yard, less  $\frac{1}{8}$  for voids.

20 Nov., 1896.

Section.	Length.	Depth of water.	Contents in cubic ft.
1 ... ..	200 ft. ...	7 ft. ...	286,200
2 ... ..	700 ft. ...	18 ft. ...	1,808,800
3 ... ..	400 ft. ...	15 ft. ...	896,000
4 ... ..	300 ft. ...	21 ft. ...	825,600
5 ... ..	200 ft. ...	22½ ft. ...	638,400
6 ... ..	200 ft. ...	27 ft. ...	760,400
7 ... ..	200 ft. ...	33 ft. ...	943,400
Average 24 ft. on top. 8 ... ..	100 ft. ...	42 ft. ...	682,000
32 " " " 9 ... ..	100 ft. ...	42 ft. ...	731,600
N. Z. prices from 10 ... ..	Slope at end. ...	42 ft. ...	416,710
2s. 2d. to 4s. 8d.			<hr/>
			7,889,100 =

292,200 cubic yards, at 1.75 tons per cubic yard = 511,350 tons— $\frac{1}{8}$  voids = 408,675 tons at 5s. = £102,169, if calculated at 2 tons per cubic yard would equal 467,520 tons at 5s. = £116,880.

*Bellambi Harbour.*

Estimated cost complete harbour, affording loading accommodation for four of the largest cargo steamers in from 31 to 43 feet of water at low water at low spring tides, and also for vessels of smaller draught at same time.

Breakwater No. 1... ..	£16,000
Do No. 2... ..	116,000

Do Loop on north side of S. B. Line ... ..	100
Making Corrimal Line ... ..	2,500
	<hr/>
	£224,733

This estimate provides for the carrying out of Breakwater No. 2, a distance of 2,800 feet. Personally, I think that 1,800 feet would meet the case; but if the Government should decide upon the construction of a longer breakwater I would offer no objection.

1170. You claim that your proposal has an advantage over the Government proposal inasmuch as it requires a shorter, less expensive, and more easily constructed breakwater, and allows of two new jetties being erected in very deep water, besides giving an ample area of protected harbourage? I claim all that for it.

1171. Do you think that the Government should have the whole control of this port, or would it do for the Government to work their own jetties and to allow the coal companies to continue to work their jetties? No. I think that the Government should have the concern in their own hands. The cost of maintaining the private jetties along the coast has been so great that I am perfectly certain that the whole of the trade would, in the course of time, naturally find its way to the Government wharf. Then, too, I think that the Government management would be better than that of private companies. It must be borne in mind that we are not asking for the construction of a breakwater, and the erection of jetties for the particular benefit of colliery proprietors, though they will receive a certain amount of benefit from the work. We think that if a charge of 2d. a ton is made upon all coal loaded at the jetties that will pay nearly 4 per cent. upon the expenditure, and we feel sure that a charge of 3d. per ton net profit would be sufficient.

1172. Some of those who have advocated the construction of a harbour at Port Kembla have reported the colliery proprietors as being willing to pay as much as 6d. a ton? I think that is too high.

1173. Why? It leaves such a small margin of profit.

1174. I suppose you are not prepared to lay down any rule as to charges? No. I simply mentioned that that charge has been thought sufficient to meet the interest upon the outlay.

1175. How would Bellambi be sheltered from north-easterly weather, even if you had the breakwater? The contour of the coast from Stanwell Park thoroughly shelters the place.

1176. How far north is Stanwell Park? About 11½ miles. A vessel can lie in the bay when it is blowing almost a hurricane from the north-east. On one occasion one of the Illawarra boats lay there for two or three days for shelter when the danger-signal was up at Wollongong. I think that was during a north-easterly blow. I have seen boats put into Bellambi for shelter, when they could not go to any of the other ports. On the south, the reef protects the place to some extent, and it is also protected by the Five Islands and by Red Point.

1177. I understand that vessels have been known to put into Bellambi when they could not lie in Port Kembla. When did that happen? Some eighteen months ago, when Mr. Darley was down there.

1178. Which way was the wind blowing? From the north-east. I do not remember the names of the vessels.

1179. The protection you want is from southerly, south-easterly, and easterly weather? We want protection from the south-east more than from anywhere else. We very rarely get any easterly weather, and a gale from the south scarcely creates any trouble inside the bay.

1180. What is the reason for the short protecting breakwater? It is contended that it would help to take the strain off the larger breakwater.

1181. Was not the Bulli jetty carried away some years ago? Part of it was. It runs out from a little cove about 2 miles to the north of Bellambi, and while it is fairly well sheltered from the south and south south-east, a sea coming more from the east breaks right in there.

1182. Was it carried away during easterly weather? The wind was east south-east.

1183. Was there a steamer there at the time? I am not sure. That place is much more exposed than Bellambi. At the same time the steamer "Mount Kembla" had to be sunk in Wollongong Harbour. The jetties of Bellambi have stood very well for many years, with the loss of only a few piles, and there is very little doubt that the proposed jetties would stand for almost all time if they were protected by a breakwater.

1184. Have there been any shipping casualties at Bellambi? A short time ago a steamer coming from the south got on to the outer end of the reef during the night, and was totally wrecked, but that, in my opinion, was due to carelessness. I do not recollect a single accident occurring in the bay.

1185. What kind of holding ground is there at Bellambi? I never heard that a vessel had broken away from her moorings there. The anchorage is not so extensive as at Port Kembla, and they must take care not to get too near the shoal water, or they will get on to a rocky bottom.

1186. Do vessels ever anchor at Bellambi? Yes, they drop their anchors there often enough.

1187. But the area available for shipping would not be so large as that available at Port Kembla? Certainly not.

1188. I understood you to say that Bellambi was really nearer to the Mount Kembla mine than Port Kembla was? Yes. The Old Kembla Company's mine, so far as the Bulli seam is concerned, is pretty well worked out to the south; in fact, I think they worked it right to the outcrop. Their workings to the north are now rapidly extending towards the Mount Keira Company's property.

1189. *Chairman.*] It is not the pit's mouth, but the body of the coal that is nearer to Bellambi? Yes. I think that if a continuous tunnel were made from one colliery to the other it would save a great deal in the cost of output.

1190. *Mr. Trickett.*] You stated just now that the proposed location of the Government breakwater at Bellambi was a mistake, because it was intended to make the breakwater in deep water;—do you wish to add to that answer? No, I do not wish to impute motives to anyone; but one would naturally think that they would have looked for the shallowest water.

1191. Do you think Bellambi harbour will present other advantages besides that of being a port for the export of coal? I think so. We have there at the present time one of the best seams of fire clay, and of other clay that I have ever seen—clay capable of making the finest kind of pottery. That is at Woonoona, 2 miles from Bellambi. They are at present making tiles there for the Sydney markets. We have also every reason to anticipate the establishment of ironworks in the immediate neighbourhood.

1192. What about the utility of the place as a harbour of refuge? It is the only place that I know of along there which would answer the purpose.

1193. How would it compare in that respect with Port Kembla? Port Kembla is fairly well sheltered from the south.

1194. I mean supposing both places had breakwaters? It is more sheltered than Port Kembla during a northerly blow, and it is equally well sheltered in any other weather.

1195. You have heard that large chlorination works are to be established near Lake Illawarra? Yes.

1196. How would Bellambi suit those works as a shipping place? I do not think that the locality of the port would make any difference to them. Mr. Howell has stated that he has been able to make such satisfactory arrangements with the Railway Commissioners that he does not care for a port at all. I am satisfied that they will never have a harbour at Lake Illawarra. If the Company had wanted the convenience of a port they should have built their works either at Port Kembla or at Bellambi.

1197. In your opinion would it be sufficient to dredge a narrow channel, 15 feet deep, across Lake Illawarra to make a harbour for shipping? No, I think that would be of no use at all, and in my opinion, even if they made the channel 50 feet deep, it would silt up, as the northern rivers do.

1198. What is your idea as to the practicability of opening the entrance to the lake? I have no doubt that it is practicable; but last time I was there there was no entrance at all. Since then I understand that the company have built a kind of retaining wall, and the channel is so altered that that wall is now high and dry on a sand-bank.

1199. Do you think that it is a good idea to propose to make a port at Lake Illawarra? No; I do not. I cannot see how it will be possible for the investment to pay one per cent. South of Mount Kembla the only occupation is dairy farming, and to imagine that the colliery proprietors would send their coal to Lake Illawarra is absurd. It would be almost as easy for them to send it by rail to Sydney.

1200. *Chairman.*] How far is it from Bellambi to Talawera Point? I should say 17 miles.

1201. *Mr. Trickett.*] What do you think of the Port Kembla scheme? Had it not been for its situation I should have advocated that scheme. I admit, without a word of equivocation, that they have the largest area of deepwater, and possibly the best anchorage, though as I said before, I have never heard of a vessel breaking adrift at Bellambi. But, inasmuch as the old Kembla Co.'s mine is 7 miles from Port Kembla, I cannot see that the export of coal from that place is likely to increase to the same extent as it is likely to increase at Bellambi. The Southern Company's prospect was an utter failure. They spent £80,000 or £90,000 and found no coal.

1202. They found burnt coal? The seam was topsy turvy—it varied from a perpendicular to a flat seam.

1203. Do you know anything about the character of the coal there? I know that they have never yet found coal of a payable character south of the old Kembla Company's mine. They have found seams of varying thickness from Kembla to Avondale, and even further south; but they are so intermixed with bands as to be unworkable.

1204. Where an upper seam is found to have been affected by volcanic action, I suppose the same thing will have occurred in regard to the lower seams? I do not know. The coal in our upper seams has been in every case of an inferior quality. The coal out towards Avondale, which they tell me is 7 feet thick, assays

J. B.  
Nicholson,  
Esq., M.P.

20 Nov., 1896.

J. B.  
Nicholson,  
Esq., M.P.  
20 Nov., 1896.

assays 51 per cent of carbon, and will not make coke of any marketable quality whatever. Consequently it is useless to say that there is a coal-field to the south of Mount Kembla which will compete with the existing mines.

1205. I understand that all the Illawarra collieries are working the same seam—what is known as the No. 3 seam? Yes; that is undoubtedly the best seam. The North Illawarra Company's seam and the Bulli 4-ft. seam met with a fair market; but the coal was so much heavier than the other coal in comparison with its bulk that the pits are now idle.

1206. Have the eleven mines that you speak of a fair supply of No. 3 coal? Yes, I think there is an unlimited quantity; at any rate sufficient for the next fifty years. I have reason to believe that the Bellambi mine is fairly well worked out, and I believe they are encroaching pretty fast on to the old Bulli workings; but as they are only employing twenty-five or thirty hands, it would not be felt if they closed down to-morrow, because the men would get work at the other collieries.

1207. Do you know the new mine which is being opened up near Lake Illawarra? I was down there once, but it is some years ago. I sent a bag full of the Avondale coal to be assayed by the Department of Mines.

1208. Was it good coal? No, it was very much inferior to the Bulli coal.

1209. We have it in evidence that very large steamers go to Port Kembla for coal. How is it that none of them go to Bellambi? Because the depth at the jetties is not sufficient. Then, too, Port Kembla has splendid loading appliances, and as many of the colliery proprietors as possible combine to send their coal down there in order to expedite the loading. They send coal there from South Bulli, and I have even known it to go from Clifton.

1210. A gentleman who is largely interested in the Southern Coal Company, which company gets its coal from Corrimai, has given evidence strongly in favour of the Port Kembla scheme? I cannot account for that, unless on the supposition of vested interests. Commercially, there is no reason why the Corrimai coal should not come to Bellambi.

1211. Possibly they are influenced by the advantages which Port Kembla offers? The only reason why the big boats go to Port Kembla is that they cannot load at any other place on the south coast.

1212. Some witnesses have suggested that it would be better for the Government not to do anything in this matter until it is seen what the Lake Illawarra people intend to do? I think it is very unlikely that the Lake Illawarra scheme is going to be carried out, and even if it were it would have no effect upon the coal trade.

1213. You admit that Port Kembla has advantages in the way of deeper water, and possibly better anchorage; but you say that Bellambi is more centrally situated and better adapted for the trade? Its central position is undoubtedly its chief recommendation. Then, too, if the breakwater were carried out only 1,800 feet, which I think would be sufficient, the cost of the whole scheme would be less than one-fourth of the cost of the Port Kembla scheme. This in itself should be such a recommendation as no public body could ignore.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

John Barnes Nicholson, Esq., M.P., sworn, and further examined:—

J. B.  
Nicholson,  
Esq., M.P.  
24 Nov., 1896.

1214. *Chairman.*] Have you any further statement to make before we continue your examination? Last Friday I made a statement to the effect that two steam colliers had to leave Port Kembla on a certain occasion and go to Bellambi for shelter. At the time I could not give the Committee the names of these vessels; but I have since ascertained that the occurrence took place on the 24th and 25th January, 1895, and that the steamers in question were the "Egmont" and the "Glaucus." In 1892 it was proposed to expend £275,000 in improving the Wollongong Harbour, and in a report upon the proposed scheme the following statement occurs:—"I do not think it at all probable that the port of Wollongong, if improved and made a really safe harbour, can count upon drawing all the southern trade there. Some will undoubtedly go direct to Sydney by rail, and a large quantity will continue to be shipped from private jetties, which in many cases are close to the collieries, the proprietors thereby saving the expense of long haulage." What was nearly correct with regard to Wollongong in 1892, is equally applicable to Port Kembla at the present time, only in a greater degree, owing to the fact that the haulage is considerably longer to Port Kembla than to Wollongong. Consequently, other conditions being equal, the prospects of shipping were greater at Wollongong than at Port Kembla; and for the very same reasons the prospects of shipping at Bellambi are proportionately greater than at either of the other places, as a tabular statement of distances of haulage to the various proposed ports, which I will presently read, will show most conclusively. The same report continues: "I, therefore, think that the utmost trade likely to be drawn to Wollongong for many years to come will not exceed 750,000 tons, or, say, five times the present output. Taking only 3d. per ton net profit on this quantity—as the expenses will be proportionately heavier on the smaller output—the proceeds would amount to £9,325, which would represent 4 per cent. interest on £234,375." If this is a true statement of the prospects of Wollongong, I maintain that the possible increase of trade at Port Kembla would be still less, because Wollongong is more in the centre of the coal field than Port Kembla is. The Mount Keira and the Mount Pleasant mines have for years shipped nearly the whole of their coal at Wollongong. It has only been on special occasions that they have sent coal to Port Kembla to facilitate the loading of deep sea vessels there. Bellambi, however, is more favourably situated than even Wollongong, because the distance from

from the coal mines to Bellambi is less than it is to Wollongong. Another statement which has come under my notice is, that the coal in the northern end of the Illawarra district is, to a certain extent, petering out, and that so much burnt coal has been met with that some of the collieries will very shortly be closed. This statement can only possibly apply to old Bulli and to Bulli "B" pit. Having worked there years ago, I know the circumstances of both collieries. In the old Bulli mine, they worked through the burnt coal, which was adjacent to what is known as the basalt dyke, which runs through the Illawarra coal-field, and got into good coal. Most of the collieries down there are getting into better coal. Mount Keira, Mount Pleasant, and some of the other collieries are now supplying better coal than they supplied in the past, and have better prospects now than they had four or five years ago. As soon as they get through the dyke the coal improves. In the Bulli pit, after we had got through the dyke, we obtained some of the best coal that has ever been turned out in the Illawarra district.

1215. *Mr. Roberts.*] Is it not a fact that during the years 1894 and 1895, and up to the 30th April, 1896, more coal was shipped at Port Kembla than at the Bellambi and Bulli jetties? If you put Bulli and Bellambi together, I cannot admit that that is so; but if you compare Bellambi alone with Port Kembla, I must admit the fact. It is due to this reason, that large steamers have hitherto not been able to come into Bellambi. Vessels which have been unable to complete their loading at Newcastle, because they could not get over the bar there with a full cargo, have gone to Port Kembla to complete their loading. Then, too, as I said last Friday, the appliances for loading at the Southern Coal Company's jetties are of a first-class character. The northern collieries—South Bulli, Bellambi, and very often South Clifton—combine, and send coal to Port Kembla to complete the loading of deep-sea steamers in as short a time as possible. Taking the shipments for some years past, however, I think that Bellambi sent away more coal than Wollongong or Port Kembla. If, at Wollongong, the exportation of 750,000 tons of coal would only give a return of 4 per cent. upon the expenditure upon the harbour works, —supposing dues of 3d. a ton were charged—the return given at Port Kembla, with a similar export, but on a proposed expenditure on works alone of £440,000, would be much less. Besides, it must be remembered that in addition to the cost of the works proposed to be carried out there, there is the cost of land resumption which must be something terrific. The land there is four times as valuable as the land around Bellambi. Then, too, there would be 10 miles of railway to resume as against 1½ mile or 1½ mile at Bellambi. The conditions under which they ship coal now at Port Kembla are such that I think any one would hesitate before saying that the Port Kembla scheme was the best scheme that has been suggested. The Southern Coal Company built their jetty and laid down their railway before prospecting for coal, and when they opened their mine they found no workable coal. To imagine that the Bulli seam extends south of Mount Kembla is utterly fallacious, and the report of the Government Geologist for 1890 states most distinctly that the Bulli seam peters out at Mount Kembla. The Mount Kembla Company have broken through to daylight in Mr. Purcell's estate, and the seam has never been discovered further south than that. I know that coal has been found south of Mount Kembla, and I had about half a hundredweight of a sample which I received from Avondale assayed. The assay gave about 51 per cent. of fixed carbon, and a large percentage of ash. The Government Assayer stated that that coal would not make coke of a marketable quality. They have some good coal down there; but the seams are so thin, and there are so many bands between the floor and the roof, that it cannot be worked at a profit. According to the Government Geologist's report, it would seem that payable coal cannot be expected down there until they sink down 3,400 feet and strike the Greta measures. The Southern Coal Company having failed to find coal in their own land purchased the Corrimal property, since which time I think they have leased the mine to the Adelaide Steamship Company, and, although Bellambi is within 1½ mile of the colliery, they send the coal 8 or 9 miles to Port Kembla. It would be to their interests as well as to the interests of other colliery proprietors if they could ship from Bellambi instead of from Port Kembla or from Lake Illawarra. I have here a table of the rail distances from the various collieries to Lake Illawarra, Port Kembla, and Bellambi:—

	Miles.	Miles.	Miles.
From Clifton to Lake Illawarra	23,	Port Kembla	17, Bellambi
„ Austinner	19,	„	13, „ 4.
„ Bulli	16,	„	10, „ 1.
„ Woonona	15,	„	9, „ 1.
„ S. Bulli	14,	„	8, „ 1.
„ Corrimal	13½,	„	7½, „ 1½.
„ Mount Pleasant	10½,	„	6, „ 2.
„ Mount Keira	10,	„	5, „ 2.
„ Mount Kembla	7,	„	5, „ 4.
„ Helensburgh	28,	„	23, „ 17.
Totals	156,		103½, 41½.

So that in the aggregate Port Kembla is two and a half times as far as Bellambi and Lake Illawarra three times as far.

1216. *Chairman.*] Have you taken these distances along the tram lines and then along the Government line? From the pit mouth along the tram line to the nearest station upon the Government line. With regard to the Mount Pleasant mine, the distance to Bellambi by their present tramway is much greater than 2 miles, but they could get to Bellambi from their present workings by making a tramway less than 2 miles in length. It has been stated that the proposed Government breakwater at Bellambi was to be constructed along the line of reef, but the plan which I handed in last Friday shows that that breakwater would be a long way inside of the reef, and would take up the deepest and best water. As compared with the breakwater which I suggest, the Government breakwater would lessen the area of the harbour by nearly one-third. All that is necessary at Bellambi is to cap the existing reef with some 1,800 feet of breakwater. Some misleading statements have also been made in regard to the depth of the reef. The outer end of the reef is absolutely bare at low water, and not once, but 100 times have I seen the reef clear of the water in calm weather. In rough weather it is easily discernible by reason of the surf breaking over it. With regard to the Lake Illawarra scheme I am of opinion that it is utterly incompatible with the estimate of expenditure. As a matter of fact, that amount would be barely sufficient to open the entrance to the lake, to say nothing of the cost of making a channel across the lake and the construction of a dock for the reception of vessels. Then, too, the improbability

J. B.  
Nicholson,  
Esq., M.P.  
24 Nov., 1896.

of any coal being shipped so far south renders the whole scheme abortive and utterly unworthy of consideration. I have not the slightest hesitation in saying that if the Lake Illawarra scheme were carried out the coal shipped from the lake would not amount to more than 200,000 tons per annum for years and years to come. The amount of coal now opened up in the Illawarra district is sufficient to supply nearly twice the present trade. The various collieries now employ something like 1,400 men, and I am within bounds when I say that they have facilities for the employment of 4,000 men; so that the output could be nearly trebled before the mines would be fully worked. With regard to what has been said by Government officials and others in regard to the possibilities of getting stone in the district, I want to state that we have any quantity of blue-metal close to the South Bulli Colliery, and can open out sufficient at very short notice to construct both the No. 1 and the No. 2 breakwaters shown on my plan. Our local engineer thinks that the sandstone near the Government railway line would be as good for the No. 2 breakwater, because it might be got out in bigger blocks, and perhaps at less expense. There has been some talk for some time past about the Railway Commissioners intending to duplicate the line from Clifton to Port Kembla. If that be so, I believe they would be glad to make an arrangement for the cutting away of the sandstone alongside the line, and if this were done in a workmanlike manner, the road being left level for the laying of the rails, I believe the freightage would be merely of a nominal character. I believe that the stone can be landed at Bellambi for less than the amount estimated by Mr. Carleton, namely, 5s. per ton. I believe we could get it for less than that, whether we got it from near the South Bulli Colliery or from the rocks contiguous to the railway. Mr. Carleton, in his report, says that two jetties have been constructed at Bellambi and two at Port Kembla. Those at Bellambi were constructed under a Crown lease, terminable in 1899, while those at Port Kembla were constructed under Acts of Parliament, which give the companies power to construct other jetties if necessary. Therefore, before anything is done, arrangements should be made to place all the collieries upon the same footing in regard to harbour dues, &c. Scarcely anything was said about the cost of resumption; but we may take it for granted that the cost of resumption at Port Kembla would be four times the cost of resumption at Bellambi. It has been stated by recognised authorities upon the southern coal-fields that Port Kembla is a centrally-situated port; but this is a matter requiring much consideration. With all due respect to the opinion of Dr. Robertson, who is one of the authorities to whom I refer, I think he may possibly be labouring under the delusion that there is a coal-field south of Mount Kembla. I deny the existence of such a coal-field. £75,000 is put down in the estimate of the cost of wharfs, &c., at Bellambi; but if that means the cost of resuming jetties, it must be known that it would not be nearly so great, inasmuch as the leases of the jetties fall in within a very few years. At Port Kembla, for which there is a similar estimate put down, the circumstances are very different, because there the companies have a right to their jetties for all time, and power to construct other new ones. Moreover, I understand that the whole of the land leading down to Port Kembla is the property of the Wentworth family, and the companies shipping coal at Port Kembla have to pay a royalty for permission to run over this land. If I mistake not, it costs the Southern Coal Company £4,000 or £5,000 per annum for the right to run over this land. Therefore, even taking into consideration the interest which they hold, and the very well equipped jetty at Port Kembla, it would serve them better to be able to ship their coal within a mile and a half of their colliery, namely at Bellambi. While they might not gain so much immediately by the change as they might by the resumption of their jetty, they would reap a benefit in the course of five or six years. Mr. Hickson estimates that the cost of protecting Bellambi would be £3,557 per acre, of protecting Wollongong £3,405 per acre, and of protecting Port Kembla £1,256 per acre; but I think this is an unfair estimate, inasmuch as it is proposed to put the breakwater at Bellambi in the very deepest water. Furthermore, the Port Kembla estimate only takes into consideration the construction of one breakwater. At Bellambi, if we availed ourselves of all the water area, we should have one-fourth, and in fact almost one-third more space as is provided by the Government scheme. With the permission of the Committee, I should like to read one or two remarks upon this matter made by Mr. John Evans, junior, who was at one time manager at Mount Kembla, and has since been manager of Bulli: He was of opinion that there must have been close on £250,000 spent in trying to make a harbour at Wollongong, and there never would be a trade there till they had a harbour. If the trade did ever come, the Wollongong harbour would be inadequate for it. The time had arrived when the trade needed expanding. At the meeting held by Mr. Wiley in Wollongong five years ago, it was prophesied that the *Orient* and other large boats would, when the trust got a fair start, be loading there in the course of two or three years. As they all well knew, that had not come about. If they could make a harbour in keeping with modern ways, that was the line they should follow out. . . . He thought that they should try and damn the Kembla scheme right out. He was prepared to wager that a million of money had been spent on the mines from Mount Pleasant to Helensburgh, whereas on the south £100,000 was about all that had been spent, with little results. There is no question that Mr. Evans was in earnest when he made those remarks, and we all know that what he says about the amount of money that has been expended is correct. It would be very hard indeed if the northern coal owners were balked by the construction of a harbour at Port Kembla when, if a harbour were made at Bellambi, it would serve the southern coal owners as well as the northern coal owners. Mr. Eddy has promised to give us practically the same facilities as they have at Newcastle and to create a 10-mile zone north and south. He named Wollongong as the starting point, because the harbour trust was then in existence and good work was expected of it, although, I am sorry to say, it was not done. A 10-mile zone from Bellambi would benefit the colliery proprietors both north and south.

1217. *Mr. Clarke.*] You are of opinion that Bellambi would be superior as a port of shipment for coal to Port Kembla? Yes.

1218. If the breakwater which you propose were carried out, you think that Bellambi would make as good a harbour as Port Kembla? I think there are better prospects for the shipment of coal at Bellambi than at any other place, because Bellambi is right in the middle of the coal-field.

1219. I suppose the trade of Bellambi would be pretty well all coal trade? Yes. There would also be shipments of coke from Unanderra, Mount Pleasant, and Clifton, and I believe that the Bulli Coke-works have recently started again.

1220. Is it safe for sailing vessels to load at Bellambi at the present time? Two gentlemen—an Englishman and an American—visited Bellambi a year ago, and they informed the manager of the South Bulli Colliery that if a breakwater were constructed it would be the safest harbour on the southern coast, and that they would guarantee an increase of trade to the extent of 500,000 tons per annum.

J. B.  
Nicholson,  
Esq., M.P.  
21 Nov., 1896.

1221. Is there good holding ground at Bellambi? I never heard of a vessel breaking adrift there. The inner part of the bay is so sheltered that I cannot conceive of the possibility of that happening.

1222. The Committee have evidence that the holding ground at Port Kembla is as good as any in the Colony? That is generally allowed to be the case; but, inasmuch as the holding ground at Bellambi has served all purposes for several years, I fail to see why a comparison should be made. We acknowledge that Port Kembla has the largest area of deep water, the greatest depth of water, and the best anchorage; but we say that a vessel has never been known to break away from her anchorage at Bellambi. At Wollongong, not many months ago, the Kembla had to be sunk inside the basin to prevent her from getting on to the breakwater.

1223. I suppose that Wollongong may be considered to be out of the question? I think so.

1224. A large amount of money has been expended there with very small results? Yes; they have carried out their works in the very best water, just where they should have their wharfs and their loading berths. Even the lighthouse is built in the deepest water.

1225. In the event of a breakwater being made at Bellambi, would the collieries which have access to that port now continue to ship there? Yes; the saving of money which that course would bring about would compel them to do so.

1226. Do you think the Metropolitan Company would ship there? I think they would send coal there, whenever they had an order, because the distance is only 17 miles, as against 26 miles to Darling Harbour, and it is nearly all down grade to Bellambi, there being only one up grade, whereas it is up grade all the way to Sydney.

1227. Do you think that the people would continue to send coal from Clifton and Bulli? I think they would send coal from Clifton, because that jetty is built upon a flat reef, and the very least disturbance of the water renders it impossible to load there. It is only a matter of time when the Clifton coal will come to Bellambi. The South Clifton Colliery has no facilities for sending its coal away except by railway, so that that Company would readily avail itself of a port at Bellambi. With regard to the old Bulli Mine, since the property came into the possession of Mr. George Adams, the jetty has been improved and lengthened, and is so sheltered by a reef upon each side of it, that I have seen vessels loading there when they could not get into the basin at Wollongong. I do not think, however, that they would go to any further expense for repairs at these jetties if there were facilities for shipping at Bellambi. Bellambi could be used for over-sea vessels, both sailing ships and steamers, just as Darling Harbour is used.

1228. Would not the Corrimal coal still go to Port Kembla? I very much doubt it. I think that the cost of repairs to the Port Kembla jetties is so great, and the distance of transit so great, that that coal will ultimately be shipped at Bellambi.

1229. What about the Mount Keira and Mount Pleasant coal? I am doubtful about those collieries; but I think they would be better served at Bellambi than at Wollongong. The country is so easy that the cost of relaying their railways would not be very great, and if a direct line was made, the distance would be much shorter as their present workings go. The great inducement for all the collieries to send to Bellambi would be this: Now, for half their time, they cannot load at their jetties, and for one-fourth or one-third of the time, coal cannot be sent from Wollongong. If, however, a safe port were made at Bellambi, they could load all the time. What we want to do is to select the best possible site for this harbour.

1230. You spoke about sandstone being procurable for the construction of a breakwater? Our local engineer is of opinion that blue-metal might be used for the construction of the outer breakwater, and sandstone for the construction of the inner breakwater, if an agreement could be come to with the Railway Commissioners for obtaining freight at a nominal rate.

1231. Would sandstone do as well as blue-metal? I think so.

1232. I do not think sandstone has been used in other breakwaters when other material has been procurable? I believe that we have sandstone along the Illawarra railway which is almost imperishable. I am not aware that stone perishes more quickly under water than when it is exposed to the air.

1233. Have you given any consideration to Jervis Bay as a port of shipment? From what I have heard I believe that Jervis Bay is a very good port; but it is too far south for the coal owners of Illawarra to be able to avail themselves of it.

1234. I suppose it is not likely that coal would be found south of the Southern Coal Company's mine, except at a very great depth? I am only aware of two small seams, one a foot and the other 18 inches thick, in which the coal is of a quality sufficiently good for market. All the other coal is so much inferior to the Bulli seam that I am sure they could not get a market for it.

1235. *Mr. Lee.*] Your contention is that there is a need for a port on the south coast, and that the best site for such a port is Bellambi? Yes.

1236. You place both Wollongong and Lake Illawarra out of the question, and confine your remarks to Bellambi and Port Kembla? Yes.

1237. Is there not sufficient shipping now going to Port Kembla and Bellambi to meet all the requirements of the trade? No, not half enough.

1238. Could you give the Committee any instance of mining operations being retarded for want of shipping? If I had made notes for the purpose I could have given instances to show that we are losing from one to two days work a week because of the want of shipping during bad weather.

1239. Bad weather interrupts the loading of steamers on the south coast? Yes.

1240. You hold that with a secure harbour the loading of steamers would be very much facilitated, and in addition an advantage would be gained by reason of the fact that sailing vessels could visit the place? Yes.

1241. The trade would then be on somewhat the same lines as the trade of Newcastle? Quite so.

1242. Do you think there is likely to be the same demand for the Illawarra coal in the eastern and other markets that there is for the Newcastle coal? I think that the demand for the southern coal will increase year by year, because it has been proved to the satisfaction of steamship owners that it is better for steaming purposes than any other coal that can be obtained in the Colonies.

1243. If the output of the south coast were to reach your forecast, do you think there would be sufficient trade to carry on all the mines? I think so. If we have a superior article to put upon the market, we must increase our trade as the years go by. There is no coal in the southern hemisphere equal to the Illawarra coal.

J. B.  
Nicholson,  
Esq., M. P.  
24 Nov., 1896.

1244. You think that there is no reason to fear a diminution of the trade in the future? None whatever.
1245. The trade is more likely to increase? That is my opinion.
1246. Therefore, you think that the same facilities for loading should be given on the south coast as have been given on the north coast? Yes. I think we have been left in the cold too long.
1247. In the event of either Bellambi or Port Kembla being made into a harbour, you think that in the interests of the country the existing jetties and railways should be resumed, so that a uniform charge might be made for the shipment of all coal? I do.
1248. At Newcastle, the Commissioners charge 10d. a ton for the haulage and shipping of coal coming from distances between 4 and 7 miles? It costs the southern coal-mine owners more than that.
1249. It is natural to suppose that if a harbour is made on the south coast, the trade will concentrate there? Yes.
1250. Therefore, no one colliery should have an advantage over the others there? No.
1251. If the jetties remain the property of private coal-mine owners, it might happen that they would find means of delaying the shipment of coal belonging to a rival company? Yes; that might happen. With regard to the concentration of trade, the captain of any ship who finds that he can get his vessel loaded more quickly at Bellambi than anywhere else will come there.
1252. But I suppose, even if a safe harbour be made at Bellambi or at Port Kembla, vessels will continue to load at the other jetties in fine weather? Possibly so; but I think only for a short length of time. The jetties would soon fall into disuse.
1253. You think that owners as soon as they could make their arrangements would ship the whole of their coal from a secure port? Without doubt.
1254. Is there any general organisation of the colliery owners in your district which has taken up the same position with regard to the construction of a breakwater at Bellambi as you take up? I am not in a position to say; but I know that certain of the managers hold the same views as I do, and I could almost vouch for two or three of the owners. It is so much to their advantage to have a harbour constructed at Bellambi that they can scarcely say anything else, even though they may belong to the Southern Coalowners Association. It is simply a question of £ s. d.
1255. No matter where the port is made, whether at Bellambi or at Port Kembla, some of the mines will be able to get there more cheaply than the other mines? Well, if the zone system is applied that may not be so. If a uniform charge is made for all collieries within a 5-mile radius and a similar charge for all collieries within a 10-mile radius, they will be all on pretty much the same basis.
1256. *Chairman.*] Why should there be two zones? Well, I do not know whether Mr. Eddy would be prepared to give the Southern Colliery the same advantages as the South Bulli Colliery, one being 6 miles away and the other about  $1\frac{1}{2}$  mile.
1257. *Mr. Lee.*] Would a 10-mile zone from Bellambi include Mount Kembla? It would include all the collieries with the exception of the Metropolitan.
1258. What rate is to be charged for each zone? Mr. Eddy did not go into any particulars. I suggested the idea to him, and he said that it was the only feasible way out of the difficulty. At the time we were advocating a reduction in the cost of transit for coal in the southern district.
1259. At Newcastle they have a varying rate, the minimum being 6d. per ton for a distance not exceeding 1 mile? That is why I stated that there might be two zones—a 10-mile zone, and another zone inside that.
1260. At any rate if the zone rates are not in excess of the rates charged at Newcastle the colliery proprietors will be prepared to pay them? I think they would be on the same ratio as the Newcastle rates. The grades to Darling Harbour are so heavy that it would cost the Commissioners more in proportion to the mileage to take coal there than it would to take it down to Bellambi.
1261. Do you think that the extra return obtained by the railways would be sufficient to pay the cost of haulage and interest upon the cost of the construction of the proposed works? I would not like to say that it would do so from the start; but I am sure that in the course of two or three years the scheme would pay. I feel certain that it would ultimately pay  $4\frac{1}{2}$  per cent. upon the capital invested.
1262. Do you think it would be advisable to have a zone charge and an additional charge of so much a ton to cover the cost of shipment? Well, let us say that 3d. a ton net gain should accrue to the Government.
1263. Do you think a clear gain of 3d. a ton would be sufficient to cover the interest? I think it would be more than sufficient.
1264. That is taking the expenditure as estimated by your engineer? Yes.
1265. Upon the Government estimate it would not be sufficient? No.
1266. I suppose that the trade from a port on the southern coast would be nearly all export trade? We shall not have much import trade for some time to come; but I believe that the district is well situated for the establishment of manufactories.
1267. Do you think that it is necessary to construct wharfs at either Port Kembla or Bellambi? No. I think that two additional jetties will serve the trade for twenty or thirty years to come.
1268. I suppose it would be a costly matter to construct a wharf at Bellambi owing to the shallowness of the water near the shore? I think that a wharf could be put alongside the breakwater in deep water.
1269. Would not that be a dangerous position for it. Would not the surf break over the breakwater on to the wharf? I think that if No. 1 breakwater were constructed, there would not be much sea coming against No. 2 breakwater. Very little sea enters the bay now. I only remember two piles having been disturbed on the outer jetty.
1270. But while there may not be sufficient sea to harm the jetties, the sea might be sufficient to break over the breakwater and interfere with unloading? I do not think so.
1271. You rely upon the No. 1 breakwater to prevent that? No; I rely upon the general direction of the storms. Our storms generally run along past the outer end of the proposed lower breakwater, and do not disturb the bay very much.
1272. If ore were brought to Bellambi could it be loaded into the trucks on the jetty? Yes. Every facility for unloading could be afforded upon either of the two jetties which we propose to construct. Moreover, between the two reefs there would be room to discharge millions of tons of ballast, and this ballast would ultimately form a protection to the inner breakwater.
1273. It matters very little, when a vessel is lying in still water, whether the stuff taken out of her hold has to be run up 10 feet or 30 feet? If she can lay comfortably at her moorings it makes very little difference.

1274. Is it not done at almost every port in the world where there are large vessels? Yes. They have to do it at sea when they bring up coal from the hold for the use of the steamer.

1275. If stuff is being unloaded on to a wharf it has to be hoisted some feet above the wharf before it is swung out? Yes; and it would only take a second more to raise anything 30 feet instead of 20 feet.

1276. Have you seen them taking out ballast at Newcastle and putting it direct into the trucks? Yes; I have seen them doing that on one or two occasions.

1277. Why should it be necessary to erect a wharf in order to allow a vessel to unload ore? I do not think it is necessary at all.

1278. So long as there is calm water, inward cargo can be discharged into the trucks on a jetty without any difficulty? Yes; just as the outward cargo can be put into the vessel.

1279. Sailing vessels will have to discharge their ballast into the trucks? Yes, unless they tip it out before they enter the port. At Bellambi they could discharge millions of tons of ballast between the two reefs.

1280. At any rate, if they can lift the ballast out of the vessel into trucks they could lift ore out? Yes.

1281. *Mr. Wright.*] You come here representing Woronora? I am the parliamentary representative of the Electoral District of Woronora.

1282. Do you oppose the Port Kembla scheme in the interests of your electorate, or in the interests of the whole district? In the interests of the whole district; not only in the interests of my own electorate.

1283. You are not personally interested in this matter? Not a cent.

1284. Is there any possibility of an import trade to the south coast? It will come about in time, and no doubt facilities for unloading would be provided as the trade came. If the jetties were found insufficient we could build a wharf.

1285. You are aware that the Departmental officers in preparing a scheme always put as much into it as they can? Unfortunately that is so. Any expenditure upon wharfs would be premature.

1286. A coal jetty is not a place upon which you can discharge ballast? I have seen coal slung up in baskets from the lower hold of a steamer, and I think it would be easy to sling ballast on to the jetty.

1287. But 15 or 20 feet of extra hoist every time means a good deal in the aggregate? Yes; it does make a difference.

1288. You believe that Bellambi has all the advantages which Port Kembla is said to possess? Well, the area of protected water and the depth of water would not be so great. It has been a harbour of refuge ever since I have resided in the district, and I believe ever since there have been vessels on the coast.

1289. The harbour is deep enough to load any merchant vessel? It can load vessels of 3,000 tons there now.

1290. And if your scheme were carried out there would be sufficient water for any sized vessel? Yes.

1291. I suppose you have some knowledge as to the amount of room required by shipping? Yes; I was at sea for a few years in my early life.

1292. Do you think that at either Bellambi or at Port Kembla there would be room for twelve 3,000-ton vessels to swing at their anchors? Yes, for twenty.

1293. Of course you are aware that at a coal port there must be anchorage for other vessels besides those loading at the jetties? Yes; but there is ample room for that at either place. I advocate Bellambi only because it is the more central, and the construction of a harbour there would mean a larger export of coal.

1294. You stated that the Bulli seam does not extend south of Mount Kembla? Yes.

1295. In the mines further north, are there not three or four workable seams under the Bulli seam? No; not of a payable character. They tried the 4-foot seam at Old Bulli, but it was knocked out of the market. The North Bulli seam is similar. Its density as compared with its bulk is greater than that of the Bulli seam.

1296. What about the deep seam there? We suppose that they are on the same seam, though the coal differs in appearance and quality as it gets deeper.

1297. There is no payable seam below the present seam? I believe not.

1298. We have been told that there are several good seams under the Bulli seam? There is any number of seams below the Bulli seam, but the quality of the coal is not good enough for the market.

1299. As far as you know there is no payable coal south of Mount Kembla? No; either the quality of the coal is poor, or there are so many bands that it does not pay to work it.

1300. Do you know of payable coal in the mountains at the back of Jamberoo? No. I believe there is no payable coal as far south as Jervis Bay. At any rate, there has been no development up to date to warrant us in thinking so.

1301. *Mr. Fegan.*] To whom does the foreshore at Bellambi belong? A township was surveyed there some years ago, and several allotments were purchased, so that there are two or three owners of the land around the bay, if not more.

1302. To whom do the jetties belong? To the South Bulli Coal Company and the Bellambi or Woonona Company. The leases of both companies terminate in 1899.

1303. Does not part of the foreshore belong to the Crown? *Mr. Darley* told me that the Government did not own a foot of water frontage around Bellambi. He said that that was the only thing against Bellambi as a place for a port.

1304. Have the companies a lease of the approaches to the jetty? They may own that land themselves, or they may pay royalty for running over it. Several land-owners in the district obtain royalty in that way.

1305. What objection have you to the breakwater proposed by the Government? We object to it because it runs out into the deepest water, and lessens our harbour area, while the cost of construction is greater than need be.

1306. What is the distance between the two breakwaters you propose to construct? I believe that at the extreme ends they are about 2,000 feet apart; but they start from the same shelf of rock.

1307. What is the distance between the Government proposed breakwater and your proposed inner breakwater? Something like 200 feet at the starting point, the distance widening as the breakwaters go out.

1308. If your scheme were carried out, we should have as good a harbour at Bellambi as we could have at Port Kembla, a harbour that would be much cheaper to construct and which would be sufficient for the trade.

J. B.  
Nicholson,  
Esq., M.P.

J. B.  
Nicholson,  
Esq., M.P.  
24 Nov., 1896.

trade for fifty years to come? Yes. The estimated cost of protecting Bellambi is less than one-half of the estimated cost of protecting Port Kembla.

1309. I understand that you take some exception to a number of soundings at Bellambi on the Government plan? At Port Kembla they have the very best soundings, while at Bellambi they have taken soundings in the deepest water. They have either made a great mistake at Bellambi, or there has been something like undue influence.

1310. What should they have done? They should have looked for the shoal water as they did at Port Kembla.

1311. We have been told that the bottom at Port Kembla is clay, while at Bellambi it is rocky? At Port Kembla they have undoubtedly a good anchorage; but at Bellambi they can anchor very well, except in the shoal water, and a vessel would never get close in shore to anchor.

1312. How long have you been living in the district? Over fifteen years.

1313. Therefore you think that you would have heard of any objection to the anchorage at Bellambi? I think so.

1314. Have you heard of any vessel breaking away from her moorings there? No. I have been there times out of number, and have seen vessels loading in all sorts of weather.

1315. I believe that was part of your work at one time, when you represented the miners of the district? Yes, my work took me there occasionally, but my own interest in the place brought me there much oftener.

1316. It has been stated that they gave up working at the Bulli Colliery, because they met with cinder coal. I understand from you, however, that they got through that bad coal? Yes, years ago.

1317. What seams in the southern district are workable? The Bulli seam is the only payable seam.

1318. What thickness is it? It varies from 8 to 10 feet, though at places it may be less than 8 feet and more than 10 feet.

1319. Whilst there are high seams to be worked it does not pay to work low seams? Certainly not. That is why the Bulli "B" pit is at present shut down. The burnt coal has cut out the bituminous coal to such an extent that it does not pay to work the bituminous coal. We have only the Bulli seam and a 4-ft. seam working, and it is a moot point whether the seam that has been worked at North Illawarra and at Clifton is the Bulli seam or not, it varies so much in thickness. I hold that there is a difference. The 4-ft. seam is 16 or 20 feet below the Bulli seam.

1320. Is it inferior coal? Yes.

1321. At present there is no coal being worked under tidal waters? No.

1322. Where the coal is not under tidal waters the greater portion of it can be recovered under good management by bringing back the pillars? Yes.

1323. There is not one-third of the coal left in the mine? Not one-fourth, I should imagine.

1324. Is this 8 or 10 feet seam clear coal? Yes. There is not a bit of dirt in it that I have seen, though in parts I have noticed a slight layer of dirt between the coal and the roof.

1325. You do not know anything about seams further down? No.

1326. Are there people in the district desirous of having a harbour at Port Kembla? As a matter of fact, there are no residents in the immediate vicinity of Port Kembla. Wollongong is, I suppose, the nearest place to it.

1327. Have you an analysis of the coal obtained by the Illawarra Land Corporation? No, but I will procure it for the Committee.

1328. We were told that it was exceptionally good coal? If the bagful sent to me was a good sample, and I presume that it was, it was not good coal. There were pieces of bright stuff mixed with it, but generally it was dull, and I should take it to be a dirty coal.

1329. Would it be good steaming coal? No. In my opinion it was scarcely good enough for domestic purposes.

1330. Are we to understand that that coal is almost valueless at the present time? I think so.

1331. Will not the smelting company use it? I am very much afraid that it is not good enough.

1332. If both Port Kembla and Bellambi were equipped with the necessary loading appliances, would not most of the trade go to Port Kembla? No, I do not think so. I do not think people would send coal 10 miles when they need only send it 4 miles.

WEDNESDAY, 25 NOVEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

David McCulloch, Esq., Statistical Clerk, Department of Mines, sworn, and further examined:—

1333. *Chairman.*] You desire to put in some returns? Yes. The following statement shows the total output of coal from the collieries within the Illawarra basin, from the opening of the field to the end of 1890, and supplements the return I have already given to the Committee:—

Charles Joseph Byrnes, Esq., Managing Director, Mount Pleasant Coal Company, sworn, and examined:—

1334. *Chairman.*] Where is the property of your company situated? At Wollongong.

1335. You wish to make a statement with regard to the question now under the consideration of the Committee? Yes. During the existence of the Wollongong Harbour Trust, the desirability of getting a deep water harbour on the south coast was mooted. I was Chairman of the Harbour Trust at the time. Accordingly meetings were held at Bellambi, Wollongong, and Kembla, at which the whole matter was discussed, and it was ultimately resolved that in order to avoid any collision and the risk of not obtaining any harbour at all, to refer the whole matter to the Government, and to abide by the decision of the Government.

C. J. Byrnes, Esq.  
25 Nov., 1896.

1336. Who were at the meeting at which this determination was arrived at? Representative men from Bellambi, Kembla, and Wollongong. I was there as Chairman of the Harbour Trust, and most of the other members of the trust were present. Among others Mr. Vickery was there, and so were Dr. Robertson and Mr. Ewing.

1337. And the meeting agreed to leave the whole matter to the Government? Yes; and I am prepared to adhere to that decision. I do not wish to offer any opinion upon the question at all.

1338. For what reasons is a port necessary on the south coast? At the present time it is impossible for the southern collieries to enter into competition for the foreign trade, because it is impossible to load sailing ships on the south coast, and it is in sailing ships that the great bulk of that trade is done. At Wollongong, vessels up to about 900 tons can be loaded, at Bellambi vessels up to 2,000 tons, and at Port Kembla, I suppose, almost any sized vessel—I am speaking of steamers only. We cannot load sailing-ships at any of these places. But if we had a commodious harbour, suitable for the accommodation of any kind of vessel, I think we should be able to do double our present trade. My own colliery has frequently had to refuse orders because we were not in a position to load the coal at Wollongong, and the railway rates to Port Kembla prevent us from shipping there.

1339. You have discussed this matter with Dr. Robertson? I have discussed it with Dr. Robertson, and with most of the coal people down there.

1340. You think that in any statement which he may make with regard to the matter your own views will be fairly well set out? I have read Mr. Vickery's evidence, and that of several other gentlemen, and I quite concur with what they have said.

1341. You feel that at this stage you have nothing to add to that evidence? Nothing. I am here quite disinterestedly. I want a deep-water harbour, and as the representative of the Mount Pleasant Company, I should be glad to get one, wherever it may be decided to make it.

Dr.

Dr. James Robert Millar Robertson, Engineer to the Bellambi, South Bulli, Coalcliff, and Mount Kembla Collieries, sworn, and examined:—

Dr. J. R. M. Robertson.

1342. *Chairman.*] You desire to make a statement to the Committee? Yes; I have embodied my opinions in the following statement:—

25 Nov., 1896.

In the purchase and development of the various collieries in Illawarra proper upwards of £1,000,000 of money has been spent; probably more than £200,000 has been spent in railways, sidings, and jetties.

On account of the inadequacy of Wollongong Harbour, where only vessels of 800 tons can load, and on which large sums of public money have been spent, the more recently-developed collieries have been obliged to build long lines of railway to the coast, and to erect very expensive jetties, which they have built and maintained at their own cost, for the purpose of loading a larger class of vessels than is possible at Wollongong. But for the existence of these jetties two-thirds of the present output from Illawarra proper would be lost.

For the past fifteen years I have been impressed with the necessity of a protected harbour for Illawarra, in order to foster the trade and safely accommodate the ever-increasing size of vessels that take our coal from the Colony. The tendency of the trade has been, and is, to drift into a larger and longer class of vessels.

At that time it was obvious to me that no ordinary expenditure would ever make Wollongong a harbour capable of accommodating the large class of ships that were offering, and after many visits to Bellambi and Wollongong it became apparent to me that Port Kembla was the most suitable spot, not only as a natural harbour which would require comparatively little protection, but was the most suitable site for the Illawarra collieries present and prospective.

In consequence, the subject of a breakwater to protect the jetties was on several occasions discussed by the Mount Kembla directors here, who, however, for various reasons, delayed taking action with respect to this desirable object; but seven or eight years ago they authorised the expense of soundings and a plan and estimates for a breakwater on a rather less pretentious scale than that proposed.

The breakwater then proposed began a little further east than the one proposed by Government engineers, and instead of running nearly north for 2,500 feet, followed the reef in a north-westerly direction, ending at a shallow patch about 1,900 feet from the point, a direction which I think preferable to that now proposed.

The ever-increasing size of vessel, and the persistent tendency of the steam coal trade to expand outside the Colony, induced me, five years ago, to go to London, and in person to urge the Board of Directors there to engage in the construction of this work, providing a Bill authorising its construction was obtained from the Parliament of New South Wales. The failure to obtain the co-operation of all interested parties decided the Directors to delay consideration of a scheme they were unanimous in their approval of. In the report I then presented the following sentences occur:—

"The proposal to construct a breakwater at Five Islands Point, Port Kembla, is not new. It has been more than once brought before your notice. This site has for years been recognised as the most feasible and suitable for a harbour of refuge in the district. Ten or eleven years ago Mount Kembla Colliery was connected with this point by railway, and erected a capacious jetty, at which large quantities of coal are daily shipped. Some years later the Southern Coal Company erected another jetty, at which large vessels have loaded.

"During recent years the character of the steam coal trade has changed. Formerly the coal was all sent to Sydney in colliers of moderate size, but of late the coal of Illawarra has grown in favour in the southern Colonies, and large inter-colonial steamers now go to the jetties at Port Kembla for cargoes. This trade is increasing.

"At the present moment vessels can load at Port Kembla when the more-exposed harbour of Wollongong, 3 miles north-west, is unapproachable.

"Loading is only rendered difficult, or, for a short time, impossible, after a protracted south-east or easterly gale, or when a heavy ground swell sets in as a result of a storm some distance out seaward. It is seldom that loading is stopped for ordinary colliers at Port Kembla. \* \* \*

"At present steamers carrying about 3,000 tons load at Port Kembla, while Wollongong Harbour, a few miles distant, on which upwards of £130,000 has been spent, can only admit steamers of 700 tons, leaving at high tide. Under the advice of the late Sir John Coode, preparations have been begun to spend about a million of money in extending this 'pool' that ought never to have been made—to make this dangerous basin more dangerous—and to fit it for the trade of two collieries, the traffic from which could just as easily be accommodated at Port Kembla, where steamers of any size could load with perfect safety at one-tenth of the cost, and where treble the quantity of coal could be shipped.

"A reef of rocks runs from the point east of our jetty in a north-westerly direction towards Wollongong. On this reef there are from 18 to 20 feet or so of water for about 1,600 feet. The breakwater proposed would follow this reef, and have deep water close up to it on the west. The point and the islands to the south and east would protect the breakwater from the force of the seas which, however, would run almost in its course.

"A survey of this reef and a plan of the proposed breakwater accompany this.

"Every yard of breakwater built would benefit the adjoining jetties.

"If this work were carried out the distance stated the loading staiths would be protected from all winds and seas, and several hundreds of acres of excellent anchorage would be protected, and could be used as a harbour of refuge, which would be the only one on the whole coast.

"The advantages to the district collieries would be—

1. Steady and continuous loading.
  2. Ability to load large sailing ships, and, in consequence, a large increase of trade to the district.
- "To the ship or trader the advantages would be—
- (a) Saving of two handlings of coal, which would be despatched in better condition and avoid much loss. The coal would be larger.
  - (b) Saving of the present freight to Sydney and cost of transhipment.
  - (c) The ship would be loaded continuously and without an hour's delay as fast as the cargo could be received, a all collieries would join.
  - (d) Saving of the more expensive Sydney tramage, wharfage, and pilotage.

"The cost of the proposed breakwater would be from £70,000 to £90,000. [The estimate of the engineer was considerably less; but I think that he was entirely wrong.] The consent of Parliament would of course be necessary before the work could be begun, and to authorise the levying of anchorage, wharfage, pilotage, or lights dues.

"The revenue would be sufficient to recoup the cost. Upwards of 200,000 tons of new trade would be captured by the district collieries."

The jetties that have been erected have cost very large sums of money to erect and maintain. The life of a jetty, without repairs, may be reckoned at fifteen years. In consequence of the changing trade and the necessity of providing for a larger and larger class of steamers in an open though sheltered roadstead, these jetties have involved a large expenditure of capital that the companies can ill afford. The jetties, however, are probably the fastest loading jetties in existence; but for this the collieries could not possibly dispose of their outputs. As it is, stoppages occur from the range of the sea when large steamers load, less frequently from stress of weather. But we are totally unable to load sailing ships for ocean voyages.

This, in these days of fierce competition, prevents us from competing in foreign markets and in many eastern ports where our coal would command a ready sale.

I calculate that with suitable protection for sailers we could sell from the Illawarra collieries to markets from which we are at present debarred on account of the expense of conveying and transhipping at Sydney, and its consequent destruction of the coal, a quantity approaching 200,000 tons a year, if not more, of new trade.

This would not compete with Newcastle. Illawarra is not a rival of Newcastle. A steam coal is no rival to a gas coal; each has its separate uses and markets.

The present collieries are capable of a largely-increased output, and the proposed breakwater would give not only steadier work but enable a large number of men being employed.

It would be a valuable harbour of refuge. Its anchorage of clay without rocks is all that can be desired. No vessel ever drags her anchors or losses them at Port Kembla.

Metallurgical or other works would be built in the vicinity of a deep-water sheltered harbour, and I am of opinion that an eastern breakwater will give us all the shelter we require.

I would use the breakwater for discharging cargo and loading sailing ships or very large steamers.

Being

Being intimately acquainted with the whole of the coal properties in the district, I find, that after making ample allowance for waste and loss from all known causes and carefully considering the geological and mineral conditions, the upper coal seam of Illawarra contains, available for sale, 117,000,000 tons of steam coal. To that quantity I would be disposed to add, say, one-fifth of the coal available from the present plant of collieries outside of the district to the north, or say in all 125,000,000 tons.

Dr. J. R. M.  
Robertson.

25 Nov., 1896.

Returning to Illawarra proper. About 5 per cent. of the whole could not under present conditions be worked to a profit, but of course it will be worked in the future under different conditions to those that at present prevail. Twenty-five per cent. of the whole available coal may be expected to go by rail out of the district, or be shipped at jetties or at Wollongong into a smaller class of vessels than would load in the proposed harbour.

Of all the available coal in the upper seam of Illawarra proper the coal-field situated south of Bellambi Colliery contains about 90 per cent., and if you take Port Kembla as a centre, and the mine of that name as a radius, about 70 per cent. of this coal would come from adits within or about that radius. The great bulk of the available upper coal is therefore contiguous to Port Kembla. The Wollongong group of collieries is really nearer to Port Kembla than is the mine that gives the port its name. Approximately, about 45 per cent. of this coal would be within the same radius of Bellambi, but about 70 per cent. of the whole available steam coal in Illawarra will come from mines virtually within an equal radius of Port Kembla.

Of the whole coal-field about one-half of the whole coal will be drawn from land leased from Government, and this will yield from the upper seam alone royalties exceeding £1,000,000, or from all the coal seams upwards of £3,000,000. The Government being principal owner would simply be giving an enlarged market and an outlet for their own minerals.

There are six lower coal seams of a quality distinctly inferior to the upper, but these so far have been neglected; at present they are not worked, the whole demand being for steam coal. Little is known about the condition of these coal seams. Undoubtedly large patches may be found workable, but these will not be worked while the superior upper seam can be easily obtained. It may be safe to say that these seams will yield north of Kembla a quantity equal to the upper seam, or 117,000,000.

South of Kembla the lower coal seams in places improve, and it is also quite safe to estimate, notwithstanding the disturbed character of part of this district from basalt intrusions, that south of Mount Kembla other 117,000,000 tons are available, or, together, 350,000,000 tons, with Port Kembla as a centre.

Considering that upwards of £200,000 of private money has been expended on jetties and approaches in the district, and that by means of these the bulk of the present output has been secured, and from these jetties solely the large vessels that load are despatched, and that Government have done nothing whatever to promote the southern coal industry except to build at great expense what is known as Wollongong Harbour, and as private enterprise is now exhausted, and can do nothing towards enabling existing collieries to load sailing ocean-going ships and increase their foreign trade, I am of opinion that, considering the national character and importance of this work, that the southern collieries may hope to obtain the boon of a breakwater, at a spot where any ship, no matter how large, could safely shelter, discharge, or load and leave at any time without risk.

A very small charge upon the coal shipped, altogether outside of the large revenue to be derived from inward cargo, and from the advantages to the railways of the large settlement it would induce, would pay handsome interest on the cost of an eastern breakwater.

Lake Illawarra scheme, so long dangled before our eyes, is apparently as near fulfilment or as distant as it was at the beginning. If constructed it would never prove of any material benefit to our trade in coal, nor would the construction of that harbour remove the necessity for the one proposed. The depth of water proposed at Lake Illawarra would not admit almost any of the vessels that trade to Port Kembla when light.

To make it deeper would involve more than treble the expense stated. It would necessitate tugs to tow vessels across the lake, and dredges to keep it free of sand. From the absence of any rivers falling into it it would have no scour. The sea-walls are so close and the channel so narrow that no vessel or steamer could go out or enter during a heavy wind or sea, and the same danger would exist all across the lake. It would probably take double as much annually to keep the channels dredged as it would to pay interest and keep on Port Kembla works. The expense of conveying coal over the Government railway, and then over a private branch line and then to be shipped by cranes in a small pool would far exceed in expense what the trade could pay or afford—that is, assuming the depth of water would permit of vessels larger than coast colliers entering. Under no circumstances that I can see could this canal be of any use as a harbour of refuge, or to the Illawarra collieries, which must have a harbour where coal can be shipped into the very largest class of steamers or sailers afloat, at the very smallest cost per ton, and at any time irrespective of weather. In the competition of the present day it is a question of pence, whether we can keep our collieries going steadily or in the irregular way we have been doing for the past two or three years. The coal trade can afford no margin; it is a race for life in the truest sense.

While Lake Illawarra scheme can never foster our coal trade nor remove the necessity of a harbour to the north, my opinion is that if Port Kembla harbour was formed Lake Illawarra would never more be heard of.

Since 1887, Mount Kembla Colliery has shipped about one and a half millions of tons at Port Kembla. The Southern Company have shipped large quantities also. Upwards of 300,000 tons will, I calculate, be shipped here during 1896.

Mount Kembla Colliery can double its present output on short notice. Mount Keira, Mount Pleasant, and South Bulli can also largely increase their outputs without additional expenditure.

By joining Mount Keira and Mount Pleasant lines with Port Kembla along the beach, upwards of 500,000 tons a year could be shipped at once, at an expense practically little in excess of what the collieries paid while the Wollongong Harbour Trust was in existence. This quantity would steadily increase year by year.

We have lost large orders recently on account of our inability to load sailers, and the inability of buyers to pay the extra charge of conveying coal to Sydney. These orders would have kept hundreds of men employed regularly, instead of intermittently, and would have been of equal benefit to the district.

Protection from seas is the one essential necessity to inaugurate a period of prosperity and activity, and to give an impetus to the coal trade in the district of Illawarra.

I would suggest that the land contiguous to the point be resumed for public works and settlement purposes; that the existing jetties be resumed as well as the rail connections with the main line; that a mineral line be constructed along the beach to connect the Wollongong group of collieries with the extensive siding at Port Kembla; and that all collieries within certain zones, or delivering their coal within those zones, pay similar rates. By so doing the resurrections would from the first be revenue-producing, and ensure a large trade at once.

Wollongong would then be the commercial centre of the whole trade, and would at once be benefited by the connection. Port Kembla would be the port of Wollongong.

The advantages of this site are, in my opinion:—

Lower first cost.

Larger deep-water area.

Greater shelter and better anchorage than at any other site on the coast.

Greater capacity of present jetties to load.

It is the most central and convenient, and the only site that at a low cost will suit for all time the exigencies of the district collieries.

It is the only harbour that would serve large ships.

It is the only harbour of refuge.

It is the one harbour that would enable the district to obtain a large annual additional trade, and enable us to compete successfully in foreign markets from which we are debarred because of the expense of conveyance and transhipment.

At present southern collieries require to maintain inclines, long railways, numerous locomotives, and seven large jetties, the expense of which Newcastle is relieved of.

1343. *Mr. Clarke.*] You are pretty well acquainted with Port Kembla and the other harbours on the south coast? I am intimately acquainted with them.

1344. Are you of opinion that it is absolutely necessary, to ensure the future prosperity of the southern coal trade, and in the interests of the general community, to have a harbour at Port Kembla? I consider that

Dr. J. R. M.  
Robertson.  
25 Nov., 1896.

that it is absolutely necessary that there should be a deep-water harbour for Illawarra, and in my opinion Port Kembla is the most convenient spot for such a harbour. The necessity for this harbour has been apparent to me for many years, and is becoming more apparent every day. Five years ago our inter-colonial trade could be measured by about 10,000 tons; but this year it will amount to almost 100,000 tons. A few years ago we had no steamer of more than 700 or 800 tons loading coal there; but now we have vessels taking 7,500 tons, and we hear of inquiries for a larger class of vessels. The shipping trade is not standing still. Every day we are getting surprises in the shape of larger and larger vessels, and I suggest that Port Kembla is the only place, and the most convenient at which these large vessels can be loaded.

1345. *Mr. Black.*] Is this new trade, or is it that coal is now shipped at the jetties at Port Kembla into vessels which were previously loaded in Sydney Harbour by coal brought up there by rail? The increase is all new trade. A few years ago our utmost foreign trade did not exceed 10,000 tons. This year it will run into between 90,000 and 100,000 tons.

1346. *Mr. Clarke.*] Do you think that the proposed eastern breakwater, or the breakwater which you have suggested would be sufficient to make Port Kembla a harbour of refuge? I think that the eastern breakwater will be quite sufficient for our requirements for many years to come. The construction of two breakwaters as proposed, would prevent the place from being used as a harbour of refuge, inasmuch as a vessel would have a difficulty in sailing in and sailing out again without assistance. If only the eastern breakwater were constructed, however, a vessel could do that in almost any wind, and it is a *sine qua non* with any harbour of refuge that vessels should be able to enter it unaided.

1347. An entrance 800 feet wide is allowed? Yes; but that would not be sufficient for a harbour of refuge.

1348. The port could be used at all times by steamers? I do not think that the northern breakwater is required at all.

1349. If the proposed eastern breakwater were constructed, I presume that sailing vessels would be able to load at the port for all parts of the world? Certainly.

1350. Is the greater part of the foreign coal trade carried on by sailing vessels or by steamers? A great proportion of it is still conducted by sailing vessels; but they are continually getting bigger and bigger in order to be able to compete against steamers.

1351. It is absolutely necessary to have a harbour of refuge for the protection of sailing vessels to increase the trade? I think it is almost indispensable that the port should have a holding ground which is beyond doubt. We must anticipate that a large fleet of vessels will lie there while awaiting their turn to load.

1352. The holding-ground at Port Kembla is undeniably good? No better holding ground could be imagined.

1353. It is much better than that at Bellambi? Undoubtedly. Bellambi is full of ridges of rocks, and numbers of vessels have lost their anchors there.

1354. Do you think it would be desirable for the Government to resume the present jetties and railway lines and a certain amount of land, supposing the proposed work is carried out? I would suggest that that course should be adopted. In my opinion it would work much more satisfactorily than any other.

1355. Can you give us any idea of the value of the land in the neighbourhood of Port Kembla? It is comparatively valueless land—very indifferent grazing ground. Its value could be estimated at so many years' purchase as grazing ground together with a fair allowance for the rents and dues which the owners receive for way-leave. It should be resumed on a rental basis.

1356. This way-leave gives it an additional value? Undoubtedly.

1357. What quantity of coal is shipped from Port Kembla by the Mount Kembla Company? Our output this year will approach 200,000 tons. For the last two or three years the average output has rather declined in consequence of an arrangement made with the other southern collieries. Our output has averaged between 150,000 and 180,000, or 190,000 tons. We have an arrangement whereby all the collieries gave percentages. There is a vend scheme in operation.

1358. What quantity of coal is shipped at Port Kembla from Corrimal? This year the amount shipped will probably be 70,000 tons, while the remaining collieries make up the total output—300,000 tons.

1359. Why should there be an extension of the trade because of the construction of a breakwater? An extension of the trade will be almost certain. We are continually refusing orders now to load sailing ships, principally for India, the Straits, Rangoon, and the Eastern markets. These orders we should be able to supply if we had a breakwater.

1360. *Mr. Hoskins.*] Does not the Japanese coal come into competition with the southern coal? To a certain extent, and the construction of the breakwater would enable us to compete more successfully with the Japanese coal. Our coal is of better quality than Japanese coal, and at Singapore we would get 2s. 6d. a ton more for it. If we could save 2s. in transit that would enable us to compete with them. The freight from this Colony to Singapore is greater than the freight from Japan to Singapore.

1361. *Mr. Clarke.*] Can you give us an opinion as to the quantity of coal available for export south of Mount Kembla? No person can give more than an approximate estimate because the various leaseholds have never been proved; but I know sufficient about it to know that I am very much within the mark when I put the amount at 117,000,000 tons.

1362. It has been stated that it is doubtful whether the coal south of Mount Kembla could be profitably worked? The principal seam, which consists of the steam coal at present worked, does not exist in a workable state south of Mount Kembla; but the lower seams rather improve in quality. This coal could not compete with the coal at present being worked; but the day is rapidly approaching when it will be used. That day would be here if we had metallurgical or other industrial works established in the district.

1363. Would that coal be at a greater depth than the present workings? No, it could all be won by means of adits.

1364. Would it be good enough for smelting purposes? It would be good enough for steam raising in the district, but not for export.

1365. *Mr. Wright.*] Would it do for manufacturing purposes? Yes; but a coal which will do for manufacturing purposes on the spot will not necessarily be taken for foreign markets, where there is a great amount of prejudice prevailing, and where double the value of the coal has to be paid in the shape of freight, none but the best is exportable.

1366. *Mr. Clarke.*] I suppose the coal shipped at Port Kembla goes mostly to foreign parts? Up to five or six years ago the Mount Kembla mine did a Sydney trade entirely; but now almost two-thirds of the output go to places outside the Colony. The trade is changing very rapidly.

Dr. J. R. M.  
Robertson.  
25 Nov., 1896.

1367. Where does the coal go to? To New Zealand, Fiji, a large quantity to Victoria, and to South Australia.

1368. And to California? Yes, a few cargoes when favourable freights offer. It also goes to Bombay and Singapore. We can only send our coal away now by steamers, and it is only in the off season, when there is no wool trade, that steamers are available. If we could get sailing ships, they would be available when steamers were not.

1369. And they would carry coal at a cheaper rate? Yes.

1370. Do you think that if the proposed scheme were carried out coal would continue to be shipped from Bellambi, Bulli, and the other jetties along the coast? Yes. I estimate that 25 per cent. of the whole available coal would be sent away from those jetties; but it is very probable that every year more and more trade would find its way down to the deep-water harbour. The difficulty of maintaining the jetties becomes greater and greater every year. If there were two outlets for the coal—one a very great outlet, the tendency of the trade would be towards the great outlet.

1371. I suppose it injures the coal to send it to Sydney for transhipment? Yes, it breaks it up, and causes a lot of loss.

1372. You think that ultimately a great deal of the coal which is now sent to Sydney for transhipment will go to Port Kembla? I am confident that all the export trade will be done at whatever deepwater harbour we have on the south coast. It may be a question with steamers requiring bunker coal whether they will run down the coast to get it or be coaled in Sydney harbour; but I daresay the tendency will be for them to come down the coast for it and so save the cost of freight to Sydney and get the coal in better condition.

1373. Are you of opinion that some of the Mount Keira and Mount Pleasant coal will still be sent from Wollongong? Yes. They would have both outlets. It would be a great advantage to these collieries to have a deepwater harbour. They could use Wollongong for small vessels, and send whatever coal was intended for large vessels to the deepwater harbour.

1374. A railway along the beach from Wollongong would facilitate the trade to Port Kembla from Mount Keira and Mount Pleasant? Yes. Such a railway would take a large amount of coal to Port Kembla. These collieries have a large foreign connection, because they are well and favourably known abroad. I should say that quite half of their coal is shipped or could be shipped to foreign ports.

1375. Do you think it would be advisable to construct a breakwater at Bellambi? I do not think that Bellambi is the place where a breakwater should be made. It is only nominally the centre of the coal-field, because some of the collieries near it are only collieries in name; they are not actually working. North of Bellambi there is very little coal at the present time. Seventy per cent. of the coal is nearer Port Kembla. South Bulli no doubt, is a very fine colliery, and contains a large quantity of coal, but it is practically the only colliery near Bellambi. That coal, too, is not so well suited for export as the coal from some of the collieries further south. It is a very fine coal, but does not bear rough usage as well as the larger coal from Mount Pleasant, Mount Keira, and Mount Kembla.

1376. What about the Metropolitan Mine? That is outside the Illawarra district altogether. I think I am quite safe in saying, however, that one-fifth of that coal will be shipped at some future time from the proposed harbour.

1377. I suppose it would be as cheap to send that coal to Port Kembla as to send it to Sydney? Yes; the mine is nearer to Port Kembla than to Sydney, and the trade to Port Kembla is all in favour of the load, whereas the grade to Sydney is all against it. A railway along the beach from Wollongong would make the distance to Port Kembla still less.

1378. What do you think would be a fair charge for wharfage, &c., independent of any charge for haulage? I think that 3d. or 4d. a ton would be a very fair charge.

1379. One gentleman has said that his company would be prepared to pay 6d. a ton? If his company send their coal exclusively to intercolonial and foreign ports, I daresay they could afford to pay 6d. a ton; but for companies which have to supply the local market that is too high. Besides, small vessels do not do so much damage as large vessels. That should be taken into consideration.

1380. Jervis Bay is a good harbour? Yes, and so are Nagasaki and Christiana Fiords good harbours. Even though Jervis Bay be a good natural harbour, I doubt very much if you could make it suitable for the shipment of coal for less money than you propose to expend at Port Kembla.

1381. Has coal been found in the neighbourhood of Jervis Bay? Coal is said to have been found near there, but there is some slight mystery about it. A little further away there is coal; but I question whether it is suitable for shipping. It would be quite suitable for manufacturing and industrial purposes, but I think there would be great difficulty in finding a market for it in foreign parts.

1382. You seem to be of opinion that Port Kembla is the most suitable place for a coal harbour? I am certainly of that opinion.

1383. *Mr. Lee.*] Wollongong is midway between Sydney and Jervis Bay? Yes; about midway.

1384. Therefore, it would be as cheap to send coal from this district to Sydney as to send it to Jervis Bay? Yes.

1385. For that reason we must put Jervis Bay out of the question? I think so.

1386. I understand that coal has been found in the neighbourhood of Jervis Bay; but that it is of an inferior quality? I cannot speak of it from personal experience.

1387. I presume that in dealing with this question we are confined to Bellambi and Port Kembla? Yes.

1388. You are not aware of any more suitable place? No.

1389. Do you know Bellambi personally? Yes, I am engineer for the South Bulli Colliery.

1390. It has been suggested that two breakwaters should be constructed at Bellambi, both of them to the south of the proposed Government breakwater? I think the Government scheme is the correct one. I question if you could construct the other breakwaters. I think they would disappear as fast as they were made.

1391. It has been said that by taking the breakwater further south the stone could be dumped upon a reef which goes out a long way? Yes; but there is a frightful surf upon that reef. I am quite sure that the Government officers had all the facts before them. They made a most careful survey of all these ports, and I am sure that they would have been put in possession of all the information. The proposed substitutes leave the shipping place perfectly open to the east, north, and north-east. 1392.

- Dr. J. R. M. Robertson,  
25 Nov., 1896.
1392. You suggest that the Government proposal should be departed from at Port Kembla? My proposal was one which was made privately to the Mount Kembla Company.
1393. The sketch of a breakwater which you have drawn upon the map, was one which you submitted for the approval of the Mount Kembla Company? Yes; to enable them to take advantage of the foreign trade.
1394. But you are not prepared to say that the Government proposal is not better? I have no fault to find with the Government proposal; but, if I may be allowed to make a suggestion, without wishing to criticise it unfairly, I would say that it might be improved if the breakwater were swerved a little to the north-west, in order to take it into the shallow water upon the patch of reef to which I have referred. It would then be more in the run of the sea. In all other respects I would leave it as it is.
1395. Would that alteration increase the length of the breakwater? No; it would decrease it a little. The same protection would be given, with a lesser length of breakwater. No doubt Mr. Darley has put out the breakwater to protect the place from the north-east; but if the breakwater swerved to the north-west a little the same protection would be afforded, with a lesser length of breakwater, and all the area included would be deep water. In making the breakwater they could adapt it for the discharge of ore, and for loading sailing vessels; and therefore it is most essential that all shallow spots inside it should be removed. This I consider indispensable.
1396. Could the breakwater be used with safety as a place for discharging cargo? I would not think of making a breakwater that could not be used from the first day in this way.
1397. Would not the seas break over this breakwater? Not at all. There are no seas at Port Kembla. The islands to the south-east break up the seas; but they get entangled now at the shore-end, and that causes them to swerve round on the jetties. We have loaded at Port Kembla during the strongest south-east gales.
1398. How would you propose to unload at the breakwater;—would you erect wharfs alongside it? I would erect short jetties.
1399. In that way you would get deep water? Yes; you would have 40 feet of water. It has been stated, I think, that the existing jetties could be used for the discharging of vessels; but in my opinion they are not suitable for that purpose. They were made to load coal, and coal can be loaded from them with a rapidity with which it can be loaded from no other jetties; but they are not suitable for discharging cargo. I would bring incoming vessels alongside the breakwater to discharge, and then haul them over to one of the jetties to load. At the jetties we can load five tons to every ton loaded by any crane that was ever made.
1400. Therefore the erection of hydraulic cranes at Port Kembla will not be necessary? No; except for unloading. You cannot improve upon the high-level jetties for loading. Three men and a boy can easily unload sixty-six waggons in an hour.
1401. *Mr. Wright.*] Do you use side-door waggons? No; waggons with butterfly doors in the bottom.
1402. *Mr. Lee.*] If you ran out short jetties from the breakwater you would not want the proposed wharf shown on the plan? No; it would not be necessary. In my opinion you will have stiller water close to the breakwater, especially if the breakwater is swerved a little to the north-west. You could load any sized vessels alongside the breakwater.
1403. If it were possible to do away with the proposed wharf, between the existing jetties, it would very considerably diminish the cost of the proposal? I do not think you would have enough still water at the proposed wharf. It would, in my opinion, injure the wharf.
1404. And the harbour would have to be dredged in order to make the water deep enough? You do not want to do any dredging in a harbour of 200 acres. The trade of the Southern Hemisphere could be done in that harbour.
1405. How would you construct your roads to these short jetties, and how would you work them? In the same way as we do now—with a high and a low level. The Southern Company have a different way of doing things from Mount Kembla, possibly because of the physical features of their ground. We had to build a new jetty on top of the old one, and we had a great many difficulties to overcome, so that we adopted a plan for running out the full waggons and running back the empty waggons without the aid of locomotives. All that we require is a sufficient number of men to lift up the doors. We can load 500 tons in an hour from our jetty.
1406. If the port were improved and the trade increased, could all the coal still be shipped from those jetties? A few alterations might be required by-and-by, but we could ship 1,000,000 tons a year from those jetties with the greatest ease.
1407. It would not be necessary to construct a new jetty? No; except to load sailing ships. Any new jetty I would construct on the same principle as our present jetty. In that way you save both cranes and locomotives.
1408. You think that when the trade develops to sufficiently large proportions it will be time enough to consider the expediency of constructing other jetties? Yes. We are travelling at such a pace just now that we do not know what class of vessels will come to our shores in three or four years' time. Who would ever have supposed three years ago that we should have a 13,000-ton vessel coming to Sydney in 1896.
1409. If the direction of the breakwater were altered as you propose, would not that considerably diminish the area of protected water? Not considerably, for this reason: the whole of the western side of the breakwater would be available for discharging and loading berths.
1410. Do you think there will be any danger of the place silting up if the southern breakwater is constructed? No.
1411. It might appear at the first blush that with the constant roll of a north-easterly sea into the basin there must be an accumulation of sand? There is no north-easterly roll into Port Kembla? It requires a north-east wind to blow for two or three days at a time to stop us from loading, and it never blows for more than three days. There is practically no sea coming in there at all. It is the ground swell that prevents us from loading.
1412. From what part of the beach does the sand pile? It does not pile with us at all. Seven or eight years ago, after a very unusual storm, we found about a foot of sand under the piles at our loading stage; but it all disappeared in a week.
1413. It often happens that when you interfere with natural currents you bring about something which you never contemplated? Yes; but Port Kembla is out of the run of the current. The current goes to the east of the island, and is miles outside of Port Kembla.
- 1414.

Dr. J. R. M.  
Robertson.  
25 Nov., 1896.

1414. It would not be necessary to leave openings in the breakwater to create a scour? No; that would spoil it. There will be no seas actually striking the breakwater. They will run along it. Wollongong, 3 miles to the north, is fairly exposed to the south-east, but we are miles within the direction of such a gale. We load at Port Kembla when the danger signals are flying at Wollongong.

1415. Do you know whether coal is ever sent to Sydney to be loaded into sailing vessels there? Yes; we loaded a sailing vessel in that way last week, and I am not sure that we are not loading another at present.

1416. But that breaks up the coal a good deal? Yes; it destroys the quality of the coal, increases the risk, and lowers the price. It is a brutal way of treating coal.

1417. I suppose very little coal is transhipped in sailing vessels? Yes.

1418. Are you of opinion that if the proposed works are carried out the Government should assume absolute control of the railways and jetties? I think so; but unless they treat us differently in the future from the way in which they have treated us in the past they will destroy the coal trade.

1419. Would you be satisfied if you were treated in the same way as the Newcastle coalowners are treated? That is better. They charge much higher rates in the south than they do in the Newcastle district. They charge the Mount Pleasant Company or Mount Keira for coal shipped at Port Kembla 1s. 3d. a ton. The haulage is only about  $3\frac{1}{2}$  miles, and that of course did not include shipping. That is no encouragement to us. We can haul coal  $7\frac{1}{2}$  miles for 1d. a ton, including shunting, marshalling, and weighing, though no calculation is made as to interest on the money expended.

1420. You admit the equity of making some charge? Certainly. A charge should be made which would give an ample return for the capital invested and the work done; but the rate should not be excessive.

1421. If the Government do not exercise complete control, do you not think that private interests might sometimes clash? I do not think so. If the Government cannot do the work on pretty much the same terms as private individuals, why not let private individuals do it and thus stimulate trade.

1422. If the Government did not resume the jetties the owners of the jetties could make their own terms? Well, I think they would be most liberal with the shippers, but I do not propose that they should keep the jetties. They might be required to give guarantees.

1423. Do you think it would be advisable for the Government to assume complete control? I think that the Government must assume control, though they should be amenable to reason if we think that we are being charged too much, and can point out where economies could be effected. Possibly it might be advisable to adopt the plan which has been adopted at Home. There, before any scheme is adopted by Parliament, they publish the schedule of dues and rates. I believe, too, that they have a permanent Railway Commission, something like this Committee, to whom any aggrieved trader may submit his grievance, and whose decision is binding upon the railway concerned.

1424. Remembering how finely the coal trade is at present worked, anything in the shape of an excessive rate would be prohibitive, and would be contrary to the object aimed at in constructing the harbour? Certainly, and the present traction rates charged are prohibitive.

1425. Therefore, if the whole of the jetties and railways were in the hands of the Government, such rates should be struck as would enable colliery proprietors to use the port? Yes. I have not given the matter any previous consideration; but it occurs to me that if the owners of private lines were allowed to retain their lines Parliament might impose a maximum rate beyond which they could not go. Probably they could deliver the coal at the harbour for much less than the Railway Commissioners would charge.

1426. At any rate you do not apprehend any difficulty from that source? None whatever. We are only too anxious to get an outlet for our Illawarra coal.

1427. It would make very little difference whether the railways belonged to the Government or to private individuals so long as there was a fixed and a general rate? Yes; that is the principal thing in the coal trade. There must be no favouritism.

1428. *Mr. Wright.*] Is the southern coal trade likely to expand largely? Undoubtedly.

1429. It has been stated that that trade at present amounts to about 900,000 tons, and that the construction of the proposed harbour would possibly double it? I think that before the harbour is finished the trade would have very largely increased; but whether it would have doubled I can hardly say.

1430. Do you think the construction of the proposed harbour would increase it by 500,000 tons per annum? I am clearly of that opinion. While the present export trade would be practically doubled, the whole trade of the district would be increased to quite the extent you mention, because I am certain that industrial concerns would be established in the district which would consume a quality of coal for which there is no foreign demand.

1431. You consider that for all purposes Kembla is a better port than Bellambi? Yes, and it is the place to select for a national work of this kind.

1432. I understand you to be in favour of a scheme which will not only give a shipping port but a harbour of refuge? Yes.

1433. If what is required is a harbour of refuge, would it be wise to diminish the area of the harbour as you propose? The breakwater which I have pencilled on the map is one which I suggested to the Mount Kembla directors. I think that Mr. Darley is quite right to take his breakwater out further than I then proposed.

1434. A closed harbour, such as shown on the map, would not do for a harbour of refuge? No, I do not think so. We do not require two breakwaters.

1435. Are you of opinion that the eastern breakwater could be constructed for less than £158,000? I have not gone into the question of expense further than I see that, in the amended scheme, for 1,600 feet Mr. Darley's estimate practically agrees with the estimate which I made to my directors five or six years ago, though, probably, I based my calculations upon higher prices. From the ease with which stone can be obtained there, I am sure that the work could be carried out for the sum estimated by Mr. Darley.

1436. As an engineer, you have some knowledge of these matters? Yes, a considerable knowledge.

1437. Are you familiar with any big breakwaters facing the open sea? Yes, I know a number of such breakwaters.

1438. Do you know any places where there are wharfs alongside the breakwaters? Nearly all the fishing harbours on the east and west coast of Scotland use their sea-walls for wharfage.

1439. But Mr. Darley proposes to construct a rubble breakwater? Yes. You would have to run out small jetties from the breakwater. A straight wall of concrete or faced stone could be brought up from below high-water mark, and from that I would run out short strong jetties, at which heavy vessels could lie safely and discharge. The drag of a big vessel upon an exposed wharf is enormous.

- Dr. J. R. M. Robertson.  
25 Nov., 1896.
1440. What height should the breakwater be above sea-level? I understand that it is to be 20 feet above sea-level, probably more.
1441. Is not that an unusual height for a breakwater? I do not think so. It would have to be quite 20 feet high to make it suitable for loading purposes.
1442. Do you know the Plymouth breakwater? Yes.
1443. It is about 4 feet high? Yes; but it is used only as a breakwater. Madras breakwater is about the same height, but I have seen a vessel washed bodily over that breakwater. The Colombo breakwater is higher; I should say that it was fully 20 feet high. It is exposed to the full force of the monsoon. The breakwater at Port Kembla would get no sea at all.
1444. Is not there a very heavy ground swell there? There is a heavier ground swell after an easterly gale than after a south-easterly gale.
1445. With a heavy ground swell, would not the sea break over the breakwater? No. It only rises 7 or 8 feet upon our jetty.
1446. But your jetty is protected by the point? Well, in many ways we could load better if it were not, because the sea, running around there, gets entangled and swerves on to the jetty. I believe that two or three hulks filled with stone and sunk would enable us to load nearly the whole year round.
1447. It is only rarely that you have to stop loading? Only at very rare intervals.
1448. During southerly and south-easterly gales? It is after the gales that we stop loading, when the swell comes in. Of course we cannot load sailing vessels at any time. They are helpless craft in a harbour; but steamers always keep steam up and can get away.
1449. Is there not a current with a northerly set on the coast? There is no current at all at Port Kembla.
1450. Therefore, there is no danger of silting up? No. Our jetty has been erected for sixteen or seventeen years; but there is the same depth of water now to an inch that there was when it was first built.
1451. You say that coal-owners would be willing to pay 3d. a ton as a shipping charge? Threepence or 4d. Possibly it would be better to charge so much for small vessels and so much for large foreign-going vessels.
1452. Would you be prepared to pay 3d. a ton for every ton of coal shipped? Yes.
1453. If you shipped 500,000 tons, that would mean about £6,000 a year? Yes.
1454. That would give practically 4 per cent. upon the cost of the breakwater;—whatever money we could make beyond that would go towards paying for maintenance and labour? Yes, and for the repayment of capital.
1455. Do you anticipate any large import trade? I think there will be a large import trade. I think that different industrial concerns will be established in the district.
1456. Would the smelting works use this port? Yes; and I think that other smelting works will be established.
1457. I understand that you are of opinion that the attempt to make Lake Illawarra a harbour for large vessels will not be successful? I think so. The scheme will never benefit the coal trade, and I said so when the Lake Illawarra people approached me first some years ago.
1458. If they fail to make a good port for the shipment of coal, they cannot make a good port for the unloading of ore? That is so. Vessels bringing ore would draw 20 or 23 feet of water. What is the use of talking about 15 feet.
1459. Then the smelting works are bound to use Port Kembla? Undoubtedly. It will not pay them to expend an enormous sum of money in improving Lake Illawarra.
1460. In what part of Illawarra do the large iron deposits exist? In Mr. Mitchell's brain, I think.
1461. You think there is no possibility of the iron industry springing up in Illawarra? I have not seen any iron deposits of moment or any limestone in the district. Besides, I do not think you could make the industry pay without a protective duty. I do not anticipate anything from the iron industry there; but I anticipate trade from other industrial concerns. Our industries have all to be founded yet.
1462. Do you think that the establishment of smelting works at Lake Illawarra will lead to the establishment of other similar works there. Yes; I think that they will act as the focus of attraction.
1463. Therefore, the Committee are justified in believing that the carrying out of the proposed scheme will attract a large trade to the place besides the coal trade? Yes. Undoubtedly.

THURSDAY, 26 NOVEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHRY.	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Dr. James Robert Millar Robertson, Engineer to the Bellambi, South Bulli, Coalcliff, and Mount Kembla Collieries, sworn, and further examined:—

- Dr. J. R. M. Robertson.  
26 Nov., 1896.
1464. *Mr. Fegan.*] I understand that you consider the northern breakwater unnecessary, and that you think that without it the harbour would be much safer, and much easier to enter and to leave? Yes. From the first time that I directed my attention to Port Kembla as a possible deep-water harbour for the south coast, I have had always in mind the total absence of a port of refuge upon that part of the coast, and, in fact, on the whole coast of New South Wales. I could see that by a small expenditure in the construction of an eastern breakwater, not only would a port of shipment be obtained, but you would also get a port of refuge. In my opinion, the construction of the northern breakwater would destroy the place as a harbour of refuge, for several reasons. A vessel ought to be able to enter a harbour of refuge under

under any conceivable circumstances, and to make safe anchorage within it. I can scarcely conceive it possible, however, that a disabled vessel could make a safe entrance into Port Kembla if there were two breakwaters. Her condition would probably not allow her to steer such a fine course as would be necessary in order to get through the opening. Then, too, the two islands lying to the east would increase the difficulty of entering. Again, supposing a vessel did get in there—that is, a sailing ship—she would not be able to leave without assistance, supposing the northern breakwater were constructed. With only one breakwater the place would be an ideal harbour of refuge. Personally, and I daresay I speak for others connected with the coal trade of Illawarra, I think that all the advantages required would be obtained by the construction of the proposed eastern breakwater. We would not like to call upon the Government to expend money upon the construction of a northern breakwater until the necessity for that work actually arises.

1465. But you think that the proposed eastern breakwater should be turned a little to the north-west? Yes; I think that that would be an advantage, though I do not for a moment presume to put my opinion in opposition to that of Mr. Darley. I should, however, like his attention to be directed to the circumstance that if the breakwater were swerved a little to the north-west, it would take in a shallow patch of rock that might otherwise be a menace to the large vessels coming to the port, and would give stiller water alongside the breakwater.

1466. And the only wharfs required should be made along the breakwater? Yes. The present jetties could easily ship 1,500,000 tons of coal a year; and by utilising the breakwater to provide wharfage, we could deal with several million tons at the place annually.

1467. Mr. Byrnes yesterday spoke about the people in the Illawarra district having agreed to leave the decision of this matter to the Government? Those interested in the formation of a deep-water harbour in Illawarra met once at Bellambi, once at Port Kembla, and a third time, at the invitation of the chairman and members of the Wollongong Harbour Trust, at Wollongong. At the Wollongong meeting, after an opportunity had been given for hearing the views for and against the different proposals, it was mutually and satisfactorily arranged that we should advance none of our own views, but join in a deputation to the Minister in Sydney to ask him to undertake the necessary surveys, we agreeing to abide by the result of the surveys. I am very sorry that some of the parties to that agreement are not honorably carrying it out.

1468. Yesterday you said that no vessel lost their anchors at Port Kembla;—have any lost their anchors at Bellambi? Certainly. They cannot avoid doing so. The bottom there is very irregular and rocky, and many anchors have been lost.

1469. There may be only a cover of rock? No, it is solid sandstone.

1470. Mr. Darley referred to the bottom at Bellambi as sandy? Well, our divers report that they have great difficulty in travelling over the bottom there, because of the large ridges of rock. Sometimes they drop suddenly down into holes 6 or 7 feet deep.

1471. Why do you employ divers there? To look after the piles of the jetties, and to see to the moorings.

1472. How deep is the clay at Port Kembla? I have no idea of the depth of the clay further than this: that the Southern Coal Company drove the piles of their jetty from 15 to 18 feet into sand and clay without touching bottom. There is no foul ground there at all. The bottom is perfectly smooth without any rock.

1473. You chiefly represent the Mount Kembla Company? No, I am equally a representative of the South Bulli, Bellambi, and Coalcliff collieries.

1474. I notice that the output of Mount Kembla has been gradually decreasing;—in 1892, it was 177,269 tons; in 1893, 156,992 tons; and in 1894, 127,155 tons? The reason of that is that, early in 1893, an association of the southern coal-owners was formed, and an arrangement came to whereby each colliery got a certain percentage. Of course, in arranging a vend someone must give way, and it so happened that for the first two or three years the Mount Kembla colliery suffered more than some of the rest. Then, too, the severe depression of 1893 affected Mount Kembla more than some of the other collieries. Mount Kembla, however, is putting out more to-day, by a great deal, than it ever did before.

1475. That is for the working days of the colliery? Yes;—we work fewer days now than we did in 1892.

1476. Have you anything to fear from the Japanese coal trade? We suffer from that competition.

1477. Is it because of the cheapness of that coal? Yes; simply because of its cheapness. The Japanese coal is a very free burning coal; but it has not the calorific power of the Illawarra coal, and so to some extent the Illawarra coal is preferred, notwithstanding the higher price. On the other hand, the Japanese are able to send their coal away at simply nominal rates compared with the low rates that we have to pay. It is further from the Japanese collieries to Singapore than from Australia to Singapore; but their freight is less than 4s. a ton, while ours is as much as 9s. and 9s. 6d. a ton. The reason for this is that very large steamers go out to China and Japan, and they take coal as a return cargo at nominal freights.

1478. Then, too, you cannot send your coal away in sailing ships? No. For that reason we are practically precluded from troubling about the trade. In the old times, before the Japanese coal came into the market, we very often got sailing vessels at practically nominal rates.

1479. What is the difference between the price of your coal per ton and the price of the Japanese coal? According to the latest advices, the price of the Japanese coal at Singapore was about 12s. or 12s. 3d., and of Australian coal, 14s. and 14s. 6d. a ton.

1480. It is not the cost of getting the coal to the pit's mouth that makes your coal dearer, but the freight? Yes. If by any means we could reduce the price of our coal at Singapore, we would capture the trade. According to the best information we get, the Japanese are unlikely to sell their product for less money than they sell it for at present.

1481. *Mr. Hoskins.*] Their coal is inferior to the Illawarra coal? Rather inferior, and to that extent we get the preference. Of course, for some purposes consumers in Singapore would give as much for Japanese coal as for our coal; but for steaming purposes, the Japanese coal is distinctly inferior to our coal. For smelting purposes, they would give as much for Japanese coal as for our coal.

1482. *Mr. Fegan.*] If you could load large sailing vessels, you would, in all probability, be able to capture that trade? I think so, considering that the Japanese coal is unlikely to be sold more cheaply than it is sold at the present time. Any alteration in the value of the dollar would be in our favour. In my time, in the east the dollar was worth 4s. 2d.; now it is worth only 2s. 2d. or 2s. 3d.

Dr. J. R. M.  
Robertson.  
26 Nov., 1896.

Dr. J. E. M.  
Robertson.  
26 Nov., 1896.

1483. It is only the freight that keeps you from competing with the Japanese coal? Yes. We have two freights at the present time. We have the freight up to Sydney, which we want to avoid, and the freight from Sydney to the port of destination, which, of course, we shall still have to pay. Probably, at the same price our coal would command the market.

1484. How long do you think your best seam will last, supposing the present yearly output is trebled? Sixty or seventy years.

1485. And then you will have to face Japan? I know sufficient of Japan to know that our difficulties will be theirs long before that. They will very soon find that they cannot keep up their present high pressure; in fact, I have seen some reports to the effect that the Japanese Government are very much alarmed at the present moment because they cannot get a decided and decisive opinion as to the amount of available coal. If we had one-third of their difficulties we could not work our coal.

1486. What are those difficulties? Their coal is steep, there is an enormous quantity of water in the mines, and the seams are very faulty. Of course they surmount these difficulties, because the wages they pay are practically nominal; but when they have to cut through these faults, and go in a long way from the pit's mouth, they will find it necessary to raise the price of their coal.

1487. They have an immense extent of coal land? Yes; but it is very much broken up. A coal field is of value, not so much by reason of its extent, as by reason of the accessibility of the coal. In Japan, they are developing their industries at such a prodigious pace that a great part of their output is consumed locally.

1488. You do not know what their yearly consumption is? No; but it is increasing month by month.

1489. Do not geologists suppose that there are several seams below the two seams which they are at present working in Japan? There is a large number of seams there, and I do not know that there are more than two collieries working the same seam. Some of the principal collieries are practically done, so far as an export trade is concerned. Takashima, the largest coal mine in Japan, has virtually been stopped from exporting, because the Government have ordained that the whole of the coal shall be kept for public purposes, and I believe the same edict affects two other of their collieries.

1490. That being so, this Colony has nothing to fear from the Japanese coal trade? I do not know that. I think that in the long run we shall come out on top; but when a man is hanging by the neck, two or three years is a long time to hang. Besides, I am not oblivious to the fact that there are very large coal-fields in some of the East India islands. I had the duty of investigating them at one time. In Tonquin there are large collieries, the coal from which competes with ours at Singapore; but the conditions of the French settlement are such that we are able to compete successfully.

1491. Is it not a fact that the miners of this country hew more coal per man than any other miners in the world? Yes, and there is a reason for that. Probably the collieries here are better equipped than those in any other part of the world, and the conditions under which the coal is found are better. We have beautiful roofs, very little water, very few faults, and very few difficulties to contend with. Besides that we have excellent miners. I should be very sorry indeed to hear the miners of Australia compared with those of Japan.

1492. There is less expense incurred in the production of coal here than in any other country? I do not know that I should quite say that. There ought to be less expense, if we were put under exactly the same conditions as the people of other countries. We pay much more for labour than is paid elsewhere; but if we were put under exactly the same conditions as, say, Germany, France, or Great Britain, we could produce coal at less cost than any other country in the world. Some of our operations are done at less cost than similar operations in other parts of the world, simply because of our favourable surroundings. I think that we require a little encouragement. We have just arrived at a point when every one's hand is against us, and unless we get some encouragement, I do not see how we can hold up our heads against collieries in other parts of the world, which are given great encouragement.

1493. You have been in the coal trade for some years? All my life, and my forefathers before me.

1494. You are manager and owner of some mines? No.

1495. A part owner? No; I do not hold a share in any mine.

1496. You advise people to buy or to sell mining properties? I have advised people to buy, and I have advised a large number of people to sell such properties.

1497. You say that we are not on equal terms with collieries in other parts of the world, and yet in face of that you advise people to buy large coal estates? I said that I had advised people to buy; I did not say that I was advising people to buy now, although if I were asked I might say that under certain conditions this would probably be a favourable time to buy.

1498. Large coal properties have been bought because you see a great future in store for us? Well, we are not going to be wiped off the roll of nations just yet.

1499. You say that there are six seams beneath the seam which you are at present working in Illawarra? Yes.

1500. What is the thickness of those seams? They are of various thicknesses. The lower seams in Illawarra will come in to fill the blanks when the top seam becomes scarcer and more difficult to work. I hope that long before there is any scarcity of top seam coal, industrial works will be established here, which will take a large surplus from the lower seams. The lower coal is very well adapted for manufacturing purposes; but for export it cannot compete against the upper coal. The thickness of the lower seams varies in every colliery; but over the whole district it varies from about 4 feet to 6 feet 7 inches. I discard altogether the seam which is spoken of as being 30 feet thick, because there is only from 4 feet 9 inches to 5 feet 6 inches of coal that could be worked, and there is no use in deluding the public into the supposition that the seam is 30 feet thick. It is a soft friable bituminous coal—not a steam coal, and it would be admirably adapted for manufacturing purposes.

1501. It is much inferior to the coal that is now being worked? Yes; for steam purposes. The first seam is called the 4-foot seam, and lies from 30 to 50 feet below the upper seam, varying in thickness from 2 feet 9 inches to 4 feet 3 inches. It is a very fair manufacturing coal; but it is not suitable for export, because it would not stand the rolling of a vessel and the severe handling it would get in trimming and transhipment. The next seam is what is known as the 30-foot seam. In that seam there are about 5 feet which could be worked. The rest of the seam is composed of alternate bands of stone and clay. Below that there are various other seams, and amongst them occurs the Hartley shale. With regard to the lower seams I can give very little definite information. They have been opened up at Mount Kembla,

but

but beyond saying that they contain fair second rate manufacturing coal, I can give no information regarding them.

Dr. J. R. M.  
Robertson.  
26 Nov., 1896.

1502. Do you know anything about the Greta series? The position of the Greta series has never been correlated to a given horizon. I could not go into the witness box and say that that coal was 2,000 feet or 3,000 feet below the Newcastle series, because there has never been a bore put down intercepting the Greta series at any certain point. That coal lies a long way below the Newcastle coal, but how far, no man can tell.

1503. Do you not think that it would be wise to test it? I think it would be very wise to test it. The only bore that may have intercepted that seam is the bore put down at Dempsey Island; but no man could really identify the Greta coal there. They may have been rather perfunctory in their manner of boring. They did not know what they were looking for, and possibly they may have passed through it.

1504. How many sailing vessels were loaded at Port Kembla and at Bellambi last year? No ocean-going sailing vessels have ever been loaded at either place; but we load small schooners sometimes, especially when we have had a steamer at hand ready to tow them out.

1505. You said yesterday that steamers could go into Port Kembla in all kinds of weathers? That being so, why do you want a breakwater? Because we want to be protected from the ground swell. Vessels cannot load when there is a heavy swell. The large vessels lying alongside the jetties probably range backwards and forwards 10 or 15 feet, when to an ordinary observer the sea is absolutely calm. In heavy weather we cannot attempt to load a large steamer, because the direct impact of the wind and the waves might cause her to destroy our jetties.

1506. Is it not a fact that during the last coal strike at Newcastle several vessels went to Port Kembla and had to leave there before they could load? That continually happens. I do not know that any vessel left Port Kembla; but vessels have to lie off for a day or two until the weather moderates. A few weeks ago a very large steamer had to lie off for two or three days until the range moderated, so that we could safely take her alongside the jetty.

1507. You lose a considerable amount of trade in not being able to load regularly? Not only that, but we lose a great deal of time at the mine. There is plenty of work for the men to do; but they cannot do it, because the waggons are all full, and waiting to be unloaded.

1508. There is a loss to the owner of the vessel: to the owner of the coal-mine; to the wage-earners connected with the mine; and to everybody concerned? Yes. Of course when a vessel is kept waiting for three or four days she tries to avoid the place in future.

1509. Do you think the Government should resume the private railways and jetties at Port Kembla, or would you leave the jetties in the hands of private companies? Personally, unless I had an assurance that the maximum rate would be only so much, I should be disposed to allow the private owners to provide traction, binding those owners to very moderate charges. To charge the present Government rates of haulage would destroy the trade. The whole object of the Commissioners seems to be to take the coal away from its natural output to bring it to Sydney.

1510. What about the control of the jetties? That is a different matter. I think the Government should resume the jetties, and charge rates according to the accommodation given. A little more might be charged for foreign-going vessels than for small and insignificant coasters, because small vessels do not cost anything like so much for moorings, or do so much damage as large vessels. They lie 10 or 12 feet off the jetties: but big foreign-going vessels, in order to get the ends of the shoots over their hatchways, have to go in close against the piles, and with any movement of the sea would draw down the jetties.

1511. If the Government resumed the jetties at Port Kembla, should not they also resume the jetties at Bellambi, so that all the coal would have to come to Port Kembla? I do not know that there would be any objection to that, provided that we had proper assurances that reasonable rates would be charged. The collieries within a certain radius should be charged the same rates, as is done at Newcastle. I know that private owners would draw the coal to the port of shipment for much less than the Government at present charge.

1512. I understand that the Government charge only  $\frac{1}{4}$ d. a ton for the coal going over the Mount Keira line? Yes; but the Mount Keira Company supplies the haulage. I think that is quite enough when the Government only provide the roadway and keep it in excessively bad repair.

1513. Are you surprised to hear that that rate does not pay the Government? I have heard the Commissioners say that the Newcastle trade does not pay them; but I would be only too happy to organise a syndicate to work that trade at the present rate. If the Newcastle coal trade does not pay the Commissioners, there is something very much out of joint. I simply do not believe the statement.

1514. Do you not think that the area of Bellambi Bay is sufficient for the trade of the next fifty or 100 years? I do not think that Bellambi is the right place for a coal port. It is not in the right position. I hope that there will be no second attempt to spend money uselessly in Illawarra in trying to make a harbour at the wrong place. We have had quite enough of that.

1515. Is the land surrounding Bellambi Government or private property? It is private property.

1516. I understand that there is a 100 feet reservation? I do not know anything about that.

1517. There is no reservation at Port Kembla;—must we not take into consideration the probable cost of land resumption? I do not think that should weigh at all. It would be no burden to the country if resumed on a rental basis.

1518. What do you think is the value of the land at Port Kembla? I should think that the land at both places was about the same value. I do not think that any of the land at Port Kembla is worth more than £7 or £8 an acre at present prices. I would not give more for it. It is poor land.

1519. Were your views ever taken in regard to the Lake Illawarra scheme by the Select Committee which investigated it? No. Some one representing the promoters—I think the engineer and the Melbourne syndicate were very anxious that I should inform them as to what quantity of trade we would give them, and my answer was that I could not see any possibility of our giving them any trade; that we had a very much superior port of our own; and that under no combination of circumstances would we ever send a ton of coal to Lake Illawarra. The opinion that I then expressed is my opinion now. Lake Illawarra as a harbour would be of no use to our coal trade.

1520. Do you think that the Government scheme should remain in abeyance until the time within which the Lake Illawarra Company have to carry out their works expires? No. I think that it is simply trifling with a great industry to think of Lake Illawarra. The whole history of the Lake Illawarra scheme is sufficient to justify me in saying that. They cannot do anything for want of money. They have raised

Dr. J. R. M.  
Robertson.  
26 Nov., 1896.

no money, except to pay for a railway, on debentures secured over the land, and, according to the latest advices that I have received from London, they are very unlikely to raise any.

1521. *Mr. Hassall.*] What do you think would be the probable increased output of Port Kembla if the proposed breakwater were made? The output would increase to the extent of upwards of 200,000 tons a year at least in addition to what it is at present.

1522. For how many years will the coal supply of the district last? Practically 200 or 300 years, because as one seam is exhausted another will take its place. The upper seam will probably last from eighty to 100 years, with an output of 1,500,000 tons a year. Of course it may last very much longer if a large part of the National Park district is worked.

1523. The Corrimal, Mount Pleasant, Osborne-Wallsend, and Mount Kembla Collieries all ship at Port Kembla? Yes.

1524. Does South Clifton? Occasionally. It belongs to a group of collieries which will always send a large part of their coal to Sydney to supply the railways and the inland demand. Besides South Clifton is a small holding, a small freehold.

1525. What is the output of the various collieries I have named? Corrimal about 120,000 tons, Mount Pleasant about 90,000 tons, Osborne-Wallsend about the same, and Mount Kembla, nearly 200,000 tons. About 300,000 tons of coal will be shipped at Port Kembla this year.

1526. In the event of the Government spending money in the construction of the proposed breakwater, would the coal companies be willing to pay the same charges as are paid at Newcastle? Most assuredly.

1527. Irrespective of the resumption of the jetties? No; the Newcastle people do not provide their own jetties.

1528. Would it be absolutely necessary for the Government to go to the expense of resuming the existing jetties? I think the Government will be obliged to resume the existing jetties. They will have to provide accommodation for sailing ships.

1529. What is there to prevent them from having a jetty of their own, besides the private jetties? Nothing at all; but there would then be competition between the private jetties and the Government jetties, and the Government would lose, because private people can conduct their operations with less expense than the Government can. The resumption of the jetties would give a good return from the start, because we are doing an absolute and certain trade, and they would be resumed on a revenue basis.

1530. You think that as a speculation it would be to the advantage of the Government to resume the jetties? Yes; if we have an assurance that fair traction rates will be charged, I say by all means put these works into the hands of the Government.

1531. You think the Government should resume the railways, jetties, and everything? I think myself that the resumption of the railways might be allowed to remain in abeyance, it being provided that the owners of the railways should arrange for the haulage of all coal at a very small charge per ton. I think that that would save the shippers considerably and enable coal to be shipped at lower rates.

1532. The less the expense of this harbour the lower will be the necessary charges? Certainly. I think it is not necessary to resume the railways; but, in any case, there should be a beach railway to connect Port Kembla with Wollongong. I am very doubtful whether the Commissioners would give us a rate anything like as low as the present cost of our haulage. I am sure that if the Government allowed the colliery proprietors to make a railway from Port Kembla to Wollongong, they could run down the coal for one-fifth of what the Commissioners would charge.

1533. Would it not then be well to leave the jetties in private hands? That would be quite feasible; but I think that Parliament would be inclined to resume the jetties. These jetties belong to particular collieries, but I presume that if the breakwater were made other colliery proprietors should have an equal right to use them on payment of certain charges.

1534. You think that otherwise the present owners of the jetties would place restrictions in the way of other collieries using them? You would have to make some provision allowing other collieries to use the jetties upon payment of fixed and moderate charges.

1535. If you have a breakwater, I suppose a good holding ground is not absolutely necessary for a port? Yes; it is very necessary. If vessels knew that they were liable to lose their anchors they would not care to use the port, and it would be no harbour of refuge.

1536. How far are you from Jervis Bay? Well, Jervis Bay cannot be considered a harbour of refuge any more than Sydney harbour is. Vessels cannot sail out of the bay without assistance, and on several occasions we have been obliged to send down steam colliers to tow out vessels which have taken refuge there. With an ideal harbour of refuge, you must be able to go in and come out unaided.

1537. Could vessels do that at Port Kembla? Yes, with almost any wind, because there is so much sea-room.

1538. Is not the entrance to Jervis Bay pretty good? It is moderately wide; but vessels cannot always get out, and they cannot always get in.

1539. Would Lake Illawarra make a harbour of refuge? Never.

1540. Would your company ever use Lake Illawarra if a harbour were made there? No; we have a much better harbour at Port Kembla as it is at present.

1541. In the event of Bellambi being made a harbour would it be used by your colliery? No; it would not be used by the Mount Kembla, or by any of the southern collieries unless special traction rates were made.

1542. Would it be used by Corrimal? Yes, under certain circumstances; but not so readily as Port Kembla.

1543. You think that Corrimal, Mount Pleasant, Osborne-Wallsend, and Mount Kembla would certainly ship at Port Kembla if a safe harbour were made there? I am certain of it. Some of these collieries, if a harbour were made at Port Kembla, would double their output. It would be an especial advantage to Corrimal and Mount Keira and Mount Pleasant, because they would then have two outlets for their coal—Wollongong for small vessels, and Port Kembla for large vessels.

1544. Would these collieries be willing to pay a shipping charge of 4d. per ton? I am certain of it.

1545. Fourpence a ton would require an export trade of 564,000 tons to give 4 per cent. upon an outlay of £235,000? Yes; but I do not think the outlay should be as large as that. You do not want cranes or elaborate wharfs.

1546. *Mr. Hoskins.*] You would require cranes for the discharge of inward cargo? Yes; but not expensive cranes, such as those required to swing heavy coal-waggons.

1547.

1547. *Mr. Roberts.*] An important witness who brought forward the claims of Bellambi laid great stress upon the fact that that place was more centrally situated than Port Kembla. Do you agree with that opinion? No. Ninety per cent. of the available coal of Illawarra is south of Bellambi. Seventy per cent. of the coal is within  $7\frac{1}{2}$  miles of Port Kembla, while only 40 per cent. of it is within the same distance of Bellambi. Mr. Vickery, the owner of the South Bulli mine, the largest, and practically the only colliery near Bellambi, is in favour of the Port Kembla scheme, and his opinion is of more value than that of an outsider. Bellambi Colliery is practically done—it will be finished in a few months.

Dr. J. B. M.  
Robertson.  
26 Nov., 1896.

1548. Are not most of the mines that are working nearer to Bellambi than to Port Kembla? No. The two principal mines in the district—Mount Pleasant and Mount Keira—are nearer to Port Kembla, and they would be very much nearer if there were a direct railway from Wollongong to Port Kembla. Such a railway should be made at comparatively little expense. The mines north of Bellambi are practically done.

1549. The witness to whom I refer said that Bellambi was more sheltered naturally than is Port Kembla? Bellambi, like Wollongong, is exposed to the full force of the south-east gales, while Port Kembla is  $2\frac{1}{2}$  miles inside them. His statement is contrary to fact.

1550. Do I understand that Bellambi is more exposed to south-easterly weather than Port Kembla? Yes. It is in full range of the south-easterly seas, while Port Kembla is protected by the Five Islands. We can continue loading at Port Kembla in a south-easterly gale when the danger signal is up at Wollongong. We have no heavy seas at Five Islands Point.

1551. You do not think that there is any place along the coast to compete with Port Kembla? No. At Wollongong the sea strikes the beach and comes back into the harbour. Some time ago, we had to scuttle a vessel there, because a sudden storm came up at low water, when she could not get out, and drove her about the harbour to such an extent that she ran the risk of being destroyed. Long before the Government determined on the last occasion to improve Wollongong Harbour, I went to Wollongong with the intention of advising the people there not to pitch good money after bad; but to ask the Government to connect them by a beach railway with Port Kembla. If money is expended in improving Bellambi, it will not be of any advantage to the largest coal-mines in the district, and will utterly ruin the vested interests of Wollongong. The improvement of Port Kembla, however, would not do that; it would be the deep-water port of Wollongong.

1552. You want to obtain a sailing-ship trade? Yes, and to ensure the regular and undisturbed loading of the largest steamers.

1553. Have you known cases in which large ocean-going steamers have had to leave your jetty, because of the approach of a gale? On several occasions steamers have had to leave the jetty and lie out in the offing until the gale abated.

