	"Western," s.s.	246	22/64ths.	85
			Qualification ...	283

The "Tinonee" is registered as a steamer, the "Argo" as a barque, but the Tide Surveyor has now reported that they are hulks in Sydney Harbour. The small vessels are pearling traders at Thursday Island, Queensland, and the steamers "Tamar," "Timaru," and "Western" are colliers trading on this coast.

1st April, 1897.

WILLIAM HARE

On board the "Captain Cook," 5th April, 1897.

Two representatives of firemen were called and asked if there was anything they wished to say, and replied:—

Firemen on the coast get overtime for any work they do after hours, and they only work eight hours, with sixteen hours off—the very opposite to what we do. We get no allowance for overtime, and yet do the additional work. On the coast they get eight hours a day and sixteen off, and whatever other work they do they are paid overtime for.

By Mr. WILSON: That is only in port? Yes.

By Mr. POWELL: Here there are no fixed hours? Yes.

You knew that when you took it? Yes.

By Mr. WILSON: The fireman in a sea-going vessel has, of course, to keep pretty well hard at it? Yes.

You have pretty long spells here, in which there is not very much to do;—there are two or three of you here, and you are really not very hard pressed for work? At times.

If you were at sea, you would have times when you would be hard at it? Four hours at a time.

There are long spells here when you are not very heavily worked? Yes.

[The Commission then adjourned at about 1.20 p.m.]

STATEMENTS made at Newcastle by Pilot Sweet and Pilot Morris on 30th April, 1897.

Present:—G. A. WILSON, Esq., J.P.; Jas. POWELL, Esq., J.P.

Mr. WILSON: You wish to make a statement?

Pilot SWEET: Yes. I joined the pilot service at a salary of £200 a year, with a yearly increment of £10. I received increments for 1892 and 1893, which makes my salary at present £218 a year; 10 per cent. is deducted. We have written to the Marine Board as regards our salaries, and have also had an interview with the Premier. He promised that the matter would be rectified. I was given to understand by both the Secretary and the harbour-master that there would be a yearly increase of £10, otherwise I would not have accepted the position. I left a much larger salary to join the service here, but I did not join for the £200. It was for the increase.

Mr. WILSON: The arrangement when you joined was that you should receive a salary of £200 a year, and an increment of £10 a year until the salary reached £400, which was the maximum?

Pilot SWEET: Yes, that was the agreement.

Mr. WILSON: You further say that if you had known that your salary would not have been increased, you would not have taken the appointment, as you were doing better outside?

Pilot SWEET: Yes. Our hours are very long on account of the tide and so much shifting of ships. This increases our work, and keeps us going early and late. We work on all Sundays and on all holidays. We have the fourteen days only off in the year. We mention this as an additional reason for receiving an increase of salary. I do not object to the work in itself, but merely wish to show that, the work being hard and the hours long, we should be better paid. The salaries of the pilots at Newcastle, even the big salaries, are less than the salaries paid to pilots in other parts of the world. In Sydney there are inside and outside men, while in Newcastle the pilots are both. Six of us do the inward and outward work, and all removals in the harbour. That keeps us going pretty well all the time. The whale boats make our calling a very dangerous one, and they are very hard on our clothing. We get wet through very often, night and day. We very often go out at night. Fifty per cent. of the shipping that comes to Newcastle enters during the night.

Mr. WILSON: What is your opinion as regards the present pilot service?

Pilot SWEET: There certainly should be a more modern system.

Mr. WILSON: Do you think a good steam-boat would lead to the saving of life and property?

Pilot SWEET: Yes.

Mr. WILSON: Is there any case of a boatman or pilot losing his life in connection with the service here?

Pilot SWEET: Not in my time. Pilots have been capsized several times during the last five years and picked up by butchers' boats, &c. There is always a lot of boats about when a ship is coming in.

Mr. POWELL: Cannot your boats live as well as the butchers' boats?

Pilot SWEET: Our boats are heavy and cannot live so well as the butchers' boats. But we go out in weather as rough as an open boat could live in.

Mr. WILSON: You hold a master's certificate?

Pilot SWEET: Yes, a foreign-going one. All the pilots hold certificates. You cannot get the position unless you hold a foreign-going certificate.

Mr. WILSON: The pilot at £218 does the same work as the man getting £353?

Pilot SWEET: Yes, there is no difference whatever in the work. The earnings for 1894 and 1895 were over £3,000 for each man, in some cases nearly £4,000.

Mr. POWELL: The harbour work increases your duties?

Pilot SWEET: Yes; very much. Every ship has to make about five shifts. She first goes up to the ballast jetties, then to the cranes, then back to finish ballasting, then to the cranes again, and then to her buoy. This increases our work very much.

Mr. POWELL: The ballast jetties are beyond the dyke?

Pilot SWEET: Yes, they are a continuation of the dyke.

Pilot MORRIS: Last year I answered an advertisement for a position as pilot. I was given to understand that the salary after the first year would be over £300 a year. I was getting at the time outside £22 a month, with board and lodging. Captain Newton informed me that my salary would be £300 after the first of the year. I left Melbourne, was appointed, and went to the expense of shifting over here. When I came here I went for four days with other pilots. I then took my own ships and have kept my turn ever since.

Mr. WILSON: Was there any salary mentioned in the advertisement?

Pilot MORRIS: No salary was mentioned in the advertisement. I naturally thought that the pilots here would be on something like the same footing as obtain in Melbourne and elsewhere. The salaries in Melbourne range up to £700, £800, and £900 a year. The position of pilot is looked upon there as one of the plums of the service. I never thought the hours would be so long as they are. I have kept a note in my note-book of the number of hours worked during the last few weeks. One week I worked 100 hours, another 94½ hours, and another 74½ hours. There has been a rush during the last five months, and as winter is coming on it is likely to be worse. I am quite willing to work as many hours as I can. We have a larger number of ships coming here than go to Sydney.

Mr. WILSON: If the Sydney pilots do the sea work only, and you with the same number of pilots do the sea work and the harbour work too, you must necessarily either have a staff too small or else Sydney has a staff too large?

Pilot MORRIS: Yes. Six of us attend to the work here, and one attends to the ballast jetties.

Mr. POWELL: Sydney has five pilots.

Mr. WILSON: So Newcastle has the larger staff.

Pilot MORRIS: Yes.

Mr. POWELL: Are you aware that Sydney pilots frequently take vessels up to the wharfs?

Pilot MORRIS: No; I was not aware of that. Here the oldest pilot is constantly engaged at the ballast jetties. Several times since I have been here I have come down the harbour after being afloat all day.

Mr. WILSON: What were you doing during those eighteen hours referred to in your note-book?

Pilot MORRIS: I went afloat that day at 2 or 3 o'clock in the morning, and it was late in the night when I got home.

Mr. POWELL: Does the assistant harbour-master remove ships?

Pilot SWEET: Occasionally, when there is no pilot available.

Mr. POWELL: From a return I have just looked up, it appears that there are eight in the pilot service at Sydney, and the same number in the pilot service at Newcastle, including the harbour-master.

Mr. WILSON: There are no means of altering the long hours unless you have an enormous staff?

Pilot SWEET: Yes, I am ready to admit that.

Mr. POWELL: If you go out in the pilot steam-boat you will not do harbour work, as that would be done by the harbour pilots. In Sydney there are two pilots on the steamer and four in the harbour.

Pilot SWEET: We have no idea yet how things will be worked. We hope the boat will soon come. We are very anxious for her to come. The night before last one of the pilots was out from 12 o'clock till 6 o'clock in an open boat on a heavy sea.

Mr. POWELL: I think that is unnecessary exposure.

Pilot SWEET: Another thing—masters very often themselves shift their vessels in this harbour in fine weather; but if the weather be a little rough, or if there be the slightest danger, they send for the pilots.

STATEMENTS made by Boatmen Adams, M'Kinnon, and M'Leod, attached to the Pilot Service (Newcastle), on 3rd May, 1897.

Present:—G. A. WILSON, Esq., J.P.; JAMES POWELL, Esq., J.P.

By. Mr. WILSON: You wish to make a statement?

Boatman ADAMS: Yes; we wish to speak about our salaries and other things. I, myself, am on the higher wage. We have very long hours, but we are not afraid of work. In view of our very laborious work and the long hours we have to put in, we ask that we may all be placed on the same footing—that is, that we be given the maximum salary, £144 a year and our quarters free. At present £18 a year is deducted from our salaries for rent and fuel.

Mr.

- Mr. WILSON: You wish to be paid £144 a year and to be allowed quarters?
- Boatman ADAMS: Yes.
- Mr. WILSON: Do you draw the £18 in money, or do you get quarters?
- Boatman ADAMS: We have quarters, such as they are.
- Mr. WILSON: What is your own particular grievance, Mr. Adams?
- Mr. ADAMS: In Sydney they are supplied with uniforms, over boots, &c., but we get nothing of that sort here, which means more expense to us.
- Mr. WILSON: Do private employers supply clothing in similar cases?
- Mr. ADAMS: In some cases, and they give the same wages that we get.
- Mr. WILSON: Do you three represent the whole of the men in the shed?
- Mr. ADAMS: Yes.
- Mr. WILSON: The chief matter so far is the hours, and then come the uniforms and the question of the wages?
- Mr. ADAMS: Yes.
- Mr. WILSON: You say you get no uniform whatever?
- Mr. ADAMS: We get nothing.
- Mr. WILSON: What leave do you receive?
- Mr. ADAMS: We are granted fourteen days during the year, provided we are not sick. From the 1st January to the 31st December we have to be at call, except those fourteen days. If we get sick, and this is not unlikely, seeing that we are often out hours after hours in an open boat and wet through, the time is taken off our leave. With the exception of the fourteen days in the year, we work Sundays, Saturdays, and holidays, day and night, whenever required. If we get leave for fourteen days, and go to Sydney or Melbourne, we are required to leave our address, and are given to understand that we must catch the first train we possibly can if we are required.
- Mr. WILSON: Supposing you are sick for a fortnight, what pay do you get?
- Mr. ADAMS: The pay goes on until the fourteen days expire; after that a man is put in our place, and we get no annual leave. I would also like to bring under your notice our irregular meal hours, but I am ready to admit that this is a matter which, owing to the peculiar nature of our work, cannot be entirely overcome.
- Mr. WILSON: If you had a steam pilot-boat would that mend matters?
- Mr. ADAMS: No; a steam-boat would not improve matters, as it would not affect the harbour work. A vessel calls for a pilot. We leave for it just before dinner—say at a quarter to 1. The vessel, however, does not get a tug until about 4 or 5 o'clock, and we have to wait till then.
- Mr. POWELL: Why could not the pilot make his own laws, and if a ship is not ready for him go elsewhere?
- Mr. ADAMS: The ship is ready, but the pilot does not know whether the tug will be there immediately or not for some time.
- Mr. POWELL: I cannot see, in view of those circumstances, how the matter can be remedied.
- Mr. M'LEOD: When I joined the Service I was promised an increase of salary as I went on. I am at present receiving £106 a year and an allowance valued at £18.
- Mr. WILSON: You contend that you are doing the same work as the men getting £126 a year?
- Mr. M'LEOD: Yes. I joined the service in 1889. I was promised increases of £5 a year, but after receiving two increases—one for 1891 and one for 1892—all increases were stopped. There have been men come into the service since I have come in who are getting more wages than I am. They were on the light-ship, but they joined that ship the year after I joined, so their service is not so long as mine. Another man, Kenneth M'Leod, who is on the pilot station, has been in the service for ten years, and is getting less than I am. He came into the boats from the light-ship at a reduced salary, but the men who have come from there since, viz., George Fraser and James Ross, have brought their light-ship pay with them. Kenneth M'Leod was not reduced for any offence, and he volunteered to join the boats because he was promised increases in his salary.
- Mr. WILSON: The question of your pay we have got in other cases. We have now taken note of the light-ship transfers, and the matter will be looked into by the full Commission on our return to Sydney.
- Mr. A. M'KINNON, Coxswain to the Lifeboat: I would also ask that the £18 deducted from our salaries for allowance be given to us.
- Mr. WILSON: If a steamer was provided the service it would lighten your work a good deal?
- Mr. M'KINNON: Yes; and there is many a time when a steamer can go out and a boat could not.
- Mr. ADAMS: It would not alter the inside work. The boats' crews would still be called to meet all ships, and take them to their berths.

## 29.

MEETING held 1st June, 1897, at the "Australian Hotel," Ballina, at 8:30 p.m.

Present:—G. A. WILSON, Esq., J.P. (in the Chair); JAMES POWELL, Esq., J.P.

Messrs. George Cheyne, W. T. Bryant, and J. L. Johnson waited on the Commission to put their cases before them.

Mr. G. CHEYNE said he was a pilot's boatman, and joined the service in 1890, at £96 per annum. At the time of his engagement he was told that his salary would be increased by £5 each year, but the increases were stopped in 1893.

Mr. W. T. BRYANT said he also joined the service in 1890 as pilot's boatman, at £96, on the understanding that he would receive annual increases of £5. The increases, however, were stopped in 1893.

Mr. J. L. JOHNSON, pilot's boatman, also complained of the stoppage of the increases. He had started in 1889 at £101, and after three months' service his salary was lowered to £96. He said he had had four yearly increases since then, but they stopped in 1893.

Mr. WILSON said that as a Public Service Board they could do nothing in this matter, but as a Royal Commission on the Marine Board they might mention it in their report, but that was all.

The Commission then adjourned at 9 p.m.

## 30.

REPORT of a deputation representing the Chamber of Commerce, Newcastle, received at Newcastle on 3rd May, 1897.

Present:—G. A. WILSON, Esq., J.P.; JAMES POWELL, Esq., J.P.

Mr. H. J. BROWN, President of the Chamber of Commerce, said that the deputation, which was the outcome of a recent public meeting, wished to urge upon the Commissioners the necessity for at once sending a steam pilot-boat to Newcastle. He referred to the dangerous risk incurred in going out to meet ships in the open pilot-boats, and he could see no reason why Newcastle should not follow in the wake of all other important ports and have a steam pilot-boat. This would not only be a very great benefit to the vessels coming to the port, but it is possible that an improved pilot service would induce vessels to come to Newcastle which, under the present system, would rather go somewhere else. It is some considerable time since the Government promised to send a steam-boat to the port, and the delay he believes is due to it having been decided to obtain the steering gear from England. He thought it was hardly necessary to send Home for the steering gear seeing that the boat was built in Sydney. Even if this were necessary, the boat should be sent to Newcastle in the meantime with her present gear.

Mr. KNIGHTLEY said that when high seas are running and a south-east gale is blowing it is impossible for men to man the open boats and to get on board an incoming vessel until she has rounded Nobby's, when the great danger and difficulty of entering the harbour has been overcome. The people who own these ships have to pay very high pilot rates. Up till recently they had to pay 4d. a ton in and 4d. a ton out, and no services in many instances were rendered to the incoming vessels. He did not wish for one moment to insinuate that the people employed in the pilot service showed any neglect. The fault was not theirs, it lies with the higher powers. If the "Ajax" had been in the possession of the harbour authorities he had no hesitation in saying that the vessels that have ineffectually endeavoured to enter the port would not now be strewn on the beach. He referred to the life-boat, which he declared to be utterly useless and not at all fit to send out in the teeth of a south-easterly gale. He compared Newcastle Harbour to Sydney Harbour, showing that the former,

former, owing to its geographical position, is much more dangerous, and that in a south-easterly gale ships have no chance of keeping off the sea-board. The Chamber of Commerce, he said, had been for over eight or ten years persistently knocking and begging at the doors of every Government as they came into power, with the view of getting a more efficient service. He expressed his pleasure at the visit of the Commissioners who, as business men, he felt sure would at once see the absolute necessity for having the "Ajax" or some other efficient steamer sent on forthwith to render service to vessels that may otherwise find themselves in the unfortunate position of those that have been lost on the beach. With an efficient steamer, vessels, instead of being allowed to run on the beach, would be towed out to sea beyond the danger point, where they could take care of themselves. The service as it is now, he declares to be a delusion and a snare—that is to say, the crews of vessels in danger assume that an important port like Newcastle would possess a life-boat or have some means available to take them off, and they would cling to the ropes in the hope of rescue, which, however, would not come, and ultimately they would drop off with fatigue. If they had jumped into the sea at first the probabilities are that they would have been then strong enough to swim to land. He referred to the last wreck which, although it occurred at 11 o'clock at night, did not receive the services of the life-boat until 7 o'clock in the morning.

Captain WILLIAMS said that when pilots go out with a ship the captain often takes them 5 or 6 miles off the port, and they are then two or three hours in getting back. In the meantime ships are waiting at the buoys to go to sea, but there are no pilots. If a steam boat were supplied, the pilots could do their work in one-half or one-third of the time it now takes. The cranes are also stopped waiting for the pilots to shift the ships. If the "Ajax" had been at the port on the night of the "Alderley" wreck, that disaster would not have occurred. He thought it hardly a fair thing to ask the owner of a tug-boat to risk his property to save life for the public. A boat should be provided to the public for the saving of life.

Mr. WILSON: The steamer would not only lead to the saving of life and property, but it would also lead to the pilots doing more work?

Mr. BROWN: Yes; a steam pilot boat could really guide five or six vessels at the same time.

Mr. WILSON: We are quite with you in this matter. We have taken a great deal of evidence upon it, and I went down to Sydney on Saturday afternoon and saw our colleague, who quite agrees with us. I handed him a report of the deputation which waited upon us the other day, and he will, if he can get an audience, submit to the Premier this morning that the matter be expedited. As you know, the Marine Board now deals with collisions, &c. Is it your opinion that the Marine Board is the proper tribunal for trying these cases?

Mr. BROWN: Most decidedly not.

Mr. WILSON: Are you in favour of a proper Marine Court, presided over by a District Court Judge and Assessors?

Mr. BROWN: Yes. A similar procedure has been adopted in England. There the Admiralty Court, which, of course, is a Court of higher jurisdiction, consists of a single Judge with assessors. The Judges, whether they originally knew anything about it or not, have evidently acquired very great knowledge relative to all matters concerning collisions, seeing that their decisions are so acquiesced in that there are very few appeals.

Mr. WILSON: Supposing there was a collision in this district, and the Court could come up here and hold an inquiry, it would be a travelling Court—it would provide for all marine disasters?