1554. I suppose that tends to retard the development of the trade? Yes. Nearly all that trade is arranged for in London, and if the steamers are delayed the owners shun the port afterwards.

1555. Do you think that a large import trade would spring up upon the construction of the eastern breakwater? Yes; it would give an assurance to persons wanting to establish industries in the district.

1556. If there were a large import trade, would not the northern breakwater be necessary? So far as we can see, and so far as we are advised by experienced ship-masters, the eastern breakwater would be sufficient; but if future trade demanded the construction of the northern breakwater, the breakwater could be made. With all due regard to Mr. Darley's opinion—and we are bound to show great respect for his views—I do not think the northern breakwater is required, especially if the eastern breakwater is swerved a little to the north-west. There is never any bad weather from the north; during westerly and north-westerly weather the bay is quite calm; and it is only very seldom that we get a black north-easter.

1557. But if the direction of the northern breakwater were modified as you suggest, would not the harbour area be contracted largely? It would only make a difference of a few acres, which would be comparatively nothing, considering the large extent of the bay.

1558. *Mr. O'Connor.*] Is there any difference in the quality of the coal obtained from the various collieries? There is practically no difference in the quality of the coal taken from the upper seam throughout Illawarra. At South Bulli and at Old Bulli there is a splendid quality of coal; but it is more easily fractured than coal from the southern mines, and is therefore less suitable for over-sea transit.

1559. I understood you to say that if the proposed scheme were carried out it would be a great advantage to the surrounding collieries; but that that would not be the case if a breakwater were made elsewhere? Yes.

1560. Your opinion is entirely a disinterested one? Yes. I have not a shilling invested in any mine in Australia. As a matter of fact, I am more interested in Bellambi than in Port Kembla, because I am engineer to three collieries in the northern part of the district, and for only one in the south.

1561. You take the view that this is a national work, and you regard it as a hideous piece of lunacy to talk about improving Wollongong? Wollongong is very centrally situated, but you could never make it a harbour equal to Port Kembla. Wollongong should have been connected with Port Kembla from the first, and I daresay there are very few old residents there who would not say amen to that. I am sure they have seen the folly of spending money on the swimming bath, which is virtually all they have produced there.

1562. *Mr. Black.*] Are you aware that at the time it was proposed to construct Wollongong Harbour no objection was raised by the residents of the locality? I was not in the Colony when the Wollongong Harbour was made. It is only sixteen years since I came here.

1563. There has been a number of improvements carried out in that time? I do not think so. I think that the late expenditure has left matters worse than they were. That is through no fault of the Harbour Trustees; but because of monetary difficulties they could not carry out their scheme.

1564. You have had no opportunity to try, in the way of adverse criticism, to prevent the waste of public money there? Before the last expenditure took place at Wollongong, I went there with the intention of advising the Wollongong people to swallow their local sentiment, and to recognise that there was a good port, within a few miles of the place, to which they could be connected by railway along the beach.

1565. You have said that a number of gentlemen interested in the southern coal trade have agreed not to advance their views in regard to this matter;—do you not think it was unwise for them to decide that they would deprive the Government of valuable local experience? No; we are giving you that experience.

1566. But if you are holding anything in reserve? We hold nothing in reserve. We simply came to the conclusion to abide by whatever scheme the Government favoured. The Government favour Port Kembla, and it so happens that Port Kembla is reckoned by us as the best place for a harbour.

1567.

Dr. J. R. M.  
Robertson.  
26 Nov., 1896.

1567. It would be rather awkward if, in the case of this scheme, as in the case of Wollongong, criticism were deferred until it had proved itself a failure? I think all are agreed that Port Kembla is the best place for a harbour.
1568. But you think that some of the arrangements which the Government engineer proposes to make should be dispensed with? Yes; modified and probably cheapened.
1569. Will not a larger amount of money be required to construct wharfs and cranes for the landing of cargo? I do not think so. Small T-headed jetties, run out from the breakwaters, would serve the purpose.
1570. If Port Kembla became, not only a place for the shipment of coal, but a place of large importation, would there not spring up in its neighbourhood a great commercial centre, or port of distribution? Yes, from Wollongong.
1571. Do you think that Wollongong would distribute the goods coming to Port Kembla? The goods required for particular works would go direct to those works; but goods required by the general community would go to Wollongong for distribution.
1572. Then you do not think it likely that a large township would spring up in the neighbourhood of Port Kembla? I do not anticipate any such thing, though I think that land should be resumed for the establishment of manufactories, and that a beach railway should be made to connect Port Kembla with Wollongong. I think that Wollongong would still remain the commercial centre. Wollongong would always benefit from this work. For one thing the collieries near Wollongong instead of working intermittently as they do now would work constantly.
1573. You do not think it necessary for the Government to resume 10,000 acres of land in the vicinity of Port Kembla for the purpose of establishing a township there? No, I should think 500 or 1,000 acres would be sufficient.
1574. I suppose the value of that land is given to it by its position? Yes.
1575. *Mr. Humphrey.*] You spoke about 70 per cent. of the coal of Illawarra being within  $7\frac{1}{2}$  miles of Port Kembla. Will you name the collieries within that radius? I think it would be rather invidious to do so, but by the aid of a pair of compasses you could ascertain which they are. Such a radius would approach Corrimal and would include Mount Pleasant, Mt. Keira, and Mount Kembla. These collieries contain the great bulk of the coal.
1576. You give that opinion as the result of close observation? Certainly, from personal knowledge.
1577. You are quite clear that Port Kembla is convenient for the shipment of 70 per cent. of the available coal of Illawarra? Yes.
1578. You are speaking of the great output and the coal which may be obtained? I am speaking of the whole of the available coal from the upper seam.
1579. And only 43 per cent. of the coal is equally convenient to Bellambi? Yes.
1580. You spoke about large deposits of coal existing upon Crown lands? The Mount Kembla Company, in addition to their freehold, lease a large quantity of Crown land to the north, probably 2,500 acres. Mount Keira leases probably 1,000 acres of Crown land; Mount Pleasant about 1,300 acres; and South Bulli about 2,000 acres. In addition to that there is a large amount of coal in Crown lands not at present leased.
1581. What is the total acreage of Crown land to which you refer? I cannot tell you from memory.
1582. What royalty is paid for the coal obtained from this land? 6d. per ton.
1583. How much has been paid to the Crown up to the present time? Not very much, because the collieries have not got through their freeholds yet. In the future the coal will come almost entirely from the Government land.
1584. Can you say how long it will be before the greater part of the output is obtained from Government land? A good deal of coal is obtained from Government land at present, and the quantity is increasing every year. South Bulli, Mount Kembla, Mount Keira, and Mount Pleasant Collieries will all be into Crown land within a couple of years.
1585. Therefore the Crown will receive a large and increasing revenue? Yes. The Crown is the principal landowner in Illawarra, and in making this harbour they are only providing a proper outlet for their tenants. Without a good outlet, we cannot afford to work a large quantity of coal, and, therefore, we will not pay so much in royalties.
1586. An increased output will mean, in addition to wharfage charges, so much royalty? Yes, undoubtedly. Before the proposed harbour can be made, all the collieries will be paying large sums to the Crown in the way of royalty.
1587. You have expressed the opinion that the coal connected with the smelting works at Lake Illawarra was suitable for smelting purposes, though not as valuable as the coal in the northern part of the district for export purposes? Yes.
1588. Have you seen their workings? Yes. I know the coal. I knew it long before the company took it up.
1589. Have you seen a seam of coal opened up not very long ago by Mr. Brown? Yes.
1590. Will you describe it? I would rather not. I think it is sufficient to say that while the coal is suitable for manufacturing purposes, it would not at present pay to export.
1591. Therefore, even if the Illawarra harbour scheme proved a success, there would not be much coal exported from these mines? None.
1592. How long is it since you inspected these seams? I saw them fifteen years ago, and I saw them about ten days ago.
1593. What is the present cost of maintaining your jetties and buoys at Port Kembla? We put everything down to the cost of the coal; but I should think that  $\frac{3}{4}$ d. or 1d. a ton would amply cover the cost of renewals and repairs to the jetties.
1594. And the maintenance of the buoys? Yes. That is a small matter.
1595. How much of that would be saved by the construction of the proposed breakwater? The expenditure in maintenance and repairs would be practically the same as it is now.
1596. *Chairman.*] Do you know what it costs you to ship your coal when you have it upon the jetties? That is a variable quantity. We are sometimes stopped from working in bad weather, but, taking bad and good weather together,  $\frac{3}{4}$ d. a ton would more than cover the expense. If we could work continuously,  $\frac{1}{4}$ d. a ton would cover it.

1597. What does it cost per ton per mile to bring coal along your railway?  $1\frac{1}{2}$ d. or  $1\frac{3}{4}$ d. a ton for  $7\frac{1}{2}$  miles. That is for railway traction. Say 2d. a ton for everything.
1598. Could all the rolling stock in the district use the present loading appliances in connection with the Port Kembla jetties? Yes; except that a slight alteration would have to be made to provide for the Mount Pleasant trucks. An expenditure of £200 would probably accommodate all the rolling stock.
1599. All the lines are of the same gauge? Yes; with the exception of the Mount Pleasant mine, which has a narrow gauge.

Dr. J. R. M.  
Robertson.  
26 Nov., 1896.

## ADDENDA.

Sir,

40, Pitt-street, Sydney, 27 November, 1896.

In supplement of the evidence I gave relative to the necessity of a deepwater harbour for Illawarra collieries, and especially with reference to certain questions you addressed to me, referring to our costs for conveying and shipping coal from Mount Kembla mine, I have looked at our costs, and find that on an average of years the actual costs are as follows per ton:—

		Length— $7\frac{1}{2}$ miles.	
Or, '722 of 1d.	1. Shipping coal—allowing for and including broken time .....	$\frac{1}{2}$ d. and '93—say, $\frac{3}{4}$ d.	
'550 ,,	2. Locomotives, stokers, drivers, cleaning.....	$\frac{1}{2}$ d. and '24	
'830 ,,	3. Fetting, including relaying rails and sleepers.....	$\frac{3}{4}$ d. and '3	
			2·04d.
2·102d.	Or, together, say .....	2 $\frac{1}{4}$ d.	
	Repairs and renewals of jetty* .....	$\frac{1}{2}$ d.	
	Rails, sleepers, bridges, renewals .....	1d.	
			3 $\frac{3}{4}$ d. per ton.

These apply to the whole line, half of which is to the west of the Government railway.

With an increased and steadier trade, the above cost would be proportionately decreased, as items 1 and 3 would be the same for double the output on which the costs are estimated.

Mr. Humphery required some figures relating to Government land and freehold. This I will be pleased to supply to you on Monday on my return from the south coast.

I have, &amp;c.,

JAMES R. M. ROBERTSON.

The Secretary, Parliamentary Standing Committee on Public Works.

Sir,

40, Pitt-street, Sydney, 1 December, 1896.

In reply to the question put by Mr. Humphery regarding the relative area of Government and freehold land south of Bellambi Colliery, on which I based certain calculations, on examining my notes, I find that of the upper coal 8,240 acres are owned by Government, and 7,470 acres have been alienated and are freehold.

I confined my estimates to land which, from our prospecting and mining works, we feel certain contains the upper seam of workable thickness. I have indulged in no fanciful estimates, but have confined myself to actual and ascertained facts. A little further west than the present leaseholds an extensive tract of intrusive basalt (igneous rock), so far as we know, cuts off the coal seams, and this for a broad yet undefined space. The basalt that cuts off the coal in Bulli and Bellambi Collieries apparently connects with this main basaltic belt, which, further south, occupies the valley of the Cordeaux.

None of the existing collieries can reasonably be expected to win any coal west of this intrusive (igneous) basalt, even should the continuity of the coal be ascertained within a moderate distance of it to the west—which it has not. I, therefore, limit my calculations to known ground—proven by the works of existing collieries.

With respect to the second inquiry of Mr. Humphery's—In what proportions will the coal from these two classes of holdings be won?

In reply, I would point out that the collieries all opened on old grants or purchased freeholds, and have been since working on these freeholds. The whole of the collieries embraced in the before-named area have secured large leaseholds and have either commenced to work them, or are rapidly advancing their winning-out places towards or into these leaseholds, so that from this date an ever-increasing proportion of the whole of their outputs will be drawn from Government land, and will pay royalty at the rate of 6d. per ton. In one or two cases the whole output of the collieries will be drawn, within a few years, from Government leaseholds, their freeholds being almost exhausted.

Practically, the whole of the coal in the lower seams south of Mount Kembla is leased from Government. The same remark applies to the large area of coal land north of Coal Cliff estate, and on which the Metropolitan Colliery, on the extreme southern margin, has been opened.

You will, however, recollect that I only calculate on one-fifth of the coal opened up by the existing plant being shipped at the deepwater harbour proposed.

If I have not replied fully to the inquiries, or if I can be of further service to you in connection with the present inquiry, I shall be very pleased to hear from you.

I have, &amp;c.,

JAMES R. M. ROBERTSON.

The Secretary, Parliamentary Standing Committee on Public Works.

Sir,

40, Pitt-street, Sydney, 3 December, 1896.

I am unable to obtain at the Lands Office any district plan of the collieries; but I have dotted on one of my own plans what I think may yet be found to be the course of the basaltic intrusion that exercises such a potent influence, not only on the coal-field a few miles west of the principal collieries, but has had such a disastrous effect upon the collieries north of South Bulli, and offshoots from which probably destroy much of the coal from south of Stanwell to the Metropolitan shafts.

It is only within recent years that the influence of these basalts have forced themselves on the attention of thoughtful managers, and it is only at collieries north of South Bulli (where it is joined by a large and broad intrusive dyke of igneous rock, coming from the S.E., and that completely cuts off Bellambi, Bulli, and Bulli Pass to the west) that its influence for evil has been felt. The collieries south of Bellambi are not likely in the present generation or the next to feel its effects. I had this steadily in view when I calculated the available areas and quantities.

To this is due the fact that only 41 per cent. of the available coal exists within a given radius of Bellambi—because here and to the north the coal is destroyed to the margins of the present workings, while within a similar radius of Port Kembla adits exist from which at least 70 per cent. of the available upper coal will be drawn.

I have, &amp;c.,

JAMES R. M. ROBERTSON.

The Secretary, Parliamentary Standing Committee on Public Works.

FRIDAY,

FRIDAY, 27 NOVEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY  
 The Hon. JAMES HOSKINS.  
 The Hon. CHARLES JAMES ROBERTS, C.M.G.  
 The Hon. WILLIAM JOSEPH TRICKETT.  
 The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.  
 CHARLES ALFRED LEE, Esq.  
 JOHN LIONEL FEGAN, Esq.  
 THOMAS HENRY HASSALL, Esq.  
 GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Captain Francis Hixson, President of the Marine Board of New South Wales, sworn, and examined:—

Captain  
 F. Hixson.  
 27 Nov., 1896.

1600. *Mr. Lee.*] I presume that you have a good general knowledge of harbours along the coast? Yes.
1601. Are there any other places upon the south coast besides Port Kembla which could be taken into consideration in connection with the matter into which the Committee are now inquiring? There is a good indentation at Shell Harbour; but I do not think that it is as good a place for a harbour as Port Kembla.
1602. You think that, if it were deemed necessary to make a harbour on the south coast Port Kembla would be the best place at which to centre the trade. Yes.
1603. For what reasons? It is a fairly good natural harbour, and the construction of the proposed eastern breakwater would make it an excellent harbour.
1604. Do you think that the proposed breakwater would afford protection to sailing ships anchored within it in any weather? Certainly.
1605. How would vessels be affected by a north-easterly blow? The proposed breakwater would not give much protection from the north-east; but our north-easterly weather is scarcely ever bad enough to endanger the safety of a ship. I do not consider that there would be any danger to sailing ships anchored in Port Kembla if a breakwater were constructed as proposed.
1606. It would appear from the contour of the coast that the place is fairly well sheltered from the north, and partly from the north-east? Yes.
1607. Do you know whether there is any particular roll on the sea into Port Kembla? The ordinary ocean swell would sometimes roll round there under present conditions; but the proposed breakwater would stop it.
1608. It has been asserted that the Five Islands are a great protection to Port Kembla? They are to a certain extent. At the same time, the sea passes between the islands round the point, and rolls on to the coast in the vicinity of the Port occasionally.
1609. Have you noticed whether the inlets on the coast are liable to silt up after severe gales? I think they are; but the action of the sea has not always that tendency. Occasionally it clears them out. Thousands of tons of silt and sand are periodically being moved along the coast. This causes silting up in certain places at times, and then it is cleared away again.
1610. What do you think would be the effect upon Port Kembla in that respect if the proposed breakwater were constructed? There might be a little silting up at the head of the bay; but I do not think that the proposed breakwater would cause any great silting up.
1611. You do not wish to speak on this matter from an engineering point of view? No: I am speaking only in generalities, and from a cursory knowledge of the place.
1612. If the proposed breakwater were constructed, would sailing vessels be able to enter and to leave the port with safety? It would depend upon the size of the vessels. Small vessels certainly could; but large vessels would have some difficulty. There would be no difficulty about entering; but if large vessels had to work out they would find the water space contracted.
1613. If a very large over-sea traffic sprang up there, a tug service might be necessary? Certainly.
1614. How is our tug-service carried out? The Government subsidise the vessels, and the owners work them in their own interests as well as they can.
1615. Is there any charge made for the use of the tugs? Yes, a charge of 4d. a ton. The Government subsidise the service, and insist that only this charge shall be made to the vessels requiring towage.
1616. Has not the trade been recently reduced? No. Fresh tenders have lately been called for; but the conditions in regard to the charge remain unchanged.
1617. Does the Government retain a tug service at every port? At most of the ports. There are very few tugs on the South Coast. There is one at Wollongong.
1618. What about Newcastle? The tug service at Newcastle is self supporting. The policy of the Government is to help the tugs while the trade is insufficient to maintain them; but as soon as the service becomes self supporting the Government withdraw the subsidy.
1619. You are of opinion that if the proposed breakwater were carried out at Port Kembla we should have to have a tug service there? Yes, as the trade of the place increases.
1620. I suppose for towing out, for towing in, and for moving from one place to another within the harbour? Yes.
1621. The removing of vessels from one place to another is a very important matter? Yes. Of course, if there were no room alongside the jetties a vessel would have to lie off at anchor till a berth was ready.
1622. What would be the cost of a tug service there? The cost of the tug service varies all along the coast. At Wollongong we pay £300 or £400 a year. At the Richmond River we pay £1,770 a year. The Government call for tenders, and the tenderers understanding the trade, the risk, and so on, offer accordingly. The Government accept the lowest eligible tender.
1623. Have the Marine Board at any time considered the propriety of constructing a harbour on the South Coast? The Marine Board would scarcely consider that matter came within the scope of their functions. They have only to do with the trade when it has been created. The policy of the Government on a matter of this sort does not concern the Board officially.

1624.

1624. Would a pilot service be required at Port Kembla if the proposed breakwater were made? That would depend upon the growth of the trade. The pilot at Wollongong occasionally gives his services there, and the tug stationed at Wollongong occasionally goes there to help vessels.

Captain  
F. Hixson.

27 Nov., 1896.

1625. Pilots are not so much required for steamships? No.

1626. If there were a large sailing-ship trade at Port Kembla, a pilot service would be absolutely necessary? Yes.

1627. Is the pilot service self-supporting? I can scarcely say that. An Act recently passed has greatly reduced the pilotage fees. As a rule the pilot service has been self-supporting. The Marine Board, instead of being a drag upon the country, has contributed considerable revenue to the Treasury.

1628. Are there any other contingent charges which would add to the cost of shipping coal from the proposed port? I can scarcely answer that question. At the present time the jetties and moorings, and all the paraphernalia necessary for maintaining the trade there are private property.

1629. If the Government make a harbour there, would not they have to see that a proper area of deep water was conserved, that proper moorings were laid down, that a tug service was supplied, a light-house erected, and all the requirements of the port met? Yes. These charges all grow as the trade of a place increases. The Marine Board would not advise the Government to incur expenditure in prospect. They would wait for the trade to grow, so that the necessity for this expenditure might be established.

1630. The inference is that a very large trade will spring up at this place? I think that is very probable.

1631. If a large trade did spring up all these necessaries would be required? Yes; and I am sure that the demand for them would be met by the Government and by the Marine Board. Some little time ago the agent for the P. and O. vessels came to me to know if I would advise him to use Port Kembla as a coaling-place for those vessels. My reply was, that Port Kembla might answer very well for five or six times, and then the steamers might not be able to get there because of the bad weather, and thus be unable to fulfil her engagement. If there were a breakwater at that place I should have no hesitation in telling him he could coal there with as great facility as at Sydney.

1632. What is the average depth of water that the general run of P. and O. boats would require? There would be quite sufficient water at Port Kembla for them. If there were much sea a greater depth would be required. With a breakwater the present depth would answer fairly well.

1633. I suppose a good deal depends upon the steadiness of a vessel when alongside a jetty? Yes. If there is what we call a "sand" a vessel must have 5 or 6 feet of water under her keel; but if the water is perfectly smooth she need only have 1 or 2 feet under her.

1634. Under any circumstances the P. and O. vessels would go to Port Kembla only for bunker coal? Yes, that is all.

1635. Have you given any attention the construction of the proposed breakwater? No; only a general glance at the plan.

1636. It has been asserted that there is no roll of the sea round Red Point into Port Kembla? I am pretty sure that whenever there is a heavy ground-swell it rolls round that point into Port Kembla; but not perhaps to the same extent that it would do at other places.

1637. If the proposed breakwater were constructed, would it be possible to utilise it for loading coal from short jetties inside it, and to unload at such jetties? Yes; it would be perfectly feasible to load and unload at such jetties.

1638. Would there be any danger of the sea rolling over the breakwater, and thus preventing unloading? I do not think that the sea would roll over the breakwater except in very heavy weather.

1639. I suppose if it did the breakwater could be raised? Yes; that could be done.

1640. Do you know the various jetties along the coast which are used for shipping coal? Yes.

1641. I suppose that steamers would continue to use those jetties in fine weather, even if the proposed work were carried out? Yes; if the mines are nearer to those jetties than they are to Port Kembla, as I believe many of them are.

1642. Are you of opinion that if the proposed breakwater were constructed the whole of the sailing-ship trade would be done at Port Kembla? Well, the sailing vessels that carry coal at the present time are very small, and they go to Wollongong. Some of them might go to Port Kembla.

1643. But if the proposed port were made larger vessels might be attracted from the over-sea trade? I have no doubt that that would be so.

1644. We may fairly assume that all those vessels would go to Port Kembla? I think it is a fair thing to assume. But if a ship brought her cargo to Sydney she would require a certain amount of "stiffening" to make her seaworthy, and the question would be, would it not be better for her to continue her loading in Sydney rather than go to Port Kembla to fill up.

1645. But possibly vessels may go straight to Port Kembla in ballast as they go to Newcastle? Yes, they might do that. Ships that come to Newcastle under those circumstances come from long distances.

1646. Do you care to offer any opinion as to the merits or demerits of Bellambi? I have already said that Port Kembla is the best place, so that I do not think that there is any occasion to go into the merits or demerits of Bellambi.

1647. Would Port Kembla offer any advantages as a harbour of refuge? Certainly. We have now to warn vessels from entering Wollongong and Kiama in bad weather. These vessels, if Port Kembla were a safe harbour, could go there.

1648. What sort of a harbour would Port Kembla make if the two breakwaters were carried out? It would make a perfect harbour.

1649. Would the construction of both breakwaters put anything in the way of ships entering the place in stormy weather? I do not think so. At the same time I do not think that the proposed northern breakwater is necessary. I think that the proposed eastern breakwater would be quite sufficient, and would make a reasonable port.

1650. If at any future time it was found to be necessary to make a closed harbour, the northern breakwater could then be constructed? Yes.

1651. Is the anchorage at Port Kembla good? I am not familiar enough with the place to say much about that; but from the little knowledge that I have I should say that it was sandy and good.

1652. Does it possess any advantages over Bellambi in that respect? Yes; Bellambi is not so sandy, and there are shoals of rock there.

Captain  
F. Hixson.  
27 Nov., 1896.

1653. Are there any remarks of a general character that you would like to offer in regard to the scheme before us? I think that I have said everything that I can state, beyond pointing out that Port Kembla is midway between Sydney and Jervis Bay, and therefore in a good position for a harbour of refuge.
1654. Has the question of defence any bearing upon this scheme? I do not think it has any special bearing upon it. No doubt if an enemy came out here, he would be in want of coal, and would endeavour to get it somehow.
1655. Unless Port Kembla were defended he would always get coal there? Well, I would be inclined to make the port harbour first, and fortify it afterwards if necessary.
1656. I suppose the guns at Wollongong would be of little use for the defence of Port Kembla? They would be of no use at all.
1657. Does it follow that if this harbour is made it will have to be defended? Perhaps. I think that there is more need to defend our coal stations than any other place along the coast.
1658. There is no coal shipped at Jervis Bay, so I presume that place would not come within the category of ports to be defended? There is no coal at Jervis Bay; but it is a place which would afford shelter to the enemy. I think we should have a defence force afloat to prevent the enemy getting coal and getting shelter. If we had a naval force, we could follow the enemy's ships; but guns on the coast are only able to defend certain positions.
1659. *Mr. Wright.*] There are no rocks at Port Kembla? I think not.
1660. Could a ship of 3,000 tons hold to her anchors there in a north-east gale, supposing the breakwater were constructed? I think so, in any ordinary gale.
1661. Can you tell us anything about the set of the current along the coast? The current is very fickle. Sometimes it sets strongly to the south, and sometimes you have no current at all. Occasionally, close in to the shore, you have a northerly current. When I have been surveying the coast I have found a northerly current in some places, and a southerly current in others.
1662. You find the northerly current close in to the shore? Yes. The southerly current is in the offing; but close in to the shore there is often a kind of eddy to the north.
1663. Would there be any necessity to have a pilot at Port Kembla, supposing the breakwater were made? Not immediately. If the trade of the port grew, and the need arose, no doubt a pilot would be sent there.
1664. Could not an ordinary master bring his ship to anchor within the port without a pilot? Yes; but a stranger might be disinclined to run the risk.
1665. Could an ordinary ship make an offing in a strong south-east breeze there? In a south-east breeze she could fetch off.
1666. So that there would not be a great necessity for a tug-boat? Even if there were no great necessity for a tug-boat, I think that one would be used to facilitate the work of the port.
1667. All that would be wanted in that case would be a small tug to move a vessel from her moorings? That is about all.
1668. *Chairman.*] The tug stationed at Wollongong could work both Wollongong and Port Kembla? Yes; for some time to come.
1669. *Mr. Wright.*] It would not be necessary to have a tug to tow vessels in from outside? I do not think so. It would depend upon the character of the man in charge of the ship. A bold navigator would come right in, while a timid man might remain 10 or 12 miles off. Of course, if a man had local knowledge he would probably come right in.
1670. You think that an ordinary sailing-ship could beat out of the port in any weather, and secure an offing? Not in any weather. Small vessels could go out with facility; but big ships are so unmanageable in narrow waters that they would find great difficulty in working out of this place. Many of the big ships at the present day do not work at all. Instead of "staying" as they used to do, they all "wear" now.
1671. Could a ship of 3,000 tons beat out? Yes, with a very smart crew.
1672. With a south-east wind? Yes.
1673. That is the prevailing wind? It is a frequent wind.
1674. It is a strong wind? Yes, we get strong winds from that direction sometimes.
1675. Do you think that a harbour of refuge is required along the coast? I think that a harbour of refuge is a very desirable thing to have; but, as a rule, harbours of refuge are made more of than is justifiable. No man should think of running for a harbour of refuge unless he were in difficulties.
1676. No man would think of running to a harbour of refuge if he was within 50 miles of Port Jackson, and had a good offing? No, I do not think so, unless he happened to be going away from Sydney.
1677. The proposed harbour might occasionally give safety to a ship, but it would not often be used as a harbour of refuge? Yes.
1678. There are long stretches in the English Channel where they have no harbours of refuge? Yes.
1679. Do you think that the proposed port would be a great convenience to the coal trade? Yes.
1680. Do you think it would be largely used by sailing vessels? I am not so sanguine about that. I think it is more a place for steamers. If ships brought a cargo to Sydney, and unloaded here, they would probably prefer to take in a new cargo at Sydney, instead of going down to Port Kembla.
1681. No ship master would take in 600 or 700 tons of ballast at Sydney, and then run down to Port Kembla for coal? No.
1682. But ships might go to Port Kembla in ballast from Victoria and Queensland? Yes, and I think that in bad weather the Melbourne steamers might get their coal there, and thus save the trip on to Newcastle.
1683. The southern coal is said to be better steaming coal than the Newcastle coal, and therefore is more sought after for that purpose? I believe that it is getting a very good character. It requires knowledge to use it to the best advantage; but when people understand it it is a very good coal.
1684. Can you give the Committee a rough estimate as to what it would cost to lay down moorings at Port Kembla? No. If we put down moorings there, they would have to be very heavy and very costly.
1685. What would a dozen separate moorings cost? Good moorings would cost about £500 or £600 each. You would want a big buoy, two very large anchors, and strong chains.
1686. *Mr. Fegan.*] You gave evidence before the Select Committee which inquired into the Lake Illawarra scheme. I believe you thought that Lake Illawarra would make a very good harbour? I said that I thought it was possible to make a harbour there as they proposed.

1687. Then do you think it would be right to carry on any work at Port Kembla until the time given to the Illawarra Corporation for the carrying out of their scheme has expired? I do not think that the improvement of Port Kembla will interfere with the Lake Illawarra scheme.

1688. Do you think that there would be sufficient trade for two harbours? I think that Lake Illawarra could do a trade with small vessels and Port Kembla would be used for larger vessels.

1689. You have taken soundings on various parts of the coast? Years ago I was engaged in surveying the coast; but I have never surveyed this part of the coast.

1690. You regard Bellambi as inferior to Port Kembla, because of its smaller area and its inferior holding-ground? I think that Port Kembla is naturally better sheltered than Bellambi, and I believe that its holding-ground is much better.

1691. You think there is no need to take the question of naval defence into consideration in dealing with this scheme? Scarcely, at the present time, though I said that I thought that if the enemy came to this coast his great need would be coal, and that a mobile force would be an advantage for purposes of defence. We have so many places where coal can be obtained, that I think we want vessels to follow any enemy, and defend any places that are attacked.

1692. But if a number of vessels were anchored at Port Kembla it would be necessary to protect them from the foe? Yes; but any guns that you placed at Port Kembla would only defend that particular place, whereas with a movable fleet you could protect any place that happened to be attacked or used by the enemy.

1693. You think that there is no place on the coast which will compare with Port Kembla as a harbour? Port Kembla is the place *par excellence* for a harbour in that locality.

1694. *Mr. Hassall.*] How long have you held your present position? Thirty-four years.

1695. Do you think, from your experience, that it is necessary to provide a harbour of refuge between Sydney and Jervis Bay? I would not say that it is actually necessary, but it would be a very desirable thing to have.

1696. For what reason? To afford shelter to shipping in the locality.

1697. Is Jervis Bay suitable as a harbour of refuge? Yes; it is a splendid natural harbour, and therefore a good harbour of refuge.

1698. Is Port Jackson a harbour of refuge? Certainly. They are both very suitable harbours of refuge.

1699. Do you think the proposed breakwater should be carried out 1,600 feet, 2,200 feet, or 2,800 feet? 1,600 feet would make an excellent harbour; but if you went out further you would get a better harbour.

1700. Do you think that the trade will require a harbour area of 260 acres? Perhaps not at first. The breakwater could be extended as the trade grew. I would not go in for a very large expenditure at first.

1701. Do you think that 1,600 feet of breakwater would be sufficient for the present? Yes; and you could extend it at any time.

1702. Do you think the same amount of trade would be done at Bellambi as at Port Kembla if a breakwater were made? Well, I am thinking of both places simply as harbours. Port Kembla is naturally better sheltered than Bellambi, by reason of the Five Islands to the south, and the configuration of the coast to the north, and the holding-ground is better. Bellambi is a risky place to let go an anchor, because there is a danger of its getting under the rocks and being lost.

1703. Do you think it probable that Lake Illawarra may be made a harbour of refuge? No. Lake Illawarra can only be made a place for the reception of small vessels; that is, unless a gigantic sum of money is expended there. The foundation of the breakwaters at Lake Illawarra would not be so good as it is at Port Kembla, where you run out from a rocky point.

1704. Have you any doubt as to the suitability of Port Kembla as a harbour? No; and I think it would be of very great assistance to trade to have a harbour made there.

1705. Would Jervis Bay make a good harbour for the south-coast trade? It is a most excellent harbour.

1706. Is there deep water there? Yes.

1707. Pretty well close to the shore? Yes; in most places. Yes; it is a fine, bold, sheltered port.

1708. A suitable place for shipping? Yes.

1709. What distance is Jervis Bay from Sydney? Eighty to 83 miles.

1710. Would Jervis Bay be as suitable for the trade as Port Kembla? Jervis Bay already affords the same facilities as a harbour of refuge as Port Kembla would give when improved.

1711. *Mr. Roberts.*] If the proposed breakwater were constructed would it be necessary to have a light-house at Port Kembla? If the port drew a large trade, I think there would have to be a light at the extremity of the breakwater.

1712. What are the nearest light-houses to the north and to the south of Port Kembla? There is a light at Wollongong, 5 miles to the north, and at Kiama, 10 or 12 miles to the south.

1713. *Chairman.*] The light you speak of would not be a light-house; it would be simply a harbour-light? Yes.

1714. *Mr. Roberts.*] What is the draught of the P. and O. or Orient vessels? Their maximum draught is 27 feet; but if they were going down to Port Kembla for coal they would draw about 20 feet.

1715. What is the draught of the "Orlando"? About 26 feet is her maximum draught.

1716. Is 27 feet the maximum draught of any vessel that has entered Port Jackson? Yes, I think so. The eastern channel has a depth of 27 feet at low water, and we have never been unable to take a vessel in or out since it has been dredged to that depth.

1717. You think there would be plenty of water in Port Kembla for vessels of any size? Yes, and you could always get deeper water by running the jetties further out.

1718. *Mr. Clarke.*] Jervis Bay is too far south to suit the Illawarra coal trade? Perhaps so. What I said with regard to Jervis Bay was altogether from a nautical point of view.

1719. Is not the water on the northern side of the bay very much exposed to northerly winds? No; though the south-eastern portion of the bay is rather exposed to such weather.

1720. You do not consider that Port Kembla is as necessary as a harbour of refuge as for ordinary purposes of trade? It would combine the two advantages.

1721. If both breakwaters were completed there would only be an entrance 800 feet wide;—would that be sufficient to enable vessels to get in and out? I think so. The opening in the Portland breakwater is only 500 feet; but I have not heard of any accidents happening there. We do not want the gap to be

Captain  
F. Hixson.

27 Nov., 1896.

- Captain  
F. Hixson.  
27 Nov., 1890.
- be too wide, or you would let too much sea in ; but if the entrance is too narrow, it would interfere with the passage of ships in and out.
1722. I suppose that something must be done to Port Kembla before it can be used as a shipping place for sailing vessels? Yes ; I would not like sailing vessels to go there under present conditions.
1723. Even with a tug it would be rather dangerous? Well, a tug to some extent converts a sailing ship into a steamer for the time being ; but I would not advise sailing ships to go there at the present time without a tug in attendance.
1724. If the eastern breakwater were constructed, could sailing vessels go there and load? Yes.
1725. Do you not think that the Illawarra coal proprietors are entitled to as much consideration as the Newcastle colliery proprietors? Yes, I think so ; especially as they have established a trade there already. I believe in helping those who help themselves.
1726. Do you think it would be possible, without a large expenditure, to make a port at Lake Illawarra? No, and I do not think that Lake Illawarra could ever compete with Port Kembla.
1727. *Mr. O'Connor.*] At the present time only vessels of small tonnage can enter Lake Illawarra? I think scarcely anything can get in there now.
1728. Would the money it is proposed to expend at Port Kembla be equally effective if spent at Lake Illawarra? No ; Port Kembla would be three or four times better than Lake Illawarra.
1729. *Chairman.*] The northern end of the proposed breakwater is two-thirds of a mile from the shore. Supposing that the breakwater were drawn round, so as to bring the end within half a mile of the shore, would the port be a dangerous one to enter? No. That would contract the harbour area a little ; but it would give better shelter for the port.
1730. Would it be as good a port to enter as with the breakwater as proposed? Yes, for all practical purposes.
1731. By bringing the end of the breakwater one-sixth of a mile nearer the shore, you have a pretty well protected port? Yes.
1732. Though you sacrifice a considerable area of deep water, do you regard that as a serious matter? No. If I had drawn the breakwater I would have carried it round in the way you suggest.
1733. Would the water out at the end of the breakwater be used for shipping? I think there would be a sufficient area of protected water by carrying the breakwater out in the way you propose. I am inclined to think, too, that a breakwater carried out in that way would resist the sea better.
1734. A south-easterly sea would run along it? Yes.

Charles Edward Rennie, Esq., Chief Draftsman, Department of Lands, sworn, and further examined:—

- C. E. Rennie,  
Esq.  
27 Nov., 1894.
1735. *Chairman.*] You have a further statement to make to the Committee? Yes ; I have had all the deeds looked up, and I find that the area of 100 feet reservations within 10 miles of Bellambi is 123 acres.
1736. Is there any reservation at Port Kembla? There are 65 acres reserved within 10 miles of the port ; but nothing within 2 miles of it. The area reserved within 10 miles of Bellambi is 123 acres ; within 10 miles of Wollongong, 100 acres ; and on the shores of Lake Illawarra, 27 acres. That is on the northern side of Mullet Creek. The area reserved on the shores of Jervis Bay is 88 acres. These reservations are shown on the map by means of black circles.

TUESDAY, 1 DECEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

John Barnes Nicholson, Esq., M.P., sworn, and further examined:—

- J. B.  
Nicholson,  
Esq., M.P.  
1 Dec., 1896.
1737. *Mr. Roberts.*] Having heard the evidence you have given, I am under the impression that you are very strong in your advocacy for Bellambi as the best position for a harbour on the South Coast? That is so.
1738. Have you arrived at that conclusion on account of Bellambi appearing to be the most central place for the reception of coal? Not only because it is the most central, but because it has been, and is still, the best natural port in the district.
1739. It is the best sheltered from southerly gales? Yes, from any gales, more especially from northerly or north-easterly gales.
1740. Is it a fact that the lay of the coast to the north of Bellambi affords admirable shelter in the case of a north-easterly gale? Yes.
1741. Will you explain how it is, if Bellambi is the most central port for the shipment of coal, that more coal appears to have been shipped at Port Kembla, according to a return furnished by the Custom House

at

J. B.  
Nicholson,  
Esq., M.P.  
1 Dec., 1896.

at Wollongong, during the last five years. For instance, in 1896, whilst the shipment of coal at Bellambi was 90,880 tons, at Port Kembla it was 133,924 tons; and in 1895, whilst at the Bellambi jetty there were shipped 175,506 tons, at Port Kembla there were shipped 220,328 tons. On looking through the return I find that in every year, except in 1892, the shipment of coal at Port Kembla far exceeded the amount shipped at Bellambi? I was not aware that prior to 1892 the shipment of coal at Port Kembla had been greater than at Bellambi. I am aware that it was from 1893 to 1896 inclusive. I explained the reason when I was here before. We have had a number of large steamers which have come from Newcastle to complete their loading, and they could not do it anywhere but at Port Kembla, owing to the fact that we had not water deep enough at any other place. I may add that certain collieries to the north of Wollongong have been conducive to the shipment of coal at Port Kembla, by sending their coal to help to load the big ocean boats in as short a space of time as possible. They have even sent coal there from Clifton, simply to oblige the Southern and the Old Port Kembla Company to get the large boats away. That is the sole reason they show a greater shipment than we do at Bellambi.

1742. Referring to the plan you laid before the Committee—you see the breakwater you suggest to the east of the Departmental breakwater? Yes.

1742½. Does not that appear to you to contract the harbour of Bellambi very much compared with the Departmental scheme? Quite the contrary. It not only increases the area of water, but it will be sufficiently protected from all gales. The outward end of the reef is supposed to be nearly in juxtaposition to the outer end of the proposed breakwater, and it amply protects the harbour. We only want to cap that reef and then we have protection for the whole of the shipping which can be stowed in the bend.

1743. But when we have bad weather from the south-east the wind frequently veers to due east, and a violent easterly gale blows;—in a case like that does it not appear to you that the breakwater, as shown on your plan, would not afford the same protection as the Departmental breakwater? I have never heard of an easterly gale blowing into Bellambi Bay since I have been a resident on the coast.

1744. What is the estimated cost of your breakwater? £132,500, which is more than one-half less than the Departmental cost.

1745. Have you given any consideration to Wollongong as being suitable for a harbour on the south coast? That is the place where I should have liked to see the harbour really built, had it been built on the original scheme as proposed by Sir John Coode.

1746. Would not Wollongong be more central than Bellambi? No; I am not aware that we have any coal whatever of a marketable character within easy access to the south of Mount Kembla. I am also aware that the Mount Kembla Company did not work up to their southern boundary, because the coal petered out.

1747. How would you place the schemes? I prefer the Bellambi to any of them, from the simple fact that the Wollongong harbour would not pay 2 per cent. interest on the money which would have to be expended. If that is a fact there, it is a greater fact at Port Kembla. If we can reduce the expenditure by bringing it to Bellambi, it must, as a matter of course, be the better place.

1748. Then you put Bellambi first, and Wollongong second? Yes; Wollongong has been so messed up that they have built the lighthouses and jetties in the water which should have been used for loading-berths. The whole of that work would have to be undone in order to make Wollongong a decent port.

1749. Is it true that at the present time there appears to be a large number of residents on the south coast who are favouring what may be termed the Jervis Bay scheme? I have heard some talk about it. Nevertheless, Jervis Bay would not serve as a shipping-place for coal.

1750. *Mr. Hoskins.*] Is there any coal to ship? Not that I am aware of.

1751. *Mr. Roberts.*] What is your main objection to it? The distance. It is about 12 miles from Nowra, which, I suppose, would bring it from 50 or 60 miles from the centre of the coal-field.

1752. I wish to refer you to a statement on page 3 of the report furnished by the Under Secretary for Public Works: "Shortly afterwards, viz., in February, 1895, as the result of a meeting held at Wollongong of the supporters of the rival claims of Wollongong, Bellambi, and Port Kembla, a further deputation waited upon Mr. Young, and requested that an officer might be appointed to report on the most suitable site for the harbour. They stated that the advocates of the various sites had agreed to leave the decision of the matter in the hands of the Department." Can you tell the Committee why the advocates of the various sites have altered their opinion on the subject? No doubt the idea was advocated. It was thought that whatever official was sent there his judgment on the schemes should be final. I think I got up and said that that was impossible. I pointed out that the matter would have to be submitted from him to the Department, then to Parliament, then to the Public Works Committee, and then again to Parliament, so that any agreement of that kind was abortive.

1753. Was the gathering a representative one? Undoubtedly.

1754. In the event of the Committee not quite agreeing with the opinion you have formed on the subject of Bellambi or Wollongong, may I ask whether you think it a wise expenditure of public money to put the eastern breakwater at Port Kembla? Certainly not.

1755. Am I to understand that if the Committee cannot see their way to take up the position you have taken up with regard to Bellambi, you are of opinion that the Committee would be very unwise in recommending the expenditure of public money in erecting a breakwater at Port Kembla? I do not like it put in that fashion; but I would feel disposed myself to oppose it on the ground of undue expenditure.

1756. Will you make it clearer as to how it would pay to put the breakwater at Bellambi, and how it would not pay to put it at Port Kembla? The other day, when I was here, I gave a tabulated statement of the transit of all the coal from the various collieries to the various proposed harbours. I admitted at the time that I might be wrong 2 or 3 miles in the aggregate; but in each case Bellambi totalled up to something like 41½ miles. Allowing every possibility for a mistake, it would not exceed 45 miles—that would be 4 miles and a fraction for each colliery. With regard to the other two, one went up to 103 miles, and the other—Lake Illawarra—went up to 156 miles. You can see for yourself that the port easiest of access must, as a matter of course, get the preference so far as shipment is concerned.

1757. Have you formed any opinion upon the Lake Illawarra scheme? I think it is a fallacy from start to finish. I cannot see how it can be made an effective port of shipment equal even to the cost of Port Kembla. Again, it is further south from the centre of the coal-field, and would attract less shipping than Port Kembla. It is the worst scheme of the three.

1758.

J. B.  
Nicholson,  
Esq., M.P.  
1 Dec., 1896.

1758. Is that on account of the shallow water? Yes; there are only about 10 feet of water in the lake.
1759. What is the minimum depth of water which you regard as necessary for a harbour on the south coast? I should like to see 35 to 40 feet.
1760. We have no steamers drawing that depth of water? Quite so; but the greater the depth the more secure shipmasters generally feel, if they have a good anchorage.
1761. Having in view the fact that the draught of the largest steamer which has yet entered Port Jackson is 27 feet, would not you regard 28 or 30 feet as a sufficient depth? It certainly could be utilised, and I think with every degree of safety; but it would be much better to have a greater depth.
1762. You have referred to good anchorage;—does not Port Kembla enjoy the reputation of being the best holding-ground on the coast? Yes; but I have never heard a complaint against Bellambi.
1763. Do you regard Bellambi as equally good? I am only speaking from reports with regard to either of them. From all I have heard Port Kembla has the best holding-ground.
1764. *Mr. Humphrey.*] What is the distance from Port Kembla to Kembla colliery? It has been called 7 miles.
1765. Dr. Robertson has told us that, within that radius, 70 per cent. of all the available coal would be nearer to Port Kembla than Bellambi? I certainly cannot credit such a statement, from the fact that the Mount Kembla Company had never worked their ground to its extreme southern boundary. We have no coal proved to the south of Mount Kembla which is of a marketable character.
1766. Do you question Dr. Robertson's statement? Yes.
1767. Upon what ground? Because I know the locality, and Mount Kembla is the only colliery nearer to Port Kembla than to Bellambi.
1768. Do you question the statement that not more than 42 per cent. of the available coal would be within a similar radius of Bellambi? If the Metropolitan Company could see their way to send their coal to Bellambi, which is nearer by 9 miles than to Darling Harbour, we should have, at least, from 60 to 75 per cent. of coal available for Bellambi, as against 25 or 30 per cent. to Port Kembla.
1769. But the Metropolitan mine would not come within the radius? But I presume special terms could be arranged.
1770. The contention is that 70 per cent. of all available coal is within a radius of 7 miles of Port Kembla; a statement has been made to the effect that 42 per cent. only of all available coal is within a similar radius of Bellambi;—do you question that statement? I do.
1771. Do you say that more than 40 per cent. of available coal would be within a similar radius? I do. We have three of the best collieries—South Bulli, Mount Pleasant, and Mount Keira—within a radius of  $3\frac{1}{2}$  miles of Bellambi Bay; each is from 7 to 9 miles to the northward of Port Kembla.
1772. Are they at present shipping from Bellambi? No; not one of the three.
1773. Is there any reason why they do not ship at Bellambi? Yes; the two jetties at Bellambi are private jetties.
1774. But, as a matter of fact, steamers of from 2,000 to 3,000 tons can ship from Bellambi? Yes.
1775. And not more than 800 or 900 tons from Wollongong? Yes.
1776. Why should not the collieries you have mentioned ship coal for over-sea from Bellambi, which at present they are unable to do from Wollongong? I cannot account for that.
1777. If Bellambi is so suitable for a shipping port, would not it be used to a greater extent than it has been? These shipping-places have been available at Wollongong for the two collieries I have alluded to—Mount Pleasant and Mount Keira—long before there was a private jetty built. Consequently, with these facilities already existing at Wollongong, and the tramways being laid to Wollongong, it was scarcely likely an agreement could be arrived at whereby they could benefit their position.
1778. Is there any difference of gauge which would prevent them using Bellambi? None whatever.
1779. Do you not perceive that the trading collieries would be limited to vessels of between 800 and 900 tons? It has been so.
1780. Whereas by using Bellambi they could do an over-sea export trade by vessels of 2,000 or 3,000 tons? Yes; but take the Mount Keira Company. They have had their own steam colliers of different tonnage, and the Mount Pleasant Company had what they called the old "mosquito" fleet running. It appears to me that they have got into a certain groove of work, and have kept in it when there was possibly a chance of bettering their condition by connecting with Bellambi. But the two jetties at Bellambi were private property, and I am not aware that any arrangement was attempted to be made in connection with them.
1781. Have the collieries to which you have referred used the jetties at Port Kembla? Only when completing the loading of a big steamer such as I have referred to.
1782. Are the facilities available for these collieries for shipping at Port Kembla greater than those which exist at the present time at Bellambi? Undoubtedly.
1783. Did I understand you to state, in answer to Mr. Roberts, that the deputation desiring harbour connection on the north coast did not accept the agreement which appeared to have been arrived at with regard to the officers of the Department selecting the site? It was one of those kinds of acceptances of a very nugatory character. I do not think half those present gave the matter any consideration at all.
1784. Do you say the matter was not understood? Yes.
1785. What interests do you represent in putting forward your views in favour of Bellambi? No interest but that of the general good of the community.
1786. You are not representing the views of proprietors of collieries? No.
1787. Then you are only giving your individual opinion? Yes.
1788. Assuming that the whole of the colliery proprietors on the south coast are content to accept the proposal put before the Committee by the Department, are we to ignore their views in favour of the view expressed by yourself in favour of Bellambi? It is scarcely a fair way of putting it. If I had a certain amount of vested interest to consider, I might possibly be induced to talk differently.
1789. Do you not think that if Bellambi were regarded by the owners of coal properties as the more suitable harbour for shipment, the evidence would have been in that direction instead of in the direction of Port Kembla? I am not aware how many coal-owners, or those interested in the southern coal-mines, have given evidence. But I can always read between the lines; and I have seen public works advocated where the evidence has not always been up to the mark, or what we might strictly call of a truthful character.
1790. Why is that so? Because there are certain interests to conserve or to preserve.

J. B.  
Nicholson,  
Esq., M.P.

1 Dec., 1896.

1791. Have you any objection to state the interests which you think will be most prominently conserved by the construction of the harbour at Port Kembla? The interests of the Southern Coal Company and the Mount Kembla Company; also the interests of the Wentworths as landed proprietors around Port Kembla.

1792. Do you think those interests have influenced the Department in placing this work before the Committee? I do not wish to say that; but I cannot possibly account for the extraordinary evidence which has been given before the Committee, unless it has been to conserve the vested interests of people down there.

1793. Are you speaking now of the evidence given by the Departmental officers? I am speaking, in the first place, of the report of Mr. Carleton, which is, on the whole, most unfair and unjustifiable. There is also a short report by Mr. Darley, and one by Mr. Hickson.

1794. Are we to understand that you are of opinion that the Department, in placing this scheme before the Committee, has been biased? I cannot help thinking so.

1795. Why? From the fact that when Mr. Darley was there about twenty months ago I was present. When he visited Bellambi he, in my presence, and in the presence of Mr. J. C. Jones, the manager of the South Bulli Company, Mr. H. S. Fry, J.P., and one or two others, said that, in his opinion, Bellambi was the most suitable place for a port in the district, and that it was a great pity that there was not a lot of Government land fronting the bay. Afterwards when we visited Port Kembla, he admitted a great objection to it, namely, that it forms almost a letter V, and is directly open to north-easterly gales. Again, the survey in 1859 tallies exactly with that in regard to Bellambi Bay. Whilst we have every natural protection and facility there, all we want is to have our reef capped in order to have a thoroughly good harbour for the next fifty years. I have no reason to suspect any Government official or Minister of the Crown of undue partiality. I look upon it as one of the errors of judgment which may be committed by anybody.

1796. *Mr. Egan.*] When I examined you last you mentioned that the coal at Old Bulli was not bad, and that there was no cinder coal? I said that Old Bulli and Bulli B pits were the only places where we had to contend with cinder coal.

1797. Do you not think that that has a bearing upon the necessity for constructing a harbour at Port Kembla? None whatever.

1798. Do you know what is the output of the Bulli Colliery? No; it has not been working regularly since Mr. Adams purchased the colliery.

1799. Prior to Mr. Adams purchasing the colliery, I believe it was stopped for some time? Yes; the estate was in liquidation.

1800. Did you give Mr. Roberts the names of the men who agreed to accept the survey made by the Government officials? I could not think of the whole of them.

1801. I want to know if these people had an interest in accepting the conditions? I do not think there was any interests under consideration. I think every one present at the meeting was of opinion that we should have a harbour on the south coast, and they were all willing to have any place the Government might decide upon.

1802. I understood you to say on a former occasion that no vessels anchoring in Bellambi Harbour broke from their anchors or moorings? Not to my knowledge.

1803. Would you be surprised if the witness had stated that several had broken away? It would be news to me. I can conceive it possible if a large steamer were lying at the South Bulli jetty that she might have to be released from her moorings to keep clear of the jetty; but I cannot conceive the possibility of any ship breaking from her anchorage there.

1804. In reply to Mr. Humphery, you have stated that some people have advocated Port Kembla as against Bellambi on account of having certain interests there? I said I could not conceive any other reason why such evidence could have been adduced.

1805. Is it not a fact that the greater portions of Mr. Vickery's interests are at Bellambi, and he advocated Port Kembla? I do not know what position he stands in with regard to the Mount Kembla Colliery.

1806. Has not Mr. Vickery greater interests at or near Bellambi than at Port Kembla? No; I cannot persuade myself that he has. I know that he has been a part owner at Port Kembla. I also know that he purchased, to a certain extent, the South Bulli Colliery. I also know that he purchased Clifton. Of course I do not know whether these are his properties entirely, or to what extent.

1807. Mr. Vickery stated that, if he were to advocate his own interests, he would advocate the opening up of Bellambi as a port;—therefore, he spoke rather against his interests? Apparently so.

1808. Now we come to another witness—the English representative of Corrimal? The sole interest they have there outside the Corrimal Colliery is the big jetty.

1809. What are their vested interests at Port Kembla? They have sunk something like £90,000 in machinery, shafts, and sinking for coal there.

1810. If they have not found coal they have not much interests there? They built the jetty before searching for coal.

1811. We want to know what their interests there are? When I state that this company pays the Commissioners £5,000 per annum in order that they can load their coal at the Southern Coal Company's jetty, and when I tell you they could load their coal at Bellambi for less than one-fifth of that amount, you can see that they have some interest, and the interest is in the good jetty they have already constructed.

1812. A company in order to make money will naturally go to the cheapest place, and if you say it is cheaper to load at Bellambi than at Kembla, we want to know the reason why? They could take the coal to Bellambi at one-fifth the cost at which they should take it to Kembla.

1813. Why? From the fact that they have a jetty at Kembla at which they could load a steamer, and they have not one at Bellambi. The fact that they have vested interests to such a large amount at Port Kembla, and none at the other place, must incline them to use that port as long as they can.

1814. What interest has Mr. Yuill there? Manager of the Adelaide Steam Navigation Company.

1815. Mr. Yuill stated that Bellambi was not to be mentioned in the same breath as Kembla as a harbour of refuge? Then he knows nothing about the respective positions.

1816. Then you think that if a witness only knows one port and not the other his evidence is not worth much? Yes.

1817. Then I suppose the same may be said of Mr. Franklin, the engineer? He is an old resident, and ought to know as much about one place as the other.

1818. Do you think it strange that a witness of his standing should know very little about Bellambi? He seems to like to talk about his experience in India and Ceylon.

1819.

J. B.  
Nicholson,  
Esq., M.P.  
1 Dec., 1896.

1819. There is a possibility, I suppose, of men not knowing certain things because they think them beneath their notice? Where he has passed Port Kembla once, he has passed Bellambi fifty times. I think he knows everything about Bellambi. Any man in the district knows did he but care to say so.

1820. The jetties at Bellambi and Kembla are, I believe, sufficient to cope with the present trade? They are not. Again, when they have an extremely heavy gale vessels are not able to come to load at either place.

1821. But we have evidence that in the fiercest gales steamers have been able to come to Port Kembla? I am sorry to say such evidence is utterly incorrect.

1822. If vessels can come in during the fiercest gale, ought that not to be sufficient to satisfy the present trade? The evidence is exaggerated to a great extent. The present facilities for loading coal at either place are not sufficient for the requirements of the district.

1823. I understood you to say that if a harbour were constructed, whether at Kembla or Bellambi, the trade would double itself? In proportion to what it has done during the past ten years.

1824. Is it not a fact that for some years you have been going back in your output? Yes.

1825. Seeing that there is a difference of opinion amongst the people of the southern district as to whether Port Kembla or Bellambi should be made a harbour of refuge, and seeing that you have facilities at the present time for shipping the trade you have, and which you are likely to have, do you not think that this matter ought to lie in abeyance? Certainly not. Our facilities are not of the character they ought to be. They cannot at all times load coal, consequently we have lost a large portion of our trade.

1826. *Mr. Hassall.*] Do you think the plan of the survey of Bellambi Harbour, as submitted to the Committee, is the best, or do you think that it might have been made better? I think it could have been made much better.

1827. I understood you to say that there was a reef, called the inner reef, 4 feet 6 inches under water, and you thought the breakwater might have been carried along it? Yes.

1828. What direction would that breakwater take from the coast? It is indicated in pencil on the plan. We should have a larger area of water. If our limits are circumscribed by one-fourth, it will reduce the cost materially. Again, the survey of the Government is in our deepest water, where we want our jetties and loading berths for sea-going vessels. Consequently the cost of construction can be reduced at least one-fourth. In the first place, because we shall have less depth in which to build, and also because there is no necessity for carrying it out 2,800 feet. I think 1,800 feet is sufficient.

1829. Then the calculation submitted to the Committee in regard to the cost could be materially reduced, and the anchorage-ground enlarged;—therefore, the cost per acre would be proportionately less than the cost submitted to the Committee? Yes.

1830. Would the breakwater, running practically in an easterly direction, stand the south-east gale? I feel sure it would, because the inner reef is protected by an outer reef which, at the extreme eastern end, is bare at low water.

1831. Then the outer reef would act as a kind of natural breakwater to any breakwater constructed on the inner reef, and would, to a great extent, protect it? Yes.

1832. What collieries would use Bellambi as a shipping port—would Coalcliff? I could not say positively. Coalcliff has a jetty of its own on a flat reef; but it is not available in rough weather.

1833. Would the South Clifton Company use it? Yes.

1834. Would the North Illawarra Company use it? That colliery is at the present time idle and has been since Mr. Mitchell gave up his lease.

1835. I understand the output of the Bulli Company is small;—what is the reason? Slackness of trade, I think. A short time ago they went to the expenditure of lengthening and strengthening their old jetty.

1836. I believe the output at South Bulli is considerable? Yes; and they have a jetty in Bellambi Bay.

1837. Do you know whether the Bulli seam has been discovered south of Port Kembla? It has not; and I do not believe it ever will be.

1838. Do you think the position of Bellambi would be more central for the southern coal-field than any other point which might be selected? Yes.

1839. Do you think the cost of shipping to owners would be less than the cost of shipping at Port Kembla? Yes, from the fact that the transit is so much shorter from all the collieries.

1840. With regard to the resumption of land;—what is the difference between Bellambi and Kembla in that respect? I assume that at Port Kembla we should have something like  $10\frac{1}{2}$  miles of railway to resume; at Bellambi we should only have the necessity of resuming  $1\frac{1}{2}$  to  $1\frac{3}{4}$  mile, and to construct two loop lines to connect the Government railway with the South Bulli tramway, one on the southern and one on the northern side to connect with the coal-owners north and south. Taking all things into consideration, I am certain that the cost of resumption of railways alone would be less than one-fifth at Bellambi as against Port Kembla. With regard to the land fronting the foreshores at Bellambi, we propose to resume 370 acres, and we assume that it can be purchased for £7 10s. per acre. At Port Kembla the land is worth double that money, and if they had to resume an equal quantity, it would cost double the amount.

1841. The jetties at Port Kembla would have to be resumed? Yes.

1842. Whilst at Bellambi the leases fall in in 1899? Yes.

1843. Do you think that, in the event of the harbour being constructed at Port Kembla, the northern collieries of the Illawarra district would use Port Kembla as a shipping port? Some might. I have very little doubt, for instance, that if anything occurred to prevent Mr. Vickery loading South Bulli coal at Bellambi he would take it to Port Kembla.

1844. In the event of the harbour being constructed at Lake Illawarra, would it be a strong opposing factor to any trade which might be carried on at Port Kembla? Not the slightest.

1845. *Chairman.*] I believe the Illawarra coal-field ceases at Kembla on the south? Yes; according to all presumptive evidence.

1846. If the Illawarra coal-fields ceased at Bulli on the north, it would be immaterial whether Kembla or Bellambi were chosen? I do not think we should require a harbour at either place if that were the fact.

1847. You contend that Bellambi is the more centrally-situated port? That is my contention.

1848. Your next contention is that in expending the Government money the best result should be obtained, and that best result would be brought about at Bellambi? Yes.

1849. You also contend that by making the port at Bellambi you save extra haulage of coal? Yes.

1850. Those are your three strong points? They are.

1851. Do you think the port is required for the coal-field? I do.

William McIntyre, Esq., Chief Electoral Officer, Chief Secretary's Department, sworn, and examined:—  
1852. *Chairman.*] Do you hand in a statement with regard to population? I do. The following return shows the population within the Registration Divisions of Electoral Districts extending from Helensburgh to the Shoalhaven.

W. McIntyre.  
1 Dec., 1896.

Electorate.	Division.	Population, 1896.
Woronora ... ..	Clifton ... ..	2,550
	Bulli ... ..	6,035
Illawarra ... ..	Wollongong ... ..	5,950
	Dapto ... ..	1,875
	Albion Park ... ..	1,800
Kiama ... ..	Kiama ... ..	5,000
Shoalhaven ... ..	Berry ... ..	2,530

The area embraced by these divisions is shown on maps of Electoral Districts, copies of which I hand in for the information of the Committee. The population in sections is as follows:—Helensburgh to Bulli, 8,585; Wollongong to Dapto, 7,825; Albion Park to Berry, 6,800. These figures were furnished by the police.

1853. What maps do you produce? Maps showing the extent of the divisions of electorates within which the population is located.

WEDNESDAY, 2 DECEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deepwater Harbour at Port Kembla.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

1854. *Chairman.*] Do you desire to make a statement to the Committee? No; I merely wish to preface what I have to say by mentioning that I was instructed by the Secretary for Public Works to send an officer to Illawarra to inquire into the possible means of railway connection with the proposed harbour at Port Kembla. I accordingly picked out Mr. Alexander, who knew the district, to do the work. Mr. Alexander has furnished me with the following report:—

H. Deane,  
Esq.  
2 Dec., 1896.

I beg to report that I have examined the several routes by which Port Kembla might be connected with the main south coast railway, including the existing connection by the coal line of the Southern Coal Company, and I would now, in advance of a report in detail and an estimate of the probable cost of making the connection, beg to submit a short summary of the subject and of the recommendations I have to make.

Port Kembla is already connected with the main line by the Southern Coal Company's railway, which takes off from the main line at a point some miles south of Wollongong station—thus, by this route, the total length of haulage, from all collieries situated to the north of Wollongong to Port Kembla, would be very much greater than would obtain by any of the other routes that have been proposed.

The length of line belonging to the Southern Coal Company that would have to be resumed or purchased is 4 miles 13 chains. The railway has been well and solidly constructed, the grading especially having been carefully done, and, with some alterations and additions, will be quite suitable for the heavy traffic it would have to carry. It is not a light line, however. Considerable work has been done on it, and hence the cost of it to the Government must be high. The line passed altogether through private land, which had to be purchased by the colliery company, and for which they must be reimbursed if the line is resumed by the Government.

The Southern Coal Company's coal line is laid out alongside the railway belonging to the Mount Kembla Colliery Company, which leads from the Mount Kembla mine to their own jetty at Port Kembla. This line (Mount Kembla Company's line) is not connected with the main line of railway, and the operations of the Mount Kembla Colliery are carried on independently of those of the Southern Coal Company.

One of the alternative routes is by way of a new construction altogether, taking off the main line just south of the Wollongong station, passing to the east of Tom Thumb's Lagoon, and crossing the entrance to the lagoon by a bridge.

This is the shortest connection that can be made, but by a few chains only. That advantage and that the take-off from the main line is so close as to be fully under control from the station are the only points in its favour. There is little room at the junction with the main line, and that a deep embankment only, where the necessary siding accommodation for coal-trucks can be formed. Some resumption of valuable land will be necessary for the construction of the line, some works of construction will be entailed, an embankment and a bad gradient (in favour of the road, however) to get up to the level of Wollongong station.

In view of other advantages shown by this route this extra expense in construction might be justified but for our other objection which may be taken to be fatal to this route.

The Wollongong station is approached from the north on rising gradients of 1 in 150, and 1 in 75, as given below:—  
From 48 miles 11 chains to 48 miles 21 chains—10 chains 1 in 50; from 48 miles 21 chains to 48 miles 57 chains—36 chains 1 in 75.

The other rise, which is all against the load, is therefore 36 feet in 46 chains. This rise would have to be overcome by all the coal from all the collieries that may be at work to the north of Wollongong.

In this place it should be pointed out that these same gradients will operate adversely to the loads in course of transit to the Southern Coal Company's line should that route be eventually chosen as the connection with Port Kembla. They will rule the weight of the trains over the whole extent of line as far as Port Kembla and the cost of working the traffic. They must therefore have consideration in estimating the suitability of the Southern Coal Company's line for the connection with the port.

Another

H. Deane,  
Esq.

2 Dec., 1896.

Another route is by way of Mount Keira railway, which is now between the main line and the port the property of the Government, and in complete working order as far as the port of Wollongong, and is connected by a loop with the main line. This might be extended past the gaol, along the open space, clear of the sand dunes, and almost entirely on Crown land, then along the east side of Tom Thumb's Lagoon, as in the case of the line described in the preceding paragraphs, crossing the entrance to the lagoon by a bridge.

This bridge will be the only costly work on the line—all the rest, excepting at the turn round the gaol where some sand must be cut into, will be of the easiest character.

Another proposition that has been made by the Wollongong Railway League is to adopt the works of the Mount Pleasant Coal Company's line of railway as far as the junction of that line with the Mount Keira railway at the port of Wollongong. From this point to Port Kembla the new line just described would have to be constructed, but as far as the port of Wollongong the Mount Pleasant line must stand comparison with the one from Mount Keira.

This route has a great deal in its favour, as the line affords the easiest gradients and the shortest route to Port Kembla from all the collieries situated to the north of Wollongong. The expense of working the traffic along this route, owing to the road being quite level or in favour of the load throughout, would be the lowest possible; but the prime cost of resumption and construction would be much heavier than by any other route, and, as compared with that via the Mount Keira line, the whole of it would be additional to the cost were that route adopted.

As the gauge of the existing Mount Pleasant road is 3 feet 6 inches, and as the rolling-stock of that colliery would have to continue to use the road, a third rail would have to be laid down. This would entail renewal of all the sleepers throughout this length of line. Considerable alterations would be required to embankments and cuttings, and some work would be needed on the bridges. A new overbridge would be necessary.

This line was formed through some deep spurs from Smith's Hill, and it shows considerable work in cutting and embankment. The work still to be done, therefore, to widen the road and make it otherwise suitable for the heavy rolling-stock and the traffic that would pass over it at all hours of day and night, added to the cost of the extra rail and sleepers, would raise the prime cost by this route to a very high figure.

In conclusion, I submit that the route via the Mount Keira railway and across the entrance to Tom Thumb's Lagoon will, I believe, be found to be the most suitable for adoption. I believe it will prove to be the most costly in prime cost—not so expensive to maintain—and that the percentage of return on capital expended will be higher than by any of the other routes.

I forwarded that report to the Minister, and afterwards Mr. Alexander made out an estimate of the probable cost of the work, which I think is a fair one. He put down £14,613 1s. 2d. for a single line of railway.

1855. *Mr. Wright.*] You concur in Mr. Alexander's report? Yes.

1856. Would much land have to be resumed in connection with the proposed railway? No. The line would pass almost entirely over Crown land.

1857. How do you propose to deal with the sand drift if the railway is laid along the beach? The line will not be laid along the beach itself. If the route is properly chosen the only bad part will be in the neighbourhood of Wollongong itself, after passing round near the gaol. There would be no difficulty in raising the line on a low timber viaduct to permit the sand to pass underneath.

1858. Would not the supports of such a viaduct offer a resistance to the sand and cause its accumulation? No, I do not think so.

1859. How high would your line be above high-water mark? That I cannot say. There has been no survey.

1860. What land would you have to resume if you continued the Mount Pleasant line to Port Kembla? I should imagine only at the junction; but the continuation of that line I look upon as out of the question, because of the gauge.

1861. What would be the cost of providing a double line of rails for a continuation of the Mount Keira line? About half as much again as the cost of a single line of rail.

1862. That would make the cost about £21,000 or £22,000? Yes.

1863. Do you think that any large amount of traffic could be carried over a single line? Well, the whole of the Illawarra line, beyond Hurstville, is a single line.

1864. We have been told that if the proposed harbour is a success, the shipment of coal at Port Kembla will exceed the present output of Illawarra;—if that were so, probably 10,000 or 15,000 tons would have to be carried over the railway in a day;—would a single line be sufficient for a traffic like that? It could be worked on a single line; but I would certainly recommend a double line. I consider that a double line should be made if the traffic is likely to become very large.

1865. You have not personally inspected the route of the proposed line? No.

1866. You have perfect confidence in Mr. Alexander? Yes. I know the district generally. I have been there several times.

1867. Does the estimate to which you have referred include the cost of all necessary yards and shunting arrangements necessary at the port? No; it is merely an estimate of the bare cost of connection. Of course, if you included all the arrangements necessary to accommodate a large export trade at the port the estimate would have to be largely increased.

1868. Before Port Kembla could be used as a place of shipment, sidings would have to be made, and other provisions arranged in order to meet the trade;—do you not think that the Commissioners, who would receive freight for drawing the coal, should make these arrangements. I understand that they find all the siding accommodation necessary at Newcastle? Yes.

1869. And they would have to do the same at Port Kembla? I think so.

1870. You cannot give us any approximate idea as to the cost of this necessary work? No. Before making such an estimate I should require some reliable data as to the amount of traffic and the area of standing room required.

1871. If the proposed line were made, what would be done with the Mount Kembla line and the Southern Coal Company's line;—would you have them torn up? Why not leave them.

1872. Are they the standard gauge? Yes.

1873. And good enough for ordinary traffic? Yes.

1874. I suppose your idea is to utilise them occasionally? I should think that the Mount Kembla Company would prefer to send their coal direct, instead of around by Wollongong. I am not at all sure that some strengthening would not have to be done to these lines to enable them to carry heavy engines.

1875. You do not apprehend any difficulty in constructing the proposed line? No.

1876. I think you said that the rise on the Mount Keira line was about 36 feet against the load;—that is not a very great height to rise? No. There is a grade of 1 in 75 on the main line, coming up to Wollongong, for about 36 chains.

1877. Are there any steep grades on the Mount Pleasant line? No.

1878. Would your proposed deviation cut out this grade on the main line? Yes.

1879.

1879. Are there any other grades on the proposed line? Nothing of importance.  
 1880. So that the line could be easily worked? Yes. On the main line, near Bellambi, there is a grade of 1 in 80 against the load. There is also a grade of 1 in 50 on the main line; but that is nothing.  
 1881. If you used the Mount Pleasant route, you would get a level road all the way? Yes.  
 1882. What would be the cost of widening the Mount Pleasant line? The bridges would have to be strengthened, and probably the embankments would scarcely be wide enough, though it is difficult to say what the cost of widening them would be. The rails for a single line would cost £600 or £700 a mile.  
 1883. In the event of no new line being constructed, there is already a connection with Port Kembla by means of the Southern Coal Company's line? Yes; but with a new line along the beach you would get rid of the grade of 1 in 75.

H. Deane,  
Esq.  
2 Dec., 1896.

Captain James McGeorge, s.s. "Kurrara," sworn, and examined:—

1884. *Chairman.*] Where does your vessel trade? To the various places along the South Coast.  
 1885. You are familiar with the various jetties along there? Yes.  
 1886. *Mr. Fegan.*] How long have you been trading to the South Coast? About ten years.  
 1887. Can you give us your opinion about Bellambi? It is not a bad place. It is better than Wollongong.  
 1888. Can you go in there in almost any kind of weather? You can go in; but you do not get a safe anchorage.  
 1889. What is the tonnage of your vessel? 239 tons net register. She draws 14 feet when loaded.  
 1890. Has any mishap ever occurred to you at Bellambi? No.  
 1891. What is the anchorage there? There is an anchorage of about 6 fathoms; but you are very close into the rocks when you get that.  
 1892. What is the bottom like? It is very bad. You may let go your anchor and drag a few yards, or 50 or 100 yards, and then bring up in something which prevents you from ever getting it back.  
 1893. Would you call it a safe anchorage? No.  
 1894. *Mr. Wright.*] Is it not a good holding-ground? No. It is loose sand and rocks.  
 1895. *Mr. Fegan.*] You load coal there? Yes.  
 1896. Can you unload anything there? I never tried to unload anything, except a few casks of tallow, or some stores for the mines.  
 1897. What is the depth of the water at the jetties? At the South Bulli jetty at low water you will not have more than 20 feet at the berth. At the other jetty, there would be about 15 feet 6 inches at low water.  
 1898. Have you any other objection to Bellambi, besides its bad anchorage? A swift sea comes in there from the south-east. We can always work with a roll; but at Bellambi the sea comes in and breaks, and where the sea breaks you cannot do anything.  
 1899. Can you get out in any weather? Yes.  
 1900. You are thoroughly acquainted with Port Kembla? Yes.  
 1901. Have you any objections to that place? None whatever. It is a much better place than Bellambi.  
 1902. Why? You get a good anchorage there.  
 1903. What is the anchorage? You can anchor at almost any depth, from 9 fathoms.  
 1904. What is the holding-ground? A kind of sand and mud.  
 1905. Any clay? I never got clay on the anchor.  
 1906. *Mr. Darley* says that at Port Kembla there is both sand and clay, and that a great deal of the bottom there is clay, the place being well known as a good holding-ground? That agrees with my opinion of the place. There must be something there besides sand, or else the anchor would not hold; but I have never seen clay come up on the anchor. It might be washed off.  
 1907. You do not say that there is no clay there? No.  
 1908. But you have no knowledge that there is clay there? No; but I know that the holding-ground is good.  
 1909. Can you go into Port Kembla in rough weather? Yes.  
 1910. Are you fairly secure there? Yes, at all times almost.  
 1911. Is it easier to get there than to get to Bellambi? No.  
 1912. There is a roll at Port Kembla? Yes, instead of a fast-running sea.  
 1913. You prefer that? Yes, because there is no weight on your chain, and you lie steady. At Bellambi the sea causes a jerk on the chain.  
 1914. What is the depth of the water at the Port Kembla jetties? At the Southern Coal Co.'s jetty there is about 26 feet, and about 23 feet alongside the other jetty.  
 1915. And a fair-sized vessel could go there without very much trouble? Yes.  
 1916. What about getting out? It is easy enough to get out—easier than to get alongside.  
 1917. Have you unloaded anything there? Just a few stores for the use of the collieries.  
 1918. What company does your steamer belong to? The "Kurrara" is owned by Captain Osborne, of Mount Keira.  
 1919. Is Mount Keira nearer to Port Kembla than to Bellambi? There is not much difference; but I could not tell you the mileage.  
 1920. Where is the Mount Keira coal shipped? At Wollongong, and at the Kembla jetty.  
 1921. Not at Bellambi? No.  
 1922. You have never spoken about the necessity for a better harbour? Well, I have said at Wollongong that it is a shame to take people in there, and to keep them there during rough weather.  
 1923. You have always found that Port Kembla was sufficiently good for your purposes? Yes; for the business I do there.  
 1924. Have you had any mishap at Port Kembla? No.  
 1925. Taking it all round it is a fine port? Yes; so long as the wind does not go to the east or south-east.  
 1926. Would you express an opinion as to the advisability of constructing the breakwater at either Bellambi or Port Kembla? A harbour is wanted there somewhere.  
 1927. Why? Well, look at the ships in distress that are sometimes along the coast. They have nowhere to go now.

Captain  
J. McGeorge.  
2 Dec., 1896.

- Captain  
J. McGeorge.  
2 Dec., 1896.
1928. And I suppose a port is wanted at which cargoes can be unloaded? Yes, undoubtedly.
1929. I suppose you have found it inconvenient not to be able to take a cargo of merchandise down there? Well, not financially, because we do not engage in that business.
1930. If there were a secure harbour at Port Kembla you would have a fair trade down there? Yes now we always go back empty.
1931. Do you know Wollongong well? Yes.
1932. You do not care much about it as a port? No; it lies just in the swell of the south-east sea. I have been lying in Wollongong loaded and tied up with hawsers, while a steamer has gone to Port Kembla, loaded, and returned to Sydney. I could not get out of Wollongong, because of the rough weather.
1933. And in rough weather you cannot get into Wollongong? No.
1934. What do you think of Jervis Bay as a harbour of refuge? It is a fine harbour—a natural harbour.
1935. But it is too far south for the coal trade? Yes; it would be as easy to send the coal to Sydney direct by rail.
1936. Of the three places, Bellambi, Wollongong, and Port Kembla, Port Kembla is the best? It is my favourite port. You can lie at anchor at Port Kembla when you cannot look at Wollongong.
1937. *Mr. Hassall.*] Which is the better port in its natural state—Bellambi or Port Kembla? Port Kembla.
1938. Would Bellambi be a pretty safe port if a breakwater were constructed? You can make a port anywhere by spending money.
1939. But suppose the same amount were spent at the two places? Then Port Kembla would be far better than Bellambi. Bellambi is a small place. If I am lying there in the fairway, sheltered from the sea, if I tail one way I am close to the reef, and if I tail the other way, I am close to the beach. You cannot anchor off the South Bulli jetty, because if you did, you would be amongst the moorings, and if you anchor off the Bellambi jetty and have a 40-fathom chain out, if you swing round towards the reef, you are very close to it, and, with an easterly wind, you are very close to the moorings. You could not get any shelter at all there with a long chain, because you would get out beyond the shelter of the reef.
1940. You would be practically out to sea? Yes.
1941. And in easterly weather how do the two places compare? There is very little difference between them.
1942. Have you ever lost an anchor at Bellambi? I lost one at the South Bulli jetty.
1943. Did you ever lose any chain there? Yes, 15 fathoms of chain.
1944. Did you ever lose an anchor at Port Kembla? No.
1945. Did you ever drag there? No.
1946. Did you ever drag at Bellambi? No.
1947. You think that a better harbour could be made at Port Kembla than at Bellambi? Yes, twice as good.
1948. A larger harbour? Yes, a harbour four or five times as large.
1949. Is Jervis Bay a good place to get into and come out of? It depends upon the wind. A ship coming from the south can always get into Jervis Bay.
1950. Could a ship get in there with an easterly wind? Yes. That would be a fair wind.
1951. Could it get out again? Well, it would have to wait for a favourable slant.
1952. You look upon Jervis Bay as a pretty safe harbour of refuge? As a splendid harbour of refuge.
1953. Is Port Jackson a harbour of refuge? Yes.
1954. *Mr. Roberts.*] Do you recognise the necessity for a deepwater harbour on the south coast? I think such a harbour is necessary.
1955. What are your principal reasons for saying that? I am of that opinion, because of the increase of trade that has taken place there during the last ten years.
1956. Are not the present facilities for shipment adequate for the trade? No, nothing like it. The other day a vessel of 7,000 tons—the “Indrani”—went along side the Southern Coal Company’s jetty to take in bunker coal.
1957. How much water did she draw? I suppose 23 or 24 feet.
1958. What reason is there for making a breakwater at Port Kembla? Sailingships cannot go there now. If a large sailing vessel went there she would require half a dozen tugs to stand by her.
1959. The steamers are quite safe; but for sailing ships a breakwater is necessary? Well, even for the steamers the place is not as well protected as it ought to be. On one occasion the “Echuca” had to leave Port Kembla before she had finished loading, and come up to Sydney for shelter, returning afterwards to finish her loading. On a great many occasions steamers have been hanging about awaiting an opportunity to load, but generally when they get alongside they finish their loading before they leave, though under difficulties very often.
1960. Do you bring coal to Sydney? Principally to Sydney.
1961. That coal is transhipped to larger vessels? Yes. It is generally used for bunker purposes.
1962. Where do the steamers which you supply trade to? All over the world. I supply the P. and O. Company, the Orient Company, the French boats, the Gulf line, and, in fact, all the mail boats, except the Black Germans—the German-Australian line.
1963. Would those steamers go to Bellambi or to Port Kembla for coal if there were a breakwater? Yes; because they would then get better coal at less cost per cent. The handling breaks up the coal.
1964. What would they save per ton? I reckon that by the time they have paid for the bringing of the coal up to Sydney, and the handling of it in Sydney, it costs them not less than 3s. 6d. a ton.
1965. How many tons would a P. and O. boat take? From 1,600 to 2,000 tons—say 1,800 tons.
1966. Would there be a net saving of 3s. 6d. a ton? I should think so.
1967. Are you supplying any large ocean-going steamer at the present time? I was supplying the “Ghazee” last night.
1968. How many tons of coal are you putting on board? I do not think that she wants more than 1,000 tons. I put a cargo into her before she went to Port Pirie.
1969. How many tons would the R.M.S. “Australia” want? I think she took about 1,700 tons this time.
1970. Then is not 1,800 tons rather above the average demand? I do not think so. Some ships carry coal on their decks to take them as far as Malta.

1971. What is the largest quantity of bunker coal that you have supplied to a steamer? I can hardly say; but the P. and O. steamers generally take 1,800 tons, and the French steamers more. I have seen them take 1,900, 2,000, and even 2,500 tons.

Captain  
J. McGeorge.  
2 Dec., 1896.

1972. Have you ever put 3,000 tons of bunker coal into a steamer? No, though steamers may have taken that quantity. We generally know to within 50 or 100 tons how much coal a vessel is taking.

1973. Which, in your opinion, is the best place for a port? Years before they started the Wollongong breakwater, I came to the conclusion that Port Kembla was the best place for a harbour.

1974. In what way would it be better than Bellambi? It has a better anchorage, and is better sheltered. When the sea is breaking outside the islands, you only get a roll in Port Kembla.

1975. Would not the two places be equally safe if breakwaters were constructed? Yes; but at the present time the sea never strikes round into Port Kembla as it does into Bellambi.

1976. Is Port Kembla known amongst mariners to have the best holding-ground on the South Coast? Well, when we have wanted to anchor for the night we have gone from the South Bulli jetty at Bellambi down to Port Kembla, and returned at daylight.

1977. From what quarter does our bad weather come—from the south south-east? The gales generally start from the south, or south-west, and work round to south and south-east.

1978. Does the wind ever blow due east? Yes; it blows right round from south to north.

1979. During easterly weather, which of the breakwaters would afford the better shelter to Bellambi—that proposed by the Government, or that suggested by Mr. Nicholson? The inside breakwater. The outer breakwater would be very little better than the present reef. Of course if the outer breakwater were carried further to the north or to the north-west it would do better than even the Government breakwater. In building a breakwater you should build it so that the sea will run along it instead of rebounding against it. The outer breakwater is comparatively useless as proposed.

1980. At Port Kembla would you prefer the breakwater to be constructed as proposed, or would you turn it slightly to the north-west when you got out 2,200 feet? I think it would be better if turned a little to the north-west. Instead of bringing the sea into the basin, as it would do if constructed as proposed, if it were turned to the north-west the sea would break away towards Wollongong.

1981. How far do you think the breakwater should be brought in a north-westerly direction? About 600 feet.

1982. *Chairman.*] The end of the proposed breakwater is three-quarters of a mile from the shore,—is there any objection to bringing it within half a mile of the shore? No; I do not think so. The sea then, instead of breaking round the point of the breakwater into Port Kembla bay, would be thrown on to the beach near Wollongong.

1983. *Mr. Hassall.*] What do you think of running the breakwater altogether in a north-westerly direction, following the line of the coast from Red Point? That would throw the sea away from Port Kembla.

1984. Would you then have a safe entrance? Yes.

1985. Would there be sufficient room for getting in and out of the harbour at any time? Yes; you could beat out of it.

1986. *Mr. Roberts.*] If the end of the breakwater were within half a mile of the shore, would the entrance be large enough? Yes; quite large enough.

1987. Would the sea be worse half a mile from the shore than three-quarters of a mile from the shore? No; it would be about the same. Of course, when you get close into the beach you get a bad sea, because the roll going one way meets the rebound from the beach.

1988. To be on the safe side, do you think the end of the breakwater should be kept three-quarters of a mile from the shore? I do not think that that is necessary.

1989. If it came within half a mile of the shore, could vessels enter the harbour in safety? Yes. Of course, a big four-masted ship might not care to go in; but vessels have been known to sail into Newcastle harbour, the entrance to which is very much less than that proposed here. A vessel could always get into shelter and drop her anchor if the entrance were half a mile wide.

1990. The proposal to carry the breakwater in a north-westerly direction, following the line of the coast from Red Point, would, if carried out, reduce the harbour area? Yes.

1991. But would not the harbour, even then, be large enough? Well, one hardly knows. Trade has increased very much within the last twenty years. I think that all that is needed is to turn the breakwater in a north-westerly direction after you have taken it out about 2,200 feet as proposed.

1992. Would there be plenty of water all over the proposed harbour? Yes, so far as I know, with the exception of a shallow patch near one of the jetties.

1993. Would there be enough water to enable a 7,000-ton steamer to go alongside the jetties? Yes.

1994. Would it be necessary to construct any more jetties? After a time, other jetties might be required.

1995. Do you ever load at Bellambi? Not very often, though I have loaded there scores of times.

1996. You know the nature of the proposed harbour works at Lake Illawarra? Yes.

1997. *Mr. Wright.*] Could you take your vessel into Lake Illawarra at the present time? No, she would require to have rollers on the bottom to enable her to get in now.

1998. *Mr. Roberts.*] Would you be likely to go there for coal if a channel 15 feet deep were cut through the lake? What is the use of a channel 15 feet deep.

1999. What depth do you think is necessary? Not less than 25 feet. I do not think my people would alter their present arrangements.

2000. If the proposed works were carried out at Lake Illawarra, would you still think it necessary to have a harbour on the south coast for the development of the sailing-ship trade? Yes. To develop that trade you must give it suitable accommodation.

2001. *Mr. Wright.*] If the proposed breakwater were constructed, would you take a sailing-ship of 2,000 tons into Port Kembla? Yes.

2002. Could you work her out with a south-easter blowing? I daresay.

2003. You think that the proposed breakwater would make a good harbour for all classes of vessels? I think so.

THURSDAY, 3 DECEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).	
The Hon. FREDERICK THOMAS HUMPHREY.	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.	

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Henry Osborne MacCabe, Esq., Manager, Mount Keira Colliery, sworn, and examined:—

H. O.  
MacCabe,  
Esq.  
3 Dec., 1896.

2004. *Mr. Hassall.*] Have you any statement to make with regard to the proposal before the Committee? The idea I have about it is that Port Kembla is the most suitable place at which to make a deepwater harbour for the southern district. At Port Kembla you could protect a large area of deep-water, and you have already there good jetties from which probably 1,000,000 tons of coal could be shipped annually. Those who are interested in the coal trade of the district have realised for many years past the need of a good shipping port on the south coast. I was chairman at a meeting at which the various interests in the district were represented. Of course, while everybody agreed that the port was necessary, each wanted to have it against his own door. At this meeting, at which there were representatives from Bellambi, Wollongong, and Kembla, it was decided that we should go to the Minister and ask him to send an officer to report upon the question of providing a harbour, we agreeing to abide by the decision of the Government. Personally, a harbour at Wollongong or at Bellambi would serve my interests better than a harbour at Port Kembla; but my conviction is that Port Kembla is the best place for a harbour.
2005. How long have you been connected with the Mount Keira Colliery? I have held a power of attorney for Mr. Frank Osborne, who owns the colliery, for the last eight or nine years, and for seven years previous to that I was assistant to my father, who held a similar power of attorney.
2006. How long was your father managing the colliery? He was managing the colliery twenty-four years ago, or more.
2007. How long do you think the coal there will last? At our present output, over seventy years.
2008. That is if you continue to work the same seam? Yes. I am only taking into consideration the top seam—the Bulli seam—at the present time.
2009. I understand that that coal has a very good reputation as a steam coal? Yes; it is the best steam coal in the Colony.
2010. Is the demand for it increasing or decreasing? It is gradually increasing. While the output of individual collieries may have fallen off slightly, the aggregate output of the district has increased.
2011. Is there any probability of the underlying seams being worked? Not for steam coal, while the Bulli seam continues. Later on the lower seams will be used, not perhaps for export purposes to a great extent, but for manufacturing purposes.
2012. What seams are there under the Bulli seam? There are nominally five. There is, first of all, a 4-foot seam. Then there is the big seam, in which there are 5 feet or 5 feet 6 inches of fairly good coal. Then there are three other seams which I have not proved very much; but I know they are there. They show on the outcrop; but I have not driven into them.
2013. What is the quality of the coal in these seams? Fair to medium.
2014. Is it equal to the coal in the Bulli seam? No; not as a steaming coal. None of our coal is equal to the Bulli seam.
2015. Neither in the southern nor in the northern districts? Not for steaming purposes.
2016. Then, if a breakwater were constructed at any place on the coast, easily accessible from the collieries, the output of the district would greatly increase? There is no doubt about that. It is only two years ago since I, with some others, endeavoured to get the coal-owners around there to combine for the allotment of proportionate shares, so that we might borrow upon the security of the whole of the properties to make a breakwater at Port Kembla.
2017. What was the result? Everybody considered his goose such a big swan that we could not apportion the interests.
2018. Are the collieries associated? No. We call ourselves the Southern Coal Owners' Agency.
2019. You desire the Government to come to your rescue by making a harbour at which the various collieries may ship their coal in any weather? Yes; that is what we want.
2020. Would the various collieries, in the event of that being done, be prepared to pay shipping charges equal to those paid at the port of Newcastle? Certainly.
2021. Have you any idea of the present output of the collieries that might ship at Port Kembla? In the three months ending 28th November last, the Agency has shipped and sold 171,000 tons of coal. That is at the rate of about 700,000 tons a year.
2022. What collieries are comprised in the agency? The Metropolitan.
2023. Where is that coal shipped? At present, in Sydney.
2024. Would any of it be likely to come to Port Kembla? I think they would be likely to ship some of their coal there, because, I take it, the Commissioners would be prepared to haul it more cheaply to Port Kembla than to Sydney, inasmuch as to Port Kembla there is a down grade. Besides the Metropolitan, there are the Clifton Colliery, and the Coalcliff, South Bulli, Mount Keira, and the Mount Kembla collieries. The Bellambi Colliery would also send coal to Port Kembla, and the Corrimal company at the present time sends about 120,000 tons a year there.
2025. What would be the yearly shipment from Port Kembla? Last quarter the Mount Kembla Company shipped about 44,000 tons there. That is at the rate of 176,000 tons a year. The two collieries ship about 300,000 tons per annum at Port Kembla.
2026. And in the event of a breakwater being constructed there the output of coal would probably increase? Yes; I think we could get sailing vessels there, and steamers would come there which do not care to come at the present time. I should think it would be a low estimate to say that the increase of trade would amount to 200,000 tons.
- 2027.

2027. That would make the total quantity shipped about 500,000 tons? Yes.

2028. How much coal would have to be shipped at a charge of 4d. a ton to pay interest upon the cost of constructing the proposed works? I do not think that so far as the appliances for shipping are concerned there need be any expense beyond the cost of resuming the present jetties. Fourpence a ton seems to me too high a charge. Threepence a ton, in my opinion, would be a fairer charge, though that would not pay interest upon the cost of constructing two new jetties. I do not think that a northern breakwater is wanted at Port Kembla. An eastern breakwater would provide sufficient shelter for the trade. When we asked the Government to send an officer to report upon this matter we did not expect to get an elaborate plan, such as that submitted to the Committee. Of course it is a very good thing to have a plan of this kind, but I do not think that it would be fair to saddle the trade or the Government with an unnecessary expenditure. In my opinion, if you constructed the eastern breakwater and resumed the existing jetties at their present value, you would do all that is necessary for the trade there. You could, at very little expense, by adding to one of the jetties, give facilities for the landing of any cargo required by the smelting works, or by anyone else. At the Southern Coal Company's jetty we have loaded a vessel carrying over 7,000 tons of cargo.

2029. What is the largest vessel that has been loaded there? A steamer came there from New Caledonia carrying 6,500 tons of nickel ore, and she took away 2,000 tons of bunker coal.

2030. In your opinion, it is not likely that a vessel of larger tonnage would come to the place? Vessels of larger tonnage might come there; but I do not think that vessels of deeper draught are likely to come, because, in my opinion, the limit of draught has almost been reached. Vessels may be made as big as you like, and with as much beam as you like; but I do not think the draught is likely to be much increased. At that jetty any vessel that is likely to come to Port Kembla could be loaded. It would be time enough to spend money in improving the jetty when the necessity for improvement arose. I do not think that any vessels come to this port which could not lie alongside that jetty.

2031. Mr. Darley estimates the value of the jetties as £8,100 and £5,430;—do you think that a fair valuation? I have never had any jetties built; but I was told that the Southern Coal Company's jetty cost £18,000, and the Mount Kembla jetty about £15,000.

2032. How long have they been constructed? The Mount Kembla jetty about eight years, and the other jetty about six years.

2033. What is the life of these jetties? With a breakwater, and if they were properly maintained, I believe they would stand over twenty years; but at the present time they are subject to the risk of being washed away. Only three years ago the end of the Mount Kembla jetty was carried away by the sea, and it cost £2,000 to replace it.

2034. Supposing the Government paid £20,000 for the jetties, would that be a fair thing? I should think that fair, though not a liberal offer.

2035. Would it be necessary to erect cranes or appliances for unloading at Port Kembla? No; I do not think so. The P. & O. steamers, and most modern vessels, carry their own cranes. You do not see any cranes at Circular Quay for the discharging of vessels.

2036. The cargo to be unloaded at Port Kembla would probably be ore chiefly? I do not think that expensive cranes would be necessary to deal with it, because the ore would not come out in very heavy quantities. All we want is protection from the sea. Of course, as the trade increased, you could have elaborate cranes and fixings.

2037. Do you think it would be necessary to carry the proposed breakwater out 2,800 feet? I should build the breakwater from the start with a sufficient cross-section to enable me to carry it out 2,800 feet if necessary; but if I found that 1,600 feet would give sufficient shelter, I would stop there. We do not want the Government to incur an unnecessarily heavy expenditure.

2038. You want to reduce the shipping charges as much as possible? Yes. Of course, we do not expect the work to be done for nothing.

2039. Do you think that a breakwater carried out in a north-westerly direction, in line with the coast from Red Point, would be more suitable than the proposed breakwater? I am not in a position to give an opinion upon that point.

2040. You think that in the event of the breakwater being made, an export of 500,000 tons of coal could be relied upon? I think so. At the present time we have to refuse many orders, because we cannot deliver the coal at Port Kembla. With a breakwater, we would have a fair chance of doing a trade at Singapore and at Colombo. The present cost of lightering the coal round to Sydney by steamer is about 2s. 6d. a ton.

2041. Do you think that if the breakwater were made, large steamers would come to Port Kembla and load there? A large number of steamers would not come to Port Kembla. The mail steamers would not do so, nor would some of the big wool-tramps. They would find it cheaper to pick up their coal at Sydney. But at the same time, vessels would come to Port Kembla to take coal to Singapore, Colombo, and San Francisco.

2042. Putting the cost of the breakwater at £160,000, do you think all necessary work might be done for £200,000? Well, there would be the beach railway from Wollongong to construct. I think that £200,000 would provide all the facilities we would want for a long time to come.

2043. And the rates to be charged would go to recoup interest on that sum? Yes.

2044. Do you know Bellambi? I have lived within a mile and a half of Bellambi nearly all my life; but I have not taken as much interest in Bellambi as in Port Kembla.

2045. Do you think it would be a better port to improve at the expense of the State? The Government engineers have dealt with the whole subject, and I have pledged myself to abide by their decision; but I must say that I think Port Kembla is the best place. If I owned all the coal in the district that is where I would make the port. I saw by the newspapers that there is some idea of making the beach line with a double track; but in my opinion a double track would not be necessary. I should be glad if we could get all the trade that we could send along a single line.

2046. *Mr. Roberts.*] In speaking of £200,000 as the total cost of the proposed works, did you include land resumption? No, because I do not think that the cost of land resumption should form part of the cost of making the harbour. The Government will make a very bad bargain if they are not able to sell the land they resume for more than they give for it, and the profits of the sale might go as a credit against the cost of the work.

H. O.  
MacCabe,  
Esq.

3 Dec., 189

H. O.  
MacCabe,  
Esq.

3 Dec., 1896.

2047. How many acres of land do you think the Government should resume there? That is a matter of policy for the Government to determine; but a certain area—perhaps 40 acres—would be required for siding accommodation.

2048. What value would you put upon the land which it would be necessary to resume? The land is at present used for grazing, and I should think £10 an acre would be a very good price for it.

2049. *Chairman.*] Does that take into account the way-leave that is paid for running over it? No.

2050. *Mr. Roberts.*] What would it cost the Government to obtain absolute possession of the land? Why not let the Government take a long lease of it, and pay way-leave, making a charge to cover the cost? I would sooner see the Government own the land, however.

2051. Do you think that £20 an acre would be its maximum value? I do not know what its value is, taking into account the way-leave.

2052. If the proposed works were carried out, would there be a large population settled at Port Kembla? I think that Wollongong would still be the business and residential centre.

2053. Will the southern coal compare, for steam and smelting purposes, with any coal in the world? For steaming purposes it is nearly equal to the best Welsh coal, which is the best coal in the world. For smelting purposes it is very good.

2054. Has the investment of capital along the coast proved remunerative in all cases? Not in all cases.

2055. Do you think that any great loss of capital has taken place owing to the absence of a safe harbour? I think so. If we had had a good harbour we should have obtained better prices, and some of the companies which went down might be in existence now.

2056. Why have these companies come to grief? Some of them over-capitalised their properties.

2057. Has a large amount of private capital been invested in the jetties along the coast? Yes. A jetty was built at Coalcliff and washed away, and another had to be built. A jetty was built at North Illawarra, a second jetty at Bulli, and at Bellambi two jetties were washed away and had to be renewed. At Port Kembla the Mount Kembla jetty proved to be too low, and five or six years ago the company had to rebuild it. The Southern Coal Company have also put up a jetty there, at which vessels of nearly 8,000 tons can load.

2058. Is more coal shipped at Port Kembla than at any other place along the coast? Yes; than at any other individual place.

2059. Are the steamers attracted there because of the protected state of the place? Yes; and because the Southern Coal Company's jetty is the only jetty at which very deep steamers can be loaded. With regard to the Bellambi jetty, I am informed that the "Glaucus" generally loads partly at Kembla and partly at Bellambi. The master says that at Bellambi the harbour is silting up, and he proposes to load now first at Bellambi, and then go on to Port Kembla.

2060. Do they want two classes of coal? I do not quite know; but they think Port Kembla the safer place, because they prefer to go there loaded instead of going to Bellambi loaded.

2061. Would it be absolutely necessary to construct the beach railway if the proposed breakwater were made? It would be a great help; otherwise traffic from the north would have to come a long way round. Only about 3 miles to 3½ miles of railway would have to be made.

2062. How long will the top seam in Illawarra last at the present rate of output? I should say 200 years.

2063. What would be the increased output following upon the construction of the proposed breakwater? I should think that within ten years the trade would more than double.

2064. Would that be owing to a development in the sailing-ship traffic? Partly, and partly because we would get more big steamers.

2065. Your coal would then go to Bombay, Madras, Singapore, and Shanghai? Yes; When Mr. M'Lean was agent for the P. & O. Company, he thought of taking coal from Port Kembla to Colombo and to Bombay, but the labour difficulty arose, and the prices went down so much that they were not able to do it. I believe that if we could have delivered the coal to them at Port Kembla they would have taken it.

2066. How much coal do the P. & O. boats take? About 45,000 tons every year.

2067. How far does their coal carry them? I think to Suez; but I really do not know.

2068. If the proposed breakwater were constructed, would the P. & O. steamers go to Port Kembla for coal? No. At that time they thought of using some of their small steamers to carry coal from Australia. The mail steamers do not go there to load coal. Their bunker holes are not suitable for one thing. The coal has to be put on board in baskets and then run along the decks. Steamers that were in a great hurry would not run down there; but we should get a large number of tramps and sailing vessels.

2069. *Mr. Black.*] Are we to understand that if the Government surveyors had not declared in favour of Port Kembla you would have preferred some other place as a harbour? No.

2070. You have no other preference? No, though my private interests would be better suited by the making of a harbour at Bellambi or at Wollongong.

2071. It is about 3 miles from Wollongong to Port Kembla? Yes.

2072. If a harbour is made at Port Kembla will the people employed there go daily backwards and forwards to Wollongong? They would have the train.

2073. You think that Wollongong is likely to remain the business centre? I think so.

2074. You spoke of a jetty being constructed at Port Kembla, which is considered too low;—is that jetty still in existence? No, the other jetty was built diagonally over it.

2075. If you were loading a vessel with large and small coal, which would you put in first? That would depend upon the skipper of the vessel. We should load according to his orders.

2076. In regard to what you said about the "Glaucus," the captain does not go to Bellambi first, because he wishes to load small or large coal there? No; but he is afraid to draw too much water at Bellambi, and, therefore, loads there before going on to Port Kembla.

2077. *Mr. O'Connor.*] You know every place south of Botany Bay which has any pretensions to be called a harbour;—which do you think is the best? Port Kembla.

2078. Why? I think that any expenditure there would give better facilities for shipping than a similar expenditure at any other place. Anyone looking at the three ports—Bellambi, Wollongong, and Port Kembla—would be impressed with the superior natural advantages of Port Kembla.

2079. What is your opinion with regard to the Lake Illawarra scheme? £200,000 spent at Lake Illawarra would not give anything like the same result as a similar expenditure at Port Kembla.

2080. Would that expenditure at Port Kembla provide a harbour of refuge there? Yes. Steamers have anchored there, and have ridden out very heavy gales at the present time.

2081.

H. O.  
MacCabe,  
Esq.

3 Dec., 1896.

2081. What is the largest vessel that could be loaded at Wollongong under the most favourable circumstances? We cannot take anything drawing more than 15 feet of water, and then we have to wait for a high tide. About 780 tons is the largest sized vessel that can load there.
2082. What could be done at Lake Illawarra? I do not think that scheme will ever be carried out, and it seems very unfair that, because a corporation has been granted certain powers, which it has not exercised, the Government should be prevented from making a harbour elsewhere. All they have done in the last seven years is to buy some land.
2083. Do you think it would be next door to throwing money away to try to provide a harbour there? I cannot help thinking that the proposal to cut a ditch across the lake would, if carried out, make a trap for any big vessel going in there. I have never seriously looked at Lake Illawarra as a possible harbour.
2084. *Mr. Lee.*] You referred to a concensus of opinion amongst colliery proprietors as to the advisability of leaving the Government to settle this matter? Yes.
2085. Were meetings held at which that decision was arrived at? The agreement was made, not so much by the colliery proprietors as by the people of the district.
2086. Did the managing directors of the various collieries ever meet together to consider this question? They were present at a meeting in which the Bellambi Progress Committee, the Kembla people, and the members of the Wollongong Harbour Trust took part.
2087. How long ago? About two years ago.
2088. Was the Lake Illawarra scheme in existence then? Yes.
2089. They were aware that the Lake Illawarra Corporation contemplated making a harbour? We had known that for five years, but we had never seen anything done. We knew that they had an Act of Parliament.
2090. If the Illawarra scheme were carried out, do you think that there would be any chance of a harbour at Port Kembla paying interest? At Lake Illawarra they are only pledged to provide a channel 15 feet deep. That would not give as much water as we have at Wollongong.
2091. If there were no Port Kembla, and the Lake Illawarra scheme were carried out, would you send your coal to Lake Illawarra? It would be no use sending coal to a place where there is only 15 feet of water. It seems to me useless to argue about conditions that can never exist.
2092. *Mr. Wright.*] To whom do you send your coal now? Most of my coal supplies the P. & O. Co.
2093. Would any of the large ocean steamers go to Port Kembla from Sydney for bunker coal? Yes; a vessel of 5,000 tons would run down there in about five hours, at a cost of about £25.
2094. Could a vessel of 5,000 tons move herself from Cockatoo Island to Circular Quay for less than £25? Well, at any rate, by going to Port Kembla a vessel would save 2s. 6d. upon every ton of coal she took.
2095. What is to prevent the ordinary steamers from going there now? They have to pay heavy insurance; but if the port were protected the insurance would not be so heavy.
2096. What is the extra insurance? I cannot tell you.
2097. It appears from your evidence that the only new trade at the port would be an occasional steamer? No. We have to refuse a great many orders now which we could fill if we could supply the coal at Port Kembla.
2098. Would a sailing vessel sooner pay 2s. 6d. a ton to load in Sydney or be towed down to Port Kembla? We would tow sailing vessels down with our own colliers.
2099. *Mr. Fegan.*] You have heard Dr. Robertson's evidence—do you agree with what he said in regard to the advantages of Port Kembla over Bellambi? Yes.
2100. *Chairman.*] With regard to the length of the proposed breakwater—I suppose you mentioned 1,600 feet as a sort of "x" quantity—you would not carry it out further than was necessary to give the shelter required? Yes. No doubt it is well to have a completed scheme kept in view, so that any work done may be in accordance with that scheme; but I do not think that half of the work proposed will be required in our time.
2101. The southern end of the Bulli coal seam is somewhere about Mount Kembla, while the eastern face runs pretty well parallel with the crest of the Illawarra range, approaching within half a mile of the sea at Austinmer, and running out at Clifton? Yes. Immediately west of Coalcliff there are about 4 feet of fair coal. North of that—at Stanwell Park—the coal is burnt a bit.
2102. Is there any break between Clifton and Coalcliff? There is a jump-up going towards Clifton; but the coal at Clifton is fairly good. There are about 1,000 acres of fairly good coal there. At Austinmer the coal is very much broken; and at Bulli the best coal has been worked out. There they are close against the cinder dyke.
2103. *Mr. Wright.*] Have they not cut through that dyke, and found good coal behind it? Not to my knowledge. I believe that there is more than three quarters of a mile of cinder coal. Coming down to Bellambi that coal was cut off by the same dyke as occurred at Bulli. South Bulli is to the west of the dyke. The tunnel mouth was in burnt coal; but now they are on the west of the dyke. There is a big cinder trouble starting at Towradgi Point, and going north-west.
2104. From there is there any serious trouble until you get to Mount Kembla? No, not until you get south of Mount Kembla.
2105. The coal to the north of the cinder dyke of which you speak, is some of it very good; but the great belt of good coal lies south of the dyke? Yes.
2106. The valuable coal in Illawarra lies abreast of Wollongong? Yes.
2107. Is Bellambi as much to the north of it as Port Kembla is to the south? I should say a little more to the north.
2108. You believe that the great bulk of the marketable coal of the district lies south of the cinder bed, which is a little north of Corrimal? Yes.
2109. North of the cinder bed the coal is broken? It is not so thick, it is not so regular, and it is more broken.
2110. It is for the coal-field lying west from Wollongong that the harbour is required? Yes. A seam has been opened up west of Lake Illawarra; but I do not think that is the top seam.

Captain  
S. Agutter,  
Dec., 1896.

Captain Frederick Samuel Agutter, s.s. "Mount Kembla," sworn, and examined:—

2111. *Mr. Roberts.*] How many tons of coal do you generally carry? 750 tons.
2112. Have you been trading down the south coast long? For twelve years, during nine of which I have been master of steam colliers.
2113. You have traded to Bellambi, Wollongong, and Port Kembla? Yes; I have traded constantly to those ports.
2114. You are intimately acquainted with them? Yes; I know them well.
2115. Have you experienced any difficulty in loading at Port Kembla in bad weather? Yes, at times; but not very often. We get a ground swell there sometimes.
2116. What other vessels have you commanded? I had charge of the "Aldinga," a smaller steamer, and one which was much easier to load.
2117. What tonnage is she? She carries 450 or 500 tons.
2118. Do you regard the construction of a breakwater as necessary to the development of the southern coal trade? Yes. If there were a breakwater at Port Kembla, we should get much larger vessels to go there. Many do not like the place, because of the slight swell there. If it comes on much they get frightened and go to Sydney.
2119. What is the largest steamer that you have seen there? Some of the Gulf boats and some of the Tiger line have been there.
2120. 5,000 or 6,000-ton boats? Yes; I suppose the largest steamer that has been there would be about 6,000 tons.
2121. Which is the best site for a harbour? I think that Port Kembla is the only place for a harbour there. It would make a harbour of refuge if the breakwater were constructed.
2122. Is a harbour of refuge necessary, considering the proximity of Jervis Bay? I do not think you can have too many harbours of refuge.
2123. In their present state which is the best place for loading and unloading—Wollongong, Bellambi, or Port Kembla? I have traded to them all, and I think that Port Kembla is undoubtedly the best place.
2124. Is the holding ground better? Yes; the anchorage is good. At Bellambi I have lost four or five anchors.
2125. Is Port Kembla naturally more sheltered than Bellambi? Yes, very much. The Five Islands shelter it from all but easterly and east-south-east weather.
2126. Do you think it would be necessary to carry the breakwater as far out as proposed? To my mind it is would be better to turn the breakwater in towards the beach a little.
2127. You would recommend the end of the breakwater being taken, say, half a mile nearer to the shore? I should think that would give plenty of room to enter.
2128. The breakwater would then afford better protection from north-east gales? It would then afford all the protection that is necessary.
2129. Would the breakwater shown on Mr. Nicholson's plan shelter Bellambi so well as the proposed Government breakwater? No; it would not even keep out a south-east gale.
2130. You think that if the proposed breakwater were constructed at Port Kembla a large foreign trade would be done there, and sailing ships would go there? Yes; I think that sailing vessels would go there for coal, as they go to Newcastle. Anything could go there that wanted to.
2131. *Mr. Lee.*] Have you ever had to slip away from Port Kembla, and put out to sea when only partly loaded? No; though I have been very glad to get finished sometimes, I have never come out half loaded.
2132. Not during a strong easterly gale? If the weather is very bad, we do not go in.
2133. In such weather, I suppose, you stay in Port Jackson? We might go down, and if we did not like the look of it we would come back again. It is only about a dozen times in the year that we have any trouble at Port Kembla.
2134. Have you ever dragged your anchor there? No; it is good holding ground.
2135. At which port would you sooner ride out a gale, at Bellambi or at Port Kembla? At Port Kembla. The holding ground is better, and the place is better sheltered. At Port Kembla you get sand and clay, whereas, at Bellambi the bottom is rocky, and if you drop your anchor you are not certain that you will get it again.
2136. Do you think that with a breakwater Bellambi would be as well protected as Port Kembla? I think it would be easier to make a harbour at Port Kembla.
2137. *Mr. Trickett.*] During what weather can you lie in Port Kembla and load? We can load there two days after a south-east wind has been blowing hard.
2138. What about an easterly wind? You cannot load anywhere along the coast during easterly weather.
2139. How about north-easterly weather? A north-easter does not stop us. It does not raise any sea.
2140. You could load even during a black north-easter? Yes; I have done it often.
2141. A breakwater is only required to protect you from south-easterly and easterly gales? You would require to keep northerly weather out if you had large ships, because they offer so much more resistance to the wind than small vessels.
2142. Can you go right alongside the jetties at Port Kembla, or do you make fast to buoys? You drop anchor, and then take ropes from the jetty, and make fast to buoys.
2143. With what winds can you load at Bellambi? You can load at Bellambi after it has been blowing from the south-east for a day, and sometimes when it has been blowing for two days; but not often.
2144. Is Bellambi as well sheltered from the north-east as Port Kembla? Yes; but Port Kembla is much better sheltered from the south.
2145. During the summer the prevailing wind is the north-easter? Yes.
2146. When do you require most protection? During June, July, and August, and sometimes in February. You get south-east and easterly weather in those months.
2147. How do you go alongside at Bellambi? Just as we do at Port Kembla.
2148. If breakwaters were constructed you would be able to steam right alongside at either place? Yes.
2149. There would be no "send" then? No.
2150. *Mr. Fegan.*] To what company does your steamer belong? To the Mount Kembla Coal Company.
2151. *Mr. Trickett.*] Can you give us any opinion in regard to the Lake Illawarra scheme? No.
2152. *Mr. Fegan.*] Have you had any conversation with your owners at any time in regard to this matter? No. I have never had anything to say about it.
2153. You have never complained to them of the risks you run? No; it becomes second nature to us now to go there.

FRIDAY, 4 DECEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Captain Hector Allen Boyle, late master ss. "Aldinga," sworn, and examined:—

2154. *Mr. Black.*] To which of the ports under the consideration of the Committee have you been trading? To all of them.

2155. Have you made trips more frequently to one place than to another? I have been more often to Port Kembla and to Wollongong than to Bellambi.

2156. Which, in your opinion, is the most suitable place for a harbour for the shipment of the southern coal? Port Kembla. There is no comparison between it and the other places. I have loaded at Port Kembla when I could not get into Wollongong.

2157. Next to Port Kembla, which is the best place? Bellambi.

2158. Why do you prefer Port Kembla? Because the approach to it is so good. There is no danger of making a mistake in getting to the jetties.

2159. What do you mean by saying that the approach is so good? It is free from all dangers.

2160. Do you mean that there are rocks and shoal-water at Bellambi? Yes. I have frequently refused to go to Bellambi when I have gone to Port Kembla; that is at night.

2161. Why have you refused to go there? Because of the danger; I lost my vessel there in the end. There is just barely room to moor alongside the jetty, and if you make a mistake you are ashore. At Port Kembla you have plenty of room.

2162. Is there a sandbank at Bellambi? Rocks and patches of sand. If you make a mistake you are either on the reef or on the beach. The "Corinna" went ashore there.

2163. If these dangers were removed by dredging, would Bellambi be as good as Port Kembla? I do not think you could dredge it. The only thing to do would be to run the jetty further out into deeper water. Of course, it could be improved; but it would be very expensive.

2164. Is there any objection to Bellambi on the score of the anchorage? Yes; the bottom is very bad. Although I was fortunate enough never to lose an anchor there, I often got them foul of the rocks.

2165. How is the place in a gale? It is no place at all in a gale, in its present condition.

2166. Is it exposed to any particular wind? It is exposed to all weather from south to north-eastwards.

2167. Does a due south wind not affect it? Not much, until it has been blowing for two or three days.

2168. If the proposed breakwater were constructed, would it be any safer from the winds? Certainly.

2169. It would be possible to provide a harbour there to which entrance would be easy in most weathers? Yes; but it would take much less to make a good harbour at Port Kembla.

2170. Was the "Corinna" lost at Bellambi? No; they got her off again.

2171. Did she run ashore? I believe that one of the hawsers carried away, and she swung round on to the reef.

2172. Was the accident caused by the weakness of the hawser? It might have been caused by too much strain. If such a thing had happened at Port Kembla the vessel would have come to no harm; she would not have gone ashore.

2173. Are we to understand that at Port Kembla there is fairly deep water all over the bay? Yes, except for a granite reef about 2 cables' length from the end of the Mount Kembla jetty, on which there are about 16 feet at low water. That reef dips and comes out again on the beach at a point north-westerly from the jetty, about halfway towards the entrance of Tom Thumb's Lagoon.

2174. Would it not be necessary to remove that reef? No; I think the breakwater goes across it. North and west of the reef the bottom is soft mud and sand, with clay underneath.

2175. That is a good holding-ground? Yes. All north and west of the reef there is good holding-ground. In between the reef and the shore the bottom is all sand, and the depth never varies more than about 18 inches.

2176. What is Port Kembla like in rough weather? It is more sheltered than any of the other places. There is no shelter at Bellambi in bad weather.

2177. Have you ever found any difficulty in loading at Port Kembla? Very seldom. I have loaded there with the sea breaking all round me.

2178. Have you ever found it necessary to cut and run? No. The "drawback" does not come against the Port Kembla jetties so heavily as against the Bellambi jetties.

2179. Which is the most dangerous wind at Port Kembla? An easterly wind, and what we call a black north-easter. The ordinary north-easters do not affect us.

2180. Would the proposed eastern breakwater be sufficient protection against an easterly gale? I think so, if it were made strong enough.

2181. Is it long enough? Yes, to protect the jetties.

2182. The head of the breakwater is shown on the plan to be three-quarters of a mile from the beach;—would the place be better sheltered if the breakwater were curved in more towards the shore? I think the breakwater should start from a point on the coast a little more to the east, so as to be outside of the shoal water. If it is carried out as proposed the sea will break on it heavily.

2183. You think that after breaking on the shoal water the sea will break more heavily upon the breakwater? Yes.

2184. If the breakwater were built at the extreme edge of the shoal you think there would be less danger of its being destroyed? Yes; it should either be built there or inside the shoal altogether. Of course, when a sea is once broken its force is pretty well spent.

Captain  
H. A. Boyle.  
4 Dec., 1896.

- Captain  
H. A. Boyle.  
4 Dec., 1896.
2185. You would recommend that the breakwater should be built either at the extreme inner edge of the shoal or at the extreme outer edge? Yes; to build it on the inner edge of the shoal would bring it too far in, I think.
2186. If the head of the breakwater were brought within half a mile of the shore, would that allow a sufficiently wide entrance for sailing vessels? Yes; though it would be better to have the entrance three-quarters of a mile wide. Some sailing vessels are sluggish in working.
2187. Do you think that the increased safety which would be obtained by bringing in the extreme end of the breakwater a quarter of a mile would more than counterbalance the difficulty provided by a narrow entrance? I think so. Of course, to steamers the width of the entrance would not matter.
2188. Do you regard Wollongong as a suitable place for a port? No.
2189. Do you think it might be made suitable? Not without a great deal of expense. The water outside is too shallow.
2190. The entrance to Wollongong is bad? Yes; it is all shoal water round there.
2191. It is much worse than Bellambi? Yes; as it is now it is simply a trap. A vessel getting in there cannot get out again in heavy weather. They had to sink one vessel in Wollongong harbour.
2192. What is the harbour like when you get into it? It is merely a basin, and there is a nasty "draw-back." It is worse now than when I knew it years ago. I was there in 1866. It was a little bit of a place then. That was before they had dug out the basin. The work that has been done lately has undone all that had previously been done, and allows the sea to come in.
2193. The proposed improvements have only made the place worse? That is all.
2194. Do you know of any objections from a navigator's point of view to the proposal to make a harbour at Port Kembla? No.
2195. Do you know any place on the coast more suitable for the purpose? No. I look upon Port Kembla as one of the safest roadsteads on the east coast of Australia. I am comparing it with places like Seal Rocks, Smoky Cape, and other places where vessels sometimes run for shelter.
2196. What about Jervis Bay? Of course you cannot compare these places to Jervis Bay.
2197. What do you think of Jervis Bay as a port? There is plenty of deep water there, though perhaps the approaches are not good.
2198. Is it not too far south? Yes; I should say so.
2199. *Mr. Trickett.*] I suppose a number of steam colliers trade to Bellambi and to Port Kembla? Yes, a good many.
2200. Has the matter before the Committee been discussed amongst the captains of these vessels? No. Shipmasters have told me in conversation that they preferred Port Kembla, and men will go from Bellambi where they are loading to lie at Port Kembla for the night. I have ridden out two or three heavy gales at Port Kembla when I would not have attempted to go in near Bellambi.
2201. We have it in evidence that at Port Kembla even in very calm weather there is a considerable "send"? Not in calm weather. I have made fast alongside the jetty there with a 2-in. line.
2202. I suppose that with a breakwater the place would be as safe as a harbour? It would make a good harbour, though, of course, it would not be safe from all gales. Sydney harbour itself is not always safe. The proposed northern breakwater is not required. It only blocks the bay up. The sea very seldom comes in from the north, except with very heavy north-east gales. The ordinary north-easter is no trouble to us. It only causes a bit of a "lift."
2203. You think that the construction of the northern breakwater is unnecessary? Yes. I have laid in safety at the mouth of the Tom Thumb's Lagoon. Of course we rolled a bit, but we were perfectly safe.
2204. *Mr. Clarke.*] Can vessels lie alongside the Port Kembla jetties except in good weather? Yes, in all ordinary weather. Sometimes there is a heavy swell there—perhaps for three or four days in the year—when we cannot load; but in ordinary weather we can load there as easily as at the wharfs in Sydney. During southerly weather, for the first forty-eight hours, the bay is quite smooth.
2205. Is it not dangerous for sailing ships to go there to load? Yes; they want to be towed away.
2206. If the breakwater were constructed they could go there? Yes; then they would be all right.
2207. Do the steamers that go there load for foreign parts, or chiefly take coal to Sydney? They take coal for intercolonial and foreign ports.
2208. If the proposed breakwater were constructed a large trade would be done by sailing vessels to various parts of the world? Yes.
2209. That cannot be done at present? No.
2210. Would it not be possible to make a breakwater at Bellambi? Yes; but you would not get so good a harbour as you could get at Port Kembla.
2211. Is there more room at Bellambi than at Port Kembla? No, not so much. There is no room at all at Bellambi.
2212. Do steamers now go to Port Kembla for bunker coal? Yes, and for cargo too. Some of the steamers coming to Sydney cannot go there for bunker coal, because their hatches are in the wrong position.
2213. I suppose the transshipping and handling of coal injures it? Yes; it breaks it up, and spoils its market value.
2214. Would Port Kembla make a harbour of refuge if the proposed works were carried out? Yes.
2215. But I suppose a harbour of refuge is not much required between Sydney and Jervis Bay? The more harbours of refuge we have the better we like it; but I do not see that a harbour of refuge is necessary.
2216. *Mr. Fegan.*] What certificates do you hold? A foreign-going master's certificate.
2217. How long have you been a captain? Since 1868. I have a thorough knowledge of the coast of Australia.
2218. Is the entrance to Port Kembla much better than the entrance to Newcastle? Yes. It is simply a wide open bay, with no dangers attached to it, apart from the Five Islands.
2219. If the proposed eastern breakwater were made, would it not in many senses be a superior port to Newcastle? The approach would be better, but not the port itself.
2220. What have you carried principally on the south coast? Coal, and a few stores for the mines.
2221. Have you had any difficulty in landing those stores? Very seldom.
2222. You could not land them in rough weather? Not very well. It might often happen that you could ship coal, but be unable to discharge.
- 2223.

2223. Have you ever made any complaint to your owners in reference to the danger at Bellambi? I have refused to go there times out of number.
2224. Because the place was so dangerous? Yes. You have barely room to moor your ship there.
2225. If a captain does not thoroughly understand Bellambi? He has no business to go there.
2226. I suppose you cannot discharge goods at Bellambi? Yes; in ordinary weather. The loading appliances there are, I think, as good as those at Port Kembla. At night, and in bad weather, the place is dangerous.
2227. I suppose there is no light either at Bellambi or at Port Kembla? No, unless they put one out.
2228. How did you lose your vessel? Because of the thick weather.
2229. Before losing your vessel you had refused to go there? Yes; dozens of times. I was loading at Wollongong, and I got a wire telling me to be at South Bulli at daylight to finish. I was obliged to leave Wollongong at 2 o'clock in the morning to get out on the tide, and while we were waiting about we drifted on to the reef.
2230. Did you tell your owners that you were afraid of losing your ship there? I told Mr. Firth, once or twice, that some of us would be coming to grief there. I made no official complaint.
2231. As a seafaring man, which do you prefer—Bellambi or Port Kembla? Port Kembla. There is no comparison between the two places.
2232. *Mr. Hassall.*] Do you think that a breakwater following the line of the coast from Red Point, and running in a north-westerly direction, would be preferable to the proposed breakwater? Yes. I think that the wider the entrance the better. Some sailing vessels do not work very well, and would like more room. If you narrow the entrance too much you cause a greater drawback inside.
2233. You think it would be better to let the breakwater run out in the direction proposed? Yes; only I would shift it inside the shoal-water.
2234. How far would you let the breakwater run out—1,600 feet? I think that would be far enough.
2235. At any rate until the trade improved? Yes. All that would be wanted would be to take the breakwater out beyond and on the reef. I do not know what the exact distance would be. There would be no great expense in running out the breakwater, because the reef is shoal, and you get a rocky bottom.

Captain  
H. A. Boyle.  
4 Dec., 1896.

Frederick George Woolcott-Waley, Esq., Manager, Bellambi Coal Company, (Limited), sworn, and examined:—

2236. *Chairman.*] You manage the Bellambi Coal Company? Yes, it is a Melbourne Company, and ships the whole of its coal from Bellambi. We also take the whole of the South Bulli coal. We own the northern jetty at Bellambi.
2237. *Mr. O'Connor.*] Have you any statement to make to the Committee? I heard Captain Boyle's evidence, and, while I do not think that there is as much difference between the two places as he makes out, I am of opinion that Port Kembla is a more suitable place for a harbour than Bellambi, though it would suit my interests better to have a harbour made at Bellambi. I know the coast very well, and I have been up and down it a great many times.
2238. Notwithstanding that you are deeply interested in the Bellambi mine and jetty, it is your opinion that Port Kembla is a better place for a harbour? Yes.
2239. And more suitable than any other place south from Sydney? I think so.
2240. *Mr. Hoskins.*] How much coal did your company ship last year? Somewhere about 200,000 tons.
2241. Where was it mostly sent to? A large amount of it goes into bunkers. We coal the Orient boats, the German mail steamers, and other steamers, and a large quantity of our coal is shipped to San Francisco.
2242. How much do you send to San Francisco? 30,000 or 40,000 tons.
2243. How is it sent there? We bring it to Sydney in small colliers, and then tranship into ocean-going vessels.
2244. All the coal you send to foreign ports has to be brought to Sydney and transhipped? Yes.
2245. Do you consider that it is desirable that a port should be made on the south coast in which vessels of large tonnage could lie with tolerable safety and load, especially sailing ships? Undoubtedly. The construction of such a harbour would give a great impetus to the coal trade.
2246. Has your company been refused large orders for coal through not having a safe harbour in which to load large vessels? Yes. In one or two instances we have had to decline very large orders. A couple of years ago two large steamers belonging to the British-India Company were detained in Sydney eight days waiting for coal, and then one had to go to Newcastle, and the other went away altogether without coal. All that time it was blowing a south-east gale, and we could not load any coal at the jetties.
2247. Is that the only instance of the kind? We cannot tell exactly what orders are lost. Quotations are asked for coal with despatch, and if we are not able to give despatch the order is lost to us.
2248. Would your company benefit by the construction of the proposed harbour? Undoubtedly.
2249. What do you think would be the average charge made for the shipment of coal at such a harbour? I suppose that a fair thing would be to put the port on the same basis as the port of Newcastle.
2250. What price would you charge intending purchasers of coal if the proposed harbour were made? I think we should get a better price than we obtain now, because so much has to be expended in carrying the coal up the coast and transhipping it. We should get about 7s. a ton for it.
2251. Would you then be able to compete with the Japanese coal at Singapore, Hong Kong, Bombay, and places like that? We actually compete with it now, although our charge is 9s. 6d. There seems to be very little doubt that if we could ship direct we should be able to compete on very favourable terms.
2252. How far would you have to send to get to Port Kembla? About 7 miles.
2253. Would the coal travel over any part of the Government railway? Yes, over, I think, about 6 miles of Government railway.
2254. If the Government charged tonnage dues at the proposed port, do you think your output would still increase? Yes. Of course the nearer the mines to the port, the better they would be situated; but with a system under which a moderate charge was made for haulage from all collieries alike, I think we should be much better off than we are now, despite the charges for haulage and the port dues.
2255. Supposing the Government charges were  $\frac{1}{4}$ d. per ton per mile for railway haulage, and 3d. or 4d. a ton for shipping? If the charges were reasonable we could afford to pay them.

F. G.  
Woolcott-  
Waley, Esq.  
4 Dec., 1896.

F. G.  
Woolcott-  
Waley, Esq.  
4 Dec., 1896.

2256. Have you ever inspected Lake Illawarra? No, I have never been on the Lake.
2257. How far south of Port Kembla is it? I should think 2 or 3 miles.
2258. In the event of a channel being dredged there 25 feet deep, would the colliery proprietors send their coal to Lake Illawarra for shipment? I do not think so. I think that the Lake Illawarra scheme is utterly impracticable, and out of the question.
2259. *Mr. Humphrey.*] What is your present output? About 200,000 tons a year from the two collieries.
2260. What would be your maximum output? We could put out 1,000 tons of best coal a day.
2261. And you could double that output? Yes.
2262. Do you represent one or more than one company? My company owns one colliery, and has purchased for a term of years the output of another colliery.
2263. You have the use of both jetties? Yes.
2264. We have been told that at South Bulli jetty you can load a vessel of 2,000 or 3,000 tons? Yes.
2265. Then what is the use of sending the coal to Sydney in small colliers? You can only load a large vessel at Bellambi under favourable circumstances as to tide and weather.
2266. The large vessels which take coal from Bellambi load at Sydney instead of at Bellambi? Yes; the only large vessels which we have loaded at Bellambi have been intercolonial vessels. We have loaded vessels partly at Bellambi, and partly at Port Kembla, or entirely at Bellambi, and they have gone to Melbourne.
2267. No coal has been loaded at Bellambi for over-sea export? Not during the last ten years in large vessels.
2268. If a harbour were made at Port Kembla, what use would you make of your present jetties? We would use them for loading bunker coal. The bunkering of the mail boats has to be done in Sydney. Their bunkers are unsuitable for taking coal from the shoots, and the coal is put on board at Sydney while they are discharging cargo.
2269. What proportion of your output is used for bunkering purposes? About three-fourths.
2270. Then you would have about 50,000 tons to ship into foreign-going vessels? Well, I am looking to an increase in the trade.
2271. In what direction? To San Francisco; there we are being cut out now by the British Columbia coal. It is impossible to compete with that coal while we are handicapped by the freight from Bellambi to Sydney, and the cost of transhipment.
2272. What would that amount to? About 3s. a ton.
2273. If all the charges for shipping at Port Kembla amounted to 1s. a ton, that would give you a saving of 2s. a ton? Yes; though 1s. a ton is a good deal to have to pay at Port Kembla, considering that the cost of the coal is not much more than 5s. a ton.
2274. A shilling would amply cover all possible charges? I think that it is a very high estimate. If the charges at Port Kembla were as high as 1s., we would be 1s. 6d. a ton better off in competing in the world's markets than we are under present conditions.
2275. With that advantage, could you compete successfully against foreign coal in the markets of the world? Yes, I think so. Of course, competition is generally met by competition, and no doubt if the price of our coal came down the price of other coal would come down too.
2276. Your coal is much better than the British Columbia coal? Yes, very much better. The rolling-mills and the Pacific railway burn nothing else when they can get it.
2277. Do you know the price of the British Columbia coal? It is controlled by the price of our coal. If the price of our coal rises, they put up their price; but if our coal is sold cheaply there is a fall in their price.
2278. Does their coal stand higher in the market than yours? No, it is not liked so well.
2279. What is the difference in freight in favour of the British Columbia coal? The man who controls the mines owns the steamers which carry the coal. The coal is run down to San Francisco in vessels of 2,000 or 3,000 tons burden. Of course in that way the freight is always the same, whereas we are more or less handicapped by any rise in freight.
2280. What class of sailing vessels would come to Port Kembla if it were made a safe harbour? Vessels of from 2,500 to 4,500 tons.
2281. Would the trade be drawn from Newcastle? No, the Newcastle trade would not be affected. Ours is a different coal from theirs.
2282. You send your coal away to foreign parts now; but instead of exporting direct you have to send from Sydney? Yes. At the present time, however, the coaling of a vessel in Sydney is often delayed or prevented by bad weather, whereas, if there were a port on the south coast we could tow a vessel down there, and load her without interruption. At the present time vessels wishing to take coal have sometimes to go away without it.
2283. What do they do if they if they cannot get coal? Some go to Newcastle, while others go away in ballast.
2284. The vessels that now go away in ballast would come south to load coal? Yes.
2285. Can you supply us with information as to the number of vessels leaving Sydney in ballast for ports other than Newcastle? I will endeavour to get that information. The proposed harbour would also allow a much larger export trade to be done by steamers. Some steamers go to Port Kembla now, but the owners of other steamers have a great objection to open roadsteads. The British-India Company will not allow any of its boats to lie in an open roadstead. We have their contract for coal, and I know that a great deal more coal would be taken by them if there were a port at which they could load direct.
2286. Do you think the proposed breakwater would meet the requirements of the harbour? I think that it should take a bend to the west, so as to break the easterly seas more. Of course, that would narrow the entrance; but that disadvantage would, I think, be more than compensated by the extra shelter.
2287. You think that the collieries making use of Port Kembla could afford to pay a moderate charge for the shipment of their coal from that place? Yes, a moderate charge.
2288. Would you care to express an opinion as to what would be a fair charge? I do not know what the Newcastle charges are; but I think they might be followed. I think that an inclusive charge of 6d. a ton would be cheerfully met. It is very important to my mind that the railway charge should be the same for every colliery, and not so much a mile; otherwise the collieries near the harbour would have an advantage over those further back.

2289. Can you give the Committee any information as to what may be expected in the way of imports? I should not think that they would be worth considering. I do not think any foreign country would send their goods to Port Kembla.

2290. Is it not probable that a large quantity of ore would come from Port Pirie? Yes, I overlooked that altogether. That, of course, would be a very large item.

2291. *Mr. Wright.*] But apart from the ore you do not think the imports would be much? No.

2292. *Mr. Trickett.*] I suppose the southern coal is pretty well world renowned as a steaming coal? Yes. The home owners look upon it as very little inferior to Welsh coal.

2293. Is it next in quality to the Cardiff coal? It is very near it. It has much the same characteristics as that coal.

2294. With facilities for export the trade would be bound to improve? Yes. I think that we shall have the whole of the East open to us. That will give an enormous market.

2295. How do you view the agitation to make Jervis Bay a port? I do not view it seriously. Jervis Bay is utterly out of reach.

2296. I suppose you would as soon send to Sydney by railway? Far rather.

2297. Even if the distance were a little in favour of Jervis Bay? Yes.

2298. A witness yesterday gave it as his opinion that the great bulk of the coal in the southern district was centred at the back of Illawarra;—do you agree with him? Yes; I heard Dr. Robertson's letter with regard to the cinder dyke read. We know to our cost that the statements contained in that letter are correct.

2299. *Mr. Lee.*] Are you of opinion that in the event of a breakwater being made at Port Kembla, the Government should have absolute control of the jetties? Yes.

2300. You think that it would be detrimental to the interests of the outside collieries if private owners were allowed to keep control of the jetties or railway lines? I think they should all be under Government control.

2301. Do you think that the place should be put upon the same footing as Newcastle? Yes.

2302. And that whatever appliances became necessary in the future should be supplied by the Government? Yes. I would not urge the construction of the Port Kembla scheme when my own interests are centred elsewhere, except on the understanding that Port Kembla is to be a Government port, and open to all without fear or favour.

2303. It would be impossible to work the port under other conditions? I think so.

2304. *Mr. Black.*] On what terms do you hold the Bellambi jetty? I think we have a yearly lease, the jetty being removable at pleasure.

2305. The material composing the jetty is your property, and you have permission from the Government to erect and use it? Yes.

2306. To whom does the land facing the jetty belong? It is private property, and is leased by the company.

2307. Under what conditions is the South Bulli jetty held? Under conditions similar to those under which our jetty is held.

2308. Do you know under what conditions the jetties at Port Kembla are held? No.

TUESDAY, 8 DECEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Robert Charles Reed, Esq., Manager, Messrs. Gibbs, Bright, & Co., sworn, and examined:—

2309. *Mr. Hoskins.*] Does your firm export large quantities of coal from New South Wales to other countries? They purchase for export.

2310. Is the coal shipped away by your own vessels, or by other vessels? Both by our own and by other vessels.

2311. Where do you send most coal? Principally to China; but now and again to Singapore, and across to America.

2312. Is more coal taken from the southern mines than from the northern mines? About the same from each coal-field, or perhaps a little more from Newcastle.

2313. Does the southern coal meet with favour abroad as a good steaming coal? It has a market quite distinct from the market for northern coal. There is a good market for southern coal at Shanghai, whereas Newcastle coal is unsaleable there.

2314. Is the southern coal sent to Singapore and to San Francisco? Yes, very largely.

2315. Is the southern coal trade increasing, or likely to increase? Its increase or decrease will depend upon its price. If means were adopted whereby its price could be reduced, the trade would increase.

2316. Is its present high price due to the high charges imposed at the ports to which the coal is sent, or because of the expense which has to be incurred here? The price of the coal is governed by the cost of getting it to its destination. One of our shipping companies carries more southern coal to Shanghai than to any other port, and a difference of 1s. a ton in its price would affect the market considerably. We have there to compete against Cardiff coal and coal from other parts of the world, and by a reduction in price we could compete very successfully.

2317. Do you bring the coal from the south coast to Sydney by colliers, and then tranship it into larger vessels, or do you load direct into large vessels? When the weather is suitable we send our steamers to Port

F. G.  
Woolcott-  
Waley, Esq.

4 Dec., 1896.

R. C. Reed,  
Esq.

8 Dec., 1896.

- R. C. Reed, Esq.  
8 Dec., 1896.
- Port Kembla—there is no other port on the south coast to which we could send vessels; at other times we load in Sydney.
2318. What is the cost of bringing coal from the south coast and putting it on board a vessel in Sydney Harbour? From 2s. to 2s. 6d. a ton freight, and there is a difference of about 6d. a ton in the stevedoring charge. For coal going direct into the ships' holds the charge is 3d. or 3½d. a ton; but when it has to be hoisted out of colliers the charge is about 9d. a ton.
2319. If the Government expended a large sum of money in providing a safe harbour on the southern coast, could you sell the southern coal more cheaply in Shanghai and in other places than you do at present? Yes, most decidedly, and for more reasons than one. When our steamers go to Port Kembla, the coal is put straight on board without any handling; but when it is loaded from colliers it is broken. The coal put direct into vessels is larger, more saleable, and brings a better price than coal loaded from colliers, and we have fewer or no complaints as to the quality of coal loaded at Port Kembla, whereas when coal is loaded in Sydney Harbour we have claims for shortage and complaints of the bad quality of the coal. The coal in China is used principally for smithy purposes, and a great deal of it goes inland, and the larger the coal the better the price we get for it. Newcastle coal is no good for this purpose, because it is too soft. If there were a safe harbour on the southern coast, a great deal of coal could be sent away in sailing vessels to places like San Francisco, where a difference of a couple of shillings in its price would mean a great increase of trade.
2320. What do you give for southern coal at Port Kembla? From 6s. 6d. to 7s. a ton.
2321. If a good port were made on the southern coast, do you think that coal could be sold at a profit at 7s. a ton? I have no reason to think otherwise.
2322. Would that be likely to turn the scale in favour of southern coal as against Japanese or British Columbia coal? The competition in the San Francisco market is so keen that a reduction of 1s. a ton in price would make a great difference. A great deal of Australian coal goes to San Francisco now, and it has to compete very keenly with the Japanese coal, the British coal, and the British Columbia coal. Not only would there be a saving in price, but we could deliver the coal in better condition.
2323. Are you familiar with the southern ports? Yes. I suppose I was one of the first who opposed the sending of large steamers to Port Kembla.
2324. Where would you recommend the expenditure of public money on the southern coast for the construction of a safe harbour? I think Port Kembla is the best place. In March, 1890, I visited the southern ports, and especially Port Kembla, to advise two of the largest shipping firms in London as to whether they should send their steamers down there to load. I went down the south coast with the Commodore captain of one of the companies' fleets and his chief engineer, and, in my report home, I said that I could not recommend the sending of large steamers down there, because it was not safe to load large cargoes of coal in what I termed an open roadstead. So long as there was fine weather, everything would go well; but immediately there was a swell or heavy weather came on, the difficulties might be most serious. A steamer loading there would have to have steam up all the time, and if she had to leave suddenly it is possible that disaster might happen to her, because of the lee shore. Therefore, I considered that the risk was too great for the small saving that might be made. I went on to say that, in my opinion, the underwriters would eventually be influenced to allow steamers to go to Port Kembla to load, but that sooner or later a mishap would take place, and then the underwriters would prevent other steamers from going there.
2325. Has that happened? There has been no loss there, but vessels have been exceptionally fortunate, and no large steamers have been loading when a gale has sprung up. We have, however, on several occasions sent steamers there to load, which, after lying off the place for twenty-four hours, have had to return without a cargo.
2326. Have you a copy of the report you sent Home? It is so mixed up with private business that it would not be possible to give it to the Committee; but I have here the report which Captain Orr, who accompanied me, drew up. At the present time, except in fine weather, Port Kembla is a dangerous place for steamers to go to; but it appears to me that if a breakwater were run out as proposed, there would be a perfectly safe harbour for steamers to load in.
2327. And for sailing vessels too? Yes. I am quite satisfied that the proposed eastern breakwater would make the place perfectly safe for either steamers or sailing vessels to load.
2328. You have not heard the master of any vessel say that he would have an objection to going there, even if a breakwater were erected? No. Every master is on pins and needles now when he is ordered to go to Port Kembla; but Captain Orr in his report says that he would not have the slightest hesitation in going there if there were a breakwater.
2329. To whom does the captain report? The report was sent home to his owners. Captain Orr was at the time in charge of the s.s. "Port Denison." The report is dated 20th March, 1890.
2330. Will you read it? Yes. It is as follows:—

*Report upon Harbour of Port Kembla as a Loading Port for large Steamers.*

PORT KEMBLA is an open roadstead, affording no protection whatever with the wind from north to north-east, and with only partial protection from winds as far round as east. The off-lying islands named Five Islands afford very little protection. The three southernmost islands lie about one mile to the southward of the promontory on east side of the port, whilst the two smallest lie about a half-mile apart, and nearly a mile off the end of the promontory, therefore being of no use as shelter. The port is formed on the east side by a promontory (on which is a signal-station used for signalling the approach of, and warning off the coal vessels using the port) about 500 yards long, and with a reef extending about 300 to 400 yards to seaward from the end of the promontory. The promontory and reef run in a north-north-east direction, and some distance off in the same direction lies the northern of the Five Islands. The beach from the promontory runs with a sweep, forming the harbour, until about 500 yards from the promontory, when it runs in a direction about north until up to Wollongong. In the bend of the port lie the two jetties for coaling; the Mount Kembla Coal Co.'s being on the east side, and Southern Coal Co.'s on the west side. The Kembla Jetty runs out into about 24 to 25 feet of water—low water—and the Southern Co.'s jetty into about 30 feet at low water. The beach is a gradually shelving one, and along the water's edge are a number of rocks, and no doubt the same under water. The tide rises about 4 feet to 4 feet 6 inches. Each of the jetties has moorings and buoys laid down for the use of vessels loading there. Upon entering, a steamer would have to drop her own anchor about 80 or 100 fathoms off the end of the jetty to allow her to swing round and clear the jetty end, then slack away and haul astern into loading berth alongside the jetty. When in position she would have to make fast on starboard side by two 12-in. hawsers, one on bow and one on quarter—these would be provided by the company; on the port side in the same manner as starboard side, but with two hawsers provided by the ship, and from the stern to a buoy aft by a ship's line also. I do not know of any steamers of say 3,000 to 4,000 burthen that would have three hawsers sufficiently strong to hold her

her with any sea on whilst loading. Steel hawsers are out of the question. In event of bad weather all these moorings would have to be slipped from the vessel's deck, thus making it very difficult to move the engines without fouling them. Large vessels would have to go alongside and load only in fine weather, and lie under steam ready to proceed to sea in half an hour's notice. The winds most to be feared at this port are north to north-east. The north-east are almost the most dreaded by coasters, and are commonly called "black north-easters." When they do set in they last for from two to four days, accompanied by murky hazy weather, with very heavy squalls. The atmosphere during a north-easter is so thick and hazy, that it is difficult to make out things a mile off. In the event of a large vessel being caught in one of the north-east to north winds, and her alongside the jetty, and supposing she were in any trim for sea, it would certainly be a very dangerous undertaking to proceed to sea. Supposing she cleared the jetty, she would have a very narrow passage to steam through, and could not see much on either side, having a dead lee shore on her port side, and a dangerous reef with a low outlying island to seaward of the reef on her starboard side. But before getting away there is the difficulty of letting go ropes from three buoys, otherwise they would have to be slipped, with the disadvantage as before mentioned; she would have to be hove up to, and the anchor picked up, and engines would have to be depended upon to move immediately they were called upon. Again, it must be borne in mind that in the case of a vessel (large one) loading alongside the jetty, the beach, with possibly large rocks around, is within say 150 feet from her keel were she drawing 20 to 24 feet of water. One thump would break her rudder-post. This or propeller-fouling the moorings would certainly be the cause of the loss of the vessel. The damage to the pier would always be a source of dread to those on board, it being impossible to tie up a vessel like the "Port Denison" alongside the pier, and to keep her in position for loading, and were the ropes to break she would certainly damage the pier severely and herself very badly.

Small vessels could always load, whilst large ones, say 3,000 to 4,000 tons, would have to wait for favourable opportunities, the smaller ones being more easily handled and loaded more quickly. No doubt large vessels could, and will, load there, but not for long before there would be a vessel lost or stranded, and this would be when least expected. When an accident does happen in the port, it will certainly be a very serious one, and well up in the thousands of pounds. Given a certainty of smooth water, or a breakwater to load under the lee of, Port Kembla would be safe, compared with what it is at present. As it now is, I am positive it is a dangerous harbour for large vessels to load at.

S. M. ORR,  
Master.

Sydney, 20th March, 1890.

The captain has been coming to this coast off and on for twenty years. The "Gulf of Guinea" was one of the first steamers to load at Port Kembla. She had steam up the whole time she was there, and succeeded in taking in half a cargo. The P. & O. steamer "Coromandel" was also fixed to go to Port Kembla, but I understand the company sent the captain, chief engineer, and their local representative down to the place to report. They then thought that they would not risk their steamer, and consequently the charter was cancelled. The position to-day is exactly the same as it was then. No doubt a number of large steamers has successfully loaded at Port Kembla. We have sent steamers there. We held out against it for three or four years, but we found that we were forced to go there in order to enable us to compete in other markets. Our China boats have either to take back coal or to go back in ballast, and the saving of 2s. 6d. a ton which is made in going to Port Kembla for coal makes almost the difference between profit and loss.

2331. Do you know anything about Bellambi? I have passed the place, but I cannot give you any opinion about it.

2332. In conversation with seafaring men, commanders of steamships, owners, and so on, have you heard the opinion expressed that if a breakwater were made at Port Kembla it would be a good place at which to load coal? Yes; I suppose since 1890 I have had as many conversations with captains on this topic as any one has had, and they, without exception, are satisfied that Port Kembla would make a good loading place for almost any sized steamer if a breakwater were run out. There is very little difference of opinion as to the direction such a breakwater should take.

2333. If the proposed breakwater were made at Port Kembla, I suppose the entrance would be safer than the entrance to Newcastle Harbour? Yes, very much safer. It is not the entering into Port Kembla that is feared, but being there on a lee shore should bad weather come up.

2334. Do you know anything about Lake Illawarra? I have seen Wollongong, but I have not been at Lake Illawarra.

2335. You have seen the entrance to Lake Illawarra? Yes.

2336. How far would the lake be from the centre of the southern coal-field? I should say that it is not so centrally situated as Port Kembla. It is a little too far south.

2337. *Mr. Humphery.*] Captain Orr in his report speaks of the black north-easters as being more to be dreaded than southerly weather? The breakwater that I have in view would keep out north-easters. It would run out in a north-westerly direction, more in the line of the coast from Red Point.

2338. The distance from the end of the proposed breakwater to the shore is three-quarters of a mile;—how much further west would you suggest that it should be taken? About 500 feet. I have been down there several times, and it appears to me that such a breakwater would sufficiently shelter the place.

2339. Would that give sufficient room to allow sailing vessels as well as steamers to enter and to leave the port? I think so. Of course, if the trade of the place increased enormously, you might have to provide more shelter; but, under the circumstances, I think that one breakwater would be sufficient.

2340. During the prevalence of a black north-easter, how would the breakwater you speak of protect the place? Well, I do not think we ever have black north-easters lasting as long as three days.

2341. On that point you do not agree with Captain Orr? No; though you only want an easterly to come up suddenly to do a great deal of damage unless the jetties are protected as proposed.

2342. Would that damage be done if the breakwater described by you were carried out? I do not think so.

2343. I take it that the breakwater to which Captain Orr refers would be an eastern breakwater? I am satisfied that what was in his mind was a breakwater such as I have described, because we discussed the matter together on the spot.

2344. And you think that, in Captain Orr's opinion, an eastern breakwater would be sufficient? Yes.

2345. *Mr. Trickett.*] For what companies are your firm agents? The Eastern & Australian Company, the Anglo-Australian Steam Navigation Company, Gellatly, Hankey & Sewell (Mogul Line), Houlder Brothers, and other steamship companies. We represent a dozen or twenty owners, besides those I have mentioned.

2346. Do the steamers of all those companies use southern coal for steaming purposes? No.

2347. Do most of them? Most of them use southern coal. The old class of steamers use Newcastle coal, but the new class of steamers use southern coal.

2348. Why is that? The newer steamers have a greater draught, and if they used a soft, gassy coal like the Newcastle coal a great deal of it would go up the funnel. Instead of burning 30 tons a day, they would be burning many more tons a day. Every mail steamer, without exception, takes southern coal.

It

R. C. Reed,  
Esq.  
8 Dec., 1896.

- R. C. Reed,  
Esq.  
8 Dec., 1896.
- It is a denser coal; it is slower in burning; and you only want the draught to get as good results from it as can be obtained from the Newcastle coal. There may be a little more labour involved in dealing with the ash, but that is a secondary matter.
2349. There has been a general improvement in regard to draught? Yes. Nowadays they have narrower bars, and a greater draught than they used to be able to get.
2350. One of your new boats—the “Australia”—went up to Newcastle the other day for coal. Why was that? Because the China agents could not recommend the shipment of southern coal to Shanghai, and advised us to send a limited quantity of coal to Hongkong. That coal is taken sometimes for the gas works at Hongkong I believe.
2351. Did the “Australia” take Newcastle coal for steaming purposes as well as for cargo? She may have taken a little to mix with the rest of her bunker coal; but most of her bunker coal was southern coal.
2352. How much coal does a vessel like the “Austrian” consume? About 28 tons a day. At the present time we are just able to hold our own in the China market, and if we could cheapen our coal to the extent of a 2s. 3d. a ton, the competition would be much easier.
2353. How is the coal trade of New South Wales affected by the Japanese coal? It is very much affected by it at the present time. Our steamers have been going to China and Japan for, I suppose, twenty-two years; but it was not until the strike of 1891 that we used Japanese coal at all. The first cargo of Japanese coal that we bought, we bought in Sydney Harbour, when we took about 1,000 tons for the “Guthrie,” and we found it so much better than our prejudices had led us to expect that we have used it ever since, off and on, on the downward voyage.
2354. Is it as good as the Bulli coal? No, it burns more quickly; but it is good coal.
2355. Is it cheaper than the colonial coal? Well, it is going up in price now.
2356. Is that because of a decrease in the output? No. I think labour in Japan is becoming a little more expensive.
2357. You only take sufficient coal from here to last you for the voyage to Japan? Invariably.
2358. Was that always your practice? No. Sometimes we took sufficient coal for the round voyage. We make our arrangements so as to get the coal as cheaply as we can. Of course it is more expensive to get Japanese coal in Hongkong or Shanghai than in Japan.
2359. When did you last send one of your eastern boats to Port Kembla? A couple of months ago, I think. The “Airlie” went down there a few months ago, and after lying off the port for about twenty-four hours, had to come back again.
2360. And load at Sydney? Yes.
2361. The captains of large vessels object very much to have to lie alongside the Port Kembla jetties? Yes. They do not mind going in there, but they are glad to get out again.
2362. Do vessels always keep steam up when they are coaling there? Yes, always.
2363. Sometimes you send steamers there, and sometimes you do not? Whenever the weather will permit we send our steamers there. We have obtained permission from the underwriters at home to go there; but I am quite certain that the loss of a steamer would put all the underwriters up in arms against Port Kembla, and they would then prevent ocean-going steamers from going there. It took us three years to get permission to go there.
2364. Was there any extra premium to pay? That I cannot say definitely.
2365. Of course, if the proposed works were carried out, charges would have to be made by the Government for the protection afforded? Yes.
2366. I suppose the shippers would be willing to pay charges equal to those paid at Newcastle for similar facilities? Yes, certainly. If we got a safe port at Port Kembla it would pay us to pay port dues or an export duty on coal rather than have the coal brought up here in small colliers at a cost of 2s. 6d. a ton.
2367. Does the irregularity of supply interfere with the export trade? I believe that the export trade would increase very largely if we always had the advantage of a reduced price. We do not export nearly as much southern coal to San Francisco as we used to do, but if we could send coal away in sailing vessels at 2s. 6d. a ton less for export we could easily compete.
2368. That is your experience as a man who is in constant correspondence with these oversea places? Yes.
2369. If the Government constructed the proposed breakwater, would it be desirable that they should resume the two private jetties at Port Kembla? Yes, I think they should be resumed and worked by the Government. I do not think there should be a monopoly established there.
2370. I suppose greater regularity of loading would be ensured if the two jetties were under one control? Yes, I think they should be entirely in the hands of the Government.
2371. *Mr. Clarke.*] Do you know if any wrecks have taken place at Port Kembla? No, much to my surprise. But there have never been any large vessels at the jetties in rough weather.
2372. To what extent do you think the coal trade would increase if the proposed breakwater were made? I would not like to estimate.
2373. It would all depend upon the demand, and upon the competition? Yes. Of course if other coal came down in price, the trade might not increase; but it is not likely that that would happen.
2374. It is necessary that the breakwater should be constructed if sailing vessels are to go to Port Kembla? Yes. They cannot go there now, and steamers will not continue to go there if there is an accident.
2375. Coal sent from there direct would bring a better price than coal shipped from Sydney? A few years ago there used to be a difference of 1s. a ton in the price of Newcastle coal in the San Francisco market, according as the coal had been shipped direct from Newcastle or from Sydney, and I daresay the same thing might happen in connection with southern coal.
2376. Do you think that if the proposed breakwater were constructed, Port Kembla would be the best port south of Sydney? I think it is the best place to make a harbour, so far as I know the coast.
2377. Have you seen the proposal to make a northern breakwater? Yes; but I think a northern breakwater would be unnecessary at the present time.
2378. *Mr. Hassall.*] Can you tell us what steamship owners would be willing to pay if the proposed improvements were made at Port Kembla? I would not like to commit myself to figures, but they would be only too pleased to pay any reasonable charge.
2379. Supposing the charge was 3d. or 6d. a ton? Inasmuch as they now pay 2s. 6d. a ton to bring the coal to Sydney to load it there, I do not think they would refuse to pay any reasonable charge which the Government might impose.
- 2380.

2380. *Mr. Fegan.*] Is the density of the southern coal an advantage to the buyer? It is an advantage to the steamers, because it enables them to carry more in their bunkers.
2381. Is not the density of the southern coal so great that it not only goes against its heating power but its steaming power? Well, that is a question for an engineer. The engineers have told me that southern coal takes up less room in the bunkers than Newcastle coal. I believe that the difference is about 4 feet to the ton.
2382. Coal deteriorates very much by handling? Yes; especially Australian coal.
2383. What is the price per ton for Japanese coal at Shanghai? We never take it at Shanghai. We take it at the mines.
2384. A witness has stated that the Japanese coal controls the eastern market because of the heavy freights from Australia? Well, we do not charge any freight at all. We take the coal up on ship's account.
2385. Why does the Japanese coal continue to keep the eastern market? It does not keep the market, but it holds its place, because of its cheapness. The fact that we can land 10,000, 20,000, and 30,000 tons of coal in the Shanghai market and get one and two dollars a ton more for it than can be obtained for the Japanese coal, shows that the Japanese coal does not hold the market.
2386. Knowing the quality of our own coal, and the facilities we have for shipping it, you are not afraid of the Japanese coal? We are not afraid of it, but we would like to see it out of the way.
2387. There is no reason to be afraid that a harbour at Port Kembla might become useless because of the large increase of the Japanese coal trade? No. The spread of the Japanese coal trade is more likely to affect the Newcastle coal than the southern coal.
2388. Why is the Newcastle coal unsaleable at Shanghai? Because it is not used there. Similarly the southern coal does not sell in the Hongkong market. The coal that goes to Shanghai is chiefly sent into the interior of China for smithy purposes.
2389. Is not the Newcastle coal good smithy coal? They say not.
2390. It is stated in the *Wealth and Progress of New South Wales* for 1894, that—
- The result of analyses made of coals from various localities in the Colony showed that the mean specific gravity of the northern district coals was 1.300; of the western coals, 1.346; and of the southern coals, 1.394; while the mean of a number of samples of British coal was 1.279. . . . The steam producing power of the coal from the northern districts of the Colony is almost equal to, and that from the south and west a little below, the generating power of the coal raised in Great Britain.
- ? Well, you can get steaming power out of the Newcastle coal, but you burn so much more of it. Some steamers would burn 2 tons of Newcastle coal to 1 of southern coal.
2391. Do you think that the southern district should have the same facilities for the shipment of coal as have been given to the northern district? Yes.
2392. I understood you to say that it would not be fair to leave the jetties of Port Kembla in the hands of private individuals;—did it ever strike you that the shipping of the coal away should be done by the Government? I have not gone so far as that.
2393. Can you give us any further reasons why the Government should go to the expense of resuming the jetties? Well, I presume that after resuming them, the Government would make such charges for their use as would repay the cost of resumption.
2394. You are not able to compare Port Kembla with Bellambi? I do not know Bellambi.
2395. If Port Kembla were a dangerous port, do you not think that some accident would have happened there before this? Well, an accident might occur to-morrow.
2396. Do you know that one of the largest vessels coming here has loaded at Port Kembla? Yes, the "Indrani" loaded there; but if she had been there in rough weather no ropes would have held her, and the probabilities are that the wharf and all would have gone.
2397. During the Newcastle strike this year, did not a large number of vessels which had gone to Port Kembla for coal have to leave there on account of the rough weather? I do not know; but I know that vessels which went there to load had to return without a cargo.
2398. I suppose that meant a considerable loss to the trade of the district? Yes; a loss to everybody concerned.
2399. *Mr. Roberts.*] Could you tell us how much the trade of Port Kembla would increase if the proposed breakwater were made, and you were enabled to compete against the Japanese coal more easily? It would be very difficult to say how much the trade would increase; but there would be a great increase.
- 2399½. Of course if a population is ever settled at Port Kembla there may be an inward trade, as there is at Newcastle. Most assuredly.
2400. Is it not probable that large quantities of ore will be brought from Port Pirie to the smelting-works? No doubt a large quantity of ore will be landed at Port Kembla if a harbour is made there.
2401. Would the construction of one breakwater render the harbour sufficiently quiet for the unloading of cargo? I think so.
2402. Is not much quieter water required for the unloading of ships than is necessary for the shipment of coal? Certainly; but in Newcastle we discharge alongside the Government wharf, and as much swell comes in there as probably would be at Port Kembla if the breakwater were made.
2403. Would not the place be rather exposed if a black north-easter were blowing? Perhaps parts of the bay would be exposed, but not that part where the jetties are. The object, I take it, is to expend sufficient money to meet present requirements, but if the trade of the port increases very largely it might afterwards be found necessary to do something more.
2404. You send your vessels to Port Kembla now if the weather permits, but otherwise you load coal in Sydney? Yes. It sometimes happens that we lose as much as half a dollar—1s. 1½d.—a ton upon coal shipped from Sydney—that is apart from the cost of transhipment—because of the depreciation in value in consequence of the extra handling.
2405. *Mr. O'Connor.*] Port Kembla at the present time is not thoroughly secure, but if the proposed improvements were made it would be secure? Yes; that is my opinion. At the present time, except in fine weather, it is a dangerous port to load at.
2406. If the proposed improvements were carried out, a steamer like the "Gulf of Guinea" could stay there sufficiently long to load a full cargo? Yes; she could stay there a month.

R. C. Reed,  
Esq.  
8 Dec., 1896.

Captain Green, Superintendent, Eastern and Australian Steamship Company (Limited), sworn, and examined :—

- Captain Green.  
8 Dec., 1896.
2407. *Mr. Humphrey.*] Have you ever been to Bellambi? I have passed close in to the place, but I have never been in there. As a sailor, I should say that Port Kembla is more convenient and could be made a more secure harbour than Bellambi. Port Kembla seems to be much more protected.
2408. Have you taken steamers to Port Kembla? Yes; I have taken vessels of 2,300 tons there.
2409. Have you loaded coal at the jetties there? Yes, at the southern jetty.
2410. Have you run any risks through the prevalence of north-easterly weather? No; I have never been interfered with by north-easterly weather, but we have once or twice left the place with less coal than we intended to take, because of south-easterly weather.
2411. Have you any opinion as to the kind of breakwater that is necessary at Port Kembla? Yes; I have had conversations with the people there on the subject. I think that a breakwater would make the place comparatively safe.
2412. You have heard Captain Orr's report about the risk in a north-easterly gale? Yes, a heavy north-easterly gale would be very awkward; but I consider that if the breakwater were taken a little more to the west than it is shown on the plan the north-easter would do no damage. I would run the breakwater out in the direction of the pencil mark. That would give much smoother water in a north-easterly gale than the proposed breakwater would give.
2413. Would that leave sufficient room between the shore and the end of the breakwater for the entrance of sailing vessels as well as of steamers? It would do well enough for the steamers, but I would not answer for sailing vessels.
2414. Would it be better to leave a wider entrance for sailing vessels? No; it would be better rather to contract the entrance. By making the eastern breakwater a little more to the westward at the northern end it would make a more secure entrance.
2415. Do you know anything about Lake Illawarra? I have seen the lake.
2416. You are not able to express an opinion as to its suitability for the shipment of coal in vessels of large tonnage? I do not know what the soundings are.
2417. You believe that Port Kembla could be made a suitable harbour for the shipment of coal? Yes; we should load our steamers there every voyage when southern coal was required if the wharfs were properly protected.
2418. Would you load bunker coal or cargo coal? If there were facilities for loading the bunkers there, we should load them at Port Kembla instead of at Sydney.
2419. Do you send your passenger ships to Newcastle for coal? Yes, sometimes.
2420. For bunker coal? Well, steamers going on to Melbourne are bunkered in Sydney.
2421. Could you not continue to take your bunker coal from Sydney even if Port Kembla were improved? We only take sufficient bunker coal in Sydney to take our steamers from here to Melbourne and back.
2422. You would not interrupt the passage from Sydney to Melbourne by a stay at Port Kembla for coal? No. We take in about 300 tons of bunker coal for the voyage from Sydney to Melbourne and back, and if we go to Newcastle we put about 600 tons into the bunkers for the voyage north. Our steamers use from 700 to 1,000 tons of bunker coal on the voyage to China. If we could load at Port Kembla we would take 700 tons there, and 300 in Sydney.
2423. Where do you get your bunker coal now? In Sydney, unless the steamer goes to Newcastle as the "Australian" did, to load cargo coal. Then we take in bunker coal there at the same time.
2424. Would it frequently happen that circumstances would permit you to put into Port Kembla for your bunker coal? No; we would not go there for bunker coal alone. Whenever we have to take a cargo of Newcastle coal, we go there to load. We would not think of loading Newcastle coal in Sydney, and it would be the same with southern coal if the harbour were protected.
2425. I suppose, then, the probability is that you would continue to get your bunker coal in Sydney? Yes.
2426. Is it likely that, if the breakwater were made, a large number of sailing ships would go to Port Kembla for coal? Yes. In that way they would save the cost of bringing the coal from Port Kembla to Sydney. If a sailing vessel has to take Newcastle coal, she goes there to load it.
2427. Do many sailing vessels at present load southern coal? Yes; I have seen several loading in Sydney harbour, but I do not know how much coal is taken by them.
2428. What is your practice in regard to obtaining bunker coal? When a steamer is on a voyage from China to Melbourne, we call in at Sydney to discharge cargo, and at the same time we put in sufficient bunker coal to take her to Melbourne and back. When she comes back here from Melbourne, if we are taking a cargo of Newcastle coal to China we go to Newcastle for it, and at the same time fill our bunkers with Newcastle coal.
2429. Would it be worth your while to send a steamer to Port Kembla simply for bunker coal? Well, as a rule we would not send a steamer to Port Kembla simply to fill her bunkers.
2430. Do you consider Port Kembla at the present time a safe place for steamers? In fine weather, perhaps. But no port where you have to keep up steam the whole time can be considered safe.
2431. It would be quite unsafe to lie alongside the jetties at Port Kembla unless you kept steam up? Yes. It would be running a risk to blow steam down.
2432. You are favourable to the proposal before the Committee? Yes.
2433. *Mr. Trickett.*] What wind was blowing when the "Airlie" had to come back from Port Kembla without a cargo? A south-east gale. She remained there at anchor for several hours, but the sea was too rough to go alongside the jetties. Had there been a breakwater, she would have loaded.
2434. The anchorage at Port Kembla is excellent? Yes. We have frequently had to anchor a steamer there while another steamer was completing its loading.
2435. The place has all the advantages of deep water and a good holding ground? Yes. When the breakwater is made, we shall load all our vessels there when southern coal has to be taken; but we cannot do it now, because of the uncertainty and the chance of delay.
2436. Is the "send" very marked at Port Kembla? Yes; but we have not been much inconvenienced by it. I have never been there in very heavy weather. They have splendid moorings there, and splendid fenders.
2437. And good appliances for loading? Yes; we have loaded coal there at the rate of 700 tons an hour.
2438. I suppose the "send" comes in direct from the ocean? Yes, on the starboard bow. The steamers drop their anchors, and swing round to the north-east.

2439. It would not be likely to come in with much force from the north or north-east if the proposed breakwater were erected? No. I have never experienced any heavy weather there with a north-east wind, and, at any rate, the water within a line drawn from the Southern Company's jetty at the head of the breakwater, would always be comparatively still.

Captain  
Green.  
8 Dec., 1896.

2440. *Mr. Lee.*] You admit the necessity for a safe port on the south coast? Yes.

2441. The present conveniences given there are not sufficiently secure for a large coal trade? No.

2442. But I suppose there is no justification for two ports? No; one good port would be quite sufficient.

2443. Do you think Jervis Bay enters into the question? No.

2444. Does Lake Illawarra? I think the position of the entrance is very much against it, also the depth of water inside.

2445. What depth of water would be required at Lake Illawarra to admit of the entrance of large vessels? The biggest ship I have taken to Port Kembla is about 330 feet long, and came away drawing about 21 ft. 6 in.; but large steamers would load down to 23 and 24 feet.

2446. Do you think it would be feasible to put in short jetties near the heel of the eastern breakwater, and carry on the discharging of cargo there? I would not build the jetties out from the breakwater. I would take them out from the main land. At Colombo you see the seas breaking over the breakwater at times. Of course, that could be prevented; but it would make the work more expensive. I think that, before any decision on that point is come to, you should see what the result of building the breakwater is.

2447. Supposing a breakwater were made, do you think the requirements of the port would demand the construction of another jetty? Yes.

2448. *Mr. Wright.*] I understood you to say that you would like the breakwater brought round more to the west for the convenience of sailing vessels? It would give vessels more shelter if brought further round to the west.

2449. But what about getting in and out? There would still be a good entrance.

2450. I suppose sailing vessels would be towed in there? Yes, I think so. It would be awkward to moor at the jetties without the assistance of a tug.

2451. A vessel of 2,000 or 3,000 tons would not attempt to sail in? No, they would not risk it unless stress of weather demanded it, when they would get a snug anchorage, especially for small craft.

2452. And in bad weather they would have difficulty in making an offing in going out? Yes, they would prefer to be towed out.

2453. Only twelve sailing vessels left Sydney in ballast last year; where would they go to? I suppose they would all go to Newcastle.

2454. *Mr. Roberts.*] If the northern end of the proposed breakwater were brought within half a mile of the shore, would that be dangerous to the place? No, the entrance would then be perfectly safe for a steamer.

2455. And there would be ample harbour accommodation? Yes, I think so. You are not much more than a ship's length off the Cawarra Bank when taking a large steamer into Newcastle.

2456. The entrance at Newcastle is less than a quarter of a mile wide? Yes. An entrance half a mile wide would be quite safe.

WEDNESDAY, 9 DECEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Captain Jose Horatio Amora, Consul for Chili, sworn, and examined:—

2457. *Chairman.*] What are you? At the present time I am engaged in commercial pursuits, but by profession I am a master mariner.

Captain  
J. H. Amora.  
9 Dec., 1896.

2458. *Mr. Trickett.*] Are you fully acquainted with the south coast between Sydney and Jervis Bay? Yes, I am very well acquainted with it.

2459. For what length of time have you known it? For over twenty years.

2460. Is that as a mariner? Yes, I have been down there with steamers, and I have also been engaged in managing businesses down there.

2461. Do you know Port Kembla? Yes, I have particular reasons for remembering Port Kembla. A vessel of which I at one time had charge, the "Llewellyn," broke her tail end shaft off Stansfield Bay, near Coalcliff, and I worked her from there down to the inside of Tom Thumb Island, where I anchored with 50 fathoms of chain on one anchor, and 40 on the other for three nights and two days during a south-east gale. During that time I refused assistance because I felt sure, from the way the vessel was riding that I was perfectly safe there.

2462. So that you had good holding-ground? Yes, splendid holding-ground.

2463. But you were not inside Port Kembla? No. Afterwards, when the weather moderated, I sent my boat to Port Kembla, to report to Sydney. Port Kembla is a place I know well, having laid the first moorings there, and having taken there the first large steamer that went down to try the Mount Kembla Jetty.

2464. Have you had any experience of Port Kembla in rough weather? On the occasion I speak of if I had had daylight, I should have gone further in; but the wind was so shifty, and my vessel was so light, that I thought it prudent to take the first good anchorage that I could get.

2465. Is Port Kembla sheltered in southerly weather? Yes.

2466. Is it sheltered in northerly and north-easterly weather? It is open to northerly and north-easterly weather, but no sea comes up with a north-easter blowing. The weather which must be provided against is the easterly, south-easterly, and south south-easterly weather.

2467.

- Captain  
J. H. Amora.  
9 Dec., 1896.
2467. Do you think that the proposed eastern breakwater would afford protection to the port in a weathers? I do; and I believe that any easterly sea that might strike the breakwater would run away the north-west instead of entering the harbour.
2468. If the head of the proposed breakwater, which is three-quarters of a mile from shore, were turned to within half a mile of the beach, would that give a sufficiently wide entrance? It might give a sufficiently wide entrance; but I am sure that the entrance would not be as good as if it were three-quarters of a mile wide. The proposed breakwater would give a larger area of protected water, and would lessen the chance of there being any surge in the harbour. In South America they have found that when they have built the breakwaters too close in to the shore the surge has been very great.
2469. The wider the entrance, the less the "send" in the enclosed water? Yes. That is the principle in moderation.
2470. You think that if the entrance to the harbour were only half a mile wide, that would increase the "send"? I think so; and by taking the breakwater in a little, you would afford more protection from northerly winds.
2471. There is a pretty good blow sometimes during a black north-easter—would the breakwater give shelter from that weather? To a certain extent. Of course, you could not keep out the north-easterly weather unless you made a northern breakwater; but the bringing of the end of the eastern breakwater a quarter of a mile nearer the shore would, I think, make things worse, because the seas would come right in and sweep round the port.
2472. What area of sheltered water would there be during north-easterly weather;—would all the water be sheltered within a line between the head of the breakwater and the northern jetty? The northern jetty would barely be sheltered. We have found, however, that when the wind is north-east the sea runs a little more to the east.
2473. So that the breakwater would be more affected in north-easterly weather than one might suppose by looking at the plan? Yes.
2474. Not nearly so much sea gets up with a north-easter as with a southerly or a south-easter? No.
2475. Do you think it is desirable that a harbour should be made on the south coast for the convenience of shipping? I think it very desirable.
2476. Besides giving facilities for loading and unloading, would it have other advantages? Besides giving facilities for the shipment of coal, it would be a port of refuge, and it would afford a splendid outlet for a great deal of the Illawarra produce.
2477. Do you know anything about Bellambi? Yes.
2478. How does that place compare with Port Kembla as a place for the construction of a breakwater? I prefer Port Kembla a thousand times.
2479. Why? The area of water at Bellambi is too confined.
2480. What is the holding ground at Bellambi? It is not so firm as at Port Kembla. The sand seems to be looser.
2481. Are there not reefs about there? Yes, outside, and the ground inside is rocky here and there.
2482. Do you think it is as well sheltered as Port Kembla? No. Red Point shelters Port Kembla to a great extent, and the Five Islands are a great natural shelter. They are a kind of breakwater in themselves.
2483. How long is it since you have had practical experience of these places? I suppose six or seven years.
2484. Do you know the proposal to construct a harbour at Lake Illawarra? I understand that it is proposed to open an entrance into the lake close to Windang Island, and to make docks for the reception of vessels in the lake.
2485. What is the least draught of water that it would be desirable to have at a port from which coal is shipped by oversea vessels? For a loading berth not less than 24 or 25 feet.
2486. Would 15 feet be of any service, except for coasting vessels? Absolutely none, and I question very much whether it would be of much use to coasting vessels; they are becoming so large.
2487. Would the breakwater be a considerable advantage in developing the sailing ship trade? Yes; a breakwater would make the port available for that trade. Sailing ships do not go there now to my knowledge.
2488. The breakwater would be of more advantage to sailing ships than to steamers? Yes; steamers can get away whenever they please; but sailing vessels would have to haul out to an anchorage. While the anchorage there is very good, and I should have no hesitation in lying there if I had good ground tackle, still it would be a great advantage to have a breakwater. I question whether some people would care for their vessels to go there at the present time.
2489. Would you like to take a sailing vessel there to load coal at the present time? Not a large sailing vessel; only a small vessel that could be easily handled.
2490. Do you know anything about the coal trade on the southern coast? I was connected with it for some years.
2491. What is your opinion of Wollongong Harbour;—is it of any use at all? It has served its purpose, and to my mind it is a great pity that the money was not spent on works like the proposed breakwater.
2492. Wollongong Harbour is only suitable for vessels up to 700 or 800 tons? Yes.
2493. As a port it could never be the means of developing the southern coal-fields? No. That is impossible.
2494. You think the Port Kembla scheme is the best that you know of? Certainly. No one with any local knowledge, and especially nautical knowledge, could arrive at any other opinion but that that is the only desirable port.
2495. Do you know anything about Jervis Bay? Yes, it is a splendid port; but it is too far south.
2496. The coal might as well be sent to Sydney as to Jervis Bay to be loaded? Yes.
2497. Therefore Jervis Bay is out of the question? Yes.
2498. *Mr. Clarke.*] Would it be possible to make Bellambi a shipping port? Everything is possible; but even with the expenditure of a great amount of money I question if you could ever make Bellambi anything like so good a harbour as Port Kembla might be made.
2499. Do you know what quantity of coal is shipped now from the two jetties at Port Kembla? I know that a large quantity is shipped, but I cannot say how much.
2500. Do you think that in the event of the proposed improvements being carried out, the shipment of coal will be increased? I do; because I have known vessels not to have been able to get coal there, and to have gone to Newcastle.

2501. What would be the extent of the increase? I should imagine it would be 50 per cent.
2502. Do you think that other collieries on the coast would continue to use their jetties if the proposed works were carried out, or would they ship entirely from Port Kembla? No doubt they would use their own jetties for a time, but after a while the safety of their property and the saving of wear and tear would probably cause them to ship wholly at Port Kembla.
2503. Independently of the intercolonial trade, they would load into large vessels at Port Kembla? Yes. A great many vessels would go to Port Kembla which now go to Newcastle. I know of three or four vessels that would have gone to Port Kembla but they were prevented by the weather.
2504. If the proposed improvements were carried out, it would be possible for sailing vessels of any size to load at Port Kembla? I think so.
2505. Can you give the Committee any information as to the quantity of coal carried in sailing ships—say, from Newcastle to various over-sea ports? Not from memory.
2506. I believe that inasmuch as freights by sailing vessels are cheaper than freights by steamers, a great increase in the coal trade would result from the employment of sailing vessels at Port Kembla? Yes; but I think that the day is not far distant when we shall be able to carry coal by steamers almost as cheaply as in sailing vessels.
2507. Steamers on long voyages consume large quantities of coal? Yes; but they are making such vast improvements in machinery that the consumption of coal is becoming smaller and smaller, and I think that steamers will pay better than sailing vessels because of the time they save. The matter is exercising the minds of shipowners at the present time. They are inquiring whether the export of nitrate of soda from the western coast of South America could not be better done by steamers.
2508. Have there been any wrecks at Port Kembla since they commenced to ship coal from there? Not that I am aware of.
2509. What kind of produce, other than coal, do you think would be shipped from Port Kembla? Much of the produce that is now carried by the steamers.
2510. I suppose chiefly dairy produce? Yes; all that was not brought by rail.
2511. Would not that be a very small item? I am not speaking only of what the coal vessels would take away, I am speaking of vessels trading up and down the coast. They could take in their coal, and whatever dairy produce they required at the same time.
2512. What other places are there to ship dairy produce from at the present time? Well, they ship a certain quantity from Wollongong now; because the railway cannot compete with the water carriage. I do not see why they should not ship from Port Kembla.
2513. Do you think it likely that large quantities of ore will come from Port Pirie to Port Kembla to be treated at the Dapto smelting works? If the smelting company has its own port, no doubt its stuff will go there; but, apart from that, I think that a good deal of stuff will be brought to Port Kembla. The fact that vessels will be able to use Port Kembla in any weather will be a point in its favour. The Illawarra steamers now cannot at times get into Wollongong or Kiama, because of the rough weather, whereas they could always make Port Kembla.
2514. In the event of the Lake Illawarra scheme not being carried out, do you think the smelting company would land their stuff at Port Kembla? I should think so. If I were the master of a vessel, and it were a question of freight from South Australia to Port Kembla, or to Lake Illawarra, I would prefer to go to Port Kembla even for a little less money.
2515. *Mr. Lee.*] Have you had experience of coastal ports in other parts of the world? Yes.
2516. Do you know any similar to Port Kembla? Yes; we have one or two similar places in South America. Tome, in Chili, and Talcahuano are splendid open places in fine weather, but in winter time vessels ride badly there owing to the prevalence of northerly gales. They constructed a breakwater at the latter port, but I heard, two mails ago, that it had been broken in the middle through the force of the sea. They spent 2,500,000 dollars there.
2517. Was that breakwater built for the express purpose of protecting the bay? Yes, and to protect the new docks of the Chili arsenal. There, however, they have a straight line of coast with nothing to break the roll of the sea; but Port Kembla is protected by Red Point, and the islands to the south, so that the sea would be broken before they reached the breakwater.
2518. Do you think that there will be any danger of the proposed breakwater being carried away? No. There is a lot of reefs between the inner Tom Thumb Island and the three islands lying off Red Point. These reefs will, I think, protect the breakwater in some measure.
2519. The conformation of the coast will largely assist to diminish the force of the sea when it reaches the breakwater? Yes.
2520. And you have no doubt as to the protection that the breakwater would give to shipping? None whatever.
2521. If there were, say, thirty sailing vessels inside the proposed breakwater waiting to be loaded, and a heavy easterly gale sprang up, could they ride it out? I think so. I think that with the proposed breakwater they would be fairly well protected. The broken ground I have spoken of would lessen the force of the sea as it approached the breakwater, and after the sea struck the breakwater it would run north-west, so that the water inside the harbour would be comparatively smooth.
2522. Would there not be a surge round the breakwater into the bay? There would be a small "sand," unless you closed in the bay altogether with two breakwaters, as shown on the plan.
2523. Is it not desirable that as large an area of water as possible should be protected? Yes, and the greater the area of protected water you have, the lesser the wash.
2524. If Port Kembla becomes a place for the export of a great quantity of coal, a large number of ships will be anchored there? Yes.
2525. The port must, therefore, be made as ample as possible? Certainly.
2526. If the end of the breakwater were drawn in towards the shore that would decrease the anchorage considerably? Yes.
2527. It might afford more protection to the port, but it would not give so much accommodation to vessels waiting to load? No; and it would bring in more ground swell, because the waves would not have sufficient room in which to spread out.
2528. In your opinion, is there any danger of the bay silting up, supposing the breakwater is constructed? I do not think there is any danger. I think that the long open stretch of coast to the north will prevent any wash into the bay. Further than that, I find that underneath the sand there is a hard clay. That I account for by the siltage coming out of Tom Thumb Lagoon.

Captain  
J. H. Amora.  
9 Dec., 1896.

Captain  
J. H. Amora.  
9 Dec., 1896.

2529. You are of opinion that it would be wise to construct the port as suggested by the Government officials, and that, if constructed, the breakwater would give all necessary protection for the present, and would allow shipping to be carried on there with safety? Yes.

2530. I find that there is a very large coal trade between Newcastle and Chili? Yes; it amounts to nearly 300,000 tons annually.

2531. Is any coal taken from the south coast to Chili? Some southern coal and some western coal have gone there; but it has been chiefly Newcastle coal.

2532. Would the construction of the proposed port have any effect upon that trade? I think so. I think that a great deal more southern coal would be sent away if the port were made.

2533. Would that be at the expense of the Newcastle trade? I do not think so. We get a great deal of coal for gas-making from Newcastle, and I know that a great deal of Newcastle coal is used for purposes for which they would prefer southern coal. If facilities were offered for shipment numerous cargoes of coal would be taken from the south coast to Chili.

2534. That trade would not be at the expense of the trade of Newcastle, but would increase the trade of the Colony generally? Yes.

2535. *Chairman.*] Can New South Wales hold the market in Chili at the present prices? No. They get a good deal of coal from Swansea.

2536. Do they get any from Vancouver? I think only one or two cargoes, when vessels fail to bring timber.

2537. If New South Wales coal could be delivered for 1s. 6d. or 2s. a ton less, would it hold its own in the Chilean market? I am sure of it. Our own mines could not be developed at the price. We have large coal-fields, and we supply our southern railways; but we cannot get sufficient coal for the purpose, and we shall not be able to do so for years.

2538. What is the coal consumption of Chili? I think somewhere about 1,000,000 tons.

2539. What is the coal production of Chili? According to the last statistics, about 63,000 tons.

2540. Is there a market there for 1,000,000 tons of New South Wales coal, if it could be sent there for 2s. a ton less? Yes; if it could compete with the British coal.

2541. If our coal were sent there for 2s. a ton less than its present price, it seems probable that it would beat the British coal? Yes; I think that it would throw it out of the market altogether.

2542. *Mr. Wright.*] What is the freight for coal from New South Wales to Chili? It has varied from 9s. a ton to as much as 17s. a ton.

2543. What is a fair average? From 12s. to 13s. a ton.

2544. What would be the average freight for Welsh coal? From 18s. to 21s. a ton.

2545. That difference in freight should more than compensate for any difference in the cost of getting the coal? Yes. They have not been able to get Welsh coal there very often, and they have had to use Newcastle coal.

2546. Is the southern coal required chiefly for steaming purposes? Yes; besides what is required on the nitrate-fields.

2547. The great bulk of the coal used on the west coast of South America is consumed for steaming purposes? Yes.

2548. If the southern coal is nearly as good as the Welsh coal, and could be delivered for 7s. a ton less, it ought to beat the Welsh coal out of the market? Yes; and years ago I wrote to my government to that effect. From my experience, the Welsh coal is similar to our southern coal. If the southern coal could be exported direct to Chili, it would compete very favourably with the British coal.

2549. This trade is done by sailing vessels principally? Exclusively.

2550. If a port were made on the southern coast at which sailing vessels could load, you think that the good quality and the cheapness of the southern coal would increase the demand for it in South America? Yes. At the present time there is a great innovation taking place in connection with the shipment of nitrate of soda from Chili to England. This work is now being done by steamers, and if ocean tramps coming out here could load coal at Port Kembla they would be glad to take it to Chili, and there load nitrates for England.

2551. The freight would then be lower? Yes; and the consumption of coal would be increased.

2552. Such an arrangement would mean cheap freights all round? Yes; it would give employment for shipping, and mean an increased output of coal.

2553. You have no doubt that the proposed breakwater would make Port Kembla a good harbour? None whatever. On the coast of Chili we load at places infinitely worse than Port Kembla.

2554. Valparaiso would not be so good a harbour? Not with a westerly wind.

2555. *Mr. Hassall.*] You have had practical knowledge of this coast by navigating vessels along it? Yes. I have taken a good number of vessels there, and I have been engaged in managing collieries. I have given this matter some consideration, and have weighed in my mind the evidence that has been given here.

2556. You said that you have not had much experience of Bellambi? No; but I have seen it often under varied conditions.

2557. Port Kembla is a more suitable place for a harbour? Yes.

2558. Do you think that if the proposed breakwater were run out in a line with the coast from Red Point, it would afford more shelter for shipping? I do not think it would give as good shelter as if carried out as proposed.

2559. Do you think that if the breakwater were run out in the direction I suggest, it would answer the present requirements of the port? It would give shelter to the port, but you have also to consider how vessels will lie in the harbour. If you take soundings from the outer Tom Thumb Island to the outermost point of the islands off Red Point, and then go across towards the point midway between Red Point and Port Kembla Point, you will find a number of outcroppings of reef. This broken ground will prevent the sea from injuring the proposed breakwater. I do not see that you gain very much by carrying out the breakwater in the direction you suggest, inasmuch as you will be bringing it into the deep-water of the basin.

2560. By taking the breakwater in the direction I suggest, you run out to comparatively shallow water, at 38½ feet, while inside you have from 40 feet to 50 feet. The question is whether a breakwater running out in line with the coast would not resist the seas better than the proposed breakwater? I do not think that the difference would be very great. The Five Islands are a natural protection to any breakwater, and by carrying out the breakwater in the direction you propose you lessen the area of the harbour. In that way you give less room for shipping, and you are likely to have rougher water. I should like to have seen the breakwater carried a little further to the east.

2561.

2561. You think it would be advisable to run the breakwater in a more easterly direction than that provided for on the plan? Well, I would not bring the breakwater in at all. I would not reduce the harbour area under any consideration. Captain  
J. H. Amora.
2562. Do you think it would be advisable to take the breakwater in a more easterly direction for some distance and then give it a curve round towards the west, so as to throw the seas away to the north? Yes, that would strengthen the breakwater a great deal, and would give a larger area of protected water inside. 9 Dec., 1896.
2563. Would it get rid of the ground swell that might arise if the proposed breakwater were constructed? I think it would be an advantage to carry the breakwater out in that way. If you confine the entrance you will get a continual "fetch."
2564. You think the head of the breakwater might remain where it is, but that it should have a curve to the east to give a larger area of protected water, and to lessen the chance of a swell in the harbour? I think so.
2565. Do you think that it is necessary to carry the breakwater out more than 2,800 feet? It would be better to go further out if possible; but that would mean an increased expenditure.
2566. Do you think that the output of coal would increase to such an extent that a charge of 3d. or 6d. a ton would pay interest upon the sum expended in making the harbour? I think so. I am sure that the southern coal would then be used a great deal more than it is now.
2567. Have you any interest in the southern coal trade? Not to the extent of one cent.
2568. Do you think the collieries interested would be willing to pay the charges necessary to cover interest? I think that it would be to their own advantage to do so, because the construction of the proposed harbour would give them a larger output.
2569. Do you think the natural advantages of Port Kembla are superior to those of other places along the coast? Yes; from Jervis Bay to Port Stephens. It requires no amount of nautical knowledge to see that. Jervis Bay is too far south for the coal trade. What is required is a place handy to Sydney, where vessels can easily run down and load. I am surprised that Port Kembla was never thought of before.
2570. Do you think the Lake Illawarra scheme, if carried out, would meet the requirements of the district? No; not for the purposes of an international traffic.
2571. You think the natural difficulties in the way of making a good port are too great to be overcome? Yes; unless an enormous sum of money is spent. Money will overcome all difficulties, but the question to be asked is, would the expenditure pay.
2572. How much would have to be expended to make a fairly safe harbour at Lake Illawarra? I could not go into figures; but a great deal of work would have to be done. Then, too, the entrance to Lake Illawarra is not so protected as Port Kembla. The whole of the sea bed outside Lake Illawarra is as flat as a fluke. There are no reefs to break the sea there, as there are at Port Kembla.
2573. In your opinion the expenditure of a certain sum of money at Port Kembla would give more satisfactory results than the same expenditure elsewhere? Certainly. I have always held that it is a pity that the money expended at Wollongong and Kiama was not expended at Port Kembla. I nearly lost my ship at one of those ports.
2574. Have you had any trouble at these other places? I have lost one or two anchors.
2575. Where? I lost an anchor off Broughton Island at one time.
2576. As a practical man, you are of opinion that Port Kembla is the most suitable place for the construction of a harbour? Yes.
2577. *Mr. Roberts.*] You stated that there was a market for 1,000,000 tons of coal a year in Chili? Yes, approximately; though I could give you the exact figures from my returns.
2578. From what parts of the world does Chili purchase her coal? From New South Wales and from Great Britain. She has got one or two cargoes from Vancouver, and she also gets coal from her own mines. They have three coal shipping ports now on the south coast of Chili.
2579. Do they purchase Japanese coal there? No; I do not know of any Japanese coal having been used there yet.
2580. If the proposed harbour were constructed and coal was sent from New South Wales at a lower price than the present, the demand for it would be considerable? Yes, I think so. I think the southern coal would cut very much into the Swansea and Cardiff coal trade.
2581. How much lower would New South Wales coal have to be sold in Chili to make sure of the Chilean market? So far as Newcastle coal is concerned they do not want to go any lower. For many purposes, however, the Welsh coal, which is dearer, is preferred, and I have no doubt that if the proposed port were made the southern coal would be exported direct to Chili, and would successfully compete against the Welsh coal all the way up the west coast of South America as far as Panama. Newcastle coal is at present being used over there for purposes for which they would prefer southern coal. They cannot get sufficient Welsh coal, even at a higher price, and therefore they are compelled to use Newcastle coal.
2582. Does any southern coal go to Chili at the present time? I do not think any has been sent there lately.
2583. Would that be because of the difference in price between southern coal and English coal? I think not. I think it is because there are no facilities for loading southern coal here. It has to be brought up to Sydney by colliers, and the charge for that work, say 4s. a ton, has to be added to the price of the coal, which brings it up from 7s. to 11s. per ton.
2584. How low would the southern coal have to go to secure the market against all comers? Not very low. There is a difference of 5s. or 6s. a ton between the freight from England and the freight from New South Wales.
2585. There is a large sailing-ship trade between Australia and Chili? Yes, and I do not think it will be long before it is supplemented by a steamship trade.
2586. If the sailing vessels could load at Port Kembla, you think there would be a great market for southern coal abroad? Yes. Merchants in Valparaiso will not order southern coal at the present time, because they have to pay 12s. a ton for it, as against 6s. a ton for Newcastle coal. If, however, the southern collieries were put in the same position as the northern collieries, it would be different.
2587. For how many tons of southern coal would there be a demand in Chili? I think 40 or 50 per cent. of the coal required would be southern coal. Industries there are making great strides at the present time, both in Chili and in Peru.

- Captain  
J. H. Amora.  
9 Dec., 1896.
2588. What is the nature of those industries? Various manufactures, and they intend to go further into the nitrate business. There is a large area of country there which will be developed very shortly.
2589. The demand for coal from the southern district will, you think, continue to increase? Yes.
2590. Do you think that if the proposed breakwater is constructed a large population will settle round Port Kembla, or will Wollongong continue to be the commercial centre? Naturally if vessels did not call at Wollongong population would increase at Port Kembla. I think that the population of all these colonies is going to increase largely, and no doubt the construction of the proposed harbour would mean the settlement of a considerable population at Port Kembla.
2591. Have you formed any opinion as to the area of land likely to be required to be resumed if the proposed harbour were constructed? No, I have not gone into that matter; but I do not think that very much would be required.
2592. On what grounds do you prefer Port Kembla to Bellambi? At Bellambi there is a very small area of protected water, and only a short beach, whereas at Port Kembla you have a large area of protected water, and a long beach to the north, while the configuration of the coast to the south creates a natural breakwater. If I did not know the coast at all, and were approaching it as a total stranger, I should go to Port Kembla.
2593. Is not Bellambi similarly protected from the south-east to Port Kembla? No; Port Kembla is much better protected.
2594. Is not Bellambi more sheltered from black north-easters? No; though there is no sea from the north-east. You can thresh through a north-east sea as you cannot do against a southerly sea.
2595. With a black north-easter blowing would there not be a great break on the shore? No. It is astonishing how little sea there is at Port Kembla when a north-easter is blowing. I have lain there during the continuance of a heavy north-easter.
2596. Without inconvenience? Yes.
2597. What lights would be necessary at Port Kembla if the expected traffic were to be created? I suppose they would require to have a light on one of the Tom Thumb Islands, and another at the end of the breakwater. You would want a small harbour light there. The light would have to be so screened as to protect approaching vessels from all dangers.
2598. Could the Wollongong lighthouse-keeper look after the Port Kembla lights? No; you would require to have a special man.
2599. He could not have come down by train to attend to it? No. You would require to have a man stationed there at night to see that nothing happened to the light.
2600. *Mr. O'Connor.*] How long have you resided in this Colony? About thirty-two years.
2601. You are the representative of several Governments? Yes, of seven.
2602. And you have been a seafaring man? Yes.
2603. The objects of the scheme before the Committee are, not only to secure the best possible harbour for commercial purposes, but also to provide a harbour of refuge for shipping;—what in your opinion is the best place for such a harbour? Most certainly, Port Kembla. A harbour on the south coast is a long-felt want.
2604. Have you any interest in this place? Absolutely none; but I have lived in the colonies for a long while. I have a love for them, and desire their advancement, and if anything I could do would help them, I would do it.
2605. You are of opinion that the best harbour for the development of the resources of the south coast is Port Kembla? Certainly.
2606. Do you know what the output of coal from Port Kembla is? I cannot remember the figures at the present moment; but every year I send reports to the Governments which I represent, on the commerce of the colonies, and therefore I take notice of these things.
2607. It is one of the duties of your position to report to the various Governments which you represent, the industrial conditions of this Colony, its commercial possibilities, and so on? That is so.
2608. You have done that from time to time? Yes. My last report to the Chilean Government covered 275 sheets of closely-written foolscap, and I make similar reports to the other Governments which I represent.
2609. Do you think that New South Wales, as a coal-producing country, will be able to hold her own in the east if proper facilities are given for the shipment of coal? Certainly.
2610. You think that with proper facilities for shipment we may hope to meet all competitors in the east? I think so. I am looking forward to a great improvement in that direction. I take it that we shall shortly have a better output in the Netherlands than we have now.
2611. You are aware that during the great coal strike here a large development took place in connection with the Japanese coal industry, and they have many advantages there in the way of cheap labour and so on which we have not. Notwithstanding this fact, do you think that we shall be able to successfully compete with the Japanese coal in the near future? I think so. What we have to fear is not so much the cheapness of the Japanese coal, but the dearth of profitable cargo. Vessels now going out to the Netherlands from Europe take coal almost for nothing, rather than go empty. I could show the Committee figures which I have received from the department in Batavia which show that. The English coal is delivered there much more cheaply than Newcastle coal; but people will soon stop taking it so cheaply, because they are getting sick of it.
2612. The quality of Australian coal is so good that it will be able to successfully compete with foreign coal? I am told that the Australian coal is preferred, and would be sought for, but for the introduction of other coal at so low a rate.
2613. It only remains for us to afford every facility for the shipment of coal to give our colliery proprietors a fair chance of successfully competing in other parts of the world? Certainly. If New South Wales could introduce her southern coal on the west coast of America, as I have shown she could, why should she not be equally successful in other places. The west coast of South America is open to Newcastle coal, and it would also be open to southern coal.
2614. You have seen the marvellous coal-fields at Newcastle, and also on the southern coast? Yes. I have been to Mount Kembla, Mount Pleasant, and Mount Keira.
2615. There are thousands of tons of coal for which there is a market in the east? Yes; the only thing is to get vessels to load it.

Captain William Henry Mills, Master Mariner, sworn, and examined:—

2616. *Mr. Clarke.*] How long have you been trading to the South Coast? Twenty-four years.  
 2617. Have you traded to all the ports between Sydney and Jervis Bay? Yes, to the whole of them.  
 2618. Which do you consider the best port in its natural state? Port Kembla; it is superior to any place between Sydney and Jervis Bay. I traded for the Bulli Company for sixteen years. When I have dragged my anchor at Bellambi I have gone to Port Kembla, and have held on there during very heavy south-east gales, not only with small boats, but with vessels of 6,000 and 7,000 tons. I have lain there quite comfortably with a single anchor out, and 60 fathoms of chain.  
 2619. *Mr. O'Connor.*] Was that during a gale? Yes. The following is a list of the vessels which I have taken to Port Kembla, and which have successfully loaded there:—

Captain  
W. H. Mills.  
9 Dec., 1896.

1892-1893.		1895.	
December.....	S.S. Eaton, 4,500 tons.	February .....	S.S. Keraweera, 2,500 tons.
February .....	„ Marie, 4,000 tons.	April .....	„ Catterthun, 3,000 tons.
April.....	„ Crown of England, 5,000 tons.	June .....	„ Keraweera, 2,500 tons.
October .....	„ Oberon, 4,000 tons.	July .....	„ Port Philip, 4,000 tons.
		August.....	„ Tirica, 3,000 tons.
		„ .....	„ Catterthun, 3,000 tons.
		September.....	„ Airlie, 3,000 tons.
		October .....	„ Indrani, 7,000 tons.
		November.....	„ Indra, 5,000 tons.
1893.		1896.	
January .....	S.S. Barmen, 4,500 tons.	January .....	S.S. Guthrie, 3,000 tons.
August .....	„ „ „ „	May .....	„ Angonia, 4,000 tons.
September.....	„ Guthrie, 3,000 tons.	„ .....	„ Echuca, 4,500 tons.
„ .....	„ Catterthun, 3,000 tons.	„ .....	„ Sonneberg, 7,000 tons.
November.....	„ Tirica, 3,000 tons.	June .....	„ Stassfurt, 5,000 tons.
December.....	„ Catterthun, 3,000 tons.	July .....	„ Port Philip, 4,000 tons.
		„ .....	„ Gulf of Ancud, 4,500 tons.
		August.....	„ Gulf of Lions, 4,000 tons.
		„ .....	„ Gulf of Bothnia, 5,000 tons.
		September.....	„ Rakanoa, 4,000 tons.
		October .....	„ Port Adelaide, 5,000 tons.
1894.			
January .....	S.S. Airlie, 3,000 tons.		
July .....	„ Franklin, 1,500 tons.		
December.....	„ Guthrie, 3,000 tons.		
„ .....	„ Ormidale, 6,000 tons.		

2620. *Mr. Clarke.*] Have you occasionally been compelled to put to sea before you had finished loading? I have occasionally had to slack my breast ropes and lie about 20 feet off the jetty. Sometimes a range sets in with the flood, and drops again on the ebb. Then we brace in and commence loading again. On several occasions I have had to let go at a minute's notice, and lie out at anchor. I have lain at anchor quite safely until the weather moderated. I have never had to lie out at anchor more than two days.

2621. The holding-ground was good? Yes. It is splendid blue clay, with sand over it.  
 2622. The danger to be feared is not so much from heavy weather? No; it is the range that is dangerous. You cannot get anything to hold you when it sets in.

2623. A breakwater would obviate that? Yes.

2624. And would make it safe for both sailing vessels and steamers to load there? Yes, that is the eastern breakwater. I do not think the northern breakwater will be required for thirty or forty years yet. No danger is to be apprehended from northerly weather. I have lain alongside the jetty quite comfortably dozens of times while it has been blowing feather white.

2625. Do you think it would be advisable to bring the end of the breakwater more in towards the west? I should say that the breakwater would do as it is; but you want as much enclosed water as you can get. With vessels 400 feet long you cannot have too much room.

2626. Do you think that the present jetties will be sufficient for a long time? I think so.

2627. Do you think that in the public interest the Government should resume them? I am not in a position to speak about that.

2628. Would it not be advisable for the Government to have control of the jetties in order to secure their use to the best public advantage? Well, that would prevent a monopoly; but it is a question whether the Government would ship coal as fast as it is shipped there now. The present rate of coaling is tremendous. The only thing you have to wait for is more coal. Sometimes all the mines cannot keep the works going.

2629. Will not the Government require revenue to pay interest upon the proposed expenditure? Well, I think harbour and pilotage dues might be charged.

2630. Do you think the coal-owners and others should pay the same rates as are charged at Newcastle? I do not see why they should not, considering the benefits which they would derive. It is evident that the trade of the port would be increased enormously if sailing vessels could go there. I have been asked to take two large sailing vessels there; but I distinctly refused, because there might be an accident, and I have never had an accident yet.

2631. A great deal of the oversea coal-trade is carried on by sailing vessels? It used to be. The Bulli company used to have eight or nine vessels loading at once.

2632. They can carry coal at a cheaper rate than steamers can carry it? Well, since the strike, the San Francisco trade has fallen off tremendously. At one time we could not supply the demand.

2633. Inasmuch as sailing vessels do a great deal of the trade from Newcastle, it is probable that they will do a great deal of the trade from Port Kembla? Decidedly. I brought two steamers from Newcastle—the “Indrani”\* and the “Ormidale”—which could not load a full cargo at Newcastle; and I also recently took the “Sonneberg,” a large German-Australian steamer of 7,000 tons there. When she left the jetty at Port Kembla she was drawing 25 feet 6 inches; but at Newcastle you cannot get out if you are drawing more than 24 feet at spring-tide, and then it must be a very smooth day. The ships are increasing in size every year; but at Port Kembla you can get deep enough water without dredging or any extra expense.

2634. Would there be any danger of the proposed harbour silting up, supposing the breakwater were made? I do not think so.

2635. And there would be a large increase in the trade if the breakwater were made? Yes, both in the steamer trade and the additional sailing-ship trade. The masters of the big steamships see dangers in the place that I do not see. Lying alongside the jetty with an anchor and 90 fathoms of chain out,

you

\* NOTE (on revision):—The “Indrani” came from New Caledonia direct to the jetty; not from Newcastle.

Captain  
W. H. Mills.  
9 Dec., 1896.

you could swing clear, suppose anything happened, without the engines at all, and there is plenty of water in which to float. Of course they see the vessel close to the beach—a thing to which they are unaccustomed—and they say that they will write to their owners and tell them what sort of a place it is. 2636. You consider that in the public interest this work should be carried out? Yes; eventually it must be done. The trade is increasing every year, and there is a great demand for the coal. I heard a gentleman say yesterday that the "Gulf of Guinea" had gone down to Port Kembla to try the place, and went away in disgust; but since then I have taken four of the "Gulf" boats there. The last vessel I took there was the "Port Adelaide," a steamer of 5,000 tons.

THURSDAY, 10 DECEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).	
The Hon. FREDERICK THOMAS HUMPHERY.	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.	

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Captain William Henry Mills, Master Mariner, sworn, and further examined:—

Captain  
W. H. Mills.  
10 Dec., 1896.

2637. *Mr. Lee.* In what capacity have you visited Port Kembla so often with the vessels you named yesterday? In the capacity of pilot, having full charge of the ship until she is loaded and taken out to sea, or to a safe anchorage, ready to proceed on her voyage.

2638. You have only taken steamers there? Yes.

2639. I suppose in taking a vessel there you choose your weather? To a certain extent, but, coming from Melbourne at times, bound to Port Kembla direct, I have had to make the best I could of it, and I have put into Port Kembla and anchored there.

2640. How long have you been acting in this capacity? Ever since the Southern Coal Company's jetty was erected. I took down the first steamer that went there—the "Gulf of Mexico." That was eight years ago, and I have taken down every large steamer which has been there since.

2641. You have never taken a sailing vessel there? No.

2642. I understand that you were asked to take two sailing vessels there, but that you declined;—why was that? They had not the needful appliances. They had hand winches but no steam winches, and it is an utter impossibility to work a ship in there by hand. With a sailing ship you have a great deal to heave against. The action of the wind and of the sea is very strong, and you cannot do much without steam power.

2643. It was for this reason, and not because you were afraid of loading in the port, that you refused to take those vessels down? Yes.

2644. Have you ever had to cease loading and to proceed to sea in consequence of bad weather at Port Kembla? Yes, several times.

2645. What are the conditions prevailing there at present should adverse weather arise suddenly? The only obstacle is the range coming in with a south-east wind. That prevents vessels from lying at the jetty.

2646. If they are not lying securely at the jetty it is impossible to load? Not only that, but they cannot hold on to the moorings.

2647. I presume you have a knowledge of the coast beyond Port Kembla? Yes; my knowledge extends all along the Australian coast.

2648. You believe that Port Kembla is the proper place for a harbour? It is the only place that I know of for a thoroughly safe harbour.

2649. Supposing the Government entrusted you with the work of making a harbour on the south coast for the purpose of developing the Illawarra coal trade, how would you proceed? I would run out a breakwater from the point as proposed.

2650. A breakwater similar to that shown on the plan? Yes, but if anything a longer one. I have heard it suggested that the breakwater should run out more in a north-westerly direction; but such a breakwater would include less water, and we must make our preparations to meet the class of vessels that we may expect to come there. I have taken vessels there 400 feet in length, and four or five such vessels lying at anchor with 60 fathoms of chain out take up a considerable amount of room. Of course the length of chain they have out depends upon the weather. In bad weather they would want a lot of chain.

2651. Do you think that the proposed breakwater goes out far enough? Yes, I think so. The only inconvenience I have seen has been from the heavy range between the point and the first island. There is no mischief anywhere else.

2652. Could a ship safely anchor outside the head of the proposed breakwater? Yes, quite safely.

2653. If the proposed harbour contained 260 acres of water, how many ships could be safely accommodated within it? I think that seven large ships would be all that could safely swing there at single anchor. Of course if they were moored it would be different. When a vessel is moored she only swings her own length; but riding at single anchor she takes three times as much room.

2654. I understand that the proposed harbour, if not dredged, will only include 153 acres, in which there would be a depth of 24 feet? Well, I do not see that it would be necessary for every vessel waiting to be loaded to cram into the harbour. Some of them could anchor outside. Of course, if the Government laid down moorings the ships would not require so much room.

2655. At Newcastle it is the common practice for over-sea vessels to lie at anchor, or at moorings, waiting their turn to load? Yes.

2656. If a large shipping trade is developed at Port Kembla the same sort of thing will take place there? Yes.

2657. The first proceeding of an over-sea vessel arriving at Port Kembla would be to go to moorings, or

to drop her anchor until her turn came to load. She would then go alongside the jetty, take out her ballast, and load with coal. Meanwhile she would have to wait in the basin. At times there might be more than seven vessels waiting in the basin? Well, of course it is impossible to say what the trade will be. Captain  
W. H. Mills.  
10 Dec., 1896.

2658. The ordinary steamer trade will still go on. There must therefore be sufficient trade left to allow the steamers to pass in and out. Supposing ten or a dozen vessels were lying in the basin, and a heavy cyclonic blow suddenly arose, what would be their position? I think they would be no worse off than if they were lying in the stream at Newcastle.

2659. Newcastle harbour is more protected than this coast would be? Sometimes it is; but at times it is a difficult job to load at a dyke, with the range that comes in from an easterly gale.

2660. But the range at Newcastle is at its minimum? Yes.

2661. The range at Port Kembla must necessarily be very much greater? Yes.

2662. If the breakwater does not prove entirely effective under the circumstances such as I describe, it will, in bad weather, act as a trap, because it will be impossible for sailing vessels to get out. They must either hang on or go ashore? Yes.

2663. You have no fear on that score? I would have no fear whatever of loading a sailing vessel there if the proposed breakwater be constructed; but at present I would not take such a vessel there, unless she were well manned and had proper steam appliances and good gear on board.

2664. If good loading appliances, in the way of cranes, were provided there, would that meet the objection? I am referring not to loading appliances; but to appliances for mooring the ships.

2665. You apprehend that there would be difficulties in moving sailing vessels from their moorings to the jetty, and away from the jetty again? Yes.

2666. Would not the creation of a harbour at Port Kembla necessitate the establishment of a tug service there? Yes, tugs would be necessary.

2667. Not only to bring vessels in and out, but to move them from their moorings? Yes.

2668. Would not that overcome your objection? It would to a great extent.

2669. In bad weather, would the sea break over the breakwater? Of course it would all depend upon the height of the breakwater, but I think that unless the breakwater was very high indeed the wash of a heavy easterly sea would come over the top of it.

2670. If the breakwater is to be used as a side track for railway trucks it will be necessary to raise it some height above the water? Yes, a tremendous height.

2671. Otherwise it would not be safe to use it for the purpose? No.

2672. Are you of opinion that jetties could be run out from the eastern side of the breakwater to be used for unloading? No. I would suggest that every jetty run out in Port Kembla, or anywhere along the coast, should take a north-easterly or south-westerly direction, because then a vessel lying alongside would lie bow on to whatever sea there was, and would not be so much affected by the range as if she were lying broadside on.

2673. Is that the direction of the present jetties? Yes; and that is why we lie there so snugly in north-easterly weather.

2674. If there should be an import trade in the shape of mineral ores, how would you discharge cargo at Port Kembla? I think that you could discharge at the jetties just as well as you could load.

2675. I presume that it would not be more difficult to discharge ore than to discharge ballast? No.

2676. If a sailing vessel came in in ballast she would have to discharge the ballast when alongside the jetty? Yes.

2677. If she could discharge ballast when alongside the jetties she could also discharge ore? Yes.

2678. Do you think that the existing jetties will be more than sufficient for the trade if the proposed breakwater is made? I think so, for some time to come. You can load an enormous quantity of coal from those jetties. I consider that until the trade increases very much it will not be necessary to run out another jetty.

2679. Has any portion of either of the jetties ever been washed away? Yes; a good deal of damage was done to the first Mount Kembla jetty; but no accident has happened to the Southern Coal Company's jetty since it has been erected, and neither has the new Mount Kembla jetty met with any accident.

2680. You do not endorse the opinion that the breakwater should be drawn in towards the shore more than is proposed? No.

2681. Your opinion is that we should give as much space in the harbour as possible? The more water you can enclose now-a-days the better. Large ocean-going steamers flying light in ballast must go in with way on. Otherwise, if it is blowing at all, you will have no rudder power. The same thing happens going out. I go out sometimes with a strong southerly wind blowing, and as soon as I let go from the jetty the vessel's stern tails round to the wind and she heads south-east, and I have to make a circle to get her out of the port. These large vessels take up a good deal of room to swing in; generally I let go from the jetty, and let the vessel swing round to the wind until the anchor is up. Then I go ahead with the helm hard-a-starboard, and she has to make nearly a circle in order to clear the islands. This takes up a good deal of room.

2682. Are there any shallow patches in the bay? There is a patch with about 16 feet of water on it at low tide; but it does not interfere with us. There is plenty of room to avoid it.

2683. Is it sand or rock? Rock.

2684. Is there much of it? Yes, it is a good-sized patch.

2685. Is there any other patch like it in the bay? No; it is the only patch.

2686. Have you noticed any tendency for silt to accumulate in Port Kembla? None whatever.

2687. What is the set of the current? It sets out from all the jetties along the coast about south-east.

2688. Therefore the breakwater would not influence the current in any way? No.

2689. The conditions that prevail now would prevail if the breakwater were constructed? I think so. There is no river or anything like that to cause the place to silt up.

2690. *Mr. Wright.*] You are acquainted with the shipping appliances at Newcastle? Yes.

2691. What is the difference between loading from the cranes at Newcastle and loading from the jetties at Port Kembla? At Port Kembla they can load 20 tons while they are loading 10 tons at Newcastle.

2692. Do you think that the proposed harbour is large enough for all practical purposes? Yes, for a long time to come.

- Captain  
W. H. Mills.  
10 Dec., 1896.
2693. If the proposed breakwater were constructed, could a large sailing ship run in there without a tug? Yes.
2694. What sized vessel would you take in? I would take in a vessel of 4,000 tons without a tug.
2695. Could such a vessel, wishing to leave, make an offing in a fairly stiff south-east breeze? She could not.
2696. With a north-easter she could not get out at all? No.
2697. So that if sailing vessels frequent this port, a tug would have to be stationed there? Yes.
2698. With the ordinary capstan and windlasses you would not handle a sailing vessel there now? No.
2699. They must have steam appliances to their warps and anchors? Yes.
2700. Do you think it would be an improvement if the proposed breakwater were carried out more to the east? No; I think the breakwater is just about in the right position. The northern breakwater I look upon as utterly unnecessary. The port will be quite safe without it.
2701. Do you think there is room there in ordinary weather for twelve vessels—seven or eight lying at anchor, and the rest loading at the jetties? Yes.
2702. Do you think it is likely that a larger number of vessels than that will go to the port for some time to come? I do not think that the harbour will be overcrowded for many years to come.
2703. Supposing the output of southern coal were doubled, would there be sufficient room in the harbour for the shipping required to export that coal? Yes.
2704. Do you think 2,000,000 tons could be shipped annually from the Port Kembla jetties? Yes.
2705. If the proposed breakwater were constructed, practically all that would be wanted to make a harbour there would be done? Yes. I think all that is wanted to make a practically safe harbour for any vessel that has ever come to this country is the proposed breakwater.
2706. Would you make a quay of the breakwater? No.
2707. You would not use it as a jetty? No.
2708. What would be the height from a vessel's hold to the top of an ordinary jetty, supposing she was loading cargo into railway trucks? I think that at the Southern Coal Company's jetty, which I believe to be the highest jetty in the colonies, the lift is nearly 100 feet.
2709. That is a very long hoist? Yes, but with steam appliances it would not be very much.
2710. Nearly all ships are now fitted with steam winches? Yes.
2711. Are not most sailing vessels supplied with steam winches for discharging? A great many of them—all the modern ships are.
2712. Could a ship lie safely alongside the breakwater if the breakwater were only 20 feet high? I think the water that would come tumbling over, even in moderate weather, would make it very uncomfortable for her, and it would be impossible to do any work. If a vessel were loading cargo at the time, I would not vouch for its condition.
2713. Do you think that while the breakwater will give protection to the port, it will not answer any other purpose? Yes.
2714. All the cargo to be handled should be handled away from the breakwater? Yes.
2715. *Mr. Pegan.*] By whom are you employed? I am employed by any one requiring my services. Both the Southern Coal Trust and the Southern Coal Company recommend me as the only man who has taken ships down there.
2716. What is the draught of the vessels which you have taken down there? Yesterday I said that I had taken vessels there with a draught of 25 feet; but last night when I went to the German-Australian Company's office I found that the draught of the "Stassfurt" was 26 feet 6 inches when she left the jetty at Port Kembla, and the draught of the "Sonneberg" 26 feet.
2717. Have you ever lost a vessel off any of the southern ports? Never.
2718. Have you ever met with any mishap there? No, I have never had an accident.
2719. But I suppose you have noticed that the southern coal trade is at times crippled for the want of a good port? Yes; and because of the prejudice of shipmasters against this place.
2720. Really there is nothing to be afraid of? Nothing whatever; of course, it is only an open roadstead, and you require a practical man to handle a ship there. Men who have never been in the trade see their vessels close to the beach, and the break along the beach, and nothing will convince them but that something will give way, and that their ship will go ashore.
2721. Do not captains of foreign vessels sometimes obtain certificates of exemption? Yes.
2722. I suppose that a great many of them do not know our coast, except the harbours of Sydney and Newcastle? Yes.
2723. If they were better acquainted with the coast a great many vessels might be taken down south to coal instead of coaling at Port Jackson? Yes.
2724. Therefore, a great deal of the want of trade at Port Kembla is due to the reluctance of foreign masters to go there? Yes.
2725. Before a master obtains a certificate of exemption, should he not show a thorough knowledge of the ports along the coast, so that he will not damage our trade in this way? He should possess a local knowledge of the place for which he is exempt.
2726. If a man receives exemption for Port Jackson or Newcastle, that exemption should only apply to those ports? Foreign-going masters are generally exempt only for Sydney and Newcastle. They are not, of course, exempt for Wollongong, for instance. Port Kembla, perhaps, would not be called a port.
2727. What constitutes the examination for exemption? A man has to show a thorough knowledge of any particular port before the fact that he is exempt from that port is endorsed upon his certificate.
2728. Do you think it would be better for the trade if captains had to obtain a certificate of exemption, not for one port, but for all the ports along the coast? I think it would be impossible to require any but local men trading on the coast to be acquainted with all the coastal ports.
2729. Sometimes mistakes are made and vessels and lives lost because of the want of knowledge of those who receive these exemptions? Yes.
2730. You have a thorough knowledge of Bellambi? Yes.
2731. You have been there in all kinds of weather? Yes.
2732. What is your opinion of the port? My opinion of the port is a very poor one.
2733. It does not compare with Port Kembla? No. I was running to Bulli jetty for sixteen years. It was the first open jetty along the coast. At Bellambi there is a little shelter from the reef. I have left  
the

the Bulli jetty and steamed to Bellambi, and, dragging there, I have had to run to Sydney. On one occasion I went from there to Port Kembla—that was before any jetty was thought of—and I lay there quite comfortably with a single anchor during a heavy east south-east gale.

Captain  
W. H. Mills.  
10 Dec., 1896.

2734. I suppose you have experienced great difficulty in discharging at Wollongong, Bellambi, and at Port Kembla? Sometimes. At one time when the Bulli Company was in full swing a great deal of cargo used to be sent down there nearly every trip.

2735. But, speaking generally, no provision is made for the discharging of cargo? None whatever.

2736. That goes against the port considerably? To a certain extent, but, so long as there are jetties you can discharge as well as load.

2737. *Mr. Roberts.*] Would you prefer the proposed breakwater to be constructed as shown on the plan or more in a bow shape? The more water you enclose the better; but I do not think the shape of the breakwater matters very much. Perhaps if you made the breakwater bow-shaped, it would strengthen it a little, because the sea would then strike it more at an angle. All that we want is to keep the south-east seas off. If the breakwater were run out in a north-westerly direction, following the line of the coast as has been suggested, it would shut out a lot of deep water that is absolutely required. At the present time a large amount of room is required to swing in, and, if the breakwater were taken out in a north-westerly direction, you would have to go astern and ahead half-a-dozen times before you got round.

2738. If the breakwater were bow-shaped, would not the seas be less likely to enter the harbour? I do not think so. You want to run the breakwater sufficiently far out to prevent the sea coming in.

2739. If the head of the breakwater is three quarters of a mile from the shore, that will give plenty of room to enter? Yes.

2740. If the head of the breakwater were brought within half-a-mile of the shore, would there be too little room? I think that would be rather close for big steamers. Running down with a beam sea, these large ocean tramps are like balloons on the water, and if you ease the engines much they simply lose all rudder power, so that you want as much room for them as possible.

2741. I suppose that if a large import trade sprang up at Port Kembla, it would be necessary to construct a northern breakwater in order to give a perfect harbour? That is looking a long way ahead. The north-easterly weather makes very little difference to Port Kembla. We never have anything like the sea there during a north-easter that there is in Hobson's Bay during a north-wester.

2742. Would you like to express an opinion as to the probability of a large import trade springing up at Port Kembla? I think that a very large coal export trade will be done there. As I have already stated, I have taken vessels there drawing 25 and 26 feet; but the greatest draught at which a vessel can get out of Newcastle is 23 ft. 6 in.; and I do not see any possibility of permanently deepening the Newcastle entrance. Therefore these large vessels cannot load full cargoes at Newcastle. One vessel coming out of Newcastle with 800 tons short of her full cargo lay in the quarantine ground here and finished loading.

2743. I asked you about the probability of an import trade? I do not think that will ever be much. Of course a large quantity of ore may come there.

2744. Would that necessitate the construction of another breakwater? No.

2745. Is it not necessary to have much quieter water for discharging than for loading? Well you have to take things as they come. At some ports vessels have to discharge when they are rolling gunwales under. You cannot always get a place like the Circular Quay. All that is necessary at Port Kembla is the proposed breakwater. When it is made, sailing vessels and vessels of any draught will be able to load there in perfect safety.

2746. Do you think a large number of sailing vessels will go there? Yes; especially if the trade increases as it did during the early days of the Bulli Company, when we had eight ships loading for San Francisco, at one time. The present system of loading in Sydney knocks the coal to pieces, and damages its value.

2747. Have you loaded vessels of as much as 7,000 tons in Port Kembla? Yes, the "Sonneberg," which I loaded there about five months ago, was that tonnage.

2748. Did she take the full cargo of coal? Yes.

2749. Nothing but coal? Yes.

2750. Where did she go to? To Bombay. The "Stassfurt" did the same.

2751. You have taken the "Gulf of Bothnia" there? Yes; the "Gulf of Ancud," the "Gulf of Mexico," the "Gulf of Lions," and the "Gulf of Bothnia."

2752. What is the tonnage of these vessels? From 4,000 to 5,000 tons. The "Gulf of Bothnia" is about 5,000 tons.

2753. Was she there recently? Yes, she took her full cargo of coal to Adelaide, while waiting for wool.

2754. How much would that be? I think about 4,000 tons odd, and about 600 tons of bunker-coal in addition.

2755. Have you ever known these vessels to be unable to load because of the weather? Yes, several times, because of the range.

2756. Would they then drop anchor in the port, or would they return to Sydney? Generally, they lie at anchor until the weather moderates; but sometimes a captain says, "I am not going to lie here," and we have to return to Sydney. I have never been forced back to Sydney by stress of weather. Sometimes the range sets in for half an hour, and drops again suddenly.

2757. Do you refer to the south-east swell? It is the under-tow that I refer to—the water at the bottom seems to boil.

2758. What would be the loss if a vessel like the "Gulf of Bothnia" had to come back to Port Jackson? She would lose about eight hours steaming time—that would be 10 or 12 tons of coal.

2759. At how much a ton? Between 6s. and 7s. a ton.

2760. Would a vessel that had returned to Sydney wait there two or three days for the weather to moderate? The Eastern and Australian Company's boats will not wait three hours—their time is so short. They will not lie off the place over night to wait for the morning. Generally, however, steamers that go down there do not go away until they have loaded. The longest stay I ever had there was with one of the German boats, when we were there three days. We lay there at anchor all the time.

2761. The masters of steamships do not like going to the place now? No; they will not go there if they can get out of it.

2762. If the proposed breakwater were constructed the prejudice against the place would be removed? Yes.

- Captain  
W. H. Mills.  
10 Dec., 1896.
2763. *Mr. O'Connor.*] What would be the width of entrance if the proposed breakwater were erected? Well, the breakwater would not much reduce the width of entrance.
2764. Would it not be a great advantage to construct a second breakwater? I do not think that a second breakwater is required. Of course if you wanted to fence the place right in you could construct it; but the expense would be enormous.
2765. Do you think that the proposed breakwater should be taken out 2,800 feet, or would a lesser distance do? I think it should be taken out the full length.
2766. You have been on the coast for a great many years? I have been sailing out of Sydney for thirty-four years.
2767. How many ships could safely lie at anchor in the proposed harbour? It is difficult to say. I should think a dozen ships could lie there if they were moored; but if they were riding with a single anchor out five or six would be enough.
2768. What is the largest vessel that would be safe there? Any ship that I have ever seen would be safe there.
2769. *Mr. Black.*] The proposed opening to the harbour is about three-quarters of a mile, and it was thought that by narrowing it to half a mile that would give greater security to the port; but a nautical witness has told us that it would increase the surge inside? So it would.
2770. And you are also of opinion that a wider entrance would be advantageous to a vessel swinging out? Yes. Larger and larger vessels are coming here every year, and you do not know where the limit will be.
2771. You think that if any alteration is made in the plan before the Committee it should be in the direction of lengthening the breakwater, rather than of altering its contour? Yes, that is what I think.
2772. *Mr. Humphery.*] What you call the 16-foot patch appears on the plan to have 26 or 30 feet of water over it? Well, I never sounded the place, but we call it the 16-foot patch.
2773. The plan may be correct? Yes; but in any sort of moderate weather it will break there, although it is smooth everywhere else. I generally anchor to leeward of it, because in heavy weather the sea breaks there tremendously.
2774. What distance is it from the end of the jetty? About half a cable's length—360 feet—east-south-east from the Mount Kembla jetty.
2775. *Mr. Roberts.*] You were present yesterday when Captain Amora was examined;—do you disagree with any of the evidence given by him from a nautical point of view? No, I do not.