Mr. BROWN: Yes, and also provide for misconduct on the part of the officers. The Marine Board here holds a very anomalous position. It acts as a Board of Inquiry, and it also sees, to a certain extent, to the working of the harbour, but it is subject in all these things to the Board in Sydney. It cannot even issue a certificate. I would like to point out that no proceedings can be taken against anybody for a breach of the Navigation Act without first obtaining the sanction of the local Marine Board. If, on a Friday or Saturday afternoon, the master of a vessel threw a quantity of ballast overboard and endangered the harbour, no proceedings could be taken against him until the Board sat, and, by then, he may have escaped. This applies to Sydney as well. Things were very much better done before the establishment of the Marine Board; but I do not say that the present unsatisfactory state of things is due to the fault of the Board. It is due more to the roundabout proceedings things have to go through.

Mr. WILSON: Do you think you should have proper local government, so far as the harbour is concerned?

Mr. BROWN: Yes; the Board should not be subordinate to any other body, and this would save time.

Mr. KEIGHTLEY: One of the most efficient men we have in Newcastle refused a seat on the Local Board because of it being so very much under the thumb of the Sydney Board.

Captain WILLIAMS: The Local Board has no control at all. The hopper barges run quite as much sand into the harbour as they take out. The Board wrote to the owner, saying that in future he should cease from sending any of his hopper barges alongside vessels. A hopper barge has, however, been sent alongside in defiance of the Board, and is still at work. The Marine Board say they have no power to prevent it.

Mr. BROWN: That is the fault of the Act, which is a very defective one. I never take a case into Court but what I expect to be beaten. I beg to hand you a copy of the correspondence that has taken place between the Chamber of Commerce and the Marine Boards of Sydney and Newcastle with reference to the erection of signals to indicate whether vessels are coming in or going out of the harbour. I might point out that the distance from the entrance to the harbour to the wharfs is very short, and a vessel coming in has no knowledge of what is taking place within the harbour until she is actually inside, when, as the channel is very narrow and dangerous, she is liable to find herself unable to avert a collision should there be a vessel going out. To obviate this, Captain Williams has suggested that a system of signals should be instituted.

Captain WILLIAMS: My reason for bringing this up is because of there being no way of knowing from outside what is going on inside the harbour. I think a signal giving this information should be erected in some prominent position where it could be seen both from outside and from up the harbour. Every shipmaster you speak to on the matter will say that it is very necessary to know before coming down the harbour whether there is a vessel coming in. If there should be, he would not attempt to come down the harbour until that vessel had passed round the corner (Stony Point). I understand that some expert evidence on this matter has been given by several of the pilots, but no chance at the time was given to the Chamber of Commerce to give evidence on the point. An exempt shipmaster, as soon as his ship is loaded, receives instructions to leave the wharf. The pilots down at their station get orders that a vessel is ready to go to sea, but before they shift her the tide must be suitable, and before one leaves the waiting-room he ascertains from the hill whether any ships are signalled, and if so, what distance they are off. So it will be seen that the pilots receive from their station the information that it is desired should be signalled to the shipping. They are in a different position to the shipmasters. The pilot people seem to think that there would be a lot of confusion if a means were adopted to signal this information to the ships; but the majority of them, however, will tell you that there is a great risk in rounding the corner should another vessel be met there. The current comes down there at the rate of fully 6 miles an hour. Quite recently I came down the harbour in the Union Company's steamer "Rakauoa," when we met a ship coming round the corner. We passed within 15 feet of the Horse-shoe Buoy, and within 10 feet of the ship. Now, I would ask if it is a fair thing to bring ships together like that. If we had known that ship was coming in we would have remained in the harbour until she got in. The "Tekapo" would not have been wrecked had the signals I suggest been shown, nor would the "Alice-Federal" collision have occurred.

Mr. WILSON: Do I understand that this has been submitted to the Marine Board, and they have not approved of it?

Mr. KEIGHTLEY: It was submitted first of all to the Marine Board here to make representations to the Marine Board in Sydney. Neither of the Boards have approved of it. We presume it is on account of the expense of having a signal-man up there.

Captain WILLIAMS: I believe it is the responsibility they are afraid of. The following is an extract from a letter received from the Under Secretary for Finance and Trade, in reply to our request for the establishment of this system of signalling: "The present system of signalling was not introduced for the guidance of masters of vessels, who have quite enough to do in the navigation of their respective craft without looking about for signals, but rather for information of the general public." I think it monstrous that an important matter like this should have been thrust aside in that manner. (Captain Williams handed in a model of the signal, which he suggests should be placed on some prominent point of the harbour. He also submitted a plan showing how it should be worked, and a sketch showing the entrance to the harbour.)

Mr. KEIGHTLEY: There is barely room for ships to pass in the channel, it is so small, and the tide rushing across makes navigation very difficult.

Captain WILLIAMS: And we have no signals to guide us. I look upon Newcastle as the most outside port I have ever been in. They have no leading lights beyond those at Bull's Beacon. We have repeatedly asked for lights for the Dyke. I do not think the present place is the most suitable for a permanent signal station. It should be

Shepherd's

Shepherd's Hill. Another thing, the rule which prohibits steamers travelling up the harbour at a speed of more than 6 miles an hour should be rigidly enforced. Very often they travel at 13 miles an hour. It is very important that all stations along the coast should be connected by telegraph. Only the other day the steamer "Byron" signalled herself as in a sinking condition to the Lake Macquarie station. This station is only 12 miles distant, and, it being Sunday, it was four hours before the news reached Newcastle, and by then the captain had run her on the beach.

Mr. BROWN: It is a pity that all the signal stations are not connected by telegraph.

Mr. WILSON: Did you ever enter into a calculation of what it would cost to carry out Captain Williams's suggestion as to the signals?

Captain WILLIAMS: The signal itself would cost about £10. I do not think it would cost an extra man. I have not brought forward this proposal without having first consulted with nearly every one I know who is connected with the harbour. My proposal would not apply to every craft, even to a small ketch, as some appear to believe. They can always get out of the way. It would apply only to large ships. When you meet a large ship fastened to a tow-boat, with a line 120 fathoms out, it is a very difficult matter to keep clear of her. I have seen ships forced to back up between the buoys. With regard to the No. 4 crane, we used to have 19 feet of water there; now there is only 14 feet. They say we have plenty of dredging power. If so, it is time a dredge was placed there. These steamers travelling up the river keep a dredge constantly employed.

Mr. GEORGE BEWICK: The question of dredging the harbour is a very important one. The northern part of the harbour should first be deepened, so that all the vessels that have been loaded at the Dyke might lie there at buoys. The entrance to the harbour, the Horse-shoe, should be left perfectly clear. If this had been attended to, one or two recent collisions could have been averted. The accommodation at the Dyke and at the ballast berths is very limited, and often three or four vessels may be seen lying abreast of one another, which is rather a dangerous thing in rough weather. There is no doubt that a great deal more accommodation is required. Only a very short time ago a vessel had to wait for a fortnight before she could get a ballast berth. If she had been able to obtain a ballast berth on her arrival she would have been loaded and away now. The harbour officials are not to blame in any way, as, with the limited appliances, it is impossible for them to do any more.

Mr. KEIGHTLEY: Three steam cranes at the end of the Dyke are not in use, owing to their being out of repair. If repaired, although they have not the capacity for shipping so much coal within a given time as the hydraulic cranes, they could load small vessels quite as quickly as the hydraulic cranes, because the small vessels cannot take the coal in as quickly as hydraulic cranes could give it. These steam cranes ought to be put into a state of repair as soon as possible. Accommodation should be provided for the shipment of horses and stock from this port. At present vessels, when being loaded with stock, monopolise a crane berth that is absolutely necessary for the use of coal. If the inner Dyke were dredged out sufficiently to accommodate the stock vessels the coal cranes would be relieved. In the matter of ballast berths, accommodation in this respect is very deficient. Altogether, Newcastle should have a great many more facilities than it has. I do not wish to deny for one moment that the Government have done a very great deal for Newcastle, but while making that acknowledgment I wish to impress upon the Commissioners that I do not suppose there are any works that have been carried out in the Colony which, to any appreciable extent, represent the return of money to the Government, not only in the case of working expenses but in the way of paying interest, as has been derived from the Newcastle works. The money laid out on the Newcastle harbour has been more than repaid by the revenue derived by the Government from the various services which they have rendered. I could produce figures, quoted before the Public Works Committee, where it was shown that the profit made by the Commissioners for Railways from coal only amounts to \$35,000 per annum, and I am quite satisfied that this year that sum will be largely exceeded. I hope the Commissioners will look at the report of the Public Works Committee regarding this port, and I am sure that the more the Commissioners become acquainted with this port the more will they become satisfied that the expenditure the deputation has to-day suggested is more than warranted.

Mr. POWELL: As to the signalling, the Marine Board people get the information from Signal Hill?

Captain WILLIAMS: Yes; they can get information about any ship about to enter the harbour.

Mr. WILSON: I think it would be best to appoint an outside independent committee to investigate that matter and bring up a report.

Captain WILLIAMS: The pilots themselves and the experts whom we questioned on this matter, all agreed that it was dangerous to meet a vessel after going round the corner. In the face of that, I think it is a fair thing to signal to the shipmasters and warn them of that danger.

Mr. WILSON: It cannot be a great expense, and it does not require an additional man.

Mr. BROWN: No doubt the Marine Board are under the impression that it is intended the signal should apply to every small craft coming in or going out of the port, and that the shipmasters are as well-informed as the pilots.

Captain WILLIAMS: I heard that the reason why they refused to accede to our request was, that in the event of a collision occurring, and the signal not being up at the time, they would be responsible.

Mr. BROWN: It appears very desirable that some provision should be made for interpreters. We have a number of seamen continually coming here from different nationalities. The Newcastle representatives of foreign nations do not as a rule understand the languages of the countries they act for, and there is great difficulty, say in a case of mutiny, in finding men who can interpret. There are, therefore, no proper means of defending them, or of convicting them if guilty of an offence. I think there might be some person or persons, stamped as it were with the Government mark, to whom reference could be made.

Mr. WILSON: The names of qualified persons could be placed in a register, and they could be allowed a retaining fee.

Mr. BROWN: Yes; and later on it would be for the Public Service Board to consider, when they saw the amount of fees paid, whether it would not be more economical to provide a permanent official.

Mr. WILSON: In the meantime, if the names of qualified persons were placed in a register, the case would be met?

Mr. KEIGHTLEY: Yes. I have seen the police running up and down the street looking for a man who would give his services for nothing. That is not a right thing for a port like this, with a volume of trade surpassing perhaps Sydney.

The deputation withdrew.

## 31.

To Mr. Barling, Royal Commission.

Newcastle, 29 April, 1897.

DISSATISFACTION is strongly expressed at the delay in stationing a suitable steam vessel here for the pilot service. It is stated that a recent wreck would not have happened if a pilot steamer had been outside to render assistance; and fears are expressed that changes in the weather may bring about serious mishaps as the winter approaches.

It appears desirable to assure the public that every exertion is being made to render the "Ajax" ready for service at Newcastle in the shortest time possible. In the meantime it would be a much appreciated concession to public feeling if a strong serviceable tug-boat could be hired at once for special service by the week or month.

GEO. A. WILSON,  
JAMES POWELL.

A DEPUTATION consisting of the Mayor (Alderman Miller), Alderman Sharp, Messrs Jas. Clark, R. A. Wallace, T. Brookes, F. Eupp, Captains Larsen, Pritchard, Jenkins, and others, representing the commercial and shipping interests of Newcastle, waited on the Public Service Board at Newcastle on the 30th April, 1897, for the purpose of bringing under notice the necessity of a steamer being provided for the pilot service of the port.

The MAYOR referred to a very representative meeting of the citizens which was held at the Council Chambers on Wednesday evening last, 28th instant, when the opinion was unanimously expressed that had there been a steam boat attached to the pilot service of the port the wreck of the "Adderley" would never have occurred. The Government, he stated promised eighteen months ago that a steamer would be set apart for this service, but as yet nothing definite had been done. At present vessels are boarded by the pilots only just outside Nobby's. This, he contended, should not be. The same practice should be followed here as obtains in Sydney and Melbourne, where the pilots go out great distances.

MR. WILSON here interposed that he and Mr. Powell were not receiving the deputation as members of the Public Service Board, but as members of a Royal Commission appointed to inquire into the management of the Marine Board. One of the Commission being not present, they would not be able to say anything definite, as they would have to consult with their colleague in arriving at a recommendation.

The MAYOR remarked that they had decided to wait also on the Premier.

Mr.

Mr. JAS. CLARK referred to a paragraph in the *Sydney Daily Telegraph* of even date which afforded additional evidence for the necessity of providing a steam service;—"A Pilot-boat in danger.—If further proof were necessary in support of the necessity for a steam pilot service at this port, it was forthcoming yesterday afternoon, when one of the pilot whaleboats was in imminent danger of swamping. During the afternoon a nasty sea broke across the bar, and as the ship 'Iolanthe' was being taken to sea, bound for Acapulco, she shipped several seas. The pilot boat, which was towing behind to bring the pilot back to port, received a severe buffeting by the seas, but it was not till she left the ship on the return trip that she got into serious trouble. Sea after sea came rolling along, and large bodies of water found their way on board, and despite the bailing of the crew, the water was gaining so fast that it was feared she would swamp. For the safety of the pilots the tug 'Young Bungaree' was hailed, and the crew was transferred to the tug, as was also the boat's gear. Some of the pilot boat's crew stated that had they not left the boat when they did the chances are that they would have been drowned." The present state of affairs, he said, is very dissatisfactory for a port so important as Newcastle. A steam service is required here more than in Sydney.

Mr. R. A. WALLACE said that the men on this pilot station are as fine a body of men as could be found at any port in the world, but they are miserably equipped for outside work. He thought that steps should be taken at once to provide a steam service, and thereby put an end to those sad mishaps which occur on this particular coast.

Alderman W. B. SHARP spoke of the number of years this question had been under discussion, which culminated in a definite promise being made by the Government eighteen months ago that the "Ajax" would be fitted up for the service. But as the "Ajax" is not here yet, he would request the receivers of the deputation to lay the matter before the Premier and urge him to cause the promise to be at once fulfilled. He is satisfied that there is no port in the world, of the importance of Newcastle, where the character of the pilot service is so primitive. He referred to the returns, which show that a greater number of ships visit Newcastle than Sydney.

Captain LARSEN gave his experience of coming into the port a few days ago. It is his first visit to this part, and it struck him as very strange, when he found himself in a most dangerous position outside, that there should be no pilot about to take charge of his ship. He only missed the bank by about 30 feet, and thought his ship would be lost. He could not help himself as he was quite a stranger to the port, and did not know its peculiarities. He certainly thought that, in the interests of the shipping trade, there should be a steam pilot boat.

Captain PRITCHARD also spoke of the difficulty he had in making this port on last Friday during the storm. They were in great danger outside, and no pilot could be found till they got inside, when, of course, his services were not nearly so necessary. In his experience this is the only port where the pilot service is so primitive; and he certainly thinks that a steam service should be provided.

Mr. EARP pointed out the dangers of the port. Forty per cent. of the ships come in at night, and in thick weather their presence is not known until they are within 2 or 3 miles. It is impossible in rough weather to render them any assistance in open boats. One pilot has lost his life indirectly consequent upon the defective service. His boat was capsized, and illness followed upon the wetting, from which he succumbed.

Mr. BROOKES said that he thought this port, which is every day growing in importance, should be properly equipped. Then the very fine body of men stationed here would be able to work effectively in safe-guarding the shipping interest, and in preventing loss of life. Under present conditions, in bad weather, the pilot has to remain inside Nobby's, but fees are charged all the same—charged for a service never rendered. He felt sure that it was never intended a pilot should board a vessel inside the harbour, and full pilot fees be charged. He admitted that the pilot fees are very low, but that is a slip of the Act. Notwithstanding, they should not be levied if not earned. Speaking generally, he thought fees sufficient to provide an efficient pilot service should be made, and every ship, excepting intercolonial traders, should be compelled to take a pilot. He cannot understand the delay that has occurred in the fitting out of the "Ajax," and is at a loss to understand why another ten weeks are required in which to do the work. He is confident that, if she were handed over to him, he would be able to have her ready in a month. He drew attention to the danger being run by ship captains who are strangers to this port. They, in the absence of a pilot, may be driven ashore, and, in consequence, cancellation of their certificates would probably ensue; so that their very living is, as it were, imperiled by the present deficient service.

Mr. CLARK asked whether, in view of the approaching south-east winter gales, it would not be possible to hire a boat pending the arrival of the "Ajax"?

Other members of the deputation supported Mr. Clark in this proposal, and Mr. WILSON promised that they would consult their colleague as to whether the Commission should recommend the course suggested by the deputation.

Captain NEWTON, Harbour-master, drew the Board's attention to the number of ships which are moved in the harbour without pilots. In 1896 there were 191 and last quarter 81 ships, so moved. This is a big loss to the revenue.

EXTRACT from *Newcastle Morning Herald*, Saturday, 1 May, 1897.

*The Steam Pilot Service.—A Temporary Boat Requested.*

YESTERDAY a deputation, consisting of the Mayor, Alderman W. B. Sharp, J. Clark, jun., Thomas Brooks, Alderman Rhead, Messrs. G. Earp, R. A. Wallace, and a large number of shipmasters, waited upon Messrs. Wilson and Powell, members of the Royal Commission to inquire into the working of Marine Boards, to request those gentlemen to use their influence in securing the speedy completion of the alterations to the steamer "Ajax," so that the vessel might take up her duties as a pilot cruiser. The deputation was introduced by the Harbour-master (Captain Newton).

The MAYOR (Alderman Miller) explained that a meeting had been held in relation to the non-arrival of the "Ajax," at which it was arranged that a deputation should wait upon the Premier to urge the completion of the repairs to the vessel without delay.

Mr. WILSON pointed out that they did not receive the deputation as the Public Service Board, but as the Royal Commission appointed to inquire into the working of Marine Boards. They would not be able to give the deputation any definite reply, as their colleague was absent, but all that was put before them would receive due consideration.

Mr. JAMES CLARK, jun., said that, acting on the advice of several representative citizens, he had written to the Commissioners asking them to receive a deputation, believing that they could gather from shipmasters and other practical men a large amount of information which would be of service to them in arriving at a decision on the question. They had kindly acceded to his request, and on coming before them he found his case materially strengthened by an incident which had occurred the day before. While the barque "Iolanthe" was being taken to sea the pilot boat, which was towing alongside, came in for a rough handling with the sea and strong wind, and on leaving the barque to return to the port filled with water. The crew were taken out by the tug boat "Young Bungaree," and brought into port safely. He contended that incidents like these more than proved the necessity for a steam service, and unless something was done soon lives would be lost. It was more necessary that Newcastle should have a steam service than Sydney, as the port was far more dangerous.

Mr. R. A. WALLACE supported Mr. Clark in his remarks as to the inefficiency of the service, but pointed out that the men employed, both pilots and boatmen, were equal to any to be found, and only needed a modern equipment to render the service a thoroughly satisfactory one.

Mr. W. B. SHARP said the matter had been under consideration for some years, and eighteen months ago the "Ajax" had been promised for service at Newcastle, but had not yet arrived. There was no port in the world with a shipping trade equal to that of Newcastle where they permitted such a primitive system to exist. There was a larger number of ships arriving at Newcastle than at Sydney, and still the Department was compelled to continue the system of using open boats. What they wanted was that the Commissioners would urge the Premier to push on the work with all possible speed, and send the vessel as soon as possible.

Captain LARSEN, of the Norwegian barque "Liv," stated that on Friday last when his vessel entered the port she was not more than 30 feet from the oyster bank, and in great danger of being lost. The vessel was well inside the port and past danger before the pilot came on board, but the latter could not be blamed, as it was impossible to come out in an open boat. In his opinion, a steam service was a necessity.

Captain PRITCHARD, of the barque "Haddon Hall," which also arrived on Friday, pointed out that he experienced some trouble owing to the tug's hawser breaking, the vessel getting down close to the beach before the tug got hold again. When approaching the bar and the most dangerous part of the entrance, there was no pilot to take charge, the latter coming on board inside the breakwater, when the vessel was really past the danger. His experience of Newcastle was that in fine weather you could get a pilot well off shore, but in bad weather, when their services were required, their primitive system of open boats prevented them from crossing the bar and meeting the vessel well outside.

Mr.

Mr. GEO. F. EARP said the Government, by promising the "Ajax," had already recognised the need of a steam service, and trusted the Commissioners would urge the Premier to carry out the promise. He had been informed that nearly 40 per cent. of the vessels arriving here made the port in the night-time. In thick weather these vessels would be within a few miles of the port before they could be seen, and consequently would be well down on the bar before the pilot could get out to them. No other port in the world was so inadequately equipped in respect of their pilot service than Newcastle, and already one life had indirectly been lost owing to the system.

Mr. THOS. BROOKS supported the previous speaker, and pointed out that not only life but property was in danger. Had the "Ajax" been in commission the "Adderley" would not have been lost. The growing trade of the port demanded that a steam service should be inaugurated. There was absolutely no excuse for the delay, as any private firm could have completed the necessary alterations in three months. The Government had stated in reply to a question that the boat would be ready in ten weeks; but, speaking as a practical man, he would guarantee to have her in commission in a month.

Mr. CLARE said, as the winter was coming on, they might expect more gales and bad weather, and possibly more wrecks. He would like to know if there was a chance of obtaining the services of a temporary boat while the "Ajax" was being prepared?

Mr. WILSON said the whole of the evidence would be type-written and forwarded to their colleague, and if the repairs to the "Ajax" were to occupy a long period they would recommend that a temporary boat be provided.

The MAYOR then thanked the Commissioners for the reception they had accorded them, and the deputation then withdrew.

## 32.

Gentlemen,

Harbour Office, Newcastle, 3 May, 1897.

At your request I have the honor to submit the following report *re* want of accommodation for shipping visiting this port:—

For some considerable time past the shipping community have expressed strongly their great dissatisfaction with regard to the very limited accommodation which is provided for vessels arriving here, also the inadequate supply of ballast berths.

Frequently every available space in the stream is occupied, and at the frontage of the ballast jetties and dolphins large ships are compelled to berth three and four abreast. This method of securing vessels in a tidal harbour, which is subject to freshets, and with an insufficient depth of water to use anchors, is not consistent with safety, and is undoubtedly a source of much inconvenience and annoyance to the masters, who contend they pay port dues and are entitled to safe accommodation.

It frequently occurs that late in the evenings the inside vessel of those berthed as above stated receives an order to proceed to a crane berth to load during the night; then the other vessels have to be cast adrift so as to get the inner ship clear. Should any hitch occur, it interferes with the shipment of coal, and is a serious loss both to the Government and the colliery proprietors.

To expedite matters I would respectfully suggest that sections of a wharf be constructed as soon as possible on the east side of the proposed basin, now being deepened, and marked red on attached plan. This would afford accommodation for a number of ships in ballast trim, or waiting their turn to load, and would relieve, to a great extent, the congested state of the ballast jetties.

In order to afford greater facilities for the discharging of ballast, I would also recommend that two jetties be constructed to the northward of Cullen's Wharf, marked blue on the plan. I need scarcely add that, with every prospect of increasing trade, the circumstances demand that every facility be given to the shipping that is commensurate with the importance of the port.

I have, &amp;c.,

The Royal Commission on Marine Board, Newcastle.

HENRY NEWTON,  
Harbour-master.

## 33.

COPIES of Correspondence *re* Entrance Signals, Newcastle.*Chamber of Commerce, Newcastle, 3 December, 1896.*

"I AM directed by my Committee to draw your attention to the fact that at the present time there are no means by which vessels going to sea can ascertain whether there is any vessel about to enter the port, and, on the other hand, vessels approaching the port cannot ascertain whether any vessels are coming down the channel until they come in sight at the North Shore point. It is suggested that a system of signalling vessels about to enter the port, and also those proceeding down the channel to sea, from some prominent position would be of very great convenience to the shipping, and give vessels timely notice of the approach of each other. I am directed to bring the matter before you for your favourable consideration."

*From the Local Marine Board, 6th January, 1897.*

"By the direction of the local Marine Board, I have the honor of replying to your letter of the 3rd ultimo, *re* establishing a system of signalling vessels moving in and out of this port, and having referred the same to the Marine Board, now send you their minute thereon, viz. :— 'That only useless expense and confusion would arise by any addition to the present excellent rules and regulations.' A deputation then waited upon the Marine Board and fully explained the suggested systems.

*From the Chamber of Commerce, 5th February, 1897.*

"In accordance with the request of your Board to the deputation from this Chamber, which waited on them on Wednesday last, I now have the honor to ask that you will again bring the matter of establishing a system of signalling vessels entering and leaving the port before the Sydney Marine Board. It was then conclusively shown how great would be the benefit to the shipping. I enclose a diagram showing how this could be done either by the erection of a semaphore, at a nominal cost, as shown in sketch No. 1, or by a more elaborate system as per sketch No. 2."

*From the Marine Board, 11th February, 1897.*

"By the direction of the local Marine Board, I have the honor of returning the attached diagram, &c., for fuller details of method of signalling, site, &c."

*From Chamber of Commerce, 22nd February, 1897.*

"With further reference to my letter of 8th instant, and in addition thereto, as requested in your letter of 11th instant, I now give you some further particulars.

"*Site.*—It is suggested that a suitable position for the erection of the signal would be at the north end of Flag-staff Hill, as it would stand clear of all other signals, and could be worked by the present signal staff.

"*Cost.*—The erection of a semaphore, as per sketch No. 1, of wooden material, say 15 feet in height, should not exceed £5 in cost, whereas the more elaborate system, as per sketch No. 2, would probably involve an expenditure of £25.

"Owing to the erection of buildings at the Stockton point it is now impossible for a vessel going to sea to discern another vessel approaching the entrance until she is close to her."

*From Local Marine Board, 5th March, 1897.*

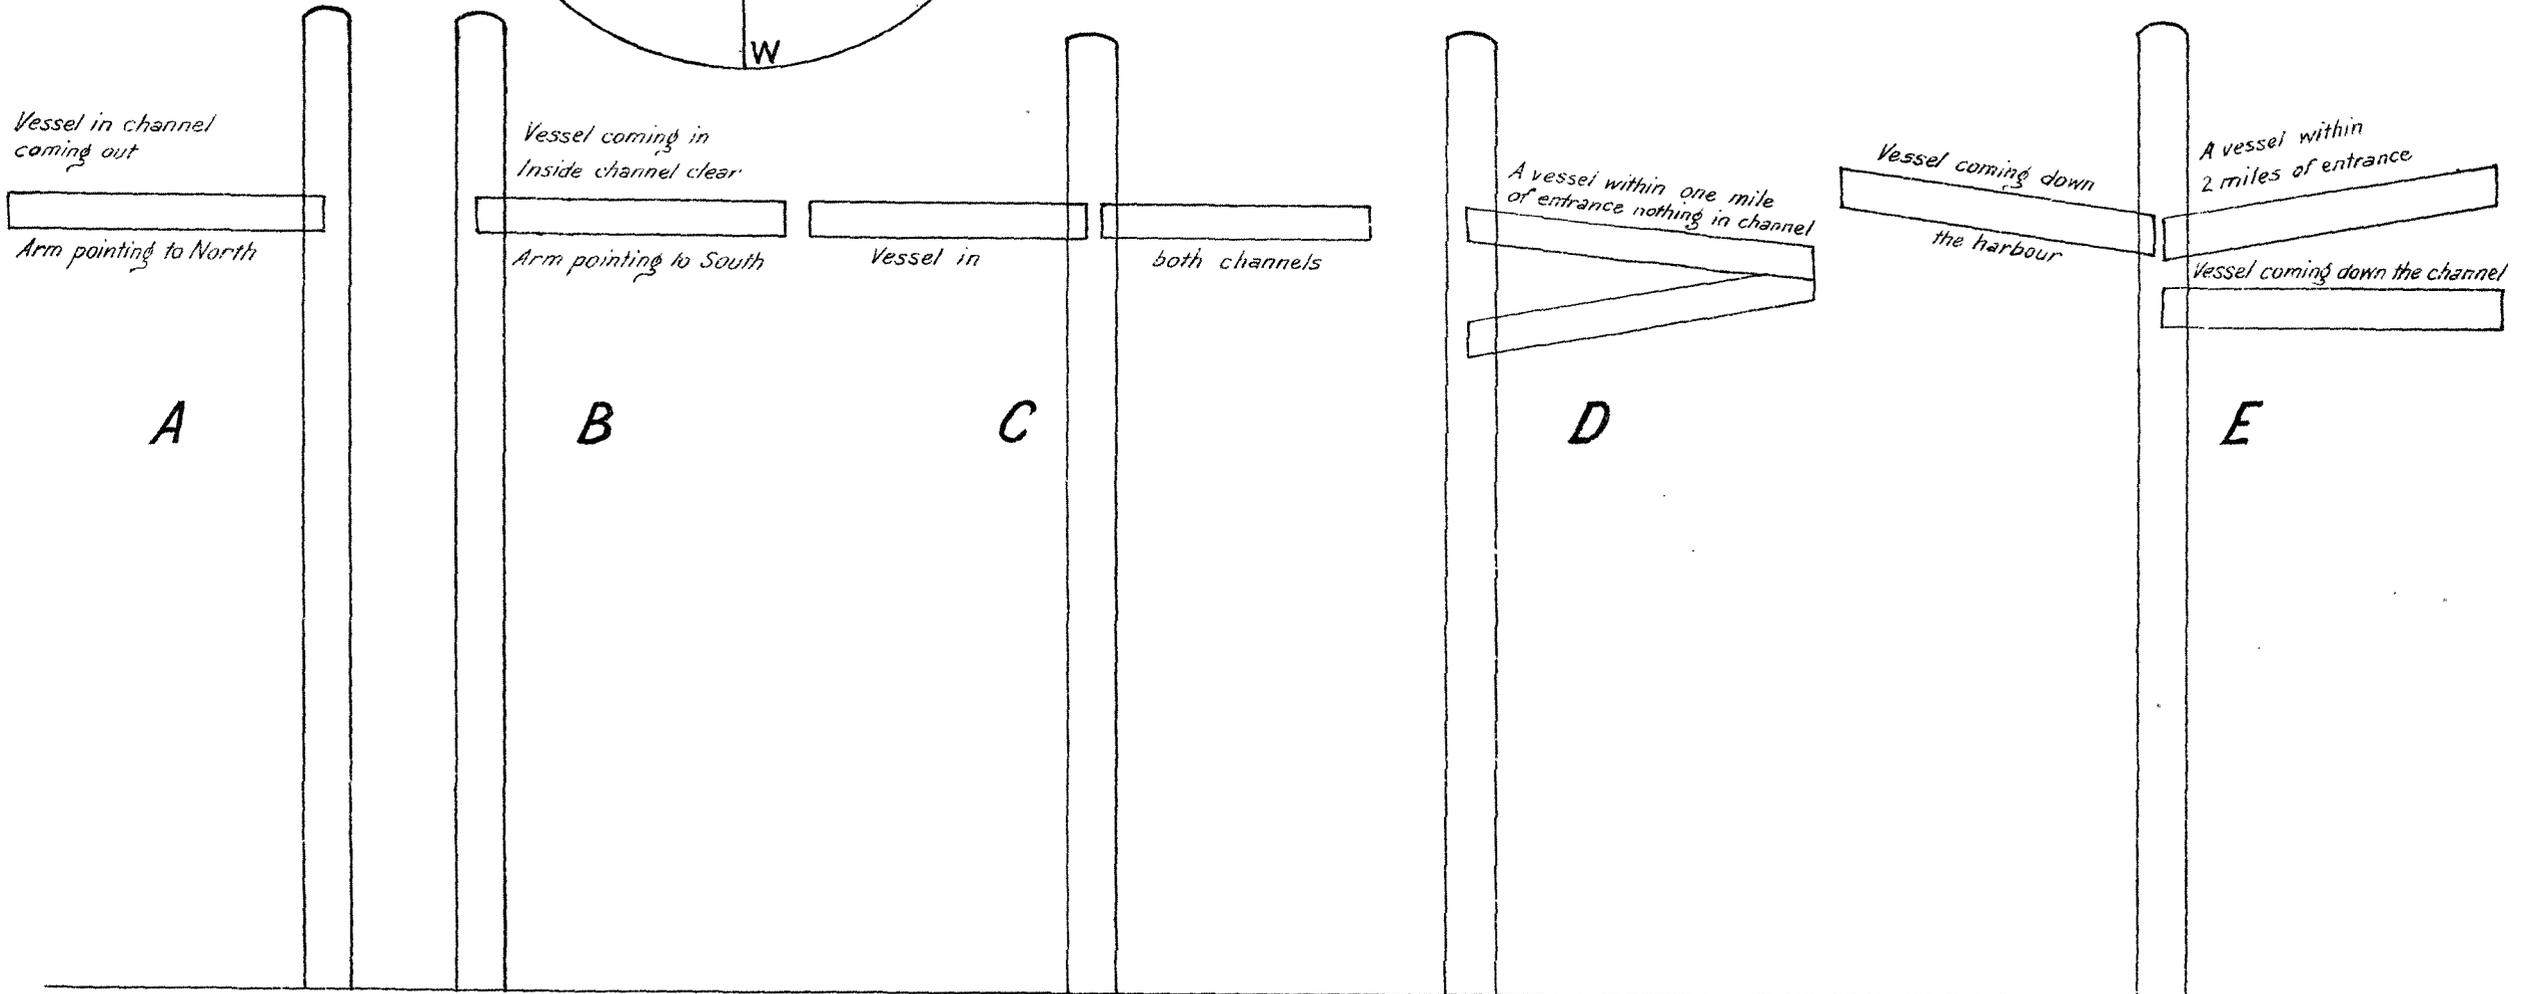

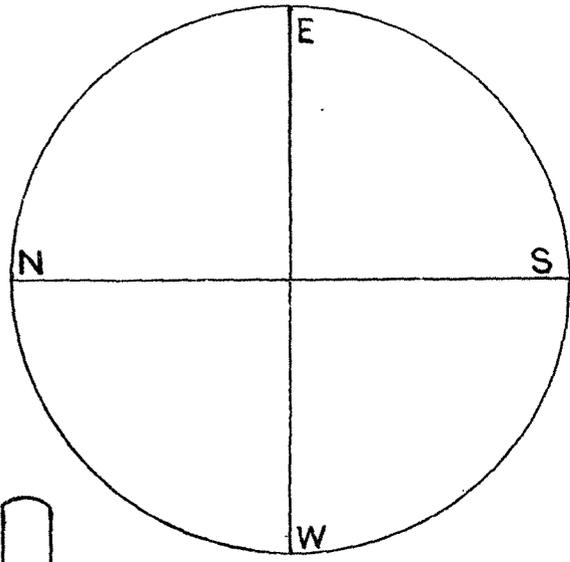

"By the direction of the local Marine Board, I have the honor of replying to your letter of the 22nd ultimo, *re* the establishing of a system of signalling vessels moving in and out of the harbour, which has again had the consideration of the Board, and who cannot recommend the adoption of such system."

*From Chamber of Commerce, 23rd March, 1897.*

"I am directed by my Committee to acknowledge receipt of your letter of 5th instant, in reference to the establishment of a system of signalling vessels moving in and out of the harbour, and stating that your Board cannot recommend its adoption. My Committee would be glad to learn the nature of the objections to the proposal, as they believe that they will be able to satisfy the Board that the public interest will be better served by the adoption of the proposed scheme than by present arrangements."

*From Marine Board, 27th March, 1897.*

"By the direction of the local Marine Board I have the honor, in reply to your letter of the 23rd instant, of informing you that after consideration the local Board regret they cannot accede to the request of your Chamber."

*The Under Secretary, Treasury, 6th April.*

"I have the honor, by direction of my Committee, to hand you, for the consideration of the Honorable the Colonial Treasurer, copies of correspondence that has taken place between the Newcastle Marine Board and this Chamber relative to the establishment of a system of signalling vessels going in and out of the harbour of each other, which my Board contend would be of great benefit to the shipping. They would ask your careful consideration of the matter, which would involve a nominal cost and cannot fail to relieve shipmasters of anxiety, the signal being intended to indicate whether the entrance channel is clear or not."