James Rowan, Esq., Government Inspector of Collieries, Wollongong, sworn, and examined:—

- J. Rowan,  
Esq.  
10 Dec., 1896.
2776. *Mr. Lee.*] Where do you reside? At Wollongong.
2777. How long have you been there? About thirteen years.
2778. Have you occupied the same position all that time? Yes.
2779. Has the southern coal trade been hindered in the past from the want of a proper port of shipment? I could not say, because I have not given the matter sufficient attention. My duties are to see that the regulations under the Coal Mines Act are faithfully adhered to.
2780. You know nothing about the shipping of the coal? Nothing more than an outsider would know.
2781. How many collieries are there at work in the Illawarra district at the present time? There are the Metropolitan, Coalcliff, South Clifton, Bulli, Bellambi, South Bellambi, Corrimal, Mount Pleasant, Osborne-Wallsend, and Mount Kembla.
2782. Are any new mines being opened? No. There are two mines working between Bulli and Bellambi.
2783. Have any mines been worked out or closed up? Mitchell's North Illawarra has been given up. At least no work has been done there for about two years.
2784. Has the seam been worked out? No; I think the associated collieries have taken it over.
2785. Have any of the mines closed for want of coal? No.
2786. Have any closed because of the inferior quality of their coal? Part of the Bulli mine has stopped working because of the burnt or cinder coal met with.
2787. Do you think these coal-beds are likely to last for any period of time? Yes, between Woonona and Mount Kembla, so far as I know, the coal is pretty fair. There is a basalt irruption about Woonona which throws off nearly three-quarters of a mile.
2788. Do you think that the coal will last for twenty-five years? Yes, so far as I know, though of course these basaltic dykes and upheavals are very erratic, running first in one direction and then veering round to another.
2789. Had you any experience of coal-mining before you obtained your present position? Yes, from the time I was 9 years old.
2790. How long have you been in the Colony? Nearly eighteen years.
2791. Do you think that the Illawarra coal-beds are likely to prove lasting? For a distance of about 8 miles there is every appearance of a good future for the coal trade; but the question is, how far does the coal go back.
2792. I suppose there is a good deal of country not yet explored? Yes. At the back of the range I suppose the dip is about 600 feet.
2793. With the exception of where the cinder-beds occur the coal is generally of good character? Yes.
2794. It is good coal for steaming purposes? Yes, so far as I know.
2795. Has it come under your notice officially that the work of the mine has been delayed for want of a proper shipping port? No; I cannot say that it has. At Coalcliff especially they are very much interfered with by rough weather, and at other places they cannot load for days together sometimes when the weather is bad.
2796. I suppose you are not concerned with anything besides the enforcement of the regulations you speak of? No; I have to do with the ventilation and safety of the mines, and report upon accidents, and so on.
2797. *Mr. Fegan.*] How much coal is left in the Illawarra mines? About 1,000 tons of coal to the acre. That is, taking no account of the rolls and faults. About 600 tons to the foot.
2798. Then you recover a larger percentage of the coal than they get in the northern collieries working under tidal waters? Yes.
2799. That will extend the life of the southern coal-mines considerably? Yes.

2800. How many of the collieries have cinder coal? At the Bulli "B" pit they drove in a mile and got cinder coal more or less all the way. At Bulli proper part of the coal is cinder coal. A wave of basalt seems to have passed through the coal there.

J. Rowan,  
Esq.

10 Dec., 1896.

2801. There is no cinder coal in the Metropolitan Colliery? There are only the ordinary dykes.

2802. There it comes in as a kind of blackstone? No; I would not say that it is the same thing. I do not think there is any real cinder coal in the Metropolitan Colliery.

2803. The collieries south of Bulli have not met with the cinder coal yet? No, except that in part of the Bellambi Colliery the coal is singed a little.

2804. Do you know anything about the other seams besides the Bulli seam? There is the 4-foot seam, which is about 24 feet under the top seam. It is not as good as the top seam.

2805. Is it easily worked? Yes; it can be worked very well on the long-wall system.

2806. Is it fairly free? Yes.

2807. It is coal that will ultimately be of value? It may be, after the top seam is finished.

2808. What is the next seam? It is known locally as the dirty seam, or the 21-foot seam. There is a series of bands in that seam.

2809. With about 7 feet of coal altogether? Altogether there might be about that.

2810. At present it is unworkable? I think so. Three of the collieries have opened up that seam, but it has not been a success. I refer to the Ringwood, the Berrima, and the Moss Vale or Mittagong collieries. There is another seam about 80 feet below these, but I cannot speak of it.

2811. Do you know what has been done at Brownville? They are doing some work there, but they are not under the Coal Mines Act yet.

2812. Is there any coal there? I do not think the top seam is of any value there. At Mr. Biggar's place the top seam is very clear.

2813. If the present output of the Illawarra district were doubled or trebled, what would be the life of the coal-field? It is a very venturesome thing to give an opinion upon the subject; but, taking a length of 8 miles and a width of about 4, we should get something over 118,000,000 tons of top-seam coal. There are collieries down there which have been working for a quarter of a century now.

2814. *Chairman.*] Is it reasonable to suppose that they will haul coal 4 miles back from the present pits' mouths? I think so. Of course, shafts are not allowed to be sunk on the Sydney water catchment area, but shafts could be put down on the table-land with appliances for hauling the coal the last mile and a half or 2 miles. Some of the mines there now are in a good way. Mount Keira is within a mile and three-quarters, and Mount Kembla over a mile.

2815. *Mr. Fegan.*] Do you come from Scotland? Yes.

2816. You bring coal from a long distance there? I was managing the Kirkwood Colliery, where, I think, the haulage is about as much as anywhere in Scotland, and there we were in about 2 miles.

2817. Are you acquainted with any of the Durham mines? No.

2818. I suppose that a great part of the top seam at Bellambi is worked out? Yes. That is the colliery where part of the coal is singed.

2819. There is not as much coal north of Bellambi as there is towards Port Kembla? Most of the coal lies south towards Port Kembla.

2820. *Mr. Trickett.*] Two or three witnesses have given it as their opinion that the bulk of the coal lies due west from Wollongong? Yes. All the disturbance is straight out to the west from Bulli, veering a little round to the north.

2821. *Chairman.*] The great body of the coal lies between Bellambi and Port Kembla? Yes.

2822. A line running west from Wollongong would strike pretty well through the middle of the coal-bed you have referred to? Yes.

2823. Will you describe the coal deposits north from Bellambi? First there is Bulli, where you get cinder coal to a very large extent, running west. At Austimmer the coal is very poor.

2824. Is it a narrow seam? Yes, very heavy, and full of bands. At Bulli "B" pit there is cinder coal. At South Clifton the coal is very good, and from there to Coalcliff, a distance of about a mile, there is good coal, with an average width of 5 feet.

2825. Is there any coal at Stanwell Park? Not that I know of. I heard that they put down a bore and got cinder coal there.

2826. There is a break from there to Helensburgh? Yes; that country is unexplored.

2827. From Bellambi south to Mount Kembla there is a fine coal-bed 6 feet thick? Yes; that is good healthy coal all along.

2828. *Mr. Humphery.*] Is the Metropolitan coal a continuation of the Bulli seam? Yes; there is no mistake about that.

2829. What is the thickness of the seam there? Eleven feet. That is altogether an exception. In the other collieries the seam is occasionally 7 or 8 feet thick.

2830. May it be assumed that between Coalcliff and the Metropolitan mine the Bulli seam continues at a thickness of from 5 to 11 feet? That I could not say. They only work about 5 feet for the Metropolitan seam—the upper portion of it.

2831. Is it the theory that there is coal between the Metropolitan mine and Coalcliff? Well, they put down a bore at Stanwell Park, but I believe they got cinder coal.

FRIDAY, 11 DECEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Andrew Innes Liddell, Esq., Civil Engineer, sworn, and examined:—

- A. I. Liddell, Esq.  
11 Dec., 1896.
2832. *Mr. Wright.*] Are you engaged on any engineering work at the present time? At the present time I am occupied chiefly as a mining engineer, and I am also engaged in surveying and laying out a township at Lake Illawarra for the Illawarra Land Corporation.
2833. Have you had anything to do with the construction of the proposed harbour works there? No.
2834. Do you know anything about the constitution of the Corporation? Yes; but I am not very intimately acquainted with its workings.
2835. Can you give the Committee any general idea as to the Corporation's intentions with reference to Lake Illawarra? The proposal is to construct a breakwater from the mainland to Windang Island, and to throw out two training-walls to the north of it, giving an entrance with a width of 450 feet and a depth of 25½ feet at mean tide. The tide rises and falls there about 5½ feet, so that will give a depth of about 27 feet at high tide. At present there is practically no rise and fall inside the lake, but when the channel is made there will probably be 2 feet range of tide.
2836. What is the rise and fall of the tide inside the lake? About 2 feet or 2 ft. 6 in.
2837. What is the average depth of water inside the lake? At present, 14 or 15 feet. The company propose to dredge a channel 100 feet wide across the lake from the entrance to Talawera Point. That channel will have a depth of 25½ feet at mean tide, and can be widened as requirements demand. There are about 2,000 acres in the lake which have a depth of 15 feet, and which could be deepened by dredging.
2838. In the event of the scheme being carried out, what further accommodation could be given to shipping? All around the wharfs the channel will open out into docks for the accommodation of vessels.
2839. Do you know what area it is proposed to deepen near the wharfs? No. The engineers will be able to tell you that.
2840. Are you an hydraulic engineer? Yes.
2841. But you have not been entrusted with this work? No.
2842. Have you ever sounded the lake? No; but I have fished there often.
2843. Do you fish with a marked line? No; but I have fished there often enough to be able to judge the depth pretty well.
2844. If it has been told us that the depth is not more than 10 feet, will you still adhere to your statement? I am certain that there are 15 feet—that is, all about the proposed channel.
2845. For an area of over 1,000 acres? Yes.
2846. Can you give us the total superficial area of the lake? I should say that the lake is about 4 miles long by 2½ miles broad.
2847. Who are the engineers for the the scheme? Messrs. Harper, Harper, and Henderson.
2848. Do you know when it is contemplated to commence the work? I believe that they will commence very shortly. Some arrangements are being made in London.
2849. Have the necessary surveys been made? Yes, all the surveys have been completed, and I understand that a contract has been let for the whole of the works.
2850. Do you know the name of the contractor? Yes, Mr. Amos.
2851. Have you any idea of the amount of the contract? From £130,000 to £150,000.
2852. Does that include the railway already built? I am not sure.
2853. What is the length of the railway that has been built? Close upon 8 miles, including a short piece of about a mile running off to the smelting company's works.
2854. Has the railway been completed? Yes, and they have been running over it.
2855. You know of your own knowledge that a contract has been let for deepening the entrance and for cutting a channel through the lake? Yes.
2856. Have you made any examination of the entrance to the lake? Yes, I have been over it carefully several times.
2857. What is it like at the present time? It is now practically closed by a sandbank.
2858. There is hardly any depth of water there? I suppose there would be only 3 or 4 feet.
2859. Was the entrance ever entirely closed? I have been told that on one occasion it was closed, or almost so, and that the farmers round about opened it in order to let out the water.
2860. What is the depth of water near Windang Island? According to the soundings taken by the engineers, and the soundings on the Government charts, there are 40 feet just north of the island.
2861. Then the Corporation will not have to deepen the bay at all? They will not have to do any dredging beyond the end of the training-walls.
2862. What is the depth further out? According to the Admiralty chart it is all deep water further out. A breakwater is to be run out from the mainland to Windang Island, to prevent the southerly seas from silting up the entrance, and when once the entrance is dredged the scour of the tide will keep it perfectly clear.
2863. As an engineer, can you give the Committee any approximate idea of the cost of cutting a channel across the lake, and giving berthing accommodation for, say, twelve big over-sea ships? The Corporation's scheme is designed to do that. Steamers will be able to lie as closely in the proposed dock as in Sydney Harbour.
2864. How many berths will they provide? I cannot say.
2865. Could they berth more than four ships, each 400 feet long? Yes; but I would not say that four ships of that length could lie alongside the proposed wharfs.
- 2866.

2866. If you had a vessel lying in the channel, it would not be possible to get another large vessel past it? If the traffic became very big the Corporation would very soon widen the channel. A. I. Liddell,  
Esq.
2867. At the present time they only intend to provide for the trade that may be expected in the immediate future? Yes. 11 Dec., 1896.
2868. But they will be ready to give further accommodation if the trade improves? I believe that is so.
2869. Where will the silt to be taken from the lake be deposited? The Corporation have the right to reclaim part of the foreshores of the bays north and south of Talawera Point.
2870. They would build training-walls there, and deposit the silt behind them? As accommodation was required, they would dredge out the necessary area, and use the silt for reclamation.
2871. They would have an enormous quantity of silt to get rid of? I understand that the idea is to deposit most of the silt on these foreshores, though some of it will be taken to sea, where that is cheaper.
2872. You know nothing about the Corporation's financial position? No.
2873. Mr. Amos' contract for the railway has been completed? Yes.
2874. And I presume that he has been paid for it? He has been paid for it.
2875. He is now going on with the harbour? Yes.
2876. Do you know anything about the coal-fields in the neighbourhood of Lake Illawarra? Not very much.
2877. What is the name of the coal-mine from which the company's railway starts? It is called the Ocean Colliery.
2878. Has the mine been opened? Yes, and I believe that they are now in about 200 feet.
2879. Have they got coal? I have been told that they have very good coal.
2880. Have you anything to do with the smelting company? No.
2881. Are the works of the smelting company in progress? Very large works were nearly completed when I was down there three weeks ago.
2882. What do they consist of? Three large furnaces—the manager told me that they were three of the largest in the world; and there are other buildings. The works are built on the top of the hill, which has been levelled off, and as the slag accumulates it will be thrown out, and will increase the area of level ground. The position of the works being elevated, everything from the furnaces will naturally run down hill.
2883. The proprietors of the smelting works depend upon getting their ore by sea? Yes.
2884. Are the smelting works connected with the main Illawarra railway? Yes; by the Illawarra Land Corporation's line.
2885. So that, failing to get their ore by sea, they will be able to get it by rail? Yes.
2886. *Mr. Hassall.* Have you given any consideration to the proposal to construct a harbour at Port Kembla? Yes.
2887. Do you think that proposal a desirable one? I do not think that the breakwater is needed there. In southerly and south-easterly weather vessels can lie there quite comfortably now, and north-easterly weather does not affect the place. With heavy easterly weather, I do not believe the harbour would be of much use, even if the proposed breakwater were constructed. A sailing vessel could not get into the proposed harbour in easterly weather, or even in heavy north-easterly weather.
2888. To make a secure harbour it would be necessary, you think, to construct the two breakwaters shown on the plan? Yes; and to have a very powerful tug service. I understand that the distance between the end of the proposed eastern breakwater and the shore is only three quarters of a mile. A sailing vessel would not attempt to make an entrance like that in heavy easterly weather.
2889. A vessel going in there in an easterly gale would have a beam wind? Yes, and she would be so close to a lee shore that I do not think any master would care to take the risk.
2890. Have you had much experience of sailing vessels? No, though I have travelled up and down the coast a good deal in both steamers and sailing vessels.
2891. Do you think Port Kembla a fair harbour at the present time? I consider it a very good harbour, except in easterly weather.
2892. It is fairly well protected from the south? It is almost perfectly protected from the south. I have been there during heavy southerlies, and I have never noticed any swell.
2893. In the event of the Government proposal being carried out, do you think it would be necessary to make the eastern breakwater 2,800 feet long? In southerly weather the breakwater would not be wanted, and in easterly weather I do not think it would be any protection. It would not allow a sailing vessel to make the harbour.
2894. That being so, would it be necessary to carry it out 2,800 feet? Yes, to give accommodation for twenty or thirty ships.
2895. Do you think it would be reasonable to run the breakwater out in a line with the coast from Red Point, taking it a distance of 2,200 feet? That would be sufficient to protect vessels lying at the jetties. Of course the length of the breakwater must depend upon the area of water you wish to protect.
2896. Have you any knowledge of Bellambi? No, I have not been much at Bellambi.
2897. You could not make a comparison between it and Port Kembla? No.
2898. Do you think that the construction of a harbour at Lake Illawarra would meet the requirements of the southern coal trade? I think so. In fine weather, or in southerly weather, they could still load steamers safely at Port Kembla, and there would be nothing to prevent a connection being made between the main south coast line and Lake Illawarra to allow them to load vessels in Lake Illawarra in rough weather. The company's Act gives them power to make wharfs, dredge channels, and do other work to facilitate this.
2899. Do you think that the various collieries having their own jetties at the present time, would go to the expense of making lines of railway to Lake Illawarra in order to load there? I think they might do that, or they could use the company's line. They would only have to come to Lake Illawarra in very bad weather.
2900. Have you any knowledge of Port Kembla? Yes; I have been there frequently.
2901. Is the holding ground good? Yes.
2902. Do you look upon Port Kembla as pretty centrally situated, having regard to the position of the southern coal-mines now being worked? It is not so centrally situated as it might be,

A. I. Liddell, 2903. Do you think that Wollongong would be more central? Yes, for the coal-mines which are now working.

Esq.  
11 Dec., 1896. 2904. Have you any idea of the cost of constructing a breakwater at Port Kembla? I only know the Government estimate.

2905. You have made no calculation on your own account? No. It appears to me, however, that the breakwater will be a very difficult one to construct. For one thing, it will be over 60 feet high—45 feet under water, and 20 feet above water. I doubt whether it is in the power of man to make a sufficiently stable breakwater there, considering the heavy seas that roll in after an easterly gale.

2906. Are the operations in connection with the Lake Illawarra scheme so advanced that you can say that they will be carried out? I am not in a position to speak about that matter.

2907. *Mr. Roberts.*] Have you given consideration to the various schemes for providing a deep-water harbour on the south coast? No, only to the Port Kembla and the Lake Illawarra schemes.

2908. Do you regard Wollongong and Bellambi as unworthy of consideration? I do not know much about Bellambi, but Wollongong seems out of it altogether.

2909. Which do you prefer—Port Kembla or Lake Illawarra? Having in view the comparative costs, I think the Lake Illawarra scheme is the better. The contract for the Lake Illawarra scheme has been actually let for £150,000; while the mere estimate of the cost of the other scheme is, I understand, £168,000. I have seen this coast during easterly gales, when the waves have been coming in with a mean height of 20 feet. Of course I should be very sorry to place my experience against that of Mr. Darley, but I really do not believe that it is possible to make a breakwater there which would stand those seas. Even at Wollongong the breakwater has crumbled away as they have tried to make it.

2910. At Newcastle there is a somewhat similar breakwater? Yes; but that breakwater extends eastwards, and is end on to the heavy easterly sea. The only seas that affect the Newcastle breakwater come from the south, but they do a good deal of damage to it at times, though they are never so big as the easterly seas. An easterly gale, however, would break upon the proposed Port Kembla breakwater at all points, and it is when a sea breaks directly like that that it does damage.

2911. Do you maintain that with an expenditure of £150,000 you could afford better facilities for the loading of sailing ships and of large steamers at Lake Illawarra than a similar expenditure at Port Kembla would give? Yes. Once you get into the lake you are quite landlocked.

2912. Do you think that the coal trade of Illawarra would be more advantageously developed by the expenditure of money at Lake Illawarra than at Port Kembla? I think so. By allowing the company to make a harbour at Lake Illawarra you bring new coal-mines into operation. If the Lake Illawarra scheme is not carried out it is certain that the coal-mines west of the lake will not go on working. Therefore the carrying out of the Port Kembla scheme would restrict the trade of the district.

2913. Are you in a position to say that if it were decided to carry out the Port Kembla scheme the Lake Illawarra scheme would not be proceeded with? No; but I think that the company is hardly prepared to make a port in such close proximity to Port Kembla.

2914. But if the contract has been let, will not the work have to be carried out? I cannot say.

2915. Do you know that the contract has been actually signed? Yes; I know that it has been signed.

2916. When do they intend to commence operations? I could not say.

2917. By what date have the works to be completed as per contract? I believe at the end of two years.

2918. Do you know the date of the signing of the contract? No.

2919. Was it signed last month, or the month before? It was signed before that; but I could not say the exact time.

2920. Was it during the present year? Yes.

2921. Was it signed before the 30th June last? I could not say.

2922. *Mr. Black.*] You have spoken about the difficulties attending any attempt to enter Port Kembla with sailing vessels during easterly or heavy north-easterly gales;—are there any circumstances which would make it easier for such vessels to enter Lake Illawarra during similar weather? No. Such vessels would be under a similar disability. A strong tug service would be required in either case. The company's Act obliges them to keep a tug service, and if they do not keep a good enough one the Government have power to take it over themselves.

2923. If a contract for the carrying out of the Lake Illawarra scheme has already been let, the works must be carried out, that is, unless the contractors are indemnified for the non-completion of the contract? That is a matter I cannot speak about.

2924. If the smelting-works which are situated on the shores of Lake Illawarra are to have the conveniences which their projectors intended, they must be provided with direct communication with the ocean? Yes, I think so; but I believe that the smelting company is in a pretty safe position. They have made arrangements with the railway authorities which, I think, render them almost independent of harbour accommodation.

2925. Do you not think that, inasmuch as there is now no entrance to Lake Illawarra, and that to make a harbour there you will have to dredge, and keep dredged, both an entrance and a channel across the lake, a better harbour could be constructed more easily at Port Kembla, supposing the proposed breakwater were made? I think not. There is more accommodation at Lake Illawarra than at Port Kembla. At Port Kembla there would be only 260 acres of protected water, but at Lake Illawarra you could get 3,000 acres if you wanted the room.

2926. Is not dredging a very expensive process? It is pretty cheap now, and the company would have no difficulty in disposing of the silt.

2927. How much would it take to dredge an acre for the accommodation of big ocean vessels? Taking the average draught at 24 feet, you could put the cost at 2d. or 2½d. per cubic yard.

2928. How much would that be an acre? Between £170 and £200. If extra accommodation is wanted, the company will be willing to give it for their own profit.

2929. How much would it take at £170 an acre to deepen 260 acres. £44,000.

2930. That estimate does not include the cost of dredging the entrance and a channel across the lake? No; that is for increasing the accommodation in the lake.

2931. I suppose the alleged superiority of Lake Illawarra is due to the fact that when a vessel once gets inside she is perfectly safe from any weather? Yes; the lake is perfectly landlocked.

2932. That is why you support the Lake Illawarra scheme in preference to any other? That is one of my

my reasons for supporting it. Another is that it will increase the coal trade of the district by giving an outlet for the coal from mines west of the lake, which have not yet been worked, and it will not in any way reduce the output from the other mines.

A. I. Liddell,  
Esq.

11 Dec., 1896.

2933. You do not think that the construction of a harbour at Port Kembla would have the effect of opening up as yet unworked mines in the vicinity of Lake Illawarra? I do not think so. I think it only means giving a monopoly to mines already working. If the Lake Illawarra scheme is not carried out no mines will be opened south of Mount Kembla.

2934. You think that the construction of a harbour at Port Kembla will give an undue advantage to the mines in the immediate vicinity? I fancy it would.

2935. Does not that always happen? Yes, I suppose so. I suppose if you made a harbour at Bulli it would be too far north for the Kembla mines.

2936. How does Bellambi compare with Port Kembla as a place for sheltering vessels? I cannot say; I have not seen it in rough weather.

2937. *Mr. Hoskins.* What is the nature of the bottom at Lake Illawarra? Volcanic mud and a soft kind of sandstone forming a stiff clay.

2938. Do many watercourses empty into the lake? There are two good-sized ones—Mullet Creek and Macquarie Rivulet.

2939. If the lake scheme is carried out it will be necessary not only to dredge the channel and docks but to keep them dredged? Only to a slight degree. I have given that question a good deal of consideration. The only silt likely to be brought into the lake will find its way down the two creeks which I have just mentioned; but neither of them enters into the lake near Talawera Point, and consequently silt is not likely to accumulate near the proposed basin. The bottom of the lake is very tenacious in character, and it is considered likely that the sides of the channels would stand up by themselves.

2940. Even though covered by water, and subject to heavy rushes consequent upon rains? There will be no movement to speak of on that account. Of course there will always be a dredge at work somewhere or other.

2941. If much business was done in the lake, would not the movement of the vessels cause the banks of the channels and docks to slip in? Well, the tugs would not draw more than 8 or 10 feet, and the excavation does not begin until you get 15 feet under water, so I do not think that their wash would do any harm.

2942. Are you aware that some of the best authorities who have given evidence before the Committee say that the existence of extensive seams of coal south of Mount Kembla has not been proved? I have heard that said, but I have also heard that these gentlemen have been down to the different places and are altering their minds. I know that the coal outcrops all along the cliffs there, and at present they are 200 or 300 feet into a very good seam of coal at the Ocean Colliery.

2943. No attempt has hitherto been made to work coal south of Mount Kembla? No, because there has never been an outlet for it.

2944. Have they not explored sufficiently to have ascertained that the seams south of Mount Kembla are very broken and faulty, and that the coal is inferior? That I cannot say. I only know one place south of the mine at present working where any tunnel or adit has been put into the hills. Men who are supposed to know about coal have told me that there is plenty of coal down there, and a good many of them have put their money into this colliery that I speak of.

2945. Have they got much coal out? They have a very good seam.

2946. Has the coal been tested? Yes, and found to be good coal. So much so that it is to be used at the smelting-works.

2947. When were you last at Lake Illawarra? About three weeks ago.

2948. What work had then been done by the Corporation? Four or 5 miles of railway had been built, and a start had been made with the breakwater.

2949. Are there many men at work down there now? That I could not say; but I do not think so.

2950. The railway was constructed with a view to supplying coal to the smelting-works? No; it was part of the company's original project.

2951. You cannot say whether any spirit has been shown in the carrying out of the scheme? I do not know enough of the company's doings to speak about that. I only know that the railways have been built.

2952. Do you think that the work will be carried out in two years? The contractor thinks so.

2953. Do you? I do not see why it should not.

2954. Would it not necessitate the employment of hundreds of men? It will require a large number of men.

2955. It has been given in evidence that the best body of coal in the southern district lies at the back of Wollongong? I have always heard it said that that was so, but I do not know much about the collieries there.

2956. How far is Port Kembla from Wollongong? About  $4\frac{1}{2}$  miles.

2957. How far is Talawera Point from Wollongong? Eight or 9 miles.

2958. So that if the Illawarra scheme is carried out in preference to the Port Kembla scheme the colliery proprietors to the north will have 4 miles further to send their coal? Yes.

2959. Are not profits in the coal trade so finely cut that additional haulage will very much hamper the coal-mine proprietors? I do not know enough about the coal trade to be able to say whether an additional haulage like that would be a killing handicap or not; but I do not see what there is to prevent a branch line being made from Kembla Grange to the lake. That would not make the lake much further away than Port Kembla.

2960. But it would necessitate a great deal of dredging? Yes. A channel would have to be dredged from the north shore of the lake to the main channel crossing the lake.

2961. I suppose you admit that it would be unwise to take a vessel drawing 25 feet of water up a channel  $25\frac{1}{2}$  feet deep? Well, you would require a lot of very soft ooze underneath.

2962. Should not the depth of the channel be nearer 30 feet? If the company wishes to provide for vessels drawing 25 feet it will have to deepen the channel, but few of the over-sea vessels, except the mail steamers, draw 24 feet.

2963. We have it in evidence that vessels drawing 26 feet have loaded at Port Kembla? Yes; I know that there was a 4,000-ton vessel there a few months ago.

2964. You admit that Port Kembla in its natural state is a good port? Yes; in all but easterly weather.

2965.

A. I.  
Liddell, Esq.  
11 Dec., 1896.

2965. *Mr. Humphery.*] Have you had experience in the carrying out of works similar to those contemplated at Lake Illawarra? I have had experience on the Macleay.
2966. But not outside the Colony? No.
2967. What works were you engaged on at the Macleay? Dredging works, and one thing and another.
2968. But have you had any experience in connection with works like those contemplated at Lake Illawarra? I was engaged in connection with the construction of the breakwater at Newcastle, and I was for a number of years with Mr. Moriarty dodging about from one place to another.
2969. Where is it proposed to get the material for the breakwater at Lake Illawarra? Most of it from the top of Windang Island, but some of it will be taken from Mount Brown.
2970. Do you think it probable that a sand-bar will form outside the entrance? No. The water is so deep that I do not think that there is any danger of that. It is about 40 feet deep there.
2971. Would you dredge to that depth at the entrance? No. It is only intended to dredge the channel to a depth of 25½ feet there; but I understand that the borings show that it would be possible to make the channel still deeper if it were thought necessary.
2972. Can you say definitely from having seen soundings of the lake what its actual depth is? Not at the present moment; but I know that all along, close to the proposed channel, there is an average depth of 15 feet. At the entrance the depth is always varying.
2973. What is the bottom of the lake like when you get beyond the mud? A good sound stiffish clay.
2974. Would it be difficult to dredge? No; those who understand dredging say that it would be easy to dredge, and it is proposed to use a sand-pump dredge, so that it cannot be very hard.
2975. Your estimate of the cost—2½d. per cubic yard—is for stiff clay? Yes. In giving that estimate I ran through my mind the prices which have been paid at different places as given to me by the engineers in charge of various dredging operations.
2976. Do you think you have over-estimated or under-estimated the cost of the work? I have not made any estimate for the whole work.
2977. Does your estimate of the cost of dredging include everything? Yes; but it does not include the first cost of the plant.
2978. Do you know anything about the coal now being worked to the west of Talawera Point? I have seen the coal.
2979. When did you last visit the mine? Four or five months ago.
2980. What distance had they then driven in? 150 or 200 feet.
2981. What is the thickness of the seam? So far as I could judge about 8 feet; but I was told that it was thicker.
2982. Without bands? They were not far enough in to say.
2983. Did you understand that they had a workable seam of 8 ft.? Yes.
2984. Has not a mine recently been opened up not very far from there by a Mr. Brownley? I do not know of it. I have only seen the mine to which I refer.
2985. How long will it be before the completion of the smelting works? I cannot say, but they are proceeding with them very rapidly. They had a couple of hundred men on when I was down there three weeks ago.
2986. Do you know if they have made arrangements to get the coal they require from the mine you speak of? They have taken a lease of that mine.
2987. Is it owned by the Illawarra Harbour and Land Corporation? It is leased by the smelting company, and I believe that it belongs to the Illawarra Harbour and Land Corporation.
2988. *Mr. Trickett.*] Would the channel across the lake be 100 ft. wide at the top or at the bottom? I should think that would be the width at the top, though I am not sure.
2989. If you were constructing it, would you make it 100 ft. wide at the top or at the bottom? At the top.
2990. What width would you have at the bottom? I would give it a batter of 1 to 1; that would make it 80 ft. wide at the bottom.
2991. You think that that batter would be sufficient to hold up the sides? I think quite sufficient.
2992. You think the bed of the lake is suitable for the cutting of a channel? I do.
2993. And you think that the sides of the channel will stand up without piling or sheathing? Yes, except that just near the entrance there is a little bit of sandy stuff which would have to be piled. When you get into the bed of the lake it is all good sound stuff.
2994. What is the flow of the tide out of the lake? I cannot say, but I think that the matter has been fully considered. It is intended to keep the entrance clear by the action of the tide.
2995. Nothing of any extent has been yet done at the entrance? No.
2996. *Mr. Clarke.*] In the event of the scheme being carried out, where would vessels lie in the lake? In the basin near Talawera Point. The channel runs out into a dock at the point.
2997. If the scour of the tide did not remove the sand at the entrance I suppose you would have to be continually dredging there? Yes; but it has been calculated, and I believe that Mr. Darley himself is satisfied that the scour will keep the channel open.
2998. The breakwater from the mainland to Windang Island will prevent sand from silting up the entrance? Yes; that is the reason for making it.
2999. Is the Ocean Colliery a new mine? Yes, entirely.
3000. Is the coal from that mine good coal for steaming or for smelting purposes? So far as I can see it does not differ from other southern coal. The smelting company is quite satisfied with it.
3001. Are you aware that the Southern Coal Company opened up a mine in that locality and found that it would not pay to work it? No.
3002. Are you aware that the company is now working the Corrinal mine on tribute? No.

Captain John Sage, Master Mariner, sworn, and examined:—

Captain  
John Sage.  
11 Dec., 1896.

3003. *Chairman.*] What are you? A master mariner.
3004. Do you know the ports on the South Coast? Some years ago I was for five years running down the coast continually from China, calling at all the ports from Port Darwin to Adelaide.
3005. Are you prepared to make a statement to the Committee? So far as I know the coast, all the ports are

are bold on the northern side and stand out a little on the southern side. In my opinion, a breakwater at Port Kembla would not stand the south-east gales unless it were at least 100 feet wide at the base. There is nothing much in the north-east weather to hurt; but if the proposed northern breakwater were constructed, no sailing vessel would ever attempt to enter the harbour in bad weather. I have had twenty-five years experience at sea, and for eleven years I have commanded 2,000-ton boats. I think a sailing vessel would also be doubtful about entering the port if the proposed eastern breakwater were constructed.

3006. *Mr. Wright.*] It is proposed to have the breakwater about 130 feet wide at the base? No doubt that would stand; but the cost would be tremendous. Sailing ships could always enter Lake Illawarra, because in bad weather they would be sheltered by the island; but it is doubtful if they would attempt to enter Port Kembla. The breakwater at Newcastle is a good deal protected by rocks to the south-east, so that the seas do not break right on it. Their force is spent before they reach it. All the ports along the coast from Gabo Island to Port Darwin are deep on the northern side, but on the southern side they nearly always silt up with sand. The proposed breakwater at Port Kembla would, however, keep that place clear of sand.

3007. *Chairman.*] I suppose all ports of any importance require a tug service? Undoubtedly; both for steamships and for sailing ships.

3008. I suppose sailing vessels would not attempt to enter Port Kembla without assistance, any more than they would attempt to enter Newcastle? No.

3009. Are you prepared to say anything with regard to Wollongong or Bellambi? No; though I have looked at the plans. I have just come down from Townsville, where there is a breakwater upon which they have spent a great deal of money. About 2 miles off there is a magnetic island; but even with that protection the breakwater, which is 40 feet at the base, and cemented right along, will not stand the sea.

3010. You believe that the approach to Port Kembla would be difficult for a sailing vessel if only one breakwater were constructed;—but it would be still worse if both breakwaters were made? Yes; a sailing vessel would never attempt to enter Port Kembla in bad weather if both breakwaters were made.

3011. In considering the cost of making the harbour at Port Kembla we must take into our calculations the probable cost of a tug service? Yes.

3012. You like the proposed approach to Lake Illawarra better than that to Port Kembla? Yes.

3013. You are doubtful if the breakwater proposed at Port Kembla would stand against the heavy easterly seas? I am sure that it would not stand unless it had a tremendous base.

3014. Does that fairly well cover your case? Yes, that is all I have to say.

3015. *Mr. Trickett.*] You have ventured the opinion that nothing less than a base of 100 feet will do;—I suppose that you think that if the base were more than 100 feet, the breakwater would stand? Yes; it might stand then.

Captain  
John Sage.  
11 Dec., 1896.

TUESDAY, 15 DECEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Stephen Henderson, Esq. (Messrs. Harper, Harper, and Henderson, Engineers to the Illawarra Harbour and Land Corporation, Limited), sworn, and examined:—

3016. *Chairman.*] What are you? Civil engineer.

3017. Have you got charge of the works proposed to be carried out by the Illawarra Harbour and Land Corporation at Lake Illawarra? Yes.

3018. Did you do the engineering? My firm did it.

3019. You can give any information that is necessary? Yes.

3020. Have you a plan with you? Yes; I have brought two plans with notes. I have here a short statement which I had better read:—

The Illawarra Harbour and Land Corporation have already constructed a railway from their coal properties in the mountain range to Talawera Point, on the shores of Lake Illawarra, also a siding connecting this railway with the Government line at Dapto, and a branch line to the works of the Smelting Company of Australia.

It is now proposed to form a harbour in Lake Illawarra by cutting an entrance channel through the sand ridge that separates the lake from the ocean; protecting the entrance channel by the construction of parallel training banks and breakwaters slightly curved on plan; by dredging a channel 100 feet wide at bottom from the entrance across the lake to Talawera Point; by dredging a shipping basin at Talawera Point 1,050 feet long by 850 feet wide; by constructing two jetties, each 450 feet long, in the shipping basin; and by reclaiming portions of foreshores at Talawera Point and near the entrance by depositing the dredgings behind reclamation banks.

With regard to the entrance works, it was originally proposed to run the southern breakwater in a northerly direction from Windang Island; but Mr. Darley suggested the present arrangement, pointing out that a breakwater running north from Windang Island would be almost broadside on to our heaviest seas, and would have to be made high and of heavy material to stand the seas. He considered that the most lasting results may be looked for when a breakwater is as nearly end on to the heaviest sea as possible. His design for the plan for the entrance works was adopted.

At the sea extremities of the breakwaters the proposed level of the top of the breakwaters is 17 feet above low water, the top width 15 feet, and both the side slopes  $1\frac{1}{2}$  to 1. As the breakwaters approach the shore the height and cross-section are reduced.

When the breakwaters and training banks are completed, and the entrance channel dredged, I expect that no dredging will be required to maintain the entrance. The area of the lake is some 13 square miles, and forms an immense natural scouring basin. The volume of water flowing in and out with each tide will maintain the channel without artificial means.

The depth to which it is proposed to dredge the shipping basin and the channel is 25 feet 6 inches below mean tide level, and this means that in the shipping basin the depth at low water will, in all probability, never be less than 24 feet 6 inches, as the range of tide in the lake is not likely to exceed 2 feet.

The

S. Henderson,  
Esq.  
15 Dec., 1896.

S. Henderson, Esq.  
15 Dec., 1896.

The areas to be excavated to this depth are as follows :—Between the breakwaters, 35 acres; in the channel across the lake, 36 acres; in the shipping basin, 20½ acres; making a total area 25 ft. 6 in. deep at mean tide level of 91½ acres. A contract has been entered into between Mr. Robert Amos and the company to construct all these works already described.

The amount of this contract is £177,060. Only half this amount has to be paid to him in cash, namely, £88,530; the other half he has agreed to take in debentures of the company. If the whole is paid in cash he is willing to reduce the prices by 20 per cent., bringing down the total cost of works to £141,648.

In the proposed tidal basin four large steamers can berth alongside the jetties, and at least half a dozen others can be moored in the basin.

The company proposes to purchase a dredge, and keep enlarging the harbour to keep pace with trade development. This dredge will also be used to deepen the harbour if required, and to widen the channel across the lake.

I have estimated that the size of the shipping basin could be increased to 40 acres; and three more jetties, 450 feet long each, could be constructed with railway connections for the sum of £25,000, giving 4,000 feet of berthing accommodation, and there is no limit to the possible extension.

Lake Illawarra possesses immense natural advantages for the site of a commercial harbour. Its artificial entrance will be protected by Windang Island from the heaviest sea. Its great area will give sufficient tidal scour to maintain the entrance without dredging. Also, the silt brought down by the inflowing streams in flood time will be deposited near their mouth, and not interfere with the navigable channel, as is the case at Newcastle, where the floods of the Hunter require an enormous amount of dredging to be carried on annually for maintenance alone.

The bottom of the lake consists of mud soft for a few feet down, and then firmer, and near the entrance of sand. The material can be dredged at a very cheap rate by sand pumps.

3021. What is the formation at the bottom of Lake Illawarra? It is mud; near the entrance, sand. It is mud all along our channel.

3022. How deep is it from the surface of the water to the mud? It varies in different places.

3023. Have you any borings? No; I have none here. In the channel, which is 3 miles long, the average depth of the first 112 chains, starting with the basin at Tallawera Point, is 11 ft. 6 in. below mean tide level; then for the next 40 chains, 5 ft. 6 in.; and for the last 91 chains, 3 ft. 6 in.

3024. That brings you to where the lake narrows before it comes to the sea? I think that stops at the western extremities of the training banks.

3025. What depth of mud is there? Borings have been put down to a depth of 30 feet and nothing was found but mud or soft stuff.

3026. Were borings taken right across the lake at various distances? Yes, right from Tallawera Point.

3027. And at no place did you find anything but mud going to a depth of 30 feet? I do not think that all the borings were put down 30 feet. The borings were taken before I came to Sydney. The most recent borings were one made by Mr. Amos to satisfy himself.

3028. Can you give the Committee any information with regard to the depth of the mud at the bottom of the lake? As far down as our contract depth there is no rock.

3029. What depth is that? 25 ft. 6 in.

3030. Did you take the boring across to the beginning of the breakwater? Yes. These borings were taken in 1889. I only came to Sydney in 1891.

3031. You believe there is nothing to be found at the bottom of the lake but mud? Mud and soft material. There has been no trace of rock, except, of course, near Tallawera Point.

3032. Is the material very soft? It is soft for the first few feet, then it gets firmer, more consolidated.

3033. Having cut that channel in your docks, is there any chance of its filling up? No, I think not.

3034. Is there any ebb and flow in the lake at all? Very little, but there will be.

3035. In your opinion it will not affect the soft material or bring it into the channel you have cut? Not to any extent; there may be some silting towards the eastern portion of the channel. The tide will be sufficient to keep the entrance to a proper depth.

3036. Will Mullet Creek and Macquarie Rivulet bring down any silt? Yes, but that will not affect the work at all.

3037. They will furnish some current? Very little, the current from the sea will be much more than their current.

3038. You think that those small tributaries will not affect the current in the lake? Not in the main stream; it will add to the current going out at the entrance.

3039. But not in the main body of the lake? Certainly not.

3040. You limit the question therefore to a scour that will carry any silt into that portion of the cut just before entering the narrows as they appear on the plan? Yes, and then it will not be silting—there will be a tendency to scour.

3041. You tell us that soundings having been taken by your firm, you find that you can get a channel across the lake? Yes.

3042. The second point is that except towards the eastern end of it there is no danger of its silting? There is no danger towards the eastern end either.

3043. There is no danger at all? No.

3044. Where the cut ceases, to the end of the breakwater, you propose to erect fascine banks do you not? Not there.

3045. You reclaim behind the bank? Yes.

3046. You propose to erect fascine work from the island near the inner entrance? Yes.

3047. This has no material connection with your scheme? No, it is only to put the dredgings in.

3048. Therefore your cutting runs clean out to the end of the breakwater? Yes.

3049. Have you any doubt with regard to your work standing from the narrows to the end of the breakwater? No.

3050. You have no doubt about it? Not the slightest; there will be plenty of scour there.

3051. I am speaking of the work standing up where the sand is near the entrance before you get to the end of your breakwater? The scour will excavate a wider channel than we make.

3052. You believe that not only the channel will stand but that it will have a tendency to increase? It will.

3053. You put no sides on? Not there.

3054-6. There will be no attempt to hold it up until your breakwater is up? That is so.

3057. What is the length of your southern training-wall? 1,650 feet.

3058. Does that terminate at the small protecting breakwater that goes south-easterly to Windang Island? Yes.

3059. And from there to the end of the southern breakwater, what distance is it? 1,815 feet.
3060. And the northern breakwater? That is the same length. The northern training-bank is much shorter.
3061. The northern training-bank starts from where? It terminates in the sand a little to the south-west of the green point shown on the map, and then the northern training-bank runs a distance of 825 feet, the western termination being approximately north of the western termination of the southern training-bank.
3062. Will you describe the width and depth of your two training-banks? I have not got the width. The depth of the foundations for the training-banks and breakwaters is 27 ft. 6 in. below mean tide level.
3063. What is the width of the crown? I have not that here.
3064. Where does your material come from? From Windang Island.
3065. You have no doubt about Windang Island furnishing that material? None whatever.
3066. What number of cubic yards will it take? The northern training-bank will take about 35,000 tons, the southern 72,000 tons.
3067. That is the amount of material you estimate to require? Yes.
3068. You are to get it from Windang Island? Yes.
3069. How do you propose to take it across the channel? That is a matter for the contractor. If I were doing the contract work I would make the northern breakwater before I dredged the channel through the lake. That is a matter for Mr. Amos. He can take the material across by railway, or punt it across.
3070. I suppose you took steps to see if Mr. Amos' contract seemed a reasonable one? Yes.
3071. Therefore you must have taken into consideration the cost of the transfer of material? Yes.
3072. And you believe the training-walls can be built at a certain price? Certainly.
3073. And you believe you can take them right across the entrance of the lake, make the northern training-wall first, then subsequently make the southern training-wall? Decidedly; before you cut the entrance through.
3074. How much a yard do you estimate the breakwater to cost? The contract price which Mr. Amos has given is in tons. It is 3s. 7½d. a ton for the breakwater.
3075. I am speaking of the training-bank? For that it is 3s. 1½d. per ton. That would have to be reduced by 20 per cent., because he has offered to do it for 20 per cent. less for cash. It is a schedule contract.
3076. The schedule virtually controls the total payments? Yes.
3077. It seems to you that banks of a certain height and width at a certain price, 3s. 1½d., would come to a certain sum of money—what is the amount for the two training banks? The northern is £5,468, and the southern is £11,250.
3078. Always subject to increase or decrease as the work progressed? Certainly.
3079. Will you give us the dimensions of the northern breakwater. It increases towards the end. You seem to have 25 feet at the end? That is the end most exposed to the sea.
3080. What is the width of your southern breakwater at the eastern end? Fifteen feet.
3081. That is on the top? Yes, and side slopes of 1½ to 1. The width at high water would be 51 feet, and at low water 66 feet.
3082. And the width at the bottom? It would be over 140 feet at the bottom.
3083. That is in 25 feet of water? Yes.
3084. What depth have you estimated for your breakwater right into the beginning of the training-wall? At the beginning of the training-wall the dimensions of the breakwater are 10 feet wide at the top, and I may mention that the side slopes of the breakwater for the last 10 chains are 1½ to 1; but from there to the shore end, they are from 1¼ to 1. That makes a difference in the quantities. The width at the top is 10 feet and the slope is 1¼ to 1, and they have to go down 27 ft. 6 in. below mean tide level.
3085. So that it is 27 ft. 6 in. at the eastern end of the northern training-bank, 10 feet on the top, then there is a gradual increase until you have 15 feet on the top, and 25 feet below low-water mark at the extreme eastern end? Yes.
3086. Have you soundings where you propose to put the northern and southern breakwaters? Yes.
3087. Have you any borings? That I cannot tell.
3088. Do you know how far it is down to the rock? No, except that one boring was put in at the middle of the channel between the two breakwaters by a 32-foot rod, and when it went down it was about 3 feet above mean tide level, and there was no rock down there.
3089. You had not got rock then? No.
3090. Is it reasonable to suppose that there would be 8 feet of sand at least under the northern and southern breakwaters? Until you come to the end of it, I think there will.
3091. And you do not think that the scour is likely to shift that? No.
3092. Still you think it will shift sand, and keep your entrance clear? Yes. When you have training banks, you will find that although it keeps the channel deep, there is beside the breakwater and training bank, a slope of sand, a gradual slope from the wall. That is owing to the action of the training bank.
3093. The basis of your calculation then was 2 feet under the sand at the eastern end, and the dimension of the breakwater as shown? Yes. I believe it was 2 feet which I allowed. I know that we did make an allowance.
3094. What amount of stone does that give you? We estimate that in the northern breakwater it will be 139,000 tons.
3095. Subject, of course, to the schedule? Yes.
3096. And what will be the cost of that? £25,193.
3097. How much a yard? 3s. 7½d. a ton.
3098. As regards the southern breakwater were the dimensions taken there in the same way? The quantity is 153,000 tons, which comes to £27,731.
3099. Will there be any trouble at all about getting material of the size you desire? We shall get it of the size we desire at Windang Island.
3100. You are sure of that? Yes.
3101. And you can make the breakwater across the entrance, and complete that before touching the southern? Before touching the entrance I would make the southern breakwater.

S. Henderson,  
Esq.

15 Dec., 1896

- S. Handerson,  
Eq.  
15 Dec., 1896.
3102. You would keep your breakwater going? I would not cut the entrance.
3103. You believe that it is practicable? It is, certainly.
3104. What is the area of the lake? About 13 square miles.
3105. What is the rise and fall of the Illawarra Lake at present? I have no record, but I believe it is pretty well imperceptible.
3106. Imperceptible? Yes, quite imperceptible.
3107. Lake Illawarra is not much affected by the tide? It is not.
3108. Therefore not much water goes in and out from the ocean? No.
3109. What rise and fall do you expect to have when the entrance is open? It is very hard to say, but I should think about 1 foot or 18 inches at the outside.
3110. Can you tell us the amount of water which a depth of 1 or 2 feet would be over 8,000 acres? I will make a note of it.
3111. Can you tell us whether that 430 feet is sufficient to give a uniformity of level between the sea and the lake at high water? I do not think it is.
3112. At what rate do you anticipate that the water will run between the breakwater and the training-bank, taking the rate uniformly right through? Do you mean uniformly over the whole width of the lake.
3113. I mean approximately between the northern side of the guide wall, and the eastern side of the breakwater? I will work it out.
3114. The water coming out of the lake to the end of the northern and southern breakwaters spills into the sea saucer, it widens out at once, and the force is lost a short distance out? Yes.
3115. Then the tendency would be for it to spill outside and to make a bar beyond the two breakwaters? That would be the tendency as far as that is concerned.
3116. If you have not a scour sufficient to shift it well out into deep water, will you not have a bar outside your two breakwaters? There is a tendency to form a bar there.
3117. Do you depend upon the scour to maintain the channel between the training-walls? Yes.
3118. You do not know the rate at which that is expected to run? No; it is rather difficult to prophesy.
3119. You maintain that it will carry your silt? Very little; it will be mostly sea water coming in and out with the tide.
3120. What is the tendency of the waves on the coast? They tend to back up the sand.
3121. How are you going to keep that sand away or remove it without a scour? We should have to dredge it if there were no scour.
3122. Supposing there were no Lake Illawarra behind it at all and you carried out your works? We should have to keep a dredge there constantly.
3123. The result would be that the beach would run out over the end of your breakwater, and it would be the same as the beach to the north? Yes; after a long time. The sand comes principally from the south. It would come round Windang Island and choke up the entrance there. It is not generally that we have an island in the direction in which the sand comes. That is a great feature of the harbour there. We connect the island with our breakwater.
3124. Unless you have a scour, the tendency will be for the thing to silt up? Yes; but it would take a long time.
3125. That is the tendency? It is the tendency. Therefore, if there were no scour it would require dredging. Of course there will be an amount of sand blown in by the wind, and it would pack up along the entrance. The island makes a very great difference. With the exception of a little distance from Windang Island the water deepens very rapidly in front, and that would make all the difference in the world.
3126. Then it comes to a question of velocity, whether the scour is sufficient to carry the silt to where the water deepens? Yes.
3127. Why have you determined that the width of the entrance should be 430 ft.? That was done before I came to Sydney. It was done, I think, in consequence of a tracing which Mr. Darley sent out. We kept to that plan as far as the width of the entrance was concerned, and the direction of it.
3128. You say that Mr. Darley recommended the width of 430 ft.? Yes.
3129. And you see no reason to alter it? I have not discussed it, but when we carry out the work we will go into the question to see whether that is the best width.
3130. For Lake Macquarie, which is very much larger than Lake Illawarra, Sir John Coode recommended a width of 200 ft.? Yes, I know he did.
3131. How do you explain the reason for proposing 430 ft. in this case when he required only 200 ft. for Lake Macquarie? One could not possibly explain that without knowing all the circumstances of the case. I believe that the channel there is ever so much longer than ours. Mr. Darley believes that 200 ft. is not enough. Unless you go into all the surroundings you cannot compare the one with the other. I do not know whether it was to get a scour that Sir John Coode recommended 200 ft.
3132. Your wall, constructed in a south-easterly direction on to Windang Island, is intended partly as a protection to your breakwater? It tends, for one thing, to prevent the sea from scouring between Windang Island and the shore; and it also forms a way of access near Windang for all time; and it prevents sand from coming round in that direction.
3133. Are you prepared to express an opinion with regard to the accessibility of the port from the sea for shipping? I think it has a first-rate entrance from the sea.
3134. That is your opinion? Yes.
3135. What weight of stones are you putting in at the end of your eastern breakwater? None less than 10 tons above 5 feet below low water.
3136. You have already said that there is an ample supply at Windang Island? Yes.
3137. Has it been tested? Quarries have been opened up, and one or two contractors have looked at it and satisfied themselves about it.
3138. Do you think that the stone will suit in large blocks? Yes.
3139. You have no doubt about that? No doubt whatever.
3140. And the quantity is ample? Yes.
3141. Of what formation is Windang Island? It is described by Mr. Pittman as ferruginous sandstone. It is a good lasting stone; it is not friable.
3142. Sandstone that has been heated by volcanic action? It looks like it.

3143. Do you care to express an opinion with regard to this other work? No; I have not gone into S. Henderson, Esq. that at all.
3144. Can you give us the cost per yard of cutting a canal right across the lake? That is a lump sum <sup>15 Dec., 1896.</sup> for dredging 25½ feet deep below mean tide water-level all along.
3145. Does mean tide level mean the surface of the lake as we know it now? No, halfway between low and high water outside.
3146. What is the lump sum? £81,200.
3147. Is that for the cutting alone? That includes the shipping basin.
3148. What area is the shipping basin? Twenty and a half acres.
3149. It includes the cutting right across—what width? 100 feet wide at the bottom.
3150. What batter do you expect? We specify not less than two to one.
3151. Can you let us know the amount of stuff you are going to shift? I believe the quantity specified to be shifted will come to about 3,600,000 yards. That includes all between the breakwaters along the channel and in the shipping basin.
3152. That is your first 21 acres; the other that could be done at £25,000 is not included in it? No.
3153. What will your wharfs cost? Timber jetties about £4,000 each, altogether £8,222.
3154. How many of them will there be? A couple are provided for in this contract.
3155. What loading space is there on them? They are 400 feet long in deep water.
3156. Will you be able to load on both sides? Yes.
3157. Therefore four boats could load at once? Yes. At the two jetties four boats could load or unload. We shall probably make one a loading and the other an unloading jetty. The loading jetty will be about 30 feet above high water, the unloading jetty about 4 feet above high water. My estimate for enlarging the shipping basin to 40 acres and constructing three additional jetties, with railway sidings, is made up as follows:—Dredging, £10,400; three jetties, £11,000; railway connections, £3,600. Total, £25,000. These prices are cash prices.
3158. Have you put anything in for loading plants? We have in the contract.
3159. Have you a list of the items? Yes. £1,750 is put down for shoots and loading gear.
3160. Could you furnish a list of the items? I will do so.
3161. Can you give us any information as to the commercial aspect of the matter? I am not able to give evidence about that.
3162. What is the cost of maintenance? If by that you mean maintaining the channel and the entrance, I think it will come to £1,500 or £2,000 a year at the outside. They do not really want a dredge for that. They will employ the dredge elsewhere in extending their works.
3163. What length of time will it take to complete these works? I estimate that the breakwaters would take to complete them for the proposed depth about two years. It can easily be done in two years. That includes the training-banks. Mr. Amos' time for doing it is eighteen months.
3164. With regard to the dredging? That depends upon the amount of plant that you put on altogether.
3165. You believe it can be done in that time? Certainly, if they put the proper plant on.
3166. What is the depth of the entrance? Twenty-five feet 6 inches below mean tide level, 23 feet at dead low water.
3167. Twenty-seven and a half feet at high water? Yes.

WEDNESDAY, 16 DECEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Tannatt William Edgeworth David, Esq., B.A., Professor of Geology and Mineralogy, University of Sydney, sworn, and further examined:—

3168. *Mr. Fegan.*] Have you any statement to make? I should like to say that Mr. Pittman, Government Geologist, and I have made a joint examination of such areas of the Illawarra Coal-fields south of Mount Kembla as had not previously been explored by me, and have prepared a short report on the subject. That report is as follows:—

T. W. E.  
David, Esq.,  
B.A.

16 Dec., 1896.

To the Parliamentary Standing Committee on Public Works,—

REPORT on portion of the Bulli Coal-measures, south of Port Kembla.

Gentlemen,

14 December, 1896.

We have the honor to report that in accordance with your instructions we have inspected recently the chief areas where the Bulli Coal-measures have been tested south of Mount Kembla. The areas inspected by us were the following:—

1. The Smelting Company of Australia's Coal Tunnels near the head of Duplo Creek.
2. The Wongawilli Coal Tunnels (inspected by Mr. Pittman).
3. Mr. Brownlee's Coal Tunnel, Tongarra Albion Park.
4. The Jamberoo Coal Tunnels.
5. The Broger's Creek Coal Tunnels.

The following is a brief summary of the results of our investigations:—

At The Smelting Company of Australia's tunnels five seams have been partially prospected.

T. W. E.  
David, Esq.,  
B.A.  
16 Dec., 1896.

The following are sections of the seams and the associated strata, in descending order :—

Third (?) Seam in the Bulli Coal-measures. Roof not seen.

	ft. in.	
	0 2	Hard fire-clay.
	2 0	Perished coal.
	0 6	Band yellowish clay shale.
	2 3	Inferior coal.
	0 9	Coaly shale.
	1 6½	Hard coal, splint, and bituminous, inferior.
	0 2½	Band, hard black clay shale.
COAL SEAM, 12 feet 4½ inches .....	0 5	Inferior splint and bituminous coal.
	0 2	Band, hard black clay.
	0 6	Bituminous coal.
	0 4	Inferior coal, bituminous passing into splint
	0 0½	Band, brown clay.
	1 2	Coal, inferior splint and bituminous.
	0 2	Band, brown clay.
	2 2	Coal, inferior splint and bituminous.
		Floor (clay shale).

The number of bands in this seam, and the inferior nature of the coal would, in our opinion, render it valueless for export purposes.

The descending section continued shows the following :—

	ft. in.		ft. in.
24 0	Strata, probably chiefly sandy shale.	0 8	Perished coal.
		0 3	Brownish-grey clay.
		1 8	Perished coal.
		0 10	White clay shale.
		0 3	Band, black stone.
		1 7	Perished coal.
7 8½	Fourth (?) COAL SEAM .....	0 1½	Clay band.
		0 4	Perished coal.
		0 1	Clay band.
		0 10	Perished coal.
		0 0½	Clay band.
		0 1½	Perished coal.
		0 1	Clay band.
		0 10	Coal and bands.

The above seam is obviously too full of bands to be workable. There follow :—

	ft. in.		ft. in.
60 0	Strata, probably chiefly soft sandstones and shales.	0 9	Perished coal.
6 0	Clay Shale.	0 0½	Clay band.
		0 10	Perished coal.
		0 3½	Band white clay.
3 10	COAL SEAM (Fifth ?) .....	1 2	Perished coal.
		0 0½	Clay band.
		0 6½	Perished coal.
		0 0½	Clay band.
		0 2	Perished coal.
		3 10	
			Floor black shale passing downwards into whitish clay shale.
47 0	Strata, chiefly clay shales and sandstones.		
		ft. in.	
		0 8	Perished coal.
1 3	(at least) COAL SEAM (Sixth ?) .....	0 1	Clay band.
		0 6	Perished coal.
24 0	Strata chiefly clay shales (?) passing downwards into sandy shale forming the roof over the seventh seam.		
		ft. in.	
		1 2	Coal splint.
			Parting.
8 0	COAL SEAM (Seventh) .....	2 10	Coal, splint, with 3 to 5 in. of soft coal about 1 foot above base of this layer.
		0 0-3	Band, dark-grey clay shale (say 1 inch).
		3 11	Coal, hard splint.
		8 0	Floor dark shale.

The following are analyses by Mr. J. C. H. Mingaye, Analyst and Assayer, Department of Mines, of samples of coal selected by us from the above seam :—

	Upper zone of 2 feet.	Second zone of 2 feet.	Third zone of 2 feet.	Lower zone of 2 feet.
Hygroscopic moisture.....	72	69	70	60
Volatile hydrocarbons .....	17.64	18.69	18.40	18.80
Fixed Carbon .....	61.45	65.72	61.25	59.35
Ash .....	20.19	14.90	19.65	21.25
	100.00	100.00	100.00	100.00
Salphur .....	.590	.494	.892	.727
Specific gravity .....	1.478	1.418	1.444	1.470
Calorific value .....	11. 3	11. 9	11. 5	11. 1
Coke .....	None formed	None formed	None formed	None formed.

Average composition of the whole seam.

Hygroscopic moisture .....	68
Volatile hydrocarbons .....	18.38
Fixed carbon .....	61.94
Ash .....	19.00
	100.00

The results of these analyses show that on the average this coal contains 19 per cent. of ash. It is therefore wholly unsuited for export.

2. The Wongawilli Coal Tunnel was inspected by Mr. E. F. Pittman with the following results:—  
Roof—Hard clay shale.

T. W. E.  
David, Esq.,  
B.A.  
16 Dec., 1896.

	ft. in.	
Total thickness, seen in face of tunnel, 45 yds. long— 4 ft. 4½ in. ....	0 10	Coal, bituminous.
	0 2½	Coal and bands.
	1 3	Coal, bituminous.
	0 1½	Clay band.
	0 7	Friable bituminous coal.
	1 4½	Coal, splint and bituminous coal, with ½ in. band at 9 in. from the bottom.
	<hr/>	
	4 4½	
Analysis of lower 2 ft.	{ Moisture .....	1·90
	{ Volatile .....	23·00
	{ Fixed .....	54·35
	{ Ash.....	20·75
		<hr/>
		100·00
Analysis of upper 2 ft. 3 in.	{ Moisture .....	3·45
	{ Volatile .....	24·30
	{ Fixed .....	53·90
	{ Ash.....	18·35
		<hr/>
		100·00

In this seam also the high percentage of ash renders the coal valueless for export. At Jamberoo we measured the following section of a coal seam in a tunnel on the property of Sir Saul Samuel:—  
6 ft. Coal splint and bituminous. This is said to be part of a 30-ft. seam of coal.

The following is an analysis of the sample of coal taken by us from the upper and lower portions of this seam:—

Hygroscopic moisture.....	4·58
Volatile hydrocarbons .....	9·86
Fixed carbon .....	59·71
Ash.....	25·85
Sulphur, not determined.	
Sp. gr. .....	100·00
Calorific value ..	
Coke, none.	

This coal is obviously unworkable, as is the coal in the second tunnel on the same property and on the same seam about half a mile further north. At the latter locality a thickness of 4½ ft. of coal is exposed in the tunnel, and about 7ft. in thickness is seen at the mouth of the tunnel. There is a thin clay band at 15 in. from the bottom of the seam seen in the tunnel.

The following is an analysis of the sample of coal taken by us:—

Hygroscopic moisture.....	2·92
Volatile hydrocarbons .....	16·97
Fixed carbon .....	56·06
Ash.....	24·05
Coke, none.	100·0

At Broger's Creek we examined the coal tunnels, and measured the following sections:—

	ft. in.	Roof Clay Shale.
1 0	Inferior splint.	
0 1	Clay band.	
0 4½	Inferior splint coal.	
0 1	Clay band.	
0 6	Splint coal.	
0 1½	Band, clay shale.	
0 10	Inferior splinty coal.	
0 4½	Hard black clay shale.	
0 7	Inferior splint coal.	
0 0½	Black clayey parting.	
0 3½	Inferior coal, splint and bituminous.	
0 4	Band, hard black shale passing into stony coal.	
0 4½	Very hard inferior splint coal.	
0 1	Band, dark clay.	
0 10	Inferior splint coal.	
0 0½	Band, dark shale.	
0 8	Inferior splint coal.	
0 1	Black clay band.	
0 9	Stony splint coal.	
0 0½	Clay band.	
0 8	Stony splint coal.	
<hr/>		
4 6	Hard brownish and bluish sandy shale, alternating with bands of stony coal.	
2 9	Hard splinty coal (sample taken).	
0 0½	Black shale band.	
1 2	Hard splinty coal	} Sample taken.
0 0·1	Band, black shale	
0 5	Splint coal	
0 0·1	Black shale band	
0 11	Splint coal	
0 1	Black band	
1 6	Splint coal	
0 7	Strong coal	
.....	Floor, hard grey shale.	

The following are analyses by Mr. J. C. H. Mingaye of the two samples selected by us:—

(A.) From upper 2 ft. 9 in. of thickness exposed in tunnel.	(B.) From lower 4 ft. 3 in. of same seam in tunnel.
Hyg. Moisture .....	·80
Vol. Hyd. ....	17·05
Fixed carbon ..	38·85
Ash .....	43·30
Coke .....	none
	<hr/>
	100·00
	<hr/>
	·90
	23·65
	53·65
	21·80
	Very poor.
	<hr/>
	100·00

The above analyses show that these coals are valueless.

T. W. E.  
David, Esq.,  
B.A.  
16 Dec., 1896.

Fifteen feet lower is a 4 ft. seam ; roof, sandstone.

- |         |                             |
|---------|-----------------------------|
| ft. in. |                             |
| 1 5     | Heavy splint coal.          |
| 0 0½    | Band—brown shale.           |
| 1 1     | Splint and bituminous coal. |
| 0 2     | Stony splint coal.          |
| 1 3½    | Splint and bituminous coal. |

On the property of Mr. W. Brownlee we measured the following section of the Coal Measures :—

COARSE PEBBLY SANDSTONE (TRIASSIC?).

ft. in.		ft. in.	
52 0	Chiefly dark grey carbonaceous shales.	0 9	Splint coal, showing evidence of contemporaneous erosion at top.
		0 2	Inferior coal and shale.
2 10	COAL SEAM (2nd? in Bulli Coal Measures).	0 2	Coaly shale.
		0 10	Splint coal.
		0 0½	Clay band.
		0 1¼	Coal.
		0 0½	Clay parting.
		0 9	Splint coal.
2 3 (about).	Fine hard sandstone.		
0 2	Sandy shale.	0 3½	Coal.
		0 0½	Band clay.
		1 1	Coal, clayey.
		0 2	Clay band.
		0 3	Coal, splint.
		0 2	Band clay.
		0 7½	Dirty splint coal.
6 11½	COAL SEAM (3rd?)	0 4	Coal, soft bituminous ; dirty.
		1 2	Band, black shale.
		0 10	Coal, splint.
		0 0½	Band.
		0 5½	Coal, splint.
		0 0½	Clay band.
		0 6	Coal, splint.
		0 1½	Band clay.
		0 10	Stony coal.
		6 11½	
2 6 (about).	Hard fine-grained sandstone, laminated.		
0 1	Black shale.	ft. in.	
		0 6	Coal, very stony.
		0 11	Coal, splint.
		0 6	Coal and bands.
4 4½	COAL SEAM	0 1-3	Band, clay shale.
		1 4	Coal, splint.
		0 0½	Band.
		0 11	Coal.
		4 4½	
4 6 (about).	Black clay shale.	ft. in.	
		0 5	Coal, perished from weathering.
		0 0½	Band, clay shale.
		1 3	Coal, perished.
		0 3	Band, clay shale.
		0 9½	Coal and bands.
		0 3	Black shale.
		0 3	Coal.
		0 0⅞	Band, clay.
		0 1½	Coal.
		0 0½	Band.
		0 3½	Coal.
		0 0⅞	Band.
		0 2	Coal.
		0 0⅞	Band.
		0 8	Coal.

		0 1	Band.
		0 4	Coal, dirty.
		0 0½	Band.
		1 7	Coal.
		0 1½	Band.
		0 7	Coal, splint.
		0 0¼	Band.
		1 3	Coal.
		0 1	Band.
		2 6	Coal.
		0 2	Band, clay shale.
		1 0	Coal, splint.

ft. in.  
65 0

ft. in.  
65 0 (about). Strata, probably chiefly fine-grained sandstones and shales, passing downwards into a roof of dark gray clay shale.

T. W. E. David, Esq., B.A.

16 Dec., 1896.

	ft. in.	
	5 3	Coal, splint and bituminous.
	0 0½	Clay band.
	0 3	Soft coal.
	0 2	Clay band.
	0 3	Splint coal.
	0 0½	Band.
	0 5½	Splint coal.
	0 1	Clay band.
	0 7	Splint coal.
	0 2½	Band, clay shale.
	0 9	Splint coal.
	0 2	Clay band.
	1 6	Coal, splint.
	0 2	Clay band.
21 9 (about). COAL SEAM .....	0 2	Stony coal.
	0 8	Band clay shale.
	0 8	Splint coal.
	0 0½	Band.
	1 8½	Coal, splint.
	0 1½	Band.
	0 4½	Coal.
	1 7	Coal, splint.
	0 1½	Clay band.
	0 11	Coal, splint.
	0 1	Band, clay.
	0 4½	Coal.
	0 2½-4	Clay band.
	0 3	Dirty coal.
	0 1	Clay band.
	4 6 (about).	Base of seam; not visible in detail.

At the tunnel on the upper portion of the above seam where Mr. Brownlee is working the coal, the following section was measured by us:—

Roof.—Blue clay shale—fireclay.

	ft. in.	
	0 6	Bituminous coal.
	1 3	Splint and bituminous coal.
	1 8	Splint coal.
	0 4	Bituminous coal.
COAL SEAM .....	0 3	Splint and bituminous coal.
	0 0½	Intermittent band.
	0 7	Hard clean splint coal.
	0 0-2	Black band.
	0 4	Splint coal.
	5 1½	

Average samples of this coal taken by us for analysis have yielded the following results:—

	Upper half of seam.	Lower half of seam.
Hygroscopic moisture .....	90	85
Vol. hyd. ....	23.50	20.85
Fixed carbon .....	60.50	59.10
Ash .....	15.10	19.20
Sulphur .....	100.00	100.00
Sp. gravity .....	.659	.563
Coke—fairly good, except for ash .....	1.398	1.422
Calorific value .....	11.7	11.6

These analyses prove that this coal is not suitable for export purposes.

It is, nevertheless, of sufficiently good quality to admit of its being used locally for supplying fuel for the dairy factories of Albion Park. This coal is now in use for this purpose at the Tongarra Factory.

The results of our examination, and the analyses of the samples of coal selected by us, show that, in our opinion, the coal opened on all the seams in the Bulli Coal Measures south of Mount Kembla, is quite unsuitable for export purposes, though in places portions of the seams may be used for local manufactures.

3169. *Mr. Hoskins.*] Is the coal you have referred to good enough for smelting purposes? It is inferior to the coal that is used further north. I would rather leave that question to the Government Geologist, as I have no technical knowledge of smelting. I should pronounce even the best of that coal inferior to the typical Bulli coal for any purposes, on account of the high percentage of ash which it contains.

3170. *Chairman.*] What were the first coal seams to which you refer? Those on the Smelting Company of Australia's property on Dapto Creek.

3171. Lying how far west of Tallawera Point? About 6 miles measured along the railway line. The tunnels are about half a mile further in than that.

3172. The next is Wongawilli;—how far is that due west from Dapto railway station? A trifle over 5½ miles.

3173. And is Mr. Brownlee's pit about 8 miles up the valley of the Macquarie Rivulet, on the southern side of the rivulet from the Albion Park railway station? Yes.

3174. Then the next is Jamberoo? Yes;—that is 8 miles due west of Kiama.

3175. And where is Broger's Creek? That is very close to Jamberoo. It will be about 1¼ mile south-west of Jamberoo tunnel previously described.

3176. *Mr. Fegan.*] In reference to the Smelting Company of Australia's coal, the analyses that you have made have proved that the seams mentioned there are inferior to the Bulli seam? Yes.

- T. W. E. David, Esq., B.A.  
16 Dec., 1896.
3177. The amount of carbon contained in that coal is much less—something like 79·40 per cent. according to Coghlan? Yes.
3178. You say that you would not like to give an opinion as to its value for smelting purposes? I should say certainly, that the bulk of that coal contains too much ash to make it valuable for smelting purposes. I would not express an opinion as to that 2-foot layer, which contains the lowest percentage of ash.
3179. But you are aware that, in working the coal seam, you could not divide it so closely as to send up the 2 feet of coal by itself? No, I should think not.
3180. After your examination of various portions of the South Coast district, are your ideas pretty much the same as they were upon your last examination in reference to the quantity and quality of the coal? I have seen nothing since the date of my last examination to alter any of my previously expressed opinions.
3181. So that we can take your evidence as being very little different indeed after your investigations with Mr. Pittman as to the accessibility, the quality, and quantity of the coal in the southern district? Yes.
3182. Did you find anything else whilst you were down there which would make the district of great importance? There is a deposit which we have not yet truly explored.
3183. Therefore, you would not like to give an opinion upon it at present? No; it is not a coal deposit.
3184. The seams to which you have referred are, commercially speaking, of very little value at present? That is my opinion.
3185. Therefore, as regards these schemes having to do with the progress of this inquiry in reference to the Port Kembla Harbour, you cannot take them into account? That is my opinion—certainly for export purposes. I have stated that the best coal might be used on a small scale locally.
3186. You have stated that the coal could not be used for smelting purposes? The bulk of it would be unsuitable. Whether it would be possible to use economically coal containing 15 per cent. of ash, I would not give an opinion.
3187. Do you think it possible to use it whilst a far superior coal is close at hand? I should not think so.
3188. Considering the bands that you have to deal with in the seams, do you consider it possible to work them at a profit, even for local purposes, whilst such good coal is near at hand? It would only be possible to do so on a very small scale. It is being worked at Albion Park, and the coal, although it is rather ashy, is being used at the butter factory.
3189. The Smelting Company of Australia have an 8-foot seam, in which there is only about 2 feet which is nearly as good as the Bulli seam? Yes.
3190. Would you be surprised if a witness said that the seam was as good as any found in the southern district for all purposes? I should be surprised.
3191. In taking the position of the Lake Illawarra smelting works, which have been erected with the prospect of smelting 500,000 tons a year, do you think it would be impossible to utilise the coal for that purpose? That coal exclusively.
3192. Yes? I do not think my opinion is worth very much on that matter, but I should give it as being wholly opposed to the idea.
3193. *Mr. Humphery.*] Am I correct in coming to the conclusion that you look upon the coal south of Port Kembla as practically valueless? I do.
3194. Is there any possibility in your mind of any coal being discovered there of a quality suitable for export? I think the chances now are so remote as to be practically negligible.
3195. There is no sign of the Bulli seam south of that point? There is a very thin seam on Mr. Biggar's land, which was taken to be an equivalent to the Bulli seam, but it is only 2½ feet thick. It is between Wongawilli and the Smelting Company of Australia's ground land.
3196. Can you give any idea whether the seams of which you have given a description here to-day, correspond with lower seams further north underlying the Bulli seam? Yes, they do. The present ones can be correlated with the same seams further north. Further south the seams come together very much, so as to make the process of differentiation a very difficult one.
3197. *Mr. Roberts.*] How far south did you make your explorations; did you go as far as Jervis Bay? Yes, I went as far as the head of the Clyde River a few years ago, and also examined further north the Cambewarra Ranges. I was reporting then on the question of putting down a bore on the Wandra Wandian Creek.
3198. I refer more particularly to your recent visit. How far south did you go? Broger's Creek was the farthest point south.
3199. What is the furthest point south that workable coal has been found at? As far as I am aware no workable coal has been found south of Mount Kembla. Even under Mount Kembla itself the coal is inferior. The inferiority has already set in there.
3200. Are the Committee to understand that the further you go south it gradually dies out? Yes.
3201. When you say that the coal is not suitable for export, are you speaking from a commercial point of view? Yes.
3202. That it would not be used by any shipping company? It would not be used by any shipping company because the percentage of ash is so far in excess of that of the coal which is now being used for economic purposes.
3203. Would it not be suitable for any purpose whatever? I have already stated that portions of it in one or two individual seams may be used locally for such purposes as driving engines in dairy factories.
3204. Would it not be suitable for household purposes? I do not think householders would take coal which contains from 15 to over 20 per cent. of ash, when they can get coal with 12 or 13 per cent. of ash close by.
3205. *Mr. O'Connor.*] Mr. Hassall asked you whether, in your opinion, there was any good coal south of Port Kembla. Can you answer that with any degree of safety? In view of my examination of these coal-fields, I think it is extremely improbable that there would be any coal of commercial value south of Port Kembla within a reasonable depth.
3206. Have you had sufficient time at your disposal to be able to answer that question decidedly? I consider that I have.
3207. *Mr. Humphery.*] What extent of coal do you think there is south of Mount Kembla, taking as your starting point, the Smelting Company of Australia's seam? I think it stops at Broger's Creek.
3208. Practically it stops at Broger's Creek? Yes.

3209. That is not necessarily the particular seam that the Smelting Company of Australia are working? I think that probably the same seam continues as far south as that, but the probability is that it deteriorates more and more.

T. W. E.  
David, Esq.,  
B.A.

3210. I want to know if in your opinion it deteriorates as you go to Broger's Creek? It does. The coal which we have had analysed from Broger's Creek is very inferior. 16 Dec., 1896.

3211. And at Jamberoo it is inferior? Yes.

3212. Did you examine any properties there other than that of Sir Saul Samuel? No.

3213. Are there any old works at Jamberoo to which attention is drawn? I think there are some tunnels near Sir Saul Samuel's to the north which I have not seen.

3214. I presume the quality of the coal would be somewhat inferior? Having seen the coal at Albion Park on the north, and Broger's Creek on the south, I hardly thought it necessary to make any further examination.

3215. You had seen sufficient to form an opinion? Yes.

3216. Therefore you are not disposed to modify the evidence you have already given with regard to the value of these coal-measures? No.

3217. *Mr. Lee.*] We must not expect the estimate which you previously gave to be supplemented by these mines further south? I do not think it is likely to be supplemented to any material extent.

3218. *Mr. Clarke.*] Have you heard of any coal being found so far south as Pigeon House Mountain, south of Ulladulla? Yes; I have heard some report of coal in that direction.

3219. But you cannot give any opinion about it? No, except that it would probably be a continuation of the Clyde coal measures, which I have examined already. I have already stated that that coal would be at a great depth under Lake Illawarra.

3220. Would the coal near Pigeon House Mountain be also at a great depth? That would almost certainly be a continuation of the Clyde coal measures, and it would dip under Lake Illawarra. If it were not it would be part of an outlying patch of the Bulli coal measures.

3221. *Mr. Wright.*] What is the average amount of ash which it is considered should be the maximum in a fairly marketable coal? I could not say off-hand; somewhere about 13 per cent. Most marketable coal contains less.

3222. What is the minimum amount of fixed carbon in good marketable coal? It would depend upon what the coal is to be used for. As long as the percentage of ash is under 13, and the sulphur does not exceed about one per cent., the coal could be used for most purposes, no matter what relative proportions the fixed and the volatile carbon might be. If the fixed carbon is high, and the volatile proportion is low, it will be a good steam coal. If the volatile carbon is high, and the fixed carbon is low in quantity, it will be a good gas coal.

3223. You mentioned that you made some examination of the coal-field further south? Yes; at the Clyde River.

3224. Does that extend further south? Not further south than the head of the Clyde. The seams run out to the surface, so far as I know from personal observation.

3225. Is there any possible connection between those coal seams and the coal in Gippsland? No; they are quite distinct.

3226. There is no geological formation which would justify you in the belief that good coal will be found near the surface further south than Mount Kembla? That is my opinion.

3227. *Chairman.*] The Illawarra coal-field lies virtually between Clifton and Mount Kembla? Yes.

3228. The most valuable deposit lies between the cinder belt and Mount Kembla? I think so. I think it exceedingly probable that there are patches of good coal north of the cinder belt. There are certain volcanic dykes, nevertheless, I think there are patches of good coal of importance.

3229. Will you look at the evidence already given, and state your opinion with regard to the answers to questions 2101 to 2110? Speaking generally I consider them correct, but I would sum up in my own words as follows:—That the good coal of the Bulli coal measures, west of a line running from Coalcliff southwards, is limited on the south by Mount Kembla; that from Kembla to Corrimal the coal is good, and very little disturbed; that from between Bellambi and Corrimal, northward to Coalcliff, the coal is deteriorated in places, through faults and volcanic dykes, but that, nevertheless, there are probably considerable areas of good coal in that northern belt between Coalcliff and a point between Bellambi and Corrimal.

Edward Fisher Pittman, Esq., A.R.S.M., Government Geologist, Department of Mines, sworn, and examined:—

3230. *Chairman.*] You have heard the evidence given by Professor David;—do you agree with it? Yes.

3231. *Mr. Hassall.*] Have you a statement to make? I have not any statement prepared, but I can answer generally any questions. The question was asked whether the coal south of Mount Kembla would be suitable for smelting purposes. I should say that it could be used for smelting purposes, but no company would continue to use it if they could get better coal close at hand, as they undoubtedly can. For commercial reasons they would not continue to use that coal when they could get better coal close by at a fair rate.

E. F.  
Pittman, Esq.,  
A.R.S.M.

16 Dec., 1896.

3232. Which is the nearest point at which they could obtain coal for smelting purposes? I think they could obtain it from any of those mines north of Mount Kembla.

3233. Would the kind of coal obtainable at the head of Dapto Creek be as suitable as that obtainable at Mount Kembla for such an enterprise as we have at Lake Illawarra? No, it would not be so suitable.

3234. Which would they use? They would use that at Mount Kembla.

3235. *Chairman.*] Is that beyond doubt? I think unquestionably it is. The first consideration is that if you have coal or coke containing 20 per cent. of ash, which you have to carry, say, only a mile, you carry 1 ton of worthless material for every five tons that is of any value to you. If you have coke containing a large quantity of ash it is more liable to form clinkers when used for raising steam. Some years ago I had to report on the coke of the Colony in reference to smelting at Broken Hill, and the statement which led up to my report was that the Broken Hill company could not use Australian coke because it contained 10 per cent. of ash. They said it was absurd to expect them to use that, because it meant carrying 1 ton of useless material for every 10 tons of coal. I made investigation concerning the coke of the Colony, and

- E. F. Pittman, Esq. A.R.S.M. 16 Dec., 1896.
- and I found that we were producing sufficient coke in New South Wales which contained under 10 per cent. of ash, some containing only between 6 and 7 per cent. of ash—some of the northern coke, whereas some of the imported coke, actually used by the Broken Hill Company—German and Welsh coke—contained as much as 9 per cent. of ash.
3236. *Mr. Hassall.*] Showing that the Australian coke compared favourably with that which was being used by the company? Yes.
3237. Did they know that? I think the managers must have known it; it is doubtful whether the secretary knew.
3238. Then you practically agree with the opinion expressed by Professor David that there would be no coal suitable for export purposes obtainable south of Mount Kembla? Yes; that is my opinion.
3239. That the whole of that coal which has been described is actually valueless? Undoubtedly valueless for export.
3240. Do you think it might be used for local purposes? It might be used in a small way.
3241. *Chairman.*] Is it your opinion that coal such as has been found at the head of Dapto Creek, cannot stand in competition with the Bulli seam? That is my opinion.
3242. And is it your opinion that in any smelting operations to be successful they must use Bulli seam coal? Yes; I am of that opinion.
3243. In making that reply you take into consideration the cost of hewing and the question of price? Yes. I consider that the coal north of Mount Kembla is not so very much more distant from the locality that you are considering than the coal at the head of Dapto Creek; but that the better coal should win the day by reason of its superiority.
3244. *Mr. Hassall.*] You think that the coal of better quality will be used, although it may be higher in price? Yes; but I do not see why it should be higher in price, though it may cost a little more in carriage.
3245. *Chairman.*] You mention as one objection to coal having a large quantity of ash, that the ash increases the cost of the carriage? Yes.
3246. Can you make a statement with regard to the effectiveness of the coal for smelting purposes? You can only compare the ashy substance which adulterates the coal. It diminishes by so much per cent. its useful character, and is just so much dead weight.
3247. Can you tell us how it would affect the cost? It would affect the smelting, and there would be more probability of its forming clinkers, and it would give more trouble and expense in cleaning the furnaces and handling the material generally, and there would be more cost in the carriage of useless material.
3248. You say definitely that it is an inferior coal? I have no doubt about that.

THURSDAY, 17 DECEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN.)

The Hon. FREDERICK THOMAS HUMPHERY.	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Stephen Henderson, Esq. (Messrs. Harper, Harper, and Henderson, Engineers to the Illawarra Harbour and Land Corporation, Limited), sworn, and further examined:—

S. Henderson, Esq. 17 Dec., 1896.

3249. *Chairman.*] There were various things which you were to look into? Yes. You asked for a copy of the quantities of Mr. Amos' contract, which I produce. They are as follows:—

*Illawarra Harbour Works—Quantities and Cost.*

	Tons.	Rate.	£	s.	d.
Northern Breakwater .....	139,000	3/7½	25,193	15	0
Southern .....	153,000	3/7½	27,731	5	0
Northern Training Bank .....	35,000	3/1½	5,468	15	0
Southern .....	72,000	3/1½	11,250	0	0
Tie Bank .....	16,000	2/9	2,200	0	0
Rubble Reclamation Bank .....	50,000	2/11	7,291	13	4
Fascine Banks .....			1,050	0	0
Excavation .....			81,200	0	0
Drift Fences .....	160 chains.	93/-	744	0	0
Two Jetties, 450 ft. long each, including shoots and loading gear, sidings, jetties, and connections with present railway line .....			13,830	0	3
Buildings—2 cottages, 1 house .....			1,100	0	0
			£177,059	8	7

The above are prices and quantities of Mr. Amos' contract.

3250. Have you anything else to lay before the Committee? You asked for an estimate of the cost of maintenance. I think that after the channel has taken its permanent dimensions £2,000 per annum ought to cover the dredging. This allows for the sinkage over 100 acres of 3 inches, and the removal of 50,000 yards of bar-forming material. There will not be any other maintenance except for the first few years. There may be some expenditure in connection with the breakwater. I think it ought to be covered by a couple of thousand pounds a year for three years, because the position is a very sheltered one. I do not think that the breakwaters ought to cost more, and after that they should cost nothing at all. It may or may not be required.

3251. Then the next point is with regard to the scour? Yes. You asked me to take out the area of the lake, and the quantity of water in every inch or so. There are about 32,000,000 cubic feet in every inch of the lake. I took the lake at 13.8 square miles—that is much more than 8,000 acres.

3252. That is within one-fifth of 14 square miles? Yes, it is practically 14 square miles.

3253. Within 40 acres of 9,000 acres? Yes. I reckon that a fall of 3 inches an hour over the whole lake is, approximately, equal to a velocity of 2 feet per second through the breakwaters.

S. Henderson,  
Esq.

17 Dec., 1896.

3254. How many miles is that per hour? About  $1\frac{1}{2}$  mile per hour.
3255. That is the velocity? Yes. A fall of 6 inches an hour would be 4 feet per second.
3256. Two and two-thirds miles per hour? Yes.
3257. If there was a fall of 6 inches it would be running at the rate of  $2\frac{1}{2}$  miles per hour? Yes.
3258. Then that would just about move sand? It would more than move sand. It would keep the channel clear. Nine inches an hour will give a velocity between the breakwaters of about 4 miles an hour.
3259. Do you think that would be the extreme velocity? I believe it would. I have got it 4 knots, but there is not much difference for practical purposes. I assume the whole channel from the island to the breakwater to have been scoured out to have a section fairly uniform with the channel between the breakwaters, thus giving a much freer flow between the lake and the sea than the contract will leave the channel. I first assume a surface fall between those two points of 2 feet 6 inches between the island and the end of the breakwater is a fall much greater than can actually occur, because that corresponds with no rise and fall in the lake at all. Then, calculating the velocity by Kutter's formula, which is the most accurate known to engineers, the result is 5.2 knots.
3260. *Mr. Wright.*] What is the distance? 7,920 feet up to the island.
3261. And the fall is 3 feet? I assume the fall to be 30 inches, which, of course, it will never be.
3262. *Chairman.*] Your result is what? 5.2 knots.
3263. Dependent upon a problematical state of things? That will give a higher velocity than will ever exist. I get a velocity of 5.2 knots, at which velocity I consider that no undermining action can take place at the breakwater and training bank. But what the actual velocity will be is a much more difficult problem—I think it will be about 4 knots. About mean-tide level in the lake the velocity will be the greatest.
3264. And as the time runs on, it will come to nothing? Yes.
3265. Do you know the exact length of time during which the tide runs in? Not exactly; it is about 6 hours. The rise and fall occupy  $12\frac{1}{2}$  hours. I do not think you will get the maximum velocity during a longer period than 3 hours.
3266. That is all you can tell us with regard to the tide between the walls;—you estimate the maximum by one calculation at 5 miles an hour, and by another at 4 miles? No; the 4 knots is not a calculation, it is an assumption. Five knots I reckon we cannot exceed. That is a maximum, but it will not come up to it.
3267. The tendency, as soon as the scour passes the ends of the breakwaters, will be to spread and deposit silt? Yes.
3268. Although it might keep the channel clear, it cannot have the same effect when it runs into the ocean at the end of the channel? No.
3269. You said that you believed that there would be no silt in suspension? Practically none after the channel is once formed to the stable equilibrium of things.
3270. Then the only question is as to the piling-up power of the waves;—will the velocity furnished by the contraction of the water between these walls be sufficient to counteract the piling-up power of the waves? Our harbour being protected by Windang Island, and the main weather and all the worst weather coming from there, there would be almost none of that piling action. After a heavy storm at home on a sandy coast, there is often a very big deposit; but in ordinary weather there is little or none. In this case the heavy weather comes over Windang Island, and it would not form a bar at all. It is very seldom that we get any weather that would form a bar there.
3271. You believe that the velocity will be sufficient? I do.
3272. Will the carrying out of this work have any effect upon the surface level of the lake? Not very much; it will tend to keep it lower on the average. At present it is often banked up by floods. The rivers fill the lake. And if the entrance is not open it rises often about a foot or more.
3273. You think it will not affect it materially? I do not think it will make any material difference. It will tend to lower the level a little.
3274. In your opinion, would it be sufficient to interfere with the amount of water for scouring? Not materially.
3275. The Act under which you are working provides that you shall construct sand-traps along the beaches at such distance, and in such positions, as shall be found necessary? I do not know what that refers to. We are going to erect drift-fences for keeping out the sand that blows. I presume that it refers to that.
3276. You have no knowledge of that? No; the Bill was passed before I came to Sydney.
3277. Was your design the same? No; the design which was before Parliament was different.
3278. Is there anything further which you have to state? You are thinking of getting the quantities taken out, and I have brought the section as I thought that it might assist you.
3279. *Mr. Lee.*] You said that eighteen months was the time which would be required to carry out the work? Eighteen months is the time in which Mr. Amos reckons he can do it.
3280. I am speaking of the work being completed so as to admit of large steamers and large sailing vessels going in there to carry coal;—how long would it take? I believe it can be done in that time. They want to hurry on with their dredging, that is all. The breakwaters can be built in eighteen months. The dredging depends upon the amount of plant that they put on.
3281. When your works, as at present designed, are carried out, how many vessels could be accommodated at the proposed jetties, and how many could lie at their moorings waiting to be loaded in the area which you propose to provide? There are four berths, two at each jetty for the ships to discharge and load at; and in the area I am sure that eight or ten others could be accommodated.
3282. Could lie at their moorings? Yes; and if they pack them as close as they do in London, a lot more.
3283. But they are in docks there? Yes; and they will practically be in dock at Illawarra.
3284. But still exposed to the influence of any gale, though not to the influence of the water? Exactly. But I have seen ships in the docks at home exposed to gales too. I have seen a punt smashed between a ship and a wall, owing to the wind.
3285. Could Lake Illawarra be made capable of carrying on the coal shipping business of the south? Yes, with an expenditure of £25,000, increasing the area of the basin to 40 acres, and providing in all five jetties, all equipped.
3286. With what accommodation each? Accommodation for two ships at each. There would be 400 feet of space for vessels to lie in at each jetty.

S. Henderson, Esq., 3287. Would it be possible to handle ships of that size within the port, to move them between their moorings and the jetties? Certainly.

3288. If there were a large number at their moorings, would you be able to handle them? Yes, there is a great deal of space in 40 acres.

3289. Then your reply is this: you think Lake Illawarra could be made a port suitable to the south? Yes.

Andrew Armstrong, Esq., Managing Director, Illawarra Harbour and Land Corporation, Limited, sworn and examined:—

A. Armstrong, Esq., 3290. *Mr. Roberts.*] Do you wish to make any statement? Yes, I want to make a few remarks. I should like to remark that at the opening of the inquiry I asked the Committee to allow me, as representing very important interests, to be heard by counsel. I feel that in taking it upon myself to appear here, I am running a great risk in regard to very large interests. Consequently, I wish it to be noted that I give my evidence entirely without prejudice to any existing interests of the Illawarra Harbour and Land Corporation. If I make a mistake in behalf of very important interests here and in London, the fact that I made such request ought to be taken a note of.

3291. *Chairman.*] What is the end in view? It is to assert that Parliament has already practically, in giving us an Act, dealt with the question now being inquired into by this Committee, and as this matter is referred to the Committee by Parliament, I have every desire to meet the Committee in the most courteous manner possible, and to tell them everything that I know, in order to assist them in coming to a decision. But in giving evidence, it is possible that I may, unintentionally or unknowingly, in shepherding the interests it is my duty to watch over, give my people away. Consequently, I ask that my evidence be taken without prejudice to any interests created under the existing Act of Parliament. I feel very strongly upon the matter, because very great interests are affected.

3292. *Mr. Roberts.*] You are the managing director of the Illawarra Harbour and Land Corporation? Yes. I also hold power of attorney as representing the Illawarra Harbour and Railway Corporation of London.

3293. You are aware that this Committee have to consider the desirableness of forming a deep-water harbour at Port Kembla? I thought that the Committee had to consider as to the best part of the southern coast to form a harbour, without any restriction to Mount Kembla.

3294. Have you prepared any statement which you would like to place before the Committee? No statement, but I have a few heads which I am prepared to give evidence upon. I have to point out that one main object of my company was, first of all, to connect the very important cheap coal of the eastern seaboard of New South Wales with the vast refractory ores of New South Wales. I may say that in doing that my promoters, jointly with myself, have taken, I think, one of the largest steps, and made one of the greatest advances ever made in Australia. To do that, it became absolutely necessary that we should have under our control a still-water harbour, not a harbour on the open coast, which would never meet their views, but which would be a failure. We spent some two or three years in making the most absolute calculations with regard to the importance of the great bulk of refractory ores. The only statistics that were obtainable of a reliable character, had reference to Broken Hill; but our knowledge of the country showed that good as Broken Hill is, it is a very small thing compared to what exists in the richer deposits of refractory, but more scattered ores of the country, not immense deposits in one place. We ascertained that to treat these things economically, and to carry out a scheme of this kind, it is absolutely necessary to have the strictest economy—it would have to be done by the admixture of ores, and a combination of the refractory ores of the interior with the cheap coal on the sea-board. In connection with this matter I lodge a set of figures prepared for the purpose, and this paper has been considered in London of sufficient importance to lead to the formation of the company we promoted, and also of another company which, prior to our going on to the London market, had made all its arrangements for the carrying of refractory ores from Broken Hill to London to be dealt with in England. All arrangements of the Sulphide Corporation were made before we lodged our figures on the London market with that object in view. The promoters placed the figures before the London market, and two large companies have been formed. I cannot remember the capital of the Ashcroft Patent Company, but the capital of my company is £300,000 of working capital upon a total of £500,000. That £300,000 is now in course of expenditure. The promoters placed figures on the London market which have already caused capital to be raised for the development of the object entirely in connection with a still-water harbour. Capital for the different companies has already been raised in England to the extent of £1,500,000—that is to say, a certain combination has been promoted by my company, the interests of which particular company are kept entirely separate. They are different companies promoted for one object. I need not tell you that a few gentlemen starting a scheme such as the Illawarra Harbour and Land Corporation scheme, if they had enough capital to carry out that object, would not bother about the object,—they would be wealthy enough not to take so many years' risk and its concomitants; they would simply retire. It is such an enormous object, that it will take at least £250,000 to carry out the work provided for by Act of Parliament, on the top of an expenditure which my company have already made. My company have already expended £50,000, and to carry out the object in view they will have to find another £250,000. It is necessary for them to see their way to make an immense trade first. Then, naturally, to finance by debentures upon the security of the trade created. All that is in progress, and has progressed so far, that a capital of £1,500,000 has already been raised, and that is being devoted principally towards carrying out;—to put it very shortly, the combination of the refractory ores with the cheap coal on the eastern seaboard. In doing that we chose Illawarra, and in choosing Illawarra the greatest possible care and caution were given to the question as to the most suitable site, and Port Kembla was very carefully considered by my promoters, who found that their scheme would fail if they had to depend upon an open roadstead harbour. On that point I have said enough. I lodge the paper with my evidence as an exhibit. It shows the importance of the connection between the refractory ores of New South Wales and the coal of a low price of the eastern seaboard.

3295. *Chairman.*] Dealing with general principles? Dealing with the general principle. It is a very big question. I may say that that document has been through the mill of the severest metallurgical critics that

that it is possible to submit any document to—five different committees of the leading metallurgists of the world dealt with that question, and upon their report my smelting company was formed with a capital of £500,000, and following that the Sulphide Corporation gave up the idea of dealing with English coal, and determined to use the coal on the eastern seaboard of New South Wales. In other words, the figures that were put before the Parliament of New South Wales following our Act, led to the formation of a smelting trade, as far as it has gone at present. I have no hesitation in predicting that in the next ten years it will lead to ten times as much.

A. Armstrong,  
Esq.  
17 Dec., 1895.

3296. *Mr. Roberts.*] How long have you held the position of managing director of the Illawarra Land Corporation? About two years. I was a director, but not the managing director, until about two years ago.

3297. Had you been connected in any other way with the corporation before that period? Yes, as a promoter—a shareholder in the first syndicate formed and in the company following.

3298. When was the company floated? About 1889 we applied for our Act of Parliament; that was immediately after the formation of the company.

3299. May I ask you how many shares there are in the company, the price of each share, and the amount paid up? I would rather give that in the form of a return. There are 10,000 shares of £100 each.

3300. How much was paid upon application? I will make out a return. I could not speak on the subject from memory. It was a large syndicate first of all. That was formed into a company, but what was paid in cash I could not tell.

3301. I think the Committee would like to know how much was paid upon application, how much upon allotment, and the total amount paid in cash up to the present date? The shares stand 16,000 paid to £60. It was a syndicate which went through a great crisis following the formation of the company. I have no hesitation in putting in the reports of, and the evidence given before, three Select Committees of Parliament by whom the question was very elaborately gone into.

3302. If you are unable to afford the information at present, you can give it at another time? I will make out a return. In the mean time I will lay before you the reports of the three Select Committees of the Legislative Assembly.

3303. Would you have any objection to tell the Committee the amount of money that you have invested in this corporation yourself;—I understood you to say that you have been a shareholder from the commencement? I have.

3304. Have you invested in it? Yes, I have invested largely.

3305. What amount? I am quite safe in saying at least £18,000.

3306. Are the Committee to understand that you have actually paid £18,000 in cash into this Illawarra Land Corporation? I have.

3307. I suppose you have not had any return for that money? None whatever.

3308. How many years' interest have you lost on it? The larger proportion of my payments was made in 1888—£7,000 to start with. I have lost between seven and eight years' interest.

3309. Before you took office as managing director, who occupied that position? There never had been a managing director. I was the first to accept the position of managing director in order to save a great many meetings.

3310. Who was responsible to the Board? The Board sat regularly. There was a very full Board. Until Mr. De Wolfe went to London, he was leading director.

3311. Who was manager or secretary? For some years the secretary was Mr. F. W. Orr.

3312. Who is secretary at the present time? Mr. Frank Jarvis.

3313. Do you appear here at the request of your co-directors? I do.

3314. Did you express a desire to give evidence, or have you been requested by the Committee to attend? I have been requested by my Board to attend.

3315. Upon what question particularly do you wish to give evidence before the Committee? Nothing more particularly than I have embodied in the statement which I have just made.

3316. Do you wish to make any statement as to the desirableness or otherwise of constructing the proposed harbour at Port Kembla? I do not wish to interfere with Port Kembla. I only wish to point out the advantages of the position which my company took after the most elaborate inquiry as to which was the best place to show the Committee that we knew what we were doing. I could put in certain evidence of experts, which led us to accept the Illawarra Lake as the best position on the southern coast, and I think I can give you evidence with regard to the fact that without a still-water harbour all the industries started would be very severely handicapped, I will not say ruined, but handicapped so much so that they would all be bound to reckon Darling harbour as the only suitable place to which to direct their shipping.

3317. If the proposed work were carried out at Port Kembla, would you feel that your scheme would be damaged in the way of probable trade? Yes, it trenches upon rights which have already been conferred by Parliament upon my company.

3318. You are fairly familiar with the South Coast? Yes, I am a native of it. I have had a very intimate connection with it for the last 35 years.

3319. Do you admit the necessity for the construction of a harbour on that coast to facilitate the shipment of coal? Not to facilitate the existing trade. A still-water harbour will lead to further development of trade. As a matter of fact, the shipping is able to do all the present trade with the present natural harbours. In other words, some of the notes in the later portions of the memorandum which I sent to the Committee mean that up to the present moment the whole trade of the Colony is done by ships which come here with a lighter set of cargoes than the cargoes which they take away—that is to say, there is no encouragement for the development of the coal trade unless ships come in ballast, and ballasting a vessel adds so much to the cost of the coal that it would be cheaper in many parts of the world to carry coal from England. We had very strong evidence on that point from the Consul for Chili, who said that if they went to England for coal they had a trade each way, but if they come here they must come in ballast. They must buy ballast and throw it away. A portion of the Illawarra Harbour and Land Corporation scheme is to encourage the shipment of profitable ballast, principally on the South American coast, of cheap ores, and by carrying out an arrangement of that kind to make it pay to bring the ore here as ballast, and by that means an impetus will be given to the coal trade. And no ship will come to Kembla in ballast, and then have to go to the expense of discharging the ballast in order to take coal. No place in the world could stand such a handicap. At present a large trade is done by vessels coming from the west coast of America with timber. They come to Sydney, then return to  
Newcastle,

A. Armstrong, Esq.  
17 Dec., 1896.

Newcastle by tug, the tug bringing down half their cargo of coal. Our scheme would encourage vessels to become purchasers of iron-ore and the low-grade copper-ores and lime of South America, and provide a natural want of the Colony by the increase of freightage inwards. We are bidding for an immense development of the coal trade, in conjunction with the treatment of ores.

3320. Is it not a fact that at the present time steamships of from 5,000 to 7,000 tons load at Port Kembla? Yes.

3321. And is it not a fact that there are numerous instances of these large steamers not being able to get there for want of protection, such as the proposed breakwaters would afford? It is partly so, but not entirely. Any breakwaters at Port Kembla will not keep out a rough sea. The Pacific has many thousands of miles of cyclone catchment area, perhaps the greatest area for wind collection in any part of the world. Although I have not had an opportunity of absolutely measuring the waves at Kembla, I should think I was safe in saying that in an easterly gale the height of the wave to be withstood by a breakwater would be at least 40 feet.

3322. I suppose you are familiar with breakwater construction at Newcastle;—do you wish to make the Committee believe that the gales are more severe at Kembla than at Newcastle? I do not. At Newcastle you have Nobbys, which acts as a breakwater to some extent. Nothing could move it. It is the same with regard to Windang Island; but Windang Island is larger than Nobbys, and affords greater protection. If Nobbys were built artificially, and rested on a base of 120 feet of stone, I would not mind predicting that it would not stand one easterly gale. That is the difference between a natural barrier like Windang Island or Nobbys and an artificial one.

3323. Do you not think that a large sailing ship trade with Singapore, Bombay, San Francisco, and Chili, would spring up if breakwaters were constructed at Port Kembla? No, I do not, because at the present moment, in certain seas, the harbour is as good as ever it could be made; but vessels in the London trade will not lie out to take in that port unless powerful interest is used to make them do so. Over and over again, during the last ten years, strong interests have been used in London to make Kembla a port of call. Wealthy people have put a great deal of money in the coal trade, and it is paying very well, but they would like to make it pay better, and they have attempted to induce the underwriters to make Kembla a port of call, but it is considered too risky. If breakwaters were made it would not alter the position a bit. I have taken the liberty of listening to the evidence given before the Committee, and I noticed that one pilot gave evidence so thoroughly confirmatory of my own knowledge of the coast, that I take the liberty of repeating it. Mr. Mills was asked whether the eastern breakwater could be used as a wharf. He laughed, and said that the average seas would be breaking over it. The breakwater is to be 15 feet high, and it would have to withstand waves of more than that height in ordinary weather. It is a very important point, showing that in an average easterly gale a 15-foot breakwater will have the breakers going right over it.

3324. Do you wish the Committee to believe that it would be impossible to put a breakwater there at a cost of £158,000 that would keep out an easterly gale? I have no hesitation in giving my opinion—an unprofessional opinion, but by no means without good ground—that New South Wales could not borrow enough money to build there a breakwater that would stand.

3325. Have you seen any breakwaters in different parts of the world? No. My sole knowledge of this world is limited to New South Wales, but I have a very intimate knowledge of that coast. The first important jetty built on that coast was built by money found by my father for the contractor, thirty-five years ago. I think it cost £30,000, and it was built end on. That jetty has been renewed five times since although it is perfectly open, and the sea has no united action against it as it would have against a breakwater. Five years after it was built the contractor was running out a lot of trucks for top hamper when the whole mass was thrown down, and several men were drowned. Even an open jetty there cannot withstand the ocean.

3326. Do you not regard that as strong evidence in favour of the construction of a breakwater? No. The kind of trade that is done at Kembla is a class of trade which will not increase.

3327. Assuming that you have nothing to do with Lake Illawarra, which of the three ports—Wollongong, Bellambi, or Port Kembla, would you regard as most suitable for a harbour? Most decidedly Kembla.

3328. On what grounds would you prefer Kembla? Because the action of the north-easterly is partially broken—very partially—but more than in the other cases, and the southerly sand drift is completely checked by Red Point.

3329. Do you know anything of Port Kembla as to its being good holding ground? No.

3330. You have never heard that it enjoyed that reputation? Not more than other places. I have not known any fault to be found with any of those places.

3331. I think that in the memorandum which you placed before the Committee you speak of the complete failure of the southern coal companies through want of individual enterprise to compete with Newcastle, notwithstanding the advantages of the natural position of the coal;—is it not a fact that the southern coal differs in its quality in a marked degree from the Newcastle coal? It does differ materially, but as far as the world's requirements are concerned, it is the most marketable coal. It contains more caloric than the Newcastle coal. Although the preponderance of ash is against the Illawarra coal it has more caloric power. There is more fixed carbon, and less volatile carbon in the South Coast coal than there is in the Newcastle coal. A certain amount of Newcastle coal will pass away as gas and flare.

3332. Will you not admit that there are markets in the world for the southern coal without interfering with the Newcastle coal? Yes, Newcastle coal is used for lighting many foreign towns. Each coal has its own destiny. The destiny of the South Coast coal is a wider one, and it commands a larger market than the Newcastle coal, that is to say that the requirements of the world will be better met with a plentiful supply of Illawarra coal than by Newcastle coal.

3333. Do you regard a still water harbour then as absolutely necessary for the shipment of this coal to foreign ports? Yes, because London being the great seat of trade, trade is directed from there, and a large firm will deal with a ship broker. They will say, "Let me have a ship to do so-and-so, and wait orders." A ship may come out and lie for a month or two, and then take a cargo of coal knowing that they have a sale for it at a certain port at a certain price. They will not come out for coal, and then go back—that would make it too dear. If, therefore, we could get a still water harbour there would be an immense development of trade, but such "await orders" could not be adapted to Kembla.

3334. Do not large steamers at present go to the jetties at Port Kembla, and is it not a fair thing to assume that if a harbour were constructed, a larger number of ships would come there? Ships come there,

there, but they come in certain channels of trade, which are limited. It is confining the trade within certain limits. A. Armstrong, Esq.

3335. That is your opinion? That is my opinion most emphatically.

3336. Do you think that if the works at Lake Illawarra were carried out a larger number of vessels would go there to load coal than would go to Port Kembla? We should never in still weather interfere in any way with the general traffic. If all our ideas were carried out, we should naturally, in order to pay interest on the immense cost of the harbour, have to impose a harbour tariff. If that could not be reduced they would go somewhere else in still weather, and we should only get the stormy weather portion of the trade. But we have calculated the matter thoroughly with a full knowledge of what can be done, and we consider that that increased traffic, not interfering with the fair weather traffic would pay a fair interest on the cost of creating the harbour.

3337. Would you regard the two harbours as necessary if the improvements are carried out at Lake Illawarra and breakwaters are made at Port Kembla? We do not think that they are both necessary, but we think that a still-water harbour will cause further traffic without interfering with what has been done in other places. We also think that the trade in time would drift into a still-water harbour. We think that because, when our Bill was before Parliament, certain parties took action thinking that they might be deprived of certain rights, and they asked an amendment of the Bill, which we readily agreed to. Supposing that the Brownlee Colliery or the Kembla Colliery wished to make a canal into the harbour, it was thought desirable that they should be able to do so, and the Bill was amended accordingly.

3338. Do you not think that if the Lake Illawarra scheme were carried out, and the Port Kembla breakwaters were made, that the coal trade would so largely develop that both undertakings would prove remunerative? The opening of a still-water harbour, with an inlet for fluxes and the cheap ores of the world—and there are millions of tons in South America that might be ballasted over here if they would pay the cost of ballasting—would, we think, create a trade to the extent of an extra 1,000,000 tons of coal, without a bit of trouble, letting the old channels of traffic run on.

3339. Are you prepared to admit that there would be a large trade in connection with Port Kembla if breakwaters were constructed that Lake Illawarra would not get? Port Kembla would get the class of trade that it now gets. The present steam traffic would still go to Kembla for some years, but eventually come to us in preference to maintaining jetties.

3340. What I asked you was, whether you were prepared to admit that if the proposed Port Kembla breakwater were constructed, a largely increased trade would spring up in Port Kembla, which would never go to Illawarra? No. The present channel through which Kembla supplies coal has been worked to the utmost for many years, and it is not at all likely that that trade will increase.

3341. If a harbour were made at Lake Illawarra, would you expect to get the foreign sailing-ship trade? Yes, the whole of it; that is to say, the whole of it outside of what naturally goes to Newcastle. Some want gas-coal, and some want steam-coal. If Illawarra had a still-water harbour the trade would increase by leaps and bounds. It would become a 3,000,000-ton traffic, instead of at present 750,000 tons. The present traffic could only be increased by giving immense facilities at Darling Harbour, and carrying very cheaply from distant mines; but the grades on the railway practically kill that, so that the only thing is to have a still-water harbour in the centre of the south coast.

3342. Do I understand you to say that a large foreign sailing-ship and steamship trade would be developed if a harbour were made at Lake Illawarra, but not if breakwaters were constructed at Port Kembla? Most emphatically, that is my opinion.

3343. And your reason for the statement is that whatever harbour is made on the South Coast it must of necessity be a still-water harbour? A still-water harbour in connection with business that can buy ballast will have a greater effect in developing the coal trade than any industry that has been started in the Colony.

3344. You have been present at this inquiry on several occasions? I have heard nearly all the evidence.

3345. Have you heard the evidence of several nautical men, who have had experience of various harbours in different parts of the world? Yes.

3346. Have you not heard them say that the construction of that eastern breakwater is all that would be necessary in order to facilitate the shipment of coal in large steamships and sailing vessels? Yes, I have heard them say so, and I admit their evidence to a certain extent; but that would not create a trade of the character which I have been trying to describe. It would not attract vessels. Sailing vessels will not come from Brazil if they have to buy ballast to come over here, then pay the cost of discharging it, afterwards to take in coal. They would rather go to England.

3347. Notwithstanding all the evidence you have heard on the point, am I to understand that notwithstanding the opinions expressed by these various commanders of vessels, you take an altogether opposite view. I do, entirely. I do not wish to dispute the evidence of nautical men as to whether a ship could get in or not. I am speaking of the matter commercially, and I say that there would be no inducement for ships to come here.

3348. But you think that they would come to Lake Illawarra? Yes, because owing to the ramifications of business, the cost of their ballasting would be paid. They would be able to sell their ballast; consequently the ships would come across in ballast. That would cause an immense addition to the trade of the Colony, and it is one of the principal aims of my company.

3349. Was it in 1890 that your company obtained an Act of Parliament giving them certain powers? Yes; our Act is dated 20th December, 1890.

3350. I think that in the year 1895, you applied for an extension of time? We applied for two-years' extension, and Parliament granted one year.

3351. What has been the cause of the delay in regard to the operations of the company? The reasons were very fully explained to the Select Committee of Parliament on that occasion.

3352. After the passing of the Act what period of time elapsed before any of your proposed works were commenced? There were certain preliminary works in compliance with the Act, which meant that something must be done at the entrance within two years, and enough was done to maintain the integrity of the Act. It was done at the time of the terrific crisis of the Colony. One of the very largest financial institutions in the colonies—the Mercantile Financial Company of Melbourne—had taken up the scheme, and agreed to place the debentures, but that company failed at a time when nearly every Bank in the colonies was breaking. That threw out the calculations of the shareholders, who were relying upon a company that seemed financially strong enough to carry them through. What had occurred was submitted to

17 Dec., 1896.

to

A. Armstrong, Esq. to Parliament, the result being that the time was extended. It was, perhaps, one of the most fearful crises that the colonies ever saw, but my company maintained the whole of its possessions, and the integrity of its position, and has complied with the Legislature's conditions to date.

17 Dec., 1896.

3353. Have all the conditions laid down in the Act been fulfilled by your company? They have been strictly adhered to. We hold a certificate from the Treasurer to that effect. Private Acts of Parliament are administered under the Constitution of New South Wales by the Treasurer, and a certificate from the Treasurer is proof that the Minister administering the Act is satisfied that the preliminary conditions have been fulfilled.

FRIDAY 18 DECEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq., (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
The Hon. JAMES HOSKINS.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
The Hon. DANIEL O'CONNOR.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.  
FRANCIS AUGUSTUS WRIGHT, Esq.  
FRANK FARNELL, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Mr. William Beach, farmer, Dapto, sworn, and examined:—

Mr.  
W. Beach.  
18 Dec., 1896.