*From The Under Secretary, Finance and Trade, 21st April, 1897.*

"With reference to your letter of 6th instant, enclosing copies of correspondence that has taken place between the Newcastle Marine Board and your Chamber, relative to the establishment of a system of signalling vessels going in and out of Newcastle Harbour of the approach of each other, I am directed by the Minister acting for the Colonial Treasurer to inform you that the Marine Board (Sydney), to whom such correspondence was referred, report as follows, viz. :—

"The Marine Board concur in the opinion expressed by the local Board, that only useless expense and confusion would arise by any addition to the present excellent rules and regulations for the guidance of vessels entering and leaving Newcastle.

"The present system of signalling was not introduced for the guidance of masters of vessels, who have quite enough to do in the navigation of their respective craft without looking about for signals, but rather for information of the general public."

### 34.

Sir,

Chamber of Commerce, Newcastle, N.S.W., 15 June, 1897.

In reference to the matter of entrance signals, referred to by my Committee at an interview which took place when the Commissioners were in Newcastle, I am directed by my Committee to refer to the collision that recently occurred at the entrance to the harbour between the steamers "Shaftsbury" and "Pacific" as an instance showing the necessity for carrying out the system suggested. Had these vessels been made aware of the approach of each other in time to prevent their meeting in the channel a collision would undoubtedly have been averted. Only on Sunday last an intercolonial steamer, which was some distance astern of a vessel in tow of a tug entering the harbour, stopped until the ship had cleared the channel, thus showing that masters consider it unsafe for two vessels to be in the channel at one time. Shipmasters frequently say that they find it difficult to pass another vessel at this point. It may be said that in the event of the Government deciding to inaugurate a system of signals they would be responsible for the mistakes of the officer in charge, but seeing that they are not answerable for the actions of their pilots, they could hardly be held responsible for the accuracy of the signals.

The sinking of the Government steamer "Castor" abreast of the lightship some years ago made the navigation of the entrance a difficult and dangerous matter; and should one of the vessels trading here be sunk in the narrow channel, the result would be that the whole trade of the port would be immediately stopped, entailing hardship and misery to the workers, particularly, that may be more easily imagined than described.

The Secretary, Public Service Board, Sydney.

I have, &c.,  
ARTHUR BOCKETT,

Secretary.

Acknowledge, and say the matter will receive the consideration of the Commission.—J.W.H. (per A.A.G.), 25/6/97. Done.—25/6/97. Refer to the Secretary to the Royal Commission.—J.W.H., 25/6. A. F. Basset Hull, Esq., B.C., 25-26/6/97. Read. Copy evidence on signal system to be made for Commissioners, and model produced on Friday, 2nd July. Captain Hixson to be summoned also for that day.—28th June, 1897. Captain Hixson.—A.F.B.H., 28/6/97.

Sir,

Engineer Surveyor's Office, 19 May, 1897.

In accordance with instructions, I have the honor to submit the following relating to the subsidised tug steamers on the New South Wales rivers, &c. Under the present arrangement we subsidise ten steamers, and to construct an entirely new plant the approximate cost would be £7,000 for "Richmond" and £2,500 for each of the others. It will also be necessary to provide at least two spare boats in case of loss, repairs, or accidents. This would represent a total capital of £34,500.

At present we pay a total subsidy of £6,353, and although this represents a capital of nearly £128,000 at 5 per cent., still it will be seen by referring to attached sheets giving approximate cost of wages, maintenance, &c., that financially there is a comparatively small balance for contractors. The figures given are correct—that is, as nearly as can be ascertained. Have only taken one of the small steamers, as the average expenses of the others are practically the same.

Captain Lindeman, Secretary.

I have, &amp;c.,

WM. CRUICKSHANK.

## Approximate Monthly Expenses of the P.S. "Protector."

Carries five hands, as follows :—	
One master, at £18 per month .....	£18
One engineer, at £16 per month .....	16
Two firemen, at £10 per month .....	20
One deck hand, at £10 per month .....	10
Total for wages .....	£64
Monthly maintenance :—	
Coal consumed per month—about 32 tons, at 15s. per ton.....	£24
Stores, packing, oil, paints, ropes, &c. ....	10
Tow-ropes—3 per year, at £25 each.....	7
Bonus to crew, in addition to wages .....	2
Twelve per cent. insurance on £4,200 .....	50
Repairs to hull, machinery, docking, &c. ....	30
Five per cent. depreciation on £4,200 .....	18
£141	
Total monthly wages .....	£64
„ maintenance .....	141
£205 = Total expense per month.	
12	
£2,460 = Total expense per year.	
Subsidy .....	£1,770
Average towages .....	800
£2,570 = Total income.	
2,460 = Total expense.	
£110 = Balance.	

## Approximate Monthly Expenses of the S.S. "Volunteer."

Carries three hands, as follows :—	
One master, at £10 per month .....	£10
One engineer, at £10 per month .....	10
One fireman (boy), at £6 per month.....	6
Total for wages .....	£26
Monthly maintenance :—	
20 tons of coal per month, at 10s. ....	£10
Stores, packing, oil, paints, ropes, &c. ....	5
Tow-ropes—3 per year, at £25 .....	7
Ten per cent. insurance on £1,680 .....	14
Repairs to hull and machinery, docking, &c.....	10
Five per cent. depreciation on £1,680 .....	7
Five per cent. to crew on towages—£700 per annum—in addition to wages .....	3
£56	
Wages, per month .....	£26
Maintenance, per month.....	56
£82 = Total expense per month.	
12	
£984 = Total expense per year.	
Subsidy .....	£564
Average towages .....	700
£1,264 = Total income per annum.	
984 = Total expense „	
£280 = Balance.	

Forwarded for the information of the Royal Commission. The Marine Board is of opinion that Mr. Cruickshank has altogether underrated the cost of this service. If the Government provide tugs the inhabitants of the different districts would insist on having much better boats than those supplied by the present contractors, and the people of the Clarence and other large rivers would never rest content with a less powerful vessel than that at the Richmond. Two spare boats—and they would have to be supplied with crews—would not be sufficient to meet the casualties and wear and tear of so dangerous a service on a coast line of over 400 miles.—Geo. S. LINDEMAN, 21/5/97.

To the Honorable John See, Sydney.

Dear Sir,

S.S. "Coraki," 14 May, 1897.

Mr. Allen requests me to report on the pilot and tug service of the northern rivers, and forward report to you. I beg to state that, in my opinion, the pilot ought to have full charge of the tug-steamers, and that the northern river tugs ought to be owned by the Government, and be made self-supporting; there would then be an efficient service. At present the pilots on the rivers have no responsibility whatever. We can never get a direct answer from scarcely any of them with regard to the state or depth of water on the bars, especially on the Manning.

In the first place, usually the pilot and the tug-master are at variance, and each appears to work against the other. They often do not speak to each other for weeks.

As regards sounding the bars or finding a channel, the pilot and his boat's crew are useless. They never go over a bar in their own boat to find a channel, no matter how smooth the sea. (This applies to the Manning.)

The usual way the bar is sounded is for the pilot to go out in the tug-boat a few minutes before a vessel either comes in or goes out. They just rush in and out a few minutes before high-water. It is impossible to get true soundings or to define a channel by doing so in such a manner. They want to avail themselves of every opportunity when the sea is smooth on the bar. If any of us mention this matter to the pilots, they say, "Oh! we do not want to trouble the tug no more than can be helped." If the circumstance is mentioned to the master of the tug, he grows and makes a complaint that he is burning too much of his owner's coals to no purpose or advantage to the tug. There are none of the tug-masters will go and sound if they can possibly avoid it, unless their tow-rope is taken by the ship, and they are sure of a tow. This applies especially to the Richmond and Manning tugs; and it is quite necessary that the Manning bar should be sounded every possible chance, especially for this past three months.

Were the tugs owned by the Government, and in charge of the pilot and his crew, and he being held responsible, this would be avoided. He would then take care to give correct depths, and be out at all times in fine weather, finding the best channels for the steamers to navigate.

On Friday, the 2nd of April, the tug-steamers broke the main steam-pipe, and became disabled in consequence. I was down with the ship, ready to go out, but had to go back to Coraki and discharge some cargo, there being the bare water on the bar.

The master of the tug positively informed me he would be ready the following morning. Late the same night I got word the tug would not be ready for a week, as the machinery had to be sent to Sydney. I wired him to try and procure the services of the Camden Haven tug; the reply I got was he was not justified in going to that expense. The pilot appeared to have no voice in the matter. After spending a lot of money in wires, I had eventually to wire Captain Kicketts to have the Manning drogher down, so that I could go out and sound in her, which we did. What I wish to point out is this: twelve months previous the same thing happened to the tug, and I had to take advantage of a moonlight night and a high tide to go out, or else I should have been delayed several days. Had the pilot sole charge of the tug there is no doubt but what he would have had a spare steam-pipe on board, which the tug has since got. In my opinion, the pilot ought to have full charge of the tug, as their situations now are only securities. It is even a difficult matter to get any of them up the rivers to replace beacons or buoys that have shifted or got out of place. I do not see what the pilot and his crew does. Whenever a vessel gets stranded the tug has to be employed to run the anchors out to get the ship off, and that is the time the tug reaps his best harvest. This ought not to be, especially at bar-harbours. When a vessel is stranded the tug ought to render all assistance free. If the tugs were owned by the Government and in charge of the pilot, he would be compelled to render all the help he could for his own credit's sake.

In many of the pilots' crews on the northern rivers, there are some of the men in the boats that have no idea how to run an anchor out, or even to pull an oar in broken water when they are wanted in cases of emergency, such as stranding, &c. Some of the men are farmers, others are joiners, and some have been firemen. These men are useless when it comes to running out ropes and laying out anchors; all has to be done by the tug-boat's crew.

Last year all the time I was running to the Macleay River and using the new entrance, I never once saw the pilot or his crew taking soundings. The bar beacons were put in position by Captain Ferguson. The pilot was always against using that channel. The only reason I could account for it was, he was afraid of his station being shifted from the old to the new bar, and that would not suit him as he has a selection close to where he now lives.

The pilots on the northern rivers, I consider, are placed there more to prevent accidents than to pilot vessels in or out, as all masters trading to the rivers are exempt, and should a pilot be wanted the tug is again called in requisition and has to go out for the vessel, the pilot being unable to go out without he goes in the tug. If the pilot was placed in a responsible position with regard to the tug there would be less accidents, and fewer strandings than at present as it is now. They always have a saving clause for themselves.

In my opinion there ought to be a head pilot or an inspector—one that has been used to bar-harbours—to go at times from river to river to see that these men do their duty, and that they keep the beacons and buoys in their proper places; there are often times, when a channel is on the shift, that the beacons and buoys require shifting from day to day, but they are often not touched. If we complain about it to them the explanation they give is—it is no use shifting them as they will have to again do so to-morrow.

Another little matter I beg to draw your attention to, and that is, there are some of the tugs not insured. Sometimes, when the bars are shallow, the tug-boat master refuses to go out to try and find a channel; they simply tell the pilot there is not sufficient water for them to go out, and the pilot does not seem to have the power to compel them to try.

That I consider another reason why the pilot should have sole charge, and the tugs owned by the Government.

I remain, &c.,

S. BOULDEN.

Dear Sir,

The North Coast Steam Navigation Company (Limited), 12 May, 1897.

In view of the sitting of the Royal Commission at the present time to inquire into the tug and pilot services, I hereby beg to express my opinion, from my experience of the working of the northern rivers for the last twenty years.

I am of opinion that the tug and pilot service should be one and the same, as it would do away with all friction between pilot and tug-boat master that so often exists. I have known the pilot wish to sound the bar and the tug master to refuse him the use of the tug. I got my ship aground on the Manning crossing on one occasion, with the tug-boat towing me, the pilot waving me one way, the master of the tug waving me another, and no buoys to give me any help or idea which way to steer. On the Macleay River, when a tug was stationed there, things were the same, and it is much the same at the Richmond River, and has been for some years past. At Port Macquarie things are better than I have ever seen them throughout my whole experience. Captain Baird, the pilot, says, "I want the tug, say, 6 a.m. to-morrow, to sound the bar," and then goes out and sounds the bar and sets his beacons accordingly. This is the only instance that I have seen the two services working amicably together. I have known the tug-boat master to say he refused the pilot to sound the bar as he would not risk his boat, the said boat not being insured.

I think that if the services, pilot and tug, were amalgamated, it would do away with all this friction, and the pilot and crew would earn their living from tug fees. I do not consider that the pilots and crews have half enough to do; consequently, in such a small community, with divided authority, there is sure to be friction.

I should also recommend that a competent man be appointed to travel on the coastal steamers to inspect all bars, buoys, boats, and beacons, both river and crossing channels, to go without notice to any of the rivers, and inspect thoroughly.

I should recommend that the buoys near the heads of all our rivers should be of different shape, the port from starboard, and they could then be distinguished from each other in fog or hazy weather, and that, as we are working nearly all the river bars at night, through there not being enough water in the day, I should recommend that the buoys near the heads should be painted with luminous paint. One word more: I do not think it fair that when a tug is employed by the steamer, that when the steamer gets stuck on a crossing and is paying the usual rates, that the tug master should charge extra for running out an anchor. I have been charged extra both on the Richmond and Manning.

In conclusion, I beg you to understand that I have not said anything here in regard to any of the tug masters or pilots through personal animus, but have stated what is strictly correct.

Mr. Cooke, Secretary North Coast S.N. Co.

Remaining, &c.,

EDWARD FARRELL,

Master, s.s. "Electra."

The

*Re Tug Boats on Northern Rivers.*

R. Cooke, Esq., Secretary.  
Dear Sir,

The North Coast Steam Navigation Company (Limited),  
Head Office, 3, Sussex-street North, Sydney, 11th May, 1897.

I venture to offer an opinion, based on over twenty years' experience trading to the northern rivers, that a Government steam-tug, manned by the pilot and his crew, would be very much more satisfactory than the service which operates at the present time, and would, no doubt, result in a large saving of expenditure to the Government of the Colony; inasmuch, that the pilot would do all the towing necessary and, to a certain extent, must undertake the responsibility of a vessel going ashore whilst being towed in. The conditions which we labour under at present, do not place the master of a vessel in a good position, for should his vessel by chance lose the power of the tow-boat and drift ashore, he (the master) is held responsible, the owner of the tug escaping scot free. There is no doubt in my mind that should the existing service of subsidised tugs be dispensed with, and the acknowledged good services of the pilots and crews replace them, that the change would not alone be a vast improvement on the present order of things but the saving to the Government would be well worth consideration.

I have, &c.,  
HORATIO WOOD,  
Master, s.s. "Australian."

*Re Tug and Pilot Service.*

R. Cooke, Esq.  
Dear Sir,

The North Coast Steam Navigation Company (Limited), May 14th, 1897.

I beg to state that in no instance have I found the present system to work satisfactorily; there is always a certain amount of bad feeling between the two services. On one occasion I arrived off a bar. Another steamer was standing off, and on flying a signal for the tug the tug came out with the pilot on board. The pilot hailed me, gave me the depth water and directions for inside channel. I therefore steamed in and the tug lost a towage. This is the sort of thing that causes enmity between the two, and it is certainly against the best interests of the shipping that it should exist.

I am strongly of the opinion that the tug ought to be in the hands of the pilot, and if any fees are to be charged they ought to take the form of tonnage dues, for the following reasons: If the pilot was empowered to charge for towage, he would naturally try to make as much as he could for his vessel; yet in many instances it is not necessary for the tug to give her tow-line to the steamer. All that is required is for the tug to go ahead and point out the best water and leave the steamer to follow. At present, to do that would cost the steamer a towage; and if the pilot was allowed to charge, it is only to be expected that the man that gave him most towages would get most attention.

I have, &c.,  
W. B. NELSON,  
Master, s.s. "Wyrallah."

## 43.

## STEAM TUG SERVICE.

CONDITIONS of Contract referred to in Treasury Notice of the 7th April, 1896, calling for tenders for the supply and maintenance of a steam tug.

- (1.) The tug is to be available for towing vessels in and out of the place tendered for.
- (2.) The tug is not to leave its station at any time without the sanction of the Marine Board; and is to endeavour to be in the vicinity of the station when vessels are there ready for sea.
- (3.) Priority of service is to be given to the vessel being then ready for sea, and first notifying to the master of the tug the want of such service, except in the case of a vessel in actual danger, when assistance is to be promptly rendered.
- (4.) Should the tug at any time, or for any reason, be absent from her station without authority, or be incapacitated from performing her duty, the subsidy for the period of such absence or incapacity shall not be paid, unless the contractor shall substitute an approved steamer for the service during such absence.
- (5.) The ordinary rate for towing in or out, chargeable for the use of the tug, is not to exceed 4d. per registered ton, with a minimum of £1 10s. In the event of cargo being taken to and from vessels, a rate not exceeding 2s. 6d. per ton may be charged.
- (6.) In the event of dispute arising, by reason of special services having been rendered by the tug to stranded vessels, or to vessels otherwise in distress, the matter is to be settled by arbitration, without litigation, by the tug owner and the owner of the distressed vessel appointing arbitrators in the usual way, and calling in an umpire if necessary. The party decided against to pay the costs of the arbitration.
- (7.) The master of the tug will be required to take the pilot off (weather permitting) to any vessel signalling for his services in the offing. He will also be expected to render any assistance—such as sounding the bar, moving buoys, or otherwise aiding in the safe navigation of the port, &c., as may be required of him by the pilot.
- (8.) The service may be terminated by six months' notice on either side, subject to the right of the Government to cancel on breach of any of the conditions.
- (9.) All conditions being observed, the subsidy will be paid monthly at the Treasury.

The Treasury, New South Wales, 7th April, 1896.

G. H. REIF

## 44.

"RICHMOND RIVER TIMES," 20 MAY, 1897.