3354. *Chairman.*] What are you? A farmer, residing at Dapto.
3355. Close to Lake Illawarra? Yes.
3356. Have you a good knowledge of Lake Illawarra? Yes, an intimate knowledge of it, having resided there forty years.
3357. *Mr. Black.*] Have you an intimate knowledge of the shores of the southern coast and Lake Illawarra? Yes.
3358. In what direction do you prefer to give evidence? I propose to give evidence in regard to Lake Illawarra.
3359. With regard to the lake, what depth of water is there in it? The average depth, I suppose, would be about 15 feet; but you can get a depth of 25 feet in some parts.
3360. Do you know Tallawera Point, where it is proposed to erect a jetty? I do.
3361. What is the depth of the water there? About 50 yards from the shore there is a depth of about 12 feet, then it gets deeper; at 150 yards distance I suppose there is a depth of 20 feet of water.
3362. What is the character of the bottom of the lake? Very soft mud.
3363. For how many feet? I took Mr. Higgins on the lake, when he came up from Victoria in reference to the dredging, and we put a paddle down tied to a sprit, and the paddle and the sprit went down out of sight. I should think the depth was 25 feet.
3364. You mean to say that the mud and water was sounded to a depth of 25 feet? Yes. That is about 100 yards from where they propose to erect the wharf at Tallawera Point.
3365. Is the character of the lake similar to that? It is quite similar right across.
3366. It is not rocky? No; you cannot find a rock in the middle of the lake.
3367. Is the mud fairly solid? It is quite soft soaky stuff.
3368. Then if a channel were constructed the operation of dredging would be easy? I think so.
3369. But if a channel were dredged out, would there not be a danger of the banks falling in from time to time? Probably they would if the channel were not pretty wide. It is very soft mud.
3370. You think it is a matter of width? Yes.
3371. You think then that the sole thing likely to affect the bank would be the wash of the vessels going in and out? I suppose if it was 100 yards wide there would be no fear of the mud shifting.
3372. Do you not think that the natural action of the water would have a tendency to eat away the sides? I do not think so; it is never very rough.
3373. There is no under current? I do not think so.
3374. Are there many streams running into the lake that are likely to carry in silt? None near Tallawera Point.
3375. There are only Mullet Creek and Macquarie Rivulet? Mullet Creek would be about 2 miles from the proposed site of the wharf, and Macquarie Rivulet about the same distance on the other side.
3376. Of course once the entrance was gained, it would be a safe harbour? Yes, quite safe. There are no rocks, so that if a vessel bumped on the bottom it would not hurt her.
3377. Do you know the proposed entrance? Yes.
3378. Is there any entrance now? The water is running in and out.
3379. What depth is it? About 6 or 7 feet.
3380. How wide is it? It is wider some days than it is on other days. It is 50 yards wide at present at high tide.
3381. What is the width between the lake and the sea? There is about 200 yards.
3382. And that is only broken by a passage-way of about 50 yards wide, and 6 or 7 feet deep? Yes.
3383. If that bar of sand were removed, do you think it possible to keep the entrance open? I think it would be.
3384. Do you not think that the action of the ocean would have a tendency to pile up sand there as it has done before? It might, unless a wall were built to prevent the sand from coming in.
3385. Do you think the construction of two breakwaters would be sufficient protection? I think it would.
3386. Do you think if those two breakwaters were constructed, as shown on the map, that sailing vessels could make the entrance in an easterly gale? I believe they could. They could come straight in.
3387. How about a north-easterly gale? It is protected by the Red Point from the north-east wind.
3388. How about a southerly? It is protected from that by Windang Island.
3389. You think that it would be an easy harbour to make in rough weather? I believe it would be.

3390.

3390. I suppose that sailing vessels would have to be towed out in the case of an east wind? I think so. The water gets deep as soon as you get into the sea.

3391. Have you any knowledge of the coal products of the district? I know there is coal right round the face of the mountains, as far as the south-western end of the Lake.

3392. Are there any coal mines working now in the neighbourhood of Lake Illawarra? Not further south than Mount Kembla.

3393. Then Port Kembla would be more easily accessible to them than Lake Illawarra? I do not think that it is any nearer to Port Kembla from the coal mines.

3394. Then there are the mines north of Mount Kembla? The mines north of Mount Kembla would be nearer to Port Kembla than they would be to the lake.

3395. It would only be in case of new mines being discovered further south that Illawarra Lake would be more central than Port Kembla? Exactly so.

3396. Do you know anything of Port Kembla as a port? I think it is a fairly good harbour, except in case of an easterly or north-easterly wind. It is exposed to both these winds.

3397. Do you think that if breakwaters were constructed as shown on the map they would sufficiently protect the port from east winds? The Southern Coal Company's jetty would not be so well protected as the Kembla Coal Company's jetty.

3398. To what height do the waves run there in rough easterly weather? There is a very big break there.

3399. If a breakwater were constructed 16 feet over high-water, and 20 feet over low-water, do you think that in a gale it would make the harbour sufficiently smooth for vessels to load and unload? I think that in a rough gale the waves would go over a 20-foot breakwater. It is exposed to the full force of the ocean.

3400. Do you know the port of Newcastle? Yes; Kembla is very similar to that.

3401. Is there no protection on the outer side of the proposed breakwater? There are the Five Islands further south.

3402. How about a north-easterly gale? Wollongong Point runs out to the north-east. I do not think they would get the full force of that as they would of a gale from the south-east. It would be very much exposed to the south-east.

3403. Do you not think the Five Islands would break the force of a south-easterly gale? No; it would come straight on to the wharf—the Five Islands are further south.

3404. You think that when there is a south-easterly gale, unless the breakwater were of great magnitude and strength, it would be washed away? I do. In Wollongong harbour there is a breakwater of concrete blocks, and it washes that about, and Wollongong is fairly well protected from south-east gales.

3405. Then you have not a very high opinion of Port Kembla as a harbour? It is all right for calm weather, but not for rough weather.

3406. And you are not very much impressed with the advantages of Wollongong? No.

3407. Do you think the money expended there has been thrown away? I think so. I do not think it can ever be made a good harbour. The entrance is too shallow.

3408. What about Bellambi? I think that a better harbour could be made there than at Wollongong.

3409. How does it compare with Port Kembla? It is about equal. There is a big reef at Bellambi.

3410. Do you know anything about the depth of water inside the reef? No, I do not know much about it.

3411. Do you not know that it is much shallower than Kembla? No.

3412. Do you think that if such works were carried out, as were proposed at Lake Illawarra, it would afford a harbour of refuge which would be easily accessible to vessels? I do.

3413. You think also that it could be made a good harbour for the shipping and unshipping of minerals? I do not see what is to prevent it once they make the entrance.

3414. Do you know what it is proposed to do? To make an entrance so that large vessels can come in and ship coal.

3415. As a man of practical common sense, how long do you think that it will take to carry out a work of that kind? Two or three years I should think.

3416. Do you think it could be done in three years? They would have to put on a good few hands to do it in that time.

3417. How many? I am not much of an engineer.

3418. You think it would require a great number of men to carry out this proposed work within three years? I do.

3419. What is the difference between high and low water in the Lake? At the present time on the western side you cannot see any difference. At the entrance to the Lake there is a difference of about 18 inches.

3420. Not sufficient water runs in whilst the tide is running to make any appreciable difference over the large body of water contained in the Lake? No.

3421. *Mr. O'Connor.*] Do you know the different schemes now under consideration? I know the Lake harbour scheme pretty well.

3422. Do you know Port Kembla and Wollongong? Yes.

3423. How long have you been there? Forty years.

3424. And you have considered this matter? Yes; I take an interest in this scheme.

3425. Which do you think is the better? I think the Lake harbour scheme is preferable to the Port Kembla scheme, because when a vessel gets inside the Lake it would be sheltered—no storm can damage it.

3426. Have you any idea what it would cost to make a scour? No, I could not say what it would cost; it would cost a good lot of money.

3427. Do you think that if there was a reasonable sum of money spent at Lake Illawarra it would be thoroughly safe? I believe it would be.

3428. Have you ever considered the tonnage of ships that could come into Lake Illawarra with safety? That would depend upon how deep they made the entrance.

3429. There are many natural advantages at Port Kembla, vessels of considerable tonnage being able to come in there without the expenditure of a shilling on harbour works? Quite so.

Mr.  
W. Beach.  
18 Dec., 1896.

3430. What is the largest sailing vessel or steamer that could come into Lake Illawarra? No vessel could go in now—it would have to be dredged.

3431. You could not tell how much it would cost to dredge it? No. When the Lake has been full, and the water has been backing over the low land, I have seen the entrance cut and the sand washed away to a depth of 12 or 13 feet, but it would close up again in time.

3432. *Mr. Hassall.*] What was the width of the opening? About 100 feet.

3433. *Mr. O'Connor.*] Is there a good entrance at present? There is only 6 or 7 feet of water.

3434. The result of your experience is that if a sufficient sum of money were spent in making a harbour to receive the biggest vessels afloat, Lake Illawarra would be the preferable port? Yes.

3435. You do not deny the many natural advantages of Port Kembla? It is alright in calm weather, but in rough weather it is dangerous to go in there.

3436. You have been to Port Kembla many times? Yes.

3437. Will you give the Committee your opinion of Port Kembla? I think it is as good as any other place on the coast for loading coal.

3438. Would it be necessary to extend the proposed breakwater to its full length as shown on the plan? I do not think it would be at all too long. It should be made the full length, as shown, then it would not give too much protection to one of the wharfs.

3439. Supposing that Lake Illawarra were improved to the fullest extent, how many ships would be able to load there? I suppose 500 or 600 if the Lake were all dredged out. It is about 9 miles long.

3440. I mean with an expenditure of about £250,000? I should think at the very least it would accommodate 40 or 50 vessels.

3441. *Mr. Trickett.*] Since you have been down at the Lake I suppose you have watched the proceedings of the Illawarra Company for the last 6 years? I have.

3442. Could you tell us what they have done in regard to improving the Lake since the 20th December, 1890? The only thing that I know of that they have done has been to make the railway to Tallawera Point.

3443. But that has nothing to do with the Lake? There was some work done over at Windang Island.

3444. As far as improving the Lake is concerned, and making it available for a port, I suppose it is in the same condition that it was in in 1890? Just about the same.

3445. Have you taken up any shares in the company? No.

3446. Would you like to take any? I have no money to spare.

3447. You have not been asked, I suppose? No.

3448. Would you like to take up the job of making a harbour? I am not an engineer.

3449. You say there is only a fall of 18 inches in the tide at the mouth of the Lake? Yes. The entrance is shallow.

3450. We heard a little while ago that there were some hundreds of men employed on the Lake? There were some employed at Windang Island for some time—I do not know how many.

3451. When was that? About 12 months ago.

3452. What were they doing? They started to make a breakwater to connect the mainland with Windang Island.

3453. How long were they there? A couple of months.

3454. Have there recently been any men at work there? Not that I know of.

3455. Do you see pretty well all that is going on there? Yes; I should be sure to know if any men were employed there.

3456. When was the railway extended down to Tallawera Point? That has been finished about 6 months.

3457. Is it being used? At times it is used. The smelting company run out on part of it, and there is a branch line on to their works.

3458. You have not seen any men employed on the railway works, or on the Lake works? Only when the railway was being constructed.

3459. But there are men employed in connection with the smelting works? Yes, a great number.

3460. But that is distinct from the Lake improvements? Yes; it has nothing to do with it.

3461. So that, beyond constructing this railway, and making a sham of constructing a breakwater to Windang Island, nothing has been done in regard to the improvement of Lake Illawarra for the last six years? No.

3462. *Mr. Clarke.*] I suppose you are aware that all these coast lakes and lagoons are often blocked up with sand? Yes.

3463. Are not the easterly gales generally the cause of it? No; the easterly gales generally open them. The north-east wind is the worst.

3464. As a rule is it not the floods from inland which open the lakes? They may have some tendency to do it.

3465. Is it not a fact that when the lakes are blocked up with sand sometimes people have to go and open them? Yes; we had to do that last year at Lake Illawarra. It blocks up every two or three years.

3466. What is your opinion about the opening of Lake Illawarra—if a harbour were formed would it not involve a great expense in dredging? As far as the inside is concerned, I think that once it was dredged there would be no more bother with it.

3467. Would it not cause a great expense? The stuff is easily shifted; it is quite soft mud.

3468. Do you think it would not fill up with sand or some other material? There is no sand in the Lake, except round the shore.

3469. You think that if a channel were dredged there would be no difficulty in keeping it open for a width of about 25 feet? I do not think there would be the least trouble in the world. Mr. Higgins told me that he could fix his apparatus in the middle of the Lake, and send all the stuff by means of pipes to either shore, a distance of about a mile and a half.

3470. What did he say about keeping the entrance open? He thought that would be more trouble than the inside of the Lake.

3471. Would it be more difficult for vessels to enter Lake Illawarra than to enter Port Kembla? I cannot see how it would be more difficult. They could go safely in.

3472. Is the entrance to Port Kembla not protected by the Five Islands? It is a bit.

3473. And if a breakwater were formed would not that make it better? It would make it a good deal better.

3474. Would there be any more difficulty in getting into Port Kembla than in getting into Lake Illawarra? I do not think there would.
3475. They would be about on a par? Yes.
3476. You are aware that a large quantity of coal has been shipped from Port Kembla? A great deal of coal goes away from there, I believe.
3477. If a harbour in Lake Illawarra were constructed, do you think that any of that coal would go to Lake Illawarra? They would be able to get in there, and lie there in rough weather.
3478. Can you give any idea of the quality of the coal south of Mount Kembla? Different seams have been tested, and I have never found any fault found with it. I see that Mr. David found coal the other day at the head of the Macquarie Rivulet, and he said that it is very good. That is much further south.
3479. We have information to show that south of Mount Kembla there is no coal suitable for export purposes? I do not know the quality of the coal, but I know that there is coal there.
3480. *Mr. Fegan.*] Have you been in the employ of that company at any time? Never.
3481. You have had every means of becoming thoroughly acquainted with the lake? Yes.
3482. You have been there in all weathers? Yes.
3483. And you think that if money is spent there Lake Illawarra will make as good a harbour as Port Kembla? Yes; I think Lake Illawarra is preferable.
3484. Do you not think it costs a large sum of money in dredging? I do not think it would once it was made.
3485. You think there would be a sufficient scour to keep it clear? Yes.
3486. Taking the coal trade as it stands now, the coal south of Mount Kembla being of very little value, and that the bulk of the trade comes from north of Mount Kembla, would you not think Mount Kembla a central position for the harbour? It is all on one side.
3487. Then you think that the advocates of Port Kembla have a very strong case as against the advocates of the harbour at Lake Illawarra? Yes, if there is no coal further south.
3488. You think that Port Kembla has a prior claim? It may have at the present time, but if a harbour were made in Lake Illawarra you could load there when you could not load at Mount Kembla.
3489. Ship-owners and colliery-owners consider the distance which they have to carry their coal, because every mile that the coal is taken depreciates its value? The distance would be about 5 miles by water.
3490. I am speaking of carriage by rail. Take the Bellambi, the Kembla, and the Metropolitan collieries, which are to the north of Kembla, and the fact that there is very little coal of any value south of Mount Kembla, would not Port Kembla be the proper harbour for that coal? Under those circumstances, yes.
3491. *Chairman.*] You said that by tying a spit on to a paddle you were able to put it down 25 feet? Yes; there is 25 feet of mud and water altogether about 150 yards from Tallawera Point. Mr. Higgins sounded it all the way across.
3492. Is it your belief that all the distance from Tallawera Point to the entrance of the lake is soft mud? It is.
3493. You have no doubt whatever about it? Not the slightest.

Mr.  
W. Beach.  
18 Dec., 1896.

Andrew Armstrong, Esq., Managing Director, Illawarra Harbour and Land Corporation, Limited, sworn, and further examined:—

3494. *Mr. Roberts.*] Can you remember what sum had been expended on works by the Illawarra Harbour and Land Corporation up to the 30th September, 1894? Not more than £2,000 or £3,000 on harbour, not including expenditure under the railway conditions of the company's Act. It was principally in preliminary surveys and preliminary work in tie-bank.
3495. It was strictly in compliance with the Act of Parliament? Yes; in preparation for larger works.
3496. Who were the contractors up to that period? A firm called Brand and Dryborough.
3497. Can you tell the Committee the nature of the works that were carried out by the firm up to September, 1894? Carrying out the bank connecting Windang Island with the main land, known as the tie-bank. At that time the company had placed its affairs in the hands of the Mercantile Financial Company of Melbourne. A great crisis came, and the company thought it was not wise to go on with the contract, and the contract was terminated under a clause in the agreement.
3498. What was the amount of the contract, and what was the amount of cash paid for the works carried out? I cannot remember the total amount of the contract, but the cash paid on that particular item was about £1,200. The contract was a schedule one.
3499. I understood you to say that about £3,000 has been expended? Yes; but this included preliminary work. There was a costly and extensive survey. There had never been any Government borings of the bottom of the lake, and we had to do that. Our expenditure up to that date was £2,000 or £3,000.
3500. I do not think you quite answered my question as to what was the amount of the contract entered into by Messrs. Brand and Dryborough. You led me to believe that the whole of the contract money had not been expended? It had not.
3501. What was the amount? I think that the tie-bank cost about £3,000 or £4,000. I am not clear; but I can ascertain for you from the engineers.
3502. Can you more clearly describe the nature of the work? The opening up of large stone quarries around Windang Island, and the formation of a connection between Windang Island and the mainland where one of the training walls was to be built.
3503. Was that with a view of constructing the breakwaters? Yes, using the top of that for breakwaters and a line to convey stones to form side walls for the main channel.
3504. Do you remember the date of the acceptance of the contract and the date when the work was discontinued? I could not give you that from memory.
3505. You said that the work was suddenly terminated owing to the financial crisis throughout Australia? Yes.
3506. How many men were employed on the works at any time, and how long were they employed? I will put in a return giving you all that.
3507. Are you not in a position to give the information? No. We had power to break the contract when we pleased. I cannot tell you how many men the contractor had. The number of men was limited, because until this main track from the quarry and the tie-banks were completed the number of men engaged could not have been very large.

A. Armstrong,  
Esq.  
18 Dec., 1896.

- A. Armstrong, 3508. Had the company the power to cancel this contract at any moment? Yes.
- Eq. 3509. Did not the company enter into a contract to complete certain works? Yes; but we had the power of cancellation. It was at schedule rates.
- 18 Dec., 1896. 3510. Your company had power to cancel it at any moment? Yes.
3511. Are you quite sure about that? Yes.
3512. You took advantage of that clause in the contract, and owing to the financial crisis the work was stopped? We terminated the contract.
3513. Can you recollect the date when this contract was terminated? No; I will give you a return.
3514. Was it prior or subsequent to the receipt of the letter from the Under Secretary for Finance and Trade in 1894? I think it was prior; but on that point I could not speak definitely.
3515. I understood you to say that you spent £1,200 on the island up to September, 1894, and in incidental expenses another £1,800, making a total of £3,000 spent in connection with this work? Yes, approximately.
3516. How much money has been expended since then? I can give it in the form of a return in detail. The company's expenditure in harbour and railway construction up to date has been £41,516; in connection with coal-mines about £600; in connection with certain quarries about £10; in connection with water supply and conservation about £32; giving a total of about £43,000.
3517. Does this £43,000 include the construction of the railway from Dapto Creek to Tallawera Point? Yes.
3518. How much of this £43,000 was expended in railway construction? About £40,000.
3519. What is the total length of the line? Roughly,  $7\frac{1}{2}$  miles—about  $4\frac{1}{2}$  miles from Dapto station to the coal-mine;  $1\frac{1}{2}$  to Tallawera Point; and  $1\frac{1}{2}$  to the smelting works.
3520. The other £3,000, I presume, were spent in the manner you have previously stated? I am giving you approximate figures.
3521. Do not the books of the company show the exact expenditure up to date? They do; but I have taken a double balance in one. I can give you accurate details on these points.
3522. You say that £40,000 has been expended on the railway, and £1,200 on Windang Island? To speak more correctly, it is £39,000 for the railway, and £3,000 on the harbour.
3523. So that the total expenditure up to date has been on the railway and the harbour? £42,000.
3524. Does this £39,000 include rolling-stock? No; we have no rolling-stock.
3525. Do you contemplate procuring any, or are you making arrangements with the Government? We shall require to have our own locomotives; but we do not intend to have much capital locked up in trucks. The coal for shipping will come to Dapto station in trucks, and they can be run on to our line under an arrangement with the Government. On all these points negotiations are pending between us and the Railway Commissioners.
3526. Have your directors approached the Railway Commissioners with a view of making arrangements for the supply of rolling-stock? Not for the supply of rolling-stock, but mutual arrangements are in course of discussion between us.
3527. No definite arrangement has yet been arrived at? Matters are pending.
3528. When you gave evidence yesterday I did not understand whether the Illawarra Harbour and Land Corporation and the company that is to deal with sulphide ores are one joint-stock company, or two companies? There are two distinct companies. In the first place, the Illawarra Harbour and Land Corporation, having their rights, sent one of their leading directors, Mr. De Wolf, to London, and his first action was to form a company called the Camden Syndicate, with a capital of £300,000. That syndicate was formed with sufficient capital to invest money, and take advantage of the rise in values which would result from the carrying out of our undertaking. That company, having acquired immense interests in mines at Broken Hill, formed a smelting company, and the smelting company are shareholders in the Camden Syndicate and in our company.
3529. Is that smelting company the company of which Mr. Howell is the manager? Yes. That was the first operation of Mr. De Wolf in carrying out large financial operations necessary to bring the whole thing to a success. He formed the Camden Syndicate, out of that sprang the Smelting Company of Australia, and out of that several other large companies. A company is now projected for supplying coal and water for Dapto Smelting Works, and I shall probably hear of the successful floatation of that during the next week or two. To give complete effect to the powers given us by Act of Parliament we have had to extend our field of operations very largely. Merely to form a harbour for the export of coal would, in view of the decreased value of coal a year or two after we got that concession, have resulted in failure.
3530. With regard to this £42,000 that you say your company has spent, has that been paid in cash by the company? Not entirely. We have had to carry out some financial operations. I can put it in this way. In the first place, my company purchased coal and land estates, to the value of £100,000. Up to the time of Mr. De Wolf's going to London we owed a balance of about £35,000, secured upon our debenture issue. But we had a call upon our 40,000 shares of £10 each—we have a calling-up power of £400,000.
3531. How much money has been raised by debentures or guarantees or otherwise by your money? Nothing more. We have one combined debt of £34,000.
3532. Were the Camden syndicate guarantors for the Illawarra Corporation? There are London arrangements by which a company formed by the syndicate are going to guarantee a loan whenever the time seems ripe for launching debentures to meet harbour expenses. The Camden Syndicate are prepared to see that loan through.
3533. When asked a question yesterday you said that you had invested £18,000 cash in this company. Are we to understand that that is cash actually put in, or is it a liability for cash? No. I have paid that much in absolute cash as investments of money in the early stages in the purchase of estate. My investments cost me £18,000 cash.
3534. Then although the company within a period of six years expended £42,000, £18,000 of your money has been lying idle all that time? I have never had any return. There has been nothing to get a return from. The mere grazing returns would not come to more than £1,000 a year, and it only paid office expenses and management.
3535. Were you one of the original promoters? I was.
3536. How many shares are you entitled to by virtue of your position as one of the promoters? I think I had about one-sixth interest. A large syndicate was formed, and that syndicate registered itself into a company.

company. The Lake Illawarra syndicate is dead, and has been wound up so long that without going back upon the past I cannot give you the information. A. Armstrong,  
Esq.

3537. Can you recollect in what year the syndicate was formed? About 1888. That syndicate registered a large company with a capital of 16,000 shares of £100 each. 18 Dec., 1896.

3538. Was any cash put down? The estates were put in, having been paid for, or nearly paid for. They cost a total of £90,000. There were probably debts amounting to £30,000 at the time when the syndicate was formed into a company.

3539. Of course a company cannot do anything unless they have cash in hand or a way of obtaining cash. Will you inform the Committee what their financial prospects were at the time of the formation of this syndicate—whether there was so much money put down, or whether it was to be guaranteed by a bank or overdraft, or how money was to be obtained to carry out the work contemplated by the syndicate? The syndicate having been registered into a company with a capital of 10,000 shares paid-up to £50, they had a calling power of £50 per share.

3540. What was the name of the syndicate? I think it was called the Lake Land Syndicate. That call was never exercised beyond one £10 call. There were practically no shareholders except the same syndicate.

3541. How many men were there in the syndicate who paid £10? I can make out a return of that. It is going back to almost a forgotten past.

3542. Did you pay then? Yes.

3543. Did you pay more than one £10? I made two different payments of £2,000 each—about £4,000 altogether.

3544. *Mr. Humphery.*] The first call was £100,000? I think so.

3545. *Mr. Roberts.*] Did you say that each individual paid £10? In the first place the syndicate merged its rights in a company, and afterwards made a call of £10 a share.

3546. Did not the Illawarra Land Syndicate put down any money at all? They furnished their own cash and put the estate in. They purchased an estate and a coal-mine which came to £90,000.

3547. *Chairman.*] There was a call made of £10 a head;—how many shareholders were there in the company? The number who had shares then I could not say.

3548. You invested £90,000 in mineral and landed property;—how much of that represented land? We gave £65,000 for land, and £25,000 for coal property.

3549. *Mr. Roberts.*] This Illawarra Land Syndicate commanded capital to the amount of £100,000;—is that a fair statement? Yes, I think so.

3550. Are you not able to say so as a fact? No. I have satisfied myself to-day as to the position of the company as it stands, and to go back into circumstances connected with the formation of the company is a thing that I cannot see the advantage of.

3551. We want all the information possible? I can get the list compiled from the books of the company.

3552. We want to trace the efforts which your company have made to carry out the powers granted to you by Act of Parliament;—it seems to me fair to ask you to give all the information possible, and to show what expenditure has taken place from the inception of your syndicate up to the present day? I came to-day prepared to give a summary of what we had done up to date, but not to give a history. But the secretary of the company can compile a complete return which can be put in as evidence.

3553. If you have no objections to put in the details, I am at a loss to understand what objection you can have to my asking you these questions? I have no objection; but it is going into the thoroughly forgotten past. I do not feel that my memory is fresh upon all these important points. I can tell you how much money I put in, and how much one or two of my friends put in.

TUESDAY, 22 DECEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Andrew Armstrong, Esq., Managing Director, Illawarra Harbour and Land Corporation (Limited),  
sworn, and further examined:—

3554. *Mr. Roberts.*] When the Committee rose on Friday last, I was asking you for some information regarding the financial operations of the Illawarra Harbour and Land Corporation, and you were good enough to say that you would supply information by way of a return? Not exactly. You were asking for information regarding the early part of the syndicate, prior to its formation into a company. The company's financial operations, of course, are only obtainable from the books of the company. The particulars of the operations of the syndicate are not so readily obtainable. A. Armstrong,  
Esq.  
22 Dec., 1896.

3555. Have you prepared a return as promised? I have not. I find that the papers leading up to the formation of the company are not in my possession. I know nothing of them, except that I was a shareholder, and occasionally met others to advise. The difficulty of putting in the documents of the syndicate is, that they were merged into two contracts, which formed the registered basis of the company. One was a document by which myself and Mr. Thomson were appointed trustees of the existing syndicate, dated 28 September, 1888; also the contract from them to the company dated 1 October, 1888. Those were the two documents which formed the basis of my company. Behind those documents I find it absolutely impossible for me to go.

3556. *Chairman.*] When does the information you have commence? The registered document is dated 1 October, 1888. 3557.

- A. Armstrong, Esq.  
22 Dec., 1896.
3557. Is it complete since then? I can give you the returns from my company, which have been registered each half year in the Registrar-General's Office. I can give copies of the balance sheet from that date.
3558. Can you give us the information from 1888? Yes; I can lay before the Committee each of my half-yearly balance sheets of the registered company, all of which are filed in the Registrar-General's Office.
3559. You have not got them with you? That is not the information which I have been asked for. I have been asked for information which led up to the company, and not about the company itself.
3560. *Mr. Roberts.*] I want to get the history of the company from the very beginning? If you subpoena our solicitor all documents can be produced.
3561. You have not got the documents with you now? No; they are with the solicitor for the company.
3562. If you think they bear on the questions I was putting to you, I shall be glad if you will produce them? I have no doubt that I can easily arrange for the solicitor to the company to bring those documents. I will make a note of it. I would recommend the Committee to take the evidence of Mr. William Andrews, solicitor, of the firm of W. W. Billyard, Andrews, and Mosely, who is the keeper of the legal documents of the company.
3563. Will you state what company or companies have been formed since 1888, with the view of carrying out the scheme at Lake Illawarra, and how much capital has been expended? You have already got that very fully in my previous evidence. The company has spent, in estates and improvements, approximately £150,000, and our total debt at present is £35,000, secured upon advanced mortgage. The position is entirely summed up in that.
3564. How many acres of land does your corporation own in the vicinity of Lake Illawarra? 2,410 acres fronting the Lake, 265 acres of farm land as the key to a lease within the water reserve behind it, and 1,280 acres of leased land, colliery property, marked on the official map before the Committee as the Ocean Colliery.
3565. Is the Smelting Company of Australia a distinct company from the Illawarra Harbour and Land Corporation? Entirely; it was formed by us in London.
3566. It was formed by your company? By the Camden Exploration Company.
3567. *Chairman.*] Does that 265 acres form part of the property of the original syndicate? Yes; they held a lease of 1,280 acres from the Crown, in addition to that 265 acres of freehold, and is now the property of the company.
3568. Does the 265 acres adjoin the coal land that you lease from the State? It does.
3569. *Mr. Roberts.*] How many companies altogether are there interested in this scheme? First, there is the Camden Syndicate, since registered as the Camden Exploration Company; then the Illawarra Harbour and Railway Company, and the Australian Smelting Company.
3570. Were all the preceding three companies merged into the Smelting Company? Certainly not.
3571. Are they four totally distinct companies? Yes. Then the fifth company registered was a company with different capital for dealing with mines which merged into the Smelting Company—for instance, the White Rock Company.
3572. That makes five? Yes.
3573. Can you tell the Committee what the capital of each of these companies is? Not exactly. The Camden Syndicate is entirely paid up with a capital of £300,000.
3574. Was that subscribed in cash? In cash in London.
3575. Or is it only nominal? The absolute capital of the syndicate which started a year ago, and has since been registered as a company is £300,000 absolutely paid up.
3576. Was that absolutely paid down in cash? As far as I knew. It is entirely a London company, intended to take advantage of the enormous increase in the value that would be given to shares through dealing with refractory ores. That is its principal object; but to carry out that object we had to form first a smelting company in connection with the cheap coal of the Illawarra district. That has a capital of £500,000, with £300,000 paid up.
3577. Was that £300,000 of the smelting company considered paid up, or was it cash actually put down? The £300,000 was cash actually subscribed, as I understand from my London correspondence, and the greater portion has been expended at the Lake.
3578. Does that make £600,000? Yes; subscribed under the operations of my company.
3579. You have given the capital of two companies;—what about the remaining three? I do not know that I can give much information about the White Rock Company. It was formed, just as a mine, with a paid-up capital of £100,000. That mine is actually at work at present, a large number of men being employed, with the object of furnishing refractory ores to be dealt with at Illawarra.
3580. Where are the works of the White Rock Company? At Tenterfield.
3581. What other capital have you got invested in connection with Lake Illawarra? The old Illawarra Harbour and Land Corporation have a nominal capital of £600,000, in 10,000 shares paid up to £60.
3582. How much of this £600,000 has been paid in cash? That could be more accurately answered by the production of the documents. Various syndicate matters were merged into these accounts. It was done by putting certain property in the syndicate into the form of paid-up shares in the company. The absolute sum expended by that company I gave you in my former evidence. The company, purchased £90,000 worth of property. They have expended a certain sum on the railway, on legal matters, and in stamp duty, making a total of £150,000.
3583. You have spent £150,000? We have spent £150,000 approximately.
3584. Assuming your statements to be correct, as you of course believe them to be, you must have a great deal of capital lying dormant; I understand you to say that there was £600,000 paid down in London, then came another company with another £600,000;—that makes £1,200,000 which you say was paid down in cash? These are operations for securing expenditure contingent upon the harbour, and are by different companies. The smelting company are spending about £300,000 in carrying out works which were to be contingent upon our works being carried out.
3585. Did the Illawarra Harbour and Land Corporation sell land to the Smelting Company? They did. They sold 500 acres to the Camden Syndicate in London, and the syndicate sold 300 acres to the Smelting Company.
3586. At what price? £25,000.
3587. How many miles of railway is the Harbour and Land Corporation Company constructing? Since I last gave evidence I have checked the figures. I said that the length of the line was  $7\frac{1}{2}$  miles; I find that it is 7 miles 75 chains.
- 3588.

3588. What was the cost of construction? About £39,000. I showed that £39,000 had been spent in railway construction, about £3,000 on the harbour, and £3,000 or £4,000 in engineering commission on all these works and other incidental expenses, bringing the total up to £150,000.
3589. How much money has the Illawarra Harbour and Land Corporation in hand at present? I could not tell you exactly. By last balance-sheets our London balance is about £8,000 or £9,000, and our Colonial balance, approximately, £2,000.
3590. Is there any money to be called up in connection with the shares in the Illawarra Harbour and Land Corporation? Yes; something like £40 each on 10,000 shares—about £400,000. I may say that that is the principal basis of finance that my company intends to operate upon. They have formed a London company to take over those shares.
3591. How many shareholders are there in the Illawarra Harbour and Land Corporation? I should think about forty. I cannot speak accurately from memory. On the first register there were thirty, but there have been some subdivisions since.
3592. Is one object of the company to export coal? No; to furnish means for the better exportation of coal is our object, but not to enter into the shipping trade itself. It may have power to do it, but I do not think that it has ever been contemplated up to the present.
3593. How does your company expect to get a return on the capital which they have invested? The capital invested so far will pay very well. The intercolonial trade would probably give a big return on the capital, because the company has power to collect harbour rates to a greater extent than the state has. It has a maximum of 1s. per ton for harbour dues besides certain wharfage rates.
3594. Can you tell me the object of constructing that railway which runs up towards Dapto Creek? It was for the development of the colliery properties owned by various holders including the company. There is a large district extending from Mount Kembla and going down by Jamberoo containing coal, workable by adit, and giving a great variety of coal. The Act of Parliament gives the right to furnish a line extending about 12 miles along the face of the mountain.
3595. Do you know for what purposes the coal would be suitable? We consider, notwithstanding some very strong evidence given here the other day, that the quality of the coal is superior for local manufacturing purposes, and we consider that it is beyond all doubt that when we have gone further the character of the coal will be established as suitable for all uses.
3596. Do you contemplate using that coal for smelting purposes? I can sum up what has been done in regard to it in this way: We gave the smelting company the option of testing the coal and to elect whether they would lease it, and they made several tests. They have driven into the coal a distance of something like 400 feet, and they have elected to lease it. The lease is no great profit to us. Where we pay the Crown 6d. we get 9d. We look upon it as a lease worth £5,000 a year to my company.
3597. Were you present a few days ago when the Government Geologist gave evidence as to the quality of the coal in the Illawarra district after a recent visit to the neighbourhood? I was.
3598. Have you heard Mr. Pittman say that the coal of Dapto Creek would not be used for smelting purposes when Mount Kembla coal was available? I heard his evidence, and it seems to me so very extraordinary that I will take the trouble to have his remarks fully inquired into. I can only point out that some of the most practical men of the Colony have tested the coal, and have advised the smelting company to take a lease. It may be that the evidence of Professor David is correct; but Mr. Howell is such an exceedingly cautious man that he would not take any coal which he was not perfectly satisfied with. I would also draw attention to the fact that those assays given by Professor David are contradictory of the assays given in the report of the Department of Mines for the year 1890 (p. 297), in which the coal is shown to have 61 per cent. of fixed carbon and only 7 per cent. of ash.
3599. Can you tell the Committee what contracts have been entered into by the Smelting Company of Australia? I am afraid I cannot. The main contract is the one I have alluded to.
3600. Is the scene of operations of the smelting company connected with the railway which is the property of the Illawarra Harbour and Land Corporation? Smelting works are being constructed on land purchased from my company, and connected with the coal-fields and the State line by our railway.
3601. Is it connected by the railway? Yes.
3602. Is that a branch line? It is a branch line leading to a Government line.
3603. Who constructed that branch line? The Illawarra Harbour and Land Corporation.
3604. The idea is to carry it to Tallawera Point? It is complete, connecting Tallawera Point with the general State line and the coal-fields. The intention of the company first was to make a branch line to connect Tallawera Point with the present site of the smelting works at a lower level.
3605. One of these smelting works is nearly finished? The smelting works are almost finished now. A couple of smelters could start to-morrow; but a certain difficulty has arisen under the new Act, dealing with riparian rights. This has necessitated an application to the Government, pending which the works are at a standstill. They hope to make a start by next March.
3606. I understand that ores will come from Broken Hill to be treated at the smelting works? Broken Hill ore, pending the construction of the harbour, will be landed at Darling Harbour, conveyed by railway to Dapto, and then along our branch line.
3607. I want you to give me all information respecting any contracts you may have entered into for improving the entrance to Lake Illawarra, forming a channel across to Tallawera Point, the deepening of the harbour, and so on, stating the amount that the works are to cost, and when they are to be completed? The company at present has a contract with Mr. Robert Amos.
3608. When was that contract signed? In August or September last year.
3609. Have you a copy of the contract? Yes.
3610. Have you brought it with you? I have not.
3611. Would you kindly bring it with you when you come to give evidence again? I have no objection to have it copied, but would not like it placed on the Parliamentary records. It is a very voluminous document.
3612. You say that it was signed in September last year? Yes.
3613. What is the amount of the contract? It is entirely at schedule rates—that is to say, our engineers estimate for both the railway line and the dredging at a lump sum of £90,000. The total will come altogether to about £200,000, work to the value of £34,000, completed, to be deducted.
3614. Will you explain to the Committee how you are going to make money out of this scheme? I have done so already.
3615. How do you expect to pay interest on the capital invested? We look upon it as certain that within

A. Armstrong,  
Esq.

22 Dec., 1896.

- A. Armstrong, Esq.  
22 Dec., 1896.
- within five years we shall create trade to the amount of 2,000,000 tons of ore and fluxes, with probably one-fifth of that outwards in bullion-lead, copper, and nickel-ores, including coal shipped outwards. We look upon it as certain that ships will never come there, bringing 2,000,000 tons of ore and go away empty. We are not bidding for the coal trade of to-day. We believe that by the carrying out of this harbour such an immenso impetus will be given to the coal trade that it will naturally flow there.
3616. *Chairman.*] Do you expect to make money by the sale of your land? By that we hope to recoup the harbour debt within the next twenty years.
3617. *Mr. Roberts.*] What would the amount of the harbour dues be? They would amount to between £60,000 and £70,000 a year when the whole scheme came into full operation.
3618. You expect a revenue of £70,000 a year from the harbour dues that you are entitled by Act of Parliament to collect? These calculations are made on a maximum charge, which would not be imposed to the full if it interfered with trade.
3619. From how far north do you expect coal to be brought down to this still-water harbour;—do you expect any coal from north of Bulli? Not north of Bulli.
3620. Do you expect any from Bellambi? Bulli is the limit of what might properly be considered the South Coast field, and it has a good gradient to Sydney, but the coal from the whole of the district must find its best market in a still-water harbour.
3621. Do you think that a large quantity of coal will come down from Bellambi to Tallawera Point, seeing that there are already two jetties at Bellambi? Yes; I think it would well pay the colliers going there to pay the freight to the harbour. It costs a great deal of money every year to renew the jetties.
3622. Does it not appear to you that Lake Illawarra is too far south to develop a large coal traffic? It is no further south than Kembla from the coal-field.
3623. Would you expect to get a large portion of the coal that is now shipped at Port Kembla? Most certainly. But what we are now doing is not interfering with that trade. We are working hard to get a better loading-place which would attract trade without injuring existing arrangements. We hope to have a still-water harbour which will attract a trade of 3,000,000 tons on its own merits, including the existing trade inwards and outwards.
3624. Would not slipping coal from Tallawera Point cost more than the present system? Not necessarily. Power is given under the Bill to colliery owners to connect with our harbour.
3625. Can you tell the Committee what has caused the delay in regard to the proposed works at Lake Illawarra, seeing that the contract was signed some fifteen months ago? I think it is easily explained. It cannot be done until the company see their way to make things pay. The raising of capital is a very difficult matter. They have done a great deal in that direction during the last twelve months, so that my last advices lead me to hope that the final landing of a debenture loan will certainly be effected early in the new year. It is merely a question of the price of debentures. If we were content to let John Bull have all the profit, we could have obtained long ago £70 on our debentures. At present we can get £85; by delaying it we shall probably get £95. It is a mere question of working things properly. We have carried out enormous ramifications of interests backed by a sound capital, and each made with the object of forwarding the main scheme, which is the harbour. The harbour is the key to the whole thing. I think from latest advices that we have now advanced sufficiently to make a trade for the harbour, that that will make the debentures of such value that we shall put them on the market.
3626. Is it a fair thing, then, to come to the conclusion that the cause of the delay in going on with this work at Lake Illawarra is the want of ready money? It is a very natural conclusion.
3627. Until you float debentures in the London market you will be unable to proceed with the work? Yes.
3628. You are unable at present to say when those debentures will be put on the market? To give an absolute date, yes.
3629. You have power to go on with the work, but when you are likely to start you are not in a position to say? My own company have no doubt whatever of being able to do it within the term fixed by the Act of Parliament. I think I can say that. If we felt that we were not able to do it, we should discontinue our arrangements, and give up the scheme altogether.
3630. If the contract is signed, there must be a time named when the work is to be carried out;—does Mr. Amos decline to proceed with the work? Not at all. Mr. Amos is only too anxious to proceed with it. The first portion was the construction of the railway, which had to be done in time to comply with our Act of Parliament. That portion of the contract has been carried out.
3631. Has Mr. Amos been paid for that work? I think I answered that question in my former evidence. I summed up the whole position by showing you that the only debt due by us was a temporary mortgage for the purpose of settling with Mr. Amos in advance of certain pending financial operations in London.
3632. Have you requested Mr. Amos not to proceed with the work pending satisfactory financial arrangements in London? We have.
3633. And he has consented to stay his hand until you are able to raise the necessary capital to carry out the work? That is exactly how it stands.
3634. *Mr. Hoskins.*] Are you acquainted with the terms of the resolution of the Legislative Assembly requiring this Committee to make an inquiry into this matter. The resolution says that the Committee is to inquire into and report upon the construction of a deep-water harbour at Port Kembla. On what grounds does your company object to the Committee carrying out this resolution? Simply because practically I consider that the question of a harbour for the South Coast was set at rest by the passing of my company's Act of Parliament, and, secondly, that this proposal is one set up in opposition to the other. It was first interfered with by Wollongong, and then Kembla. It materially affects the chances of raising capital to carry out our harbour to have a chance of a State harbour in the immediate vicinity.
3635. But there is nothing in the Act of Parliament empowering the Illawarra Harbour and Land Corporation to prevent any other harbour from being made on the South Coast between Sydney and Lake Illawarra? I admit there is not.
3636. Then your company might be open to the charge of desiring to prevent improvements from being carried out? If private enterprise undertakes to form a harbour, and efforts are made to promote a trade, and the State then threatens to form another harbour adjacent to it, that would interfere very seriously with private enterprise. I am convinced that in passing the Act Parliament intended to give private enterprise a chance to do the work, and not during its infancy to check its life by State opposition.
3637. Have we not given the company an opportunity to carry out the work, seeing that the Act has been passed now for six years? During those six years the Colony has gone through one of the most terrible financial

financial and commercial crises which we have ever had in Australia. We are entitled to some consideration, but we do not get it when we are threatened with a competing harbour, so adjacent to us that it is practically killing our financial powers.

3638. Have you not had consideration extended to you, seeing that you have had an Act in existence for six years, and that your time has been extended? I do not think that in the history of companies throughout Australia you can find a company that has done as much as we here, and our extension powers are not yet in use.

3639. Can you say that your company has not been treated fairly? Yes. I think that Parliament is not giving us sufficient consideration, so long as it is interfering with our operations by bringing forward a conflicting scheme. Before our time is up, I have little hesitation in saying all our operations will be carried out.

3640. Has it not been stated by your engineer that it will take two years to carry out the work? Our operations are nearly treble those described in the Act of Parliament. We could carry out the terms of the Act by an expenditure of £40,000, and do so within six months.

3641. Why do you not expend that money, and show that you intend to do something more? Because our arrangements are made so as to secure a source of profit to us as well as to meet public requirements.

3642. What has been done to make it a useful harbour? Our time is not up.

3643. Have you done anything to make it a useful harbour? We have expended £40,000 in the creation of trade for the coming harbour.

3644. You have made a railway  $7\frac{1}{2}$  miles long to a coal-mine? Yes; and spent money on the harbour.

3645. What have you done to the harbour? We have practically nearly finished one of the tie-banks. The expenditure on the harbour has amounted to about £3,000.

3646. Do you think it fair, having delayed the work for six years, that the matter should be delayed for two years longer? The coal-owners have not suffered in any way. They have the same harbour accommodation that they always had.

3647. Do you think it fair that any harbour improvements which ought to be carried out ought to be delayed still longer until this company can see whether or not they can raise funds? It remains for the Committee to decide whether other harbours should be given the chance of securing trade created by us.

3648. The Committee only report? The Committee have pretty well all the facts before them.

3649. Your company objects to the construction of a port at Kempl, because it assumes that if a deep-water harbour is constructed it will interfere with its project? That is the stand it takes.

3650. You said that your company would not be able to carry out the work until it could raise the money to do it;—can you give us any reason to believe that it will be able to raise the money? Certainly no guarantee.

3651. You have been present during the whole of this inquiry? Yes.

3652. You have heard from colliery managers, and Professor David, and the Government Geologist that there is no good workable seam of steam coal to the southward of Mount Kempl? The whole thing does not hinge upon steam coal.

3653. Does not Professor David say that they have tested the coal and found it unsuitable for export? Yes.

3654. Is it not a fact that southern coal is in demand for steam purposes only? Yes.

3655. Did you listen to the evidence given by Mr. MacCabe, Dr. Robertson, and others, endorsed by Government officers, that nearly the whole of the valuable seam of Bulli coal was between Coalcliff on the north, and Mount Kempl on the south? Yes; I know all that before I heard them.

3656. Then how can you make Illawarra the place for the shipment of the coal? For the reason, that assuming that we had carried out the whole system, vessels bringing ore would arrive in Lake Illawarra at the rate of at least 1,000 tons a day, probably a great deal more. If vessels can load at all times, and in all seasons as they can in a land-locked harbour, they would never go to Mount Kempl to get their coal, and Kempl could be easily connected by canal with the northern end of the Lake.

3657. Do you know that steamers which come from Port Pirie with silver and lead ore have other cargoes besides, and they must unload in Sydney? Yes; but I know there is at present no ore trade between the places named.

3658. Do you think that after unloading in Sydney they would go to Lake Illawarra for coal? I know exactly what tenders we have got in connection with the enterprise. We put it on the London market with absolute figures, showing that we could carry stuff from Port Pirie to the Lake at 4s. 6d. a ton, creating trade entirely outside existing currents.

3659. Do you know also that many steamers trading to South Australia take other cargoes besides coal? Yes.

3660. Do you know also that the manager of the proposed smelting works at Lake Illawarra has been in communication with the Railway Commissioners who have undertaken to carry the ore from Sydney by railway? Yes.

3661. Are you a shareholder in this smelting company? Yes.

3662. Have you not heard the evidence of engineers and others to the effect that if the eastern or southern breakwater was erected at Port Kempl there would be comparatively still water there? Yes, and I heard it flatly contradicted by Pilot Mills, who pointed out that a breakwater of the height proposed by Mr. Darley would have the water constantly washing over it in average weather.

3663. Have you seen breakwaters in other parts of the world? I was never out of New South Wales.

3664. Have you heard of the breakwater at Colombo? I have read about it.

3665. There is also the breakwater at Plymouth;—the sea frequently breaks over these breakwaters, and yet they exist? I think that I am correct in saying that within two years of its construction, the breakwater at Colombo cost £900,000, including repairs; and the rise and fall of the tide there is only 2 feet, and the highest wave measures only 10 feet. I would not mind venturing the opinion that you would see waves 40 feet in height at Kempl.

3666. I have heard that the Five Islands affords an excellent breakwater? If you saw the place in a south-easterly gale you would not say so.

3667. Do you think that the Government or Parliament would be justified in withholding the power to make a harbour at Port Kempl until your company are able to carry out the work at Lake Illawarra? My opinion is, that no harbour to develop the coal trade of the south coast would equal the one at Lake Illawarra, where you can have so many miles of still water made available for ships by simply dredging.

3668. You do not propose to give many miles of still water;—are you aware that it is proposed to employ 260 acres in Port Kempl, while you propose to make 25 acres in Lake Illawarra available for ships, the area, if necessary, to be extended to 40 acres;—do you think that would suffice for a largely extended trade? The first proposal is one that provides for the trade, as far as can be seen, of the immediate future.

3669.

A. Armstrong,  
Esq.  
22 Dec., 1896.

- A. Armstrong, Esq.  
22 Dec., 1896.
3669. Did you hear Dr. Robertson and others say that they would not send their coal to Lake Illawarra because it is too far away? Yes.
3670. Therefore, if they would not use the harbour made by your company, would you prevent them from being provided with a harbour more convenient for shipping their coal? If they have a trade of 750,000 tons, and by the construction of our harbour we can create a trade of 2,000,000 tons, no harm can be done by allowing us to carry it out.
3671. What would you ship? Coal outwards and ores inwards.
3672. Where would you get it from? If we create a still-water harbour it will come to us.
3673. You stated that your company had already expended £250,000? No; I said one of the companies formed under the operation of my company had spent that amount.
3674. Do you mean the smelting company? Yes.
3675. Seeing that no harbour works can be carried out at Lake Illawarra under two years, and the smelting company are about to commence operations, in what way can they get the ore? The smelting company was formed with the distinct understanding that it would take at least two years before the harbour improvements were completed.
3676. How far is Port Kembla from Lake Illawarra? Not far; the distance of the entrance is approximately 5 miles; but the lake itself is nearer the coal-field than Kembla.
3677. Do you think it would not be feasible, if a good harbour is made at Port Kembla, to unload ore there, and take it down to the smelting works by a railway 5 or 6 miles in length? No. I am sure that the smelting company would prefer to rely upon a still-water harbour, instead of unshipping perhaps 1,000 to 2,000 tons a day in rough weather. It would interfere with the regular flow of trade. It would also mean the construction of a railway extending from Mullet Creek to Kembla, where it would be very difficult to make a railway, and that to reach a port that never could be relied on. This would entail the purchase of our line, which we do not want to sell.
3678. You are aware that your view is opposed to the engineering and other evidence which has been given in this room? I put my evidence against the evidence of certain persons who are giving evidence for a certain purpose. They recommend the construction of a harbour where vessels will not go in bad weather. I have fully discussed the matter with Mr. Howell, and he says that if he had to rely upon Kembla, he would cut out all his traffic for Darling Harbour. He never authorised many of the statements which have been made here with regard to his ores going there.
3679. The smelting company cannot take the ore to their works, except by means of a railway, can they? No.
3680. Then your company have a monopoly of the approach to the smelting works? Exactly; and the company was formed with full knowledge of this fact.
3681. *Mr. Humphrey.* Do you assert that the works proposed by the Illawarra Harbour and Land Corporation are a *bona fide* enterprise, and that they will be completed in terms of your Act of Parliament? I see no doubt of it whatever.
3682. I want you to answer straight out? I assert that they are in every way *bona fide*.
3683. And the works will be carried out? Yes.
3684. Under the Extension Act, a certain railway had to be completed before "the 20th of December last"? Yes.
3685. Has that railway been completed? Yes, and has been running ever since.
3686. Under another provision of the Act you have to lodge £10,000 with the Government before the 20th December, 1897, as a guarantee for the completion of the harbour works proposed? That is so. If the works are not completed before December 23, 1897, my company has to lodge £10,000 with the Treasurer, in order to gain one year more time.
3687. What provision have you made for that deposit;—is the company prepared to lodge the money? Most certainly.
3688. And you say that the work can be completed, as proposed by the Bill, within two years, if you give a depth of 25½ feet in the Lake? Yes.
3689. Have you let contracts to cover the provisions of the Bill? We have, inclusive of work enormously in excess.
3690. *Bona fide* contracts? Yes; and if we do not proceed with them, we shall have to pay a fine of £5,000.
3691. How do you propose to find the means for paying Mr. Amos? Out of the debenture loan, by an increased mortgage of our property. We have only a liability of £34,000, secured by mortgage to Mr. Amos.
3692. Is that in connection with the railway? Yes.
3693. Is that the only debt owing by your company? It is.
3694. And you intend to raise money to carry out the harbour works by issuing debentures upon the company's property? That would be increasing the mortgage from £34,000 to £200,000.
3695. To whom? It would be a debenture mortgage.
3696. That is the way you propose to raise the necessary funds? Yes.
3697. Have you taken any steps, up to the present time, to issue these debentures? We are trying to make the harbour a success by creating a trade for it before we place the debentures on the market.
3698. I want to know whether you have taken the preliminary steps to raise the necessary funds to pay the contractor? Yes, they are very complete. When there is a favourable market we shall take advantage of the trade, of which we have already laid the foundations in connection with our company.
3699. Is the contractor aware of the means by which you intend to pay him? Yes.
3700. And is he prepared to go on with the contract, relying upon the ability of your corporation to find the necessary funds? He is most undoubtedly prepared to go on when called upon.
3701. What property is owned at the present time by the Illawarra Harbour and Land Corporation? The whole of the Lakeland estate—2,410 acres; 263 acres of coal land; 1,280 acres of leased land; the railway siding; and the land purchased for the railway, somewhere about 4½ miles in length, and about 7½ miles of completed railway.
3702. These are the properties owned by the land corporation? Yes.
3703. What is the cost to the company of the property you have described as being owned by them? £150,000 altogether.
3704. Has that amount been paid? With the exception of the debt of £34,000.
3705. Your company has paid the difference between £35,000 and £150,000—the cost of this property? Yes.
3706. That is your position? That is our position.
3707. Upon that basis, and having regard to the present value of the properties that you possess, and the valuable concession obtained under the Act of Parliament, you propose to operate in London with the view of paying for these works? That is the position exactly.

WEDNESDAY, 23 DECEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
The Hon. JAMES HOSKINS.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
The Hon. DANIEL O'CONNOR.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.  
FRANCIS AUGUSTUS WRIGHT, Esq.  
FRANK FARNELL, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Andrew Armstrong, Esq., Managing Director, Illawarra Harbour and Land Corporation (Limited),  
sworn, and further examined:—

3708. *Mr. Trickett.*] In answer to Mr. Humphery, you stated that the Illawarra Harbour and Land Corporation had expended £150,000? Yes. A. Armstrong,  
Esq.

3709. And that of that £150,000, £35,000 is still owing to Mr. Amos? Due on mortgage to them.

3710. Will you tell us how the £150,000 is made up? The first great item is for estates, £90,000.

23 Dec., 1896.

3711. Is that one of the properties adjoining the Lake? Yes, 2,400 acres, with 4½ miles frontage to Lake Illawarra.

3712. Did you pay that in cash? We owe nothing.

3713. You say you have paid £115,000, and you owe £35,000 on mortgage;—have you paid that £115,000 in cash? We have.

3714. That was absolutely paid in cash? Yes. The cash transactions of the company to this date. I put the answer as entirely separating the company from its inflated values.

3715. You paid £90,000 for the two estates? Yes, £65,000 for the Lakeland Estate, and £25,000 for the colliery estate.

3716. Then the other money was expended on what? About £39,000 on a railway, and £3,000 in harbour works, surveys, and incidental expenses.

3717. You have actually paid away in cash £115,000, and you owe £35,000? Yes; our total expenditure is £150,000 on the management of this great company. Its legal costs, outlay in stamp duties, and so on, bring the total up to that amount.

3718. How was that £150,000 raised? I think that would be best answered by the answer I gave yesterday with regard to the two agreements which merged the old syndicate arrangements into a company.

3719. That answer will not suit me;—I want to know where that £150,000 came from? It has been subscribed by the present shareholders of the Illawarra Harbour and Land Corporation.

3720. Voluntarily or by calls, or how? By merging the syndicate arrangements into the company, and taking their shares in the company as paid to £60.

3721. Then it was not cash? It is absolute cash. As I said before, I strip the whole thing of its inflated values, and give absolute cash payments.

3722. Can you say that £150,000 in cash has been paid by the shareholders of the Illawarra Harbour and Land Corporation? Yes.

3723. I suppose it is paid *pro rata* according to their share? Exactly.

3724. That being so, how do you account for it that in your summary of capital and shares filed on the 13th November, 1896, you only put down that £100,000 as having been paid in cash, that a call of £10 per share has been made, and £100,000 has been paid? I think that is quite correct.

3725. You say in the statement which you filed, "We made on the 13th November, 1893, a call of £10 a share, and that £100,000 has been paid, and all the rest is made up by shares issued as made up in cash";—how do you account for that? The last call made adjusted accounts between the promoters' syndicate and company.

3726. That is absurd. There are 10,000 shares, and the document states that a call of £10 per share has been made. If your shareholders have paid claims to the amount of £150,000, I want to know how it is that in the form, which you are required by the Companies Act to file, you have only put down that £100,000 as having been paid? I think I have given you a summary of the actual position, with the total amount paid by my company without any liabilities to any person outside the company, except for the £35,000 mortgage.

3727. Here is the simple statement from information obtained by the Secretary at the company's office that a call of £10 per share has been made, amounting to £100,000, and the total amount of calls unpaid is nil? They have spent £100,000. The difference between the promoters and the syndicate who formed that company amounts to a paid-up value of 10,000 shares holding the estate. A later expenditure has been created by the issue of preference shares entirely outside that altogether.

3728. Then the return which you file is not a correct one? No, because these preference shares are two years after that return. You take the 1893 date. The great bulk of the expenditure was commenced in 1896.

3729. Was it not down in the statement? No, because it was commenced in 1896.

3730. But this was filed on the 13th November, 1896. How many shares have you in the company? 1,000.

3731. In the list of shareholders filed in November, 1896, you are put down as the holder of one share? I think that can be explained by carrying out the suggestion which I made yesterday—that the company's solicitor should give full information in the matter.

3732. The company's solicitor will not put you down for one share if you have 1,000? A company has been formed in London to purchase and guarantee our debentures into which my shares are merged.

3733. You never had more than one share according to the return? I beg your pardon.

3734. On the 20th January, 1896, there were 9,970 shares in the name of Mr. De Wolf, out of the 10,000, and is it not a fact that he transferred the whole of that lot to some company in London? Yes.

3735. You are put down in the statutory return, filed under the Companies Act, as the holder of one share. I want you to explain that; I do not want the solicitor to the company to do it? I do not think there

- A. Armstrong, Esq.*  
23 Dec., 1896.
- there is anything anomalous in it. It is simply transferring under a power of attorney, to one leading director, to give him power to deal with them in London.
3736. But you have always been the holder of only one share? All others were transferred to him. Probably in the return prior to that my interest is not altered.
3737. Is it a correct or a false return? It is a correct return for that year.
3738. What is the good of saying that when the year before the same state of things prevailed,—Mr. De Wolf had 9,970 shares? It is a matter that can be explained. The shareholders, both individually and as a company, gave full power of attorney to Mr. De Wolf. Those shares are absolutely mine, and were transferred to him to deal with in London.
3739. Who is the chairman of the company in Sydney? Mr. Edmund Barton.
3740. When did you have a meeting last? I think about four or five weeks ago.
3741. Who are the other members of the board? Mr. Arthur Friend and myself. The board, at present, has been reduced from the larger number, in anticipation of certain nominations from London, which are expected daily.
3742. You are down on the return as the holder of one share;—have you one, or more than one? I have one, the rest being transferred to Mr. De Wolf for his operations in London.
3743. How many of the 9,970 shares remain with Mr. De Wolf? I can file a return.
3744. Can you tell me how many shares you have in the company? The number is 1,010 or 1,019, or somewhere thereabouts, subject to action under power of attorney in London.
3745. That you yourself have? Yes, which are with all other shares for financial purposes in London transferred to Mr. De Wolf. We are bound by that transfer. It is a matter of business arrangement.
3746. There is another question which I should like to ask you;—when was the money paid for this land which you spoke of—this £90,000? In various payments between 1888 and 1896.
3747. And that you say has absolutely been paid? Absolutely paid in cash.
3748. Was it paid for any particular estate or vendors? At the time we purchased the estate it had been sold by Mr. Osborne to the Lakeland syndicate, and we bought from that syndicate. We carried out our contract till that syndicate released itself from Mr. Osborne. We bought it and other properties for £90,000, and the estate is now clear from the mortgages.
3749. I understand that all the land you bought at Illawarra in connection with this company has cost £90,000;—is that the total? That is the total purchase money.
3750. And by your agreement between yourself and Mr. J. A. Thompson you agreed to sell to the Illawarra Company the same land for £600,000? Yes.
3751. So that you are making a profit, if it comes off, of £510,000,—in the first instance, did not Mr. Newton and Mr. Frederick W. Orr agree to pay £250,000 cash towards the payment for this land? Yes.
3752. Was that ever paid? It was not.
3753. By subsequent agreement, was not that deposit of £250,000 reduced to £100,000? Yes; by reducing the shares down as so much paid.
3754. Was that ever paid? No; except by reducing down the shares in value.
3755. Then, as regards these agreements, which are filed in the Registrar-General's Office, neither was the £250,000 agreed to in the first instance paid, nor the £100,000 the reduced amount? Not in cash.
3756. Then how have they been paid? By taking the estate at the nominal value of the purchase made by the company, and reducing down the shares to an amount equal.
3757. It has been paid on paper? Yes. The whole estate and concessions paid for are held by the company represented by shares paid to £60 each.
3758. I understood you to say that the land had been paid for in cash? So it has been. The company have paid the amount of the original purchase money. I have been very careful to let my evidence consist of existing facts, wiping out all the kind of business, which was very common in those days, of adding inflated values.
3759. That is the state of things;—you bought this land for £90,000, and this Illawarra Harbour and Land Corporation agreed to sell it for £600,000? Yes.
3760. So, if it comes off, it will be a very nice thing for you? No; these things have been merged into a settlement.
3761. What is the use of talking about merging, when you know as well as I do that any contract of that kind has to be filed in the office, and any alteration of that has to be filed under a heavy penalty, and there is no such alteration? The settlement has been that the company bought it at that price.
3762. I understood you in answer to questions to state that the reasons you applied for your extended Act in December, 1895, was because of certain financial difficulties arising owing to some Melbourne company having failed? Yes.
3763. That being so, you having stated in answer to several questions that that was the reason of your applying the money difficulty, will you listen to this question, and your answer, given before a Select Committee on the 10th October, 1895. The Chairman of that Committee was Mr. Neild:—
- Chairman.]* The object of the Bill is not to palter with financial responsibilities, but to provide against possible contingencies, such as storms or any other casualty? Anything that cannot possibly be predicted. Our arrangements are as complete as any company could make them, and they are within the terms specified in the Bill. Our whole and sole object in asking for an extension of time is that we fear that towards the completion of the work heavy easterly gales might so injure our breakwaters as to prevent a ship drawing 15 feet from coming into the harbour, and, if that happened, our powers under the Bill would be jeopardised, and would be doubtful in law.
- I want you to tell the Committee which is the right answer, what you swore yesterday, or what you swore on the 10th October, 1895? What I swore at that particular time was simply with a full knowledge of the facts that a large and important firm of underwriters had agreed to underwrite our debentures. That agreement is still in existence, and there is nothing whatever contradictory in the two statements, that is to say, we consider that we have plenty of time to carry it out, and we are anxious to place our debentures on the market in a complete and satisfactory manner, not at a price contingent upon some conflicting harbour, or difficulty hanging over our heads. As long as the Kembla inquiry has been pending, our harbour debentures would only be underwritten at a very big price below par. They are practically guaranteed at their market value. Their market value has not reached, and will not till this conflicting difficulty is settled, anything like par, and placing them on the market would have been attended by a terrible discount, something like 20 per cent. Clear away these difficulties, and they would be worth £95, or par £100.

3764. Why did you not tell us that yesterday. In answer to questions you said that there were no financial difficulties at all? I do not think there are any. We can put our debentures on the market now, if we liked to do it at a price which would handicap us severely. We shall do it in time, but we do not want to handicap ourselves with a debt for which we should get nothing.

A. Armstrong,  
Esq.  
23 Dec., 1896.

3765. I am going to look at these works which you have done at the Illawarra Lake. Will you describe them, so that I can find out what you have done? The only work done to the harbour is a portion of the tie-bank connecting Windang Island with the main land, and the necessary soundings, which come to about £3,000, and 7 miles 75 chains of railway.

3766. You wish the Committee to believe that, although you have had plenty of money, and although you had an Act of Parliament since 1890, you have only put up a tie-bank between Windang Island and the mainland? I do not think that is a fair way of putting it, for this reason; that under our Act of Parliament a new class of trade entirely has been created throughout the district. Nothing that we have done has tended to check the steam coal trade. What we are doing is making provision for a trade four or five times the size of the steam coal trade for which all our preparations are certain, as far as it is possible for me to judge, to be complete. The trade that we are doing will not be ready for ships till about the time that we are ready for them, pending which we have made satisfactory arrangements with the Government to carry our ores from Darling Harbour, and by our railway erected in terms of our Act.

3767. But your own Act of Parliament does not say anything about a new trade;—you obtained your Act for coal trade purposes? There was no occasion for an Act of Parliament to define that. This is the idea which sprang out of the kind of calculations which we made for developing entirely new trade. The crisis, immediately after our Act of Parliament was passed, completely killed the coal trade, and the promoters of the company turned their attention to the carrying out of a much larger idea, in view of the fact that, apparently, useless coal here could be applied to that purpose.

3768. Do you want the Committee to believe that you and the smelting company are working together? Most decidedly.

3769. You are certain? Yes.

3770. You know Mr. Howell? I do.

3771. What is he in connection with the smelting company? He is managing director in Sydney.

3772. Will you listen to this question which was asked him when giving evidence with reference to the proposed railway from Condobolin to Broken Hill:—

Have you any fixed period within which the work will probably be commenced? We have nothing to do with the harbour business.

The opening of the harbour is not one of the objects of your company? No.

You said that the two companies were working together? So we are; but there are separate interests in the same company. His company have taken up interests in my company in London. The interests are the same, although the registered companies are different.

3773. Mr. Henderson, your engineer, gave detailed items, and he estimated that the cost of the Illawarra Harbour works, not the railway, will be £177,059, and you come to this Committee, having had an Enabling Bill since 1890, and tell us that you have spent £2,000;—is not that so? Yes, exclusive of expenditure under the railway provisions of our Act.

3774. Mr. Clarke.] This Illawarra company is entirely a private company? Yes.

3775. And any profits will go to the shareholders? Yes.

3776. Then what objection have you to Port Kembla being made a shipping port for the shipment of coal and other produce? Two harbours adjacent to each other would not pay.

3777. Why has not your company been more expeditious in carrying out the work at Lake Illawarra? We consider that any company that has done as much as we have has done wonders.

3778. Do you not consider that the people at the Illawarra district are as much entitled to have Government money spent there as the Newcastle people were? I would rather not give an opinion on that point.

3779. If this harbour were constructed at Lake Illawarra, would it be as suitable for the shipment of coal from Mount Kembla and Bellambi as Port Kembla? I think it would be far more suitable. I have heard a great deal of evidence adverse to it, but it has not shaken my opinion.

3780. For what reason? That a still-water harbour will attract a kind of trade which an open-sea wharf will never attract. I certainly think that Lake Illawarra is capable of being turned into a harbour very superior to that of Newcastle, because it is similar to Newcastle without having the immense amount of alluvium that is brought down the river at flood-time. At Newcastle they have to dredge out of the harbour 1,400,000 tons of mud per annum, so as to maintain the present area for vessels. We have the opinion of experts that any dredging done at Lake Illawarra would not silt up more than 1 inch in ten years.

3781. Are you of opinion that it would be better for private individuals to have the work carried out at Lake Illawarra by the company, instead of a harbour being made by the Government at Port Kembla? Most certainly I am.

3782. You maintain that you did not depend upon the coal to be shipped at Lake Illawarra? We depend upon creating a trade which we are certain will take away coal. Vessels which bring ores would never go away empty, and a development of the coal trade will follow the erection of a safe, still-water, insurable port.

3783. What do you rely upon? I have given my evidence in consideration of the fact that various firms interested in the coal trade have stated that they would not ship there.

3784. Is not Lake Illawarra a much greater distance from where the great bulk of the coal is raised than Port Kembla? As a matter of fact it is rather nearer, and easier to connect with the State railway.

3785. From the map it appears to be further off? A railway could be made to reach the northern end of the Lake. But it would necessitate a certain amount of dredging, which has not been provided for in our calculations.

3786. Mr. Lee.] Do you appear here to oppose the construction of a harbour at Port Kembla in the interests of the State, or because you are of opinion that if a harbour is constructed there it will infringe upon the rights granted to the Illawarra Harbour and Land Corporation? I believe it would be more advantageous to the State to have the harbour at Lake Illawarra.

3787. Do you think you have a right to oppose this proposal on the part of your company, because it will infringe the rights granted to you in 1890? I appear here to offer the fullest information, so as to enable the

A. Armstrong, Esq.  
23 Dec., 1896.

the Committee to judge whether the ideas, which I believe are fully expressed in our Act of Parliament of 1888, should be maintained in their integrity.

3788. Will you tell the Committee what right your company has under its Act? I suppose it is a matter of opinion. We consider that those rights give us practically the key to the south coast trade.

3789. What does the preamble of your Act say? That we have a right to make a harbour at Lake Illawarra.

3790. Does it confer upon you any rights outside of that? It does not.

3791. Therefore the rights which you spoke of a couple of days ago, in reply to Mr. Roberts, really do not exist? They are rights which are given to us which would be severely damaged by the State doing something else in the immediate vicinity of the Lake. I take it that Parliament never intended to give with one hand something that it would take away with the other.

3792. Did not Parliament give you what you asked for? Yes.

3793. But it gave you no rights outside of that? What rights we have, Parliament gave us, and our object is very similar to that which the Committee are inquiring into.

3794. When Parliament does a certain thing it expresses it in an Act;—Parliament has given you power to make a harbour at Lake Illawarra, but it might also have given the power to someone else to carry out a similar work at the Tom Thumb Lagoon? In giving that right, Parliament practically gave the right to everybody concerned to take advantage of it. It gave the right to persons in the neighbourhood to connect by a canal with the harbour.

3795. Those are the surrounding colliery owners? Yes.

3796. They did not oppose your going for an Act of Parliament? No; They united in seeing that Parliament gave them the right to utilise the scheme.

3797. Your rights were confined exclusively to Lake Illawarra? Yes.

3798. Therefore if the State should think proper to construct a harbour at Port Kembla for the better development of the coal trade, how can you say that your rights would be infringed? It is a right which will encroach upon our rights, the proposed work being so adjacent, and I feel sure that it is beyond the intention of Parliament to do such a thing.

3799. You infer that when the right was granted to make a harbour at Lake Illawarra it covered the right to shipping facilities to the whole of the southern coast? Yes, seeing that the shipping interest united in giving evidence in favour of the Bill, and secured rights for themselves.

3800. You know that the majority of the colliery owners are not in favour of Lake Illawarra at all, therefore how will their rights be jeopardised? The question raises a lot of very conflicting ideas, seeing that every one of those interests supported the Bill. Mr. MacCabe's brother was secretary of the company, and he gave evidence in favour of the Bill directly representing the very same interests that Mr. MacCabe does. Seeing the terrible conflict between the evidence of parties now and that which they gave then, I admit that I do not understand how to deal with it.

3801. You can only be presumed to appear here to defend certain rights. I want to give you an opportunity of showing the Committee that if the Port Kembla works are carried out you will be deprived of the benefits conferred under your Act? I say that Kembla would do a large proportion of the trade, and thus interfere with our scheme.

3802. Your scheme will not work out as profitably as it otherwise would? It will be materially lessened in value.

3803. Keeping in view the fact that most of the large colliery owners have come before the Committee and said that they are not in favour of Lake Illawarra, that it would not answer their purposes, and that the harbour should be at Port Kembla, would you tell the Committee that the estimated profits of the Lake Illawarra scheme are likely to be interfered with? Every one of those interests according to their sworn evidence four years ago would have been only too glad to use a harbour at Lake Illawarra.

3804. It is only right that you can produce evidence that they are in favour of it, that you should do so. All the evidence that we have shows that they are against it? I would refer to the evidence of Mr. MacCabe, brother of the man who gave evidence here the other day. It will be found in the report of the Select Committee dated 5th June, 1889.

3805. That gentleman has not been before us as a witness;—can you pick out anyone who has? No; but it is the same interest.

3806. If your scheme at Lake Illawarra were carried out, the depth of water would be increased from 15 to 25 feet? Yes.

3807. Have you made any calculation as to the amount of tonnage which you expect to receive, the quantity of coal you will ship, and the charges that you will make, and what annual revenue you expect to receive? Yes, we have; but that embraces so many important calculations that if you have no objection to let it stand over until after the holidays, I will put the information in the form of a return.

3808. We can hardly accept it in that form;—I suppose the works would have to produce 6 per cent. to cover interest and maintenance charges? Maintenance for increased trade that would grow, would come to considerably more than 6 per cent.

3809. Could you tell us what charge you contemplated making for shipping coal? I think that any calculations before the harbour is constructed would be premature; but pending the consideration of reductions, we should charge the maximum provided by the Act.

3810. Then that would be for tonnage rates, 1s. per ton? Yes.

3811. Then the next rates would be under your schedule, ballast, 1s. per ton; coal, 10d.; coke, 1s. 8d.; limestone, 2s. a ton; and so on. If you charge 1s. per ton on the tonnage of the ship, and 10d. on the coal, do you think it possible that ships could go into that harbour to take cargo? No; our calculation is that the maximum tonnage rates alone will pay a good return and relieve us of the other charges.

3812. That would be 1s. a ton? Yes.

3813. If the same trade could be carried on effectually from Port Kembla, the hauling and shipping of coal for a total charge of 8d. per ton,—do you not think that your charges would be excessive? No. I do not think it possible to rely upon Port Kembla meeting a regular flow of steamer trade unless you have a still-water harbour, which you could not get there.

3814. The evidence is very strong that if Port Kembla were made a good harbour, shipping could be done there, including the baulage of coal, for 8d. a ton, as against 1s. at Lake Illawarra;—do you not think that business would not be likely to come to your port? No, I do not, because I cannot see that any other

other port can do the kind of trade that we contemplate. I feel that the whole importance of what we are undertaking depends upon the fact that we require a still-water harbour insurable by the general marine offices.

A. Armstrong,  
Esq.  
23 Dec., 1896.

3815. Your port would be so much better than can be made at Port Kembla that it will attract shipping in spite of the extra charge? Yes.

3816. Will you point out on the map the South Coast Colliery mentioned in your Act? Its name on the map is the Southern Coal-mining Company, Mount Kembla, and it lies immediately behind Port Kembla.

3817. Your Act gives you power to make a railway between that point and the Macquarie Rivulet, but no further? I think the expression in our Act is "The Ocean Colliery."

3818. By the Act you are restricted between those two points? Yes, as to the making of railways.

3819. Then you are practically on the southern limit of the coal-field? According to the evidence we are beyond the southern limit.

3820. That being the case, how could you expect the coal-mines north of the South Coast Colliery to send their coal for shipment to Lake Illawarra, when you would have no advantage or control over any line except those which you have power to make? It is no further away from the mines than Newcastle is.

3821. You are aware that at Newcastle the whole of the haulage and shipping are done by the Railway Commissioners? Yes.

3822. Your case is not analagous. You have private rights, and expect to make profit;—how are you going to attract the coal to Lake Illawarra for shipment? We think that what has been done already will not attract the coal, but will create a local use for coal—for more coal than is sent away; that is to say that we have created a local use and prospective sale for 2,000,000 tons of coal annually.

3823. What do you mean by local use? Smelting operations that will be carried out locally. A still-water harbour will naturally be more suitable at all times for people to adapt themselves to.

3824. The coal required for the smelting works will be brought from the mines at the back of Lake Illawarra? Yes; I take it that the smelting works will want immense quantities of the present class of coal that is used, and other varieties of coal. The industry now starting at Dapto will consume as much coal as the present field now ships.

3825. There is coal enough for any industry that can be established? Yes, and there will be a natural market created for it.

3826. The question of any coal coming by water is very remote? Most certainly coal would never come by water. The State line of railway is immediately under the level of all the coal-mines. They are all workable by adit to the existing State line, and all our connections are made with the State line, in order to be prepared for the trade whether it comes by sea or by railway.

3827. You know that there is a large steamer trade with Port Kembla? Yes.

3828. If they can load under present conditions, do you think it is at all probable that that traffic will go to Lake Illawarra? Most certainly. I have discussed the matter with leading insurance agents, and they are of that opinion.

3829. Notwithstanding that your charges will be more than double? The charges will be made to catch the business. A maximum is placed in the Act to give certain powers.

3830. If they took one of these big steamers into your harbour, it would cost £200 at 1s. a ton? Yes.

3831. Do you think that would be done when they can run into Port Kembla free of that charge? I have no doubt that as soon as a fair interest has been earned on the cost of the work the rates would be reduced to catch more and more traffic.

3832. I want to know what gross charge you are relying upon;—you say that 1s. will cover everything? The whole thing, we anticipate, can be covered by the tonnage charge only.

3833. That will be 1s. a ton, and it will cost £200 to take a large ship into that port? By-laws are in course of preparation dealing with these things, and they will have to be submitted to the Attorney-General.

3834. *Mr. Fegan.*] The first Bill that you had passed allowed a certain time within which to provide for a harbour and the cutting of a channel;—but that Act which was passed in 1890, did not compel the company to make a deposit with the Treasurer? No.

3835. But the Act passed in 1895 stipulated that a certain sum of money should be placed in the hands of the Colonial Treasurer? It did.

3836. What sum was that? £10,000.

3837. What are the conditions under which that money was to be forfeited? I do not remember.

3838. Did it not provide that the money should be forfeited unless the work were carried out within a specified time? That is it.

3839. Is the money in the Treasurer's hands yet? Certainly not.

3840. What is there to compel the company, in the event of work not being completed to pay that money? Nothing at all.

3841. Then what is the use of this provision in the Act that a sum of £10,000 should be deposited by the company with the Colonial Treasurer? I take it that if on the 23rd December, 1897, we have not satisfied the Colonial Treasurer that the conditions prescribed in Schedules 1 and 2 have been complied with, our Act is dead, unless we lodge £10,000.

3842. The two Acts giving you these rights cease to be of any effect? They cease and become void, if we cannot show by December, 1897, that there is a channel capable of taking in ships of 15 feet draught. If it is not completed by that date twelve months we absolutely forfeit the £10,000 which we shall have deposited. If we do not deposit £10,000 on a certain date, in lieu of certain work having been done, the Act lapses. If we do deposit £10,000 we get another year in which to carry out the work. If after the lapse of that year, the work is not carried out, we lose both the Act and the £10,000.

3843. In the interest of the company, you often attended in the House when the Bill was under consideration? I did.

3844. Was not Mr. Howell with you? Yes.

3845. And Mr. Howell took a very great interest in the passing of the Act of 1895? Yes.

3846. What interest had he in that company that he should take such an interest in the passing of the measure? None whatever, except that the shareholders of his company in London are shareholders in mine, their interests are identical, although they are separate companies.

3847. Is not Mr. Howell's time too valuable for him to give a great deal of his time to a matter in which he has no interest? I should think so.

3848.

- A. Armstrong, Esq.  
23 Dec., 1896.
3848. Is it not a fact that those who were supporting the Bill in the House consulted Mr. Howell time after time? Yes, they did, both in London and here.
3849. Did not Mr. Neild consult him more than once? Yes.
3850. Was not Mr. Howell the person to be consulted as to the provisions of the Bill when it was being passed? That is putting it rather strong. He had only just come from England, and he was interested in seeing that my company were to get a little more time to carry out its works.
3851. How do you mean he had just come out from England? He had only arrived a few days before.
3852. You know that Mr. Howell was consulted in the House about the Bill? Yes.
3853. Was Mr. Howell consulted about every amendment? Yes.
3854. Showing that he must have some interest in it? I do not think he has a direct interest in the company.
3855. Why should he be consulted in reference to the Bill? Only because the interests of the two companies are identical. I do not know that he has not, but he may have acquired certain interests in the company in London without my knowledge.
3856. You do not know whether Mr. Howell has any interest in this company, but you will not swear that he has not? I will not.
3857. In answer to Mr. Clarke you said that you came to oppose the Government scheme at Port Kembla; on account of the Acts referred to giving certain rights to your company? Yes.
3858. You think that the time allowed by your Acts should expire before the Port Kembla scheme is taken in hand? Yes, before Parliament sets up an opposition which is very damaging to our interests.
3859. You admit that there is not room for two schemes, one at Port Kembla and one at Bellambi? The combination of two schemes could not pay interest on the total cost.
3860. You think that after Parliament has gone to the trouble of passing your Act, it is only right to give them the time prescribed in that measure? That is the kind of equity which one expects from Parliament.
3861. That is your chief reason for being here to-day? Yes.
3862. When, in your imagination, do you expect 2,000,000 tons of coal to come into a harbour at Lake Illawarra? We do not expect any to come in.
3863. You have railway communication to the Lake at present? Yes.
3864. Where are you going to export 2,000,000 tons of coal from? The first trade principally will be in refractory ores coming by ships from all the colonies, and those ships would not go away empty.
3865. How many tons a year? At present we contemplate a traffic of 200,000 tons of ore per annum with its fluxes.
3866. Which means how many tons for smelting one ton of ore? I think 3 tons.
3867. Where are your 2,000,000 tons of coal? There would be a great local use of coal, and ships going away would take coal. The coal, ores, and other merchandise would create a traffic of about 2,000,000 tons.
3868. It will be ore, coal, and merchandise? Yes: 30 per cent. of the ore will go back in the form of bullion, and the shipping would create roughly a market for about 2,000,000 tons of coal.
3869. Do you know that with all the shipping facilities which they possess at Newcastle the export of coal has sometimes been less than 3,000,000 tons a year? During the last five years the total did not average 2,250,000 tons a year; it only reached 3,000,000 tons once or twice.
3870. Then how is it possible for you to do a trade to the extent of 2,000,000 tons of coal, seeing that Bellambi and Port Kembla will have their own wharfs? Of course at those places there will always be a certain amount of shipping.
3871. Where will you get your trade? Our idea is, that with facilities for the shipment of coal of the Upper Wollongong type it would give a great impetus to the trade, and that the trade can be encouraged by the means that we are endeavouring to take to become purchasers of ballast or cheap ore from South America. We should be prepared to buy cheap ore at ballast prices. Newcastle has done nothing to bid for a ballast trade. Take our lowest limit, 600,000 tons per annum. Such a trade might be carried on with a still-water harbour, with the coal a trifle under Newcastle prices. Under the old union rates some years ago, there was a fixed price of 2s. a ton in favour of Illawarra coal always, seeing that it was 4s. 3d. in Newcastle, and only 2s. 2d. in Illawarra, for hewing. The coal could always be got at a percentage less than the Newcastle coal, and with a still-water harbour, and with a ballast trade the business must assume very considerable proportions. It would be absolutely impossible to fix our estimate until our preparations have further progressed.
3872. You were here when the great proportion of evidence was given by the other witnesses? Yes.
3873. How much did you pay for the Illawarra land estate? £65,000.
3874. When did you pay for it? It was bought on long terms; the first payment was made in 1888.
3875. Did you fulfil the agreement? Yes.
3876. Were you behind the time? We have been behind several times.
3877. Did you not hear a witness say that it took you a long time to raise £40,000? I think I heard some remark of that kind, but I could not understand its meaning.
3878. The meaning was that the company was so impoverished that they could not meet their payments according to the agreement? I think it was Mr. MacCabe who made some remark of that kind. It was not made in answer to any question, and it seemed to me unauthorised, and exceedingly impertinent.
3879. Can you refute the statement? Yes, most emphatically.
3880. Let us hear your statement? We purchased the estate in 1888 or 1889, upon certain terms which have all been complied with.
3881. Did you give the first price they asked? Yes.
3882. That was £65,000? Yes; for the Lakeland estate.
3883. How long after the time agreed upon did you pay for it? We bought the land from some original purchasers, from first vendors. They had some years payments to make. We kept their portion of the contract, and we left a portion of that £60,000 on mortgage.
3884. What was the reason that you did not pay the money at the time agreed upon? We did.
3885. You said that you were behind at times, now you say that the whole agreement was kept? I think I made that remark referring to a trifling matter which does not affect the title to the land.

THURSDAY, 24 DECEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.  
The Hon. JAMES HOSKINS.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
The Hon. DANIEL O'CONNOR.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.  
FRANCIS AUGUSTUS WRIGHT, Esq.  
FRANK FARNELL, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

3886. *Chairman.*] Since being here you have had an opportunity of looking further into the question of the connection between the southern coast line and Port Kembla? I have had another connection inquired into with the present station at Wollongong.

H. Deane,  
Esq.

24 Dec., 1896.

3887. You might tell the Committee the position of the two lines? I have a plan here.

3888. You are going to describe the routes considered as rival routes? Yes. The map shows two lines on which levels have been taken. The coast line is shown starting round by the gaol, passing by the back of the racecourse, and out to Port Kembla; and there is another connecting line which leaves Wollongong station at the southern end, crossing the head of Tom Thumb Lagoon, and joining the other line at the back of the racecourse.

3889. The lines become virtually the same north of the Tom Thumb Lagoon? Yes.

3890. We are going to consider the question of alternative lines, and therefore you will not go further from the north of the Tom Thumb Lagoon? No. The line starting from Wollongong is practically a level line. The line starting from the south end of the Wollongong station has a down grade of 1 in 75, but it is with the load, and that would not matter.

3891. As far as grades are concerned they are equal? Yes; because the grade of 1 in 75 is not against the load. As regards the grade before the traffic comes on to the new line, there is a grade of 1 in 75, as I have already pointed out, rising towards the Wollongong station. I find on further inquiry that there are grades on the Wollongong and port connection, which amount practically to a ruling grade of 1 in 80; so it is not very much better. As regards expense, I find that this being a single line the expense will be about the same, whether you go along the coast round by the gaol or cut across from the station. But if you make a double line the expense will be about £1,300 less starting from the southern end of the station, because you save on the length of the line a certain amount of permanent way. I think these are the principal points.

3892. There is an up grade on the Keira line, which balances the up grade on the main southern line? Very nearly.

3893. Would it be a very difficult thing to cut that out? No; it could be easily cut out. It would be easier to cut that grade out than the one on the main line.

3894. Would there be much difference in cost? I do not think there would be very much difference. I worked out the cost of altering the main line; it would come to about £1,600, and the other line would be a little less.

3895. Whatever line were constructed, the cost of haulage would be the same? I think it would be practically the same.

3896. How do they compare in regard to length? The line via Wollongong station is shorter than the other.

3897. How much shorter? Forty-five chains.

3898. Then what would the difference be between the cost of the two? About £1,300 for a double line.

3899. Which is the more expensive? The longer line is the more expensive. The coast line is more expensive for a double line, but for a single line about the same.

3900. Then we may regard the cost of the two lines as being approximately the same? For all practical purposes.

3901. Is there anything further from an engineering standpoint that you desire to say with reference to a comparison? No; they are both good lines. It has been pointed out to me that the sand is likely to be troublesome at Wollongong; but I have inquired into that, and I do not think it will. I think, as regards the question of recommending one or other of these two lines, the Committee could recommend either of them without any fear.

3902. Is this the state of things: that the line by the coast is 45 chains longer than the other, but the cost of construction is practically the same—that the cost of hauling will be practically the same, *plus*, of course, the extra half mile? Yes.

3903. That line joins the ports, but it is beset with some little danger because of the sand? No, I do not think there is any danger at all; but there may be some trouble as regards maintenance.

3904. There may be some little annoyance because of the sand? There may be a little annoyance.

3905. It has the advantage, however, of joining the two ports? Yes.

3906. The other line passing through the station has the disadvantage of bringing the whole of the coal traffic through the station, whilst the other one would have the disadvantage of bringing it through the town? Yes; I am not sure that there is any disadvantage in bringing the traffic through the station. It might be convenient to have the marking of the trucks under the control of the station clerk.

3907. You say, then, that going to the station may possibly be of some advantage? Yes; it requires very careful consideration. I think that either of them may be looked upon as an unobjectionable scheme.

3908. A little while ago you desired to amend your scheme? I find that the estimate ought to be increased, in consequence of the greater amount of traffic anticipated. It ought to be a strong permanent-way, stronger than that of the present Mount Keira line.

3909.

- H. Deane, Esq.  
24 Dec., 1896.
3909. How much do you propose to increase your estimate in providing for extra stability? I think it was put down roughly at about £22,000. I propose to add some junction sidings and extra sidings at the port, as suggested by the Committee; that should go into the estimate. I put the whole estimate down at £30,000 for a double line.
3910. *Mr. Lee.*] That includes everything? Yes, which the previous estimate did not—it was only for a connecting line.
3911. *Chairman.*] You are speaking now of a single line with loops? No; a double line.
3912. Does that deal pretty well with the case from Wollongong? The length of the new line is 4 miles 73 chains along the coast. The length of the other is 3 miles 68 chains. The difference I gave you was the difference in the total length running over the old lines. The difference in construction on the new lines is 35 chains, the difference in the total running being 45 chains.
3913. Have you a tabulated form showing the length from the intersection of the approaches to the coal-mines from the various ports? Yes, I have had that got out. I have a table here showing the distance to the ports from the intersection to the colliery tramway with the main south coast railway (*vide Appendix*). I have also a table here showing the distances from the pit's mouth to the ports (*vide Appendix*).
3914. *Mr. Hoskins.*] What would be the gain or loss to the proprietors of the Bellambi or Mount Keira coal mines in taking their coal to Port Kembla by your deviation, as against the distance they would have to travel under the present state of things? The difference is given in the table. The difference from the Bellambi mine to the port is 1 mile; the distance to Wollongong is 5 miles 16 chains; the distance to Port Kembla *via* Wollongong, 8 miles 62 chains.
3915. My reason for asking you the question is to see whether the proprietors of the coal-mines would be likely to object to having their coal taken so far by the deviations, instead of by the existing route? They would, of course, have the advantage of a safe port—a port which they could always use.
3916. The distance by your deviation would be less? It would be less than going round by the southern colliery.
3917. How much? About 1½ mile.
3918. *Mr. Wright.*] Will it be less than by the present Mount Kembla line? Yes, about 1½ mile less.
3919. *Chairman.*] The reason why you propose to construct another line *via* the Tom Thumb Lagoon is that the line going to Unanderra, then turning south-easterly, is considerably longer? Yes.
3920. How much? It is over a mile and a half by the longest route.
3921. Will you put that in your statement? Yes.

TUESDAY, 12 JANUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

THE HON. FREDERICK THOMAS HUMPHREY.	}	CHARLES ALFRED LEE, Esq.
THE HON. JAMES HOSKINS.		JOHN LIONEL PEGAN, Esq.
THE HON. CHARLES JAMES ROBERTS, C.M.G.		THOMAS HENRY HASSALL, Esq.
THE HON. DANIEL O'CONNOR.		GEORGE BLACK, Esq.
HENRY CLARKE, Esq.		FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

William Andrews, Esq. (Messrs. W. W. Billyard, Andrews, and Moseley, Solicitors), sworn, and examined:—

- W. Andrews, Esq.  
12 Jan., 1897.
3922. *Chairman.*] You represent the firm of W. W. Billyard, Andrews, and Moseley, solicitors? Yes.
3923. We were informed by Mr. Armstrong that you could give some definite information with regard to an enterprise on the south coast with which he is intimately connected,—have you any information with regard to the formation of the Illawarra Harbour and Land Company? I have no information in connection with the formation of the company except some agreements.
3924. Do you know the history of the company? I do not.
3925. What is the nature of the agreements? The first agreement is an agreement for the sale from Mr. T. A. De Wolf to Mr. Armstrong and Mr. Thompson.
3926. Nothing prior to that? No.
3927. Have you the agreement here? I have. The title deeds of the company are not in my possession; they are in the possession of Mr. Amos, the mortgagee. The document which I have here is a sale from Mr. De Wolf to Messrs. Thompson and Armstrong for £240,000 of what is called Lakeland estate, and then some land, 265 acres, known as the ocean collieries.
3928. And the history of it prior to that you know nothing about? I know that the Lakeland estate was originally sold to a syndicate for £40,000. From that syndicate Mr. Simpson, solicitor, of the firm of Johnson, Minter, and Simpson, was purchaser. They subsequently sold the estate to Mr. De Wolf for £65,000. As to the land on the hills, that I have been informed cost about £25,000.
3929. Did that comprise the whole asset in the sale eventually by Mr. De Wolf to Mr. Armstrong? That and the concessions under the Bill.
3930. Have you any history of the case subsequent to that? I have a copy of an agreement by which Mr. Armstrong and Mr. Thompson sold to Mr. Newton and Mr. Orr as trustees of the proposed company. The consideration of that sale was £700,000.
3931. The same asset there again? The same asset again. Then there is a copy of a subsequent agreement between Mr. Thompson and Mr. Armstrong and Mr. Newton, Mr. Orr, and the company, whereby the consideration money was reduced to £600,000.
3932. Is that the position now? Yes, that is the position now.
3933. And the legal documents sustain those three steps? Yes.

Cecil West Darley, Esq., Engineer-in-Chief for Public Works, sworn, and further examined:—

3934. *Chairman.*] You have had an opportunity of seeing the evidence given by the engineer of the C. W. Darley, Illawarra Lake scheme? I have. Esq.

3935. You have had also an opportunity of further investigating the question of a deposit of suitable stone at Port Kembla? Yes. 12 Jan., 1897.

3936. *Mr. Hoskins.*] A witness who was examined before the Committee, and who was opposed to the proposal to construct a harbour at Port Kembla, stated that the seas at Port Kembla during north-easterly gales are so heavy that the breakwater, if erected there, would be carried away. That witness mentioned the breakwater at Colombo, which, he said, had cost £900,000 to repair. Do you believe anything approaching £900,000 has had to be expended in repairing the breakwater at Colombo? No; nothing like it.

3937. Did it originally cost so much as that? I could not say exactly what the cost was. I should think it was something approaching that.

3938. The witness said that the seas at Port Kembla would wash away any breakwater,—are not the seas at Colombo as big as any seas on the coast of Australia? When the monsoon breaks they will get a heavier sea at Colombo than we get here; but the two works cannot be compared. Perhaps I might explain the main difference between them. The proposal at Port Kembla is to make a breakwater of blocks of stone. The sea in approaching a breakwater of that class is torn up. It is disintegrated. It goes into the interstices of the stone and it has not the power to rise over the breakwater to any destructive extent. At Colombo the breakwater is built like a wall. The sea cannot get into it and it must go over, and the whole wave goes over. I have stood at the end of the Newcastle breakwater, which is, undoubtedly, in a no less exposed position than Port Kembla, when there was a heavy gale, and nothing but spray came over. Occasionally a big sea would give one a sousing; but no such thing as a very heavy body of water ever goes over the Newcastle breakwater.

3939. Still there were stones displaced? They were drawn down. They are tipped to a steep slope and they are drawn down and the head is drawn out. I have seen a large sea approaching the breakwater, apparently higher than my head, and if I had not known what was going to happen I should have run several hundred feet in from the point, but the sea did not go over the breakwater.

3940. Then the end of the southern breakwater at Newcastle during a heavy gale would be more exposed to a heavy sea than the proposed breakwater at Port Kembla? Port Kembla will be no more exposed than Newcastle, though I do not say it will be any less. It will have a considerable amount of shelter from the Islands.

3941. There is a considerable amount of shelter from the Five Islands at Port Kembla which does not exist at Newcastle? Yes. And we have another case of a breakwater in a still more exposed position—the breakwater at Trial Bay, which is right out in the ocean, where there is no shelter whatever.

3942. How far has that been carried out? About 560 feet.

3943. Is that composed of blocks of stone? Blocks of granite.

3944. What is the width of that breakwater at its base? It varies according to depth. We work from the top. The top is 17 feet wide, and it is 18 feet above high water.

3945. I understand that the proposed eastern breakwater at Port Kembla is to be 170 feet wide at the base? It will be at some parts. The width is greater where you have to go deeper. Where the water is 60 feet deep, the width will be considerably more than that.

3946. Has any serious injury resulted to the breakwater at Trial Bay during heavy gales? Not since we have raised it up to its present height. Originally it was only 12 feet above high water. Then the seas used to come over, and they did a considerable amount of harm. I had the works raised to a height of 18 feet above high water, and we have never had a sea over it since. It is a great saving in time, because men can work on a high breakwater when they could not possibly work on a low breakwater.

3947. In the event of the Committee reporting in favour of the construction of the breakwaters at Port Kembla, and Parliament sanctioning the scheme, how soon would the Department be able to commence the work? If it was an ordinary case we could commence very soon. But there are a great many difficulties to be overcome in this particular case. Resumptions have to be made, and there have to be negotiations for the purchase of railways. We should have to extinguish existing rights, and do other things which would cause delay.

3948. How soon could the Department commence the work if those difficulties were removed? They could start at once with the opening up of the quarry.

3949. Mr. Vickery says that every 20 yards of breakwater that is constructed would make a great improvement in the harbour? There is nothing to prevent the work from being commenced within a fortnight of our getting authority to commence.

3950. It has been suggested that there should be only one breakwater;—do you think that one would be sufficient to make tolerably secure anchorage for vessels in rough weather? It would be quite sufficient shelter for ships receiving coal; but if sailing ships are to go there, they must carry ballast, and it will not be an easy matter to land ballast alongside a wharf with the shelter afforded by only one breakwater. There must be a certain amount of sand into the harbour from the north beach. For landing ballast or cargo you must have cranes on the wharf, and if a crane is lifting 4 or 5 tons whilst the ship is jumping a great deal of damage may be done. If that harbour is to be used for landing cargo the northern breakwater must be constructed, and it will be used for discharging, because sailing vessels must come in ballast.

3951. If only one breakwater was constructed steamships could take coal at any time? Yes.

3952. Do you think that the breakwater would sufficiently protect the port from north-easterly gales to enable vessels to lie there? I think that vessels could safely lie there with one breakwater by hauling off to an anchorage. There is not so great weight in a north-easterly gale as there is in a southerly.

3953. The north-easterly gales are the worst they have to contend with? Yes. The port is open directly to the north-east.

3954. On a former occasion you were understood to say that you did not think that two important works for the improvement of harbour accommodation on the southern coast should be going on at the same time, meaning the Lake Illawarra work and the proposed improvements at Port Kembla. Did I interpret your meaning aright? You did. I think there is nothing to justify the construction of two harbours so close together.

- C. W. Darley, Esq.  
12 Jan., 1897.
3955. Have you seen the place where they propose to make the harbour at Lake Illawarra? I have been there two or three times.
3956. Have they made much progress with the work? They have only just started a connecting wall.
3957. How long do you think it would take to carry out the proposed works at Lake Illawarra? I do not think they could possibly be done under two years. That would be very smart work. I should say three years under ordinary circumstances.
3958. The works which the so-called company propose to carry out at Lake Illawarra would probably take three years, and certainly two. They would have to be pushed forward with very great energy to carry it out in two years. Three years is a fair estimate.
3959. That is judging by the amount of work they have carried out at present? No. Judging by that it would take them twenty years. You would have to work with considerable energy to complete the undertaking in three years.
3960. How long do you think it would take you if you commenced without delay to carry out the proposed works at Port Kembla. To complete the eastern breakwater I think it would take about six years.
3961. Is that for the completion of the whole of your scheme? No, that is only the eastern breakwater.
3962. Could you in two or three years make such an improvement in the harbour at Port Kembla as to enable vessels to enter the port with greater safety than at present? In two years a considerable amount of shelter would be afforded; very nearly half the work would be done. The first half would be done much more quickly than the other half, because the first half would be in shallow water.
3963. Then in two years you would expect to give largely increased accommodation for shipping at Port Kembla? Certainly.
3964. *Mr. Humphery.*] In reply to a question on the 29th October last you said that if the Lake Illawarra scheme were carried out it would be impossible for any other scheme to pay expenses, and that there would be nothing to justify the Government in opening another harbour. Do you think that this scheme should be started before the time has expired within which the Lake Illawarra scheme might be proceeded with? The Illawarra Harbour and Land Corporation have only two years within which to complete their works.
3965. They state that they have let a contract, and that contract will be proceeded with shortly. With that evidence before the Committee, do you desire to express any opinion as to the time when this proposal to construct a breakwater at Port Kembla should be proceeded with? My own opinion is that it is impossible to carry out the works at Lake Illawarra in two years. I know the rate at which such work can be done, and I say that it is impossible to finish it within two years.
3966. You said that in your opinion a fair time to allow for the completion of the works would be three years? That would require a great amount of energy.
3967. We have been told that the contract has been let, and that the work will be proceeded with very speedily. Unless it is proceeded with, a deposit of £10,000 must be made at the Treasury on the 20th December next. Assuming that the projectors have a *bona fide* intention to go on with the work, and in view of the evidence which you have already given, would it be desirable to proceed with the proposed work at Port Kembla before the time has expired within which the Illawarra works must be carried out? I do not think that it will be necessary to wait much longer. It will be six months before this project can come before Parliament, and we know that if the work is not started by then it cannot be done. According to the Act the work must be completed by the 20th December, 1898. It was originally 1897, but they got an extension of one year. On the 20th December, 1897, if the works are not completed they must deposit £10,000, and they get one year's grace.
3968. Until the expiration of that time would it be wise to proceed with the proposed works at Port Kembla? They must complete the work or forfeit their £10,000. In another six months we should know definitely what they are going to do. They will then have only eighteen months within which to finish the work, and we know that it would be impossible for them to do it in that time.
3969. In view of that, do you advise that it should be made a condition in connection with any recommendation which this Committee should make that the works should be delayed until a certain date so as to ascertain whether there is any probability of the Illawarra scheme being carried out? I would advise the Committee to make it a condition that unless the works at the Illawarra Harbour are being very vigorously proceeded with on the 1st July next and have been for some time before, that the Act should be looked upon as lost and that Parliament is free to take any action it may think proper.
3970. Why do you fix the 1st July? Because that would only leave eighteen months.
3971. Until the time has expired within which the deposit must be made it would be impossible to know whether the company intends to proceed with its works? I think it is a legal question. The question is perhaps whether the deposit of the £10,000 will allow them to complete the works when they like. What I say is that the works must be completed by December, 1898, and that if they are not the Act is null and void and that the company lose everything that they had done. I say it is impossible to complete the work in two years and, so far as the Government is concerned, it could safely commence the works at Port Kembla to-morrow.
3972. Except in view of the dilemma created by your evidence of the 29th October, in which you say that it is undesirable to have two harbours so close together? I have repeated that this afternoon.
3973. You are still of opinion that if the Illawarra scheme is carried out it will be undesirable to proceed with the proposed harbour at Port Kembla? It certainly could not be made a financial success.
3974. Have you read the figures of the engineer of the company as to the probable cost of carrying out the works at Lake Illawarra? Yes.
3975. Are you prepared to express any opinion as to the possibility of the works being completed so as to allow the entrance of vessels with a draught of 25 feet at the cost mentioned? I do not think so.
3976. What period would be necessary to carry out a scheme to make a harbour which would admit vessels of 25 feet draught assuming the work to be vigorously proceeded with? I said the work could be done in three years, but I know that the Government would not do it in three years. I wish to give the company the full benefit of the doubt but the work could not be done in three years.
3977. Regarding this as a Government work what period would you allow for completion? Six or seven years.
3978. And from the same point of view what provision in your opinion would be necessary to cover the cost? My estimate is £288,570.

3979. For that expenditure you are of opinion that you could provide a good harbour with a safe entrance at Lake Illawarra? That would open a 25-ft. entrance. C. W. Darley, Esq.
3980. Your estimate for Port Kembla, including the northern breakwater, would amount to about the same sum? £250,000. 12 Jan., 1897.
3981. But the total cost of the work at Port Kembla would be about £410,000? That is for wharfs, cranes, lighthouse, pilot station, &c.
3982. Would the £258,000 for Lake Illawarra cover works of a description similar to those contemplated at Port Kembla? I have put down nothing for a lighthouse at Lake Illawarra, and I have taken the company's estimates for jetties, drift fences, shoots, gear, cranes, and so on. I have simply altered the quantity according to what my own experience shows me the quantities should be, and I have put in my own price.
3983. Would the £258,000 be by way of comparison with £140,000 or with £270,000, the cost of two breakwaters? I could knock off £14,000 to make a comparison between the breakwaters of the two schemes.
3984. That is, that the expenditure at Port Kembla would be £430,000 as against £280,000 at Lake Illawarra? Taking similar works at the two places, the cost at Lake Illawarra would be about £273,000 as against £280,000 at Port Kembla.
3985. If you compare the two ports as affording facilities for loading and discharging, would the comparison be favourable to Port Kembla? Undoubtedly.
3986. Will you state in what respect the harbour at Port Kembla would present advantages over Lake Illawarra? There would be no dredging at Port Kembla, and there would be very little cost of maintenance. To maintain a proper depth in Lake Illawarra they will have to be dredging for many years to come.
3987. Therefore the cost of maintenance would be very much greater at Lake Illawarra than at Port Kembla? Very much greater.
3988. Would that mean a heavier charge upon the shipping at Lake Illawarra than at Port Kembla? I think so.
3989. Would the cost be heavier to the colliery proprietors and to the shipowners to transact their business at Port Kembla than to transact it at Lake Illawarra? I think Lake Illawarra would necessarily involve the heaviest charges upon the shipping.
3990. That would be to cover the interest and the cost of annual maintenance? Yes.
3991. Therefore, assuming that the two ports afford equal facilities, the more economical for shipowners would be Port Kembla? Undoubtedly.
3992. Is that your opinion? That is my opinion.
3993. *Mr. Lee.*] If this Illawarra Harbour scheme were carried out according to the terms of the Act, do you think it would afford proper facilities for carrying on the coal trade of the southern coast? It could be made suitable with sufficient expenditure. It would want a large amount of dredging to deepen the channel. It is possible to make it a good harbour.
3994. But there would have to be a large expenditure? In my opinion it would involve a larger expenditure than Port Kembla.
3995. A much larger expenditure to provide accommodation for the class of ships that are required to conduct the trade for the south coast; but the Act only requires them to make a channel a depth of 16 feet? The Act only requires a depth of 16 feet, but that would be of very little use.
3996. Do you think it reasonable to expect that the harbour of Lake Illawarra will ever be so improved as to permit the free ingress of the large ships that will be used in the trade? I do not think it will. It is quite possible with a large expenditure to make Lake Illawarra a suitable harbour for ships of 25 feet draught.
3997. Would not that expenditure be largely in excess of the amount stated by the company's engineer? It would undoubtedly be largely in excess of the estimate.
3998. Would it not be more than double? I think so. So as to be fair I have taken the estimates out in five different ways. I do not think that Lake Illawarra could ever be called as good a harbour as Port Kembla. I do not think that shipmasters would like taking it so well. There will be a distance of something like 2 miles to go across Lake Illawarra from the entrance to the shipping wharf, and when a ship is towing during a southerly or northerly wind she would very likely be rubbing on the sand all the way; she would be blown to one side of the channel. That is certainly an objectionable feature unless the channel is made very much wider than they contemplate. To tow a ship 2 miles along a channel of 100 feet in width with a strong wind broadside on would be a serious thing.
3999. If the breakwaters were made, would there not be a difficulty in keeping the entrance free? The breakwaters must be maintained.
4000. Would there be a sufficient scour to keep the outer portion free from sand? There might be some trouble outside through a bar of sand forming from the concentrated current into the ocean. There will be a considerable rush with each tide, and where the water discharges into the ocean the current is lost, silt is precipitated and it forms a bar which causes considerable trouble.
4001. I think, when you were asked (Question 48) on a former occasion, you said it would not be justifiable to make two harbours so close together on the south coast. Did you not intend to convey the idea that if the Illawarra Company were to construct a harbour of sufficient size for the coal trade there would be no occasion for the Government to make a harbour at Port Kembla? That is what I have always stated. There would be no justification for the Government to make a harbour if the company would make one.
4002. It was in October when you made that statement. Are you of opinion that the company is taking steps to carry out the proposed works in such a way as to allow shipping to be carried on there? The company has done nothing since.
4003. Are you of opinion that, so far as the coal trade is concerned, if they want to secure it they will have to deepen the harbour to at least 25 feet? They will want to dredge to a depth of 27 or 28 feet. Ships will not enter a harbour where they will be rubbing on the bottom.
4004. Are you prepared to assure the Committee that, unless the Illawarra Company construct a harbour with a mean depth of 27 feet, they will not be able to carry on the coal trade of the southern coast as it ought to be carried out? Not as it ought to be carried on.
4005. You are perfectly satisfied that the conditions for carrying on shipping in large bottoms exist about Port Kembla? Yes. 4006.

C. W. Darley, Esq.  
12 Jan., 1897.

4006. A question as to the site has arisen since you gave evidence on a former occasion. We have been told by one witness that Bellambi would be a more suitable position for a harbour than Port Kembla. Do you think it possible that with the same expenditure Bellambi Bay could be converted into as safe a harbour as Port Kembla? No; I have already given evidence that in my opinion Port Kembla would be the safest harbour.

4007. You have no reason to alter your opinion on that point? None whatever.

4008. *Mr. Wright.*] We have had a good deal of evidence from shipmasters in reference to the breakwater, and we have been told that if the end was bent more towards the coast it would afford more shelter? I studied that very much in preparing the designs, and you must consider that breakwater as a portion of the whole. It will not do to construct the harbour in such a way as to render it impossible to make the northern breakwater in the future. The northern breakwater must be constructed. It will not do to push the entrance further down towards the beach than I have put it. Shipmasters do not like to take their vessels close to the beach to get into the harbour. They prefer to keep off the land.

4009. Do you think it is in the best position now? Yes.

4010. What is the distance from the point of the breakwater to the beach? 3,000 feet.

4011. That is close enough to put it? If you are near the shore and the ship became unmanageable she would be on shore in no time.

4012. There is another aspect of the question that is mentioned, and it was that by making the breakwater with a bigger bow it would give greater resistance to the sea? That would not affect it at all.

4013. There is nothing to be gained by it? On the contrary, it will increase the risk by pushing the vessels down near the beach.

4014. What is the size of the breakwater at its base in the deepest part? You have to calculate from the top. It is 20 feet wide at the top and the batter is about  $1\frac{1}{2}$  to 1 on the three faces at the sea end. At that point it would be about 214 feet wide at the base.

4015. Roughly speaking, it will be from 116 to 200 feet at the extreme length? Yes.

4016. You think that is sufficient to resist the impact of the sea? Quite sufficient.

4017. The great force of the blow is 10 feet below the surface? No, just below the water mark.

4018. You think that from 16 to 20 feet is wide enough at the top? Yes; at the outer end we always widen it.

4019. You know Mr. Amos? I do.

4020. Have you noticed the evidence of Mr. Henderson, the engineer? Yes.

4021. Have you looked over the quantities which he gives for the work? I think the quantities are under-estimated.

4022. I suppose there is no question about the prices being correct? We must accept them.

4023. They are considerably less than your own prices for Port Kembla? Seeing that the stone is on the spot the work could be done for those prices; but I can see a difficulty in construction. Unless you can get the stone across from the southern side, before you open the entrance, it will have to be punted across, or a bridge will have to be made to take it across. There is nothing in the estimate for that.

4024. A witness has sworn that Amos has entered into this contract? Yes; but I know that the work could not be done for those quantities. He would simply go on at schedule prices.

4025. Your estimate for material for Port Kembla breakwater is 5s. per cubic yard, is it not? I put down 5s., but subsequently reduced it on account of finding the stone close at hand.

4026. So that instead of understating you have slightly overstated the charge? There are contingencies to be allowed for. It can be done for the price I named.

4027. It might be done for less? It might be.

4028. Can you tell us how much you think these quantities are under-estimated for the northern and southern breakwaters at Lake Illawarra? In the case of the northern breakwater the company estimate for 139,000 tons of stone. To construct that in a substantial manner I think it would require 261,000 tons of stone. The company's estimate for the southern breakwater is 153,000 tons of stone. I make it 248,000 tons of stone.

4029. Have you taken into consideration the fact that they get a large measure of protection from Windang Island? Yes.

4030. And that therefore their works need not be so strong as they would have to be if they were not protected from the ocean? It is not protected from the east.

4031. Do not the two points afford considerable protection from the south-east and north-east gales? There is no protection from the easterly gales.

4032. Easterly gales are not very common? They are very destructive when they do come.

4033. You do not think that those points give very much protection? A certain protection in light weather.

4034. Looking at it from a marine engineer's standpoint would anyone propose to construct a breakwater at Lake Illawarra of lighter and less bulky material than would have to be used at Port Kembla? No.

4035. You think that material of equal stability would be required in both cases? Yes.

4036. Therefore, you think that the works proposed at Illawarra will not be strong enough for the purpose intended? They may be strong enough. I do not know how the quantities are taken out. You must allow for the scour, and you must get to the bottom of that scour.

WEDNESDAY, 13 JANUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
 The Hon. JAMES HOSKINS.  
 The Hon. CHARLES JAMES ROBERTS, C.M.G.  
 The Hon. DANIEL O'CONNOR.  
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
 JOHN LIONEL FEGAN, Esq.  
 THOMAS HENRY HASSALL, Esq.  
 GEORGE BLACK, Esq.  
 FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

John Evans, Esq., Mining Engineer, Bulli, sworn, and examined:—

4037. *Chairman.*] What are you? A mining engineer.4038. *Mr. Humphery.*] Are you at present connected with any colliery on the south coast? Only as mining engineer.

4039. In connection with what colliery? The Bulli mine.

4040. Is that mine owned by Mr. Adams? Yes.

4041. You have expressed a desire to give evidence in connection with the proposal now before the Committee? Yes.

4042. Have you prepared a statement? I have some evidence which I desire to give. In the first place, I do not think it is necessary for me to bring under your notice the necessity for a harbour on the south coast. In my capacity as a mining manager, and having a full knowledge of the coal measures in the district, I think it incumbent upon me to offer evidence that might help you to come to a conclusion as to where to put that harbour to the best advantage of all concerned. I should like to say a few words with reference to the existing collieries. You are aware that a seam of coal already being worked in the Illawarra district is No. 1 top seam of the coal measures which lie between Mount Kembla on the south and Clifton on the north. At Mount Kembla the coal is about 600 feet above the sea; at Clifton it is at the sea level. There is no other seam which has been proved to be of marketable quality but the one that I have mentioned. Several attempts have been made to develop the lower measures, but they have not been found to be of much value. That territory now comprises some eight or nine collieries, some of which have been in existence for periods of something like thirty years, and working as they do upon the outcrop of the coal seams their workings have extended very considerably into the mountains, some of them about 2 miles. Some of them have exhausted the coal over large areas, hundreds of acres. Some of the mines are in a chronic state of consumption; others are actually in the throes of death; and some are already dead. Therefore, a harbour anywhere between Port Kembla on the south and Clifton on the north, would, in my opinion, not be required. It would not be a desirable thing to place a harbour at the northern end of that particular coal-seam. Between West Bellambi and South Clifton there is a distance of about 7 miles, and the whole of the coal there is of a very questionable character as regards quality; it is inferior coal.

4043. I suppose you mean from South Clifton to the north? No, from South Clifton to Bulli. That is a distance of about 7 miles. It has cost about £250,000 to prove it, and it is of no use with the exception of the Bulli Colliery. There is very little hope of any development in that quarter.

4044. *Chairman.*] Is that from the Woonona mine to South Clifton? Yes.

4045. *Mr. Humphery.*] You omitted Clifton from your statement? Clifton is north of South Clifton. The Woonona mine is due west of Bellambi Bay, and south of the Bulli railway station, midway between the railway station and Bellambi Point. The whole of that territory from South Clifton down to Woonona, exclusive of South Clifton but inclusive of Woonona, is useless.

4046. What is it north of South Clifton? You get there a seam of coal about 6 feet thick. That extends as far as Stanwell Park. Bores which have been put down at Stanwell Park prove the existence of burnt coal there.

4047. Who are the owners of the property? I think the North Illawarra Coal Company.

4048. How many miles of good coal are north of Coalcliff? Three miles north of Clifton. I think the first bore got us into coal. I suppose about 3½ miles north of Clifton is where the coal was burnt.

4049. Are you satisfied from your knowledge that marketable coal can be obtained north of Coalcliff? Yes, to within 3 or 4 miles.

4050. *Chairman.*] Do you mean that immediately north of Clifton there are 4 miles of coal running parallel with the coast? Yes.

4051. *Mr. Humphery.*] Between Coalcliff and Stanwell Park? Yes, there is a good coal-field there. A bore put down at Otford, further north, was a failure; about Helensburgh I do not want to say anything.

4052. That mine is worked by a shaft, and nearly all the collieries south of Stanwell Park are worked by adits? Yes. Taking into consideration that this vast territory of coal land has been proved a failure, and that the mines there are dismantled and broken up, a very large deduction has to be made from the quantity of coal available from the southern coal-field.

4053. You are not prepared to say that the country south of the Metropolitan coal mine has been explored and proved unfavourable? One bore has been put down, and that was unfavourable.

4054. How does it occur that the Metropolitan mine is now being worked towards Stanwell Park? It does not come to Otford.

4055. What is the distance of Otford from the Metropolitan Company's shaft? I suppose from 1½ to 2 miles.

4056. Are you prepared to say that the Metropolitan Company's seam does not extend any distance? The seam is there.

4057. Your evidence seems to show that the seam is not a marketable coal? There was a bore put down at Otford and it was a failure.

4058. What depth was it? About 1,100 feet.

J. Evans, Esq.  
 13 Jan., 1897.

4059.

- J. Evans, Esq. 4059. Was it supposed to have reached the Metropolitan Company's seam? Yes. At least the first seam they got to they stopped.
- 18 Jan., 1897. 4060. Then you infer that the Metropolitan Company's seam does not extend  $1\frac{1}{2}$  mile southward? It is not good in the direction of the Otford bore.
4061. But it may extend towards the west? Yes.
4062. Your evidence would show that the coal ceases at the Metropolitan Company's mine? I do not mean to say that. All I would say is that the bore at Otford found the seam in a burnt state. What kind of coal there is to the right or the left of the bore it is impossible for anybody to say. The coal does extend to it, but it suffers at that point from the intrusion of volcanic rock into it. The Otford bore was  $1\frac{1}{2}$  mile due south of Helensburgh.
4063. You do not wish it to be inferred that the Metropolitan Company's seam does not extend either south-west or west? No. I do not express an opinion as to what may be to the left of that bore. From my practical observation of those mines I think it would be a fair thing to assume that they cannot continue to work the outcrop of coal in the present way for any very considerable length of time.
4064. Will you say what collieries you refer to? I mean the existing mines at Mount Kembla, Mount Keira, and Mount Pleasant. Two of them are very old mines. Corrimal is a comparatively new one, and South Bulli is a comparatively new one.
4065. You might distinguish those which, in your opinion, will not work for a considerable period from the others? The mines which I do not think will work for a very considerable period, judging from the evidence which we have at present, are the South Clifton, and the mines between South Clifton and Bulli. The longevity of the Bulli mine is questionable, and I put it amongst the doubtful ones. The Woonona mine is practically exhausted. The South Bulli mine will maintain its vitality for a long time to come. Mount Pleasant, Mount Keira, and Mount Kembla have large areas of coal to the west, but they are old mines and they have gone in a considerable distance. If you give these mines about 3 miles to work that is as much as ever they can do. I mean the mines which I have mentioned as good mines, Mount Kembla, Mount Keira, Mount Pleasant, Corrimal, South Bulli, South Clifton, and North Clifton.
4066. Perhaps you had better fix the probable period? That depends upon the output. With reference to the extent of the workings by shaft at present the summit of all that mountain is part of the Sydney water reserve, and no works are allowed to be carried out on the surface; so if the development of the field is to extend westerly some arrangement will have to be made to allow the sinking of shafts and the making of railways on that water reserve. Those mines will come to an end, and the lapse of another quarter of a century will make them very costly mines indeed to work, unless some provision is made to sink shafts on the west, towards Appin. Experience shows that you cannot long continue to work those mines on the present system. The same thing has occurred in England and everywhere else where coal outcrops have been worked; flourishing townships have sprung up, but the workings have afterwards been abandoned.
4067. Do you mean the sinking of shafts for ventilating on the water reserve or to win the coal? To win the coal.
4068. Therefore, the south coast jetties at present in use would be useless in connection with the shafts which you say would have to be sunk on the water reserve? The cost of keeping the mines in repair when you have got 3 miles in would be too great. The selling price of coal would have to be greater than it is now to enable you to do it.
4069. You think that the mines would cease to contribute a return for the proposed works when a distance of 3 miles has been reached? That is if you have to draw the coal in the present way through the tunnels. I do not say that the supply of coal would be exhausted; perhaps arrangements could be made to get certain haulage to bring the coal over the mountain. It would be too expensive to work it 3 miles in, and compete in the markets of the world.
4070. You do not contemplate the coal being brought from the surface down to Kembla or Bellambi? No; but it could be done.
4071. What is the altitude? At Bulli, 1,100 feet to the top of the mountain, and further south it is 2,000 feet. I bring this before you to prove that there is a very considerable amount of coal between these respective properties that I have told you of, South Bulli and Clifton, but no development can be expected from South Kembla. Kembla is the scene of great trouble. There is no top seam or any other that is of very much good. The mine has been abandoned by the Southern Coal Company.
4072. You leave that out of consideration? Yes. As you go down south the land is all Crown land. It is Crown land for miles.
4073. The coal lands south and west from Mount Kembla are Crown lands? Yes, as far as Jamberoo at any rate.
4074. How long will it take to exhaust those particular mines to which you have referred, at their present rate of working? That depends upon the quantity of coal that is worked. If you and I possessed a million of money and wanted to get a seam in the Illawarra district we could not get it. There is no room there for new developments. All the properties are held between Clifton and Kembla except one gap between Kembla and Keira, a property lately bought by the Mount Kembla Company, and formerly belonging to the Great Wollongong Company. Any estimate that may be made as to the probable quantity of coal must be very problematical. Roughly speaking, I should say there are available in the collieries within 3 miles about 100,000,000 tons of coal. South of Mount Kembla, very little has been done by the Government or by private individuals to prove the existence of any workable coal. In fact, up to within the last six months I do not think that one place was driven more than 20 yards from the outcrop. That vast coal-field south of Kembla has been lying unexplored. No serious attempt has been made to do anything. A few capitalists and one or two farmers have put in a hole here and there, and some Government official would come and see the outcrop and probably condemn the whole field as being no good. Since then people have seriously taken into consideration that there does really exist coal of commercial value south of Kembla. I have studied the matter for many years, and I am convinced that there is. I know it has been said by Government officials that there is not good coal south of Kembla, but from my observations and from reports which I have read on those coal-measures I have come to the conclusion that there is something there which will warrant us in building our hopes upon that coal-field, and that we may rely upon its resources. The top seam, that already worked in the existing collieries, does not exist to any considerable distance beyond Mount Kembla. A few miles south of Kembla the seam rapidly thins out and ceases to exist.

4075. So far you concur in the view expressed by Professor David and other witnesses? As far as the top seam is concerned. J. Evans, Esq.

4076. Would you say upon what you base the opinion as to workable coal being found there? Some years ago when I was manager of the Mount Kembla mine before I ever dreamt of the construction of a harbour, I made an examination of the southern coal measures and at that time I sent for analysis a fair sample of a seam known as the fifth seam, in the Macquarie Valley. 13 Jan., 1897.

4077. At the head of the Macquarie Rivulet? Yes.

4078. How many miles distant is it from the coast? I suppose not more than 10 miles as the crow flies.

4079. Would it be south-west of Lake Illawarra? Yes. In the year 1889, I sent some of this coal to the Government for analysis, and they furnished me with a return, in which they stated that the fourth seam was a coal containing 10·85 per cent. of ash; 59·5 of fixed carbon; 26·08 of volatile hydrocarbons; 3·82 of hygroscopic moisture. That analysis was made in the Department of Mines.

4080. Who was the owner at the time you made the test? I do not know.

4081. Were you employed by anyone to examine the seam? I was asked to go and visit the place.

4082. By whom? I went by myself.

4083. You were not employed to make the inspection? No.

4084. Who was the owner of the land upon which you found the coal which you say gave these excellent results? I think a man named Brownlee.

4085. Will you describe the seam to which you refer? I can only say that the coal was taken from the outcrop of a very thick seam. I sent samples of No. 5 seam to the Department and I got the following analysis:—

Hygroscopic moisture ... ..	1·60
Volatile hydrocarbons... ..	21·75
Fixed carbon ... ..	63·98
Ash ... ..	12·66

In the year 1895, that was six years after, I was asked by the parties who visited the property and who intended to go in for a coal-mining scheme, to make a further report upon that property and in consequence of what I advised, the owner developed this seam. I procured samples of the coal in 1895.

4086. Did you examine the seam in 1895? Yes.

4087. What was the thickness of it? The whole thickness at the time of my examination was not proved, but what I advised as being the workable portion was the upper portion of the seam which was 5 ft. 10 in. in thickness with 2 in. of band, then 4 in. of coal, then  $\frac{1}{2}$  in. of band and then coal the thickness of which was never proved.

4088. You say that that is workable coal? Yes. The analysis of that sample gave somewhat better results than the analysis made in 1889. It gave these results:—Ash 11·45 as against 12·67 in 1889, about 1 per cent. less in ash and 1 per cent. better in fixed carbon. On the 23rd November last I obtained samples of coal from the opening into the third seam due west of Lake Illawarra.

4089. *Chairman.*] Is that at the head of Dapto Creek? Yes; exactly due west of Dapto and about 3 miles distant. In November last samples of this coal were sent up to the Department of Mines for analysis by myself and also samples of coke made from coal obtained from that seam. On the 23rd November I got the result of the analysis from Mr. Pittman, which showed that the coal contained 9·25 of ash. Another sample of the upper portion of the seam contained 8·10 of ash.

4090. *Mr. Humphery.*] What was the thickness of the seam from which you took the sample? 6 ft. 2 in.

4091. Workable coal? There were two bands in it.

4092. Of what thickness? One is  $1\frac{1}{2}$  inch and the other is  $\frac{1}{2}$  an inch. The coke manufactured from that coal gave by analysis 14·55 of ash. The coal was got from the outcrop of the seam. What I should like to point out is this. That, according to the analysis, that coal is equal to the best Illawarra coal, and the coke is equal to the best coke manufactured there at the present time. True, the seam is not so clean. I admit that. It contains two bands, whereas the coal in the existing collieries has no bands. But it is an exceptional thing for coal to be without bands. In England, if they were to disregard coal which contained bands, the coal trade of England would be reduced by 50 per cent. There is hardly a colliery at Newcastle that works coal without bands. Some of them have a number of different qualities coming out of the same mine, and they have to separate those different qualities before they can get a market. It does not matter about the bands if the quality of the coal is good. I should be very glad to show anyone where the coal was taken from. To my knowledge there exists south of Kembla for a distance of about 16 miles workable coal not less than 10 feet thick in two seams, that is at least from 5 to 6 feet of this third seam and an equal thickness of the fifth seam or Brownlee's seam. These measures rather improve in quality as you go down south. It has been said that there is no workable coal there, but I find on reference to a book which I have here on the mineral products of New South Wales, dated 1887, by Mr. Mackenzie, the late Examiner of Coal-Fields, a very exhaustive report upon the coal lands of Jamberoo, a few miles south of the Macquarie Rivulet. In his report Mr. Mackenzie enumerates the number of seams of first-class coal, and estimates the quantity at some millions of tons. I should like to bring it under the notice of the Committee that Mr. Mackenzie has expressed the opinion in an official report that there is good coal down there. These things are really to be seen, and I have seen some of them. I can vouch for the truth of the report, and I am of the same opinion as Mr. Mackenzie that there are workable fields of coal in that district. If Mr. Mackenzie's statements are not true his report is about the most wicked tissue of falsehoods ever published by a Government. South of Kembla, and down to Jamberoo, there are 16 miles of undeveloped coal territory taking that as only possessing 10 feet of workable coal, which can be seen by anyone who desires to see it (that is 10 feet of workable coal lying south of Kembla for 16 miles) on the same basis of calculation as I used in regard to the northern collieries that would yield some 250,000,000 tons at the very least.

4093. Within a distance of 3 miles of the outcrop? Yes. I do not want to clash with anybody's opinion. I want to show that we are perfectly safe, as far as the capabilities of the district are concerned, in granting a harbour for the south coast. It would, in my opinion, be an advantage to have the harbour centrally situated, both as regards existing collieries and the future development of the resources of that district.

4094. Will you look at the plan showing the site of the proposed south coast harbour, and then express your opinion on the Government proposal? I have no interest in any scheme; but I think that Lake Illawarra

J. Evans, Esq. Illawarra is about the most central position for a harbour. It is central for existing mines, and central for the development of future mines further south. I am aware that there is some sort of a scheme to make a harbour at the Lake, and that certain persons have got power under an Act of Parliament to make a harbour there. I presume that owing to the non-accomplishment of that work an agitation has arisen to get a harbour at Bellambi. I dismiss that idea from my mind, because Bellambi is too far north, and in the district surrounding it there is no room for development. Therefore, I confine my attention to the question as to whether the harbour should be at Port Kembla or at Lake Illawarra. I am satisfied in my own mind, and I have had considerable experience in the loading of vessels in rough weather, and I have seen the heavy seas on that coast for the last ten years when I was manager of the Kembla mine; and I honestly say that if the money could be obtained to make a harbour, I believe that Lake Illawarra would be the best harbour and the most economical in the long run.

13 Jan., 1897.

4095. You had better consider the proposal before the Committee, and express your opinion upon that, assuming that the Lake Illawarra enterprise should fail? Well, I do not say it is not possible to make a harbour at Port Kembla. I believe it is possible to make a good harbour there; but it is out of the question to talk about making a harbour there with a single breakwater. It is very questionable whether anybody can estimate what it will cost to make that breakwater. You will observe that that breakwater, unlike breakwaters generally, is to be side on to the heavy seas. I have no data to show exactly the wave force at that particular point; but we know that in other countries instances have been known of masses of stone of 130 tons weight being shifted 20 yards and lifted to a height of 10 feet by wave force. What the wave force is there I am not able to say. All I know is that the waves there are very great at times, and this breakwater is to be side on to the seas. At the Lake a breakwater would also have to be made before the entrance could be effective; but it would have the advantage of being end on to the sea, which makes a lot of difference. I am quite convinced that money will make a harbour, and a good one, at Port Kembla, and I know of no place on the coast which has better physical features such as those islands, which protect Kembla more or less. No other place possesses better features for the construction of an artificial harbour. I think it is superior to Wollongong; but it remains for other authorities to say whether it is possible to construct an artificial harbour side on to the sea that will stand the force of the waves. It may stand the force of the waves, but it is very questionable. I have observed that at Wollongong 20 ton blocks of concrete were very small things indeed to the sea, which in an easterly gale threw them about as if they were pebbles. Whether a stone breakwater will stand at Port Kembla is doubtful. My own opinion is that it will not.

4096. Assuming the proposed work to be carried out by the Government will Port Kembla, in your opinion, afford all the facilities which would be afforded by the Lake Illawarra scheme? Yes, that is to say if the scheme is carried out in its entirety. But to put up one breakwater only would offer no inducements to shipping. It has been said that it would offer great inducements, but from my experience of loading vessels there I do not think so. I should say that there are thirty days in any year during which you cannot load under ordinary circumstances. The weather for thirty days is such as to prevent you from loading a big vessel.

4097. The object of these works is to afford facilities for sailing vessels—not steamers? Yes. You could put up one breakwater to break the force of the gale so that you will only lose ten days in the year instead of thirty, because one breakwater would not stop the easterly gales. You would be constructing a breakwater to enable them to utilise twenty more days in the year than you could without it. But I do not think it is possible to construct a single breakwater there that will render it safe for sailing vessels to lie at anchor.

4098. In your opinion in order to have a safe harbour for sailing vessels as well as for steamers it is necessary that the whole scheme should be completed, and that the northern as well as the eastern breakwater should be carried out immediately? Absolutely necessary. Suppose that a maritime strike came upon you! When the last strike took place we had vessels in Sydney harbour waiting three or four months for coal. Supposing that those vessels were at Port Kembla, would you allow the sailing vessels to lie there in that open roadstead. I do not think there is any place in the world offering such an extensive area of sea where vessels could lie for months with impunity protected by a single breakwater.

4099. Then your view is that the harbour is absolutely necessary for the development of the southern coal trade? Yes.

4100. And the proposed harbour at Port Kembla would be in every way suitable if both breakwaters were made? Yes.

4101. And in your opinion Lake Illawarra would be equally suitable if the scheme were carried out to accommodate vessels of equal tonnage to those going into Port Kembla? Yes. I wish you to bear in mind that in my opinion a harbour at Lake Illawarra would be a better harbour in every sense of the word than the artificial harbour proposed to be made at Port Kembla. Supposing that the breakwaters were washed away at Lake Illawarra, no damage could be done, assuming that there was the requisite depth of water in the Lake; but if by chance a terrific storm, such as we saw at Bulli and Bellambi when the jetties there were washed away, should knock down the breakwater at Port Kembla, everyone knows what the result would be to the shipping. I say, from an engineering point of view, that the lake could be made into a good harbour. It is only a question of money, and I believe that that scheme would be a more economical one and a safer one in the long run than the Port Kembla scheme. And I say this, that if there is any possible show of the work being done by private enterprise I believe in giving encouragement to private enterprise. If you believe that the Illawarra Harbour Company are sincere, and that there is a probability of their carrying out this work, it will be really cruel for the Government to carry out this opposition scheme. We do not want two harbours. We want one only, and the best that can be constructed. I think that the Lake Illawarra would be the most suitable place for a harbour. At the same time I do not wish to say anything against the Port Kembla scheme. I believe that at Port Kembla a magnificent harbour can be formed, if it can be made strong enough to resist the waves.

4102. Mr. Clarke.] You have stated that if only the eastern breakwater is made at Port Kembla it would not be a safe port for a large number of ships? I did not put it exactly in that way. I say that a large number of ships can enter, but it would not be a harbour such as the owners of sailing vessels would care, in case of a strike, to allow their vessels to lie in.

4103. Would it be better to have the two breakwaters? Most decidedly; that would make an enclosed harbour.

4104. If that were carried out, would it make a harbour equal to the proposed harbour at Lake Illawarra? *J. Evans, Esq.*  
 Certainly, as long as the breakwaters do not give way. There is no chance of the banks of the lake giving way. *13 Jan., 1897.*
4105. Might not the breakwaters at Lake Illawarra be carried away? Most decidedly, but the result in one case would be quite different from the result in the other. If the breakwater were carried away at Port Kembla, your vessels would be in the open sea. At Lake Illawarra, if the breakwaters were carried away, the vessels would still be in smooth water.
4106. You say that in case of a breakwater giving way at Port Kembla it will be dangerous for the shipping;—would it be any more dangerous than it is now to the large vessels that go there? We want a harbour where sailing vessels can come in and lie. Most of the export trade is done by sailing vessels.
4107. Then the danger in case of the breakwater giving way at Port Kembla would only apply to sailing vessels? Yes.
4108. Would steamers be in a much worse position than they are at present? They would be in a better position.
4109. Steamers go in and out there? They do.
4110. I suppose not at all times? They can go in at all times, except in very rough weather indeed.
4111. Do you think that Lake Illawarra or Port Kembla would be the more central place for the various mines? As far as position goes and as regards haulage when you have the coal in the railway trucks a mile or two is of no importance. One place is about as near as the other to the collieries.
4112. What is your opinion as regards the construction of a breakwater at Bellambi? For the same reasons that I have stated with regard to Port Kembla—a single breakwater would be of no use at Bellambi. There would be no inducement to foreign shipping if you made a single breakwater. I look upon it as a State aid to existing collieries immediately connected with the place.
4113. Then you leave Bellambi out of the question? Yes. A good harbour could be made at Bellambi, but it would necessitate two breakwaters.
4114. Is it probable that coal from the north of Clifton—say, from the Metropolitan Mine—would be shipped at Bellambi? No; I think the coal from the Metropolitan Mine would go to Sydney.
4115. Is the Metropolitan Mine in a central position between Lake Illawarra and Sydney? Yes; being only 27 miles from Sydney, the coal of the Metropolitan Mine would most probably go to Sydney.
4116. I suppose that Wollongong is out of the question? Yes. I think that a far better harbour could be made at Port Kembla than at Wollongong.
4117. Are you of opinion that any of the coal now shipped from various ports south of Clifton would still be sent to Sydney? Yes, no doubt of it.
4118. Could you form any opinion as to the probable quantity? The collieries could not produce more than about 1,500,000 tons to-morrow if they did their best, and I daresay that one-half of that would be sent to Sydney unless it can be shown that the Orient liners, the German liners, and the other big mail steamers could be better supplied down there than at Sydney. No doubt the bulk of the coal used for steaming purposes would have to be sent to Sydney, because the vessels at Sydney can take in cargo and take in coal at the same time.
4119. If there was a good harbour, would they not come to Port Kembla and take their bunkerc coal from there? I do not think it at all likely.
4120. You think it better for these large boats to be supplied by the present means? I think so. I think that the supply of the mail steamers would be carried on the same way as it is now if we had ten harbours on the coast.
4121. Would a quarter of the coal now being raised come to Sydney? I think that half of the coal would come to Sydney.
4122. I think we have it in evidence that a quarter of the coal raised would still come to Sydney? Of course it is a matter of opinion. I think that if vessels can take cargo on board at Sydney and can take in coal at the same time it is more economical for them to do that.
4123. Then a great deal of coal would still be shipped to Sydney, and the balance would be taken away by vessels going to different parts of the world? Yes.
4124. You have stated, and it is contrary to the opinions given by others, that there are payable coal-fields in existence south of Port Kembla? Yes.
4125. Is it good coal? I gave you the analysis which shows that it is equal to any other coal got in that district. I am satisfied that the future developments of the coal trade in the Illawarra district will take place in the south.
4126. *Mr. Lee.*] Have you had much experience in shipping coal? For the last ten years I have been manager of the Bulli and Mount Kembla mines.
4127. And you have had experience of the loading of sailing vessels and steamers? Yes. Invariably when a sailing vessel is loading there is a tug alongside.
4128. I suppose you know something about the development of the coal trade of Newcastle? Yes.
4129. Are you of opinion that it would be wise on the part of the State to construct a harbour, no matter where on the southern coast, for the probable development of the coal trade? I think so, because although Newcastle and the south coast districts do clash, still, generally speaking, there is a difference in the quality of the two kinds of coal. One is essentially a steam coal and the other a house and gas coal.
4130. Therefore you are of opinion that there is a demand in other countries for both classes of coal? Yes.
4131. Is not a large quantity of the Newcastle coal carried in sailing vessels? A very large quantity.
4132. Is it necessary to make such provision on the southern coast as to enable these collieries to compete on the same lines as Newcastle? I think so.
4133. You are aware that the tendency is to carry coal in very large bottoms? Yes. The Bulli Company used to send about 60,000 tons of coal a year to San Francisco. Nearly all of it went in sailing vessels.
4134. You have no doubt that if the southern coal trade is to be properly developed it must be placed in communication with every part of the world by sailing vessels? That is my opinion.
4135. You have already stated that there was no justification for the construction of a harbour between Kembla on the south and Bulli on the north;—where would you construct the harbour? If I were a private capitalist and had the money I would construct one at Lake Illawarra.
4136. But not south of it? No.

- J. Evans, Esq. 4137. Then if it becomes a question of the Government constructing a harbour you think Port Kembla is the best? Of the two schemes, Bellambi and Port Kembla, I think Port Kembla is decidedly the better.
- 13 Jan., 1897. 4138. If the Government undertook to construct a harbour, you think that Port Kembla is decidedly the best place for it? Yes, of those two sites; but Lake Illawarra is preferable to either.
4139. You are very strong in your opinion that sailing vessels would not be able to lie safely at Kembla in the event of only the eastern breakwater being constructed? Yes.
4140. Are you aware that your opinion is at variance with the opinion of a number of shipping masters who have traded there for very many years? That may be.
4141. Have you seen the shipping of coal at Port Kembla? I have; and I have seen vessels there dragging their anchors in great danger.
4142. Steamers? Yes.
4143. In the event of a breakwater being constructed, do you not think there will be room for sailing vessels to lie there in security? No; I do not think so. There would not be sufficient protection.
4144. Notwithstanding the fact that shipmasters who have traded there for years—one of whom has traded there for twenty years—and have taken vessels in in all states of the weather, and have gone in there for anchorage when they could not lie at Bellambi, you still hold that if the breakwater were made vessels could not lie there? I do. You can get men to say anything that pleases them or that pleases somebody else. What I have stated is based upon my own experience and observation. I say that I do not know of any place existing under similar conditions in any part of the world where vessels are allowed to lie. If any shipmaster can tell me where there is such a place upon a coast exposed to the fury of such gales as we have there I shall be glad to hear of it.
4145. Are you aware that your evidence is at variance with that of the engineers? Quite possibly. I have known engineers to say funny things in my time.
4146. Can you give us any reason why we should accept your evidence in preference to that of all these men who have had so much more experience than you? These men have not had experience at this place. They are all speaking from theory. The seas are heavy. We have fearful easterly gales and there is a strong current. I know that for nine months of the year a current sets from the north to the south sweeping with great velocity round those points.
4147. Are you aware that that current does not set into Port Kembla at all? No, I am not aware of that. I think it does. There is another feature in connection with the harbour scheme. Both the engineers and everybody else will find that somebody has blundered somewhere. I know from my experience of Port Kembla that the current shifts immense bodies of sand there and steamers have to dodge those shifting sand banks.
4148. Have you known these to occur at Port Kembla? Yes; and at Bulli and Bellambi. You can see the seas breaking on the sand banks.
4149. You are not confusing the reef of rock at Port Kembla? No.
4150. Are you aware that soundings have been taken at Port Kembla for several years in succession and these occurrences have never been noticed? I am giving you my own observations.
4151. Could you fix the date when any of these things have occurred? I think that if Mr. Artis were to give evidence he could tell you something about it. He has been thirty years in charge of jetties and his duties bring him in contact with the sea.
4152. With reference to the loading of sailing vessels, do you not think the practice likely to be that outward bound ships would discharge at Sydney then go to Port Kembla to take in coal? That would be the practice of sailing vessels cargoed from foreign ports to Sydney.
4153. There must always be a large amount of traffic conducted in coastal collieries for transshipment to ocean-going steamers? Yes; and no doubt big sailing vessels would take in a stiffening of coal at Sydney before going down the coast, supplied by the tug boat from the harbour of destination.
4154. It may be that vessels coming with ore from New Caledonia would run in and fill up with coal? Yes.
4155. All they want is protection to enable them to coal with safety? Yes.
4156. You think the eastern breakwater by itself will not afford that protection? I think it would not.
4157. Do you think that in the interest of the country it will be wise for the Government to refrain from constructing a harbour until it is clearly determined whether the Illawarra Harbour and Land Corporation will construct their proposed harbour? If there is any chance of private enterprise making the harbour by all means let them do it.
4158. Do you know what class of harbour they would have to make to carry on the trade? They would have to make a class of harbour on the lines of that which has been agitated for. It will have to be a deep-water safe harbour with all modern appliances for loading vessels.
4159. What depth of water do you expect they will have to dredge in Lake Illawarra? Thirty feet at the very least.
4160. Would not that involve an enormous expenditure? Not when once the channel was made. It would not be necessary to dredge the whole of the lake. A portion of the area might be dredged and the rest done afterwards.
4161. It must be a process of a great many years? No doubt it will occupy some time.
4162. Having in view the construction of a harbour to conduct the coal trade in big bottoms, which everybody says is necessary, if we are to compete in the open markets successfully? I think from an engineering point of view it is quite easy to make a harbour at Lake Illawarra. It is simply a question of money, and if the harbour was made in a piecemeal way, making room at first for a small number of vessels, ultimately a harbour could be constructed which would provide accommodation for the whole of the British fleet. I think it would be a remunerative undertaking. If money could be got to do the work I have not the slightest doubt that the Lake Illawarra scheme would prove a very acceptable one.
4163. It is an undertaking involving a very large expenditure, one considerably in excess of the contemplated expenditure at Port Kembla? If the Lake Illawarra syndicate cannot make a harbour then you will have to consider whether it will be better to make a harbour at Lake Illawarra or at Port Kembla.
4164. Do you think the Corporation could make a harbour by the end of 1898? No.
4165. *Mr. Fegan.*] You said that your company exported 60,000 tons to San Francisco last year by sailing vessels? No, they formerly did.
4166. How was it shipped? It was taken to Sydney in small steamers.
4167. Therefore no sailing vessels came to the jetty? No.

4168. Another point in your evidence was that in thirty days during the year vessels could not load at Port Kembla? I should say about that. J. Evans, Esq.
4169. Then where are the terrific storms and the great waves? When you build a breakwater you have to build it on the chance of its having to combat the biggest storm ever known there. Twenty-five years ago the Bulli jetty was washed away with forty waggons. About four years ago it was again washed away. We have these violent visitations only occasionally. 13 Jan., 1897.
4170. Has any damage been done down there which would make you believe that the breakwater would not stand? At Wollongong the blocks are tossed about in every shape and form.
4171. But still they are there? They are still there.
4172. Will you tell us what company you reported for in reference to the coal measures down there? I have only reported once upon a property there, and it was one in which I understood Mr. Robert Sands to be interested.
4173. You were employed as an expert—could we have a copy of that report? Yes; I will forward a copy.
4174. Have you had much agitation for a harbour for the southern coal trade? For some years it has been evident that a harbour was required. Hence, the inaugurating of the Wollongong Harbour Trust, which proved a failure.
4175. During the time that you were manager of the Mount Kembla and Bulli Colliery you have not seen very much necessity for greater facilities than you have now for shipping? I have felt, from a business point of view, the terrible drawback to the development and working of mines of having to pay 3s. 6d. a ton for carriage, and then to ship and tranship coal by means of baskets. I have felt the necessity for some accommodation to enable vessels to take the coal direct from the mines to different parts of the world. The cost of transshipping coal alone is a very serious item.
4176. The cost, you say, is 3s. 6d. a ton? At that time it was.
4177. What is it now? I suppose the freights are 2s. 6d. or 3s. a ton.
4178. So the freight has not gone down quite so much as the workman's wages? I do not think it has.
4179. The great contention has been that the southern coal could not compete with the foreign market because the wages were too high; but was it not the freights which had not gone down in comparison with the wages? I do not think they have gone down as low, but still if coal were carried for nothing it is detrimental to have the transhipment.
4180. Every mile of carriage on the railway means greater depreciation? It does; but it is the worst on vessels. The men drop the coal in; then it gets trampled on.
4181. There is a great depreciation in the value of the coal even when it is carried on the railways? Yes.
4182. Therefore, the construction of a harbour at Lake Illawarra means a greater distance for the conveyance of the coal than if the harbour were constructed at Port Kembla? It is 3 or 4 miles further, but that is nothing.
4183. You say that in the southern portion of the district there are 250,000,000 tons of coal, and that in the other part of the district there are 100,000,000 tons of coal, but they are only working the 100,000,000 tons at present? That is so.
4184. Therefore, under these conditions, Port Kembla would be the most central position? Port Kembla and the lake are equally central.
4185. I am speaking about the existing collieries;—Port Kembla is the centre? Yes; it is rather nearer.
4186. If a harbour were constructed in Lake Illawarra would not the owners of the jetties at Port Kembla and Bellambi still use their jetties for the shipment of coal? To some extent no doubt they would.
4187. Do you think the Mount Kembla Company would not keep on shipping? If you make a harbour at Mount Kembla I presume that you have to take over the jetties.
4188. I am not speaking of that. In the event of the Illawarra Harbour and Land Corporation completing the proposed works would that make the Mount Kembla Company and the Southern Coal Company go to the lake to ship their coal? Any colliery that would ship coal at the Kembla harbour would ship coal at the lake most decidedly, if facilities were provided. People are not going to refuse to ship at the lake because it is a lake. They will ship the coal wherever the harbour is.
4189. The Mount Kembla Company has a jetty at Port Kembla? Yes.
4190. In the event of the construction of a harbour, do you think it would give greater facilities to this company than they have at the present time to ship at the lake? Yes.
4191. What would be the facilities? At present, if a 5,000-ton ship wanted coal for San Francisco that coal would have to be brought to Sydney, and put in the vessel here, but if there was a harbour at the lake the vessel would go there, and any southern coal company would load her there.
4192. What is the distance from the Southern Coal Company's mine to the lake? The Southern Coal Company's colliery is about the smallest on the coast. It is at Corrimal, near Bulli.
4193. What is the distance from the colliery to the lake? I suppose it would be 10 or 12 miles.
4194. What would be the difference in the carriage and the transhipment as compared with taking it to their own jetty? I presume it would be slightly more unless there was a zone system introduced, as they have at Newcastle.
4195. Then it would be about the same cost as shipping from their own jetty? The economy is in the saving of transshipping and the transit to Sydney.
4196. It would only be in the case of sailing vessels that there would be the extra saving? Steamers can go and load with comparative safety at Port Kembla now.

THURSDAY, 14 JANUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.
HENRY CLABKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

John Evans, Esq., Mining Engineer, Bulli, sworn, and further examined:—

- J. Evans, Esq. 4197. *Mr. Fegan.*] Do you know anything about the formation of the Illawarra Harbour and Land Corporation? I do not.
- 14 Jan., 1897. 4198. You are not a shareholder in it? No.
4199. You only reported for this gentleman in reference to the coal measures south of Mount Kembla? Not for that gentleman.
4200. For Mr. Sands? Yes, but he is not interested in that company.
4201. Where did you get that specimen of coal that you produced yesterday,—how far from Mount Kembla? It was taken from a measure due west of Dapto from the outcrop of the coal.
4202. Is there any bore down there? No. That coal was taken from the outcrop of the third seam.
4203. Are there any bands there? Yes, two bands in 6 feet of coal.
4204. What is the thickness of the bands? The aggregate thickness is 2 inches.
4205. Have you ever been connected with any collieries in the Newcastle district? Yes, I have managed the Stockton mine.
4206. Are there any bands there? No. There was a band I think in the lower seam, but the upper seam was free from bands.
4207. Have you ever worked in the old country? Yes, in South Wales. I was assistant manager of Harris' Navigation, and I have been employed in the Rhondda Valley.
4208. Under what Act did you receive a certificate as a mining engineer? The Act of 1872.
4209. You have held that certificate for how many years? Fifteen years.
4210. When you were examined you had to have a certain knowledge of geology and metallurgy? Yes. I was two years at the Bristol School of Mines, and I am a Fellow of the Geological Society of London.
4211. Have you had any conversation with Mr. Armstrong in reference to the port? None whatever.
4212. You do not know anything about the Illawarra Lake scheme? No.
4213. The proposal is to have a channel 15 feet deep,—do you think that will be sufficient? I do not.
4214. You know that in 1890 an Act was passed empowering the Corporation to do certain things? Yes.
4215. Do you know how much money has been spent on those works at Lake Illawarra? No. From what I hear I cannot say that there has been any money spent.
4216. If there was a prospect of the corporation taking advantage of their Act, do you think they would have been so long in making alterations there? I do not know what impediments may have been put in the way. Through somebody's instrumentality very large sums of money had been spent on smelting works which were part of the original scheme.
4217. No; the original scheme was to construct wharfs and to dredge a channel, but not to construct any buildings? I do not mean to say that the smelting works were included in the Act, but it was a scheme essential to the development of the harbour.
4218. You have not read the Bill? No.
4219. If you were told that a certain corporation was formed in 1890 to construct wharfs and dredge a channel, and all this time having elapsed without anything having been done, would you think the corporation was in earnest? No doubt something tangible ought to have been done. I suppose there has been some difficulty in obtaining capital.
4220. Without obtaining the money they cannot go on? No.
4221. Do you think it is right that the people of the Illawarra district should have to wait still longer for the construction of a harbour? No doubt as long as this second harbour is spoken of as likely to be constructed by no less an authority than the Government it is not likely that capitalists will be inclined to find the money.
4222. Do you not think then that something should be done to give the south coast a safe harbour? A harbour is absolutely necessary.
4223. You think it is not fair to the coal trade of the southern district that the public should have to wait until we see whether the lake scheme is a failure or not? If you are satisfied that the lake scheme is a failure, I should recommend you to provide any other harbour which you may think proper.
4224. You say that 15 feet in depth will not be sufficient for the channel? I do not think it will.
4225. Yesterday you said it would be necessary to have a channel 30 feet deep? To enable vessels with absolute safety to go in and out the channel ought to be from 28 to 30 feet deep.
4226. Do you know that small boats in the trade are becoming things of the past? Yes.
4227. Would it not mean the expenditure of a much larger sum of money to construct a channel 30 feet deep than to make one 15 feet deep? No doubt.
4228. And if they cannot get money enough to construct a channel 15 feet deep would it not be impossible for them to raise money enough to make a channel 30 feet deep? That is logical.
4229. Is it not almost an impossibility for that harbour to be constructed under the circumstances? I believe that if the money can be obtained it will be a success.
4230. Do you not think that if it is likely that they can get the money it would have been got before this agitation arose for a harbour at Port Kembla? That I do not know.
4231. Would they not be more likely to get it before there was any talk of a second harbour being made by the Government? I should think so. The fact of a large sum of money being spent there by the Smelting

J Evans,  
Esq.  
14 Jan., 1897.

Smelting Company of Australia would be an inducement to capitalists to advance money to construct a harbour in the Lake. That company has been instrumental in bringing a very large amount of capital into the district. I think that is a consideration which should weigh.

4232. Do you think it is possible for them to construct a harbour with a channel 30 feet deep in the next two years? I do not think it is. They would have to get an extension of time.

4233. Do you think it is possible for them to get an extension after appealing to Parliament twice? If you are satisfied that there is a strong syndicate with a million of money who are going to spend their money I should think it desirable to let them do it.

4234. How much of the coal do you think will find its way to Illawarra Lake in the event of that scheme being carried out? At present there is a somewhat bitter feeling existing as to the rival harbours, but the same coal that would go to Port Kembla, if there were a good harbour there, would go to Lake Illawarra, if there were an equally good harbour at the Lake.

4235. The extra distance would be no consideration? Really no consideration.

4236. Is it not a fact that from the brittle nature of your coal an extra 4 or 5 miles carriage would mean considerable depreciation? No. The depreciation in a mile or two is inappreciable.

4237. But colliery managers kick up a row about an extra half-mile in shunting? Yes, when using skips, but with proper railway wagons on springs there is a difference.

4238. Then how far would a train have to go before that depreciation could be considered? A very large quantity of coal is sent from South Wales to London to be shipped a distance of 177 miles.

4239. Is there not a great difference between the coal of the south coast and the coal of South Wales? Some of the coal here is much harder than the Welsh coal.

4240. And some much softer? I do not know of any that would excel the Mount Keira coal for hardness.

4241. Is it not a fact that the Welsh coal is exceedingly hard? No; except the Anthracite coal which is exceedingly hard.

4242. Is it not a fact that at the greater portion of the mines in South Wales the system of working forces the men to get very large coal? Yes. They are working long wall at a great depth.

4243. I am talking of the filling; there being no sides to the skips it forces the men to fill much larger coal? Yes.

4244. That being so the conditions existing in the collieries of the South Coast are entirely different? They are.

4245. Therefore, the comparison between South Wales and the coal mines of this Colony is of no account? The skips in the old country are not all of the kind you mention. At Harris' Navigation they use closed skips.

4246. There are about three mines that use them in the whole principality? As a rule they use open skips.

4247. Do you not think that if the coal has to be carried an extra 5 or 6 miles it will mean considerable loss to the coal owners? I do not think so. I admit that there is a theoretical loss. But it is so trivial that it ought not to be considered. The bulk of the South Wales coal is shipped at Cardiff, and so dissatisfied were the companies there, because the facilities for loading were not such that they would like to keep up the trade, that the colliery owners themselves (they did not ask the Government to do it) went down to Barry and made a very large harbour. They did not mind carrying their coal a little further.

4248. If they did not get greater convenience do you think they would have constructed that harbour? No.

4249. Would you tell the Committee what distance you consider coal should be carried before it depreciates? No doubt it depreciates every mile that it is carried; but it has been proved by experience that coal does not depreciate in the same proportion all the time. Supposing it breaks up to the amount of 1 per cent. in 10 miles, it will not break up to the amount of 10 per cent. in 100 miles. Once it is broken the small coal acts as a bed, and it saves the round coal from being broken.

4250. Do you think any harm will be done by waiting until 1898 to ascertain the success or failure of the Illawarra scheme? I do not see that you need wait. Taking into consideration that Parliament has granted these powers if you are satisfied that the company cannot carry out the work then proceed with yours.

4251. Would there be any harm in waiting until 1898 to see whether or not this scheme will be carried out? You would lose two years of valuable time.

4252. Then what would you suggest? I would suggest that before this work was undertaken at Port Kembla you should obtain some positive guarantee that the proposed works at Lake Illawarra will be proceeded with at once.

4253. If you cannot get it? Then go on with your own works. There ought to be some means of discovering the position of the company.

4254. You think that two years would be too great a loss of time? Yes.

4255. And that something better ought to be provided at Port Kembla for the trade and to give a harbour of refuge? Yes.

4256. And under these conditions you would support that proposal? I would.

4257. *Mr. Hassall.*] Have you any idea what sized vessels they propose to bring into the Illawarra harbour if it is constructed? They could not have any idea of bringing very large vessels into a harbour with a depth of only 14 feet. I suppose that that would be the the minimum not the maximum depth.

4258. Have you any idea of the proposed width of the channel? No.

4259. With a narrow channel would not the vessels be bumping against the side every few yards? You can get a very large vessel through a narrow channel, in the Suez Canal for instance.

4260. You are aware that it is desired to have a harbour constructed into which large ocean-going vessels could go to load coal? That is the desire.

4261. It would be impossible to bring large ocean-going vessels through a channel of the size of that which the Illawarra Company propose to make? Yes, I think so; but I am not sure that I know the intended width.

4262. And if they attempt to make provision for the larger vessels it will probably cost a couple of hundred per cent. more than they propose to spend? It will cost more than twice as much to make a channel 30 feet deep instead of 15 feet.

4263. So that the estimate which they have submitted is ridiculously wrong? Everything must be on a larger scale than was originally designed.

4264.

- J. Evans,  
Esq.  
14 Jan., 1897.
4264. I suppose you are aware that they would have to leave a certain amount of water on each side of the vessel, and that the channel would have to be a good depth? Yes.
4265. Do you know whether any arrangement has been entered into between the Smelting company and the Illawarra company with regard to using that port if it is completed? I do not.
4266. They are two separate companies? I believe they are.
4267. The probability is that if a harbour were constructed at Port Kembla, the Smelting company would use that? Undoubtedly; if a harbour is not made at the Lake, they will have to use it.
4268. Do you think there is any possibility of the collieries using Lake Illawarra for the shipment of coal if a harbour is made there? Most certainly.
4269. With the appliances which they have on the coast, do you think they would use the harbour at Lake Illawarra? If that argument holds good with regard to Lake Illawarra, it holds good with regard to Port Kembla. Is it likely that the South Bulli Colliery will send coal to Port Kembla when they have their own jetty,—and the North Bulli and the Clifton companies have jetties.
4270. When the wind is favourable they would use them? Yes.
4271. The probability is that if a harbour were constructed at Port Kembla, to save harbour dues and shipping charges, the collieries would continue to use their own jetties? No doubt they would. They can ship coal for consumption in Sydney for 3½d. or 4d. a ton at their own jetties. Why should they pay 10d. a ton to take the coal down to Port Kembla. There would be that in railway charges to begin with; then 6d. a ton wharfage and port dues; making 1s. 4d. a ton, altogether, as against 4d. if they ship the coal at their own jetties.
4272. It resolves itself into this, that they would only use the harbour at Port Kembla when they were prevented from using their own jetties? That is it.
4273. The only increase in the shipments which could be safely relied upon at Port Kembla would be the shipment over sea in large vessels? Yes; and that is why I think that more than one-half of the output of the collieries would be shipped from the harbour.
4274. Is it not probable that if the harbour is constructed at the expense of the State, the people at Bellambi and Bulli might say they also have a right to a harbour? The general feeling is that each ought to have a harbour at his own colliery; but that does not do. They might bring the zone system into operation, and a colliery being an extra 2 or 3 miles distant would not make any difference.
4275. Does it not seem reasonable to expect that if a harbour is constructed the rates will be so arranged as to make no difference? It will be necessary to do that.
4276. Do you think that a harbour on the south coast is necessary? I think so.
4277. And you are in favour of which? I believe in giving every encouragement to private enterprise, and I am convinced that in the main a better harbour could be made at Lake Illawarra than at Port Kembla. I gave my reasons for saying that yesterday. Port Kembla is essentially an artificial one from beginning to end.
4278. And so the other will be? Not so much so. At Port Kembla the breakwaters will be side on to the sea. They will be very costly and the range of big vessels is something terrific on wharfs. We have experienced that even in Wollongong Harbour. The range is so bad there that some time ago they had to sink a vessel to prevent her from becoming a complete wreck in the harbour.
4279. How are you to make vessels fast in this single breakwater harbour? If you have short jetties on to rubble breakwaters, I do not see anything very permanent in that. It is not going to be an easy job to lay down plant to hold big vessels.
4280. Your evidence practically resolves itself into this,—that if the Illawarra Company can carry out their proposed work that will be the most suitable harbour? I think so.
4281. Failing that, you are quite willing for the Government to step in and make a harbour at Port Kembla? Yes.
4282. *Mr. Roberts.*] Are you, directly or indirectly, interested in any way in the Illawarra Harbour and Land Corporation? In no way whatever.
4283. Have you ever been employed professionally by that company? No.
4284. I understand you to prefer the Lake Illawarra scheme to the one that has been submitted for providing a harbour at Port Kembla? Yes.
4285. When you formed that opinion did you contemplate that the depth of the water in Lake Illawarra would be 30 feet? Yes. The first day that I set eyes upon Lake Illawarra, a little over ten years ago, whilst taking a survey of the country from the top of Mount Kembla, I made the remark that if that sheet of water was in any other part of the world it would have been made into a harbour. I have always thought that there would be no difficulty in making that a good harbour.
4286. Would you consider it a good harbour if the depth of the water was anything less than 30 feet? Not for the requirements of the present trade.
4287. Have you ever heard that there is any likelihood of 30 feet of water being obtained there? Some borings, I believe, have been put down, and I am told that the bottom of the lake is mud, and that there will be no difficulty in dredging.
4288. When you say there will be no difficulty in dredging it, what depth have you got in your mind? Even suppose it was stone, it could be deepened.
4289. Are you not aware that, according to the Act of Parliament, the minimum depth is to be 15 feet? Yes.
4290. Would that be of any use for the requirements of the south coast? Only for small vessels, and we can load them at the present jetties.
4291. You are of opinion that nothing less than 30 feet would suffice? We want a harbour to put us on an equality with Newcastle. We want a harbour into which we can take any vessel that comes to Australia for coal. I suppose that the biggest vessels that come here would draw about 27 feet.
4292. Have you made any calculations as to the cost of such a work as you think should be carried out at Lake Illawarra? I have not.
4293. Do you regard the construction of the proposed eastern breakwater as altogether inadequate or almost useless for providing a safe harbour for sailing vessels and large steamers? I am quite sure that there is not a gentleman who has given evidence in reference to the eastern breakwater who does not know that it will be absolutely necessary to have the other breakwater. I do not think we should ever see the accommodation which is necessary to give us an insurable port where you can have large sailing vessels—and the tendency is now to build large sailing vessels—unless we have a double breakwater.

4294. Are you referring to the outward traffic, or have you in contemplation the import trade? Both the import and the export trade.

4295. Do you not think that the eastern breakwater would give sufficient protection for the export trade? I do not think so. A large vessel could not lie at anchor without a tug alongside of it. There is no doubt that the eastern breakwater will afford a measure of protection, but we have not loaded big sailing vessels down there yet.

4296. Would not sailing vessels be able to come under the lee of that breakwater and remain in perfect safety? They could not lie there.

4297. Are you aware that Port Kembla is regarded as having remarkably good holding ground? Yes.

4298. Seeing the shelter that will be given, will not vessels be attracted there? No doubt they would, but it will not be a harbour in the fullest sense of the word. I should like to see a harbour in which vessels could lie and await their turn. During the strike we have had vessels waiting in Sydney for months. I do not know of any similar port in the world with a single breakwater in an open sea.

4299. It will protect the port from the east and the south-east winds, but the north-east wind is not considered tempestuous? No; as a rule it does not bring up a very heavy sea.

4300. Except as regards the north-east wind, would not that breakwater afford every protection from stormy weather? I do not think it would afford enough. With a single breakwater there would be a frightful range there. There will be an everlasting whirlpool in that place. It is my opinion that the very construction of the breakwater will make a current in that place.

4301. Do you say that Lake Illawarra, taking Tallawera Point, occupies a more central position for the shipment of coal than Port Kembla? Not for the existing collieries. For the existing collieries Port Kembla is somewhat nearer, but you do not make a harbour for any particular collieries. If you make a harbour it will have to do for the next century, and taking the extent of the coal-field with the immense quantity of Crown lands down to the south, and the fact that the northern portion of the field is in a rapid state of consumption, with only four good collieries near to Port Kembla, I think that the lake will be more central as regards the coal-field as a whole.

4302. Do you disagree with the opinion given by Professor David that the good coal of the Bulli coal mine, west of a line running from Coal Cliff southwards, is limited on the south by Mount Kembla? That is the top seam. Does he refer only to the top seam.

4303. No, to them all? Then I most decidedly do not agree with him.

4304. Do you regard the coal south of Mount Kembla as suitable for smelting purposes? There are seams there very suitable for manufacturing coke. They do not smelt with coal. There are seams south of Mount Kembla quite as good for manufacturing coke as any to the north. Some of the coal to the north of Mount Kembla is no good for coke at all. Mount Kembla coal will not coke.

4305. What is the quality of the coal at Dapto Creek? The lower seams there improve down towards Jamberoo.

4306. *Mr. Black.*] I understood from your evidence yesterday that owing to the way in which the coal has been got in the Illawarra district a harbour on the south coast would not be of such great benefit to the colliery owners as we anticipate? I did not intend to convey that idea.

4307. It was my impression that you thought underground haulage was so expensive that it will be better to sink shafts and bring the coal to the surface at a greater distance from the coast than they now do? Some of those mines have been in operation for a quarter of a century, and they are getting a long way into the mountain, consequently the longevity of these mines is limited. There is a day coming when it will be too costly to produce that coal, and then they will not be able to compete with new collieries. Then these collieries will have to stand idle.

4308. You conveyed the impression that underground haulage was much more expensive than overground haulage? Certainly.

4309. And that if they continue to work they would have to sink shafts instead of bringing the coal through the tunnels? Yes. If the seams north of Kembla are to be worked when it becomes too expensive to work the mines through the adits, the working must be done by sinking shafts on the top of the mountains, and the coal will have to be brought down by some means to the harbour.

4309½. In some cases it will be almost as expensive to convey the coal from the shafts to the seaboard as to convey it to Sydney? Yes; it would involve the expense of a railway over the mountains.

4310. Under such circumstances as these the construction of a harbour would not be of very great assistance? If you constructed a harbour at Bellambi or north of the existing field, you would be dealing with an exhausted coal field. But by making a harbour to the southward you are affording convenience for existing collieries, and offering facilities for the development of Crown property which is at present lying idle.

4311. The presumption is that that property contains coal? Yes. If that magnificent coal territory was in Melbourne or West Australia they would ascertain before they spent any money on a harbour whether there is payable coal in it. It would be very easy to prove the existence of coal south of Mount Kembla by putting down a series of diamond drill bores on the top of the mountain. That would demonstrate the whole matter, and put it beyond a shadow of a doubt. I do not think it right that the impression should get abroad that that immense coal field belonging to the Crown is of no value.

4312. Do you not think it would be inadvisable for the State to spend large sums of money in the construction of a harbour until it is proved that on the Crown lands there exist large quantities of unexploited coal? If we have nothing to depend upon for a return upon the capital invested but the coal in the existing mines you had better not make a harbour at all.

4313. Then I may conclude from your evidence that the expenditure of a sum variously estimated at from £250,000 to £500,000 in making a harbour on the south coast may be looked upon as nothing but a State bonus to half a dozen collieries, most of which are now worked out? Yes, that is if you are satisfied that there is no coal except in the existing collieries, but I think there is. I do not think you would be warranted in making a harbour for half a dozen collieries.

4314. You said in reply to Mr. Hassall that in the event of the failure of the company to construct a harbour at Lake Illawarra, you see no objection to the construction by the Government of a harbour at Port Kembla? Yes; but I am satisfied that we have 250,000,000 tons of coal south of Kembla. I am satisfied that the bulk of the coal for the next century is to come from the south of Kembla.

4315. Would it not be better for the Government to have some better assurance than your mere statement? Certainly.

J. Evans,  
Esq.

14 Jan., 1897.

- J. Evans, Esq.  
14 Jan., 1897.
4316. I understood you to say that a harbour at Port Kembla would be incomplete with only one breakwater? Yes.
4317. And that even with two breakwaters it could never offer the security of a land-locked harbour? Well, it would not be absolutely secure, because there is always a danger in very heavy seas of a breakwater carrying away.
4318. I suppose you are aware that Sir John Coode said years ago that the position of the southern coal trade did not justify the expenditure of a large amount of money in making a harbour? Yes.
4319. Do you think there has been any improvement in the trade since then? Yes; there is an increased demand for the coal, and the output last year was greater than ever before.
4320. Was not that due to the fact that the Newcastle mines were not working? Not altogether.
4321. Is it not true that there has been a decrease in the quantity of coal to be worked through its being continually extracted? Certainly. Every ton you take away makes a ton less to come.
4322. If before that harbour at Port Kembla can be made it will necessitate the construction of two breakwaters, and as you think it necessary that the Government should purchase the jetties already in existence, entailing the resumption of some portions of water frontage—if all that expenditure be gone through, which according to the estimate will mean a cost of about half a million of money, what annual return on that expenditure do you think will be a fair one to the State? I do not suppose you could borrow the money under  $3\frac{1}{2}$  per cent., and it would be fair to get something over and above that, say, 5 per cent.
4323. We will assume that the total output of the southern district is about 600,000 tons, and 500,000 tons of that goes by vessel—a gentleman who gave evidence here told us that he would be willing to pay 6d. per ton harbour dues;—that would mean a return to the State of £6,250 a year;—do you think that that would be a fair return on an expenditure of half a million? No, certainly not.
4324. Mr. Vickery said he thought the State was not entitled to more than 3d. a ton—that would give a return of £3,125;—do you think the country would be justified in spending such a large sum to get such a paltry return? I do not.
4325. If a million tons of coal were shipped from Port Kembla, which is very improbable, that would mean a return at 6d. a ton of £25,000? That would be 5 per cent. on half a million.
4326. Even then that would only recoup the Government for the expenditure;—there would still be a loss entailed from the cost of annual maintenance and supervision? You could add another £10,000 or £15,000, to that which you would obtain from royalties for coal from land which is now lying idle. Even from the existing collieries you would derive royalties, because they will soon have to work in Crown lands.
4327. But the more you work those mines the sooner they will be worked out? Yes.
4328. Then that would mean a diminution of the return in a few years unless new mines were discovered? Yes.
4329. Do you not think, unless it be proved to the satisfaction of the Committee that there is a great area of coal land existing in the southern district which has not yet been worked, the construction of a harbour at Port Kembla, Bellambi, or any other place at the public cost which would mean the expenditure of half a million of public money in the interest of one or more collieries, would be such a gross misuse of public money as could only be characterised as a job? I am perfectly clear upon that. If you have not sufficient evidence to convince you that there is coal in the district other than that in the existing collieries, I do not think that you will be warranted in constructing a harbour of that magnitude. It is evident that it would cost half a million of money to make the proposed harbour; perhaps a great deal more. There was not much show at Wollongong of an expenditure of half a million. You would require a million tons of coal at 6d. a ton to be shipped from the existing collieries to make that harbour pay interest on the cost of construction. If you are satisfied that there is no other coal than that in the existing collieries I do not see how it is going to be a remunerative undertaking. If you are not satisfied that there is coal to the south of Mount Kembla you would not be justified in spending this large amount of money. The Government should take steps to prove the Crown land in that district, and this could be done by putting down three or four bores. Four bores put down to a depth of 1,000 feet each would demonstrate beyond a doubt as to the continuity of the coal seams southward. They could be put down away back, where there is not the intrusion of volcanic rock which we have bordering the sea.
4330. If you were a Member of the Committee your recommendation to the Government would be that they should do nothing in regard to harbour construction until the existence of unexplored coal-fields on the southern coast is clearly proved? Yes.
4331. *Chairman.*] Professor David and Mr. Pittman informed the Committee that without taking into consideration the country to the south of Kembla it was reasonable to estimate that 350,000,000 tons of coal would be won north of Kembla;—what do you think of that statement? I think they are entirely wrong.
4332. Do you believe that is an over-estimate? It is an over-estimate.
4333. How do you come to the conclusion that their calculation is wrong? I stated yesterday that between South Clifton and Woonona a quarter of a million has been spent to prove the existence of coal, and the quantity contained in the remaining area is dependent upon the distance that they go back westward. Perhaps Professor David calculates that it is possible for the mines to be worked for a distance of 5 or 6 miles back.
4334. He says 5 miles? It cannot be done properly. Three miles is the outside limit.
4335. *Mr. Hoskins.*] Are they not working more than 3 miles under the sea in Cumberland and Durham? No.
4336. *Chairman.*] If they have worked 5 miles in other parts of the world could they not do it here? It is different here. These seams are dipping. What I wish to point out is that a colliery which is working 5 miles into the mountains cannot produce coal at the same price as a freshly opened colliery, and must become unremunerative.
4337. Can collieries in other parts of the world win coal at a distance of 5 miles underground? It is done in one or two exceptional cases.
4338. It is a question of cost? Yes.
4339. Do you believe that 5 miles west is too far to go? I believe it is too far to go, and no doubt the difference between Professor David's estimate and mine is as to the distance to be worked.
4340. You informed the Committee that you calculate that south of Kembla there will be 250,000,000 tons of coal available? Yes.

4341. What is the basis of that calculation? There are two seams of coal there of an aggregate thickness of something over 10 feet, and it has been proved by analysis to be of a marketable quality, and it will make good coke.

4342. Since the mines commenced further exploration has exposed faults that were not expected? Yes. We had to abandon the Bulli colliery in consequence of the discoveries that were made.

4343. Supposing your estimate as to the quantity of coal south of Kemplā is correct, and Professor David and Mr. Pittman are wrong, what evidence have you as to the continuity of the coal to the south? The only evidence that I have is from examinations which I have made extending over many years. I and others who are fully acquainted with that field have made investigations. There has been absolutely nothing done either by Government or by private enterprise to prove the existence of anything down south. I think it is a most unwise policy to condemn hundreds of square miles of territory because coal taken from a particular outcrop which has been exposed to the action of the weather was found to be inferior.

4344. You regard it as theoretical, and to some extent as problematical? Yes, and to a large extent practical, because it can be demonstrated. I will give you the basis of my calculation. The country that I traversed contained about 10 feet of workable coal in two seams. I have examined the outcrop in various places for a distance of about 16 miles, and I find that the coal is fairly continuous. In some places the seam shows bands, but I estimate that there is from 10 to 12 feet of workable coal, the ash in which will not exceed on the average from 9½ to 12 per cent. for a distance of 16 miles. That will yield about 10,000 tons per acre.

4345. Is that the Bulli seam? No.

4346. Then how are you justified in comparing a seam to the south of which you have had no experience with the Bulli seam to the north of which we have had experience? If you are satisfied as to the continuity of the seam, then by specific gravity you can always tell the quantity per acre.

4347. You have investigated the outcrop? Yes.

4348. Is the lake centrally situated for the existing mines? Not so centrally situated for the existing collieries as Port Kemplā.

4349. Any coal coming from Austinner, Bulli, Coalcliff, and Corinnal would have to pass Bellambi? Yes.

4350. Therefore any coal north of Bellambi will be handicapped the distance from Bellambi to Lake Illawarra? Yes.

4351. And the same applies to Wollongong and Kemplā? Yes.

4352. Therefore the lake is not centrally situated for the present trade? No, unless further canal construction were effected from the northern end of the lake.

4353. As regards the future trade, it depends upon the outcrops turning out as you anticipate? Yes.

4354. Where was your analysis made? At the Department of Mines on the 23rd November, 1893.

4355. *Mr. Black.*] I suppose you attach some importance to the statements of Professor David? Most decidedly, but I have evidence of the continuity of the coal south of Kemplā.

4356. Professor David was asked several questions, which I will read with his answers.—

3193. *Mr. Humphrey.*] Am I correct in coming to the conclusion that you look upon the coal south of Port Kemplā as practically valueless? I do.

3194. Is there any possibility in your mind of any coal being discovered there of a quality suitable for export? I think the chances now are so remote as to be practically negligible.

3195. There is no sign of the Bulli seam south of that point? There is a very thin seam on Mr. Biggar's land, which was taken to be an equivalent to the Bulli seam, but it is only 2½ feet thick. It is between Wongawilli and the Lake Illawarra company's ground land.

3196. Can you give any idea whether the seams of which you have given a description here to-day correspond with lower seams further north to seams underlying the Bulli seams? Yes, they do. The present ones can be correlated with the same seams further north. Further south the seams come together very much, so as to make the process of differentiation a very difficult one.

3197. *Mr. Roberts.*] How far south did you make your explorations; did you go as far as Jervis Bay? Yes, I went as far as the head of Clyde River a few years ago, and also examined further north the Cambewarra Ranges. I was reporting then on the question of putting down a bore on the Wandra-Wandian Creek.

3198. I refer more particularly to your recent visit;—how far south did you go? Broger's Creek was the farthest point south.

3199. What is the furthest point south that workable coal has been found at? As far as I am aware no workable coal has been found south of Mount Kemplā. Even under Mount Kemplā itself the coal is inferior. The inferiority has already set in there.

3200. Are the Committee to understand that the further you go south it gradually dies out? Yes.

3201. When you say that the coal is not suitable for export, are you speaking from a commercial point of view? Yes.

3202. That it would not be used by any shipping company? It would not be used by any shipping company because the percentage of ash is so far in excess of that of the coal which is now being used for economic purposes.

If that evidence is borne out by fact, and I do not say that it is, do you consider that there would be any justification for the Government to construct a harbour at Port Kemplā? No.

4357. *Mr. Wright.*] I think you said that the coal which you first had analysed was taken from the outcrop? Yes. Brownlee's coal in 1889.

4358. Subsequently there was some work done there, was there not? Yes; there has been a tunnel opened on the place.

4359. Where was the second sample taken from? From the face of the coal.

4360. How far was it in? Not more than 100 feet. That was in 1895.

4361. Did it continue the same? It showed 1 per cent. better in ash.

Mr. Thomas Downie, Wharfinger at Port Kemplā for the Southern Coal Company, sworn, and examined:—

4362. *Chairman.*] What are you? Wharfinger for the Southern Coal Company at Port Kemplā.

4363. How long have you been there? About six years. I have been at Port Kemplā since 1882 as wharfinger for the Port Kemplā Company and the Southern Coal Company.

4364. *Mr. Clarke.*] Can you tell the Committee how many vessels loaded at Port Kemplā in the year 1896? I cannot supply that information.

4365. Can you supply information as to the companies you represent? Yes. For 1893 there were 173 foreign vessels loaded at the Southern Coal Company's wharf; 1894, 113; in 1895 there were 110; for 1896 I have not got the complete returns. The ships would be larger for 1896 than in previous years.

- Mr. T. Downie.  
14 Jan., 1897.
4366. Is the trade increasing or decreasing? Since the construction of the Southern Company's wharf and getting deeper water the tendency has been to increase the tonnage of the vessels loading there. In fact we take any cargo vessels afloat.
4367. Has your trade been foreign or intercolonial? Most of our trade would be intercolonial. We have loaded ships from Singapore, Bombay, Madras, Fiji, and other places.
4368. Can you give the number of tons shipped from the Southern Coal Company's wharf? In 1896 the number of tons was 131,377.
4369. Do you consider it a safe port? In its present condition it is not anything like a safe port.
4370. Do vessels when loading have to leave and go to sea without their loading being completed? Yes; on several occasions vessels have had to go from the wharf and lie to an anchor. In some instances they have had to go to Sydney for shelter.
4371. Can you give the number of days in a year when vessels cannot load there? We might say from 25 to 30 days in a year.
4372. What is the greatest depth of water at your jetty? Thirty-three feet at low water.
4373. Then I presume it is possible to load almost any vessel there? We can load larger vessels than can enter any other port except Sydney. We can load vessels that cannot enter the harbour at Newcastle.
4374. Vessels up to 5,000 or 6,000 tons? The largest ship we have had there is the *Indrani*. She had 6,500 tons of cargo, and we bunkered her with 1,200 tons of coal.
4375. Would it improve the port if the proposed eastern breakwater was made? That would be a great improvement; but my own idea is that the breakwater as proposed would be a little too much towards the sea. It would be far better to keep it a little further in shore. It would then cover the 2½-fathom patch.
4376. If the breakwater was constructed as shown on the plan would the harbour be safer for vessels? Yes; but it will cause a hidden danger in the harbour. The breakwater should be brought over the crown of the patch. It would be a good protection against south-easterly weather.
4377. Do sailing vessels load at Port Kembla at the present time? Only small coasting vessels. The only foreign vessel loaded at the company's wharf was the *Olga*.
4378. Is it safe for sailing vessels there? Not unless there is a steamer in attendance.
4379. If the breakwater were constructed do you think it would be safe for vessels to load there? A vessel could lie there with perfect safety with the eastern breakwater.
4380. Do you ever unload sailing vessels there? No; the port is not adapted for an import trade.
4381. Do the vessels come in ballast? The steamers have water ballast, which they pump out as we load.
4382. At present it is not possible for sailing vessels to land ballast? No; if a sailing vessel was coming from Sydney they would put stiffening into her at Sydney.
4383. During your time at Port Kembla, have any vessels been lost there in going in or coming out? No accident of any description has occurred at Kembla.
4384. Do you consider that if a breakwater was constructed it would be much safer not only for steamers but also for sailing vessels? Yes. If we had the eastern breakwater sailing vessels could come and load with safety, and it would be of great assistance to steamers.
4385. Are you aware that a great deal of sea-borne coal goes by sailing vessels? Yes. That is the reason why we are agitating to get a harbour on the south coast. We want to get those large sailing vessels there.
4386. Do you think in the public interest the breakwater ought to be constructed? Certainly.
4387. You want to have all the facilities for loading vessels that they have at Newcastle? Yes. That is the idea. The district and the whole country would be gainers by the breakwater being constructed.
4388. You see a second breakwater provided for on the plan; would that be really necessary? No. The northern breakwater will not be necessary. With the eastern breakwater, a vessel could make the harbour and bring up in good holding ground. The harbour is protected from the north-west by the mountains.
4389. Are you acquainted with Lake Illawarra? Yes. I am fairly well acquainted with it.
4390. In the event of a harbour being made by the Illawarra company for vessels drawing from 25 to 30 feet would it be as good a harbour as Port Kembla? I say that the Lake Illawarra scheme is impracticable. It is impossible to carry it through. The channel they propose to make is to be either 100 or 150 feet wide. That is not a sufficient width to allow vessels of the larger class to enter. When entering light the wind would catch them and they would sway to one side because they would not have sufficient speed to steer by.
4391. Would it be liable to silt up during an easterly gale? In 1879 one of the Spier's vessels was lost there. She was a schooner of 90 tons burden. I have stood on the beach and touched the top when the whole of the hull and the mast has been covered with sand.
4392. It would take a large amount of money to form a harbour there? It will take far more money to make a harbour there to dredge the Lake and construct retaining walls than it would take to construct one breakwater at Port Kembla.
4393. You are of opinion that the entrance would be too narrow to enable ships to get in with safety? Yes; and if the depth is to be 15 feet it will be quite useless.
4394. They propose to deepen it to 25 feet? At the Southern Coal Company's wharf we have loaded vessels drawing 26 ft. 6 in. To get a vessel of that size up the channel in Lake Illawarra you would require from 3 to 4 feet under her.
4395. *Mr. Hassall.*] Would not a westerly trend be more satisfactory in the eastern breakwater than its present direction, as shown on the map? In my opinion it ought to be brought more in shore.
4396. *Mr. Roberts.*] Does it not appear to you that if a breakwater was constructed as suggested by Mr. Hassall the harbour would be somewhat contracted? It would be reduced somewhat in size, but we should have plenty of room.
4397. But the space for ships coming in would be limited? There would be plenty of room for entering. Vessels could get under weigh comfortably there.
4398. The breakwater is three-quarters of a mile from the shore. Do you think that that distance would bear contraction? Yes. It should be contracted sufficiently to bring the breakwater in over the patch. By building on that patch you remove all danger.
4399. In your opinion, the northern breakwater will not be necessary? At present, the eastern breakwater will be sufficient.
- 4400.

4400. Do you not think it would be wiser to construct the eastern breakwater in such a way that if a northern breakwater would be necessary hereafter it can be constructed without having the harbour space limited? You can build the eastern breakwater, and afterwards come in with your northern breakwater. The eastern breakwater could be brought in, say, by one point of the compass—that would mean a reduction in the area of the harbour by from 5 to 7 acres.

Mr.  
T. Downie.  
14 Jan., 1897.

4401. Would it lead to the existence of calmer water? It would. There would be no fear of seas heading round into the harbour. They would go past the breakwater, and shoot right into the bay.

4402. I think you will admit that the making of the port by sailing ships would be rendered more difficult if a north-westerly trend were given to the eastern breakwater? Not necessarily. A vessel would be able to sail three or four times her own length in the bay.

4403. Is it not a fact that most shipmasters have a great objection to getting too near the shore? There is plenty of water there for them to come in.

4404. Would there not be a large break of the sea some distance from the shore? No. The water carries its depth well in shore.

4405. How far from the shore do the rollers set in? That depends upon the strength of the "send."

4406. How near the shore could a ship of 2,000 tons safely venture in sailing in? Within a quarter of a mile with safety.

4407. Are you of opinion that if a clear space of half a mile were left within the breakwater and the shore that would be sufficient? It would be ample. Three-quarters of a mile is shown on the plan, and that is ample room for vessels to work in.

4408. Are the Committee to understand that that three-quarters of a mile can be contracted to half a mile? No; one width of the breakwater, as shown there, will land it on the shallow patch.

4409. Do you think that if the point of the breakwater were brought in 220 yards, there would still be sufficient room to manipulate sailing vessels? Certainly.

Mr. George Sinclair, Wharfinger at Port Kembla for the Mount Kembla Coal Company, sworn, and examined:—

4410. *Chairman.*] What are you? Wharfinger for the Mount Kembla Coal Company at Port Kembla.

4411. How long have you been there? Nearly ten years.

4412. You have a full knowledge of the bay? Yes.

4413. You have heard Mr. Downie's evidence? Yes.

4414. Do you agree with him? Yes. I agree with everything he said, more especially as to bringing the breakwater more towards the shore, so as to carry it over the top of the patch and to make the seas strike it at right angles.

4415. Is there any part of Mr. Downie's evidence that you desire to emphasise or to correct? No; I do not think he said anything that I could correct.

4416. Is there anything that you think it necessary to say? I believe that everything he said was right.

4417. Do you believe that if the proposed eastern breakwater were erected vessels would lie in comparatively smooth water? Yes.

4418. Do many storms come from the north-east? The wind from the north-east makes a choppy sea, but it does not interfere with loading operations.

4419. If the eastern breakwater were constructed would Port Kembla be a suitable port? It would be a suitable port for loading coal.

4420. But you think that if the point of the breakwater were brought in 220 yards that would give you ample room to manipulate sailing vessels? There would be ample room for sailing vessels to come in and bring up.

4421. And the curve on the breakwater, as suggested, would be partial protection against north-east gales? Yes.

4422. And, therefore, more advantageous to the shipping lying in the port? Yes.

Mr.  
G. Sinclair.  
14 Jan., 1897.

FRIDAY, 15 JANUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Robert Amos, Esq., Contractor, sworn, and examined:—

4423. *Chairman.*] What are you? A public works contractor.

4424. *Mr. Lee.*] Have you contracted with the Illawarra Harbour and Land Corporation for the construction of harbour works at Illawarra? I have.

4425. Would you tell the Committee what is the nature of the work you have to do under that contract? In the first instance, the construction of certain sections of railway which have been partly constructed and are complete; thereafter the excavation of a channel, the construction of breakwaters and training-walls, the construction of jetties, and other general work for harbour purposes.

4426. What is the length of the proposed channel? About a mile and a quarter.

4427. And the depth? Twenty-five feet 6 inches below mean water. That is my contract.

4428. What is to be the width of the channel? 100 feet at the base, with a slope of 2 to 1.

R. Amos, Esq.  
15 Jan., 1897.

4429.

- R. Amos, Esq. 4429. *Chairman.*] What is the depth of water? The water in the Lake averages about 12 feet.
4430. *Mr. Lee.*] In addition to the channel have you contracted to excavate the basin inside? Yes.
- 15 Jan., 1897. 4431. What area? Approximately from 25 to 30 acres.
4432. To what depth? The same depth.
4433. Have you any objection to state the amount of your contract? The gross amount of the contract is £200,000. I am being paid by schedule rates, the total amount of the work being estimated at £200,000.
4434. Within what time have you to complete the work? Up to the 23rd December, 1898. The time originally fixed was the 23rd December, 1897, but there was a year's extension.
4435. You are aware that the privileges granted to the company expire in 1898? Yes.
4436. And the object is to have the work completed before those privileges expire? Yes. It will be well to understand that the Act only provides for a depth of water of 15 feet, and not 28 feet, as now proposed to be provided.
4437. Do you contemplate that you will have all this work completed within the contract time? I question very much if I can with a depth of water of 28 feet.
4438. When did you enter into the contract? I began negotiations in June, 1893, and the contract was signed on the 16th August, 1895.
4439. Have you done any work under the contract? Yes, to the amount of £25,000 or £30,000.
4440. What portion? The railway portion.
4441. You have not started the harbour yet? No; except a small portion of the tie-bank, to the amount of about £800.
4442. Do I understand that you do not see your way clear to have the whole of the work completed by December, 1898? So far as the specification under the Act goes I could—that is, providing for a depth of water of 15 feet.
4443. But you have entered into a contract far in excess of that? I have entered into a contract for a depth of 25 ft. 6 in. mean tide.
4444. Do you contemplate being able to finish that contract by the end of December, 1898? It depends altogether upon when I get instructions to proceed. Give me instructions to-morrow, and assure me of my money, and I think I can.
4445. At the present moment you do not know when you are going to start? I do not.
4446. If you have entered into a contract with the corporation is it not obligatory on your part to proceed with the work? If they find me the money or security.
4447. Then the work will depend entirely upon whether the money is available? Yes, that is about it.
4448. If the money is not forthcoming the work will not be done—that is the long and short of it? Yes.
4449. If you had the whole of the money available to-morrow would you be able to complete the contract and provide a depth of water of 25 ft. 6 in. by the end of 1898? Yes, certainly.
4450. Do you think you would be able to dredge it alone within that time, to say nothing of other works? The other works would go on simultaneously with the dredging.
4451. Would you be able to pick out the mud from that area you have described within the period mentioned? Yes. If you give me more money I will do it in half the time. It is all a question of money.
4452. It is not always a question of money in works of the kind,—it is a question of the number of men you can put on? It is not a question of men at all—it is a question of machinery; I do not suppose you would want thirty men altogether on each shift of the dredge which I propose to work continuously by two or more shifts, with the electric light. I may tell you that I have made every arrangement in San Francisco for the shipment of the necessary machinery. All the appliances are in readiness, provided I am satisfied that the money is forthcoming.
4453. In other words, you are ready to carry out your portion of the contract when the corporation are ready to carry out theirs? If they find the money I will do the work, and do it within the time.
4454. Do you contemplate that you will have to proceed with your contract? I hope I will have to proceed with the contract.
4455. Do you think you will have to carry it out? I hope I shall. I have already told you it is entirely a question of money—the floating of debentures, or something of that sort, I suppose. These are matters outside of my scope. I am a contractor.
4456. You have nothing to do with raising money? Nothing whatever.
4457. Supposing it were found that the channel and the basin would have to be excavated to a depth of 27 feet, how much longer would it take you to do the work? Not very much longer.
4458. Supposing the depth had to be extended to 30 feet? Give me six months more and it would all be done. If you wanted a depth of 30 feet you would have to give a greater base. Very likely you would have to make the base 120 or 130 feet.
4459. But that would very largely increase the cost? It would involve a certain amount of increased cost unquestionably.
4460. I suppose the railway portion of your contract has been carried out and provided for satisfactorily? I have not got the money, but I have the security, which is satisfactory to me.
4461. At all events, that portion of the work has been carried out? Yes.
4462. I suppose you would not care to express an opinion as to whether, if the work were carried out, the harbour would meet all requirements? If I expressed an opinion at all it would certainly be in the affirmative. I think it is a splendid scheme. It only wants to be carried out.
4463. You think if it were carried out it would meet the requirements of the southern coast? It would.
4464. The object of our enquiry is to ascertain: first, whether a port is necessary on the southern coast; and secondly, where is the best place for such a port to enable the coal trade to be carried out satisfactorily? I think in the first place that a port is very necessary; and in the second place, I do not think there is a better or more sheltered place than Lake Hawarra.
4465. I understand there is a question about Port Kembla,—do you know of any ocean breakwater that has yet been constructed that has been any good? There are four or five in New Zealand; they are all in financial difficulties, and none of them are much good as a harbour.
4466. Are you prepared to give any instance of a coastal breakwater that has not stood the action of the sea? Take the breakwaters at Oamaru, Timaru, New Plymouth, and Napier—is either of these a success as a harbour.
4467. You say that neither of these has been a success? I do not think so. They are all in financial difficulties, notwithstanding large grants from the Government.

4468. Leaving the financial aspect out altogether, have they not stood the practical test? The breakwater at Timaru has carried away; they wrecked a ship.
4469. But of what was that constructed? Blocks of artificial stone made of gravel and cement.
4470. What was the depth of water? I could not tell you.
4471. Do you know of any other case? No. The breakwater at Port Lyttleton has stood very well, but that was a natural harbour simply improved by the breakwater, the same as Newcastle.
4472. If the proposed breakwater at Port Kembla were carried out you have no reason to suppose it could not stand? No. I would be very pleased to be the contractor to carry it out.
4473. You think that it is quite possible that if properly constructed it would stand the ordinary seas? Properly constructed. With plenty of money to back you up you can make a good harbour.
4474. To admit otherwise would be to admit that the proposed breakwater at the entrance to Lake Illawarra would not stand? It does not follow at all. In the case of Port Kembla the sea will come sideways on to the breakwater, but at Lake Illawarra it will come end on.
4475. A southerly wind would act upon the proposed direction of the Illawarra breakwater? In a southerly wind Windang Island is a natural breakwater of itself.
4476. You have said that about £30,000 worth of work has been done out of your contract of £200,000; by what is that £30,000 represented? By the railway which has been constructed.
4477. You have already sworn that you have not done any portion of the harbour works under your contract? No; I explained that I had done work in connection with the tie bank to the amount of £700 or £800.
4478. *Mr. Humphery.*] With the appliances you intend using how much longer will it take you to dredge to a depth of 28 feet than to a depth of 15 feet, as provided by the company's Act? Approximately I should say eight or ten months.
4479. Do you think within the terms of your contract you would be able to dredge a depth of 15 feet by December, 1898? Easily. I have only to send a telegram to San Francisco to get the machinery.
4480. And within eight months of that date you would be able to complete the dredging to a depth of 28 feet? Eight months from December, 1898.
4481. To admit of the entrance of vessels drawing 25 feet of water? Yes. Dealing with marine matters you cannot estimate with the same correctness as you can in dealing with land matters.
4482. Does your contract include the widening of the lake to admit of the navigation of vessels of 25 feet draught? Yes; in fact of 28 feet draught.
4483. What would be the width of the opening? 450 feet.
4484. And for the whole of that width you will have a depth of 28 feet? Yes; 25 feet 6 inches at mean tide, and 28 feet at high tide.
4485. *Mr. Wright.*] How long is it since you were prepared to go on with your dredging operations? I suppose I have had the plans and particulars from San Francisco for twelve months. I am not prepared to go on with the work now. It would take at least eight months to get the machinery here.
4486. The cause of the delay, I suppose, is the want of money? You have struck it.
4487. How long has that caused the delay? I have been negotiating since 1893, and in 1895 we entered into the contract.
4488. So that for nearly two years you have been waiting for the wherewithal? Yes.
4489. Have you any idea when it is likely to come forward? I am not up in financial matters. I am a contractor.
4490. You do not care about giving an opinion on the question? No. I do not think the present inquiry is doing any good in the direction of helping to raise the money. It is delaying operations at the present time.
4491. I suppose the company at the present time have not the money? They have not. At least I should say so—they did not give me any.
4492. Do you think it is likely you will ever get authority to go on with the work with the money at the back of it? I have got the money at the back of what I have done, so I am not going to decry the company who have so far stood by me.
4493. So far the company has met its obligations? Yes. I have security over the whole of their property for the work I have done and £5,000 which I advanced to the company. It is solvent at the present time, so far as I know.
4494. Is there any likelihood of their being able to find the additional money required to enable you to complete your work? If this Committee report in favour of a harbour being constructed by the Government I do not think there is. If the Port Kembla scheme is to be carried out by the Government I should fancy that the man would be mad who would put his money into the Illawarra scheme.
4495. You think that the Port Kembla proposal then is seriously damaging the other one? Very seriously damaging the prospects of the other one.
4496. If the Port Kembla scheme is approved by the Committee there is no chance of the other scheme being carried out? No. I should not like to put money into it.
4497. If on the other hand the Port Kembla scheme is rejected by the Committee you think that there is a reasonable chance of the other scheme being a success? I should think so. If I had money I should put it into the scheme.
4498. I suppose you are going to do the dredging work by means of sand-pumps? Yes.
4499. *Mr. Hassall.*] Have you taken soundings at the entrance? I have.
4500. At the depth of 28 feet below mean water mark did you find sand or mud? We forced the rods down to a depth of 21 feet through sand without meeting any rock.
4501. When did you commence operations in connection with this work? In September or October, 1895. I completed the work so as to comply with the Act which provided that the railway should be completed by the 20th December, 1895.
4502. The railway is completed from a point inside Illawarra Harbour to the smelting works, or to the coal mines? The Government railway. The branch to the smelting works is a separate contract altogether.
4503. With regard to the operations commenced by you at the entrance to Lake Illawarra, did you do much work there? Very little. Under a previous contract work was done to the amount of £1,500 or £2,000.
4504. Did you take over the work the previous contractor left uncompleted? Yes, and carried it out until I was stopped. I did some £850 worth of work.

R. Amos, Esq.  
15 Jan., 1897.

- R. Amos, Esq. 4505. I presume you have inspected Windang Island? Yes.
- 16 Jan., 1897. 4506. Of what does the material there, which has been put into the breakwater, consist? It is very good stone.
4507. There is a good deal of waste material on Windang Island? Yes.
4508. Material that is soft, and which when exposed to the water breaks up? Some of it is of that description, but as you get into it the material is much stronger. It is more affected by the wind than by the water. Under water it is strong and hard, but the stone which is exposed to the air seem friable to some extent.
4509. Breaks up and crumbles away? I do not think it crumbles away, but it is much more friable than the stone which is under the water. It is very hard and solid under the water.
4510. Do you think there is sufficient material on Windang Island to carry out the whole of the work in connection with the entrance to the harbour? According to my estimate there is.
4511. You are depending upon Windang Island to supply that material? To some extent. I have made provision for other supplies in the event of that not being sufficient.
4512. No work is being carried on at present? No.
4513. Whether or not the work goes on any further depends upon the question of raising funds? Exactly.
4514. *Mr. Wright.*] From your knowledge of large works and your experience as a contractor, do you seriously believe it is possible to make Lake Illawarra a perfectly good harbour at a moderate expenditure? I do.
4515. That is viewing all the circumstances of the case? Yes. My late firm have spent about three millions of Government money on public works, and I ought to know something about these matters.
4516. Do you think it could be made a perfectly good harbour at a cost of (say) half a million? Certainly. Of course it depends upon the accommodation you require for your shipping.
4517. You would put your money into such a scheme if the Port Kembla proposal were not sanctioned? Yes. If the Port Kembla scheme is to go on, with the Government at its back, of course I would not.
4518. *Mr. Humphrey.*] How did you ascertain that there would be a difference of 5 feet between high and low water? I took the figures given by the Department. Personally I do not think there is a rise and fall of 5 feet in the Lake.

Cecil West Darley, Esq., Engineer-in-Chief for Public Works, sworn, and further examined:—

- C. W. Darley, Esq. 4519. *Mr. Roberts.*] Would you mind mentioning to the Committee the breakwaters in Australia that you have constructed, or with which you have been connected professionally? Those at Newcastle, Lake Macquarie, Moruya, Trial Bay, and the Clarence and Richmond Rivers.
- 16 Jan., 1897. 4520. Have you been concerned in the construction of any breakwaters in any other part of the world? Not directly, except at Swansea, in South Wales.
4521. In all the cases mentioned have the works been a success? So far they have been a success. A great many of them, of course, are not yet completed.
4522. Do you know anything of the breakwaters in New Zealand—those for instance at Oamaru and Timaru? I have seen them.
4523. The Committee have been informed that they were carried away in heavy weather;—are you aware of the fact, and if so could you tell the Committee the reason? The breakwaters at Oamaru and Timaru suffered some minor injury, but were not seriously damaged. At Napier the breakwater has been very seriously injured. But these breakwaters in New Zealand are constructed on an entirely different principle from that proposed in this case. They are formed of great blocks of concrete which present a straight side to the sea. When a heavy sea approaches a breakwater constructed in that form there is no alternative but for the sea to roll over. It is not broken in any way, but rolls *en masse* over the straight wall with very destructive effect. It is also well known that the sea has great power in lifting large flat blocks of concrete. The flat surface is acted upon by the approaching wave with a hydraulic force which causes the block to slide. In this way blocks of concrete weighing as much as 450 tons have been floated—that is the only term by which I can express it, because it is distinctly a floating action by hydraulic force. This occurred in the harbour of Wick in the North of Scotland. The same wave that moved that block of concrete would not, perhaps, move a 20-ton block if it were angular and irregular. Experience shows that where you make a breakwater of rough work the wave becomes, as it were, torn up, and heavy seas are not so damaging in their effect. Then again, the breakwaters at Oamaru, Timaru, Napier, and other places in New Zealand are very low. They are only made about 8 feet above high-water mark. There is certainly a parapet to the sea face, but most of them are very low, and the water strikes them with terrific force.
4524. From your long experience I suppose you have no hesitation in saying that the breakwater you contemplate constructing, if this scheme be recommended by the Committee and sanctioned by Parliament, will be a success? I have no hesitation in saying so. Where good stone is obtainable I always prefer the random blocks to square concrete.
4525. Referring to the plan of the eastern breakwater, a witness examined yesterday, and I think others who gave evidence before, stated that if the breakwater trended somewhat in a north-westerly direction, it would not only take in some shallow water, but would also afford better protection from the easterly gales. On the other hand, it was stated that if the breakwater was constructed as shown on the plan, there would be some very shallow water immediately inside the breakwater? It is all deep water inside there now.
4526. I think that a witness stated yesterday that the water was very shallow towards the end? It depends upon what you call shallow. If you call 46 feet shallow it is shallow. There is no shallow water whatever about the entrance. It is all over 48 feet. Just close under the eastern breakwater there is a depth of 43 feet.
4527. You do not think you could improve that? No; I do not think it would be safe to take the breakwater further to the west.
4528. It would contract the area of the harbour? Yes; it would send ships closer down to the beach.
4529. The witness alluded to referred to a ridge of rocks just inside the proposed breakwater which he thought it would be as well to put the breakwater upon;—are you aware of the existence of any such rocks? No.
4530. Would any saving of money be effected if both breakwaters were tendered for at once—the northern breakwater and the eastern breakwater? It would be very slight.
4531. Not worth consideration? Hardly worth consideration. There would be a little saving of course.

A contractor who was cutting his work fine would distribute his plant over a larger quantity of stone. But I do not think the saving would be sufficient to justify your committing yourself to the two works at once. 4532. *Mr. Hoskins.*] Do you know the width of the Suez Canal? I think it is about 250 odd feet; but they are continually dredging, and I could not say what is now the exact width. C. W. Darley, Esq. 15 Jan., 1897.

4533. Is there much batter in the banks there? Yes.

4534. No sailing vessels are taken through the Suez Canal? I have never heard of it, except perhaps yachts.

4535. Is it your opinion that if a channel were cut through Lake Illawarra 100 feet wide, that would be sufficient width for the class of sailing vessels that now go to Newcastle to get coal, averaging about 300 feet in length and 45 feet beam; do you think that would be sufficient width in the case of such vessels which would have to be towed in by tug boats? I do not think it would. The width would have to be very largely increased to make it safe for large ships. Before the master of a large ship would allow his boat to be taken through he would want a wider channel.

4536. And in the case of sailing vessels taken through the channel by means of tugs, the channel would have to be wider than in the case of the Suez Canal, where the vessels are propelled by steam? In the Suez Canal the circumstances are more favourable than at Lake Illawarra, because the canal for nearly the whole of its length is through a pretty deep cutting. First of all there is little wind there, and when it does blow it does not strike the hull of the ship, but only the rigging, and the steamers passing through the canal have very little rigging. But on Lake Illawarra there would be nothing above water level, so that the whole of the ship's hull would be exposed to the strong north-north-east and southerly winds, and I am afraid they would find it very difficult indeed to keep a ship under control during its course along the 2½ miles of water.

4537. Do you really think that the trade could be carried on by sailing vessels being towed to and fro in a channel only 100 feet? I feel sure if the work is carried out the company will find it necessary to widen the channel a great deal over 100 feet.

4538. I suppose you are acquainted with the nature of the bottom of Lake Illawarra which has been described as consisting not of sand but of mud;—if sailing vessels were taken up a channel 100 feet wide, even with a good batter, the bottom consisting of mud, would not the action of the tug in towing the vessel, cause an erosion of the banks, continually lessening the depth in the middle of the channel? There is no doubt that the motion of the tug-boat would cause the flattening of the slopes, and therefore the shallowing of the channel. For that reason the channel would need to be very much wider in the first instance. When there is motion in the water there is always a tendency to flatten the slopes.

4539. I suppose you are aware that in the Suez Canal they dredge very frequently along the whole length of the channel in order to maintain the depth of the water;—would there not be a greater necessity for keeping dredges on this proposed channel, only 100 feet wide, the bottom consisting of mud, partly liquid, looking at the action of a steamer in towing vessels up the channel? I think the continual dredging would be a very costly item. The amount of dredging to be done and the maintenance would be very costly.

4540. You are of opinion that the channel, to make it practicable for the traffic of sailing vessels, should be more than 100 feet wide? That is my opinion.

4541. And do you think the banks of the proposed channel would stand unless a retaining wall were built alongside them to keep them in position—looking at the fact of their being composed of mud and of the action of the water on the mud? Not necessarily a retaining wall, but good flat slopes.

4542. It has been stated here to day, and by a contractor, that to carry out the works proposed at Lake Illawarra—to make a channel 25 ft. 6 in. deep for vessels drawing 25 feet of water—would necessitate having a channel 27 feet deep;—do you think that amount of dredging and the dredging also of the basin with an area of 25 acres—do you think that the work could be completed by the end of 1898? It would be impossible.

4543. How long do you think it would take to complete such a work so that the harbour could be continually used without the necessity of dredging, and the consequent stoppage of trade so as to make it useful, and to your satisfaction, and to the satisfaction of every reasonable man? In answering that question I should like to explain that when I last gave my evidence I had not gone very closely into the question of the time it would take to do the work looking at all the surroundings. I said that if carried on with great energy the breakwater and the entrance at Lake Illawarra might possibly be constructed in three years. I have since looked into the question in the light of the different surrounding circumstances. If you had an unlimited quarry, an unlimited quantity of stone coming forward, no doubt my estimate would be borne out. But there are other things beside the mere force of men which have to be considered. There is the possibility of getting rid of a certain quantity of stone, with certain tips in a certain time and there are conditions in this respect which I find would make it impossible to carry out the work in the time mentioned. These breakwaters, as the company's engineer pointed out, are kept very narrow, so that it is not possible to get two tips over the head at the same time, and it would not be possible to get the quantity of material over the tip heads in two years. My experience is that the roads could not be extended and made up quickly enough. I think any contractor will admit that 400 tons of stone a day, in large blocks, is a good output from any quarry. It is not a good quarry at Windang Island, and I doubt whether the contractor could put down 400 tons of stone a day. That would be equal to 10,000 tons a month, and a total of 608,000 tons would mean five years work. That is allowing nothing for loss of time and for bad weather, but assuming that the men work from day to day right through the year of 300 working days. The quantity of 608,000 tons just mentioned, is according to the amended Departmental design which provides for a breakwater a little higher and a little wider. But taking the company's own design of a low and narrow breakwater the quantity of stone is 465,000 tons. At the rate of 10,000 tons a month, that would represent three years and ten and a half months' work. That is not allowing for any loss of time or accident or stoppage of any kind. I believe that is the very quickest time in which the work could be done. Mr. Amos, who is in the room, I think, can bear me out in saying that when he had the contract at Lake Macquarie he had a very fine quarry to work, a much higher and wider quarry than that to be obtained at Windang Island, and the largest output ever made on that work was 400 tons a day, that was his record output; and I am assuming that all through this work he will maintain his record of 400 tons a day, with an inferior quarry, and at that rate the work would take four years.

4544. Do I understand you to say that the face of the rock which could be got at Windang Island would not be a large one or a very satisfactory one? No, because it is not a high quarry. It will not be very high, it will be a long and somewhat straggling face. 4545.

- C. W. Darley, Esq.  
15 Jan., 1897.
4545. Do you know whether there is good stone there? The stone, I thought, looked very well when I saw it, or a lot of it, but I did not get a geologist's opinion about its durability.
4546. You would not undertake to say that it would be a stone that would be inclined to crumble by the action of the water and the weather? I would not like to say that on my own authority. I have heard that stated on good authority.
4547. From your knowledge of the cost of public works, would you give me your opinion as to the estimated cost to carry out to full completion and in a satisfactory manner a channel as well as a dock for the use of vessels drawing (say) 25 feet of water? I should say, allowing for the increased dredging and all, it would cost about £280,000.
4548. The whole work? Yes. That estimate is based on Mr. Amos' contract prices, as supplied to me by the engineer of the company.
4549. *Mr. Humphrey.*] Where did you get the figures for the calculation you have just made as to the period which would be required to complete the work according to Mr. Amos' contract—the 450,000 yards? I took out the quantities from the company's description and design.
4550. The quantities were not supplied by Mr. Amos? No.
4551. Looking at the figures given in Mr. Amos' contract, a copy of which is before you, will you say whether those figures would induce you to modify the evidence you have given as to the period necessary for the completion of the contract? No; I have taken out the quantities carefully.
4552. You are satisfied that not less than four years will be necessary to complete the breakwater? Yes. I may mention that the quantity, according to the contract, will largely exceed the quantity I have stated. According to the contract the estimated quantity would be 718,000 tons.
4553. So that accepting the quantity as appearing in the contract, instead of four years, about seven years would be necessary to complete the work, allowing an output of 400 tons of stone per day? Six years.
4554. On the same basis, what in your opinion, is the shortest period within which the northern and the eastern breakwaters at Port Kembla could be completed? The eastern breakwater could be constructed in five years.
4555. And the northern breakwater? That could be going on at the same time. The two could be worked together.
4556. Then both breakwaters could be completed within five years? Yes.
4557. You have no reason to modify the opinion you have already expressed that Port Kembla would not be altogether a suitable harbour for sailers until both breakwaters were completed? It would not be altogether a suitable harbour for sailing ships without the two breakwaters; but with the construction of the eastern breakwater it would be a sheltered harbour for shipping coal.
4558. You are speaking now of steamers? Yes. But for sailing ships it would not be a desirable harbour until the northern breakwater was also constructed.
4559. Until the completion of the northern breakwater, or until a large portion of the work is done? A large portion of the work, at any rate.
4560. How many years do you think may be fairly allowed for the completion of such portion of the work as would be absolutely necessary to render Port Kembla a safe harbour for sailers as well as steamers? I think after three years sailing ships could go there in fine weather.
4561. And you are of opinion, in regard to Lake Illawarra, that at least five years would be necessary to make the Lake suitable for similar purposes? Before ships could get in it, would take five years. It does not depend merely on the length of time required to construct the breakwaters, but also upon the amount of dredging to be done. According to my own estimate and that of the engineer, the quantity of dredging required would be 5,576,000 tons.
4562. If we have been told that the whole of the work could be done within two years, you do not agree with the witness who has expressed his ability to complete it within that time? No; I do not.
4563. *Mr. Wright.*] Do I understand you to say that 50 tons per hour is the maximum quantity of stone you can get over the tip head? Yes.
4564. That seems a very small quantity? It is not like tipping muck. Sometimes a big stone will block you for an hour. Then you have to carry out ballast, and pack up the rails.
4565. You are satisfied that is about the average maximum? You could not get 400 tons a day over one tip. It would be impossible.
4566. *Chairman.*] You believe it may be possible to construct the breakwaters within five years. After the completion of those breakwaters, what time is it reasonable to suppose will elapse before the scour has made the water at the entrance 28 feet deep? When once you had dredged the inside close to the entrance, so as to let the tide ebb and flow, the scour would be going on concurrently with the construction of the work. You could not wait until the breakwater was finished to get the entrance through.
4567. You believe that at the end of five years, immediately on the completion of the works, there would be a depth of 28 feet of water between the breakwaters? I should think there would be between the breakwaters. I do not say there would be that depth on the bar outside; but there would be, I think, between the breakwaters.
4568. What will become of the sand that is scoured out from between the breakwaters? It will be thrown out to sea. A certain amount of it would form a bar outside, no doubt. There is always that risk.
4569. Can you explain to the Committee how great rivers such as the Hunter, the Clarence, and the Richmond,—take the Hunter, for instance,—how is it that when that river cannot clear itself, but becomes blocked with sand before it gets beyond Nobbys,—Lake Illawarra, which is like a saucer, depending only on the ebb and flow of the tide, is going to carry the sand sufficiently far out to prevent the formation of a bar which will block the entrance? The velocity necessary to carry a sufficient quantity of water to get a tidal range of only about 10 inches in the Lake would be sufficient to maintain a depth of at least 28 feet between the breakwaters, and possibly deeper in places. The sand will be thrown out, and no doubt at times there will be a great tendency for a bar to form round the entrance outside. That has been the experience at the entrance to the Gippsland Lakes. While at times there is a depth of 50 feet between the breakwaters, at the same time there may be only a depth of 17 feet a short distance outside.
4570. Is there anything special in the surroundings at Lake Illawarra to cause you to believe that the same state of things would not wait upon works at the entrance to that lake as we have in existence in  
the

the Gippsland Lakes? I think there is a very great risk of the same thing happening. It is very likely. C. W. Darley, Esq.  
 4571. So that if they carry out the work there will be a great probability of a bar forming eastward from the entrance? A very great risk. That could only be kept down by putting a dredge upon the bar. 15 Jan., 1897.

4572. Which is a difficult matter, is it not? It would not be very difficult with a suction dredge.

4573. Do you think a bar would form there? I do.

4574. And the question of removing it might be a greater or lesser annual expense? It might flatten down at times, but at other times it would gather up again.

4575. How wide is the entrance to be at Lake Illawarra under the company's scheme? 450 feet, I think.

4576. How wide has Sir John Coode suggested that the entrance to the northern rivers should be,—the Richmond and the Clarence, for instance? The Richmond about a thousand feet; for Lake Macquarie he only proposed 250 feet.

4577. And how wide is the entrance to the Clarence? About 1,200 feet.

4578. And Newcastle approximately between 1,000 and 1,200 feet? At Newcastle you cannot call the entrance effective at much less than 800 feet.

4579. And here we have an entrance of 450 feet? Yes.

4580. About half the width of the entrance of the ports just mentioned? Yes.

4581. And therefore inferior to that extent? It is not for the sake of the port that they have such a large entrance to the Clarence and the Richmond but simply to let out the floods.

4582. You think then that 400 feet is a big enough entrance to a port? No, I do not say so.

4583. You said that the entrance to Lake Macquarie was 250 feet wide? I think it is 240 feet.

4584. Why did Sir John Coode make it so narrow? I could not say.

4585. Is the basin in Lake Macquarie larger than that in Lake Illawarra? Yes, rather larger.

4586. Is the body of water in Lake Macquarie larger than that in Lake Illawarra? Yes.

4587. Have you any exact calculation as to the water that would go into Lake Illawarra in an ordinary tide? I think I communicated to the Committee the result of some enquiries I made.

4588. You were doubtful about it? You cannot fix anything definite. There are so many unknown quantities that it is difficult to give a definite answer to a question of the kind.

4589. If there is not enough water flowing in and out of the Lake between the retaining walls or the breakwater, the result will be what we know—a sand flat across the mouth;—it is only the scour that keeps the passage open? The scour keeps it open and the breakwaters will prevent the sea from shutting up the sand mouth again. That is the object of the breakwaters; they will prevent the action of the sea from shutting up the entrance.

4590. There were some works carried out at Lake Macquarie, were they not? They were commenced to some extent, and then stopped.

4591. You regard the opening of Lake Illawarra as a simple engineering feat? It is simple; the thing can be done.

4592. It can be done for £300,000? I think so.

4593. It can be done for £300,000, and within from four to seven years? From five to seven years.

4594. Would there be a possibility or a probability of a bar forming in front of the entrance to Lake Illawarra when the work was completed? A probability.

4595. How is it proposed to get across the entrance to Lake Illawarra while the process of scouring is going on, in order to get the material from Windang Island on to the northern breakwater? If I were the contractor I would construct a viaduct or a bridge across.

4596. A viaduct would not be affected by the scour? No. You could drive the piles down pretty well and carry the bridge across.

4597. If you were advising the Government in regard to carrying out a scheme, would you advise them to carry out the Lake Illawarra scheme or the Port Kembla scheme? The Port Kembla scheme.

4598. Will you give your reasons, briefly, comparing the two places? I think Port Kembla is a harbour that would require very little maintenance. It is a harbour that can always be safely taken in all weathers by sailing ships or steamers, if it is made a close harbour. There will be very little cost of maintenance after the first construction. In the case of Illawarra there would be a constant expense for dredging and maintenance.

4599. Brushing aside the question of where the money comes from for the development of the south coast, are you of opinion that the place at which to spend the money most wisely is Port Kembla? That is my opinion.

4600. If the eastern breakwater alone were constructed at Port Kembla would it be sufficient for the coal trade in steamers? Yes; it would give shelter for the coal trade carried on by steamers.

4601. Could sailing vessels, with a tug in attendance, safely load coal behind the eastern breakwater? If sailing vessels go there you must give them accommodation to discharge their ballast.

4602. Leaving the question of discharging ballast out of consideration, would it then be safe? I am quite satisfied that no master of a ship would like to take his vessel in there.

4603. Not a large sailing ship? No; without more shelter than one breakwater.

4604. Is there anything else you think the Committee ought to know? When I came into the room I heard Mr. Amos, speaking of the proposed Illawarra channel, mentioning a depth of 25 ft. 6 in. below mean tide level. I would point out that a depth of 25 ft. 6 in. below mean tide level would only represent a depth of water on the bar of 22 ft. 6 in. at low tide.

4605. *Mr. Lee.*] It is provided that the depth should be 25 ft. 6 in. below the mean tide level? That is a line that is common to all states of the tide—halfway between high and low water; and that is really the normal level at present of Lake Illawarra or any lake that has only a limited amount of communication with the sea. It practically stands at mean tide level. When you get 25 ft. 6 in. below mean tide level that is all the contractor is asked to do. That really means that the company should only have 22 ft. 6 in. through the entrance at low water. If the contractor gave that depth he would be complying with the contract. I will explain to the Committee (*by diagram*) that if the rise and fall caused by the opening of the Lake were 1 ft., that would be 6 in. above and 6 in. below the present mean tide level. It would be joined with the high tide outside by a tidal slope which would leave the entrance at the bar at 22 ft. 6 in., the water having fallen at that point 3 ft. below mean tide level at low water.

WEDNESDAY, 27 JANUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Henry Chamberlaine Russell, Esq., C.M.G., Government Astronomer, sworn, and examined:—

H. C.  
Russell, Esq.,  
C.M.G.

27 Jan., 1897.

4606. *Chairman.*] It has been suggested that the Committee should avail themselves of any information you can furnish with regard to the force of waves on the eastern coast of New South Wales;— have you a statement with regard to that? Yes. I have no measures of my own; I have not had the opportunity of making them. But Mr. R. Price Williams, the eminent engineer, called at the Observatory some few years ago specially to give me the result of his observations between here and New Zealand, stating at the time that he thought the information might be useful. The result of his measures was that in a heavy storm between New Zealand and Sydney his aneroid indicated a rise and fall of the steamer of from 50 to 54 feet. Of course the steamer would not rise quite so high as the waves, because on the top of the wave it would sink deeper into the water than it would in the hollow of the wave. Another statement that comes to me, not so directly, but which I believe is reliable, is that Captain Parker, of the ship "Hermione," off the coast of Queensland, gives the height of waves from his observation as from 60 to 65 feet. The late Sir John Robertson told me when he was living at Watson's Bay that in a heavy storm a great quantity of water had been thrown over the Gap, coming in at the back of his property there. With the assistance of Pilot Clear, I had the rocks measured the other day, and the perpendicular rocks at the Gap measured 72 feet high. These are the only facts I have in regard to the coast.

4607. *Mr. Wright.*] Would the water Sir John spoke of be a body of water or only the spray? He said that large quantities of water came into the yard and washed away his back fence, and I saw myself that a great quantity of water had gone in there, when I afterwards visited the spot. But the pilot there seems to think that nothing but the spray and the tops of the waves come over. Of course, if it were blowing very hard the wind might carry large quantities of water over. There are some definite measures of waves on the coast of Spain. In a very heavy gale on the coast of Spain a competent observer went on shore and was able to determine exactly the height of the waves looking at them across the bay as they passed a perpendicular wall of rock running along the coast, and he found that the waves rose 21 feet above mean sea-level. Assuming that the trough of the waves is about the same, it would make its height something like 42 feet. Another fact was that there was a lighthouse at the entrance to the bay rising 133 feet above the mean level of the sea, and that the waves were running up to the very top of it, and over it, and throwing the spray 20 feet higher. It is recorded of the Eddystone Lighthouse that in a heavy storm the solid part of a wave has gone right over the top of it, and that on one occasion during a heavy storm a large fog bell hanging up outside the lantern was torn away and carried off by a wave, showing that at that height—100 feet above mean sea-level—the waves were possessed of very great force.

4608. *Chairman.*] Do you regard the waves on the northern coast of Queensland and the waves between the eastern seaboard of New South Wales and New Zealand as giving a fair indication of the waves to be expected at such a port as Kembla? Yes, in very heavy gales.

4609. Have you any information with regard to the height of the waves at Colombo? No; I have not.

4610. Are the waves on the eastern coast of New South Wales heavier than in other parts of the world where breakwaters are erected? That I could not say. I know that shipmasters consider the seas in a gale here as heavy as they get them anywhere else.

4611. Are they heavier? I have never heard that statement made.

4612. In your opinion the gales would be as heavy on the east coast of Australia as elsewhere? Yes.

4613. But you have no information that causes you to believe they would be heavier? No.

4614. *Mr. Wright.*] Can you give the Committee any information about the force of the impact of a big wave? I am afraid I cannot remember the figures exactly. I read a statement about some experiments made by Stevenson, and the pressure to the square foot was somewhat startling.

4615. Could you obtain the information for us? Yes.

Mr. William Smith Thompson, Dapto, sworn, and examined:—

Mr. W. S.  
Thompson.

27 Jan., 1897.

4616. *Chairman.*] You are a resident of Dapto? Yes.

4617. How long have you resided there? Over forty years.

4618. You have a good knowledge of Lake Illawarra? Yes.

4619. You desire to inform the Committee with regard to the natural protection at the mouth of Lake Illawarra? Yes. In order to substantiate my statement, that I believe that the entrance of Lake Illawarra is well protected, I would direct attention to the map, which shows that any sea coming from the south will be broken in the first instance by Bass Point, and in the next place that Red Point and the islands give protection on the north. I would also point out that on Windang Island there is a large quantity of good soil. If heavy seas broke on Windang Island that soil would not be present. I desire further to make a comparison between Windang Island and Shellharbour with regard to the force of the seas, and to state that in Shellharbour there are fig-trees and fir-trees growing close down to the beach, whereas in Wollongong, right up in Market-square, the effect of the wind can be seen upon the trees, which show a bend from the south-east. In my opinion the mouth of Lake Macquarie, if the breakwaters were constructed, would never fill up. The reason that it fills up at present is that so small a quantity of water comes down Mullet Creek and Macquarie Rivulet that sufficient water does not come into the Lake

Lake to keep the entrance open. Near Bevil Island, which is just west from where the breakwaters would be, there is even now 17 feet or 18 feet of water. I desire to direct the attention of the Committee to the fact that any coal lying south of Kembla is not on private property, as has been stated. Most of the farms are bounded by the face of the mountain; they do not go over the mountain, and therefore in most cases a few chains would bring the workings out of private land on to Crown lands. With reference to the coal lying west of Lake Illawarra, I am not sufficiently expert to express a definite opinion; but I know that Mr. Biggar sunk several drives in three various seams, and I know the workings carried out by him, and also some work done by Mr. Larkin some thirty years ago. I have seen this coal tested locally by residents, who were of opinion that it was a useful commercial article.

Mr. W. S. Thompson.  
27 Jan., 1897.

Mr. Evan Robert Evans, farmer, Dapto, sworn, and examined:—

4620. *Chairman.*] What are you? A farmer, resident at Dapto.