*The Richmond River Tug.*

THE tug "Protector" arrived off the bar on Tuesday night, having left Sydney on Sunday. Captain J. Lewis resolved to bring the vessel into the river instead of standing off till daylight, and in spite of the fact that the night was dark, the moon not having arisen, succeeded in doing so, crossing in about seven o'clock. To look at the vessel as she lays at the wharf, a superficial observer would scarcely comprehend the extent of repairs and improvements that have been made during the recent visit to Sydney. The hull, in the hands of Mr. D. Drake, of Balmain, was stripped and newly planked and caulked. A new keelson was also put in, new boiler beds, new stringer pieces, with diagonal stays between, 37 feet of new keel, new combings, and finally the hull was re-metalled all through, making the vessel far stronger than she has ever been before. The machinery, in the hands of Mr. W. Grant, of Pymont, has received the best attention. The boilers were lifted out, patches renewed, new smoke boxes provided, also new boiler beds and pistons. The condenser tubes were thoroughly cleaned, paddles rebushed, and machinery relined, consequently the whole may now be truthfully said to be in first-class order. The management of repairs to machinery was in the hands of Mr. Andrew Fenwick, while Captain J. Lewis, in conjunction with Captain J. Banks, supervised the repairs to the hull. Great credit is due to Captain Lewis for the expedient way he had the work carried out, and singular to say, his ideas of strengthening the hull were exactly the same as those of Captain J. Banks and Mr. Drake, he having taken the necessary timber with him to put those ideas into execution. Regarding the cost of repairs, which are the result of the work on the bar, Mr. A. Fenwick quite agrees with a par in a recent issue of the *Times* in which it was stated that the tug service is not all "beer and skittles." The work of renovation was completed on Saturday last and a trial spin made in the afternoon, when, beyond the usual stiffness consequent upon so thorough an overhaul, everything proved satisfactory. The trip up the coast was a fine one, and no hurry was made, Captain Lewis wisely opining that new bearings, &c., would best get into order by steady work.

## MINUTE PAPER.

*Subject* :—Combining duties of Dredge Service Tugs and Pilot Tugs.

Department of Public Works, Engineer-in-Chief's Office, Sydney, 23 June, 1897.

CAPTAIN HIXSON asked me if I could say, in the absence of Mr. Darley, whether it would be practicable and advantageous to the Public Service to arrange for the towing work at the bars of the different ports to be performed by the tugs attached to the dredges, instead of, as now, by chartered steamers. In my opinion the dual service would not be workable, and in proof of this I will briefly state how the dredging is carried on at the different rivers.

Tweed Heads.—Dredging by sand-pump; no tug required.

Richmond Heads.—Dredging by sand-pump; no tug required. A tug is used by Mr. Keele for towing punts with 20-ton blocks from the quarry 20 miles away to Ballina, but the vessel could not be spared for an hour on account of so many men being dependent upon the regularity of the tug.

Clarence Heads.—The improvement to the bar and crossing by training walls has rendered dredging at the Heads unnecessary. The dredge is employed from 10 to 40 miles away, and the tug attached is a small launch worked by one man, and arrangements are in progress for employing a pump so as to dispense with the tug.

Bellinger Heads.—Sand-pump employed; no tug.

Nambucca Heads.—Sand-pump employed; no tug.

Macleay Heads.—Sand-pump employed; no tug. A ladder-dredge with a small tug may be commissioned for work near Kempsey, 28 miles from Heads.

Port Macquarie.—Sand-pump nearly completed; no tug required.

Camden Haven.—Sand-pump working; no tug.

Manning River.—Dredge with tug generally working many miles from Heads; tug cannot be spared.

Cape Hawke.—Sand-pump; no tug.

Port Stephens.—Sand-pump; no tug.

Wollongong.—No dredge stationed here.

I should have stated that two small launches are used by Mr. Blomfield at the Clarence Heads training walls, but as they will not be required when the work is finished it would not be advisable to calculate upon them for bar work; besides, they are unsuitable for sea towing.

A. B. PORTUS.

## 46.

## MINUTE PAPER.

*Subject* :—Tugs for Bar Harbours.

Department of Public Works, Engineer-in-Chief's Office, Sydney, 9 July, 1897.

The Engineer-in-Chief for Public Works to The Chairman of the Royal Commission on the Marine Board.

FORWARDED for the information of the Royal Commission on Marine Board.

I think Mr. Portus' minute contains the information asked for. I have prepared a schedule showing in detail the probable cost of crew, working expenses, and maintenance of each class of boat. From the experience gained with our own tug boats, I find it costs on an average, taking one year with another, just about 10 per cent. of the original cost of each boat to maintain it. This, of course, includes repairs, painting, docking, and keeping everything up to a high state of efficiency, so that, after a number of years, most of our boats are, for all practical purposes, as good as new.

In my opinion, two of the large class of boats would be necessary, which may be called Class A, and nine of the smaller boats, called Class B.

The two Class A boats to be stationed at the Richmond and Clarence Rivers, and when one of them may be in need of an overhaul, it should be relieved temporarily by sending a Class B boat to the Clarence, but always keeping a Class A boat at the Richmond.

The Class B boats are required as follows :—

Tweed .....	1	Manning .....	1
Bellinger .....	1	Cape Hawke .....	1
Nambucca .....	1	Wollongong .....	1
Macleay .....	1	Spare relief boats .....	2
Port Macquarie .....	1		
Camden Haven .....	1		9

The boat stationed at Clarence River should act as tender, supplying stores to Solitary Island Lighthouse, having more time to spare than the Macleay boat, and the Clarence being a safer and more convenient port to send stores to.

I invite special attention to Mr. Portus' observations about the eight-hour system. It is obvious that if this service is established, it must be under special regulations, apart from any other branch of the Public Service.

The tug boat crews may have long hours of continuous work occasionally to suit the tides, but, on the other hand, they will, at other times, have days of idleness when the bar is too rough to work, or no vessels approaching.

C. DARLEY.

I concur generally with Mr. Darley, except that I think the boats are unnecessarily heavily manned. I would point out that as the master of the boat would be the pilot, the whole cost of the existing pilot services at those ports would be saved.—R.H., 9/7/97.

SCHEDULE of probable cost and annual expenses connected with Tug-boats for Pilot Service.

Class A.		Class B.	
	£		£
Estimated cost .....	3,200	Estimated cost .....	2,300
Crew—		Crew—	
Master, at £16 per month .....	192	Master, at £14 per month .....	168
Engineer, at £16 per month .....	192	Engineer, at £14 per month .....	168
Firemen, at £11 per month .....	132	Firemen, at £7 10s. per month* .....	90
Seaman, at £9 10s. per month .....	114	Boy, at £5 10s. per month .....	66
Coal (say 18 tons per month), at 13s. = £11 14s.	140	Coal (say 10 tons), at 14s. = £7 .....	84
Stores (say) .....	75	Stores (say) .....	60
Maintenance, including wear and tear, at 10 per cent. on cost of boat .....	320	Maintenance, at 10 per cent. on cost .....	230
	1,165		866
Write off capital value of boat (say, 5 per cent. per annum) .....	160	Write off capital value of boat (say 5 per cent. per annum) .....	115
	£1,325		£981
Interest, at 3 per cent. .....	96	Interest, at 3 per cent. .....	69

\* On some of the rivers the firemen might be dispensed with—work to be divided between the engineer and a smart lad.

C. DARLEY,

9/7/97.

MINUTE

## MINUTE PAPER.

Subject:—Tugs for Bar Harbours.

Department of Public Works, Engineer-in-Chief's Office, Sydney, 9 July, 1897.

FIRST-CLASS Tugs.—A suitable tug for the Clarence and Richmond would cost, new, about £3,200. Dimensions, about 85 to 90 ft. x 19 ft. 6 in., with 7 ft. draught. Engines, 13 in. and 26 in.; steam, 120 lb. The crew to consist of:—Master, at £16 per month; engineer, £16; fireman, £11; seaman, £9 10s.; but it should be clearly understood that no eight-hour system should apply to this service. The wages named are higher than those paid by owners of tugs now performing the service.

For the other rivers the class of tug should be a vessel 80 x 17½, with 6 ft. draught, or for very shallow bars, 5 ft. Engines, 11 and 22, with 120 lb. steam. Estimated cost, new, £2,300. Crew:—Master and engineer, £14 per month; fireman, £7 10s.; seaman, £5 10s. Conditions of work same as stated above. Crews to find themselves with provisions. The cost for coal, stores, repairs, might be put down at £500 per year for the large tugs, and £400 for the small ones.

Depreciation, 9 per cent. per annum.

A. B. PORTUS.

COMMUNICATION from Mr. Alfred Langley in connection with his Evidence.

In my opinion it would be sufficient if the Marine Board were to issue instructions to the masters of all the tugs that they must tow vessels of a night when there is sufficient water and favourable weather, and also instruction to all the pilots that they must render all assistance possible with their crews, by putting up leading lights of a night and in any other way. Some of the pilots and captains of tugs do this now, but others, I believe, decline to do so.

ALFRED LANGLEY.

## 49.

MEMORANDUM from Henry Selfe, Government Engineer Surveyor, Marine Board Office, Circular Quay.

To the Secretary, Royal Commission.

Sydney, 23 June, 1897.

Sir, As the great object of the Commission is economy, I do myself the honour to respectfully call their attention to the antiquated method in use for lighting Sydney Harbour at the Heads.

A small tower could be erected on Sow and Pigs reef, and it, together with the south reef lighthouse and leading lights, be connected by cables, and illuminated from the South Head lighthouse.

The lights are all of moderate power, and incandescent lamps would be suitable, the whole installation being in duplicate.

A lighthouse without keepers might seem strange, but at the present stage of advancement in electric lighting I am of opinion an up-to-date expert could only approve of it.

Trusting I am not exceeding the privileges of my position,

I have, &amp;c.,

HENRY SELFE.

Acknowledge receipt of letter, and thank Mr. Selfe for suggestions contained in his communication, which will receive due consideration.—J.W.H., per A.G., 24/6/97. Done.—24/6/97. Refer to Secretary of Royal Commission.—J.W.H., 25/6/97. A. F. Basset Hull, Esq., B.C., 25/6/97. Read. Mr. Selfe to be summoned before the Commission on Friday, the 2nd July.—28/6/97. Mr. Henry Selfe.—A.F.B.H., 28/6/97.

## 50.

Marine Board of New South Wales, Sydney, 12 July, 1897.

Sir, Referring to my late examination by the Royal Commission on the Marine Board, I beg to inform you that I have put myself in communication with Mr. Elwell, and ascertained that he has no scheme, nor has he ever heard of one, for substituting electricity for present appliances at the light-ship, pile-light, &c.

This arrangement could, no doubt, be carried out, but it is surrounded by many difficulties, and the expense would be so great as to justify the Marine Board in retaining the present system, which answers admirably for fogs and storms and all conditions of bad weather, at all events for the present.

I have, &amp;c.,

FRANCIS HIXSON,

President.

The Secretary, Royal Commission on Marine Board.

Read.—A.F.B.H., 14/7/97.

No. 1.

Minute by The Honorable the Premier.

5 November, 1896.

INFORM Mr. Brooks that in the opinion of the Government his positions as Lloyd's Surveyor and Shipwright Surveyor to the Sydney Marine Board are inconsistent with his position as member of the local Marine Board, and state that he must either give up the latter position or the other positions. State also that I hope he will definitely act upon this suggestion at once, as otherwise it will be the duty of the Government to remove him from the local Marine Board without further delay.

G.H.R.

Mr. Robberds.—F.K., 5/11/96. Informed.—C.E.F.R., 6/11/96. Records.

No. 2.

Mr. Thomas Brooks to The Under Secretary for Finance and Trade.

Sir,

Newcastle, 13 November, 1896.

In reply to your favour dated 6th November, I beg to state that in deference to the wishes of the Hon. the Premier and Treasurer, I tender my resignation as a member of the Newcastle local Marine Board, and in doing so feel, whether rightly or wrongly, that I am the victim to make a holiday for some one.

The latter paragraph of your letter, wherein you state if I do not take definite action it will be the duty of the Government to remove me from the local Marine Board, was unnecessary and uncalled for, and a gratuitous insult.

I have, &c.,  
THOMAS BROOKS.

Submitted.—F.K., 16/11/96. Approved.—G.H.R., 16. Mr. Robberds.—F.K., 16/11/96.  
Acknowledged.—C.E.F.R., 17/11/96. The Secretary, Marine Board.—F.K., 19/11/96. Noted  
and returned.—G.S.L., 12/5/97. The Under Secretary, Finance and Trade.

## No. 3.

Mr. Stewart Keightley to The Honorable the Premier.

Dear sir, Newcastle, 1 October, 1896.  
 Replying to your letter of the 30th ultimo, Lloyd's surveyor does quite five-sixths (5ths) of  
 all the surveying at this port. Yours, &c.,  
 STEWART KEIGHTLEY.

For Cabinet.—G.H.R., 2.

## No. 4.

Mr. Thomas Brooks to The Under Secretary for Finance and Trade.

Sir, Newcastle, 17 January, 1895.  
 In reply to your letter of 9th instant, I would have responded earlier to your previous communication of 22nd October, 1894, except, from the fact, that I cannot see why I should be selected to give effect to the opinions expressed therein as every member of the local Board, as at present constituted, are under the same disabilities as myself, all being connected with shipping interests.  
 I can only give you my assurance that I will refrain from taking any part in an inquiry where I have been engaged professionally.

Yours, &c.,  
 THOMAS BROOKS.

## No. 5.

Mr. C. F. Stokes to The Under Secretary for Finance and Trade.

Sir, Newcastle, 21 November, 1894.  
 I have the honor to acknowledge your letters of 17th ultimo and 17th instant.  
 I would state for the information of the Honorable the Colonial Treasurer that I have a house of business (Charles F. Stokes & Co.) in Newcastle, and one in Sydney (R. Towns & Co.), so that my time is passed between the two cities.  
 I own a residence in Newcastle, and my wife one in Sydney, she was ordered by her medical adviser to reside out of Newcastle, the strong sea air not agreeing with her.  
 Communication by train and steam being so frequent and speedy, I am always in either city when required. My travelling being at night, I have the clear day in either city, and when necessary I stay longer. After the first of the coming year I shall be in Newcastle even more frequently.  
 My attendance at the sittings of the Board is so constant and regular that it is impossible that any public inconvenience has at any time been experienced through my absence.

I have, &c.,  
 C. F. STOKES.

I think nothing more need be done.—G.H.R., 30. Records. Mr. Ross, reminder to Mr. Brooks.—F.K., 8/1/95. Reminder.—M.R., 9/1/95. Marine Board, at Newcastle.—Messrs. Stokes and Brooks have not replied to Treasury letters. Registrar, please say.—F.K., 14/11/94. Not to Treasury letters of 15th (to Mr. Stokes), and 22nd October (to Mr. Brooks). Papers herewith.—A.L., 14/11/94. The Under Secretary. Remind.—G.H.R., 16. Mr. Ross.—F.K., 16/11/94. Reminders sent.—M.R., 17/11/94.

## No. 6.

Mr. Thomas Brooks to The Under Secretary for Finance and Trade.

Sir, Newcastle, 17 October, 1894.  
 I have the honor to acknowledge receipt of your letter No. 1,122, of the 5th instant, re Messrs. Thompson and Windeyer's letter, dated 7th September, 1894, and in reply thereto beg to state:—  
 1. I did survey the s.s. "Ceres," for the Harbours and Rivers Department, for the purpose of ascertaining the extent of the damage, and to advise as to her seaworthiness to proceed to Sydney for repairs (and not for the purpose of ascertaining the cause of the damage, as implied by Messrs. Thompson and Windeyer).  
 2. I informed Mr. Thompson, before he subpoenaed me, that I knew nothing about the collision, except that it had occurred, and yet, in the face of these facts, he subpoenaed me for the self-evident purpose of preventing my sitting at the inquiry.  
 3. After the usual Board business was completed on the 11th October, and the inquiry about to commence, I informed the Chairman that I was subpoenaed as a witness, and regretted I could not sit and assist in the inquiry. I accordingly left the room, and remained in attendance while two witnesses were examined (Dunnet and Steele), after which the Board adjourned. Mr. Thompson then informed me that as I could not throw any light on the cause of collision he would not require me to attend any longer as a witness.  
 4. I must admit that I felt indignant at what I believed to have been a trick on the part of Mr. Thompson to prevent me from sitting, and bringing my common sense and experience to bear on the inquiry; therefore, this action on the part of Mr. Thompson was quite unnecessary, for, from my observation and long experience of ship-masters visiting this port, I believe Dunnet, the master of the "Bungaree," to be one of the best masters in Newcastle.  
 5. When discharged as a witness, I attended next morning, the 12th, and informed the Chairman that I would sit. Mr. Thompson objected and protested, but it being an open court I knew that so long as I did not take part in the finding, there was nothing to prevent my enjoying the same privileges as the public.  
 6. On the 8th November, the Board met for the usual business, and when finished the Chairman announced that they must give their finding in the "Ceres"-"Bungaree" collision. I informed him that, although I sat during part of the inquiry in view of Mr. Thompson's protest, and my not having heard the evidence

evidence of two witnesses I must decline to take part or join in the finding. Although not taking part in the finding, I sat throughout, except when Dunnet and Steele's evidence was taken. I have perused their evidence very carefully, and have come to the conclusion that Mr. Thompson is attempting to make a scapegoat of Mr. Stokes and myself to extort money from the Government. I beg to refer you to the Chairman of the local Board who will verify my statements as to my not joining in the finding.

Trusting this explanation will prove satisfactory,

I am, &c.,

THOMAS BROOKS.

Inform Mr. Brooks that it is not considered desirable that a gentleman however otherwise competent should be a member of the Marine Board while following the profession of a marine surveyor. Inform him that in my opinion he should either discontinue the practice of his profession or terminate his connection with the Marine Board.—G.H.R., 19.

Mr. Galloway.—F.K., 20. Informed.—F.H.G., 22/10/94.

### No. 7.

#### Mr. C. F. Stokes to The Under Secretary for Finance and Trade.

Sir,

Newcastle, 10 October, 1894.

I have the honor to acknowledge receipt of your communication, M. 1,124, 6402, Misc. of date 5th instant, with a copy of a letter from Messrs. Thompson and Windeyer, dated 7th September last.

In reference to the paragraph in the letter from these gentlemen respecting myself, I have the honor to state that as circumstances prevented me sitting on the inquiry in question on the second day, "I did not sit on the inquiry on the last nor on any other day except the first."

The local Board deliberated and arrived at their finding during my absence, and entirely irrespective of and without in any way referring to me.

Messrs. Thompson and Windeyer are therefore in error in their inference that I took any part in the finding.

I have, &c.,

C. F. STOKES.

I would suggest that Messrs. Thompson and Windeyer be so informed.—F.K., 12. Appd.—G.H.R. Mr. Galloway. Then write to Mr. Stokes and ask him if it would suit his convenience to reside in Newcastle.—F.K., 13. Informed.—F.H.G., 15/10/94.

### No. 8.

#### Messrs. Thompson and Windeyer to The Under Secretary for Finance and Trade.

Sir,

Newcastle, 7 September, 1894.

For the information of the Honorable the Premier we do ourselves the honor to bring under his notice certain facts in connection with the method of working the Marine Board at this port, with the view, in the first place, of showing how absolutely necessary it appears to be that some alteration, as proposed by the Government with regard to the Marine Board in Sydney, should be made in its constitution and working, and secondly, that some redress may be afforded to our clients, Messrs. J. and A. Brown, of this city, for the mischief that has been caused to them in the particular matter to which we desire to draw attention.

In the month of October last a collision took place in the harbour of Newcastle between the Government steamer "Ceres," under the command of Captain Hare, and the tug "Bungaree," belonging to our clients, in consequence of which our clients applied to the local Marine Board for an inquiry, which was granted, and duly came on for hearing.

Mr. Thomas Brooks surveyed the "Ceres" for the Government shortly after the collision, and whilst the damages to that vessel were still quite fresh and apparent.

From our instructions it appeared to us that Mr. Brooks could give very material and valuable evidence as to the way in which the collision probably occurred, and we accordingly caused him to be subpoenaed, and he was paid the sum of one guinea therewith.

Our Mr. Thompson, who conducted the inquiry on behalf of our clients, was unable to see Mr. Brooks as to the evidence he could give until the inquiry had commenced, and after hearing what Mr. Brooks had to say on the point as to which it was believed he could give evidence, Mr. Thompson informed him that he need not further attend.

Mr. Brooks was at this time a member of the Marine Board, but was not present at the sittings of the Board when the evidence of several of the witnesses for Messrs. J. and A. Brown was given.

Just before the opening of the inquiry (which extended over many days) on one of the days of hearing, Mr. Thompson was informed that Mr. Brooks intended to sit that day, and accordingly Mr. Brooks appeared in the Board-room, and before the proceedings opened addressed the Chairman and said he intended to sit in the inquiry.

Mr. Thompson then addressed, and pointed out that it appeared to him that Mr. Brooks certainly could not, and his own sense of propriety should show him that he ought not, to sit on the inquiry, for, putting aside the matter of the subpoena, under which Mr. Thompson admitted his attendance was not required, Mr. Thompson pointed out that Mr. Brooks had not heard the evidence that had already been adduced, and being in effect both a jurymen and a judge at the Board he was bound to give his decision according to the evidence, which then he could not do, but independently of that fact he had been admittedly employed and paid by the Government for his survey and report of the damage to the "Ceres," in the matter of the very collision which was the subject of inquiry.

The Chairman said the Board could not prevent Mr. Brooks sitting if he chose, and thereupon Mr. Thompson handed in a written protest, which should be with the papers in the case to which Mr. Thompson craves leave to direct the Premier's serious attention.

The inquiry proceeded, and Mr. Brooks sat throughout, and the decision of the Board, in which Mr. Brooks joined, was that both parties were equally in fault, which, according to Mr. Thompson's view of the matter, was dead in the teeth of the evidence and of the probabilities of the case.

It should be here mentioned that the Captain of the "Ceres," shortly before this, had been one of the parties in another collision case in this harbour which occurred shortly before, in which case the decision showed that he had been utterly in fault.

We

We now desire to call the Premier's attention to another matter with regard to the same inquiry which, though not so startling in its aspect as that in which Mr. Brookes is concerned, yet shows what a curious view members of the Board take of their duties.

Mr. C. F. Stokes was a member of the Board at the time of inquiry. He attended and sat the first day, and never again, to our belief, until the last day, when he sat again; and he, too, joined in giving the decision.

It appears to us that it is virtually impossible that justice can be done in any such case as that referred to if this practice of members of the Board, disregarding the principle of *audi alteram partem*, be allowed to obtain, and members come and sit when and as long as they please.

Consequent upon the collision, our clients have been put to considerable expense in repairing their vessel and in demurrage, and they have deemed it their duty to commence proceedings for the recovery of damages, as the late Government, guided, no doubt, by the faulty decision of the local Marine Board, refused to make compensation.

We conceive, however, that it is not too late to bring the matter of this claim once more under attention; and we have, therefore, the honor to ask, that as soon as the Premier can spare time to go into the whole matter, the papers in the case may be submitted to him for inspection, when, we think, it will be seen that our clients are certainly entitled to compensation, without being compelled to go through the whole inquiry case once more in the Supreme Court.

Awaiting a reply, at the convenience of the Premier.

We have, &c.,

THOMPSON AND WINDEYER.

Mr. Galloway.—Acknowledge receipt, please.—F.K., 10/9/94. Acknowledged.—F.H.G., 11/9/94. The President of the Marine Board, for inquiry and report.—Does Mr. Stokes live in Newcastle? Does Mr. Brooks practise as a marine surveyor?—G.H.R., 17/9/94. The Secretary, Marine Board.—F.K., 17.

I have ascertained that Mr. Stokes does not live at Newcastle; also that Mr. Brookes does practise as a marine surveyor, although he is a member of the local Marine Board. Perhaps an official communication should be sent from the Treasury to each of these gentlemen, asking if they can, under the circumstances, show why they should not be removed from their positions as members of the local Marine Board at Newcastle.—FRANCIS HIXSON, 26/9/94. The Under Secretary for Finance and Trade.

Approved.—G.H.R., 28. Mr. Galloway.—F.K., 28. Copy of Messrs. Thompson and Windeyer's letter sent to Messrs. Brooks and Stokes.—F.H.G., 5/10/94.

#### No. 9.

Captain H. Newton to The Under Secretary for Finance and Trade.

Sir,

Harbour-master's Office, Newcastle, 6 January, 1897.

I do myself the honor to acknowledge the receipt of your letter of the 31st ultimo, and, in compliance with your request, beg to tender my resignation as a member of the local Marine Board at this port, which position I have held for nearly nine years, and since the retirement of Captain D. T. Allan.

I would, however, respectfully state, that when promoted to the office of Harbour-master, in December, 1884, I held the position of Inspector to the Marine Board, also Examiner for Pilotage at £50 per annum, which was part of my salary.

These offices I held until appointed a member of the local Marine Board. I could not, however, consistently hold both positions, consequently resigned the office of Inspector; that of Examiner for Pilotage I still retain without emolument.

Under these circumstances, my retirement from the local Marine Board is a reduction in my salary of £54 per annum, which I trust may be considered.

I have, &c.,

H. NEWTON, H.-M.

Submitted.—F.K., 7/1/97. Resignation accepted.—J.N.B., 7/1/97. Mr. Robberds.—F.K., 7/1/97. Informed.—C.E.F.R., 8/1/97. Records.

Harbour-master's Office, Newcastle, 6 January, 1897.

Captain H. R. Cross, Chairman, local Marine Board, Newcastle.

Dear sir,

I have been invited by the Government to sever my connection with the Marine Board by resignation.

In compliance therewith, I beg to tender my resignation as a member of the local Marine Board, after a membership of nearly nine years.

I am, &c.,

H. NEWTON, H.-M.

The Chairman and remaining member of the local Board (Mr. Reid) forward, with much regret, this communication from Captain Newton, and desire to say that the Board will suffer great loss from his absence from their deliberations. By order.—J. H. VERRILL, Secretary, L.M.B. Newcastle 6/1/97.

In forwarding this communication the Marine Board begs to point out that the local Marine Board at Newcastle is ineffective at the present time, from the fact that there are not sufficient members on it to form a quorum. By order.—GEO. S. LINDEMAN, 12/1/97. The Under Secretary for Finance and Trade. Seen.—J.N.B., 14/1/97. Records.

Telegraphic message from Henry Newton, Harbour-master, Newcastle, to F. Kirkpatrick, Under Secretary for Finance and Trade, Sydney.

6 January, 1897.

"My resignation posted to you this day."

Seen.—J.N.B., 7/1/97. Records.

## No. 10.

J. H. Veitch to The Secretary Marine Board, Sydney.

Sir, Office of the local Marine Board at Newcastle, 30 December, 1896.  
I have the honor, by direction, of forwarding the attached papers referring to the proposed resignation of Captain Newton from the local Marine Board.

The said Board wish to express their regret that such a step has been thought necessary, as Captain Newton has been and is a most valuable member, and the local Board have always received the greatest assistance from his experience and services, which his position as Harbour-master in no way interferes with.

The Board therefore trust that the matter may be reconsidered.

I have, &c.,  
J. H. VEITCH,  
Secretary, Local Marine Board.

This communication, which has been received from the local Board at Newcastle, is forwarded for the consideration of the Government. By order—G. S. LINDEMAN, 5/1/97. The Under Secretary for Finance and Trade.

May be informed that the subject has been fully considered and the decision cannot be reversed. Captain Newton has already resigned.—J.N.B., 7/1/97. Mr. Robberds.—F.K., 7/1/97. Done.—C.E.F.R., 8/1/97. Records.

## No. 11.

The Under Secretary for Finance and Trade to Captain H. Newton.

Sir, The Treasury, New South Wales, Sydney, 21 December, 1896.

I am directed to inform you that the Cabinet have recently had under consideration the constitution of the Newcastle Marine Board—and that the conclusion was arrived at that it was inadvisable that the Harbour-master at that port should be Chairman of the Board,—but should rather be the Board's officer. In intimating that it is the wish of the Government that you should resign the position of Chairman of the Newcastle Marine Board, I am, however, to explain that the step is in no wise to be considered as in any way reflecting upon your personal competency or fitness for that or any other position in the Public Service.

I have, &c.,  
F. KIRKPATRICK,  
Under Secretary for Finance and Trade.

## No. 12.

Captain H. Newton to The Under Secretary for Finance and Trade.

Sir, Harbour Office, Newcastle, 24 December, 1896.

I do myself the honor to acknowledge the receipt of your letter of 21st instant *re* retirement as Chairman of the Newcastle Marine Board.

I would most respectfully point out that the Cabinet are under a misapprehension in assuming that I am Chairman of the local Marine Board. The previous Harbour-master was Chairman for many years.

I am a member, however, and will lay the letter before the Board at their next meeting.

In the meantime I would be glad to be informed if it is the intention of the Government to cause me to resign my connection with the Board as a member.

I have, &c.,  
H. NEWTON,  
Harbour-master.

Submitted.—F.K., 29/12/96. Harbour-master Newton to be informed that the Government disapprove of his association with the Marine Board, and suggest his retirement from the position. See Premier's minutes.—J.N.B., 29/12/96.

Mr. Robberds.—F.K., 29/12/96. Done.—C.E.F.R., 31/12/96.

## No. 13.

W. T. Dick, Esq., M.P., to The Honorable the Premier.

Dear sir, Newcastle, 14 December, 1896.

I beg once more to bring under your notice the matter of the Marine Board appointment. General dissatisfaction will be caused among the mercantile and nautical men if a gentleman be appointed not qualified in the way of special knowledge for such a post, however unexceptionable he may be in other respects. You may have recognised in your visits to the city that this matter is, in the eyes of the citizens, an important one, and should another appointment be made similar to some in the past, odium will attach to the Government and (by reflection) to me. I recognise it is not my business (though it certainly is my interest) to interfere in such a matter.

Yours, &c.,  
W. T. DICK.

For Cabinet.—G.H.R., 16.

Cabinet decide that Harbour-master, Newcastle, should not be Chairman of the Newcastle Marine Board. The Government consider that such an officer should be the servant of the Board, rather than its head. Inform Captain Newton that it is the wish of the Government he should resign the position of Chairman; also that this step is not to be considered as in any way a reflection upon his competency, or fitness for the position, or any other position in the Public Service.—G.H.R., 18.

Mr. Robberds.—F.K., 18/12/96. Captain Newton.—C.E.F.R., 21/12/96. Records.

1897.

LEGISLATIVE ASSEMBLY,  
NEW SOUTH WALES.

### Commission.

VICTORIA, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen,  
Defender of the Faith, and so forth,—

To Our Trusty and Well-beloved

PROFESSOR RICHARD THRELFALL, M.A., and  
EDWARD FISHER PITTMAN, F.G.S., A.R.S.M.,—

Greeting :—

KNOW ye, That We, reposing great trust and confidence in your ability, zeal, industry, discretion, and integrity, do, by these presents, authorise and appoint you, or any one of you, as hereinafter mentioned, to make a diligent and full inquiry into the cause of the dangers to which vessels carrying coal are said to be peculiarly liable, and as to the best means that can be adopted for removing or lessening the same: And We do, by these presents, grant to you, or one of you, at any meeting or meetings to which both of you shall have been duly summoned, full power and authority to call before you all such persons as you may judge necessary, by whom you may be better informed of the truth in the premises, and to require the production of all such books, papers, writings, and all other documents as you may deem expedient, and to visit and inspect the same at the offices or places where the same or any of them may be deposited, and to inquire of the premises by all lawful ways and means: And Our further will and pleasure is that you do, within three months after the date of this Our Commission, certify to Us, in the office of Our Colonial Secretary, under your hands and seals, what you shall find touching the premises: And We hereby command all Government Officers and other persons whomsoever within Our said Colony, that they be assistant to you and each of you in the execution of these presents: And We appoint you, the said Professor RICHARD THRELFALL, to be President of this Our Commission, which said Commission We declare to be a Commission for all purposes of the Act 44 Victoria No. 1, intituled "*An Act to regulate the taking of Evidence by Commissioners under the Great Seal.*"

In testimony whereof, We have caused these Our Letters to be made Patent, and the Great Seal of Our said Colony of New South Wales to be hereunto affixed.

Witness our Right Trusty and Well-beloved Cousin, HENRY ROBERT, VISCOUNT HAMPDEN, Our Governor and Commander-in-Chief of Our said Colony of New South Wales and its Dependencies, at Government House, Sydney, in New South Wales aforesaid, this twenty-eighth day of July, in the year of Our Lord One thousand eight hundred and ninety-six, and in the sixtieth year of Our Reign.

(L.S.)

HAMPDEN.

By His Excellency's Command,  
JAMES N. BRUNKER.

Entered on Record by me, in REGISTER OF PATENTS No. 18, page 76, this twenty-eighth day of July, one thousand eight hundred and ninety-six.

For the Colonial Secretary and Registrar of Records,  
CRITCHETT WALKER,  
Principal Under Secretary.

## EXTENSION OF COMMISSION.

ROYAL COMMISSION OF INQUIRY INTO THE DANGERS TO WHICH SHIPS CARRYING COAL CARGOES  
ARE LIABLE.

WHEREAS it is necessary to extend the time within which the Commissioners are to make their report in the above matter: Now, therefore, I do hereby, with the advice of the Executive Council, extend the time within which the said Commissioners are to make such report for a period of three months,—to take effect from the 28th instant.

Given under my hand, at Government House, Sydney, this twenty-second day of October, one thousand eight hundred and ninety-six.

HAMPDEN.

By His Excellency's Command,  
JAMES N. BRUNKER.

## FURTHER EXTENSIONS.

ROYAL COMMISSION OF INQUIRY INTO THE DANGERS TO WHICH SHIPS CARRYING COAL CARGOES  
ARE LIABLE.

WHEREAS the time appointed for the return of the Commission in the above matter was, by an instrument dated the twenty-second day of October last, extended for a period of three months: And whereas it is necessary to extend the same still further: Now, therefore, I do hereby, with the advice of the Executive Council, extend the time within which the Commission are to make their return to and for a further period of two months beyond the time in and by the aforesaid instrument appointed for the purpose,—to take effect from the 28th ultimo.

Given under my hand, at Government House, Sydney, this third day of February, one thousand eight hundred and ninety-seven.

By Deputation from His Excellency,  
FREDK. M. DARLEY,  
Lieutenant-Governor.

By His Excellency's Command,  
JAMES N. BRUNKER.

WHEREAS the time appointed for the return of the Commission in the above matter was, by an instrument dated the third day of February last, extended for a period of two months: And whereas it is necessary to extend the same still further: Now, therefore, I do hereby, with the advice of the Executive Council, extend the time within which the Commission are to make their return to and for a further period of one month beyond the time in and by the aforesaid instrument appointed for the purpose,—to take effect from the 28th instant.

Given under my hand, at Government House, Sydney, this thirty-first day of March, one thousand eight hundred and ninety-seven.

HAMPDEN.

By His Excellency's Command,  
JAMES N. BRUNKER.

PROCEEDINGS OF THE COMMISSION.

---

27 AUGUST, 1896.

THE Commission met at the University, Sydney, at 2:30 p.m., and examined Captain Francis Hixson, President of the Marine Board.

---

1 SEPTEMBER, 1896.

Left Sydney for Newcastle.

---

2 SEPTEMBER, 1896.

Morning.—Inspected the loading of vessels at Bullock Island, Newcastle.

Afternoon.—Met at the Custom-house, Newcastle, at 2:15 o'clock, and examined the following witnesses:—Messrs. T. Brooks, A. Bertram, and J. Russell.

---

3 SEPTEMBER, 1896.

Morning.—Inspected the trimming of two vessels at Bullock Island, Newcastle.

Afternoon.—Met at the Custom-house, Newcastle, at 2:15 o'clock, and examined the following witnesses:—Captain Parkhill, Mr. J. D. Beeston, Captain H. Porter, and Messrs. H. Ford and J. Gallaghan.

---

4 SEPTEMBER, 1896.

Morning.—Visited the Wickham and Bullock Island Colliery.

Afternoon.—Met at the Custom-house, Newcastle, at 2:30 o'clock, and examined the following witnesses:—Captain R. C. Perry, Mr. J. M. Hyde, Captain D. Williams, Messrs. W. H. Cremor and A. Wallace.

Visited the vessel, "Geneva M. Tucker," to view an enlarged hatch.

---

5 SEPTEMBER, 1896.

Returned to Sydney.

---

9 SEPTEMBER, 1896.

Morning.—Left Sydney for Newcastle.

Afternoon.—Met at the Custom-house, Newcastle, at 2:30 o'clock, and examined the following witnesses:—Messrs. J. May, J. Whittaker, A. Gardiner, and J. Dixon.