4621. You have a good knowledge of the Dapto district and of Lake Illawarra? I resided there over fifty-five years. I desire to state to the Committee that I believe Lake Illawarra is the most suitable place to make a port anywhere in the Illawarra district. I have spent a considerable amount of time on the lake, and I know that any alterations in deepening or cutting a channel would not be interfered with by rock. I have no objection to Port Kembla, but I think that a very strong breakwater would be required to make it safe. The lake is quite different; it has the point of Shellharbour and then Windang Island, and a breakwater from Windang Island to the shore—that is where the rough weather comes in—would make the lake safe. When once it was dredged out there would be a safe harbour where vessels could lie with safety. On the other hand, Port Kembla is more open and more exposed to the weather. Then we know that there is a large quantity of coal in the vicinity of the mountains. The top of the mountains consists of stone, timber, and coal. Some person gave evidence to the effect that there was no good coal south of Port Kembla, but I saw the report of a test made in Sydney of coal in reference to which Mr. John Evans gave evidence; and other coal has been tested though no mine has been opened of any magnitude to carry on operations. I would like to point out that Lake Illawarra as a harbour would suit Kiama, Shellharbour, and those other places as well as the northern end of the district. There is any amount of coal at the Macquarie, west of Albion Park. In fact a mine has been working for years supplying the factories at Albion Park. Coal has been taken out, but it has not been sent to Sydney because there are no means of transit. This coal could be shifted to Lake Illawarra. Then, again, there is any amount of coal on the Jamberoo Mountains, and that also could be shipped at Lake Illawarra.

Mr. E. R. Evans.  
27 Jan., 1897.

4622. *Mr. Wright.*] Have you anything to say against Port Kembla? It would take a great deal more money to make a safe harbour at Port Kembla than it would at Lake Illawarra.

4623. *Chairman.*] In regard to Port Kembla, you believe that the seas would be too heavy to permit of a breakwater standing, and that when the eastern breakwater was erected the water would not be still but there would be a range in it? Yes. I have some knowledge of Shellharbour, and have had business relations in connection with the steamer trading there and been a director of the company. It has been no unusual thing for boats to be able to lie at Shellharbour when they could not approach the Port of Wollongong or Kiama. I mention this to sustain the position I took up in the earlier part of my evidence as to the protection afforded to Lake Illawarra by Bass Point.

Mr. John Reed, Dapto, sworn, and examined:—

4624. *Chairman.*] I believe you are a resident of Dapto? I have resided there for the last twenty-two years.

4625. Have you a full knowledge of Lake Illawarra? I have a very good knowledge of it; I have been many times on the lake.

4626. You have heard the evidence given by Mr. Evans and Mr. Thompson? Yes.

4627. Do you agree with that evidence? I do.

4628. You believe it to be correct? Yes.

4629. Do you desire to add anything to it? No. We are not like dogs in the manger. We do not want to interfere with the Kembla harbour scheme, but we want to try to push on Lake Illawarra, because we believe that the gentlemen who are promoting the harbour works there will carry them out; and I believe we shall have a harbour there many years before they get one at Port Kembla. With regard to the coal, I have burnt coal from most of the collieries there. Coal which I have obtained merely from the outcrop I have proved to be as good as the coal I would buy from South Clifton. I know of many mines south of Kembla where the coal is quite as good as any in the district.

Mr. John Reed.  
27 Jan., 1897.

Mr. William John Wiseman, Wollongong, sworn, and examined:—

4630. *Chairman.*] You are a resident of Wollongong? I have lived there for thirty-five years.

4631. What is the evidence you desire to place before the Committee? I notice from the reports in the papers that a great deal of objection has been raised to the construction of a harbour at Port Kembla, on the ground that it would interfere with vested interests at Wollongong. Having a large interest in that place, both personally and as trustee for others, I wish to say that, as far as I am concerned, it will not at all interfere with the interests of Wollongong to have a harbour at Port Kembla. I have also had an intimation from about fifty residents of Wollongong, principally storekeepers and owners of land, that they do not object to the construction of a harbour at Port Kembla. Port Kembla is no further from Wollongong than about 3 miles, and a harbour at Port Kembla would no more interfere with the interests of Wollongong than does the railway terminus or Circular Quay interfere with the business part of Sydney. Port Kembla will be connected with the railway system and with the defence works, and the port of Wollongong, being connected with the Port of Kembla, there will be almost, as it were, one harbour, and I cannot see how the interests of Wollongong would be interfered with. I know that several wrecks took place at Bellambi. I was at Bulli when the jetty was put up, and shortly afterwards several wrecks occurred there. At Wollongong also there have been many wrecks. At Shellharbour there have been wrecks and also at Kiama. I suppose there has been as much coal shipped at Port Kembla as either at Wollongong, Bellambi, or Bulli, and yet there has never been a wreck or any loss of life

Mr. W. J. Wiseman.  
7 Jan., 1897.

Mr. W. J.  
Wiseman.  
27 Jan., 1897.

life at Port Kembla. Before a jetty was erected at Port Kembla, and before it was made a port, I have seen vessels lying at anchor there in rough sea when they could not get into Wollongong. When the ball has been raised keeping vessels out of Wollongong and other ports, they have been riding safely in Port Kembla, and there have been no wrecks there during the whole of the time. I have noticed from reading in the papers reports of the evidence taken by the Committee, that several gentlemen have been raising objections to Kembla. I cannot understand this at all, seeing that if those interested in Lake Illawarra really meant anything at all they ought to have commenced their harbour six years ago. That is the time, I think, when they had their Bill passed. I think that the efforts of the Lake Illawarra company are not likely to be crowned with success, looking at their proceedings in the past. I notice that Mr. Atkinson, an alderman of Central Illawarra, stated in his evidence that he was employed by a surveyor when an iron rod or borer was put down to a depth of something like 30 feet from the surface of the water, or to a depth of about 20 feet into the silt, the average depth of water being about 10 feet. He said that this rod was placed down near the entrance and inside the lake. I do not see that he said anything about its being placed half a mile inwards from the entrance.

4632. Can you make a definite statement as regards the bottom of the lake? My belief is that 6 feet from the surface you will find the bed-rock—that is just inside the sandbank, half a mile inwards to the lake. I have been there several times getting oysters, and I feel positive there is rock there.

4633. Can you give us the reasons for believing that rock is to be found some half dozen feet under the surface within half a mile from the sandbank inwards? I have been told it several times, and I think it could be proved. I do not think that Lake Illawarra would be a better and safer harbour than Port Kembla. In order to make it clear to the Committee how heavy the seas are that run at Wollongong, I may state that I witnessed the wreck of a vessel whose anchors failed to hold, and she was thrown on the rocks; loss of life occurred on that occasion. A port of refuge should be made at once. Since the wreck of sailing vessels at Bellambi and Bulli sailing ships have not been able to load at the jetties because it is so unsafe. The coal trade is now done principally by steamers and they have to keep up steam while loading, in case of a storm. I remember the Bulli jetty being carried away with forty waggons on it. The waggons alone represented a loss of something like £2,000, and in addition to that the whole of the jetty was swept away. The same thing has occurred at Bellambi several times, but in Port Kembla the jetty has very seldom been swept away. At Bulli on one occasion there were two steamers half-loaded when a storm came up and they had to go out to sea. One of them was never heard of again, and the other was found at Broken Bay. I make these statements to show that we require a port of refuge at once. We have nothing of the kind on the coast right away from Jervis Bay to Sydney. The Members of the Committee who have been down there must have seen that it is highly dangerous to load coal at these jetties without proper protection. Then with regard to the financial aspect of the question, I am of the opinion that a harbour ought to pay well. During the short time that the Wollongong Harbour Trust was in existence we received between £2,000 and £3,000 in harbour dues. For two years we received £3,000 a year, and then the revenue dwindled down to £2,500. At present the Corrimal Company pays £3,000 a year to the Railway Commissioners for the carriage of coal to Port Kembla and Wollongong. I am certain that if a harbour were made at Port Kembla for the shipment of coal the revenue would be quadrupled in a very short time. Vessels anchored there would be quite safe, and this would be recognised by the insurance companies. I do not say that I do not believe in the Lake Illawarra scheme. I believe the lake people ought to go on with their scheme. I believe they will have plenty of trade, and they have the smelting-works there. I do not think we should throw any obstacle in the way of the lake scheme. I took objection to it in the first instance, on the ground that the Government were going absolutely to hand the whole thing over to the company. That was the only opposition that was given to the lake scheme at any time. I do not think anyone is opposed to the lake scheme or to the company at the lake, but let them go on and do their work, if they really mean to do it.

4634. *Mr. Wright.*] You said just now that the Government were drawing £3,000 a year from harbour dues for conveying coal to Kembla and Wollongong;—are you positive of that? I was a member of the Wollongong Harbour Trust for five years, and heard the balance-sheets read.

4635. Does that sum represent harbour dues or railway freight and harbour dues combined? It comprises revenue from harbour dues and the pilot service and railway freight from Corrimal, total £6,000.

4636. You spoke just now of severe storms having wrecked the jetties at Bellambi and Bulli;—do you think these storms would have any serious effect on a strong breakwater at Kembla? I do not think they would.

4637. What effect did they have on the Wollongong work? I think if the Wollongong Harbour Trust Commissioners had had sufficient means to purchase proper plant, and had been able to call for a good contract, they could have put a breakwater there that would have stood any gale.

4638. If it has been stated to the Committee that at Wollongong blocks of concrete 20 tons weight have been rolled about the beach like pebbles, do you think that is a fact? Not a single one has rolled 10 yards away from the mound it was put on. Unless it has been placed there by the engineer, you will not find a single block 10 yards away from where it was first laid down.

4639. I understand you to say that the concrete blocks placed on the proposed breakwater at Wollongong have stood all the seas that have dashed against them? On one occasion just the end moved out, that was all; but the blocks were placed there in an unfinished state. The part that was finished did not move, and the repairs that have been done only recently were connected with a part of the work that was unfinished. The blocks are thrown in, and there is a sea-wall without any protection—no apron, or whatever it is called.

4640. Is not that wall protected somewhat by a reef of rocks? No; it is right in the open sea.

4641. And very strong gales have produced no detrimental effect on that work? No; not that I can see.

4642. And you judge from that that a stone breakwater at Port Kembla would stand? Port Kembla is more protected, and a stone breakwater there would be bound to stand very much better than at Wollongong. There is another thing I should like to say. The engineer for the lake harbour scheme took the contract to erect jetties at Kembla and Bellambi. He was an Associate Member of the Institute of Engineers, and in his evidence before a Parliamentary Committee he stated that after watching the loading at Kembla he was satisfied that during the year only five days were lost from north-easterly weather.

4643. *Mr. Hassall.*] With regard to the Lake Illawarra scheme, I understand you to say you have no desire to see any obstacles thrown in the way of the work being carried on? No desire at all.

Mr. W. J.  
Wiseman.

27 Jan., 1897.

4644. Do you not think that the construction of a harbour at Port Kembla would be the biggest obstacle you could throw in the way of the Illawarra scheme? I do not think so.

4645. In the face of another harbour being constructed immediately alongside of it, do you think that people in England will be likely to invest their money in such an enterprise at Illawarra? If I remember correctly, about twelve or eighteen months ago a cablegram came from England saying they had got all their money, and they were prepared to spend their money then. Well, where is the money, and why do they not go on with the work?

4646. Do you think there is room for two harbours so close together? It would take about 12 miles to get round.

4647. But how far are the two places apart? That does not make any difference—you would have to go right round to where they ship the coal.

4648. I suppose you are aware that there is no agreement entered into between the smelting company at Lake Illawarra, who have built their works on the shores of the lake, and the Illawarra Harbour and Land Corporation in regard to their using that place as a port? I do not know.

4649. Does it not stand to reason that if a port were constructed at Port Kembla and the smelting company desired to get their stuff to the smelting works, they would make arrangements with the Government to run a line of railway to their works? No. They would be very poor business people to do so seeing that within about 2 miles or about a mile and a half there is a shipping place, and surely they would never go right round to Kembla, a distance of something like 12 miles. I do not think that is going to block them, because we heard to-day from the Dapto people about the coal lying in the Jamberoo Mountains and in that direction. We have sufficient there to keep two or three harbours going. Look at the large quantity of coal that is shipped at Newcastle? As far as I can see, the lake company are not going on with the harbour; otherwise, why have they not gone on with it before. It is only humbug; anyone can see it.

4650. You say you have no desire to throw obstacles in the way if there is any possibility of the work at Illawarra being carried out;—would not the very fact of the construction of a harbour at Port Kembla knock the Illawarra scheme on the head? I do not see why it ought to do so. They have any amount of land there, and they have the whole thing free to their hands, and according to their account the work is not going to cost them a great deal.

4651. Practically, from your own knowledge, do you not know that a scheme has been entered into for the purpose of providing a harbour on the coast? Yes.

4652. In the event of another harbour being formed in the immediate vicinity, do you not think that would have a detrimental effect upon the scheme? I do not see why it should.

4653. Would you invest any money in the scheme under those conditions? I am thankful to say I have just made sufficient to keep me comfortable, and I am not going to speculate.

4654. *Mr. Farnell.*] You say that on one memorable occasion there was a boat that could not ride in the harbour at Wollongong, while at the same time there were vessels safely lying in Port Kembla? Yes. When vessels could not enter Wollongong I have seen them anchored in Port Kembla. That is before there was a jetty there.

4655. For how many days in the year would you say that the harbour at Port Kembla as at present existing was safely available for shipping? I could not say.

4656. If a statement were made that for the whole of the year, with the exception of thirty days, the harbour was available and safe, would that be correct? I think so, because we do not have thirty storms during the year.

4657. What would be the most dangerous or inconvenient wind that could affect the harbour of Port Kembla under existing circumstances? I think the south-east winds.

4658. Do they get any easterly winds there? They get north-easterly.

4659. No easterly? Very seldom. Perhaps once in the whole of the twelve months we get a good easterly gale, and then it baffles the masters of vessels to lie in shore, and they must get out to sea.

4660. If it were decided to establish the proposed harbour at Port Kembla, do you think it would be the means of diverting any of the traffic at present going to Wollongong? I do not think so.

4661. You think that the companies at present taking advantage of the facilities afforded at Wollongong Harbour would still continue to do so? I think so; and I think they would load also at Port Kembla, because you cannot take a vessel into Wollongong of more than 800 tons burden, while you can take a vessel into Port Kembla of 8,000 tons. The owners of Mount Pleasant and Mount Keira who use Wollongong also load vessels at Kembla. Coal from Wollongong and Mount Pleasant goes to Kembla now, so that they would still use Wollongong as well as Kembla—that is for smaller vessels.

4662. You think then that the trade of the port of Wollongong would not be interfered with? Not very much; probably it would a little, but not very much. At Mount Pleasant they have a narrow-gauge line, and it would not pay them to run it down to Port Kembla. You could not run the railway waggons, or even the Mount Keira waggons, on it.

4663. *Mr. Fegan.*] Has there been much agitation in the southern district for some port of refuge or some better facilities there? There has been for many years.

4664. I suppose that was one of the reasons why the trust was formed at Wollongong? Yes.

4665. In answer to Mr. Hassall you said that as far as you were personally concerned you were not opposed to the Lake Illawarra scheme? No, I am not. I should like to see it carried out myself.

4666. You have not come here to speak against the scheme as laid before this Committee in reference to the Corporation's scheme? No.

4667. But you say there is a doubt as to whether the company intends to carry out the work? There is a doubt.

4668. In what way? Simply because they have not gone on with their work.

4669. Have you been on the lake very often? Yes.

4670. You know the locality well? Yes.

4671. Have you any property about there yourself? None whatever.

4672. Therefore, as far as that scheme is concerned, personally you are disinterested? Yes.

4673. Do you think that £200,000 or £300,000 will complete that scheme? They reckon that £300,000 would do it, but of course I could not say.

4674. You have been a member of the Wollongong Harbour Trust? Yes, for five years.

4675.

- Mr. W. J. Wiseman.  
27 Jan., 1897.
4675. In view of the work done in connection with the Wollongong Harbour Trust, is it your opinion that £300,000 will cover the cost of the necessary work at Illawarra? I think myself it would take £300,000 to open the entrance—to cut away the rock I was speaking about this afternoon.
4676. The amended proposal is, as you are aware, not only to dredge a 15-foot channel but to dredge to a depth of 27½ feet;—do you think that £300,000 would cover that expense? I am afraid it never would.
4677. Do you think that the people of the south coast district, not only the colliery-owners, but other men with other interests, should wait until 1898 to see whether or not the company will carry out this scheme? I think we have already had proof enough that they do not mean to go on with the work.
4678. Do you think the coal trade and other interests should wait until they see whether or not this work will be carried out? I do not think they should wait.
4679. Are you of opinion that the interests of the southern coast districts are of such value that something should be done to facilitate shipping and make a harbour of refuge there? I think so; I think we ought to have a harbour made there immediately; I think we have waited quite long enough.
4680. Do you think there is room for two harbours down there? I think there would be room. I think it would pay the Lake company, and I think it would pay the Government too, simply because the southern coal supercedes the northern coal—that is for steam purposes. Therefore I believe that if we had proper facilities for loading coal the trade would increase. As far as I understand, the smelting company would almost keep a coal company going.
4681. Then there would be no necessity for a shipping place? But we have no ore to smelt down there. They would have to bring the ore into the harbour. They cannot smelt it without coal.
4682. If the trade is to consist of ore sent from Broken Hill to Lake Illawarra, what are you going to send away? We will send away coal. Our coal is required now for steam purposes, for which it is considered to be the very best in the Colony.
4683. If two harbours were constructed, how would you find trade for them: seeing that Newcastle with all its appliances only ships about 3,000,000 tons per year, where is this district going to get the trade for two harbours? The only answer I can give you is that I do not believe we are going to have two harbours; I believe we shall get only one.
4684. Do you think it possible for trade to develop to that extent that it will pay to construct two harbours in the southern district? I think it ought to; seeing that we in Wollongong, with our small harbour, are able to collect a revenue of £3,000 a year, having a port like a little basin only about 13 ft. or 14 ft. deep.
4685. Do you know the output of the southern mines? I think that in a good time it is about 900,000 tons a year.
4686. At Bellambi would it pay the company to ship at their own jetty? If we had a safe harbour with proper facilities for loading, I feel satisfied it would not pay any of the companies to have jetties on the coast to load there.
4687. Do you think it would pay the owners of the Bulli Colliery who ship at Port Bellambi, to run their coal down to Lake Illawarra should the lake scheme be carried out, or would it pay them better to send their coal to Port Kembla, being so many miles nearer? They would go to Port Kembla.
4688. We are told by the Engineer-in-Chief for Public Works that there is no room for two harbours on this part of the south coast—that it must be either Port Kembla or Illawarra. Is it fair that the south coast people should wait for the construction of the harbour at Illawarra, or should the Government go on with the proposal before this Committee and construct a harbour at Port Kembla? My opinion is that they should go on with the Port Kembla scheme.
4689. But if the Port Kembla scheme goes on, and the Lake Illawarra is also carried out? I do not believe that the Lake Illawarra scheme will be carried out.
4690. For what reason? Simply because they have had six years to go on with the work, and they have not attempted to do anything. They spent about £2,000 over Windang Island, and then they stopped.
4691. Have they not constructed a railway? Yes.
4692. Is not that spending money towards the completion of the scheme? It looks to me like a blind. Why did they not go on with the harbour first.
4693. For what reason may they be adopting this blind? Well, I do not know; they have a large quantity of land to sell there for one thing.
4694. Do you think the chief reason then for holding back is in order to sell building allotments there, or something of that kind? It might be, for what I know.
4695. You cannot say? No, not particularly.
4696. You would not like to give an opinion? I think the Government, under the terms of the Act, ought to appoint somebody to look through their accounts and see really what they are doing, and what money they have spent on the harbour. The Government have power to appoint a consulting engineer.
4697. You really cannot say why this company is not carrying out this scheme? I cannot say. I suppose if they had the money they would be able to go on with it; but they have not.
4698. You say you have been on the lake often and know the property well;—how far would you have to sink down before you got rock? I think the depth inside the lake is right enough, but at the entrance for about half a mile inward, at a depth of 6 feet, it is nothing but rock, and it will take hundreds of thousands to make an entrance to a depth of 27 feet, and it would take, I suppose, ten years to do it.
4699. Do I understand you to say that from the entrance, for a distance of half a mile inside, there is only about 6 feet of sand before you come to the rock? I think so.
4700. Do you know the thickness of the rock? I suppose that to get a depth of 27 ft. you would have to go 21 ft. into the rock. I know that in the lake there is an average depth of 10 ft. of water and that outside there is something like 30 ft. of water. If the rock was at a depth of 27 ft., a channel cut in the sand would be worn down to the full depth of the bed-rock and the whole of the sand to that depth would be carried away; but as a matter of fact it is not carried away to a greater depth than 6 ft.
4701. You are sure then that there is only about a depth of 6 ft. of sand before you come to the rock? That is my firm belief.
4702. If that be the case dredging operations will not be so easily carried on? They could not get their dredge in there at all. They would have to get their dredge in by the railway and put it on the lake.
4703. Have you any property at Port Kembla? No; not within 6 miles.
4704. You came here as a resident of the district to advocate what you believe to be in its best interests? Yes; I have been there for many years and have always taken an active interest in the place, having been an alderman there for about thirty years.

Andrew Love, Esq., Civil Engineer, sworn, and examined:—

4705. *Chairman.*] What are you? A civil engineer.

4706. *Mr. Hoskins.*] Have you been engineer for Mr. Amos, the contractor for the Illawarra Harbour works, since the scheme started? Yes.

A. Love, Esq.

27 Jan., 1897.

4707. How long have you been engaged with Mr. Amos as an engineer? Off and on for about 11 years. While Messrs. R. and A. Amos were constructing heavy railways throughout the colony. I was then in their employ as engineer and manager of works.

4708. Where? The first contract was between Tamworth and Uralla, the next was between Newcastle and Gosford. I was engineer and manager for them there, and have been on other works.

4709. Have you ever been employed by Messrs. Amos or any other contractors in connection with marine work or harbour work? No.

4710. You have never had anything to do with harbour works before? No.

4711. Have you any statement you would like to make to the Committee? I should like to say one or two words with regard to the quantities in connection with the Illawarra Harbour contract, and the time it will take to do the work. I have checked the quantities of the engineers for the Lake Illawarra company, and I find that in the breakwaters 215,177 cubic yards, or about 404,000 tons of stone will be required. This includes both the northern and southern breakwaters, and also the training-banks. The length of each breakwater is about half a mile, speaking roughly.

4712. What will be the width at the base and at the top? The width at the base will depend entirely on the depth, but the width on the top will run from 10 feet, increasing towards the end of the breakwater.

4713. How far will the training-wall be carried inside the lake beyond the breakwaters? It is a continuation of the breakwater. It is really one bank, except that it is lighter stone.

4714. How far beyond the breakwater and into the lake will it be taken? I think about 13 chains.

4715. Where is it proposed to get the 404,000 tons of stone from? From Windang Island if the stone proves suitable. There are different quarries around containing suitable stone; some within  $1\frac{1}{2}$  mile and others within 3 miles.

4716. How far would Windang Island be from where you will erect the breakwaters and training-wall? 20 chains to the nearest point.

4717. That would be the nearest quarry where you would get stone? Yes. We are not confined to that.

4718. But you are not sure whether the stone from Windang Island would be suitable for your work? I cannot form an opinion as to that; that rests with the engineers for the company.

4719. If the stone at Windang Island is accepted how do you propose to convey it to the breakwaters and the training-wall? By a training-bank of which part has been made. It is an embankment made to the nearest point on the breakwaters and about 10 chains of it have already been made.

4720. How are you going to get the stone across the water from the island? At present there is a sandbank there.

4721. Do you think you can depend upon the sandbank to be used as a roadway to convey the stone from the island to the breakwaters and training-wall? Yes, undoubtedly.

4722. During the whole time that the works are under construction? Yes. There is a part there now made in quite a rough unfinished state and it has stood all weather, though there has been a heavy storm since it was made.

4723. If this place is already made will not the sand you are going to use to convey the stone from the island to the breakwater be an obstacle in the way of the entrance to the channel? Not after the breakwaters are made. The sand over which we shall convey the stone will be outside the breakwaters altogether.

4724. Would the sandbank over which you are going to take the stone limit the width of the entrance? No; it has no connection with it at all.

4725. How many tons of stone a day do you think could be quarried from Windang Island and taken over to the breakwaters and training-wall? It depends on the length of face you have in the quarry and also the height. If the stone is taken from Windang Island you can have a face about 1,000 ft. in length to 33 ft. in height. It just depends upon the number of men you put on or the capital you could employ. It is the quantity of stone you can tip over the ends of the breakwaters—that I can give you.

4726. Have you inspected Windang Island? Yes.

4727. Have you ascertained the length of face you can have in the quarry and the depth of the quarry? Yes. By cutting through the island in the first place you could get three working faces.

4728. But you cannot say whether Windang Island will be accepted as the place from where the stone will be taken? No.

4729. Where are the other places? There is one place within 2 miles of it; that is on the southern side of the entrance—what they call Wild Dog Hill. That is within 2 miles of the breakwaters. Another one is to the north again, within about 3 miles.

4730. Have these other quarries been properly explored to ascertain what kind of stone can be obtained and what length of face you can get? On either of them you could have any length of face; they are long hills and high as well.

4731. How many tons a day on an average could be taken from Windang Island, or from either of these two other quarries, to the breakwaters and training-wall? Mr. Darley said 400 tons a day, but that is over one tip; that is doing good work I should say. But there would be four tips. There would be two tips over the training-banks where you strike them, and two tips over the breakwaters. They will be all worked simultaneously, so that there will be four tips, and taking Mr. Darley's figures that would be 1,600 tons a day. I do not say that would be done.

4732. If Mr. Darley estimates that only one road can be used from the breakwaters to Windang Island, how can you put in four or five roads? There will be one leading road—that is to connect on to the breakwaters. Then from where you strike that point there will be one tip back on the southern breakwater, and one forward into the ocean, and the same on the northern breakwater.

4733. If the stone on Windang Island is found unsuitable how much longer would it take to get the requisite quantity of stone (404,000 tons) from the two other quarries? It would not take any longer; it would take more plant—extra waggons.

4734. How far are these other two quarries from the quarries the Government propose to use in their scheme for making a harbour at Port Kembla? The one on the northern side of the harbour would be within about one mile or a mile and a quarter.

4735. A mile away from Port Kembla? From where the Government propose taking the stone. We inspected that at the same time. It would be within 4 miles of the Illawarra Harbour.

- A. Love, Esq. 4736. Having suggested so many roads to be brought into use in this work are you quite sure there would be sufficient face of quarry either on Windang Island or the other places—sufficient room to lay down all these roads as well as sufficient room to find employment for all the men you could utilise? Undoubtedly.
- 27 Jan., 1897. 4737. What work has the contractor done towards opening out these quarries? He has not done anything except at Windang Island.
4738. What has he done there? He has tipped about 10,000 yards on the road to the breakwaters. That has opened a face.
4739. Supposing that the company and the contractor intend to proceed with the work before you had got through a quarter or more than a quarter of the 404,000 tons, would you not find the difficulties greatly increased as compared with the difficulties you had to contend with in dealing with that small quantity of 10,000 yards? No. In dealing with that 10,000 yards of stone no proper facilities were used. Had the contractor been authorised to go on and construct a harbour right off, he would have had proper appliances to do so. What has already been done has been merely a makeshift.
4740. The contractor you say has not yet been authorised to proceed with the work? I cannot say; that I do not know.
4741. You said just now that if the contractor had been authorised the work would have been proceeded with, and the quarrying work would have been carried on more vigorously? Yes.
4742. Taking the most sanguine estimate of the time it would take to carry and deposit on the proposed breakwaters and training-walls 404,000 tons of stone, how long do you calculate it would take to complete that work? I consider that it could be done well within two years—that is if the matter were pushed.
4743. How long did it take the contractor to deposit the 10,000 yards of stone? He was working about a month at it.
4744. Are we to understand that if the contractor had received instructions to go on vigorously with the work at the entrance to Lake Illawarra the breakwaters and the training-wall could have been constructed in two years? I have no doubt they could.
4745. What plant has the contractor got on that work at the present time with which to commence operations? There is very little on it.
4746. What is there on it? A few tip-waggons and rails.
4747. Not a hundred? No, nothing like it.
4748. What plant would he require to have to get all that work completed in two years from the present time? He would require about sixty or eighty tip-waggons and two engines.
4749. Would he not have to lay down a pretty permanent road on which to carry the engine and the trucks of stone across from the Island to the breakwater? No; not any more so than would be the case on a temporary road on a railway.
4750. If the contractor got instructions to proceed vigorously with the work so as to complete it in two years, how long do you think it would take him to collect sufficient material including trucks, engines, derricks, cranes, and everything required for the work? I have no doubt that Mr. Amos could have the greater part of these things on the ground within two or three weeks. The bulk of them could be picked up in this colony almost at any moment.
4751. What object had you in coming here to give evidence? I am not interested either in one harbour or the other. I have no interest to serve.
4752. Did you come here with the view by your testimony of disproving a statement that has been made, and to throw some new light on the subject? I desired to give evidence more with regard to the time that it would take to complete the work as referred to by Mr. Darley, and also as to the quantities in the breakwaters.
4753. Have you read Mr. Darley's evidence? It was read to me.
4754. You assume that Mr. Darley gave evidence as to the time that should be occupied in this work on the basis of having only one road from the quarry? Not one road from the quarry but one tip—that is one place of deposit. I understand that Mr. Darley said there would be only one tip, whereas for the great bulk of the time there would be four tips.
4755. *Mr. Clarke.*] You said that it would take two years to complete the breakwaters and retaining wall from Windang Island to the entrance to the lake? Yes.
4756. How long would it take to complete the proposed dock in which, after they got in, vessels could lie with safety? That would be another matter. Of course that would be done at the same time. That would be done by dredges—either ordinary dredges or sand dredges. The work would be carried on simultaneously.
4757. Would the construction of the channel, about 100 feet wide from the lake to the main land, be also carried on simultaneously with the breakwaters? Yes. That would be quite apart;—another work altogether you might say.
4758. It would be part of the same contract? Yes; but it would be carried on under other men, though under the one firm.
4759. The contract is taken, I understand, by Mr. Amos? Yes.
4760. And do you give the Committee to understand that the whole work could be completed and ready for vessels to enter the lake within two years? That is my opinion.
4761. And are you of opinion that the work proposed to be carried out by the Illawarra company would be satisfactory? Yes; I am certain of that.
4762. Have you formed any idea as to the probability, when the work was completed, of the sand, during an easterly gale, or one from any other quarter, blocking up the channel to a certain extent? I do not think it would.
4763. The previous witness has stated his belief that there are only 6 or 7 feet of sand before you come to the rock;—do you believe that to be a fact? I sounded right throughout the lake and bored it, and I found that there was 25 ft. 6 in.—the depth required. We did not try any further. It was mostly composed of loose mud.
4764. How was it near the entrance? We tried the depth at the entrance, adopting the method of driving right down through the sand, which offers great resistance owing to the suction. Three men, after driving for about three hours, went down 21 ft. 6 in. below medium water level.
4765. You heard the statement of the previous witness with regard to rock—do you agree or disagree with that? I disagree with him entirely.
4766. Are you aware of the nature of the bottom of the lake where the canal would have to be excavated? Yes.

4767. Of what does it consist? Throughout the lake it is of very soft mud, almost in a liquid state. If A. Love, Esq. you allow the rod to go down, it will go down 25 feet almost without any pressure at all.
4768. You are aware that it is intended to excavate that canal to a depth of about 27 feet, and that 10 feet <sup>27 Jan., 1897.</sup> or 15 feet of that would be underneath the bed of the present lake? Yes.
4769. Is that practicable? Undoubtedly. It is the very place for such a work.
4770. When the canal was excavated underneath the lake, would the sides remain firm or have a tendency to fall in? I have had no experience with regard to that, and would not like to offer an opinion.
4771. *Mr. Lee.*] You told the Committee that you proposed to carry out the breakwater and dredging simultaneously? Yes.
4772. How do you propose to get your dredges into the lake? If they were imported of course they would have to come out in pieces, and be built on the shores of the lake; they would have to be put together on the lake and floated out.
4773. Has that matter not been decided? That is a matter that is always left to the contractor.
4774. But inasmuch as the contract has been signed for doing this work, has that question not been decided? By the contractor, of course—he is the responsible man.
4775. You do not depend upon the entrance opening itself in the early stages of the construction of the breakwater sufficiently to admit the dredge? No.
4776. And if the dredging were to go on simultaneously, you are of opinion that the dredges would have to be imported in pieces and constructed on the lake? Yes; no doubt that is the way it will have to be done.
4777. *Mr. Hoskins.*] Do you know whether Mr. Amos has given orders for the dredges? I have not seen Mr. Amos for some days.
4778. *Mr. Wright.*] Could you tell the Committee how the silt dredged out of the lake will be disposed of while the training-walls are being constructed? It will have to be conveyed in pipes or pontoons.
4779. You would have a sand-pump dredge? Yes.
4780. Where would you convey the silt to? It is supposed to be conveyed a thousand feet away from the channel.
4781. And there deposited? Yes.
4782. If it were all liquid mud would it not be carried back into the channel again? I do not think so.
4783. An enormous amount of silt will be taken from a channel 2 or 3 miles long, 100 feet wide, and 25 feet deep, and I want to know what provision has been made for the disposal of this silt? There are places where a large portion is supposed to go,—parts to be reclaimed; around these there are to be fascine banks built to enclose the silt.
4784. The fascine banks would have to be built simultaneously with the progress of the work? Yes.
4785. Do you not see very great difficulty in that? Not at all.
4786. For instance, if you started two sand dredges dredging 8,000 or 10,000 yards of silt per hour every day, you must have some place in which to retain the silt, unless you throw it on the dry land? There will be places for the purpose. Fascine banks will be constructed.
4787. Before the dredging is proceeded with? By the time the dredges were at work I expect these banks would be constructed.
4788. Then your contention is, that while the dredges are being put together, the contractors would construct the necessary fascine banks to hold the dredged material? Exactly.
4789. In reference to the entrance of the harbour and the depth of water, did you do the boring yourself? I did not actually handle the rods, but I was on the steam launch; it was under my supervision.
4790. And you can vouch that there is a depth of 25 feet in the lake itself, and you say that your rods got down to a depth of 21 ft. 6 in. in the sand at the entrance,—a witness has sworn distinctly that he has been told there is only 6 feet of sand on top of the rock? That is a mistake.
4791. *Mr. Fegan.*] Is it your intention to use the stone on Windang Island? If suitable.
4792. But is it suitable? It certainly is suitable, under water.
4793. You have already used some stone from that source? Yes.
4794. You do not find it suitable to deal with? Suitable under water.
4795. You would not like to build a breakwater with it? As I say, up to water-line it seems perfectly suitable.
4796. But it is more perishable above the water-line? It certainly does not stand so well when exposed to the weather.
4797. Is the stone different in the other two quarries you mentioned? Yes; entirely different. With regard to Port Kembla, I was one of the contractors who built the jetty for the Mount Kembla Coal Company, and at one time we had very rough weather there. The top of the jetty was about 26 feet above high-water, and on one occasion part of it was swept away—I think about two spans. During this storm a blue wave rose to a height of about 17 feet upon the piles. That would be 17 feet above high-water, and the waves themselves broke over the jetty and deposited seaweed on top.
4798. You prefer not to express an opinion with regard to the quality of material on Windang Island? I did not say that: I said the stone was suitable below water.
4799. Could large blocks be got out of that quarry? Yes.
4800. Would you depend on that quarry to complete the work? No: Mr. Amos is not tied to that quarry.
4801. Do you believe the stone from that quarry is sufficiently good? As I say, it is sufficiently good for all work under water-mark.
4802. Is it sufficiently good to complete the breakwater? I do not say with regard to the stone above the water line; that could be conveyed from elsewhere if the stone on Windang Island were not suitable.
4803. You have seen the tie-bank at Windang Island? Yes.
4804. How wide is that tie-bank? It was made roughly about 10 feet on top.
4805. If you are going to work four tips, how many sets of rails would you require? Only one set of rails.
4806. One set of rails would work four tips? Yes.
4807. And carry 1,600 tons of stone a day? I take Mr. Darley's figures for the 400 tons over one tip. I do not say 1,600 tons would be put over in a day.
4808. Still you believe that the one connecting line from Windang Island along the tie-bank would be sufficient to feed the four tips? There is no doubt of that.
4809. Are you aware whether the estimates for this work were prepared on the belief that the stone could be got from Windang Island? I fancy so, but I would not be sure about it,

- A. Love, Esq. 4810. Supposing the quarries are 2 or 3 miles away, instead of 16 or 20 chains away, would that make a difference in the calculations? No; it would mean extra plant and extra waggons.
- 27 Jan., 1897. 4811. It would mean extra haulage? Yes.
4812. It would mean the construction of a road either on the northern or southern side of the lake? Yes.
4813. *Mr. Hoskins.*] Do you believe that a channel  $3\frac{1}{2}$  miles long and 100 feet wide at the bottom, and a basin of about 35 or 40 acres, can be completed and the harbour ready for work in two years? Yes; the breakwaters would take the longest time.
4814. *Mr. Wright.*] Were you present when the stone was taken out of the quarry at Windang Island for the present retaining wall or breakwater? No. I was not actually present; but I went across on two or three occasions and saw them at work.
4815. Would it be possible to get out of the quarry one stone weighing 20 tons without a fracture in it? I have no doubt you could get some, although you might not get many. It would be very easy to get blocks of 10 tons and a little over that.
4816. Did you ever see a stone taken out of the quarry 20 tons in weight? Yes. I have never seen it carried away.
4817. It would not stand being moved? No, I do not say that at all.
4818. Is not that stone fractured into comparatively small blocks; is it not of the ordinary basaltic formation? It depends very much upon the explosives you use.
4819. You think that blocks of stone could be obtained from that quarry sufficiently large to be put into an ocean breakwater? Yes, I do.

THURSDAY, 28 JANUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL PEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

William Lovegrove, Esq., late Clerk of Petty Sessions and District Officer, Nowra, sworn, and examined:—

- W. Lovegrove, Esq. 4820. *Chairman.*] What are you? I have no occupation at present; but for thirty years I was Clerk of Petty Sessions and District Officer for the Shoalhaven District, resident near Nowra.
- 28 Jan., 1897. 4821. What is the nature of the evidence you desire to tender to the Committee? It is similar to the evidence given by Mr. McLean and Mr. Morton, M.L.A. I gave evidence before a Parliamentary Committee, and it will be found in their report, which is called 24 of 91. The Committee, in their report, stated they were unanimous in recommending the extension of the railway to Jervis Bay. That was in 1891. If the railway had been carried out it would have made a great difference by this time. For instance, Mr. Howell, who has established his smelting works where he has no port and is not likely to get one, would have established them at Jervis Bay had there been a railway there.
4822. Do you desire to place the extension of the railway to Jervis Bay in antagonism to the question of expending money on the coast? It is not altogether in antagonism. Port Kembla is very useful; but I do not think the proposed plan for a harbour there would add very much to its value.
4823. *Mr. Clarke.*] You have been a resident of Shoalhaven for a great number of years? For thirty-four years.
4824. Are you thoroughly acquainted with the resources of the district? Yes; I think no one more so.
4825. You seem to imply from what you have stated that you are against the construction of a breakwater from Port Kembla? Not against the construction of a breakwater or the construction of some work at Port Kembla, but I think the proposed work will not be a very good one.
4826. Are you virtually against the proposed breakwater at Port Kembla? No; I would rather say that Jervis Bay is a more suitable place for the expenditure of any money, and that it will require very little in comparison with Port Kembla.
4827. Can you give any reasons for your rejecting the proposed breakwater at Port Kembla and also reasons for the extension of the railway to Jervis Bay? Well, the first reason for the extension of the railway to Jervis Bay is that the railway was promised to the district as long ago as fifteen or sixteen years, and the money was borrowed in England to construct it, a very much larger sum being borrowed than was required. Of the sum borrowed £804,000, only about £250,000 has been expended on the extension of the line from Kiama to Nowra. Therefore, there remains a balance of about £550,000 for the remainder of the line of which sum not more than £150,000 will be required.
4828. The money having been voted for the extension of the railway to Jervis Bay, can you give any reason why the work is not carried out? There was no reason except some political undercurrent.
4829. I suppose the Government of the day declined to carry it out? Not only so, but they prevented a Melbourne company from constructing a railway from Jervis Bay up to the coal seams.
4830. What are the capabilities of Jervis Bay for shipping purposes? Well, it is supposed to be one of the finest harbours in the world.
4831. What part of the bay would be the most suitable for the erection of jetties which I suppose is all that would be required at Jervis Bay? You may say that from the Currambene Creek the whole of the southern shore and the whole of the eastern shore to Bowen Island would be available for that purpose. At the present moment vessels could go alongside at any point along that part of the shore without anything but an insignificant jetty. In some places there are 30 feet of water right up to the land.
4832. I suppose what is known as South Huskisson would be one place? South Huskisson would be the best place pretty nearly on the western shore.
4833. And the place known as the Hole in the Wall? That would be better still, but it would require 4 miles more railway.
4834. That is nearer the heads? Yes; it is in fact only a mile from the lighthouse.

4835.

W.  
Lovegrove,  
Esq.  
28 Jan., 1897.

4835. In the event of a railway being constructed to Jervis Bay, what produce or what freight would be likely to be sent in order to produce a revenue? In the first place I think all the coal-mines south of Kiama would be opened and that there would be junctions with the railway in order to ship the coal at Jervis Bay. I think the coal from the Jamberoo seam would also go to Jervis Bay, and there are about 50 miles of coal seams south of Jervis Bay.

4836. But have these coal-fields been proved to be of good quality for commercial purposes and for export? Yes; not many of them have been proved but reports concerning them have been furnished from the Department of Mines from time to time, principally by Mr. Wilkinson, late Government Geologist. Mr. Norman Taylor, of Melbourne, also reported on those seams and I think Mr. Pittman; but of course until a coal-seam is opened you cannot see very much of it.

4837. Would you be surprised to learn that we have it in evidence, both from Professor David and Mr. Pittman, that there are no coal-fields of proved commercial value south of Mount Kembla? I do not think you can have such evidence as that. I think the misunderstanding arises from the word "proved." As I said before they have not been proved in the sense in which coal-seams are generally proved, but it is known they extend as far up as Moss Vale.

4838. At all events they are not developed? That is true.

4839. And it is uncertain whether coal would be found suitable for export? There is no question that coal could be found.

4840. Not suitable for export? Well, Mr. Wilkinson said so at all events.

4841. Leaving coal out of the question altogether, what other goods would be sent by a railway to Jervis Bay? There are minerals in the Shoalhaven district, both copper and gold. The Rev. Mr. Clarke said that tin also existed there, but that has not been proved yet, except that he found a stray specimen in the bed of the Shoalhaven.

4842. Where are the mines to which you refer situated? The gold-mines are at Yalwal, and the whole bed of the Shoalhaven is worked for gold.

4843. But gold as an article of export would not give much freight to the railway? Not the gold itself; but the miners would.

4844. Would the miners get their supplies from Jervis Bay;—would they not get their supplies from Nowra or the nearest place in the district? If they did, Nowra would be a station on the railway.

4845. Is there any other source of revenue likely to induce the Government to carry the railway to Jervis Bay? I do not think there is anything to induce the Government to do it, because the Government seem to have made up their minds that Sydney should be the only port in the Colony. I have seen statements one after another that there is no good land at the back of Jervis Bay, and that that is the reason why Jervis Bay is not used as a harbour. The whole of the Shoalhaven district lies at the back of Jervis Bay—one of the finest districts in the whole Colony.

4846. But would not people on both banks of the Shoalhaven continue to send their goods by rail to Sydney or by steamer to Sydney? My own idea of the course of trade is that the coal-mines would be opened, that the produce of the Shoalhaven would go to feed the coal-mines, and the coal-mines would go to feed Jervis Bay.

4847. The land along the line of railway which the Committee passed through the other day from Nowra to Jervis Bay by the new line of road does not seem to be very good? No; but that is not the proper line of road—that is a line which takes 16 miles, whereas the distance is only 11 miles.

4848. Is there better land along the 11-mile route? It touches Mr. Berry's estate very nearly, and without very much deviation it might be made to touch his estate altogether.

4849. Can you give any further reasons why the railway should be carried to Jervis Bay? I think it should go there as a mere act of honesty to begin with.

4850. Do you think it would be advisable to carry a railway across the Shoalhaven River from Bomaderry into the town of Nowra independently of the extension of the line to Jervis Bay? No. I have already given evidence in a former inquiry to the effect that if Nowra was the only consideration there is nothing to show why the railway should go across the river though the people of Nowra offered to pay 6d. carriage for the one mile.

4851. But do you not think that if the railway were carried into Nowra a large quantity of goods which now go by steamer to Sydney would be sent by rail to Sydney? I cannot say. I look upon the traffic of the Shoalhaven at the present moment as being crippled altogether for want of a railway.

4852. A railway going into Nowra? To Jervis Bay. Without the railway it is impossible for the district to develop.

4853. If the railway were carried into Nowra would it not be a step towards the line, at some time or other, being carried to Jervis Bay? I do not think so. I do not look at it in that light at all. I look at it as a national question.

4854. *Mr. Lee.*] What is the distance from Jamberoo to the nearest point on the South Coast railway? The Jamberoo seam, at its southern end, is about 3 miles westward of a station named Toolijooa, and from that station the distance to Jervis Bay would be about 26 or 27 miles.

4855. Has the southern end of the seam been tested? It has not been tested. I have seen it. There are two seams of about 6 ft. 6 in. divided by a sandstone band of a foot.

4856. Then from the most southern end of the Jamberoo seam to Jervis Bay the distance is 29 or 30 miles? Yes.

4857. Consequently from the middle of the seam the distance would be about 39 miles? I do not think so. I take it that all these things would be worked from the most available point on the railway, and not from the furthest point.

4858. What distance would it be from that point to Kembla? It would have to be a private railway from the northern end.

4859. In any case you would have to make a private railway from the pit mouth to the existing railway? Just so.

4860. If the coal were carried to Toolijooa, how far would it be from there to Port Kembla? About 38 miles.

4861. If the northern portion of the Jamberoo seam were worked it would practically be as close to Kembla as the southern portion of the seam is to Jervis Bay? There would not be very much difference.

4862. So that if it became a choice as to shipping coal, there would be very little inducement to send the coal on to Jervis Bay? The inducement would be this;—that you have only a problematical harbour at Kembla. You have a fine weather harbour—an open roadstead. Whereas at Jervis Bay you have a harbour that is undeniable;—one of the known harbours of the world. 4863.

W.  
Lovegrove,  
Esq.  
28 Jan., 1897.

4863. But that hardly enters into the question of the cost of getting there? The cost of getting there is simply the cost of the railway, which is about one-fourth of the estimated cost of the harbour.

4864. But would not expensive jetties have to be erected at Jervis Bay? It would be absurd to talk of a cost of a jetty there, because the deep water is so close up to the land. It is not like these other places where they have to send out long jetties for a quarter of a mile. I was in charge of the "Chimborazo" at the time she got on to the north head at Jervis Bay. She was lying close to the land, and she could swing in her own length. There was no difficulty in her having over 26 feet of water with a depth then of 8 feet or 10 feet between her bottom and the ground.

4865. Where was the "Chimborazo" stranded? She was not stranded, she ran on to a cliff.

4866. Was that outside or inside the bay? I should call it outside. Then she backed into the bay to the Hole in the Wall.

4867. But you would not suggest having jetties for the shipment of coal at that point? It would not be necessary so far as I can see that the railway should be carried right round there.

4868. Then if you put the jetties on the more southern or south-western side you would have shallower water near the shore? Not always. At Captain's Point for instance there is a depth of upwards of 30 feet at the shore.

4869. But you have to get out to that point first of all? There is not much getting out wanted there.

4870. Have you examined the soundings at Jervis Bay, because it seems difficult to understand your statement that only short jetties would be required? If you talk of the western side, which is known as Sir Henry Parkes' frontage, that is all a sand beach, but I am talking of south of that towards the Moona Moona, and from the Moona Moona south again.

4871. The more you work round towards the Hole in the Wall the greater length of railway you will have to make? Yes; of course.

4872. Can you give the Committee any idea how it is that Jervis Bay, being such a splendid port as it is held to be, no trade has yet sprung up between that place and Sydney? When a Government is centralised it can do what it likes. The Government make all the railways in this colony to come to Sydney. When it thought that Newcastle was going to be an independent port it made a railway from Newcastle to Sydney in order to try and get the trade of Newcastle.

4873. But the trade was at Newcastle all the same—it differs from Jervis Bay in that respect—that there appears to be no trade at all at Jervis Bay? Well, there is none except ship-building.

4874. What is there going to be in the future? There is nothing to bring the trade there; there are no means of conveyance. The very road over which the Committee travelled the other day was not intended to convenience Jervis Bay at all. It is a mere offshoot from the Ulladulla Road.

4875. Then your contention is that unless the railway is taken down to Jervis Bay we cannot expect that there will be any trade from that place? Yes.

4876. And if the line were taken there you think that the coal in the vicinity of Port Kembla would be shipped from there? I think it is likely that a great deal of it would go there. But I have said nothing against Port Kembla as an open roadstead.

4877. But your contention is that if the railway were extended to Jervis Bay the collieries in the vicinity of Port Kembla could ship their coal there? They come from Clifton and they probably would in certain cases if they had contracts. Supposing, for instance, that the Bulli Colliery got a contract to send 1,000 tons of coal to Adelaide, and there was a railway to Jervis Bay, it would probably ship that coal at Jervis Bay, unless it was fine weather, and then it might ship it at its own jetty.

4878. Do you think it at all probable that collieries would send their coal from there to Jervis Bay, such a long distance, when they lie so much closer to Sydney? That all depends. We will suppose that the railway had been constructed to Jervis Bay, as it honestly should have been, and suppose that Mr. Howell's smelting works had been established at Jervis Bay, Mr. Howell's ships would have brought his ore to Jervis Bay and would have received a cargo of coal from Jervis Bay and gone away to Frisco or wherever they were going. It is because Jervis Bay has not got its facilities that the thing does not happen.

4879. Does not that go to prove that what you and other residents of the Nowra district require is an extension of the railway from Bomaderry to Jervis Bay, is not that really the gist of your case? That is true.

4880. If that were done then the question of the trade that might spring up in the future would depend entirely upon circumstances? Yes. It does depend on the fact of the railway being made.

4881. But you do not wish this Committee to understand that if a railway were taken to Jervis Bay the coal-fields that would be served by a port at Kembla Bay would be served by Jervis Bay? Unless there was a contract.

4882. What is the use of talking about contracts; it is a question of haulage and the distance? And it is a question also of safety for the ships.

4883. But is Jervis Bay safer than Port Jackson? Well, it is easier to enter. Vessels can enter in south-easterly weather when they have to stand off the land at Port Jackson.

4884. Is Jervis Bay a safer port than Port Jackson? You have had the proof of that. Vessels in a south-easterly gale have had to run to Jervis Bay for shelter.

4885. You are aware that any trade, if carried on to a large extent, must be conducted in ships carrying cargo both ways? That is quite true.

4886. Is it not extremely probable that vessels coming to Port Jackson loaded with cargo would prefer to take in their cargo of coal there rather than ship ballast and go down to Jervis Bay to take in a cargo of coal there? Such a thing they would not do.

4887. Therefore, is it not extremely probable that although the railway might be carried to Jervis Bay those intermediate collieries being closer to Port Jackson would send their coal to Port Jackson for shipment? It all depends. I have already mentioned one class of trade which would go there. Vessels carrying ore to be smelted if there were smelting works at Jervis Bay would get their coal at Jervis Bay.

4888. I notice that you have a great objection to the proposed harbour at Kembla as being made in an open roadstead? Well, it is this way; I consider that Wollongong was spoilt by the harbour works carried out there; it was diminished; it was cut to pieces in order to make a small harbour inside what was really a very much better harbour. The same thing happened at Kiama. Nature as I thought had pointed out the way there for a larger harbour at very much less expense. But a small harbour is made in the middle of the larger harbour, and that small harbour would be an obstacle to the making of a larger harbour. If the same thing is to be done at Kembla it would have been far better to have left the company to use its own jetty and to have helped them by contributing to the maintenance of a jetty.

4889. You are aware that there is a proposal to make a deep water harbour at Lake Illawarra? Yes.

4890.

W.  
Lovegrove,  
Esq.

28 Jan., 1897.

4890. If that were carried out, do you not think it would meet most of the objections you have raised? I do not think there is the slightest likelihood of its being carried out.

4891. Why? I have ridden across the mouth of the lake and I noticed that when the tide was going out it was pretty firm and when the tide was coming in it was a quicksand.

4891½. Does not that go to prove that if proper breakwaters were erected there would be a scour that would create a deep channel there? When the company was formed I expressed my opinion about it pretty strongly—that they would never do it.

4892. Supposing it could be done and carried out, do you think that would be a harbour sufficient to meet the requirements of the coal trade of the south coast? I do not know, because it would depend on the depth of water at the entrance and the width of the channel, and also upon how they would dredge the whole of the shores on the western side where there is not 6 inches of water. For instance, where Mr. Howell has put his works there are not 6 inches of water.

4893. If these works were carried out in their entirety with a mean depth of water of 27 ft. 6 in. do you think there would be a harbour sufficient to meet the requirements of the south coast? I think by the time that was done £6,000,000 or £7,000,000 would have been spent.

4893½. Therefore, you think the scheme is impracticable? I do not look upon it as a serious project.

4894. Do you think it would be wise in the interests of the company to refrain from making a harbour at Kemplia until such time had elapsed as would enable the Illawarra people to see whether or not they could carry out their harbour? I do not think the Illawarra scheme ought to be considered at all. It has been on foot for ten years, and it has not been carried out yet in the slightest degree.

4895. In other words, you would dismiss that scheme from consideration altogether? Just so.

4896. Therefore, you limit the question to one as between Kemplia and Jervis Bay? Yes; and it must be understood that I have no objection whatever to Port Kemplia.

4897. But you think Jervis Bay is better? I would let Kemplia take its chance. It has a railway there, and there are mines close to it, and I think Mr. Howell's smelting works will have to use Port Kemplia.

4898. Have you considered the matter from this point of view,—what objection could the Nowra people raise if the Kemplia harbour were constructed and the railway were extended from Bomaderry to Jervis Bay? They could raise no objection, and they would not.

4899. Do you not think that both will be required in the future? First of all, I think that as the money was voted about thirteen years ago the railway to Jervis Bay ought to be completed as a mere act of honesty.

4900. But if both those works were carried out could one interfere with the other? No.

4901. Is there not a possibility of work for both in the future? Quite.

4902. Therefore, you do not urge anything against Kemplia at present, but you think that the extension of the railway to Jervis Bay is a more urgent matter? No; not more urgent. I have looked upon it, as I have said, as a mere act of honesty that it should be done. And as for Port Kemplia, it gets along very well with its jetty in anything but extreme weather; and I think if the Government were to confine their assistance to the jetty and to other jetties at Bulli and Clifton that are established,—if the Government wished to help those jetties a little and the owners of them, it would be far less expensive than attempting to confine Port Kemplia to a small place.

4903. But you understand that the maintenance of these jetties will not meet the case, inasmuch as the contention is that the colliery owners require to have large sailing vessels to enable them to carry on their business satisfactorily, and to do that they must have a protected harbour? Even so, more jetties at Port Kemplia might meet the case.

4904. No matter how many jetties you made there you would not give any stiller water than there is at present? Well; I have thought myself that a jetty further out even than the jetty that is there now would give quite as still water. There are three islands. I have passed between the nearest island and the mainland on at least three occasions and I have been up and down the coast a great many times, and it seemed to me that the water was as still within those islands as it was further in shore.

4905. *Mr. Wright.* Can you tell me what is the population of the country between Berry and Jervis Bay? I suppose about 10,000.

4906. Is it an increasing population? Yes.

4907. It is principally engaged in the dairying industry? They have confined themselves principally to dairying of late, but I think they will again turn their attention to crops a good deal.

4908. Has not the agricultural industry at Shoalhaven almost died out? Well, young men are not very fond of using the plough nowadays.

4909. You say that to keep faith with the people there should be a railway to Jervis Bay? Yes.

4910. What means would there be of giving profitable employment to that railway? Where there is a railway industries spring up all round it, and as the railway will go close to the coal-fields the coal will be opened up for one thing.

4911. It is said by very good authorities that the coal there is no good? My answer to that is that they have not tried it.

4912. Supposing the experts to be correct and there is no marketable coal in that district, is there any earthly prospect of a railway paying between Nowra and Jervis Bay, putting coal out of the question altogether? I think the railway ought not merely to go to Jervis Bay, but I think it ought also to go up to Conjola towards Ulladulla.

4913. You think it ought to go right down the south coast? Well, between Ulladulla and Bateman's Bay there is a stretch of disconnected sort of country without much agricultural land. But Ulladulla itself has a great deal of agricultural land, and coal at the back of it which has never been tapped because there are no means of conveyance.

4914. You think that to make the railway pay it would have to go to Jervis Bay? I do not say to make it pay.

4915. The people of Nowra cannot ask the Government to construct a railway unless there is some reasonable hope of its paying either now or in the distant future? We do not ask the Government for that now, because the Government thirteen years ago decided that it was desirable to make the railway. The money was voted for it, and the Government got the money for it.

4916. They took authority to borrow the money? They borrowed the money.

4917. Can you give the Committee any forecast of what the traffic is likely to be, presuming that the coal is not marketable? The traffic would pour in from all sides. For instance, you do not convey sandstone from Sydney by railway, and yet because of the railway, the sandstone is used. The same thing would happen

W.  
Lovegrove,  
Esq.  
28 Jan., 1897.

happen in the case of this railway. We have immense limestone beds at the back of Jervis Bay, and those limestone beds would all come into use. The same thing would happen with regard to other products. The moment you construct a railway in the country, that country begins to develop its resources, because everything is wanted for different purposes. There are large iron deposits which might possibly be worked.

4918. If the Kembla harbour scheme is not proceeded with, and the railway is constructed to Jervis Bay, do you think it probable that coal would be taken there for shipment? Yes.

4919. Even though the distance from the mines to Jervis Bay is greater than from the mines to Sydney? You cannot say what will spring up in the future. When you have a railway terminus at the bay, it will be time enough to touch that question.

4920. It is all in the distant future then? It appears to me to be very distant.

4921. *Mr. O'Connor.*] You know the district well? Yes.

4922. How far does the agricultural wealth of the south extend in a southerly direction from Wollongong? About 40 miles.

4923. What is the name of the place? Part of Mr. Berry's estate. That is all rich agricultural land.

4924. If the railway were extended not only to Jervis Bay, but right along the coast, do you think there would be any chance of a favourable return from the expenditure? Yes.

4925. If Jervis Bay did not realise the expectations as to the richness of the coal-fields, is it your opinion that the agricultural land beyond is sufficiently productive to provide freight for the railway to Sydney? My opinion is that that district, acre for acre, is the richest in the Colony.

4926. Do you think the produce of that wealthy land would be sufficient to yield a considerable annual revenue to the Railway Commissioners? Yes, I think so.

4927. With regard to the coal-fields of Jervis Bay, what prospecting has been done there to enable anyone to say that the coal-fields are rich, or on the other hand that the district is stricken with poverty? All I can say is this: I was mining warden in that district for several years, and it was my business to visit any locality that was reported to me as mineral bearing, and to report to the Department. In the course of my duty I visited and inspected the Jamberoo seam, and I saw the outcrops in various places. I visited an outcrop in Cambewarra, about 12 miles further west, and I visited an outcrop at the back of Broughton Creek. I have also been in communication with Mr. Seaver, formerly member for Gloucester, who examined and reported on a seam of coal near the head waters of the Clyde, at the back of Jervis Bay, 18 miles distant in a straight line. Mr. Seaver found the coal there a bituminous shale, and he found that the seam was very large, but a good deal broken by bands.

4928. Are you a professional man? I have not any professional title; but I have studied geology, and know a good deal about minerals.

4929. You have had a good deal of experience with regard to minerals? Yes.

4930. How long have you been in the Colony? About 44 years.

4931. Is it not a fact in your experience that some places that have been declared sterile and poor after a few years have been discovered to be wealthy in minerals? The most glaring instance of that kind which I recollect was in connection with a piece of land of some 8,000 or 9,000 acres, which Dr. Alcorn first tried to get surveyed, and which I also tried to get surveyed, but which surveyor after surveyor declared to be impenetrable scrub, and the whole of which is now cleared and is carrying about a cow to the acre.

4932. It is not outside the region of probability that Jervis Bay and the country surrounding it, as far as investigations have gone up to the present time, may be one of the richest coal-fields in Australia? Yes; the presumption is that the coal seams extend 50 miles south.

4933. Apart altogether from its very fine geographical surroundings, if that district should prove to be coal-bearing it must of necessity, in your opinion, become very wealthy? Yes.

Philip Mackell, Esq., late Post and Telegraph Master, Wollongong, sworn, and examined:—

P. Mackell,  
Esq.  
28 Jan., 1897.

4934. *Chairman.*] What are you? I was a resident of Wollongong for over twenty-five years. I occupied the position of post and telegraph master.

4935. What information do you desire to give to the Committee? I wish to state that I was post and telegraph master at Wollongong for over 25 years. It was part of my duty to report the movements of the shipping, and also to report the wind and weather three times a day for the information of the Government Astronomer. I thus became conversant with the shipping interests. My position also gave me ample opportunity of knowing the general opinion of the residents of Wollongong and the district on all subjects of general interest. I consider Port Kembla the most suitable place for a harbour to serve the developed interests of the south coast because it would, when the breakwaters were constructed, be not only amply capacious, but give a sufficient depth of water for the largest vessels afloat. It would be easy of access in all weathers, and would, therefore, be of great advantage as a harbour of refuge in that locality. I do not think the making of a harbour at Port Kembla would be at all injurious to Wollongong, because Wollongong would then have all the advantages of a coal port with the minimum of disadvantages. Up to the time I left the residents and property owners of Wollongong, seeing that experience had proved the impracticability of constructing a suitable harbour at Wollongong, were in favour of the port at Kembla. I have good reasons to believe that they still hold that opinion. I may add that masters of vessels trading to Wollongong, with whom I had constant intercourse, always discouraged any attempts to make a suitable harbour at Wollongong, and said that Port Kembla was the proper place. They would say, "Why does not the Government, instead of throwing money into the sea at Wollongong, make a proper harbour at Kembla." I do not think the harbour at Port Kembla would suffer to any serious extent from the south-easterly gales. The islands to the east would, in my opinion, break the sea before it reached the breakwater. There would, therefore, be very little range inside; I think there would be comparatively still water at the loading jetties.

4936. Have you seen many easterly gales on the coast? A great number.

4937. There is a considerable amount of easterly sea on the coast? Yes.

Frank Jarvis Esq., Secretary, Illawarra Harbour and Land Corporation (Limited), sworn, and examined:—

F. Jarvis,  
Esq.  
28 Jan., 1897.

4938. *Chairman.*] What are you? Secretary to the Illawarra Harbour and Land Corporation (Limited).

4939. *Mr. Lee.*] Have you been secretary to the company since its registration? No.

4940. For how long? The last eighteen months.

4941.

4941. Are you acquainted with all the details in connection with the contract? Fairly so.

4942. Could you give the Committee any explanation as to the cablegram which appeared recently in the Sydney papers as to the despatch of dredges from the old country? Officially I have had no intimation from London—that is to the company; but Mr. Armstrong has had advices from Mr. De Wolf as far back as November last, and Mr. De Wolf was then in treaty with a firm—Messrs. Gwynn & Co.—for two dredges of large power with steel barges, and a subsequent letter informed us that those negotiations were still going on. We heard nothing further, although we expected to hear, until we saw the cablegram in the paper.

F. Jarvis,  
Esq.,  
28 Jan., 1897.

4943. You really do not know then officially whether any contract has been entered into with the makers for these dredges and hoppers? No. Not officially.

4944. Have you sufficient preliminary information to be able to say how they are to be sent to the Colony, whether they are to be sailed out to the Colony or otherwise? I know nothing of that.

4945. For what purpose were they coming? For dredging Lake Illawarra—the channel.

4946. In its formation? The formation of the channel.

4947. I suppose these dredges would have to be of a powerful character and of high pressure? I understand they would be capable of throwing out 800 tons an hour each.

4948. You do not know how they were to be brought to the Colony? No.

4949. Could you tell us how they were to be got into the lake after they were brought here? Either by cutting their way through the sand—

4950. From where? From the outside.

4951. Did you ever hear of a dredge working in a heavy surf? There is not always a heavy surf there.

4952. Do you think they would last there ten minutes? I do.

4953. Then your idea is that they would come out and attack the channel from the ocean side, and cut their way through into the lake? Of course there are two ways,—it could either be done that way or by the dredges being sent out in parts and being put together on the lake. I do not know which method was intended.

4954. You do not seem to know really anything about the dredge matter? Well, I have had very little information with regard to it.

4955. If the dredges were to be built on the lake it would take considerable time? Not very long; it appears to me to be a matter of rivetting.

4956. How long do you estimate it would take to put an ordinary dredge together and fit it with machinery, even if all the appliances were at hand? That is a question I cannot answer; it is more for an engineer.

4957. Taking all these things into consideration, are you prepared to endorse the evidence that has been given that the work of cutting the channel, making the breakwaters, and dredging the basin can be carried out in two years? I am informed it can be done, and I believe it can.

4958. You believe it on the statement made by the engineers? By the engineers and the contractor.

4959. And from what they have said you are of opinion it can be done? Certainly.

4960. Being secretary to the company, you know that unless the work is done by the end of next year they will forfeit £10,000? I do.

4961. Do you think there is the remotest possibility of your being able to do the work within the time? I do indeed.

4962. Do you swear that in face of the evidence of the contractor, who says he has no money to go on with, that he is waiting for money, and he does not know when the money will be ready? I say provided always that the contractor is told to go on with the work.

4963. The contractor swears that he cannot go on until he gets the money;—what the Committee want to know is this—what possibility is there of the company being able to carry out the terms of their Act by the end of December, 1898? I have had no official information regarding financial matters in London.

4964. But you must remember that your representatives have been here and have contended that the Port Kembla works should not be proceeded with, on the ground that they have certain rights under their Act in connection with Lake Illawarra, and those rights expire at the end of 1898? I feel very confident myself that the financial part of it will be carried out satisfactorily. I am not in a position to say how far it has gone or what has been done.

4965. Are you in a position to assure the Committee approximately that the amount of money required by the contract entered into between Mr. Amos and the company will be raised in sufficient time to admit of Mr. Amos proceeding with his work, and having it accomplished by the time the Act expires at the end of 1898? No; but I feel confident that successful financing will eventuate.

4966. *Mr. O'Connor.*] Your position is that of secretary to the company? Yes.

4967. Is it any portion of your business to know exactly what may be the most delicate and important relations between your company and the outside world? I only know what comes before me.

4968. For instance, if the company were borrowing £50,000 or £5,000, would you know that? If they borrowed it I should know it.

4969. But you do not know it up to the present time? I have had no official intimation.

4970. Is it possible that they could do it without your knowing it? They might do it and not advise me until by letter per incoming mail.

4971. Mr. Lee asked you if there was any probability of the contract being completed within the specified time, in view of the fact that there appeared to be no money in the treasury;—is it within the region of commercial probability that at the present time a loan or grant of money for £50,000, or £15,000, or £1,000, may be coming out without your knowing it? Not without my knowing it.

4972. Then it is a positive fact that there is no money and no probability of the company getting any? No; I do not say that at all. I have every reason to believe that the money will be forthcoming.

4973. I asked you if it were possible that the company might be negotiating a loan? They are negotiating a loan.

4974. And that a sum of money might be coming along without your knowing it, and that although to-day there might not be 1s. in the treasury to-morrow you might have a considerable sum—is it a fact that that could happen without your knowledge? I know that negotiations are pending and I believe they will be satisfactory.

4975. Then it is possible that they may be satisfactory? Quite possible.

Stephen Henderson, Esq. (Messrs. Harper, Harper, & Henderson), sworn, and further examined:—

S. Henderson, 4976. *Chairman.*] You have had an opportunity of reading Mr. Darley's evidence with regard to the time required to carry out certain works at Lake Illawarra? Yes.

Esq.  
28 Jan., 1897. 4977. Do you desire to make a statement to the Committee with regard to that matter? Yes; and with regard to one or two other points. I would first refer to the question as to the depth of the harbour at Lake Illawarra. Mr. Darley pointed out by diagram that while the depth was 25 feet 6 inches at mean tide level, it would only be 22 feet 6 inches at low water spring tide. In that calculation he took a range and fall of tide of 6 feet. Now he has only got 5 feet 6 inches at Kembla, so I think he ought to have given us a depth of 3 inches more, which would be 22 feet 9 inches. And I want to point out that if that is the depth at low water the depth at high water six hours afterwards will be 28 feet 3 inches, taking that range and fall of tide. Then at neap tide with about 3 feet 6 inches range the depth at low water would be 23 feet 9 inches, and at high water 27 feet 3 inches. As far as the depth of the Illawarra harbour is concerned, I have made enquiries in shipping circles, and I find that 23 feet is the maximum draught allowed by the harbour master at Newcastle. If vessels draw more they must proceed with great risk. Mr. Darley made the remark that our scheme would not be adequate for the south coast trade for some time to come; but in view of the fact just stated, I think it would be adequate. Of course, we are not prevented from dredging further; but still, it is a very well thought out scheme and takes a fairly good mean draught of vessel. For instance, take sailers from Newcastle, very few of them ever load more than 22 feet 6 in. A draught of from 21 feet to 22 feet is about the maximum of sailers in Newcastle.

4978. *Mr. Hoskins.*] They want 3 feet of water under the keel then? They want 1 or 2 feet under them. Our harbour at high water neap tide will have a depth of 27 feet 3 inches, so that vessels would have a good lot of water under them. As far as the width of the channel is concerned, I should like to put on record figures with regard to the width of some of the most important canals in the world. The Suez Canal, which was originally 72 feet wide at the bottom, has now been enlarged to a width of 113 feet; the Manchester Ship Canal has a width of 120 feet; the North Sea and Baltic Canal 85 feet, and the Amsterdam Ship Canal 88½ feet.

4979. *Mr. Wright.*] May I ask you where you got these measurements from? From a book on the Nicaragua Ship Canal, by Mr. Colquhoun, the first administrator of Mashonaland. I checked the measurements by figures from another source. In giving his evidence about the time it would take to construct the Illawarra Harbour, Mr. Darley said that 10,000 tons a month was about the maximum that a contractor could put over the tip. He had in his mind a working day of eight hours, because he was asked whether 400 tons would not be 50 tons an hour. I believe 10,000 tons a month is a very good record, but if you worked overtime and were pushed, you could average that easily, and probably do more. The time taken to construct the Illawarra Harbour will depend, not on the total number of tons you have to put in, because there is more than one tip—there are four tips.—but on the number of tons you put in the biggest breakwater, added to the number of tons you put in the tie-bank, which is the connection between Windang Island and the works. According to our estimate, the tonnage is 163,000 in the biggest breakwater, added to the tonnage in the tie-bank. At 10,000 tons a month, according to Mr. Darley's estimate, and taking our estimate of tonnage, it would take one year and four months and a half to construct the Illawarra Harbour. Therefore, to say that we can complete it in two years is, I think, a very fair thing. Then let us compare it with the proposed eastern breakwater at Port Kembla—Mr. Darley said there were 633,000 tons in that work. At 10,000 tons a month, that would be five years and three months and a half, and the work would be done at tremendous speed. The Government estimate for the completion of the Kembla work is six years. Taking it altogether, I think the Illawarra work would have as great a chance of being completed in two years as the eastern breakwater at Kembla would have of being completed in six years. That is all I have to say about the time. I have had the quantities of our breakwaters taken out again, and the new estimate practically checks the old. For the northern breakwater the old estimate was 139,000 tons and the new estimate is 139,748. For the southern breakwater the old estimate was 153,000 tons and the new estimate is 152,671 tons.

4980. So that in effect you have verified your previous estimate? That is so. I should like also to say a word about the strength of the breakwaters. Mr. Darley said our breakwaters were very low and narrow, but that he estimated for more substantial designs. In view of that statement I had a few sections made of our breakwaters, which I desire to show to the Committee. It will be seen that for the outer 13 chains of the breakwaters our section is larger for the same depth of water than the Government section of the northern breakwater at Port Kembla. At the present high-water mark on the beach the sections of our breakwaters are slightly smaller; but I am confident they are sufficiently large to withstand any seas that can possibly strike them. Our breakwaters get larger as they approach the end; the end section of our breakwaters is considerably stronger than the Government section of the northern breakwater at Kembla in the same depth of water. The following table is compiled from the sections now before the Committee, and shows in detail the comparative strength of the Illawarra breakwaters and the Kembla northern breakwater:—

	Distance from present high-water mark.	Width at mean tide.	Width at top.	Height above mean-tide level.
	Chains.	ft. in.	ft. in.	ft. in.
Lake Illawarra—North breakwater .....	0-00	31 1	11 4	7 11
	6-40	37 5	12 5	10 0
	20-00	58 6	15 0	14 6
South breakwater.....	0-00	30 2	11 2	7 7
	2-50	32 8	11 5	8 6
	11-20	46 3	13 3	12 0
	20-90	58 6	15 0	14 6
Kembla—North breakwater .....	type section	34 6	14 0	10 3

4981. Do you wish to make any further statement? No.

4982. These works were designed by your firm? They were designed by Messrs. Harper and Harper, with whom I have since been associated.

4983. Are you quite clear about the possibility of these works being carried out in a couple of years' time? Undoubtedly.

4984.

4984. If Mr. Darley says they will take at the very least five years, do you doubt the correctness of his belief? Certainly. S. Henderson,  
Esq.
4985. It is a matter of opinion, and you think that his opinion is wrong? Exactly. 28 Jan., 1897
4986. What method are you going to adopt for dredging—are you going to dredge the entrance to the channel? That is a matter for the contractor. Mr. Amos proposes, if his contract is gone on with, to get suction dredgers—sand-pump dredges.
4987. Supposing Mr. Amos undertook to do this work in about eighteen months—because by the time he got his plant he would not have any more time than that—where would he deposit his silt? He has to fill up a lot of ground marked on our plans—he has to reclaim it.
4988. Reclamation inside the lake? On the shores of the lake—at Coonawarra Bay, and also at the entrance.
4989. Would not that necessitate training-banks of some kind? Yes; fascine banks, which are provided for in the contract.
4990. And you think that the construction of these fascine banks to hold the silt—the dredging out of the enormous amount of silt that would be taken from a channel  $3\frac{1}{2}$  miles long and 100 feet wide, with a depth of over 20 feet, and also the dredging of the basin—you think that all this could be done inside of two years, especially considering that within that time the contractor would have to place his plant on the ground? Yes.
4991. You still contend that it is quite possible to do the work? Yes.
4992. That it is only a question of money and machinery? Just so.
4993. That with the supply of the necessary funds and with judicious management the work could be done in the time specified? Yes.
4994. Under the Illawarra Harbour and Land Corporation's Act they are compelled to have a channel only 15 feet deep within the time specified? I think the Act says, "ships with a draught of 15 feet."
4995. So that if they could manage within the time to get two or three vessels in drawing 15 feet of water they would in effect comply with their charter? I believe so, but that would be a lawyer's question.
4996. The question of constructing the breakwaters is one you know something about;—have you inspected the quarries in the district? I have seen Windang Island.
4997. Do you think there is any stone to be got on Windang Island suitable for a breakwater? Yes, certainly.
4998. Where would you get it from? It was my opinion that the whole of Windang Island contained stone suitable for a breakwater. But a portion they have used for the tie-bank has weathered a little, and this makes it a bit doubtful. I certainly think, however, that the stone at the other end of the island is perfectly suitable. It is very hard stone.
4999. What do you call it? It is a sort of sandstone—a ferruginous sandstone.
5000. Is there any basalt? I think there is a little vein of basalt through the centre.
5001. Is not the stone on the western end of the island, where the quarries are now situated, very much broken up? I have not seen that myself. I hear that it has weathered a little.
5002. Did you supervise the construction of the wall that is there now? Yes.
5003. Is the stone used there sufficiently good, in your opinion, for a breakwater? The stone in the bank down below the water has stood very well, and the edges are still sharp. Above the water where smaller stuff was used the stones have been rolled about and have become slightly rounded, but there is not much trace of weathering.
5004. You are aware as an engineer that in constructing a breakwater exposed to the ocean the stones must be of a pretty good size? Yes.
5005. And they must be free from natural joints which will eventually open? Yes. I believe that you will get very large blocks of stone from the end of Windang Island.
5006. The outer end? Yes.
5007. But how are you going to get it from the outer end? By a tramway.
5008. A wire tramway? No; a tramway along the base of the island. This will be done as they open out the quarry.
5009. It has been stated in evidence that in the event of the stone on Windang Island not being suitable there were two other quarries from which stone could be obtained—one about a mile and a half, and the other three miles from the entrance to the lake;—have you visited these? No; I have not visited them myself.
5010. And you can say nothing as to the suitability or otherwise of the stone? No. In our contract we say that the contractor has undertaken to get sufficiently good stone should stone not be procurable at Windang Island, and when the time comes of course we shall investigate.
5011. But you have yourself personally examined Windang Island? Yes.
5012. And you consider that the stone to be obtained there is good enough for the breakwater? I do. I believe we shall get most if not all of our stone from Windang Island.
5013. Supposing that two breakwaters are constructed and the channel is cut through, have you any doubt about the channel remaining permanent? I have no doubt whatever; the scour will maintain it.
5014. There is a very small outflow from the lake, is there not? At present, yes.
5015. What would increase it? If you have a small pipe you have a small outlet, and if you have a big pipe you have a larger outlet. When we construct the channel we shall have a tremendous scour.
5016. You will have a scour caused by the tide flowing in and out of the lake, except in times of flood, when it would be greater? We do not want a flood; the tidal water is quite sufficient.
5017. Do you think that the tidal water passing through a channel 100 feet wide will be sufficient to maintain a scour which would keep the channel free? Yes.
5018. Would not floods and heavy rains assist in the scour? No, not materially.
5019. Is it not likely that while the lake may gradually deepen by the scour the silt will block the entrance? No; because through the lake there will practically be no current at all.
5020. There will be the tide in and out? Yes; but the lake has a large area.
5021. The channel is simply the neck of the bottle? Exactly.
5022. But if you are going to have a scour there will be a certain amount of current? There would not be much velocity a quarter of a mile from the neck of the bottle. At the neck of the bottle there would be some scour but as regards the whole of the lake there would not be much disturbance.

- S. Henderson, Esq.  
28 Jan., 1897.
5023. *Chairman.*] Could you state how far from the entrance into the narrows on the western side the velocity would cease to have any practical effect? Speaking as a guess I should say about 1,000 feet.
5024. You say you have no fear of the channel silting up from the inside,—is there any danger of it silting up from the outside—from storms? I think that heavy gales from the north-east might tend to make a bar there but that gales from the south-east would not, and heavy north-easterly weather is so rarely met with that it may be discounted.
5025. The wall you have already built there from the island has silted up and the sand is going over the top? Yes; that is coming from the south.
5026. Do you think Windang Island would afford sufficient protection to prevent a similar thing happening to the extremity of the breakwater? Certainly.
5027. *Mr. Hoskins.*] On what date was the information prepared which you furnished to the Committee with regard to the width of various canals? It was taken from a book published last year or the year before.
5028. Because the Suez Canal has been considerably widened? As far as that is concerned the information published in the book was to this effect. It was in the report of an engineer describing the result of a Commission to widen and deepen the Suez Canal. It stated that in 1889 they had started this work of widening the canal.
5029. They started to widen the canal in 1889? I think it was in 1889, but I am not sure.
5030. Do you mean to say that since the Suez Canal has been widened the width is only 113 ft.? Exactly, that is what I mean to say.
5031. That it is only 113 ft. now? Yes—at the bottom.
5032. You know that only steamships pass through the canal? Yes.
5033. Do you think that a sailing vessel with a long tow-rope from a tug and with scarcely any ballast could go through a canal, where there is a great expanse of water and where violent gales of wind occasionally occur, as readily as a steam vessel could go through the Suez Canal propelled by steam? Steam vessels have some difficulty in going through the Suez Canal; they very often knock up against the sides and often run right across.
5034. Would not a sailing vessel being towed in a narrow channel under the conditions I have described not be liable to be driven against the banks and against other vessels? If she had no cargo she might not strike the bank at all, she might drift over the top of it. At any rate if the vessels did strike the bank and rubbed along the whole way they would only have to put on a little more paint when they got into a dry dock.
5035. *Chairman.*] You say that at a distance of 1,000 feet to the west of the entrance to the lake the current would be such as not to be of any vital importance? Yes.
5036. If that is the case, it would not have any velocity 1,000 feet from the entrance to the lake in an easterly direction? That is so.
5037. That being so, the sand which the water carries through the entrance of the lake will be deposited at the point where the velocity ceases? It will go further out into the sea than into the lake.
5038. The water would not go much further than 1,000 feet outside before it commenced to deposit the silt. Very likely it would lose its power or velocity immediately it passed outside the training wall? The silt will be carried away by the ocean current. There is a steady current there.
5039. What evidence have you got of a current off Lake Illawarra? There always is a current along a coast.
5040. There would be a current off the Five Islands, but it would probably pass just east of the Five Islands. That would not prove that there would be a current in the bay near Windang Island. If you had any evidence with regard to a current there it would be important? I do not think we have any data as to the strength of the current.

FRIDAY, 29 JANUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Frank Jarvis, Esq., Secretary, Illawarra Harbour and Land Corporation (Limited), sworn, and further examined:—

- F. Jarvis, Esq.  
29 Jan., 1897.
5041. *Chairman.*] Do you desire to make a statement to the Committee? I wish to add something to the evidence I gave yesterday which I had not then an opportunity of stating. In reference to the apparent discrepancy between Mr. Amos' evidence and the recent cable from London in regard to the dredges, I would state that Mr. De Wolf in London, not knowing what arrangements Mr. Amos had made in the event of his being instructed to proceed with his contract, to save time, took the matter of the dredges into his own hand; and Mr. Amos has expressed to my managing director, Mr. Armstrong, his willingness to accept such dredges, provided they are up to date, as a cash payment on account in his contract. The Committee will remember that Mr. Amos in his evidence said he had made arrangements in San Francisco.
5042. You desire to say something in regard to the working of the tug at Illawarra? Mr. Hoskins, when asking some questions of Mr. Henderson yesterday, seemed to imply that a sailing vessel could not go up our channel, that she would be sagging all the time alongside the channel at the end of a long tow-rope. Such a thing would never occur. Under our Act we have to provide an efficient tug service and make by-laws for that service, subject of course to the approval of the Marine Board. When a vessel approached the entrance to the harbour the tug would either range alongside under the lee of Windang Island or else shorten

shorten rope; so that a sailing vessel could be brought in under perfect command of steam—for the time being the vessel would be a steam vessel to all intents and purposes. Mr. Amess, the Government contractor for the tug service at Wollongong, is now in attendance with the view of showing the practicability of what I have just stated, and he will be willing to give evidence to that effect if desired. A sailing vessel would never go up the channel behind a long tow-rope; she would have the tug alongside or a short tow-rope.

5043. *Mr. Hoskins.*] She would have to be taken along a channel 100 ft. wide? There would be plenty of room. 100 ft. is the width at the bottom which should give about 250 ft. at the top.

5044. *Mr. Wright.*] When did you receive the communication referred to from Mr. De Wolf? In November; I forget the exact date, but I think it was about the 10th or 12th.

5045. You were aware then that he had purchased dredges? No. I knew he was in negotiation for the purchase of dredges and he mentioned the name of the firm, Messrs. Gwynne & Co.—very eminent men in that branch of business.

F. Jarvis,  
Esq.  
29 Jan., 1897.

Edward Fisher Pittman, Esq., A.R.S.M., Government Geologist, sworn, and further examined:—

5046. *Chairman.*] The evidence the Committee desire from you is in reference to the stone at Windang Island, as to whether it is suitable for breakwater purposes—have you seen the place? Yes. I have been on Windang Island and inspected the stone.

5047. Can you describe it? It is a volcanic tuff. It is composed in fact of volcanic ashes and fragments of rock which have been formed into a sedimentary rock. It is not at all, in my opinion, a suitable rock for making breakwaters or retaining walls which will be exposed to the atmosphere. It crumbles very readily on exposure. In fact, an inspection of Windang Island will show at once that disintegration is going on very rapidly there, where the stone has been quarried, and also in the retaining wall, or foundation for a retaining wall, which has been made between Windang Island and the mouth of Lake Illawarra. The rock there is crumbling very rapidly. I do not think it at all a suitable rock for such a purpose.

5048. Would it come out in large rocks? I do not think so.

5049. Could you say definitely whether it would or not? In my opinion it would not. Of course it altogether depends on what you call large rocks.

5050. Twenty tons weight? Certainly not. It is in beds, the maximum thickness of which I should say from memory does not exceed 3 feet.

5051. Therefore, it would not do for breakwater purposes exposed to the sea? That is my opinion.

5052. The same objection would not apply to so great an extent to its use in training-walls, where the sea would not affect it? I think the ordinary effect of the atmosphere is largely responsible for the disintegration.

5053. First of all, if the rocks were not of 20 tons weight, they would not be suitable for breakwater purposes? No.

5054. Still, the stone on Windang Island might do for training-wall purposes, where it would not be affected by the force of the sea—do you consider it would be unsuitable for such a purpose as that? I think it would be unsuitable, very much less suitable than other rock in the same district. I think it is rock that would always have a tendency to disintegrate under atmospheric influences.

5055. It would be impossible, or most likely impossible, to build a breakwater with it that was exposed to the force of the sea, and it would not be a good material to use for the training-walls inside? It would not be impossible to build a breakwater, but I think it would not last any time.

5056. What other stone is there in the vicinity? There is a rock which geologically is called *augite andesite* which occurs all through that district. It is a volcanic rock occurring in what are called contemporaneous sheets. It is to be found right through these coal measures in the south. The bed is of varying thickness, but in places it goes up to several hundred feet, and it outcrops very near the volcanic tuff to which I have referred, and could be easily obtained. In my opinion that would form an excellent stone for breakwaters, and it could be got in large blocks.

5057. Can you state where it is to be found? Yes; it occurs in the locality where it is proposed to construct a harbour at Port Kembla—alongside the jetties. The Illawarra smelting works are really built on the same rock, only there it is a bit decomposed, but if you sank down a few feet I have no doubt you would get on to the solid stone there also.

5058. Is that the stone that is lying southward that shows on the rise south of Port Kembla? Yes.

5059. It would come out in large blocks beyond doubt? Yes.

5060. Have you seen the two shafts that have been put down? I have not.

5061. You have only inspected the outcrop? That is all.

5062. Is that the nearest stone to the lake that you know of, of that class? Yes; it occurs right on the bank of the lake where the smelting company's works are.

5063. But on the sea-board side of the lake? Yes; that is the nearest stone.

5064. Might there not be some nearer which might be found on further inspection? No; I think not. The only other stone in the district that I know of which would answer the same purpose is the basalt known as the Blow Hole basalt which occurs at Kiama.

5065. In your opinion could no other stone be found within three miles of the entrance of the lake? I can certainly say that no other stone can be found within that distance suitable for the purpose.

5066. You know that long sand-tongue dividing the ocean from Lake Illawarra? Yes; I have ridden all down that.

5067. And you are sure there is none there? Yes.

5068. That really brings you almost abreast of Five Islands Point? The same rock of which I spoke, the *andesite*, comes through between the lake and Five Islands Point.

5069. That brings you down a little closer? Yes.

5070. *Mr. Wright.*] Is the same rock on Five Islands Point? I have not been on Five Islands Point, but I think it very likely. I have no moral doubt that Five Islands are composed of the same rock; but I have not been on the islands, and I cannot say. From the shore it looked as if they were.

5071. *Chairman.*] Then we can interpret your reply in this way, that in a northerly direction suitable stone for breakwater purposes is not likely to be found nearer than the north-east point of the lake? Quite so.

5072. To the west, the same formation is found where the smelting works are being erected? Yes.

5073.

E. F.  
Pittman,  
Esq.,  
A.R.S.M.  
29 Jan., 1897.

E. F.  
Pittman,  
Esq.,  
A.R.S.M.  
29 Jan., 1897.

5073. Then as to the south? I have been along the road from Shellharbour Railway Station to Shellharbour township, and right on to Windang Island, and the nearest point along that road at which I saw the *andesite* was at the junction of the Shellharbour Road with the railway line. In my opinion, no suitable stone will be found nearer to the mouth of the lake on the south than at Shellharbour Railway Station, unless it may be on the coast south of Shellharbour. The basalt which occurs at Shellharbour station would be equally suitable.

5074. That would appear to be a distance of about 5 miles? I should think it is about 5 miles.

5075. Are you fairly sure of this information? I am quite sure of it. I have been over all the ground you mention quite recently.

5076. And you have no doubt whatever about it? No.

5077. Are you aware that Mr. Evans, a mine manager of some repute on the south coast, has given evidence contradictory to that given by Professor David and yourself with reference to the coal deposits south of Kembla? I have not had an opportunity of seeing Mr. Evans' evidence, but before visiting the Wongawilli site Professor David and myself were informed at Dapto that Mr. Evans was working the coal there, and that he and several others had stated that it was magnificent coal; in fact, we heard one statement to the effect that it was better than Newcastle coal. I can only say that the analysis of the samples, which I took very carefully and which represented the entire thickness of the seam where visible, showed a very inferior coal indeed to that of Newcastle.

5078. *Mr. Hoskins.*] What was the percentage of ash? 20.75 and 18.35. The coal was full of bands.

5079. *Chairman.*] Do you say that the evidence given before the Committee, as reported on page 139, is a correct statement in regard to the Wongawilli coal deposits? Yes.

5080. Where were the samples taken from? From the end of the tunnel; as far in as we could get.

5081. And in regard to the Jamberoo coal, you still maintain your position? Yes; I have not seen any reason to alter my opinion.

5082. Can you tell us anything in regard to the coal contiguous to Jervis Bay? No; I cannot. We did not make any examination of that recently, and, as far as I know, Professor David is the only one who has really examined it at any time.

5083. How far south did you investigate recently with Professor David? Down to Jamberoo and Broger's Creek.

5084. You have no desire to alter your evidence previously given, in which you told us definitely that there was no coal fit for export south of Mount Kembla? No.

5085. *Mr. Humphery.*] Have you any recollection of the analyses of coal submitted to your Department by Mr. Evans, in 1889 and in 1895,—the former of which gave a result of 12.66 of ash, and the latter 11.45 of ash, as against the analysis of 15.10 mentioned by Professor David in his evidence on the 16th December last? The return given in 1895, no doubt, passed through my hands, and I have no doubt I signed the letter conveying the information, but I have no distinct recollection of it, and it is quite possible that these analyses are quite correct. But I should like to point out that the value of a coal analysis depends entirely upon the manner in which the sample is taken. It is quite possible that you might get small samples of coal, taken from some of these southern seams, which would contain even less than 11 per cent. of ash. But the analyses furnished in Professor David's evidence and my own, were from samples taken by ourselves and representative of certain thicknesses of the seam. That is the only way in which an analysis of coal can be regarded as of any consequence at all. Then, again, although I have no doubt whatever that the evidence referred to is right, and that an analysis was made showing 11 per cent. of ash, still the locality of these samples is always taken for granted by us when people send them in, and I cannot really say they actually came from that country at all, although I think it is quite possible they did.

5086. It is not impossible that the coal could have been got from elsewhere? It is quite possible.

5087. As the result of your personal examination of the seam of coal referred to the percentage of ash from a fair representative sample was, as stated by Professor David, 15.10? Quite so. I do not think that coal could be worked commercially containing as high a percentage as that. The sample taken by us was a representative sample of a certain thickness of a seam that could be commercially worked. It was not an analysis of a small picked sample which might have been taken out from the most promising part of the seam, which perhaps might not have been more than 2 or 3 inches thick.

5088. You are not now referring to coal at Dapto Creek belonging to the Illawarra Harbour and Land Corporation, but you are referring to what is known as Brownlee's coal? Yes.

5089. *Mr. Wright.*] In regard to the stone on Windang Island, if it has been described as ferruginous sandstone, would that be correct? No; that is not a strictly correct term. It is really a sedimentary rock formed of volcanic ashes and small fragments of shale and sand.

5090. Not a sandstone at all? No; a geologist would not call it a sandstone. It is really a volcanic tuff, but passes into a tuffaceous sandstone in places.

5091. Did you examine the stone on the outer part of the island over which the sea washes—the lower layer? No; my examination was chiefly confined to the quarry. I thought I should have a better chance of seeing the stone in the solid there, and therefore confined my attention to that. I walked round the top of the island. The sides there were so precipitous that I did not care to go down, especially as I was pressed for time and the tide was coming in.

5092. On the sea face there is apparently a bed of solid stone;—you do not know what that is? I am certain the whole of the island is composed of volcanic tuff; because I examined the same beds right along the coast beyond Shellharbour.

5093. What do you call the stone found close to Port Kembla? *Augite andesite.*

5094. There is a shaft there 30 feet deep—have you examined that? No.

5095. Can you tell the Committee what is the usual character of the stone? The character of it can be best ascertained at the quarries on the top of the hill at Kiama where it occurs in pentagonal prisms, as it were. You can see it in the quarries there looking like five-sided pillars.

5096. *Chairman.*] Is it what we are accustomed to call columnar basalt? It is a kind of basalt, but it is not true basalt. It occurs in the columnar form.

5097. *Mr. Wright.*] Does it usually occur in beds of sufficient size to enable you to get large blocks of stone? Yes.

5098. In the 30-foot shaft just mentioned there is only a depth of 5 feet near the bottom showing solid stone, all the rest being considerably fractured? Yes.

5099. You think that stone is of a quality which will enable large blocks to be quarried out? I think so. The size of the blocks would only be limited by the columnar structure I have mentioned.

5100. Would that columnar structure enable you to get out blocks of from 20 to 25 tons? I think so. The width of the columns is about the width of this table (about 3 feet), as a rule, and they are five-sided.

5101. There is no evidence of that in the shaft? Possibly not.

5102. You are satisfied the stone is of a quality suitable for a breakwater? I think it is essentially so.

5103. *Mr. Fegan.*] Is it not possible that you may receive samples of coal stated to come from places where you would be surprised to find coal of such quality? We have received samples of ores—I cannot call to mind any samples of coal—from localities which I am perfectly certain were incorrectly given.

5104. And there might be that possibility in regard to the various coal lands south of Kembla? There is quite that possibility. I do not say for a moment it is done.

5105. But it could be done? Yes.

5106. If people wished to make their property appear more valuable than it really was, they could do that? Yes.

5107. You never make any question as to the place from which the coal comes—all you do is to give an analysis of the sample? Yes; except that in publishing the analysis in the annual report wherever I am doubtful I always put in the words "said" to come, &c.

E. F.  
Pittman,  
Esq.,  
A.R.S.M.

29 Jan., 1897.

Mr. John James Amess, lighterman and tug-owner, sworn, and examined:—

5108. *Chairman.*] What are you? A lighterman and tug-owner.

5109. *Mr. Wright.*] You are familiar with the handling of vessels? Yes.

5110. The proposed channel at Lake Illawarra is 100 feet wide at the bottom and 3 miles long, and about 450 feet wide between the breakwaters, where there would be a considerable sea;—are you quite positive in your own mind that you could take a ship of (say) 4,000 tons burden in and out of the lake in an ordinary stiff breeze of wind? Yes.

5111. There would be no danger of her fouling the bank? I do not think so with a powerful tug.

5112. And no danger of her fouling the breakwaters? No; as soon as you pass the breakwaters you get your tug close on to the ship's bow and shorten your line.

5113. Supposing it was blowing a stiff breeze? You get on the lee side and keep her up.

5114. You think that an ordinary tug could keep her up? Yes; an efficient tug—a tug of 100 horse-power.

5115. Such a tug would be sufficiently powerful to take a ship of 4,000 tons through the breakwaters and through the channel just described? Yes, in my opinion it would.

5116. There would be no danger of a ship fouling? No.

5117. Would there not be a danger of a strong breeze striking the ship's side, forcing her on to the bank of the channel? I do not think so with a powerful tug ahead of her, because it would give her steerage way.

5118. You are satisfied in your mind that a big ship could be taken in and out with perfect safety? Yes.

5119. *Mr. O'Connor.*] You have been engaged in this business for years, and have had considerable experience? Yes.

5120. And you are now in the same business? Yes.

Mr.  
J. J. Amess,  
Esq.,  
A.R.S.M.

9 Jan., 1897.

Stanley Alexander, Esq., Acting Inspecting Engineer, Railway Construction Branch, Department of Public Works, sworn, and examined:—

5121. *Chairman.*] What are you? Acting Inspecting Engineer in the Railway Construction Branch of S. Alexander, the Department of Public Works.

5122. *Mr. Fegan.*] Have you information with regard to the cost of resumption at Port Kembla in connection with the Mount Pleasant line and the Mount Keira line? I have a paper sent to me by the Committee which mentions only the cost of the lines at Port Kembla within the resumed land—two lines, the Kembla line and the Great Southern line within the land proposed to be resumed.

5123. Including the Mount Pleasant line? No.

5124. *Chairman.*] Assuming that a port was to be made at Kembla, and it was determined to resume the private railways, how much per mile would it cost going west? The cost that would be incurred to reproduce a line similar to that portion of the Mount Kembla line, exclusive of land resumption, would be £3,800 altogether.

5125. *Mr. Fegan.*] What is the distance? The length of the line is 105 chains, and there are 40 chains of sidings. To reconstruct the line would cost £3,800. I do not know what the resumption would cost.

5126. There is the resumption of the jetty? Yes. That estimate is really for a railway line up to the beginning of the jetty.

5127. Have you the figures with regard to the Mount Pleasant line? No. The Mount Pleasant line is not at Port Kembla.

5128. If a harbour is constructed at Kembla, and if you resume one line, it would be better to resume all; therefore the Mount Pleasant line would come in also, would it not;—the Mount Pleasant collieries ship at Kembla, do they not? They do ship at Kembla. But they tranship their coal at their own junction, which is several miles away from Port Kembla. They have to tranship into other waggons. The Mount Pleasant line is a separate affair altogether. Mount Pleasant communicates directly with Wollongong Harbour. It is not within miles of Port Kembla.

5129. But if a breakwater were constructed at Kembla which would give security to shipping, is it not probable that the Mount Pleasant Company would ship there also? They would then have to go by the new railway which the Government would construct, transhipping their coal into Government trucks at the port of Wollongong.

5130. But there would be some resumption in connection with their railway also, would there not? No.

5131. Now with regard to the Great Southern line? The length of that line is 77 chains and there are 54 chains of sidings. The cost would be £3,308.

5132. That is to construct a similar line to-day? Yes.

5133. With the resumption of land? No, exclusive of land resumption.

5134. Have you any idea what the resumption of land there would be? It would be very little. The land is not worth much. The resumption, I suppose, would amount to about 10 or 15 acres, at £5 an acre.

5135. Do you think you could get it for that? I do not suppose they ever gave more than that for it; but I am not sure that there is not a right-of-way. I think there was some right-of-way given. I do not think the land was ever purchased.

5136.

Stanley Alexander,  
Esq.

29 Jan., 1897.

- S. Alexander, Esq.  
29 Jan., 1897.
5136. What would be the easier grade or the nearer way to get from the collieries to Port Kembla—that is on to the Government line? I think the best route would be to go from Wollongong, from the gaol. But it is only a matter of personal opinion.
5137. Right through the town? Along the beach and across the Tom Thumb Lagoon.
5138. Is that a good place to construct a line? The only difficulty is the crossing at the mouth of the Tom Thumb Lagoon.
5139. What would it cost to put a bridge over? I think Mr. Deane has given you that information in his estimate. I merely made an exploration.
5140. Could you trace on the map the route by which you propose the line should be constructed? There were two lines surveyed. After passing round the gaol and going along the sand the line would cross over to the shore of Tom Thumb Lagoon. Then it would follow a straight course past the Agricultural Ground and Racecourse, and then across the mouth of Tom Thumb Lagoon to Port Kembla. That is what has been talked of as the beach line.
5141. Have you any doubt that the Mount Pleasant collieries would ultimately ship at Kembla if a break-water were constructed there;—could they safely ship at Wollongong at all times? The Mount Pleasant Colliery has been shipping at Wollongong for the last twenty-five years.
5142. But they want to employ large steamers, and only comparatively small vessels go into Wollongong? Any evidence I could give you about the shipping of coal would not be of any value. I will tell you all about the railways. The Mount Pleasant line traverses the borders of Wollongong. It passes right along the foreshore to the port.
5143. What is the grade there? It is practically level.
5144. The grade on the Government line—the South Coast line—is rather steep there, is it not, and that is why you suggest that the line should be brought round along the beach? That is one of the advantages to be gained by adopting the route of the Mount Keira line.
5145. But is not that one of the reasons—that you would miss the steep grade there? Yes.
5146. What is the grade there on the main south coast? Between the crossing of the Keira line and the railway station the grade is 1 in 75.
5147. On the proposed beach line you would have practically level country? From where the Mount Keira line crosses the South Coast railway line there is a rising grade of 1 in 80 on the Keira line.
5148. That is not a heavy grade, is it? It is nearly the same as on the main line. It is a comparatively simple matter to cut it down.
5149. Would it be cheaper to cut down the grade on the main line than to construct the beach railway? I would cut down the grade on the Keira line. It is the line already resumed by the Railway Commissioners.
5150. The Kembla line? No, the Keira line.
5151. There would have to be a larger resumption, would there not? I believe that no further resumption would be necessary.
5152. Do you think that in the construction of a line to Port Kembla the junction should be made with the Mount Pleasant line instead of with the Mount Keira line? No; I do not think so. That is my personal opinion.
5153. Do you not think it would be more expensive to cut the grade down on the main line than to resume the Mount Pleasant line? No. To make the Mount Pleasant line available for a portion of the new line would be very expensive.
5154. More so than cutting down the grade? Much more so. It is only a narrow gauge now, and near the port of Wollongong there is a quantity of rock, more or less hard, and the work would be very expensive. It would practically mean the construction of a new line.
5155. Therefore, you suggest that the connection should be with the Mount Keira line? Yes.
5156. *Mr. Hassall.*] Would the extension along from the Tom Thumb Lagoon be an expensive one to construct? The Mount Pleasant portion has not been estimated. Mr. Deane in his evidence in regard to the other portion estimated the cost of a double line at £30,000.
5157. In your opinion which would be the more suitable route—to run the line along the sea-coast or to follow the main line and go round the Tom Thumb Lagoon? I think it ought to go along the coast.
5158. *Mr. Roberts.*] Would any difficulty be experienced with the sand-drift which occurs close to where the proposed line would run? No.
5159. How far would the line be west of the beach? It is only just in passing the gaol that the sand would interfere with the line, and there has been no motion of the sand there for a great many years. Some little expense would have to be incurred to protect the line from the sand, but there would be no practical difficulty in dealing with it.
5160. No difficulty that you are quite sure could not be grappled with? None whatever. The position of the sand has not changed ever since I have known the locality. I knew it first in 1883.
5161. Would the line pass to the east of the agricultural buildings? It will pass between the Agricultural Ground and the lagoon—that is, to the west.
5162. If it goes to the west, will it not go right through the centre of the agricultural ground? No; it will avoid the agricultural ground and also the racecourse. It will go along the eastern shores of the Tom Thumb Lagoon.
5163. Was there a route suggested by a bridge over the Tom Thumb Lagoon, and round the western shore of the lagoon instead of the eastern shore? I think such a route has been explored. There is no difficulty about it. The only objection to it is that it is altogether through private property—grazing land, which is of some value.
5164. The cost of the resumption would be considerably greater along that route? Yes. Along the other route there is practically no resumption, or at all events very little.
5165. On the ground of expense, you recommend the more eastern route? Yes. There are other points in favour of the eastern line. One of them is that it connects the port of Wollongong with the proposed port at Kembla. Then, again, a railway constructed between the two ports would have a platform at the foot of Crown-street, which would be useful for ordinary communication between Wollongong and Port Kembla. In addition to that there would be the traffic occurring two or three times a year in connection with the racecourse and agricultural ground, which all means revenue. The people of Wollongong all prefer this line.
5166. Where would the new line start from—from the Mount Keira line? Yes; just outside the Custom House at Wollongong.

5167. Would the traffic on the Mount Keira line and the Mount Pleasant line have to be transhipped? *S. Alexander, Esq.*  
 No. The Mount Keira line is of the same gauge as the Government line. It is connected with the main line by a loop, and is actually in use by the Railway Commissioners, and under their control. The Mount Pleasant line has a narrow gauge, and the colliery proprietors would have to make some transshipping arrangement if they intended to unload at Port Kembla. 29 Jan., 1897.

5168. Either that or alter their gauge? Yes.

5169. Any alteration of gauge would have to be done at the expense of the Mount Pleasant Colliery? Yes.

5170. *Mr. Hoskins.*] Did you make a survey of the shortest distance and the most practicable route for a branch line of railway from Port Kembla to the smelting works? It was explored.

5171. By you? No; by Mr. Wickham, one of our engineers.

5172. What would be the shortest distance? Six and a half miles.

5173. And would it be an easy matter to make the line? No. It is not an easy line but it is a perfectly practicable one.

5174. No estimate has been made of the probable cost? No; it was only explored. Any estimate of cost would be merely a guess. It would cost about £5,000 or £6,000 a mile.

5175. *Mr. Lee.*] Kindly look at this little sketch showing the Mount Pleasant line. There has been a suggestion to start the line from the Government line at the 47-mile post, with a slight loop on to the existing Mount Pleasant line, the object being to avoid the heavy grade on the main line;—do you not think that would be better than making the connection with the Mount Keira line? It would produce a better result but it would be more expensive.

5176. In what would the cost consist? In making practically a new railway along the Mount Pleasant line.

5177. Why? The Mount Pleasant line has a gauge of 3 ft. 6 in. and the bridges are very poor constructions indeed—very old.

5178. Practically that would mean an entirely new line? Yes.

5179. Is the gauge of the Mount Keira line 4 ft. 8½ in.? Yes. It is now Government property and therefore there will be no further expenditure upon it as a single line. On the Mount Pleasant line near the port of Wollongong it is doubtful whether there is sufficient land to make the cuttings. The slopes are now nearly vertical and if we increase the width of the line and flatten down the curves, the slopes of the cuttings would run back for some little distance and it is doubtful whether there would be sufficient land. The locality I refer to is right along Smith's Hill, after you pass Stuart Park and right into the park.

5180. You look upon that as an important matter? The line would certainly have to be increased in width, and you must either take the extra width, and I doubt whether there is sufficient land, or else you must go out to the sea side and build a wall.

5181. At all events you have the Mount Keira line with a workable grade which will admit of a maximum load being carried, and which belongs to the Government? Yes.

5182. And it could be used to-morrow, I suppose, for any amount of traffic? It could be used at once.

5183. *Mr. Wright.*] I suppose the line along the beach is really, all things considered, the most economical one to construct? Yes, I think it is.

5184. And the chances of traffic are greater than in the case of any other route that could be adopted? I think so.

5185. Has the country from Wollongong station along the western side of the Tom Thumb lagoon been closely examined? Yes.

5186. And you say unhesitatingly that you are in favour of the eastern or sea-beach line? Yes; I think that will prove to be the cheapest.

5187. Do you think a double line would be required there? As a matter of personal opinion I do not think it would—not yet; but in this proposal to adopt the Mount Pleasant line you must always bear in mind that a double line may be required some day.

5188. In the event of the coal shipment at Port Kembla reaching 2,000,000 tons per annum, as we have been told might be possible, would not a double line be necessary then? Yes; it would probably.

5189. You think that at present a single line would carry the traffic? Yes.

5190. *Chairman.*] Reverting to the Mount Pleasant line, what would be the length from Stuart Park towards the port of Wollongong where the hill drops enough to render it no longer necessary to have a heavy cutting;—what would be the length between the bridge close to Brighton and the bluff on the Wollongong side of Stuart Park—that is where your trouble is? I should think the length is under ¼ of a mile.

5191. And you regard that as involving heavy expenditure? Yes.

5192. Can you give us any idea of the cost? It would be only a guess. As I mentioned just now, there are several conditions we have to find out,—whether there is room enough on the land side for the cuttings. If there is room, it is a matter of cutting only; but if there is not, then we must go on to the sea side and build the wall. It is a heavy piece of line in any case. That piece might cost (say) £5,000.

5193. Do you regard that as the extreme for a single line? Yes; it would not cost more than that in any case.

5194. Then going west you have the main part of the embankment done up to the south coast line? Yes.

5195. It is very narrow, you say? Yes.

5196. And the bridges are bad? The bridges will require to be renewed altogether.

5197. What would be the total expense right through, approximately;—you have another ¼ of a mile, have you not? Yes. The earthwork from the cuttings could go to make the banks.

5198. Would you make the whole job for £10,000 right through? You see, you want ballast; and you would have to re-rail the whole thing and re-sleeper it. The rails and ballast and sleepers would be worth £2,000.

5199. You have a 1¼-mile to make? Yes.

5200. £10,000 seems a very reasonable thing, considering a good deal of the work is done? Yes; perhaps £10,000 might do it.

5201. That is from the Mount Pleasant line to Wollongong? Yes.

5202. From the intersection of the Mount Pleasant line with the main south coast line, what is the grade along the latter to the intersection of the Kemplia line? There is a grade of 1 in 75 running up to the Wollongong Station.

5203. Between Mount Pleasant and the Mount Keira line what is the grade? One in 150.

5204.

- S. Alexander, Esq.  
29 Jan., 1897.
5204. Is there nothing worse than that? No. I have before me the working plan of the Sydney to Wollongong and Kiama line, and I find that immediately south of the intersection of the Mount Pleasant line with the main line the grade is 1 in 400 for 37 chains; then it is 1 in 150 for 10 chains; then there are 15 chains of 1 in 75—up to the crossing of the Mount Keira Railway.
5205. Therefore, the grade of 1 in 75 running up into the town of Wollongong extends 15 chains northward beyond the Mount Keira line? Yes.
5206. How are you to get rid of that 15 chains of 1 in 75? The loop-line turns off about 4 chains south from the beginning of the 1 in 75 grade, and, therefore, we have only 4 chains of the 1 in 75 grade to deal with. The loop I believe to have a grade of 1 in 80, and the length is 31 chains to the top of it.
5207. Then when you join the Mount Keira line what grade have you got? The 31 chains extend right up to the top of the grade along the Keira line.
5208. That includes the loop line and that portion of the Mount Keira line that is 1 in 80? Yes.
5209. The rest is a down grade? Yes.
5210. Then what we have to deal with is 4 chains of 1 in 75, and 31 chains of 1 in 80—the question is how to get rid of that? Yes. Mr. Deane estimated the cost of reducing the grade on the loop line to 1 in 100 at £1,600. That will leave no grade worse than 1 in 100 between Belmore basin and Mount Pleasant crossing.
5211. The cost of the Mount Kembla line and the Great Southern line leading to a point west of the jetties you have given at £7,108—is that the value of new lines similar to these, or the present value of the lines? New lines similar to these.
5212. What ought to be allowed by the Department for depreciation in resuming them? All sorts of things come in when considering the cost of resumption.
5213. However, you could build new lines for that money as good as the present ones were when new? Yes.
5214. What, in your opinion, would be the cost of a single line between Belmore basin and Kembla? About £18,000.
5215. In the first statement given in answer to question 1854 the amount for a single line of railway is stated at £14,613;—what reason have you for adding on 25 per cent? For additional sidings and better ballast and heavier rails. The lower estimate was made in June, and there is now an expectation of greater traffic.
5216. The Department now intends to make the line very much more stable than they did in the first instance? Yes.

TUESDAY, 2 FEBRUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Fitzwilliam Wentworth, Esq., Trustee of the Wentworth Estate, Port Kembla, sworn, and examined:—

F.  
Wentworth,  
Esq.  
2 Feb., 1897.

5217. *Chairman.*] Are you acquainted with an area of 2,400 odd acres of land lying adjacent to Port Kembla? Yes.
5218. Are you the owner of that property? I am not the owner. I am merely trustee for it. The owner is my brother.
5219. Are you empowered to deal with it in any way that appears to be in the interests of the property? Yes, subject to my brother's consent.
5220. Your brother would take your advice with regard to it? Most probably.
5221. Are you aware of the proposal to construct a port at Kembla? Yes.
5222. You are at present, I believe, in receipt of a sum of money for way-leave from the two coal companies? Yes.
5223. The way-leave is represented by a  $\frac{1}{2}$ d. a ton upon all coal going over those lines? A  $\frac{1}{2}$ d. a ton at present, with power to raise it at a certain time to 1d. a ton.
5224. If those lines were resumed the way-leave would go with them? Certainly.
5225. And then your estate would be injured? Certainly.
5226. If those lines were resumed, and the rights under the Bill not impaired, the way-leave, therefore, not being interfered with, your estate would not be injured, so far as the lines are concerned? That is so.
5227. Supposing the Government resumed a piece of land adjacent to the loading-places, running back, say, by way of illustration, a quarter of a mile, and they took the delivery of the coal a quarter of a mile from the jetty, as if it were on the jetty, and conveyed it free of cost from that boundary on to the jetty;—under those circumstances, would your way-leave be unimpaired? Certainly not, as far as I can see.
5228. The more coal that goes along the Port Kembla line to Port Kembla the more advantageous it is to you as the owner of the way-leave? Yes.
5229. If there were a good port at Kembla more coal would come from the Port Kembla mine in all probability over your land? Yes.
5230. And to that extent your land would appear to be benefited? Yes.
5231. Supposing the Government relieved the coal companies, at a distance say of a quarter of a mile from the jetties, of the cost of haulage, leaving you still the right to charge way-leave, delivery being taken at the end of the resumed land instead of at the jetty, would you consider your right then impaired? I would, for this reason: I gave them this low rate of way-leave simply with the additional prospect of getting the benefit which I saw would ultimately accrue from settlement at the end of the lines, and I made it a distinct condition in the terms that they were not to erect any buildings, or anything of that sort—that the estate was to get the prospective benefit.