---

10 SEPTEMBER, 1896.

Morning.—Visited two vessels which were preparing for coal cargoes, and interviewed the masters.

Afternoon.—Met at the Custom-house, Newcastle, at 2:30 o'clock, and examined the following witnesses:—Messrs. A. Ross, H. Harper, W. Marsden, W. R. Logan, and J. O'Sullivan.

---

11 SEPTEMBER, 1896.

Morning.—Visited the Wallsend Colliery.

Afternoon.—Met at the Custom-house, Newcastle, at 2 o'clock, and examined the following witnesses:—Captain H. R. Cross, Messrs. G. Bewick, W. M'Neil, R. A. Buhl, G. Wycherly, and W. F. Ossinger.

---

12 SEPTEMBER, 1896.

Returned to Sydney.

---

23 SEPTEMBER, 1896.

Morning.—Left Sydney for Newcastle.

Afternoon.—Visited the Wallsend Colliery with the object of ascertaining the extent of the breakage of coal in the loading of the waggons, and witnessed experiments conducted with a view to prevent such breakage. Inspected a "small-coal" hopper at the colliery, and from it took samples, for future analysis, of coal which was at and above the normal temperature.

---

24 SEPTEMBER, 1896.

Morning.—Visited the Australian Agricultural Company's Borehole pit to examine portions of the mine where fires had occurred.

Afternoon.—Inspected the coal shoots of the Australian Agricultural Company at Newcastle.

---

25 SEPTEMBER,

---

25 SEPTEMBER, 1896.

Morning.—Inspected the loading of coal from the Australian Agricultural Company's shoots; and visited the Waratah Colliery to examine the system there adopted of screening coal by means of shifting screens and a continuous belt.

Afternoon.—Met at the Custom-house, Newcastle, at 2:30 o'clock, and examined the following witnesses:—Messrs. Jesse Gragson, G. Hewison, R. West, J. Price, and T. Burke.

Visited the vessel "Les Adelphe" referred to by R. West in evidence.  
Inspected the coal distributing appliance patented by Mr. H. Harper.

---

26 SEPTEMBER, 1896.

Returned to Sydney.

Consulted literature having reference to the subject of the Commission's inquiry.

---

1 OCTOBER, 1896.

Afternoon.—Met at Sydney and inquired into the researches of authorities on the spontaneous combustion of coal, &c. Abstracted literature.

---

2 OCTOBER, 1896.

Afternoon.—Met at Sydney, at 2:30 o'clock, and examined the following witnesses:—Captain Laidman, Messrs. J. H. Storey, J. St. Vincent Welch, and S. Hague Smith.

---

7 OCTOBER, 1896.

Afternoon.—Met at Sydney, and examined and abstracted works relating to the subject of the Commission's inquiry.

---

9 OCTOBER, 1896.

Afternoon.—Met at the Chief Secretary's Office, Sydney, at 2:30 o'clock, and examined Captain W. Barfield. Messrs. R. Long, J. C. Rankin, E. E. Brett, and H. McLachlan (Secretary for Railways) appeared before the Commission by arrangement, the two former partly explaining methods for the manufacture and application of carbon dioxide for the prevention of fires on board coal-laden ships.

---

14 OCTOBER, 1896.

Afternoon.—Inspected the Australian Gas-light Company's coal stores at Darling Harbour and Mortlake.

---

16 OCTOBER, 1896.

Afternoon.—Met at the Chief Secretary's Office, Sydney, at 2:15 o'clock, and examined the following witnesses:—Colonel C. E. Stokes, Messrs. T. J. Bush, T. Croudace, W. G. Dixon, T. J. Watters, W. A. Gibb, and C. Danvers.

Left Sydney for Newcastle.

---

17 OCTOBER, 1896.

Morning.—Visited the Wallsend Colliery, and arranged for the conduct of an experiment with the coal in the "small-coal" hopper at that mine.

---

21 OCTOBER, 1896.

Afternoon.—Met at the Chief Secretary's Office, Sydney, at 2:30 o'clock, and examined the following witnesses:—Messrs. L. R. Mitchell, T. M. Tinley, W. H. Rowsell, A. F. Robinson, C. J. Royle, and E. S. Chapman.

---

29 OCTOBER, 1896.

Left Sydney for Wollongong.

---

30 OCTOBER, 1896.

Morning.—Examined the coal-loading shoots at Wollongong and at Port Kembla.

Afternoon.—Proceeded to Bulli, and inspected the loading appliances at the jetty there.

---

31 OCTOBER, 1896.

Morning.—Visited the Corrimal Colliery and Coke Works at Unanderra.

Afternoon.—Returned to Sydney.

---

11 NOVEMBER, 1896.

Afternoon.—Met at the Chief Secretary's Office, Sydney, at 2:30 o'clock, and examined the following witnesses:—Hon. Alex. Brown, M.L.C., Messrs. N. Mcadon (Fleet Engineer), C. T. McGlew, F. W. Binney, and J. R. M. Robertson.

17 NOVEMBER,

---

17 *NOVEMBER*, 1896.

Left Sydney for Newcastle. Inspected Harper's patent coal distributing appliance in use in the loading of the vessel "Frances Fisher." Returned to Sydney.

---

18 *NOVEMBER*, 1896.

Afternoon.—Met at Sydney, at 2:30 o'clock, and examined the following witnesses:—Messrs. S. E. Laidley, B. Chadwick, J. S. Hutchinson, W. A. Firth, and T. Kerr.

---

20 *NOVEMBER*, 1896.

Morning.—Left Sydney for Newcastle.  
 Afternoon.—Met at the Custom House, Newcastle, at 2:30 o'clock, and examined the following witnesses:—Messrs. J. Brown, J. Reed, W. B. Sharp, and Captain T. Williams.  
 Visited Stockton, and inspected the loading shoots in active use.  
 Returned to Sydney.

---

11 *DECEMBER*, 1896.

Afternoon.—Met at Sydney, at 2:30 o'clock, and examined Mr. H. McLachlan (Secretary for Railways), and Mr. Cecil W. Darley (Engineer-in-Chief for Public Works).

---

14 *DECEMBER*, 1896.

Morning.—Met at Sydney, at 10:15 o'clock, for consideration of evidence, Appendices, &c.

---

23 *DECEMBER*, 1896.

Afternoon.—Met at Sydney, at 2:30 o'clock, and examined Messrs. W. Thow (Chief Mechanical Engineer for Railways), and T. R. Firth (Engineer-in-Chief for Existing Lines).

---

1 *FEBRUARY*, 1897.

Afternoon.—Met at Sydney for consideration of statistics regarding the coal trade of Newcastle, casualties, &c., &c.

---

5 *FEBRUARY*, 1897.

Afternoon.—Met at Sydney for consideration of scientific investigations on the subjects of the weathering and spontaneous combustion of coal, &c. Translated and abstracted the works of E. Richters.

---

23 *FEBRUARY*, 1897.

Afternoon.—Met at Sydney for consideration of statistics to be embodied in Appendices to Report.

---

19 *MARCH*, 1897.

Afternoon.—Continued examination of scientific literature on the subject of the Commission's inquiry. Abstracted the writings of M. Fayol.

---

26 *MARCH*, 1897.

Afternoon.—Met at Sydney, and continued the examination of the investigations of French and German experts relating to the subject of the spontaneous combustion of coal, &c. Translated and abstracted literature.

---

ROYAL COMMISSION TO INQUIRE INTO THE CAUSE OF THE DANGERS TO WHICH VESSELS CARRYING COAL ARE SAID TO BE PECULIARLY LIABLE, AND AS TO THE BEST MEANS THAT CAN BE ADOPTED FOR REMOVING OR LESSENING THE SAME.

---

REPORT.

---

To His Excellency the Right Honorable HENRY ROBERT, VISCOUNT HAMPDEN, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies.

MAY IT PLEASE YOUR EXCELLENCY,—

We, the Commissioners appointed on the 28th July, 1896, to make a diligent and full inquiry into the cause of the dangers, to which vessels carrying coal are said to be peculiarly liable, and as to the best means that can be adopted for removing or lessening the same, have the honor to submit the following Report:—

Although the Commission issued on the 28th July, 1896, a month elapsed before the Secretary was appointed, and, consequently, the formal inquiry did not begin until the 27th August.

We examined a large number of witnesses, whose names and occupations will be found on page 87. Amongst them were included representatives of all branches of the coal-mining and shipping industries, including underwriters. Witnesses examined.

We visited a good many mines with the object of familiarising ourselves with the present practice of coal-mining, and also visited the Dyke at Newcastle on several occasions, and saw the methods of loading and trimming coal in practical operation. We went down into the holds of ships where coal was being loaded and generally studied the whole process until we felt that we were sufficiently acquainted with it. In fact, every branch of the coal-shipping industry passed under our personal observation. Places visited.

The statistics of the coal trade since the year 1888 were collected by the Secretary and tabulated by him from the monthly shipping reports of Messrs. Charles F. Stokes & Company and the firm of Robert B. Wallace, which are admittedly accurate. (*See Appendix L, p. 46.*) The data thus obtained were treated by us, and we are, therefore, in a position to report exactly as to the facts. Statistics of coal trade.

For reasons which will appear later, it became very desirable to examine the behaviour of Newcastle coal, stored in large quantities, under the combined influence of air and moisture. The Newcastle-Wallsend Coal Company have a large hopper in which variable quantities of small coal are stored, and this was very courteously placed at our disposal for experimental purposes. Unfortunately, however, the hopper has happened to be empty or nearly so (as we have been informed by the officials of the company) ever since the commencement of our inquiry, and, therefore, up to the present time, we have not had an opportunity of making the observations we desired to make on this subject. Examination of large stores of coal.

The literature of the spontaneous heating of coal is fairly heavy, and will be found in a condensed form in the Appendix, page 65. We wish to acknowledge the assistance we have obtained from the works of Richters and Fayol, particularly the latter. Literature consulted.

Method of loading coal.	The possibility of improvements in the manner of loading coal at Newcastle has occupied much of our attention, and a discussion of the matter will be found towards the end of this Report. We desire to express our indebtedness to the Agent-General of New South Wales for the trouble he has taken in procuring information for us under this head.
Missing ships.	As will appear later, there are a few cases on record of ships leaving the port of Newcastle, and never being heard of again. We have devoted some attention to the question of the most probable cause of loss in these cases, and have been led to investigate the subject of the trimming of coal-laden ships, both from the mechanical and economical point of view, including the relation of the trimmers and stevedores to each other and to the officers and agents of the ships.
Trimming of coal-ships.	
Causes of heating.	Before entering upon the Report in detail, we wish to say that we consider that the main causes of heating of cargoes of coal have been thoroughly established by the authors we have quoted; and that we agree with the finding of the English Commission of 1876, that it is, on the whole, better not to attempt to ventilate coal cargoes, except from the surface.
Ventilation of coal cargoes.	
Size of shipments.	The English Commission also found a relation between the size of coal shipments and their liability to spontaneous combustion. This conclusion is strongly supported by our data, and may be regarded as perfectly established.
Schemes for extinguishing fires.	Several patent schemes for extinguishing fires on board coal-laden ships have come before us, but we are unable to recommend any of them.

#### *Statistics of the Coal Trade of Newcastle.*

Statistics of the coal trade of Newcastle. No known case of the loss of a ship from the spontaneous combustion of coal derived from the Newcastle mines occurred previously to 1892. We have tabulated the statistics of the coal trade since 1888 only, on account of the fact that the Marine Board only began in that year to make official inquiry into the cause of the loss of missing ships. It must not be supposed, however, that the scope of the inquiry generally was restricted in like manner.

Oversea sailing shipments to America, selected for statistical treatment. A great deal of the coal shipped from Newcastle goes to Melbourne and other colonial ports; some shipments are also made to oversea ports by steamers. Since, under normal conditions, time is required for spontaneous combustion, it is evident that in an inquiry having for its object the elucidation of the laws to which the heating of coal cargoes are subject, we must begin by excluding shipments which are at sea for short periods only. Since climatic conditions are also of importance, it appears desirable that we should, in the first instance, confine ourselves to one class of shipping, and we have selected the oversea trade to America from Newcastle by sailing ships as being the most suitable for statistical treatment. It comprises by far the greater part of the oversea trade, as may be seen from Table III of *Appendix L*, page 47).

Number of casualties in American trade. On pages 7, 8, and 9 of the Report will be found some tables and diagrams showing the history of the sailing trade to American ports, classified according to the tonnage of the shipments. During the epoch considered, there were 2,149 shipments of coal to the west coast of America (see Table VI, page 10 of Report), and out of these there were thirteen cases where the cargo is known to have become heated or to have taken fire, and seventeen cases of missing vessels, some of which may also have been cases of heating. The total casualties amount to 1.4 per cent. of the shipments, and of this 0.61 per cent. is known to be due to spontaneous heating. This is shown in Table VI, and in detail in *Appendix "A,"* p. 27.

These figures compare favourably with those disclosed by the Report of the English Commission for the year 1874, where out of 490 shipments of between 1,000 and 1,500 tons, there were 3½ per cent. of casualties, and this increased as the tonnage rose.

Sudden increase in casualties during 1895-6. During the years 1895 and 1896, however, the percentage of casualties with Newcastle coal was much larger, as is shown by *Appendix "A,"* Synopsis of Table I (page 30), and by Table VII of *Appendix L* (page 49), and by the Table appearing below. In 1895, out of 294 ships sailing to America 6 were either burned or the cargoes became hot, and in the first nine months of 1896 the number was 4 out of 200.

TABLE

*General Explanation of the Theory of Spontaneous Heating.*

It is necessary to give a short account of the elements of the subject of spontaneous heating, otherwise the rest of the Report will be unintelligible. We have also found that the principles of the matter are not in general understood even by those directly interested in the shipping of coal. The Appendices will, we think, justify the views we adopt.

The following theory of the spontaneous heating of coal appears to us to be well established. Coal naturally absorbs oxygen from the air and undergoes a process of slow combustion. As this process goes on heat is developed, and the temperature of the coal tends to rise. The activity with which oxygen is absorbed increases as the temperature rises. It appears, therefore, that the conditions necessary for the spontaneous heating of coal are (1) a sufficient supply of oxygen, (2) prevention of the escape of the heat generated. These two conditions are more or less incompatible. Whether the coal heats or not depends on whether the heat can or cannot escape as fast as it is generated. Since heat passes away more rapidly (other things being equal) the hotter the coal, while the supply of air for promoting combustion is conditioned by other circumstances, it often happens that the temperature of a heap of coal will rise to a certain point, which it will not pass.

If a heap of coal is prevented from coming in contact with air, no action will occur and no heat will be developed. On the other hand, if the air supply be so free as to carry away the heat generated at a sufficient rate, again, no heating will take place. In order that spontaneous combustion may occur, the supply of air must be nicely regulated. The kind of ventilation which used formerly to be employed with coal cargoes often supplied just the air necessary for spontaneous heating. At low temperatures the absorption of oxygen by coal is a comparatively slow process, and, at a given temperature, the rate of absorption depends on the ratio of the surface of the coal to its volume. Thus, other things being equal, the smaller the coal the more rapidly will it absorb oxygen. On the other hand, the coal cannot absorb oxygen unless the oxygen is there to be absorbed, and when the coal is in very fine dust the rate at which the air can penetrate the heap is only small. It, therefore, appears that when the coal is in large pieces it will only absorb oxygen slowly, because of the comparatively restricted area of surface which it exposes; while, if the coal is in very fine powder, the air will not be able to penetrate the mass with sufficient freedom. There must, therefore, be a certain size of coal at which the rate of absorption will be a maximum. Such an effect was observed by Fayol\*, who shows that heaps of small coal mixed with coal-dust offers the most favourable conditions for heating. Such heaps are formed under the hatchways of ships which are loaded by dropping the coal from hoppers, spouts, or waggons, so that the coal gets broken up during the process.

The size of a heap of coal has a great influence on its liability to spontaneous combustion. Thus, Fayol\* found that the coal of Commentry never took fire by exposure to air when the heaps were less than 2 metres deep, no matter what the lateral dimensions of the heaps might be.

We

\* "Études sur l'Altération et la Combustion spontanée de la Houille exposé à l'air" (see Appendix DD, p. 73).

We obtained some valuable evidence on this point from Mr. Bush, the engineer of the Australian Gaslight Company. It appears that the Australian Gaslight Company has two coal stores—one at Kent-street, the other at Mortlake. These stores are kept more or less full of slack for gas making. The Kent-street store is filled with coal to a depth of 14 feet; the Mortlake store to a depth of 20 feet. The Mortlake store requires great care to prevent the coal firing, whereas no case of firing from spontaneous combustion has occurred at Kent-street. All other circumstances are, so far as are known, exactly the same at both stores. The opinion of Mr. Bush (Answer No. 2562), with which we agree, is that the cause of the difference in the behaviour of the coal in the two stores is to be attributed to the difference of depth of the coal. The importance of this will appear later on.

Effect of  
pyrites and of  
moisture.

It was formerly supposed that the oxidation of pyrites (a common impurity of coal) is the initial cause of spontaneous heating. This, however, has been disproved in many test cases by direct experiment, and it also appears that there is no direct relation between the pyrites content of coal and its liability to spontaneous combustion. On the other hand, if coal is wet it has been shown that the pyrites tends to oxidise, and in so doing may help to break up the coal, and so render it more liable to spontaneous combustion by increasing the surface. We are of opinion, however, that the cases of spontaneous combustion of Newcastle coal are not in any way traceable to this action, since we have not been able to find that the cargoes which have fired have been unusually wet, or that the sulphur content was unusually high; in fact, the average sulphur content is only about 0.5 per cent.

It must still be regarded as an open question, however, whether the heating of Newcastle coal is in any way dependent on the amount of moisture which it contains. On the one hand, we have the very definite experimental result of Fayol that moisture has no influence whatever on the liability to spontaneous combustion of the coal of Commentry, and, on the other, we see that the disintegrating action of oxidising pyrites may have an indirect effect.