5232.

F.  
Wentworth,  
Esq.  
2 Feb., 1897.

5232. Your way-leave is under certain stated conditions for a term approximately of fifty years. If the Government saved the companies using the railway lines the last quarter of a mile haulage, your agreement with the companies still being allowed to stand, how could it affect you with regard to the way-leave? It would affect me in this way: if the Government took a quarter of a mile —

5233. We will come to that presently—we are now only talking of the way-leave? No, I do not think it would affect me materially.

5234. Take the question of the land resumption. You are aware that an expenditure such as the Government propose at Port Kembla, if carried out, would have some effect upon any estate adjacent thereto. Your rights are limited by the foreshore. It is within the right of the Government to refuse any private owner permission to erect a wharf? Yes.

5235. Supposing they spent a large sum of money at Kembla, so that it became possible to have a large extent of wharfage, would you recognise it as being of some benefit to your estate, provided there was no resumption. Supposing the Government constructed large works at Port Kembla and made no resumption at all, would it be beneficial to an estate adjacent to those works? I should think it would.

5236. And to all parts of that estate? Well, no, I do not think it would to all parts, because a great deal of the estate is only fit for the use to which it is put at present. I think it would within a certain distance of the terminus of the railway.

5237. You recognise that the fact that vessels from all parts of the world would come to that port would produce some benefit to the estate? I do not know that it would. It has not up to date. It has not brought any considerable value to the estate, though there has been an extensive shipment of coal.

5238. You recognise what a very different state of things there would be with a large port there? There is a considerable shipment of coal there now.

5239. Do you recognise that it would be of any benefit to your estate? Yes.

5240. By the increase in the quantity of coal for shipment it would receive some benefit, but you cannot say how much? No.

5241. Would you be prepared to give the Government any land for the erection of wharfs, jetties, breakwaters, and other works pertaining to the port? I am prepared to recommend my brother to give it to them, provided I see that his rights are maintained, and that he gets his way-leave on the coal and stuff hauled.

5242. Would you be prepared to give the Government free of cost a sufficient quantity of land as an approach to such wharfs as they might erect at a port in Kembla Bay? I should like to know how much land they required first; they might take the whole lot unless I had a limitation.

5243. A little south from Kembla headland is a rise in which it has been ascertained with reasonable certainty that there is a large deposit of stone suitable for the construction of a breakwater; would you be prepared to give a quarry site to the Government? I cannot say on the spur of the moment. It is a matter which requires consideration. This is the first time I have heard of such a thing.

5244. What area would you be prepared to recommend to your brother as a reasonable area to give for all purposes? I should like in the first instance to see how much the Government required. Let the proposition come from them. I cannot off-hand say anything definite about it.

5245. What do you think the land adjacent to Kembla is worth? I could not say just now.

5246. Have you any idea of the value of it? No, I cannot say. At the present moment it only has the value of dairy land. But it has a prospective value. I gave these people the land for their railways and gave them a right to haul their coal on very liberal terms so as to increase the value of the land.

5247. *Mr. Wright.*] Have these concessions given an increased value to the land? Not a bit, up to date.

5248. *Chairman.*] The value of the land is primarily dependent upon its position? Yes.

5249. As dairy land do you regard it as of a high class? It is of the ordinary Illawarra class; it is very good land.

5250. Have you no idea what the value of the land is? As to the value of land a buyer and a seller have different ideas. I consider the value of the land is greatly increased by the fact that it is situated in one of the choicest places for a natural harbour on that part of the coast.

5251. But you cannot make use of those natural opportunities furnished by Kembla Bay without the permission of the Government? Yes; but the Government never interfere with the development of private estates. That would be altogether an arbitrary thing to do—to interfere with legitimate development such as I have been giving to this estate. I have been giving the people there facilities for shipping coal on the most favourable terms. We have got very little out of it. I should like to know if the Government would let them ship coal for a ½d. a ton? I think the Government would charge 6d.

5252. Could you not state approximately the value of the Kembla land? No, I could not. The Government have the right to resume any land they want for a public work. You see I am a trustee, and I have to act very cautiously. My position is this: if I see that my brother's income from the estate is going to be increased in value, or that the estate is going to be increased in value, I shall be prepared to deal liberally with the Government or anybody else, as I have dealt liberally with the coal companies. The price of the land would depend upon the price offered by the Government.

5253. And you are prepared to take into consideration the fact that the construction of a harbour adjacent to your land will have some benefit? Certainly.

5254. But what that benefit is you are not prepared to say? No, not offhand.

5255. If you were still left in a position to charge way-leave over the lines running to Kembla as heretofore, you would not regard the way-leave as impaired? Certainly not.

5256. You would be prepared to recognise in the construction of a port some betterment given to the property? It ought to be the case, certainly.

5257. How much the betterment you do not know? No.

5258. If the Committee make a definite proposal to you after considering the main question whether or not it is well to make a port at Kembla, you will let us have as speedy a reply as you can? Certainly.

5259. *Mr. Hoskins.*] You will be prepared to recommend your brother to deal liberally with the Government? Certainly; provided his way-leave is not interfered with.

5260. *Chairman.*] Can you inform the Committee what is the present return from the property, outside the way-leave? The present return from the property is the same as it was thirty or forty years ago. We have had people there who have been born and bred on the land, and we have never increased their rent; they pay the same rent now as they did thirty or forty years ago.

F.  
Wentworth,  
Esq.  
2 Feb., 1897.

5261. Can you tell us what it amounts to? I think it is £500 a year for 2,400 acres. The people who rent it were born on it; their fathers and mothers lived there before them.
5262. *Mr. Lee.*] How much land actually is under way-leave by the two companies? I cannot say from memory.
5263. They have a strip 2 chains wide for the whole length of your property? Yes; and they have a certain amount of land at the terminus for any railway works, such as sidings.
5264. *Chairman.*] Could you let us know exactly these three points—first of all the return from farming pursuits, the return in the shape of way-leave, and the extent of land under way-leave? Yes; I shall be glad to do so.
5265. *Mr. Lee.*] I think you said that you would prefer that the Government should leave this matter of a harbour at Kembla alone altogether? Yes.
5266. At the present time you get what you call a way-leave from the existing collieries of  $\frac{3}{4}$ d. per ton? Yes; to be increased after a certain number of years to 1d. per ton.
5267. Your land is occupied by the length of the railway for  $2\frac{1}{2}$  miles and about 2 chains wide? Yes.
5268. The estimated shipment from Kembla of coal brought along that railway will be 750,000 tons a year? Yes.
5269. What would that bring to your estate at  $\frac{1}{4}$ d. per ton? £1,552 per year.
5270. In the face of such figures, can you say that you would rather that the Government should not interfere in the matter at all? Yes; because only a year or two ago the shipment of coal amounted to only 50,000 tons, whereas it is now 250,000 tons. It is a growing trade, and there is room for three or four more lines of railways.
5271. And room for more jetties? Certainly.
5272. But you would not be giving up a source of income such as you are now getting in the shape of way-leave unless the Government actually resumed the land on which the railways stand? No.
5273. You have already said that you would have no objection to the Government taking over the railways so long as the way-leave was not interfered with? I say if the estate would be benefited by the increased haulage of coal.
5274. The more the Government develop that port, and the more coal that is shipped there, the larger would be the income to your estate? Certainly.
5275. In point of fact, instead of the income being £1,500 a year as at present, if the way-leave were raised to 1d. a ton, and if the quantity of coal shipped was 750,000 tons, the income would be increased to £3,000? Certainly. If the Government will show me what they want I shall be prepared to deal most liberally with them.
5276. *Mr. Wright.*] If the Government should decide to construct a harbour at Port Kembla, would that fact cause you to put an enhanced value on the land beyond what you think it is worth now? It all depends. Of course if I am to lose the shipping facilities altogether, and the Government are to step into my shoes, I shall want fair compensation.
5277. But provided that the Government did not interfere with your way-leave, you would not require much extra money then? I do not think so. I want to deal fairly and liberally with the Government, while at the same time protecting my brother's rights.

Henry Richard Carleton, Esq., M.E., M.Inst.C.E., Principal Assistant Engineer, Harbours and Rivers Branch, Department of Public Works, sworn, and examined:—

H. R.  
Carleton,  
Esq., M.E.,  
M.I.C.E.  
2 Feb., 1897.

5278. *Chairman.*] What are you? Principal Assistant Engineer, Harbours and Rivers Branch, Department of Public Works.
5279. *Mr. Hassall.*] Are you in a position to furnish the Committee with the estimated cost of purchasing the two jetties at Port Kembla? Yes. Mr. Darley's estimate is—for the Mount Kembla Company's jetty, £5,450; and for the Southern Coal Company's jetty, £8,100, making a total of £13,550. That is the present value.
5280. Could you give us the estimated cost of a wharf providing two unloading berths? For two berths, each 100 feet long, the cost would be £1,725; for ballast and retaining-wall along the back of the wharfs and jetties, £1,400; cost of dredging, 21 feet at low water, in front of the wharf, and reclaiming the land at the back, £6,700. That is the whole cost in connection with the two berths.
5281. Can you state the cost of constructing a low-level jetty for unloading purposes, running out parallel with the existing jetty? One has been designed 500 feet long, of which the estimated cost is £6,250; shipping appliances on the wharf embracing six whips, £1,500; railway lines, four sets of lines, £1,000, with sundries, £925. Total estimate for the two berths, each 100 feet long, and the jetty 500 feet long, £19,500.
5282. That amount, added to the previous sum of £13,550, would make a total cost for the works mentioned of £33,050? Yes.
5283. So that you estimate that the two existing jetties can be resumed, and every convenience provided for loading and unloading at Port Kembla, at a total cost of about £33,000? That would be sufficient at present.
5284. What area of land do you think would have to be resumed to enable operations to be carried on? I think it would be necessary to resume about 660 acres, as shown on a plan I have had prepared.
5285. Where is that land situated? It would embrace all the land to the east of a north-west line running from near the south-east corner of David Allen's grant of 2,200 acres.
5286. Would that include the point at Port Kembla? Yes, it would include Red Point, which would probably be required as a signal station.
5287. Would it also include the land upon which the quarry is situated? Yes; a sufficient area to give us stone for the whole of the works. I think it would be very necessary to take in Red Point, as it would be required for a signal-station.
5288. Does the existing railway stand upon any portion of the land you propose to resume? Yes; the railway passes through it.
5289. The resumption you propose extends from Red Point right up to Tom Thumb Lagoon? Yes, to the entrance to Tom Thumb Lagoon. It has an average width of about 85 chains.

5290.

5290. Do you think it will be necessary to resume the whole of that? I think we cannot do with any less, in order to provide for an approach, to obtain sufficient land in the proper position to give what stone we require, and to take in Red Point as a signal station.

5291. Would you require Red Point for signalling purposes? Yes.

5292. And in the event of the whole of the other land not being required for shipping purposes, you think it would, perhaps, be feasible for the Government to sell a portion of it, so as to recoup themselves for some of the outlay? I think we ought, at least, to have a width of about 30 chains at a point near the jetties for approach and sidings.

5293. In the event of the railway being carried on from Belmore basin, you think it would be necessary to have that width of land to enable the railway to be brought along without any trouble? Yes.

5294. Would you state concisely the reasons why you think it advisable to resume this area of land? I think we should have the portion at Red Point as a signal station. The adjoining piece between that and the wharfs, or the greater portion of it, will be required for quarry purposes; and the remaining part will be required for approaches to the harbour—for road and railway purposes, for shunting and sidings.

5295. You think it advisable to resume a sufficient area in view of the further development of trade which might ensue if these harbour works were carried out? Yes. We thought we ought also at this time to take all the land fronting the harbour even as far as the northern breakwater.

5296. You think the whole of that land surrounding the work should be in the hands of the Government to be dealt with as they think fit? I do.

5297. *Mr. Roberts.*] I think you said just now, in answer to Mr. Hassall, that if this breakwater were carried out you would recommend the construction of another jetty at Port Kembla? Yes, a low level jetty for unloading purposes, the existing jetties being merely for the loading of coal.

5298. You think there should be a jetty for the inward traffic? Yes. The deck would be 4 feet 6 inches above high water.

5299. If only the eastern breakwater were constructed, do you think the water in the harbour would be sufficiently calm to enable ships to unload with safety? Not in all weather. I think there would be days when they would have to haul off from the jetties.

5300. That being so, do you not think it would be desirable to leave the question of an extra jetty for future consideration? I think you will require something to unload at. No doubt there must be some inward traffic. There may be days in the year when you would not be able to work there.

5301. Am I to understand that it would only be in the very severe weather indeed that there would be a difficulty about unloading? Yes; in easterly weather, when there would be a range at the wharf.

5302. Would those wharfs be for the accommodation of the inward traffic? Yes, and for the discharge of ballast.

5303. What is the estimated cost of the wharfs? We only propose at present to construct two lengths 100 feet each, which will be quite sufficient for the discharge of ballast.

5304. What is the new jetty to cost for the inward traffic? £6,250. It will be 500 feet long.

5305. Have you had large experience in the selection of stone suitable for the construction of breakwaters? Yes, I think I have. I have been at that work for some eighteen years now in the Department.

5306. And you have made recommendations, I presume, with regard to nearly all the works on the coast? Yes, from the Tweed southwards.

5307. Would you mention a few of them? The Richmond, the Clarence, the Bellinger, the Nambucca, the Macleay, Trial Bay, and Lake Macquarie.

5308. And in every instance the opinion you formed as to the quality of the stone has been realised? Yes; I think so.

5309. Are you of opinion that the stone from the quarry close to Port Kembla is well adapted for the construction of the proposed breakwater? Yes. I think we could get very good stone there.

5310. Do you think the deposit of stone in the quarry is sufficiently extensive for all purposes? Yes, quite sufficient for the complete scheme.

5311. Have you visited Lake Illawarra? I was there with the Committee.

5312. Did you inspect the stone on Windang Island? I did.

5313. Would it be suitable for the construction of a breakwater at Lake Illawarra? Well, it is not a stone I should advise the Government to use. I do not like it myself.

5314. If the stone on Windang Island were on the shores of Port Kembla would you recommend its being used? No, I would not.

5315. Have you gone into the commercial aspect of the question as to the probability or otherwise of the proposed harbour works proving remunerative? I did, to a slight extent, in my preliminary report, which I think was handed in to the Committee with Mr. Hickson's statement.

5316. *Mr. Black.*] Do you know how many days during the year on an average it is possible for vessels to load at Port Kembla now? No, I do not.

5317. If it were stated that they could load on an average 335 days in the year, would you think that would be a fair statement? I hardly think the harbour would be available so many days in the year under present conditions.

5318. If that statement were a correct one, do you think the Government would be justified in constructing works for the improvement of the harbour? I do. It would induce another class of vessels to go there—sailing vessels.

5319. Have you formed any opinion with regard to the use of sailing vessels for the conveyance of coal—do you think they are likely to increase or decrease in number? I do not think there will be any diminution.

5320. Do you not think that their slowness, and the difficulty of handling them puts them out of court, as compared with vessels driven by steam? I think the same number are still going to Newcastle—rather increasing I think.

5321. Then you believe that if the eastern breakwater were constructed at Port Kembla it would make that harbour suitable for sailing vessels? Yes, far more convenient.

5322. Do you think they could get in as easily as they do now in rough weather? I think a sailing vessel would only go in and out with a tug at any time, as is the case at Sydney and Newcastle.

H. R.  
Carleton,  
Esq., M.E.,  
M.I.C.E.

2 Feb., 1897.

H. R.  
Carleton,  
Esq., M.E.,  
M.I.C.E.  
2 Feb., 1897.

5323. In what particular way would a sailing vessel be benefited by the construction of the eastern breakwater? It would diminish the roll in the harbour very much indeed.

5324. And how is that a point that tells against a sailing vessel more than against one driven by steam? Well, there would be a certain amount of shelter provided as well. I daresay a vessel, if the breakwater were constructed, could ride through any gale, but she could not hang on there under present circumstances.

5325. Why should the roll in the harbour militate more against a sailing vessel than a steamer? I do not say that it would, but a certain amount of protection would be afforded to the vessel by the breakwater. She would know that she could ride out against almost any gale that occurred while she was loading. At present she would have to be on the watch to get away at once on the slightest sign of a sea getting up.

5326. Would not that be true of any vessel, whether driven by steam or sail? Yes; except that a sailing vessel is far more helpless than a steamer.

5327. Where does the special inducement for sailing vessels come in then, as contrasted with steamers? I do not know that there is any inducement. It is cheaper freight, of course.

5328. I mean special inducement for them to use the harbour. I asked you in the first instance whether, if it were true that the harbour could be used 335 days in the year under present circumstances without the breakwater, the Government would be justified in constructing a breakwater in order to make the harbour safe during the other thirty days, and you said "Yes, because of the advantage it would give to sailing vessels." Now, I want to know from you what special advantage it gives to sailing vessels over vessels driven by steam? Well, a sailing vessel would not go there at all now—not the large class.

5329. Do you think they would go there if the eastern breakwater were constructed? I think they would.

5330. And the reason they do not go there, you think, is because of the danger that might arise from sudden storms? Yes; a vessel might be caught in a trap at present.

5331. And you think that the eastern breakwater would be sufficient protection? For loading purposes, but not for discharging. Sufficient protection for a vessel; she could lie behind it in any weather—she would not have to go to sea.

5332. If she could not load she could lie there? Yes; she could haul off from the wharf and lie behind the breakwater.

5333. Then we are to understand that the construction of the eastern breakwater will not so much increase the facilities for loading as to furnish the sailing vessels with a safe harbour? Yes. Of course the breakwater would not increase the facilities for loading.

5334. I mean facile loading in rough weather. I suppose it is difficult to load vessels there when there is any kind of a jumble? Yes.

5335. And even with the eastern breakwater, when there was rough weather outside, there would still be a slight range which would make it dangerous to vessels and to the jetties if they were alongside? Yes.

5336. Then it lessens down to this—that the construction of the eastern breakwater would make the harbour safe—vessels could always lie there at anchor without danger? I believe they could; it would be a harbour of refuge.

5337. Would it make any difference what quarter the wind came from? The worst would be an easterly gale.

5338. Do you think that is worse than a north-easter? The north-easters are never very bad. You never get the long sea from the north-easters that you do from the others.

5339. You heard some of the evidence given with regard to Jervis Bay? Yes.

5340. If that port were protected by the junction of an island situated at the entrance with the mainland by means of a breakwater, do you think it would be a safe port in all weathers? Yes. I believe there would be shelter down at the southern end of Jervis Bay in any weather.

5341. Do you think the water is sufficiently deep? No; you will have to go a greater distance from the shore to get the same depth of water at Jervis Bay than you will have to do at Port Kembla. We get into deep water more quickly at Port Kembla.

5342. At what distance from the shore do you get into deep water at Jervis Bay? I think I am right in saying that it is over a quarter of a mile.

5343. At that distance, do you not lose a great deal of the shelter? No; there would still be considerable shelter if you connected Bowen Island with the mainland.

5344. You think the connection of Bowen Island with the mainland a necessity? Yes; if you want to make a shipping port there, I think it would be.

5345. *Mr. Hoskins.* In the event of this Committee recommending, and Parliament sanctioning, the construction of a port at Kembla, how soon afterwards do you think the works could be commenced, so that some benefit would result from them? The resumption of the land would be the chief thing. As soon as that was completed we could start work, as far as getting plant on the ground is concerned, in a month.

5346. How long would it take you to open up the quarry to make it fit for work, and ready to turn out large blocks of stone for the breakwater? We should not want the very large blocks at the root of the breakwater; the smaller blocks would come in there at the start. It would be three or four months before we could get out the 30-ton blocks.

5347. Still, you could get to work and get stone suitable for the breakwater within how long a time after receiving orders and after the land had been resumed? We could be running stone down in three months' time.

5348. Is it intended to proceed with the eastern and northern breakwaters at the same time? Yes; we could do both at the same time.

5349. Do you intend to do so? It would be more economical in that way, because the smaller class of stone would go to the northern breakwater.

5350. Evidence has been given that by the construction of the eastern breakwater a very great improvement would be effected, and vessels could lie in Port Kembla in comparative safety; and some witnesses have even gone so far as to say that for every 20 yards of the breakwater that was constructed an improvement would be observable in the water in the harbour;—do you think that is correct? I do.

5351. Then would it not be desirable, if possible, to go on with the eastern breakwater first? Certainly; I think the eastern breakwater should be first built, but there might be material that we would get from the

the quarry which would not be suitable for the eastern breakwater, and would have to be run for spoil, but which could be used in the northern breakwater.

5352. Have you any doubt that you would be able to get plenty of stone of sufficient size and durability, and suitable in other respects for the purposes of the breakwater from the quarry you propose to open at Kembla Bay? From what I have seen of it, it looks as well as any quarry we are working for harbour 2 purposes on the coast.

5353. *Mr. Humphrey.*] Are you of opinion that it would be unnecessary to construct the northern breakwater? I think it will have to be constructed eventually.

5354. Why? To make a complete harbour.

5355. Are you of opinion that when the eastern breakwater is completed all the necessary facilities for shipping inwards and outwards will then exist in Port Kembla? I do not think it would be a perfect harbour with only one breakwater.

5356. You have expressed the opinion that there would, perhaps, be some interruption from the prevalence of easterly gales? Yes; that would simply mean that any vessel unloading would probably have to haul off from the wharf and ride out the gale.

5357. Would there be any danger to the shipping? No, I do not think ships would ever have to leave the port.

5358. The worst that would happen without the construction of the northern breakwater is that a slight interruption might for a time take place in the unloading of sailing vessels at the wharf? Yes, and until the northern breakwater is constructed the unloading will not be carried on as easily or as well as if we had the second breakwater; there will always be a slight range.

5359. When the wind is from a certain quarter, or at all times? With an easterly sea.

5360. Do you think it desirable to proceed at all at the present time with the northern breakwater? I think it would be sufficient to build the eastern one first.

5361. Will any saving in your estimate be effected by reason of the discovery of the present quarry site? Yes. Mr. Darley thinks he can save 9d. per ton on all stone used in the eastern breakwater, since he submitted his original estimate—that is, that the price can be reduced from 5s. a ton to 4s. 3d.

5362. I suppose there will be no saving in quantity? No. I think the quantity has been estimated liberally.

5363. You are speaking now, I suppose, of a saving of 9d. per ton in connection with the eastern breakwater? The saving would be similar in both cases.

5364. What would be the total? On the eastern breakwater there would be a saving of £23,745, and on the northern breakwater £22,710. The cost of the eastern breakwater would be reduced by £23,745, leaving it at £135,890.

5365. Do you say that that sum would be ample to construct the eastern breakwater as designed, and shown on the plan now before the Committee? Yes.

5366. *Mr. Trickett.*] During the earlier stages of this inquiry several witnesses went into the question of the proposed height of the breakwater above ocean level—has that been decided upon yet? It is proposed to construct the eastern breakwater 20 feet above low water.

5367. Is it proposed to use the top of that breakwater for the conveyance of goods to the ships or anything of that kind? No, not for wharfage purposes at all.

5368. I ask the question because some discredit was sought to be thrown upon the scheme on the ground that if the top of the breakwater was to be utilised for the conveyance of goods it would have to be a great width. That objection, I understand, will not apply, because it is not proposed to use the breakwater for the purpose mentioned? No; I do not think it would be a suitable site for a wharf.

5369. And it is not intended? It was never contemplated by the Department.

5370. It was also urged by some witnesses that even with a breakwater of the height proposed the waves would occasionally break over into the basin,—supposing that did happen, would it, in your opinion, cause such a disturbance as to effect the safety of the ships? In the first place, I do not admit that the waves would break over. The breakwater at Trial Bay is the same height above low-water, and it is in a far more exposed position, being situated on the most easterly point on the coast. The waves do not break over the breakwater there. At first the Trial Bay breakwater was only 16 feet above low-water, and the waves then went over it. We have since raised it 4 feet.

5371. Now that its height is 20 feet, does the water go over it, even in easterly gales? No; no green water. Of course, there is a splashing over it.

5372. No water that would have the effect of disturbing the basin as a port for vessels to lie in? No.

5373. You referred just now to a proposal to resume 660 acres of land for the purposes of this scheme? Yes.

5374. If that area, or anything approaching it, is resumed, is it intended by the Government that a portion of it should be re-sold for the purpose of recouping some of the expenditure? Yes; I think a portion of it might be disposed of hereafter.

5375. Mr. Darley in his evidence, in answer to question No. 165, said, "I think it is only right that the Government should resume a liberal area, and get a profit on the improved value,"—as far as you know, there has been no alteration of that policy? None whatever.

5376. *Mr. Clarke.*] You said just now, that when the eastern breakwater was completed there would still be some danger to sailing vessels, either loading or discharging? I do not think I said there would be any danger in loading when the eastern breakwater was completed.

5377. In discharging? Yes.

5378. If a tug was at hand to assist sailing-vessels in the case of rough weather setting in, would not that be something in favour of sailing vessels loading there? Yes.

5379. There would be less danger? Yes. Still we want to get the port as good a name as we possibly can, to induce vessels to go there.

5380. *Mr. Lee.*] I want to be quite certain as to the approximate cost of this proposed scheme,—at what do you estimate the total cost of the eastern breakwater? £134,555.

5381. And the cost of the purchase of the existing jetties, and the construction of additional jetties with loading appliances? £33,050.

5382. And then there is a sum of £42,580 for lighthouse, signal station and quarters, engineer, supervision, and cranes? Yes.

5383. At what do you value the 660 acres which you think will have to be resumed? I could not give an opinion upon that.

5384.

H. R.  
Carleton,  
Esq., M.E.,  
M.I.C.E.  
Feb., 1897.

H. R.  
Carleton,  
Esq., M.E.,  
M.L.C.E.  
2 Feb., 1897.

5384. How many acres of land are included in the area over which the railways run at present? From the crossing of the colliery companies' lines with the main south coast line, down to the harbour, I think there are 66 acres—33 acres in each line.
5385. Then in addition to the figures you have given as to the cost of the breakwater and incidental work, there will have to be added the value of the 660 acres to be resumed, and also the 66 acres upon which the railways run at present? No; I do not see any necessity for resuming the land upon which the railways run up to our proposed boundary.
5386. Why not? I do not see why it should not still remain the property of the company.
5387. But you are aware that the owners of that estate have a permanent charge upon all coal that goes over their land of from  $\frac{1}{2}$ d. to a maximum of 1d. per ton? I did not know what the terms were.
5388. Therefore, if it is going to be a Government port with Government charges, does it not necessarily follow that the Government must resume the railway lines and the land? It is a matter that requires further consideration. I did not know the terms under which the ground was held.
5389. If the facts are as just stated, the cost of the 66 acres will have to be added, and also the cost of resuming the railway lines themselves? Yes.
5390. And the cost of constructing the line from Wollongong along the beach to Port Kembla would have to be added also? Yes.
5391. Are there any other charges? I think that covers the whole ground.
5392. You know a little about dredging, do you not? I think so.
5393. Do you think it is possible—I mean within practicable limits—to work a dredge in the surf outside the proposed entrance to Lake Illawarra? It would have to be a dredge specially constructed. We have no dredge here with which it could be done.
5394. Is it the practice to use dredges in the open surf? It is not a common practice. But we are about to design a dredge at present for bar work. Such dredges, however, do a very small amount of work.
5395. When the Newcastle work was under consideration either yourself or some other officer of your Department said it would be impossible to use a dredge on the bar. That being the case, how would it be possible to use a dredge in a heavy surf like that at the entrance of Lake Illawarra? We have not a dredge with which we could do that work; but we are about to design one for that kind of work on the northern bars.
5396. As a matter of fact, if you put a dredge in a heavy surf, either at Lake Illawarra or anywhere else, would it not be in imminent danger of being stranded on the first blow that came up? There would be very few days on which she could work at all, and then you would perhaps only get an occasional hopper full at a time.
5397. You do not look upon that as a practicable idea at all? I think if any of these bars have to be deepened it must be done by scour. You can do the interior portion by dredging, but I do not think we shall be able to deepen the bars themselves by dredging to any great extent. You might afford temporary relief on some of the smaller bars.
5398. Supposing you wanted to construct a dredge on the shores of Lake Illawarra for the purpose of dredging out that lake, how long would it take you to have the material made, to convey it there, and to fit it together? If we fitted the dredge together before sending it down there, I should say it would not take more than two or three months.
5399. Have you any idea how long it takes a contractor to build one of the ordinary dredges? Six months.
5400. And equip her ready for service? Yes. I am speaking of a dredge of the larger class. It all depends on the size and style of dredge.
5401. *Mr. Wright.*] Of the land proposed to be resumed, a portion of it is to be reclaimed, is it not? No; we shall reclaim some land in addition to that proposed to be resumed.
5402. Is there not some low-lying land a couple of hundred yards behind the beach? There is, but that is not included in the area proposed to be resumed.
5403. So that no portion of the land to be resumed will have to be raised artificially? Some of the land just above high-water mark we should want to raise from 3 to 4 feet.
5404. In reference to the resumption of Red Point, is there any stone on Red Point or anywhere near it? Yes, our quarry is at the root of it. I think we should get the same stone at Red Point.
5405. Can you explain to the Committee why you want a signal station on Red Point? You cannot see to the southward from the harbour itself on account of the intervening high land.
5406. Would not the proper place for a signal station be on Kembla Point? That would be the proper place for a harbour light.
5407. What other light do you want along that coast;—you have Kiama on the one side and Wollongong on the other? They are only harbour lights; they are not looked upon as coast lights.
5408. From your experience, do you consider you want a lighthouse on Red Point to indicate the harbour? I do not know that we should want a lighthouse, but we should want a look-out station and a signal station.
5409. To report vessels? Yes.
5410. That would not be a very expensive thing? No; but we ought to resume that land.
5411. What have you put down in your estimate as the cost of the signal station? *Mr. Darley* in his evidence (Question 160) said—
- Will there be any necessity to erect a lighthouse on the breakwater? There will be a leading light on the breakwater, and a lighthouse on the headland. That is included in the item of £75,000 in the estimate submitted to the Committee. The whole thing will only amount to £2,000 or £3,000.
- Does the headland there mentioned refer to Kembla Point? No; I think *Mr. Darley* was referring to Red Point.
5412. Would he speak of Red Point as the headland in connection with Kombla Bay? Yes.
5413. Will you kindly find out what are *Mr. Darley's* ideas in regard to a signal-station and lighthouse and the cost of each, and where they are to be situated? Yes.\*
5414. You think there is almost a certainty of finding suitable stone at the site you selected for the quarry—all along that ridge? Yes.
5415. Supposing on further testing it should be found not suitable, where would you obtain the stone then? I searched the whole of that country, and there are two or three other sites I could fall back upon.

5416.

\* NOTE (on revision):—*Mr. Darley* has since supplied the Committee with this information.

H. R.  
Carleton,  
Esq., M.E.,  
M.I.C.E.

2 Feb., 1897.

5416. At any distance? The next nearest one would be about  $3\frac{1}{2}$  miles away.
5417. Would that increase the cost very much? We should have to build a railway at not less than £2,000 a mile, and probably resume some land.
5418. Then that would involve an additional £15,000 or £20,000? Yes; probably the £23,000 we have saved as represented by the 9d. per ton on the stone.
5419. But you yourself have no doubt that the stone found will be suitable? I feel very confident about it.
5420. I suppose you recognise the fact that there is only one bed of stone there at present which is suitable? We have another 40 feet to go below that still, to take us down to high water.
5421. But in the event of that stone not being found suitable, you have other suitable stone at a distance of 3 miles? Yes; I believe so.
5422. Has that other stone been tested? It has been opened up slightly, and it shows very well; it is just as hard as the other.
5423. It is on private property? Yes.
5424. In what direction—further inland? Yes, it is near the main south coast road, about half way between Wollongong and Unanderra.
5425. That is immediately west of Port Kembla? Yes.
5426. In bringing the railway along the coast as proposed from Wollongong, would it be of sufficient elevation to enable the existing jetties to be used? We should have to raise the latter portion.
5427. You propose to build up the railway so as to utilise the existing jetties? Yes.
5428. There is no intention on the part of the Department to depart from the old system of loading, and to adopt the Newcastle system of loading by cranes? I think the existing jetties will be utilised for the shipping of coal. There will have to be some slight alteration, so as to suit the waggons of the different companies.
5429. But you will continue the shipment of coal by gravitation without lifting? I think so.
5430. It is proposed to construct the low-level jetties to a height of 4 feet 6 inches above high-water mark? Yes.
5431. Is that necessary? It is more convenient, and, of course, cheaper.
5432. In the first place if you construct that jetty on which to discharge cargo, you will have to climb up a steep ascent in order to get on a level with the railway line, on which you bring in the coal? There would be quite a different approach to the low-level jetty.
5433. Then there must be a different railway? It would be the same line until you commenced to rise on to the jetties.
5434. But the high-level jetty is 50 feet above high-water mark, and the low-level jetty only 5 feet? I do not think the high-level jetty is 50 feet above high water.
5435. Take it at 40 feet. The low-level jetty is only 5 feet. There is a rise of 35 feet to get on to the main line of railway? Exactly.
5436. Is not that an excessive rise in a short distance? It is done under existing circumstances. The railway approaching there at present has portions that are quite as low as the line from Wollongong would be.
5437. But you have to make a junction with the line almost immediately after you leave the jetty or construct a separate line? I think we have quite sufficient length to rise in.
5438. If you are going to construct a low-level jetty, and run a railway on that jetty, you will have to construct a long length of railway before you can get on to the line by which you approach the high-level jetty? You would, certainly.
5439. Is there any provision made for that in the estimate? I do not think we have made out any estimate for the lines at all.
5440. You have left the railways out altogether? Yes.
5441. But that would involve extra expense in the railway station? Yes.
5442. Has that been brought under the notice of the railway authorities in preparing their estimate;—is Mr. Deane cognisant of the fact? I think he is. I think Mr. Darley told him.
5443. Will you kindly ascertain from Mr. Deane whether he has made provision for meeting that expenditure? Yes.
5444. Is there any necessity to resume such a large area of land as you have stated? We tried to cut it down as much as possible.
5445. You do not propose to build summer residences on Red Point, do you? We must have that point, and we must have some 40 acres of land for quarry purposes. We could not see our way to cut down the area any more.
5446. Could you not cut off a small portion at the northern end of the proposed resumption by taking the boundary line further to the east? We might cut off a small portion there, but it is the least valuable portion of the land.
5447. *Mr. Fegan.*] Is it not better to resume at once the full area of land that is necessary, than to make a further resumption after the breakwaters and the harbour have been constructed? I think every acre that is required should be taken in the first instance.
5448. It is much cheaper to take it in the first instance? Yes.
5449. After the construction of the breakwaters and the jetties, the land would be of greater value, and more costly to resume? Yes.
5450. On those grounds you propose now to make provision for resuming 660 acres? Yes.
5451. *Chairman.*] Can you give me the soundings across from the point to Five Islands? We have not got the soundings there. I was able to get one sounding that I saw on the Admiralty chart, and that was quite sufficient to give an indication.
5452. If the mainland were connected with the island the southern seas would not go round on to Kemplia? The effect would be to diminish their forces very much.
5453. It would be a great help to the harbour? I believe it would.

WEDNESDAY,

WEDNESDAY, 3 FEBRUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHRY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Construction of a Deep-water Harbour at Port Kembla.

Louis Richard Gundlach, Esq., sworn, and examined:—

- L. R. 5454. *Chairman.*] Do you know Windang Island? Yes.  
 Gundlach, 5455. Are you competent to express an opinion with regard to the material to be obtained therefrom?  
 Esq. I think so.  
 3 Feb., 1897. 5456. What has been your experience? I have been connected with engineering works for a good many years, and I have had a good deal of stone going through my hands. I have made it a special study to some extent, and I think I am competent to speak about it.  
 5457. With what works, for instance, have you been connected? Since I have been in the colony I have been connected with the construction of a jetty at Kembla; I was engaged in the construction of the Manly Waterworks; and prior to that I was engaged in the Department of Railways. I have since been engaged as resident engineer in the Dapto district in connection with the works going on there.  
 5458. You have a statement you desire to lay before the Committee? Yes. I wish to make a statement concerning some matters that came under my notice during this inquiry. I heard the evidence given by Mr. Pittman regarding the stone at Windang Island; but before I refer to that evidence, I beg to state that the quarry from which the stone for the tie-bank is taken, and which, I presume, the Committee has inspected, displays probably the worst portion of the stone on the island. But as the tie-bank is a minor portion of the works which, when the southern breakwater is once constructed, will be of very little importance beyond forming a sort of backbone for the sand deposit to the south of the entrance works, and a roadway on to the island, it would have been unwise to use the stronger material from the northern and eastern portions of the island, and which will be far better employed in the more exposed works. Mr. Pittman gave evidence that he visited the quarry and saw the tie-bank; but he also stated that he did not inspect the northern and eastern portion of the island. He further said that there is no stone on the island fit for the proposed works, and that no large blocks could be quarried owing to the thickness of the beds being nowhere greater than 3 feet. I have repeatedly and carefully examined the large faces on the northern and eastern sides of the island, and I regret that Mr. Pittman omitted to inspect these freely accessible places that show the whole rock formation. I believe that at least 75 per cent. of the rock showing there is of a durable nature, and can be readily quarried in large blocks up to 20 tons and more in weight. At the eastern end this is exemplified by several huge blocks, probably up to hundreds of tons in weight, which have been exposed for many years to the fiercest attacks of the Pacific, and yet show hardly any wear. I understood Mr. Pittman to say that the rock was a sort of volcanic tuff. Mr. Card, to whom I submitted a sample, taken from the tie-bank, thinks that the stone is a sandstone; and the late Mr. Wilkinson, to whom I submitted a sample, stated it was a ferruginous sandstone. In any case, should it be found in opening up the main quarry that sufficient sound material is not to be got at the island the contractor, under the terms of his contract, is bound to procure suitable stone elsewhere at the schedule price of the contract. One other matter I wish to refer to, is the height of waves. As resident engineer in charge of the construction of the Kembla Coal Company's jetty at Port Kembla, I had an opportunity, on or about the 28th May, 1889, to personally observe several waves to rise to a height of 17 feet above high water, at a distance of about 850 feet from the shore, where soundings showed about 21 feet depth below low water. The height of the waves was observed on a pile of the jetty, above which I stood at the time. The waves were solid and without any sign of break, and measured probably over 30 feet in height, from trough to crest, and were the result of a heavy southerly gale.  
 5459. In your opinion the information furnished to the Committee with regard to the stone on Windang Island appears to have been based on the stone that was exposed on the southern side of the island, and which did not clearly convey your view with regard to the matter? Yes.  
 5460. You believe that the stone to the north and the east will be found satisfactory? Yes; I am sure of that. I have been several times with the contractor examining the stone, and I am sure it is of an excellent quality, and that as good stone as is to be got in the district is to be found there.  
 5461. You heard the evidence given by Mr. Pittman, Mr. Carleton, and others with regard to the question? Yes.  
 5462. And you still maintain your position? Yes; I have observed the same quality of stone in that district in various places. I have found the stone weathered in portions the same as it is weathered in that quarry; but other portions of the stone we have used for metal on our railways, and although the test is severe under those conditions it has stood very well indeed, and shows no sign of weathering.  
 5463. *Mr. Wright.*] You say that large blocks may be got from the island? Yes.  
 5464. No big blocks have yet been quarried? No; the specification for the tie-bank only requires blocks up to a ton in weight.  
 5465. Practically rubble? Yes; and for that very reason, not wanting to waste the better material, we use that particular spot to get the stone from.  
 5466. Have you seen the tie-bank lately? Yes.  
 5467. What has been the effect of the weather upon it? I find that only that portion of the stone that is exposed to the air is weathering, while the portion that is under water is showing hardly any sign of weathering, although that stone is not good.  
 5468. You spoke of the large blocks of stone on the extreme eastern point of the island;—can you get any large bed of stone similar to that on the island itself? I think we could quarry stone up to 50 tons in weight on the eastern end of the island.  
 5469. If you could get those big stones you are under the impression that they would be suitable? That is so.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Construction of a Deep-water Harbour at Port Kembla.

APPENDIX.

A.

[To Evidence taken before the Committee.]

RETURN showing the quantity of Coke shipped from Port Kembla from 30th June, 1891, to 30th June, 1896, inclusive :—

Year.	Tons.	
1891 .....	3,189	To Port Pirie.
1892* .....		.....
1893 .....	3,209	To Port Pirie.
1894 .....	10,790	Do
1895 .....	7,120	Do
1896 .....	511	Do
	24,819	

This was shipped from the Southern Coal Co.'s Jetty at Port Kembla. The coke works have been closed now for some time.

\* NOTE.—There were only 80 tons of coke shipped during the year 1892, and that was shipped at Belmore Basin, Wollongong, for Strahan, Tasmania.

E. POTTS,  
Customs Officer, Wollongong.

[To Evidence of H. C. Russell, Esq., C.M.G.]

FORCE OF SEA-WAVES ON EXPOSED STRUCTURES.

EXTRACT from *Nature*, page 87, Vol. XL.

"It is extremely difficult to estimate, with a fair degree of accuracy, the maximum force of the waves with which some of the most exposed of these sea structures may occasionally have to contend.

"The late eminent lighthouse engineer Mr. Thomas Stevenson, F.R.S.E., carried out a long series of experiments with a self-registering instrument he devised for determining the force of sea waves on exposed structures. He found at the Skerryvore Rock Lighthouse the Atlantic waves there gave an average force for the fine summer months in 1843-44 of 611 pounds per square foot. The average result for the six winter months for the same year was 2,086 pounds per square foot, or three times as great as the summer months.

"The greatest force registered was on 29th March, during a westerly gale, when a pressure of 6,083 pounds, or 2½ tons nearly, per square foot was recorded."

27/1/97.

[To Evidence of J. R. M. Robertson, Esq.]

STATEMENT OF COAL SHIPPED AT PORT KEMBLA, BELLAMBI, AND BELMORE BASIN DURING THE YEAR 1895.

Sir, 40, Pitt-street, Sydney, 5 February, 1897.  
In reply to your letter of yesterday's date, I now beg to give you the shipments of coal at the under-mentioned ports during the year 1895:—

Kembla .....	233,438 tons
Belmore Basin .....	163,226 „
Bellambi.....	178,317 „

I can give you no information regarding Bulli, but believe that no coal was shipped during 1895, the colliery being stopped.

The Secretary, Parliamentary Standing Committee on Public Works.

I have, &c.,  
E. G. WEYLAND,  
for J. R. M. ROBERTSON.

## G.

[To Evidence of S. Alexander, Esq.]

RAILWAY CONNECTION WITH PORT KEMBLA.

The cost of constructing a single line between Belmore Basin and Port Kembla has been estimated at £18,000, and the value of portion of the coal lines on land to be resumed at Port Kembla has been estimated at £7,108.

Whether these lines are resumed or not, they, or some substitute for them, will be required for carriage of the coal from the collieries by which they are now owned.

Certainly, considerable rearrangement of lines will be made, but it would not be safe to say now that any saving can be made on the estimated cost of construction by reason of these resumptions.

I concur.—H. D., 2/2/97.

S. H. A., 2/2/97.

## H.

[To Evidence of C. W. Darley, Esq.]

TIDAL RANGE AT LAKE ILLAWARRA.

Sir, Department of Public Works, Engineer-in-Chief's Office, Sydney, 24 November, 1896.  
In reply to your letter of the 21st instant, with reference to Lake Illawarra, I beg to inform you that there is no tidal range inside the lake at present. It stands at about mean tide level except during wet weather, when it rises and breaks out again.

The water at Tallawera Point deepens out from 0 at water-edge to 10 feet at about 100 feet out.

The Secretary, Parliamentary Standing Committee on Public Works.

I have, &c.,  
C. W. DARLEY,  
Engineer-in-Chief for Public Works.

## H 1.

EQUIPMENT OF PORT KEMBLA AS A HARBOUR.

Sir, Public Works Department, Sydney, 4 February, 1897.

In reply to your letter of this date, I submit the following estimate for cost of the works mentioned. I must explain that from date of starting the works it would probably be quite seven years before a light could safely be placed on the end of the breakwater. In the meantime, seeing that the port would be growing into importance, and probably a large amount of shipping would be resorting there for coal long before the breakwater is complete, it will be necessary to establish a port light on the headland or island at a site to be selected. It is my opinion that the main port light should not at any time be located on end of breakwater, but a small leading light only placed there. I therefore think that a fourth order port light should be provided for in conjunction with the signal station, and on this I have based my estimate.

I estimate the cost as follows:—

1. Cost of a 20-ton steam derrick crane, complete .....	£4,000
2. Cost of leading light in the harbour and a small light on breakwater hereafter.....	1,500
3. 4th order light, complete .....	3,000
4. Signal station and quarters .....	1,500
	<u>£10,000</u>

Besides the above, of course, provision must be made for pilots and boatmen's quarters, boat-sheds and slips, buoys and moorings in harbour, and, in fact, an allowance for general harbour equipment, which must inevitably be required if a large harbour is to be established.

I consider a sum of £25,000 in all will be required for expenditure within a few years of the harbour starting, to cover the items I have mentioned, as well as equipment generally.

The Secretary, Parliamentary Standing Committee on Public Works.

I have, &c.,  
C. W. DARLEY,  
Acting Under Secretary and Commissioner for Roads.

## H 2.

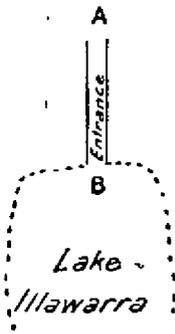

POINTS IN THE INQUIRY RESPECTING THE CONSTRUCTION OF A HARBOUR AT LAKE ILLAWARRA.

Department of Public Works, Engineer-in-Chief's Office, Sydney, 9 December, 1896.

Sir,

In answering the following questions put to me by the Chairman of the Public Works Committee, I should point out that they deal with some very abstruse subjects in hydraulic engineering, so involved indeed, on account of the number of points that must be assumed, that the merest prediction only can be given of what is likely to result from so large an interference of the natural regime of the lake entrance.

The

The questions asked are :—

1. The width to be estimated as the narrowest permissible, or as proposed by the Lake Illawarra Corporation.
2. Taking into consideration rise and fall of tide, what rate and for what periods would the current run daily from A to B and from B to A.

1st. The width proposed by the Lake Illawarra Corporation is 430 feet between bases of the breakwaters, or say 500 feet clear at low water-mark. This should form a safe entrance, bearing in mind that vessels must always be under control of a tug boat when entering or leaving.

2nd. Tidal action alone must be relied upon to scour the entrance. Waves have no scouring effect whatever in an entrance such as this. The rise and fall of tide on the coast is from 3 ft. 6 in. to 5 ft. 6 in. neaps and springs. In the lake there is no tidal range; we must assume that its normal level coincides with mean sea level. Should such an opening as that proposed be constructed, the tide would run ebb, say 5½ hours, and flood 5½ hours, and slack water about one hour out of every 12; or daily during 24 hours, there would be about 11 hours flood-tide, 11 hours ebb-tide, and 2 hours slack water.

Assume that an average rise and fall of one foot was brought about in the lake, this would necessitate the tide running in and out at an average rate of 2½ miles per hour during the 5½ hours allowed for each tide, but as the velocity would start at nil and end at nil, and only gradually reach its maximum, it is probable that its maximum rate would exceed 7 miles per hour. This would cause a very severe scour through the entrance; but in all probability this velocity would not be reached, and the average tidal range in the lake would not exceed say 8 inches, being somewhat greater near the inlet, and less at the furthest extremities.

I have, &c.,  
**C. W. DARLEY,**  
 Engineer-in-Chief for Public Works.

The Secretary, Parliamentary Standing Committee on Public Works.

**H 3.**

**PARTICULARS RESPECTING WHARFAGE ACCOMMODATION AT PORT KEMBLA.**

Sir,

Public Works Department, Sydney, 28 January, 1897.  
 With reference to your letter of the 27th instant, in which you ask for certain particulars in regard to the wharfage accommodation at Port Kembla, I have the honour to forward herewith a statement containing the information asked for.

I have, &c.,  
**C. W. DARLEY.**

Acting Under Secretary and Commissioner for Roads.

The Secretary, Parliamentary Standing Committee on Public Works.

*Proposed Harbour at Port Kembla.*

Replies to questions asked by the Parliamentary Standing Committee on Public Works, 27th January, 1897 :—

1. The estimated cost of purchasing the two jetties at Port Kembla?

<i>Answer</i> —Mount Kembla Company's Jetty .....	£5,450	
Southern Coal Company's Jetty .....	8,100	£13,550

2. The estimated cost of constructing a wharf providing two unloading berths?

3. The position and estimated cost of constructing a low-level jetty for unloading purposes, run out parallel with the existing jetties?

*Answer*—

2. { Two berths, each 100 feet long .....	£1,725	
{ Ballast-retaining wall along back of wharfs and jetty .....	1,400	
{ Dredging to 24 feet at low-water in front of wharf, and reclaiming land at back .....	6,700	
{ Jetty 500 feet long .....	6,250	
3. { Shipping appliances, cranes, &c. ....	1,500	
{ Railway-lines, &c., on jetty .....	1,000	
{ Sundries .....	925	
	19,500	£33,050

# PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## SECTIONAL COMMITTEE.

### CONSTRUCTION OF A DEEP-WATER HARBOUR AT PORT KEMBLA.

#### REPORT.

THE Sectional Committee appointed to inspect, take evidence, and report with reference to the proposed construction of a Deep-water Harbour at Port Kembla, left Sydney for Wollongong on Friday, the 15th instant.

On the following day they visited Bellambi for the purpose of inspecting a proposed site for a breakwater at that port, and hearing the views of the local residents thereon.

At the Bellambi Railway Station they were met by the managers and engineers of the local collieries who accompanied them during their inspection.

A careful examination was made of the bay and the existing jetties, and a full explanation was given the Sectional Committee by Mr. Charles Morton, C.E., of the Harbour Works suggested by him.

On Monday, the 18th instant, the Sectional Committee took evidence at the Wollongong Council Chambers. Amongst the witnesses there were several from Bellambi who strongly recommended the construction of a harbour at Bellambi instead of at Port Kembla.

Mr. Morton furnished elaborate details of his project, and contended that a harbour at Bellambi would be more convenient than any other to the greater part of the coal measures of North Illawarra, and would be both safe and commodious.

The great majority of the inhabitants of Wollongong are in favour of the construction of a harbour at Port Kembla.

Evidence given by persons engaged in the shipping business supported the testimony already furnished as to the superiority of the bay at Port Kembla over that at Bellambi with regard to depth of water and good anchorage, and as a place of safety in stormy weather.

An opinion was expressed that if a secure harbour were provided at Port Kembla the colliery owners would no longer burden themselves with the expense of maintaining their private jetties.

The visit of the Sectional Committee confirmed the evidence given before the Parliamentary Standing Committee on Public Works as to the superiority of the site at Port Kembla over all others.

A deposit of stone situated about a mile south of Port Kembla appears to be suitable for the construction of a breakwater, and should much lessen the original estimated cost of the proposed work.

The Port of Wollongong has already been fully described by witnesses before the Parliamentary Standing Committee on Public Works, and after careful inspection the Sectional Committee has not been able to discover any new facts in connection therewith.

The Departmental statements furnished regarding Lake Illawarra have already made clear the general features of that place.

At the time of the Sectional Committee's inspection a sandy beach stretched from the western side of Windang Island to the point to the north of the entrance; a narrow stream of water not more than a foot and a half deep which traversed this joined the waters of the lake with the ocean.

Westwards towards the lake the entrance was shoal water.

The stone on Windang Island, although it might be used for the erection of inner training walls, does not appear suitable for breakwater purposes.

The Committee regard the construction of a port at Lake Illawarra as being impossible within the specified time, and, at best, surrounded by difficulties.

The manager of the Smelting Company of Australia, of which works the Sectional Committee made a thorough inspection, stated that the expenditure of that company up to the present time had been £70,000, that the total outlay by the time the works are completed will be £120,000, and they are capable of large extension. It is anticipated the works will be finished in about four months from the present time, and when in full operation they will be capable of treating 65,000 tons of ore per annum, so that in the near future, it was stated, the freight to the works in ore and coal will amount to something like 120,000 tons per annum. The manager estimates that about one-half of the ore brought to the works will be carried by sea and the other half by rail. The company has not fully developed the coal-mine at Dapto Creek, the coal not promising well for smelting purposes.

The main contention of the inhabitants of Nowra is that before undertaking any other expensive public works on the south coast the Government are under an obligation to complete the South Coast Railway by extending it from Bomaderry to Jervis Bay, and they strongly advocate the claims of Jervis Bay as a port.

Although Jervis Bay could be safely used for shipping, its value for this purpose depends rather on developments in its vicinity than on coal measures so far removed as is the Bulli seam. The cost of not less than 60 miles of haulage would be too great to permit of owners of the coal deposits at present being worked using Jervis Bay as a port of shipment in preference to Sydney.

During the visit of the Sectional Committee neither evidence nor personal inspection disclosed any fact materially at variance with the Departmental statements made before the Parliamentary Standing Committee on Public Works.

The Report has therefore been limited to a brief statement.

THOS. EWING,  
Chairman.

28 January, 1897.

---

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

CONSTRUCTION OF A DEEP-WATER HARBOUR AT PORT KEMBLA.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

MONDAY, 18 JANUARY, 1897.

[The Sectional Committee met at the Council Chambers, Wollongong, at 10:30 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. DANIEL O'CONNOR.  
HENRY CLARKE, Esq.  
CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.  
FRANCIS AUGUSTUS WRIGHT, Esq.  
FRANK FARNELL, Esq.

The Sectional Committee proceeded to consider the proposed Construction of a Deep-water Harbour at Port Kembla.

Mr. John Archibald Beatson, Mayor of Wollongong, sworn, and examined:—

1. *Chairman.*] Are you acquainted with the harbour scheme under consideration? I am.
2. Have you a knowledge of this district? Yes; I was born in the district, and have resided here all my life.
3. Do you desire to make any statement with regard to the provision of harbour accommodation for the Illawarra district? I might say that the need for improved harbour accommodation for Illawarra has been felt for some years. During the month of April a requisition was presented to me from a number of citizens, asking me to call a public meeting to consider the best means of securing harbour accommodation for the district. I did so. A meeting was held in the Council Chambers, at which there were present representatives of Wollongong, Bellambi, and Bulli. The necessity for increased harbour accommodation was pointed out, and a motion was proposed by Mr. MacCabe to the effect that the Government should take the necessary steps, as speedily as possible, to provide harbour accommodation. This motion was duly carried, after having been supported by the representatives of Bellambi, Wollongong, and Port Kembla. The main principle which actuated the meeting was that the whole matter should be left to the Government, and whatever scheme the Government considered the best should receive the support of the whole district—that local preferences should be sunk in favour of that scheme. The meeting decided that the Government officials would be able to find out which was the best scheme, and, as far as the meeting was concerned, it was quite willing to leave the matter in their hands. Following on that, a deputation was appointed to wait upon the Minister for Works. That deputation waited upon the Minister some time in May following, and he promised that the matter should receive the attention of the Public Works Committee at as early a date as possible.
4. The district was unanimously of opinion that the best port should be chosen to give an outlet for the coal of Illawarra, and that the choice of that site should be left to the engineers of the Department? Yes. The meeting was a thoroughly representative one, and embraced interests representing the whole district.
5. The meeting was held prior to the Government deciding on Port Kembla? Yes.
6. Port Kembla having been decided upon, in your opinion is the district fairly satisfied with that selection? I may say that following on that meeting alluded to above, the south coast harbour league was formed, the object of which was to induce the Government to construct a harbour for the south coast where they might think it best to have one. The people of Wollongong have adhered to the resolution to leave the matter to the Government, and they are quite content that the Government should construct the harbour at Port Kembla or wherever else they deem best. The people of Port Kembla are also agreeable to allow the Government to have a free hand in the matter. I can state from my own knowledge, however, that meetings have been held at Bulli and I think at Bellambi for the purpose of opposing the construction of a harbour at Port Kembla, and in favour of the construction of one at Bellambi. According to the papers, another movement has been made at Dapto, but I should say that the lake scheme ought to be treated as a separate matter altogether. Wollongong has many claims, but we have allowed the matter to rest with the Government. Personally, Wollongong would suit me best, as my interests are centered here, but I am perfectly willing to suit private interests to the public good.
7. Are the people of Wollongong by a large majority favourable to the construction of a harbour at Port Kembla? Yes.
8. Is it their opinion that it is not a wise thing to agitate for a harbour at Wollongong? Yes.
9. What is the reason of that? They consider from expert evidence that the cost of construction at this port debars Wollongong from being made the principal harbour for the Illawarra trade. At Port Kembla, for a comparatively small outlay, such a harbour could be provided.
10. You speak as the representative of the people in your official position? Yes.

Mr.  
J. A. Beatson.  
18 Jan., 1897.

- Mr. J. A. Beatson.  
18 Jan., 1897.
11. *Mr. Lee.*] When that meeting of residents was held was the Illawarra lake scheme made known to the public? Yes.
12. The public knew that that was a project which if carried out would at all events afford a port there? Yes.
13. The meeting at that time had full knowledge of the existence of that company? Yes.
14. And notwithstanding that they determined that the most suitable place for a port for the southern coast was Kembla? The meeting did not decide that; they left the whole matter to the Government.
15. Do you intend to convey the idea that the meeting wished the Government to consider the Lake Illawarra scheme alongside of any other scheme? We looked upon it that the Government should make a port at Kembla, and that if a private company wished they could make one at Lake Illawarra.
16. I presume that all that is required by the people here is to have a suitable port to carry on the coal trade of the district? Yes, coal is the principal export.
17. If the promoters of the Illawarra scheme were to make such a port would you be satisfied with it? I do not think it would answer the requirements of the district.
18. If the Illawarra Harbour and Land Corporation were to carry out their scheme in its entirety and provide a port that would accommodate vessels of as deep draught as could be accommodated at Port Kembla, would that scheme suit the requirements of the district? I should say that it would not, because the coal measures are to the north of Lake Illawarra. To my mind Kembla would be the best port of the whole lot.
19. Although at the date of that meeting there was a possibility of the Illawarra Harbour and Land Corporation carrying out their scheme, the people did not pronounce in favour of it; but they left it an open matter for the Government to decide? Yes. The Government to decide as to the most suitable place for a harbour for the coal trade of the district.
20. Are we right in assuming that that meeting looked upon the Lake Illawarra project with a certain amount of doubt or disfavour? The fact was well known to them that the Illawarra scheme had been a long time dangling before the public, and as nothing had been done, it was then thought it would be far better for the Government to step in and make a harbour.
21. If the Illawarra harbour were carried out I presume it would be detrimental to the best interests of the town of Wollongong. It would not improve Wollongong, and I do not think it would be as convenient as Port Kembla for the district generally.
22. As far as the trade of Wollongong is concerned, would it not interfere materially with the prospects of this town? Yes.
23. I understand that you personally advocate the construction of a harbour at Kembla? I consider it the best place of all the sites submitted.
24. Do you think that if that is carried out it will interfere with vested interests in Wollongong? I think not, because I understand that communication will be established between Wollongong and Kembla.
25. What sort of communication? By railway from the Port of Wollongong to that of Kembla.
26. If that were carried out, then the people of Wollongong, suppose that the interest of their town will not be interfered with? I think not; we have all the public buildings established here; Kembla would be the shipping port and Wollongong would be the commercial centre.
27. So that after all, in advocating the establishment of a port at Kembla the people of Wollongong have an eye to their own interests? Yes.
28. *Mr. Black.*] When the people decided to accept the decision of the Government with regard to the construction of a harbour on the south coast, had they any idea that Port Kembla would be the place chosen? No; I think not, because all the plans were to be submitted to the Government for them to choose. I do not think the Wollongong people knew then which place would be selected.
29. What sort of a harbour have you at Wollongong—is it a good rough weather harbour? No; I cannot say that it is.
30. Is it difficult to enter and to get out of in rough weather? It is. In rough weather vessels cannot enter or leave the port.
31. Do the inhabitants of Wollongong and district desire a port solely for the shipment of coal? That is the principal industry of the district. We send milk and other produce by rail to Sydney.
32. Do you desire a port solely for the shipment of coal, or have you any desire to have such a port as would enable you to ship and receive other produce? It is thought desirable to have a port in which the large ocean-going steamers can take in coal.
33. You would require a still-water harbour? That would be best, of course.
34. Then unless two breakwaters are built, Port Kembla will not be suitable for your requirements? I can only speak from a rough knowledge. I do not pretend to know anything about breakwaters, but I should say that the eastern breakwater would be sufficient for some time to come.
35. Do you think the water in the harbour would be sufficiently still for steamers to lie alongside the wharf and take in produce that requires delicate handling? Hardly. But even now large vessels can load there. I have seen them there in rather rough weather.
36. They load coal, but not butter and eggs? No, at present they only load coal.
37. Are you sanguine that Kembla will make a good harbour in all weathers? Yes. With two breakwaters I believe it would make a splendid harbour.
38. Were you not equally sanguine about Wollongong? We anticipated that, with the Harbour Trust operations, it would make a good harbour.
39. Have you no suspicion that your judgment may again be at fault? I do not speak as an engineer, but from what I have heard and seen I think that Kembla would be the best place for a harbour on the south coast for coal exportation.
40. Do you think that the shipping trade of the southern district would warrant the expenditure of half a million of money from the public revenue? That is another question upon which I could not speak with authority. The Committee, I presume, know as much as I do about the mines in the Illawarra district and their output.
41. Am I to understand that the people of Wollongong simply desire a port, and give no consideration to the question of expenditure? At the meeting it was pointed out by several speakers that the amount of coal shipped would bring in a sufficient revenue to defray the interest on the expenditure for a harbour.
42. *Mr. Clarke.*] You are aware that a large amount of money has been spent on the port at Wollongong? Yes.

43. From your experience, do you consider that the port is sufficient for the trade of the district? I do not.
44. Although it may be injurious to the trade of Wollongong in some respects, you think that the people would prefer to have a better harbour at Port Kembla or Lake Illawarra? The people of Wollongong do not care much where the harbour is as long as a harbour is made to meet the requirements of the south coast. At present the trade is hampered by the non-existence of a suitable port.
45. Wollongong is about the centre of the coal-fields in this district? Yes.
46. Do you consider that chiefly for the output of coal a harbour should be made at either Bellambi, Port Kembla, or Lake Illawarra? Yes.
47. Is it likely there would be any other produce shipped at Port Kembla? No; I think that most of our other produce would go by rail.
48. You consider that on the whole the interests of the people of the Illawarra district, and the interests of the coal owners will be best served by the construction of a harbour at Port Kembla? I do; because it has been taken up as a Government scheme, and everything points to the conclusion that Port Kembla will be the best place for the harbour, and the work will soon be undertaken.
49. *Mr. Roberts.*] What is the size of the vessels at present engaged in the coal trade at Wollongong? They are small schooners and sailing craft from 80 to 500 tons.
50. Do not many steamers come to Wollongong;—what would be the tonnage of the largest steamer that is in the habit of visiting Wollongong to obtain coal? 500 or 600 tons.
51. What is the depth of the water in the basin? That I could not say exactly, but I think from 12 to 16 feet.
52. Have you a number of sailing vessels plying to Wollongong for coal? Yes.
53. Do the largest steamers at present go to Kembla? Yes, and to Bellambi.
54. Do you think that if these breakwaters were constructed at Port Kembla a large sailing vessel traffic would spring up with foreign countries? I do; because even now sailing vessels go to Kembla and are loaded there.
55. Of what size? Small sailing vessels from 160 to 300 tons;—they are towed in and towed out.
56. Since the meeting to which you referred, and since the Government has referred the construction of a harbour at Port Kembla to the Committee, have you heard of any expressions of dissatisfaction from the people in the surrounding districts? I have;—at Bulli and Bellambi there have been one or two meetings. I did not attend those meetings, as I was President of the South Coast Harbour League.
57. Is the feeling amongst the Bulli and Bellambi people in favour of the harbour at Bellambi? Yes.
58. Do you know upon what grounds they advocate the Bellambi scheme? They say that a good harbour could be constructed at Bellambi, that it is the most suitable place, and that the cost would compare favourably with that of Kembla.
59. Do they regard Bellambi as occupying a more central position than Kembla? I believe that that is one of the grounds on which their claim is based.
60. Can you give us the opinions of the people south of Bellambi with regard to the Port Kembla and Lake Illawarra schemes? The opinion of the people here is that a harbour should be made at Kembla. At Dapto a meeting was called to take steps to support the Lake Illawarra scheme.
61. All things being equal, do you think that Wollongong would be a central position for the construction of a harbour, and that it would be as good a position for the harbour as Port Kembla? Wollongong would be; but there are engineering difficulties in the way of the construction of a harbour at Wollongong.
62. Engineering difficulties which would prevent the construction of a harbour as suitable as one at Port Kembla? Yes.
63. *Mr. Farnell.*] What collieries at present use the Wollongong harbour? Mount Keira, Mount Pleasant, and Corrimal.
64. You stated that it was possible to afford facilities in Wollongong harbour for vessels of only 500 or 600 tons to be loaded there? Only small vessels of the tonnage mentioned can load at Wollongong.
65. Can you tell me what collieries are likely to use the proposed new harbour at Port Kembla? I should say that nearly all the collieries in the district would use it.
66. Would the collieries which at present use Wollongong harbour use Port Kembla? I am of opinion that they would; but vessels would always be loaded in Wollongong harbour.
67. The trade carried on by small vessels in Wollongong harbour would be retained? Yes.
68. Wollongong harbour would still be used to the same extent as at present? Yes, I believe so.
69. Then that means that if the collieries are going to use the new harbour there would be a greater output of coal, and a great increase of business if coal is to be shipped at Port Kembla? Yes; a larger class of vessels will come to Port Kembla, and they will be more numerous.

Mr. Walter Evans, shipping manager, Southern Coal Company, sworn, and examined:—

70. *Chairman.*] You deal with the coal after it has come from the pit? Yes.
71. You are aware that officers in connection with your mine have already given evidence in reference to the proposed harbour at Port Kembla? Yes.
72. Is there anything that you could add to their evidence? There is a suggestion which I should like to make in reference to the route of the railway.
73. The Department proposes to go down to the Wollongong basin and turn to the south behind the gaol and the convent? How do they propose to get the coal to Wollongong?
74. They propose to go down the Kiera line and then turn round by the gaol? The suggestion I would make is in reference to the route of the railway from any mines north of Mount Pleasant. I would suggest that a similar loop-line be made at Mount Pleasant to that at Keira, in order to avoid the heavy grade on the Government railway, between Mount Pleasant and Wollongong, which is 1 in 75.
- 74½. Could they come down the present line? They could come down the Mount Pleasant line, which is a narrow-gauge line, by laying down an extra rail.
75. *Mr. Hassall.*] From your knowledge of the shipping of the coal, would you expect any considerable increase in the trade at Port Kembla if the harbour were constructed? I should.
76. To what extent? Fully 50 per cent.
77. Do you know whether any inquiries were ever made here as to whether you could load large vessels for the over-sea trade? We do it now at Port Kembla when the weather is favourable. The largest vessel we ever had here took away a total cargo of 7,600 tons.

Mr.  
J. A. Beatson,  
18 Jan., 1897.

Mr.  
W. Evans,  
18 Jan., 1897.

Mr.

Mr. Jacob Carlos Jones, mining engineer and colliery manager, South Bulli Coal Company, sworn, and examined:—

- Mr. J. C. Jones.  
18 Jan., 1897.
78. *Mr. Clarke.*] What colliery do you manage? The South Bulli Coal Company's mine.  
79. To whom does that colliery belong? To Mr. Ebenezer Vickery.  
80. Will you give us a statement as to the coal measures from Clifton to Mount Kembla, and also further south? I have here a statement drawn up by myself, and I produce a plan showing the areas of the properties at present alienated and occupied by colliery owners. It includes the property of the Metropolitan Company.  
81. The Metropolitan Company is not much interested in the proposed harbour? I am referring more particularly to Bellambi Harbour than to Port Kembla, and the Metropolitan Company becomes very important in connection with that, as it brings the port within nearly half the distance. The following is a return of the shipment at South Bulli Jetty, Bellambi, including coal from South Bulli and Bellambi collieries:—

		tons.	tons.
For the year 1892—South Bulli Company	...	130,560	
Bellambi Company	...	112,694	
		—	243,254
„ 1893—South Bulli Company	...	141,381	
Bellambi Company	...	42,716	
		—	184,097

## ILLAWARRA COAL-YIELD.

Name of Colliery.	Approximate		
	Area of coal worked.	Area of coal unworked.	Total area.
	acres.	acres.	acres.
Mount Kembla and Great Wollongong	1,000	7,700	8,700
Mount Keira	1,000	1,100	2,100
Mount Pleasant	1,000	1,100	2,100
Corrimal	200	150	350
South Bulli	250	2,330	2,580
Bellambi Company	200	200	400
Bulli Company	2,000	400	2,400
North Illawarra and South Clifton	560	3,000	3,560
Coalcliff and Lily Vale Estates	230	5,000	5,230
Lands about Otford (about)	...	2,000	2,000
Metropolitan Company	1,000	17,000	18,000
Stanwell Park	.....	1,200	1,200
Totals	acres 7,440	41,180	48,620

NOTE. The several areas here are only approximate, having been obtained by scaling off the district plans.—J.C.J.

Assuming that there are 6,000 tons to the acre, we have 247 millions of tons of coal unworked in the present mineral holdings. In addition to the area of unworked coal in the lands already alienated, which comprises almost entirely the mountain ranges, we have the unalienated coal lands to the west of the ranges. I estimate this latter to be in round numbers 50,000 acres, all of which will contain the top or Bulli seam of superior quality. There may be much more land with coal in than I have estimated, as I have included only the land immediately west of the present collieries—from Kembla to Coalcliff—and the greatest distance from Bellambi port is 9 miles west. Evidence has been given before the Committee with a view to show that most of the available coal is centred around Mount Kembla. A glance at the map which I produce will be sufficient to show that this view is quite erroneous. It may be true that parts of Bellambi and Bulli mines have been destroyed by the intrusion of basalt burning large areas of coal; but it is not right to assume that North Illawarra, South Clifton, and Coalcliff, and the vast area of Crown lands to the west of these places are so affected. I produce a return of outputs from all the southern district for the next 100 years on the basis of an annual increase of 100,000 tons. These will show you that there is ample coal available by present holders of coal-lands to last 130 years. It is possible, and indeed probable, that the annual output of coal from this district will increase at a more rapid rate than I have assumed, everything depending on the shipping facilities afforded; but if we reckon on the most liberal basis, we have coal now available in alienated lands to last about 100 years. Then sufficient coal remains in the unalienated lands to last a further period of about 100 years. It must not be forgotten that considerably more than half of the alienated land, and practically the whole of the unalienated lands referred to herein belong to the Crown, and a royalty of 6d. per ton will be paid to the Government for all coal extracted from the Crown lands.

ILLAWARRA

## ILLAWARRA COAL-FIELD.

OUTPUT from 1897 to 1997, in decadal periods, commencing with 1,000,000 tons the first year:—

1897	...	...	...	...	1,000,000 tons annual output.
1907	...	...	...	...	2,000,000 " "
1917	...	...	...	...	3,000,000 " "
1927	...	...	...	...	4,000,000 " "
1937	...	...	...	...	5,000,000 " "
1947	...	...	...	...	6,000,000 " "
1957	...	...	...	...	7,000,000 " "
1967	...	...	...	...	8,000,000 " "
1977	...	...	...	...	9,000,000 " "
1987	...	...	...	...	10,000,000 " "
1997	...	...	...	...	11,000,000 " "

66,000,000 tons in 100 years.

From Return A (1) there are 247 millions of tons unworked coal in lands already alienated, or occupied by present coal-owners. Assuming, then, that half the above quantity is destroyed by basaltic disturbances and other faults, we have  $\frac{247,000,000}{2} = 123,500,000$  tons, which can be considered as available coal. This quantity will last at the above rate of increase about 130 years. As to the respective ports, I should like to state that if the Government thinks fit to spend sufficient money I am willing to admit that Kemplā can be made a better harbour than Bellambi; but being one of those who were very much interested in the first movement I may say that the initiators of the movement did not expect a very large expenditure. They thought that for an outlay of £200,000 Bellambi could be made a very good port for the district. As to the cost of the harbour I do not want to say very much, but I cannot see why a breakwater at Bellambi should cost so much more than a similar breakwater would cost at Port Kemplā. The average depth of the water is not greater and there is ample stone within 2 miles of Bellambi on the Russel Vale Estate. There is a very large quantity of very good blue metal immediately fronting the South Bulli Colliery. I have heard it said that the coal south of Kemplā is very good coal. I had occasion some few years ago to report upon that coal-field for a few gentlemen who were interested in it, but I could not get hold of my report or I would have produced it here. There is only one seam of coal south of Kemplā that you could say was of any value, that is the lower seam, and for steaming purposes it is practically useless. It is on the Wongawilli property.

82. You think that south of Mount Kemplā the coal is not a good quality? The coal-field is extensive enough but the coal has not been proved to be of a marketable quality.

83. Do you think that if the Government constructed a harbour at Bellambi, Port Kemplā, or Lake Illawarra, it would increase the trade of the district? Undoubtedly. Our coal is coming into favour all over the world. There is no other coal but this which can be compared to the best steam coal of South Wales. It has had a lot of fighting to do to obtain recognition and it is only during the last few years it has come to be known by the general public as a good steam coal—the owners of every steamer would like to use it. Some gentlemen from America recently visited this district, one of whom is interested in the lake scheme and represents large shipping interests in America. That gentleman told me distinctly that if we had a good port here that would accommodate large sailing ships he could see his way to give us nearly half a million tons of trade annually. He said he knew of a hundred sailing ships which could be put into the trade, if they could get a connecting link, so as to make a round trip from Europe.

84. Do you think that in the event of a good port being made on the south coast, the jetties at present existing would still take a large portion of the trade? I do not think they would.

85. How much of the trade would continue to be done upon the present jetties? At Bulli, Coalcliff, and North Illawarra they would not use their jetties. Those jetties are so very old that they would be very glad to get rid of them.

86. Would 25 per cent. of the trade continue to be done at the existing jetties? We should do 25 per cent. at Bellambi with small steamers, but in a short time it would not pay; it is very expensive to maintain the jetties. It would be more expensive than sending to the port established by the Government.

87. If you had facilities provided by the Government for the loading of large vessels with safety, you think that the trade would go to the new harbour? Yes; and the existing jetties would be left unrepaired, and in a year or two they would be washed away.

88. What port do you consider would be the best for the district? I am bound to say that Bellambi will be the central spot for the next fifty years.

89. Are you aware of the estimated cost of the proposed breakwater at Bellambi? Yes; about £208,000.

90. Are you aware of the cost of the proposed breakwater at Port Kemplā? Yes; it is about £50,000 less. I really cannot see why it should cost so much more to erect a breakwater at Bellambi.

91. It is proposed to construct an eastern breakwater and a northern breakwater; but according to the evidence of some witnesses the eastern breakwater will be sufficient for the present? Yes; for a shelter it would be, I have no doubt.

92. What is your opinion of the proposed harbour at Lake Illawarra? They have spent a lot of money at Lake Macquarie, which is a better lake than Lake Illawarra, and they have never made a harbour of it. I am afraid that they will never make a harbour at Lake Illawarra.

93. For what reason? The silting up would necessitate constant dredging, and that would make it too costly, and making a breakwater to protect an entrance often has the effect of closing the entrance by causing it to silt up.

94. Your opinion is that Bellambi would be the best port? Yes; to suit our requirements.

95. I think that the owner of your mines said it would be more to his interest to have a port at Bellambi, but he was in favour of Port Kemplā because it was more in the public interest? You can make a more commodious harbour at Port Kemplā than at Bellambi, but I think it could be constructed at Bellambi more cheaply.

96. *Mr. Hegan.*] I see that you delivered a speech on the 4th of November on the proposed harbour schemes. Was not that after the proposal to bring this scheme before the Public Works Committee? I think so. I had been requested to deliver a speech on the subject. 97.

Mr.  
J. C. Jones.  
18 Jan., 1897.

- Mr. J. C. Jones.  
18 Jan., 1897.
97. How is it that you did not give that speech before? The progress committee requested me to deliver an address on the subject when the matter was before Parliament. After I heard that the matter had been placed before the Public Works Committee, I asked the progress committee if they still wished me to deliver this speech and they said yes.
98. And how long have you been managing the South Bulli Colliery? Six years.
99. Have you managed any other collieries in this district? Yes; the North Illawarra Colliery.
100. As a mining engineer? Yes.
101. When did you obtain your certificate? I am a member of the Mining Institute of the North of England. I have held a certificate of competency for the last twenty years.
102. Therefore you can speak with a certain amount of confidence as to the necessity to make provision for the shipping trade of this district? Yes.
103. Have you heard any complaint in regard to the holding-ground at Bellambi? I cannot say that I have.
104. Have you heard of many vessels losing their anchors there in consequence of the bad holding-ground? I have heard of chains breaking, and the anchors being dropped.
105. You have heard of anchors being lost on account of the bad holding-ground? No; on account of the bad chains.
106. Is it not a fact that the holding-ground at Port Kembla is far superior to that at Bellambi? We have clay and sand at Bellambi, and also rock.
107. You say that you reported for some company upon the coal south of Mount Kembla—what company was it? Messrs. Biggar and Bertram.
108. We have had evidence that the coal measures down there are very valuable. You differ entirely from that? I do. It may have been proved since I was there. It is eight or nine years since I reported on the coal.
109. I suppose your knowledge of geology will give you an idea as to whether coal—a marketable quality—is to be found south of Kembla? Geology will not tell you that; you have to prove it.
110. Can you tell the Committee the reason why your output for the southern district for the last year or two has been less than it used to be? I am not aware that it was less.
111. One year it reached 900,000 tons, did it not? In 1895 it was 910,000 tons. Probably it will be more for the following year.
112. During the strike of 1890 the coal trade in the district increased considerably; then after that it diminished. Was it for want of shipping facilities? I suppose it was to a great extent. The coal trade is always fluctuating.
113. If the coal trade is on the decline here what is the use of constructing a harbour? I should look at it in another way. If the coal trade is declining it may be for the want of a harbour, but it is not declining it is increasing.
114. But was not that owing to the strike at Newcastle? No.
115. You think that Newcastle does not interfere with the southern trade, seeing that the kinds of coal from each district are entirely different? They are different kinds of coal and they do not compete much with one another. The coal of this district is essentially a steam and smelting coal. The Newcastle coal is a household coal.
116. Would you tell us the difference in cost between the constructing breakwaters and the resumptions necessary at Bellambi and Port Kembla? I cannot do that except from the Government estimate.
117. Yet in your speech you refute the statement of the Engineer-in-Chief in favour of Mount Kembla? I do not refute the whole statement; we do not know upon what basis they work out their estimates.
118. What about the resumptions? They will have to resume four times as much land at Kembla as they would at Bellambi.
119. Did you say that the jetties at Port Kembla were old? No; but they are at Bellambi.
120. Therefore, it would not cost much to resume the jetties at Bellambi? No.
121. What sum would you put down for the resumption of jetties at Bellambi? The amount for one would be about £5,000, and the amount for the other about £9,000.
122. And what would be the amount for the resumption of the jetties at Port Kembla? They are of more recent construction, and the amount would be from £15,000 to £20,000 each.
123. If Parliament sanctioned the construction of a harbour at Port Kembla would you resume the jetties there? I do not see how you could make it a Government harbour without doing so.
124. And you would resume the railways going down to the jetties? Yes; or make new ones; probably both. That is one reason why it would be expensive. You will have to make railways for the northern coal then resume jetties for the southern coal.
125. Do you know anything about the Lake Illawarra scheme? No.
126. Do you know the coal at Dapto? No; I have not seen that being worked. I have seen all the seams as far as the Macquarie Pass.
127. Then you would not say that it is equal to the coal you are getting here at present? No.
128. Neither are the lower seams equal to the top seams which you are working now? No.
129. You think there are about 220,000,000 tons of coal yet to be got out of the top seam? The top seam contains about 247,000,000 tons. Reckon about half of that waste, assuming that a quantity would be destroyed by basaltic disturbance still there would be 123,000,000 tons of coal available.
130. Can you tell us the percentage of coal left in the mine? As a mine has to exist for a number of years we leave probably about two-thirds of the coal in order to keep everything in order for ventilating for years to come. I suppose that about 10 per cent. of that would be wasted.
131. What is the area of alienated coal lands from Kembla to Helensburgh? 48,600 acres.
132. And according to your estimate that coal-field will last 200 years? The coal on the alienated land will last 100 years and that on the unalienated land another 100 years.
133. I suppose you have been taking a prominent part in the agitation for the Bellambi harbour? I did originally.
134. And you were one of those who decided to leave the selection of the site of the harbour to the Government? I was at the meeting.
135. Were you one of those who came to that conclusion? I think so.
136. What is your idea for altering your attitude after the site has been chosen? The real reason is this; that when the Departmental estimates were published the cost of the Kembla breakwater was put down  
at

at £158,000, and the cost of the Bellambi breakwater at £208,000 and so on. Everybody was satisfied that that was correct, but as soon as the Public Works Committee got hold of it we found that the cost of the Kemplabour would amount to £440,000. There is nothing in the published statements to show what Bellambi would cost under the same circumstances. We thought there was something wrong. We said it was very unfair. Why did they not publish similar estimates in both cases. It had been decided that Kemplabour should be the site it being the cheapest; but the resolution passed at the meeting said that the site decided upon by the Government should be the most economical. The cost of construction is the thing that upset the Bulli people.

Mr.  
J. C. Jones.  
18 Jan., 1897.

137. Did you tell those gentlemen whom you met that you could not contain yourselves, and that you wanted the harbour at Bulli? No. I say that they could not contain themselves; they went before the Public Works Committee long before we did, and they have strenuously advocated one scheme.

138. Seeing that the cost of a harbour at Kemplabour would be greater than you anticipated at the time of the meeting, you thought it was not to the interest of the district to have the harbour there, when you could get one cheaper at Bellambi? That is really what we thought.

139. *Chairman.*] What is the greatest distance that coal is worked underground in any part of the world? Three and a half to 4 miles.

140. How far from the pit's mouth can it be hauled under ground? Easily from 3½ to 4 miles with our present machinery.

141. If there is coal beyond a distance of 5 miles, can it be brought out? It can be brought by relays, for which they have to sink shafts and put down relays of machinery.

142. Would it pay to haul it a distance of 5 miles? It would.

143. Would you undertake to do it? Yes.

Mr. Robert Dodd, stevedore, Wollongong, sworn, and examined:—

144. *Chairman.*] What are you? A stevedore.

145. What evidence have you got for the Committee? I have had eighteen years experience in the district, trimming coal at all the ports.

Mr. R. Dodd  
18 Jan., 1897.

146. *Mr. Black.*] Do you mean all the ports on the southern coast? The ports from Bellambi to Port Kembla.

147. And which port do you favour? Port Kembla.

148. For what reason? On account of the depth of the water and the good anchorage.

149. It has a better holding-ground than Bellambi? Yes.

150. Do you think, in other respects, it is as well situated with regard to the collieries? Yes.

151. Do you think that with the construction of one breakwater it would be suitable for the unloading of ships in rough weather? Yes. I think Port Kembla will be far superior to Bellambi.

152. Putting Bellambi on one side, do you think that with one breakwater only it would be possible to load vessels with coal at Port Kembla in rough weather? That would depend upon which way the wind was blowing. If the wind was blowing from the north, I would not say that one breakwater would be sufficient. In the majority of instances they could load with one breakwater. In the summer the wind generally blows from the north-east and it does not cause such a heavy sea as the south and east winds.

153. When the wind is blowing strong from the north, would it be possible to load vessels at the jetty? In five cases out of six, they could load with a northerly wind.

154. If they could only do it in five cases out of six the harbour would not be an absolutely safe one in all weathers? My contention is that if you were at the jetties and it was blowing from the north and raising a heavy sea, the ship could go out to its anchorage.

155. But it could not load? Not if there is a very heavy sea.

156. Is Port Kembla an easy harbour to make in rough weather? It is. I have seen boats lying there in heavy gales.

157. Do you know the harbour at Newcastle? No.

158. Do you think that if Kemplabour were made a comparatively safe harbour for loading vessels with coal there would be any great increase in the coal trade? Yes.

159. Would it be a new trade or only a trade attracted from other ports less suitable? I think it would be a new trade carried on with foreign vessels.

Mr. William Weeks, butcher, Wollongong, sworn, and examined:—

160. *Chairman.*] What are you? A butcher at Wollongong.

161. What evidence have you to offer? I wish to state that I supply the steamers at the two ports with stores, and I have frequently heard the captains say that Kemplabour is a superior harbour to Bellambi. Once when I was at Bellambi the "Easby" bumped terribly. She went to Port Kembla where she had 4 feet of pure water at her stern. The "Glaucus" bumped at Bellambi several times, and she is a vessel of only 18 feet draft.

Mr.  
W. Weeks.  
18 Jan., 1897.

161½. *Mr. O'Connor.*] In your opinion Port Kembla is the superior harbour? Yes.

162. How long have you been in the district? About ten years.

Mr. William Henry Rees, commission agent and secretary to the Wollongong Gaslight Company, Wollongong, sworn, and examined:—

163. *Chairman.*] What are you? A commission agent and secretary to the Wollongong Gaslight Company, and secretary of the South Coast Harbour League.

164. *Mr. Lee.*] You hold an official position in some local organisation? Yes. After a deputation had waited on the Minister for Works it was considered advisable to form a league to agitate for the construction of a harbour in the district, and I was appointed secretary.

Mr.  
W. H. Rees.  
18 Jan., 1897.

165. What action has that league taken? It has taken but little action. As the Minister promised to enquire into the matter, and to submit the harbour scheme to the Public Works Committee, it was thought useless to do anything further for the present.

166. The result was practically to leave the matter in the hands of the Government? Yes.

Mr.  
W. H. Rees.  
18 Jan., 1897.

167. Of whom was your league composed? Of representatives from Bulli, Bellambi, Woonona, Wollongong, Unanderra, and the surrounding district.

168. Had you any representatives from Dapto? No; we invited them but they did not seem inclined to come. I think it was on account of the Illawarra Lake scheme.

169. Did your league look upon the construction of a harbour at Lake Illawarra as opposed to their interests? No; but the Dapto people said they would oppose anything being done on the south coast except at Lake Illawarra. The opinion of all I have consulted is that it will be too costly a matter to make a harbour at Lake Illawarra in which large ships can load.

170. To put the matter shortly I suppose that your league did not believe in the Illawarra Lake scheme? Certainly; the company have been a long time about it, and we see no result. The opinion is that they are only putting forward the harbour scheme to enable them to sell their land.

171. If your league had been of opinion that the Lake Illawarra company was going to make a harbour to admit deep ships, would they have used their influence to induce the Government to construct a harbour at Port Kembla? The general opinion is that it would not be convenient for the bulk of the coal trade to go to Lake Illawarra. All that the people want is a harbour for the south coast. They do not care whether it is at Bellambi, Wollongong, or Kembla.

172. Your league were fully acquainted with the proposal of the Lake Illawarra company? Yes.

173. If they had been satisfied that the company was going to give them a substantial harbour there would have been little necessity for them to take action to induce the Government to construct a harbour? Just so.

174. Do you consider that if a harbour were made at Lake Illawarra it would be detrimental to the interests of Wollongong? No; that was not taken into consideration at all.

175. Can you assure the Committee that the only reason that influenced your league in their advocacy of a suitable harbour for the south coast trade was purely the public interest? It was.

176. And that you were not influenced by the fact that if a harbour were constructed at Lake Illawarra vested interests would suffer? No. But the lake was not considered a suitable place.

177. You are aware that if a harbour is made at Port Kembla there will be a railway connection between Kembla and Wollongong? Yes.

178. Do you consider that is all that is required as far as Wollongong is concerned? Yes.

179. The railway will start from the Keira line, in the vicinity of the Belmore basin, and proceed along the coast between the culvert and the sea to Kembla? Yes; I believe it is all a dead level.

180. Do you think the Mount Kembla Colliery could use that line? The Kembla mine could use the main line; all the other collieries could use the new line to their own advantage.

181. You maintain that a maximum load could be carried that way? Yes.

182. Where only about two-thirds of the load could be carried over the main line? Yes.

183. Have you ever heard any expression of opinion from colliery managers or owners as to the suitability, or otherwise, of this route? I understood it was the unanimous opinion, until I saw that evidence had been given to the contrary, that that would be the best route.

184. If the harbour is made at Kembla, it will follow as a necessity that this line must be made? Yes; it will be about  $3\frac{1}{2}$  miles in length.

185. If the alternative were adopted of running over the existing line? Then the trade would be hampered by the increased cost of carrying half-loads.

186. Supposing that that difficult bank on the main line could be cut out at a reasonable cost, and as good a grade formed on that line as can be got by way of the Tom Thumb Lagoon, do you not think it will be equally advantageous to use the main line? No. The line by way of the Tom Thumb Lagoon would be as cheap a line as could be made. It would cost a great deal of money to alter the grade on the main line.

187. How much? I am only telling you what I have heard.

188. If the steep grade could be cut out of the main line for less than it would cost to make the new line, would it not be advisable to cut it out and to use that line? Yes; but it would take the traffic through the railway station, and that would be inconvenient.

189. Would it make any difference to those who want to ship their coal whether the coal was sent by the main line or by the proposed new line? I do not suppose it would.

190. All the information at our command shows that if this new line were made it would be possible to haul just double the loads to Port Kembla which they can now carry over the existing lines? Yes. The opinion of the people at Wollongong is that it would be an advantage to have the proposed new line made as people could get out at the bottom of Crown-street where there would be a platform.

191. That would be a matter of small consideration would it not, as regards the earnings on the line? There would be a lot of business between Port Kembla and Wollongong. There would be the supplies for the shipping. At present Wollongong is cut off from Port Kembla and the trades-people cannot supply orders sent from the ships. There will also be a passenger traffic on the line as the majority of those working at Port Kembla would live in Wollongong. I believe the line would pay for itself from that traffic alone.

192. Did your league ascertain from the colliery proprietors whether they were prepared to pay any sum by way of shipping charges for the convenience of using that port? When it was mentioned at our meeting that the Government might spend half a million in making a harbour, it was calculated that a charge of 3d. per ton on an output of 1,000,000 tons—the output being 750,000 tons at present—3 per cent. on the outlay.

193. Not including the cost of maintenance, lighting, and other charges? It was said that it would pay 3 per cent. reckoning the increase of traffic that would take place on an outlay of half a million. According to the present estimate the cost will not be anything like half a million, especially if you only make one breakwater.

194. Did the league base their opinion upon the assumption that it would be necessary to construct only one breakwater? It was thought that for several years one breakwater would be sufficient; that is the opinion of the captains who visited that port.

195. Are they of the opinion that the erection of one breakwater would offer sufficient protection to attract large sailing vessels from other parts of the world? Yes. They reckon upon the great ocean-going ships coming here.

196. Steamers can load there at present? Yes.

197. It is said that the coal trade of the southern coast is considerably handicapped because they are unable to ship coal in large sailing vessels? Yes. One breakwater would not be sufficient for sailing ships; but if the full scheme were carried out sailing ships could load there at any time.

198. Do you know whether if the eastern breakwater were constructed large sailing vessels could load safely at Port Kembla? Yes.

199. *Mr. Black.*] I understand you to say that one breakwater would be sufficient—but that the increase of trade would make two breakwaters necessary;—how do you work that out? At present we want one breakwater for the trade for a couple of years, but when the trade increases no doubt we shall require another for the extra shipping.

200. If one ship is protected by one breakwater why should a dozen ships require two breakwaters? So as to make it still-water. Another wharf or jetty would be required and should be protected.

Mr.  
W. H. Rees  
18 Jan., 1897

Mr. Charles Morton, civil and mining engineer, Bulli, sworn, and examined:—

201-3. *Chairman.*] What are you? Civil and mining engineer.

204. Have you a knowledge of the south coast? I have been here eleven or twelve years. I came here to lay out works for the North Illawarra Company, and then laid out works for Bellambi.

205. Have you a written statement? I have.

206. Will you read it and hand it in? Yes. It is as follows:—

Mr.  
C. Morton.  
18 Jan., 1897

I appear here to advocate the just claims of Bellambi as the most suitable and proper site, under all existing circumstances, for the deep-water harbour for the Illawarra district, and more especially its coal trade. The Committee have a perfect right, in investigating a question of this sort, whether there should be a certain work carried out at Port Kembla, to take evidence and consider whether it would not be better to put that work somewhere else. I hope, first, to satisfy this Committee by evidence, by plans, and by figures, that such a work as a deep-water harbour for the Illawarra district, of the southern coast, is absolutely necessary, secondly, that Port Kembla is not the best place for it, and thirdly, that some other place is the best place for the deep-water harbour, and that under all existing circumstances I hope to prove to the Committee that such place is Bellambi. I do not appear before them with the slightest intention of deriding the claims and facilities that Port Kembla offers as a harbour, but I will admit at once that a good deep-water harbour can be constructed there, and excellent accommodation can be made for the shipment of coal and the landing of goods. To accomplish all this in an effectual manner is a mere matter of £ s. d. No one can doubt, that if this Committee recommend it, and Parliament elects to spend the money in sufficient quantity a grand harbour can be made at Port Kembla, the necessary area of land can be resumed, railways can be purchased and built, roads of access constructed, and the owners of jetties compensated. But when all this is provided for, I am convinced that your Committee will agree with me, that the cost of the work, if carried out in the substantial manner proposed and necessary, will prove to be fully three times the amount which the maximum estimated revenue of the complete port is capable of paying interest upon. The Minister for Works in speaking of the grant of £10,000 which was voted for the improvement of Bellambi harbour, and allowed to lapse many years ago, remarked that if the district members at that time had displayed any active interest in their work, that Bellambi to-day would have been a good harbour.

#### *Revenue from District.*

The people of this district have always been a large revenue-paying class, and have contributed large sums to the exchequer of the Colony. Only small sums of this money have been disbursed in useful works throughout the district. Therefore justice should now be done in carrying out the all-important work of a deep-sea harbour. It is a national work as well as a local one.

Mr. Copeland tells us that "we spent a lot of money on the Illawarra railway, and we were told that they were going to use that to carry the coal." I reply, that this is another engineering difficulty, which the people of this district are not to be held responsible for. The Illawarra railway, owing to the heavy grades on the line, can only carry coal from the Metropolitan Mine, at Helensburgh, at a payable rate. Mr. Eddy has advocated the establishment of a central harbour for Illawarra, and the adoption of a zone system around such harbour. This equitable system could be put in force from Bellambi, where an 8-mile zone would embrace all mines from North Clifton to South Kembla.

Large sums have been spent all over the Colony, even in the inland rivers for the shipping of wool and other produce so as to enable it to be taken to a market, yet in this district, and for one trade alone, private enterprise has been compelled to spend upwards of £100,000 upon the construction of jetties at open roadsteads, which costly property is constantly more or less at the mercy of wind and wave.

Early in the year 1892, Mr. Cecil W. Darley, Engineer-in-Chief for Harbours and Rivers, was called upon to furnish a report upon Sir John Coode's monumental scheme for a deep-water harbour at Wollongong, the total cost of which, as estimated by Sir John Coode, was a fraction over £1,653,000. It will be found that Mr. Darley apologised for the elaborate amount of Sir John's total, by stating that it was never intended that the whole of this large scheme for internal works should be proceeded with at once. He then proceeds to deal with Sir John's scheme in a business manner, and asks will the probable future trade of the port pay the interest on this debt. To do so would require a net annual revenue of £70,000, to collect which would require an output of 4,200,000 tons per annum.

After carefully reviewing the coal trade of the district, Mr. Darley reports,—“I, therefore, think that the utmost trade likely to be drawn to Wollongong for many years to come will not exceed 750,000 tons, the port charges on which would amount to £9,375, which would represent 4 per cent. interest on £234,375. Therefore, this is the greatest amount of capital which could be expended with any prospect of a return of interest.” Mr. Darley also considered in what way can the proposed works (Sir John's) at Wollongong be constructed so as to keep down the first expenditure, to enable the revenue of the port to pay 4 per cent. interest on the outlay? Mr. Darley finally brought down the estimated expenditure at Wollongong to £447,200. This, he said, was the lowest sum to which the cost of the work, if carried out in a substantial manner, could be reduced, and even this capital charge remains nearly double what the maximum estimated revenue is capable of paying interest upon. Basing his reasons upon these calculations, he concludes by saying,—“I regret, therefore, to have to conclude with the opinion that there is no prospect whatever of the trade of the port of Wollongong ever being able to pay interest on such an expenditure, viz. £447,200.” Then what do we learn from these deductions? That any scheme to meet with the approbation of the Engineer-in-Chief for Harbours and Rivers must involve an expenditure of not more than £250,000.

#### *Private Jetties.*

It is pointed out that if a really safe harbour were made on the south coast, that it would not draw all the southern trade. Some would go direct to Sydney by rail, and some would continue to be shipped from the private jetties. Therefore, the money expended on the port would be wasted. Following this reasoning out logically, we must conclude that a great deal of money has been wasted in Newcastle, as in that port hundreds of thousands of tons are shipped annually from private wharfs. The A. A. Company, Waratah Company, and Alex. Brown & Company,—three of the largest companies in the north,—ship almost their entire output on their own wharfs. These companies have their wharfs protected by Government work. In Illawarra it will be only the port chosen which will be protected by Government work. All other jetties will be just as they are now. Jetties, moorings, chains, and ropes are very costly things to maintain. They entail a heavy annual outlay, especially in unprotected shipping-places. The cost of shipping, for labour only, is great for an individual colliery, as compared with the charges at a Government port, where a number of collieries would be sending their collective shipments. Furthermore, each colliery owner must send and ship his coal where the ships are berthed, and it is absurd to say that they will ship at their own jetties, when the ships will not go to them if there is a protected port in the vicinity. Sending coal by rail, will, for the reasons already stated, be out of all question when a sheltered port is constructed.

*The Lake Scheme.*

Mr.  
C. Morton.  
18 Jan., 1897.

The Illawarra Harbour and Land Corporation obtained an Act under power of which they proposed to open the Illawarra Lake as a harbour. The Act provided for the construction of breakwaters and training-walls at the entrance, the dredging of a long deepwater channel across the lake, and forming a large dock and shipping place on the western shore of the lake. But what is the use of all this elaborate work when the Act only provides for a depth of 15 feet of water at the entrance. This company by scooping out a bit of a ditch can now hold the lake against all comers. Mr. Andrew Armstrong, managing director of the company tells us that the contract for these harbour works was let to Mr. Amos fifteen months ago. The contractor had been asked to suspend operations until the company had made satisfactory financial arrangements in London. The managing director of this company is of opinion that the people of the south coast district had no right to move in the direction of obtaining a harbour, because by doing so they materially interfered with his company's chances of raising capital in London. Mr. Darley, I am sorry to notice, writes in his report of 16th May, 1896, and states:—"I have had several interviews with the engineer for the Illawarra Lake company and the managing director, and I have been informed from time to time that they are daily expecting word from London that the required capital has been provided, and to receive instructions to proceed with the works."

This puts me in mind of a man who once took a ticket in Adams' Melbourne Cup Sweep. He has been expecting a fortune ever since. The completion of this lake harbour will be of no benefit to the trade of the existing coal-mines. And if it is constructed it must stand upon its own merits. We are told by some enthusiastic adventurers that they have grand marketable coal south of Kembla. If so, so much the better for them. Let them work it and supply the smelting works with it if they can, or let them ship it at the lake harbour. This lake harbour must be completed if the smelting company are to have a cheap and useful shipping place. No other district harbour can be of much service to them. A harbour to be of much real advantage to the smelting company should be so situated that the cargoes could be discharged from the ships direct into the works, and thus save two handlings. Mr. Darley has something to say in his report upon this matter. He states that he interviewed Mr. John Howell, the manager, on the subject, and he gave him to understand that while a good harbour would unquestionably be of great benefit to his company, he has made such terms with the Railway Commissioners for the carriage of his ore, &c., that he could profitably carry on without access to a local harbour. From a statement made in a public meeting by a Mr. W. R. Atkinson, who is an authority on the lake harbour and land corporation affairs, there would seem to be some doubt as to the power of the smelting company obtaining access to any local harbour but the lake. Mr. Atkinson states,—"Evidence has been given before the Public Works Committee to the effect that Kembla had no possible means of getting on to their works without permission of the Illawarra Harbour and Land Corporation." Under these circumstances we can dismiss the idea of making harbour provision for the smelting company from our minds, leaving them to the tender mercies of the Illawarra Harbour and Land Corporation, who, no doubt, are bound to make a harbour for the smelting company; and if for them why not accommodate the new coal-fields of the south? Then having the lake harbour, could not Dr. Robertson be persuaded to use that harbour for shipping Kembla coal; it is only a few miles farther south, so he could not object, seeing that he wants all other coal-owners to travel out of their way to ship at Port Kembla. Then since the Engineer-in-Chief for Harbours and Rivers has such a high opinion of the lake as a harbour there can be no reason why, if when the present company forfeit their right, it cannot then be carried out by the Government or the smelting company.

*Port Kembla.*

I shall content myself with a very few remarks in dealing with this place. I have already stated that I agree with Mr. Darley that a fine useful harbour can be made at Kembla, but it will cost too much money to complete it; more than that, it is not centrally situated. Therefore, if completed regardless of cost, it will then not be so serviceable or beneficial as Bellambi Harbour, which is central. A design and estimate for the Port Kembla Harbour has been submitted by the Harbours and Rivers Department which I accept, because I cannot see how to better it, when all things are carefully reviewed. It stands as follows:—

Eastern breakwater .....	£158,300
Northern do .....	121,120
Sidings and coal-lines .....	4,000
Coal shipping jetty .....	35,000
Cranes, lighthouse, &c. ....	42,580
Timber wharf, 1 mile .....	44,000
Ballast wall at back .....	10,000
Dredging .....	25,000
Total .....	£440,000

Let us now analyse this schedule and retain that which is absolutely necessary and expunge all that is not of immediate use. I have not seen the detail plan and specification of the proposed Kembla Harbour, therefore, until I obtain a little more information on this point some of the items seem to me inconsistent one with another. For instance, the northern breakwater which is 3,530 feet long, is estimated to cost £121,120. The eastern breakwater is to be 2,800 feet, and its cost is to amount to £158,300. Thus showing that although the northern breakwater is 730 feet longer and in deeper water it is to cost £37,180 less than the eastern breakwater. Then again, in a newspaper report of Mr. Hickson's evidence I read, "This harbour, if constructed, would contain an area of 260 acres, with 24 feet depth at low water." Then in the following day's paper I find in the report of Mr. Darley's evidence that "the enclosed area at low-water would be 223 acres." This area agrees with that published in the schedules relating to all the harbour schemes, but is absolutely 37 acres less than that named by Mr. Hickson as having a depth of 24 feet at low-water. No doubt all this may bear explanation; but if it does, I anticipate that it will mean placing the sea end of the northern breakwater greatly in advance, or to the north, of the eastern breakwater, which would leave the northern breakwater exposed to the violence of the south-easterly gales, and to a great extent would cancel the utility of the eastern breakwater. Instead of being so placed the eastern breakwater should overlap the sea end of the northern breakwater—this would increase the length and cost of that structure,—or the northern breakwater would have to be brought back within bounds, and thus curtail the area of the harbour, which would then have an area of 88½ acres, with a depth of 24 feet and over, instead of 126, as returned in the schedule, and would be 171 acres less than the area stated by Mr. Hickson as affording a depth of 24 feet and more at low spring tides.

The first item on the schedule for the Kembla Harbour is the eastern breakwater, £158,300. This item is undisputed, therefore unless, for reasons which I have given, the advocates for Kembla wish to lengthen it—a most costly proceeding,—we will let it stand. Item No. 2, northern breakwater: Some evidence has been given in which the opinion was ventured that the eastern breakwater would suffice for all purposes; but I think your Committee will not only require most emphatic evidence upon that point, but you will also require and call for statistics proving that at no time have vessels been unable to load owing to the north-east gales. Then, if this cannot be proved, and I know it cannot, we may be assured that after the eastern breakwater is constructed it will confine the force of the north-east sea, which will in consequence gain power, and become more destructive than it is now. Therefore the item must stand. Sidings and coal-lines, £4,000, is too little for a place like Kembla, and will have to be increased. Coal shipping jetty, £35,000, must stand: not knowing the site proposed I cannot comment upon it. Crane, lighthouse, signal station and quarters, engineering and supervision, is a big order and seems to be a very big price. This is perhaps excusable when the last item is thought over. Sometimes people like to be liberal to others, others like to be liberal to themselves. So let it pass. Timber wharf 1 mile long, ballast wall and dredging. These items can be struck out for some time to come, but should be included in calculating the cost of a complete harbour. These items, as given by Mr. Darley for a complete harbour, amount to £440,000, to which sum must be added the construction of a new line from Wollongong by way of Tom Thumb Lagoon, resumption of lands and railways, extinction of harbour rights and compensation for same, purchase of jetties, making roads, &c., which will bring the total up to £600,000. Strike out the items which are not immediately necessary, viz., £79,000, leaving a capital expenditure of £361,000. To this sum must be added the cost of construction of 4½ miles of railway including a bridge over Tom Thumb Lagoon for connecting Port Kembla with the main South Coast Railway from the North. The cost of this line has been set down at £14,613, exclusive of land. This, I venture to say, is a most ridiculous estimate, and must be the result of some misunderstanding. A suitable railway could

could not be made over this line of country for less than double that amount. The Keira line from the Government railway to Wollongong Harbour would also have to be relaid with new rails, which would bring the total cost of that connection to at least £30,000. This, added to the £361,000, gives a total of (say) £390,000, which shows a cost of £4,383 per acre, having 24 feet of water, without resumptions, instead of £1,256 per acre as per Government schedule of prices.

This shows a necessary expenditure of £390,000, exclusive of purchase of land and private rights to existing jetties and lines. Upon this point Mr. Darley has something to say. In his report of 16th May, 1896, he states: "I quite concur with all that has been said in favour of selecting Port Kembla as a harbour site, but the fact that Port Kembla site is situated wholly on private property does not appear to have been brought forward prominently. There is not, as far as I can ascertain, even a public road approaching, or near to it. The large resumption of land that will be required, not only in connection with the harbour, but to gain access thereto, and the purchase of existing rights to railways and jetties, to abolish any monopoly, will be a very costly matter, and must be taken into consideration when estimating the probable cost."

Seeing that the two jetties at Kembla are the most costly of any on the coast, and considering that the colliery owners have a right to the foreshore and to maintain these jetties for all time, they are not likely to part with such rights for a trifle.

But why waste time speculating upon the cost of these resumptions, which must bring the total cost of Port Kembla Harbour, as a coaling port for the south coast, to at least £500,000, which is more than double the amount—without the costly resumptions—which the Engineer-in-Chief states is the greatest amount of capital which could be expended with any prospect of a return of interest. Then why does he recommend this scheme? And in a former report, when he brought down the cost of Sir John Coode's scheme, for Wollongong, to £447,200, he said even this capital charge remains nearly double what the maximum estimated revenue is capable of paying interest upon. Therefore he declined to recommend that scheme.

#### *Wollongong Harbour.*

Yet of the two places Wollongong would be far and away ahead of Kembla as a revenue-earning port. It is more central, and the vested and mercantile interests of the town and district would be a guarantee of a certain revenue which Kembla could not, and never would, command. A complete harbour, with all its necessary adjuncts, can be constructed at Wollongong far more cheaply than it can at Kembla. There the railways and lands belong to the Government, and there is a certain amount of accommodation in the port which now suits trading steamers and a class of small boats which carry cargoes of coal to the northern rivers and other places. This can be greatly improved by judicious management and proper dealing with the port.

On the 18th March, 1892, I offered to place a rough sketch plan of a harbour scheme for the port of Wollongong for the consideration of the Trust, which in my opinion would have answered all the requirements of the district and would have cost about £150,000 without approaches, which would not have been an extravagant item. This plan could have been added to, and in course of years to come the port would have become a large, useful, and creditable harbour to the Colony. At any rate by this time facilities would have been given for the shipment of about 5,000 tons per day. Even now I see by the estimates prepared by the Government engineers that the cost given for the two breakwaters at Wollongong amounts to £224,215 as against £279,420 for Kembla, showing a balance in favour of Wollongong of £55,000. Take from this the same amount as charged against Kembla for a coal-shipping jetty, £35,000, there will then remain £20,000 to the credit of the port for the construction of siding accommodation, &c., &c. The recent structure dignified with the name of a breakwater might with some additions be utilised as a jetty whereat two vessels could load at one time, in 24 feet of water. Coal sidings would have to be constructed at a cost of about £5,000. A railway line from off the main South Coast line to come into the port south of the town about 2½ miles, £6,000. We may, therefore, conclude that, taking the Government estimates for the breakwaters at Wollongong as being correct, the total cost of Wollongong Harbour would not greatly exceed the £280,000 set down for Kembla breakwaters alone.

Now comes the feasibility of the scheme, and the question must be asked, and caution must be used in giving an answer—Can a breakwater be constructed from off this point—Pulpit Rock? To be successful, must the work be favoured with exceptional weather?—or, will some extra costly principles have to be adopted, so as to enable such work to be carried out from the foreshore to deep water? I am of opinion that it will, because this is, undoubtedly, for reasons which I cannot give, the roughest spot on the coast between Clifton and Kembla. Therefore, I now leave the recommendation or the condemnation of this scheme to those who should have a better and closer knowledge of the place than I possess.

#### *Bellambi Harbour.*

The only official documents having any bearing upon Bellambi Harbour in connection with this inquiry *re* the proposed harbour for the south coast, are the reports of Mr. H. R. Carleton, Principal Assistant Engineer for Harbours and Rivers, dated 26th November, 1895, and that of Mr. Robert R. P. Hickson, Engineer-in-Chief for Public Works, dated 29th November, 1895. I will now review these reports, so far as they go. They are most meagre, and utterly destitute of much necessary and reliable information, which I would certainly expect to find in high official reports. The second paragraph in Mr. Carleton's report speaks about the facilities for obtaining suitable stone for the breakwaters. In this particular point nature and private enterprise have given Bellambi a great advantage, as an unlimited supply of the best quality of blue metal or basaltic rock at the foot of South Bulli incline, within a few yards of the South Bulli Company's railway. Therefore, the cost of obtaining and delivering the rock is, in the case of Bellambi, reduced to a minimum.

The next paragraph professes to deal with the cost of each harbour (a) per acre, having a depth of 24 feet and over at low water. This is a most incomplete statement, and one which should not have been put forward, based as it is upon one item of cost only. I am glad that the author states in brackets that it is only comparative at this stage. Bellambi scheme, paragraph 4, states that the surveys show that the anchorage at Port Kembla is the best. That I admit. At the same time, I state that the anchorage at Bellambi has never, to my knowledge, been found wanting. It states that Port Kembla is also sheltered from the south and south-east by the Five Islands. This is a very moot question. Personally, I am of opinion that the site chosen for the harbour would be better off, as regards steady water, without the Five Islands. I believe that it is the concentration of the sea-force through the island channels that causes the tremendous roll in the port, and prevents shipping for so long a time. It then states that Bellambi is also sheltered by the outer reef, but not to the same extent as Port Kembla. This statement I emphatically deny, and upon investigation I find that the opening at Port Kembla, between Red Point and Big Island, measures 1,500 feet. That the opening between Red Point and the Big Rock, which is awash at high water, is 600 feet, and from Big Rock to the Big Island, is 800 feet, and that these openings are distant 1½ mile from the root of the proposed breakwater. While at Bellambi the opening in the big reef is 600 feet only, and distant 1,200 feet from the breakwater. For these reasons I contend, and properly so, that Bellambi is better sheltered, naturally, as a harbour than Kembla. This is borne out by the fact that vessels can load offener in a southerly gale at Bellambi than they do at Kembla. It is also patent to everyone who will look at the plan that Big Island is too far away from its work to be of any immediate shelter to the present shipping-place at Port Kembla. So, also, will the plan convince any impartial judge that the big reef at Bellambi is close up to its work, and when dealt with, as I propose, will form the principal feature in the construction of a safe, useful, and commodious coal-shipping harbour at Bellambi.