Most of the witnesses we examined were of the opinion that coal was more likely to fire when wet; and some important evidence was given us by Mr. A. Ross, Manager of the Wallsend Mine (answer 1379 *et seq.*), also by Mr. Reed, Screen Overseer, in charge of the hoppers in which the Newcastle-Wallsend Coal Company store their small coal (answer 3407 *et seq.*). These witnesses stated that the temperature of the coal in the Wallsend hopper increased within a few days after a shower of rain. On visiting the hopper, and digging into the coal to a depth of 2 or 3 feet, we obtained samples of coal, some hot and moist, others dry and cool. The place whence the hot sample was obtained was distant only a few feet from the place where the cold sample was taken. Chemical examination disclosed no appreciable difference between the samples. It occurred to us that possibly the hot coal had been heated by the distillation of steam from the coal below, which was spontaneously heated, and this, we are inclined to think, was really the case, for the seat of spontaneous combustion is never within 3 feet of the surface of a heap of coal. On drawing Mr. Reed's attention to the possibility of this explanation, he appeared inclined to agree with us (Q. 3426-8). We consider it not unlikely that the heating up of otherwise unheated coal by the distillation (and condensation) of steam may have given rise to the idea that moisture is favourable to spontaneous heating.

Of course, if coal is red hot and small quantities of water are poured upon it, the resulting steam is decomposed by the red-hot coal, and the carbon monoxide and hydrogen thus liberated burn with flaming. This fact, also, we are inclined to think, may have tended to give rise to the impression that moisture assists the spontaneous combustion of coal.

It is to be regretted that, though we placed tubes for thermometers in the Wallsend hopper, the store of coal was never large enough to allow us to make observations which could carry any weight, nor was the weather sufficiently variable. We hope, however, to be enabled to carry this experiment through in course of time, and hence to settle the important point as to whether the Wallsend coal, and hence the Newcastle coal generally, is more liable to heat when damp. At present, our impression is that moisture has no effect in promoting spontaneous combustion.

It

It is, perhaps, obvious from what has been said on the subject of the absorption of oxygen by coal, that a very important condition is the initial temperature of the coal. From two cases which came under our notice we are inclined to think that the masters of ships are not sufficiently alive to the importance of keeping the coal away from hot surfaces, especially when these surfaces are themselves far below the ignition point of coal. A donkey-engine and boiler, for instance, may be separated from the hold by a cement floor laid on the deck planking, and—so far as we could ascertain—there seemed to be an impression that the heat which could be transmitted through such a shield could have no ill effect on the coal. The fact is, however, that the rate of absorption of oxygen increases so greatly with rise of temperature that the moderate warming of the coal by a steam pipe or boiler may enormously shorten the time necessary for spontaneous combustion to set in, or may render spontaneous combustion possible in cases where it would otherwise be impossible.

Initial temperature of coal on loading.

These remarks apply with great force to the practice of loading coal in very hot weather. The coal lying in trucks on the dyke and exposed to the sun is loaded at a temperature which it might take months to reach if it had to generate the necessary heat by absorption of oxygen. This reasonable conclusion is supported by the fact—sad, but significant—that three very large ships loaded together during the hot weather of January, 1896, and all three were the victims of spontaneous combustion.

The acceleration of the rise of temperature, consequent on a large initial temperature, is also well illustrated by the cases of the "Knight of St. Michael," the "Morna," and the "Invermay," all of which were loaded during extremely hot weather, and all of whose cargoes became dangerously heated within a short time of loading.

We are now in a position to understand the main features of the phenomena of the spontaneous combustion of coal. Coal always absorbs oxygen from the air, and always generates heat in consequence of the combination of the oxygen with the carbonaceous contents of the coal. The rise of temperature, however, which accompanies this process is dependent on the rate at which oxygen is absorbed, on the one hand, and on the rate at which heat escapes, on the other. Both of these factors may be greatly influenced by comparatively trifling variations in the conditions. The size of the coal, the distribution of coal-dust, the initial temperature of the coal, the temperature of the enclosure in which the coal is placed, the size of the heap of coal—all have an effect on the temperature attained. To anyone approaching the subject for the first time, the great puzzle is to understand why some cargoes fire and why others escape—all being under conditions which are to the first order identical. After study of the phenomena, however, it easily appears that there must necessarily be a kind of critical temperature. If the coal succeeds in reaching this, then its thermal equilibrium becomes unstable and the temperature rises indefinitely. A very slight difference in the conditions will determine whether this critical temperature, which itself depends on the special circumstances, is attained or not. The puzzle above referred to is, therefore, solved by the remark that when some cargoes fire and others do not, the conditions are *not* the same in reality, though, roughly speaking, they may appear to be so. The apparently erratic behaviour of coal cargoes is, therefore, just what would be expected, having in view the fact that *very slight variations* in the circumstances may make all the difference in determining whether the critical temperature will be passed or not.

Conditions affecting heating.

Critical temperature.

#### *Mining and Treatment of Coal in the Newcastle District.*

The coal is mined in the Newcastle district chiefly by undercutting, followed by blasting. The coal on coming up from the mines is partially separated from the "band," or dirty portion, on the screens, from which it is dropped into waggons—generally of the hopper kind, and capable of holding some seven to eight tons of coal. Most of the coal is friable, so that as it falls into the waggons—a distance of about seven feet—it tends to break up. A further pulverisation occurs during the journey, averaging several miles, to the ship's side. On arrival at the dyke, where the cranes are situated, the hoppers are lifted from the under-carriages, hoisted over the hatchways of the ships, and discharged by opening the swing bottoms. In some cases the hoppers are now lowered to the bottom of the ships (this was formerly not the practice), but this is not always practicable,

Mining and treatment of coal in the Newcastle district.

Agencies of breakage of coal.

Process of  
loading and  
trimming.

practicable, either because the jibs of the cranes are too short, or because the hoppers are too large to go down the hatchways. The general result is that the coal gets greatly broken up by falling from the top of the hatch. Even when the hoppers are lowered so that breakage during this part of the operation is minimised, there still remains the dust and small coal which has accumulated at the bottom of the waggons, partly as a result of the method employed in loading them, and partly due to breakage during transit. We satisfied ourselves that the waggons arriving at the cranes do, as a matter of fact, contain a large percentage of smalls and dust. When the coal which has been poured through the hatchway has formed a heap reaching to the top of the hatch, the trimmers get to work and shovel the coal into the empty spaces at each side of the hold (called the "wings"). As the heap becomes less steep during this process, iron plates are placed upon it to assist the coal in gliding away, and the processes of loading and trimming thereafter go on together. Some contractors, it appears, fill up all the hatches of the ship with coal before the men are put on to trim—a matter to which we shall have to return when we consider the problem of the shifting of coal cargoes.

We must not forget to mention that when the ships first go under the cranes they still have a certain amount of ballast on board. The coal is poured into the hold in the first instance to a sufficient extent to enable the ballast to be discharged without endangering the stability of the ship. Coal loaded to replace ballast is generally called "stiffening coal." In the case of ships carrying cargoes to Sydney, which are discharged at that port, it is often necessary to introduce stiffening coal before the ship can proceed to Newcastle. Such coal is brought from Newcastle in coasting vessels, or from the southern coal-fields by train or sea, and is loaded into the ships by means of baskets. These baskets might, of course, be lowered into the hold, but we understand that, in practice, the baskets are generally emptied from the coamings of the hatch—a practice which leads to the same breakage as if the coal were dropped from hopper waggons. The quantity of coal loaded in this way is in general too small to be able to heat, but if the weather is exceptionally hot it may do so—witness the cases of the "Morna" and "Invermay," in Table I of Appendix A, page 27.

Increase in  
casualties  
during 1895-6

One of the objects of the appointment of the Commission was to ascertain the reason for the unfortunate increase in the number of casualties occurring during the years 1895-1896. The following table, together with the diagrams 1, 2, and 3, pages 8, 9, and 10 of Report, will, we think, enable this question to receive a satisfactory answer.

TABLE II.

*Cargoes that Fired or Heated.*

Date of Sailing.	Name of Vessel.	Tonnage of Vessel.	Depth of Hold.	Tonnage of Coal.	Maximum shade temperature during loading.
1892. 23 December	King James	2,200	.....	3,489	78·5
1893. 5 March	Cedarbank	2,800	24·5	4,283	91·0
4 November	Hawaiian Isles	2,027	23·6	3,300	79·0
1895. 13 June	Royal Forth	2,988	25·6	4,558	68·5
7 September	West Glen	700	18·6	1,086	78·0
19 "	John Ena	2,568	25·0	4,257	80·0
10 December	Garsdale	1,645	23·0	2,490	99·0
10 "	Hollinwood	2,606	24·2	4,060	99·0
27 "	Alexandra	1,297	23·9	1,798	91·0
1896. 22 January	Republic	2,847	24·0	3,770	103·0
31 "	Brablock	2,000	24·2	3,154	103·0
2 February	Knight of St. Michael	2,191	24·1	3,206	90·0
22 April	Flora P. Stafford	1,250	23·8	1,964	80·0 (to Manila)
25 August	Rhuddlan Castle	2,093	24·6	3,100	63·0

It will be noted that all these ships were loaded at high (some of them at very high) temperatures. They were all deep ships; all were fairly large, and some very large. The temperatures given in the table are shade temperatures, and, of course, in

in general less than the temperatures of the coal at the times of loading. We are enabled to get some idea of the probable temperature of the coal from some observations made for the purposes of the Commission by Mr. T. H. Palmer, the chemist employed by the Commission at the Wallsend hopper.

TABLE III.

Date.	Maximum shade temperature.	Maximum temperature observed in coal in Wallsend hopper at a depth of 3 in. or 4 in.
1896.		
27 December ... ..	100.0	136.6
28 " ... ..	107.8	133.4
29 " ... ..	83.4	120.2
30 " ... ..	79.2	115.7
31 " ... ..	83.4	117.5
1897.		
1 January ... ..	101.6	127.6
2 " ... ..	88.6	119.8

The latter months of 1895 and the early months of 1896 were exceptionally hot, and it is not too much to say that the accidents which occurred to ships loaded during this period are directly attributable to the loading of large ships with exceptionally hot and much broken coal. This conclusion we shall now proceed to establish. Cause of increase of casualties in 1895-6.

We have been able from the records to trace out very distinctly both the growth of the Newcastle sailing trade to Western American ports, and the increase in the size of the ships employed in the trade. Growth of trade and increase in size of ships.

The following Tables and Diagrams show clearly that during the year 1891 there was an increase both in the tonnage carried and in the percentage of that tonnage carried by ships of 2,000 tons burden and upwards. During the years between 1891 and 1894 the size of the shipments increased pretty uniformly; during 1895 rather smaller vessels were used, and in 1896 the size returned very nearly to its 1894 value.

TABLE IV.

(Illustrated by Diagram I, p. 8.)

ЕРОСИ 1888-1896 (to 30 September).

THE Table shows the total Sailing Vessel Coal Trade to America (1) in ships carrying cargoes of under 2,000 tons, and (2) in ships carrying cargoes of 2,000 tons and over.

Year.	(1)	(2)
	Cargoes under 2,000 tons.	Cargoes of 2,000 tons and over.
	tons.	tons.
1888 .....	254,334	186,976

	1,686,198	38.73	2,667,481	61.27

## DIAGRAM II.

EPOCH 1888-1896

*Ordinates* : Percentage of total sailing trade to America in each year carried by ships as classified.*Abscissæ* : Time in years.

The full line represents the magnitude of the shipments in cargoes of 2,000 tons and over, expressed as a percentage of the total trade of the year.

The dotted line represents the magnitude of the shipments in cargoes of under 2,000 tons, expressed as a percentage of the total trade of the year.

Another aspect of the same phenomenon is presented by Table XIV of Appendix L, page 53, which shows the growth of the trade in very large ships, *i.e.*, carrying over 4,000 tons. Taking the year 1895, we see that out of seven of these vessels three suffered from the heating of the cargo. From what has been said above as to the theory of heating, it, therefore, appears that the risk of accident must have increased of late.

It was the opinion of at least one witness that the increase in the tonnage of the ships had not been accompanied by any considerable increase in their depth—a view which, if correct, would make it more difficult to understand why there should be more danger with large ships than small ones. We consequently examined this question by a process of sampling, by taking ships at random and noting their tonnage and depth. Such a list appears as Table XV of Appendix L, page 54; and this shows very clearly what is, we presume, really well known, that the larger ships are, on the whole, deeper than the smaller ones.

From what has already been said with respect to the experiments of Fayol and the experience of Mr. Bush, a difference of even 1 foot in the depth of the hold may be of immense importance in determining whether coal in a suitable condition as to size shall become unmanageably hot or not. If to this we add (1) that the coal gets more broken the further it falls; (2) that the greater the cargo the greater the heap of smalls and dust; we shall be prepared to consider a small increase in the depth of hold as a phenomenon of the first importance in relation to the

the question of heating of cargoes. There are strong *a priori* reasons, therefore, for an anticipation that an increase in the size of the ships has an important influence on the percentage of casualties, and this anticipation is verified with startling completeness by a reference to the following Diagram, No. III and Table VI.

TABLE VI.

SHOWING the number of sailing shipments to America between the years 1888 and 1896, classified according to size of cargoes; also showing the number of cargoes that fired and heated, and the number of missing vessels.

(To accompany Diagrams III and IV, which exhibit the results graphically.)

Size of Cargoes.	Number of Shipments.	(1) Cargoes that Fired or Heated.		(2) Vessels Missing.	
		Number.	Percentage of Total Shipments in each class.	Number.	Percentage of Total Shipments in each class.
Under 500 tons .....	6	.....	.....	.....	.....
500 and under 1,000.....	146	.....	.....	1	68
1,000 " 1,500.....	446	1	22	2	45
1,500 " 2,000.....	567	1	18	7	123
2,000 " 2,500.....	441	1	23	3	68
2,500 " 3,000.....	267	.....	.....	3	112
3,000 " 3,500.....	162	5	309	1	62
3,500 and over .....	114	5	439	.....	.....
	2,149	13	61	17	79

Note --Between 1888 and 1896 there were twenty-two cargoes to America of over 4,000 tons, and of these four either fired or heated = 18.18 per cent. (See Table XIV, Appendix L, p. 53)

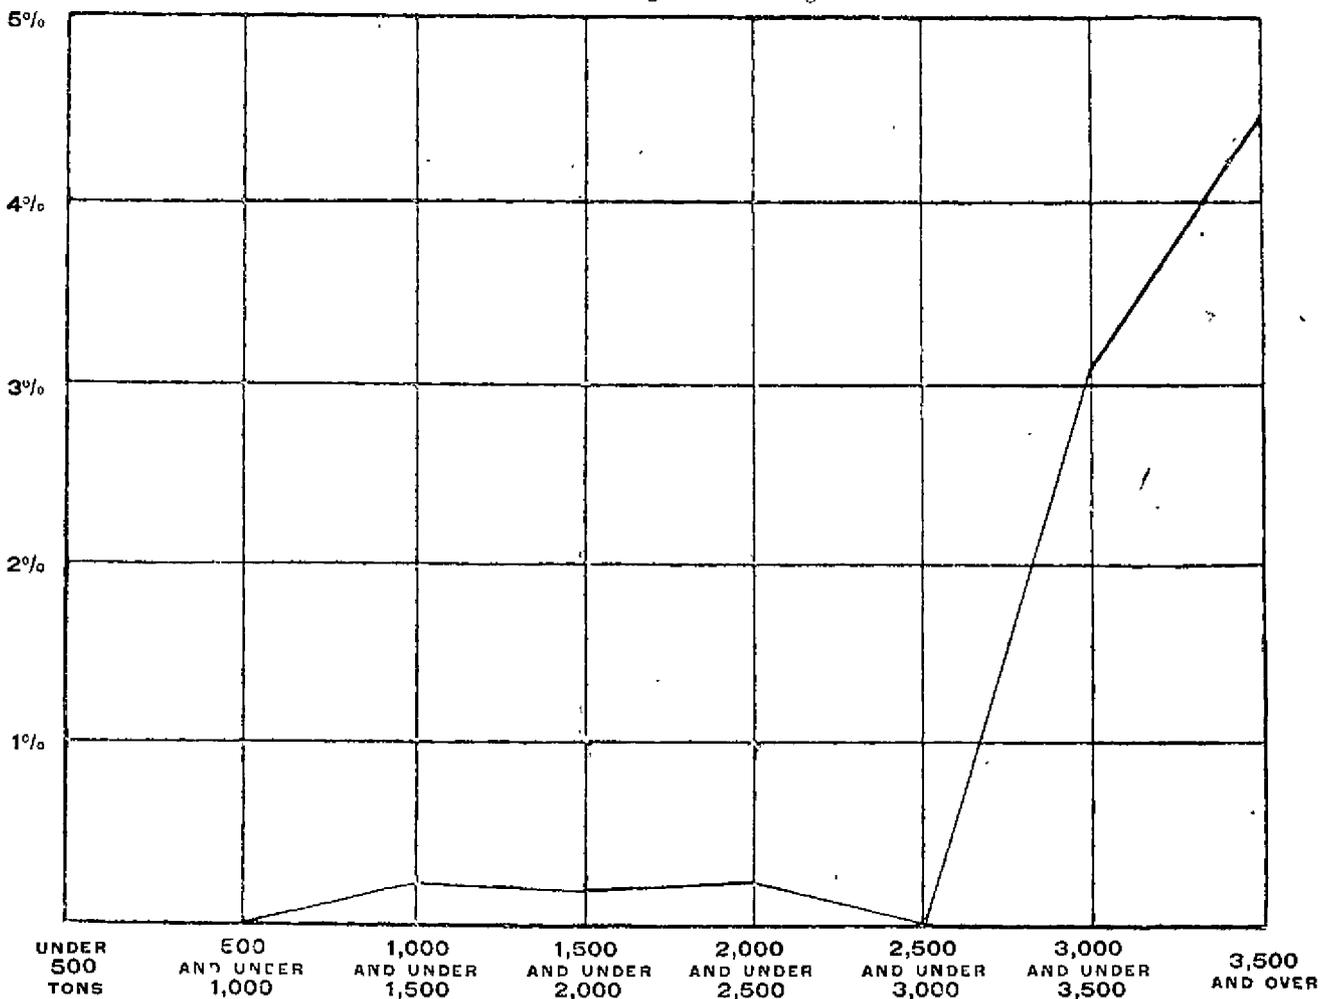

DIAGRAM III.

Illustrating heating of cargoes in (classified) ships which sailed to American ports.

EPOCH 1888-1896.

Ordinates : Percentage of casualties.

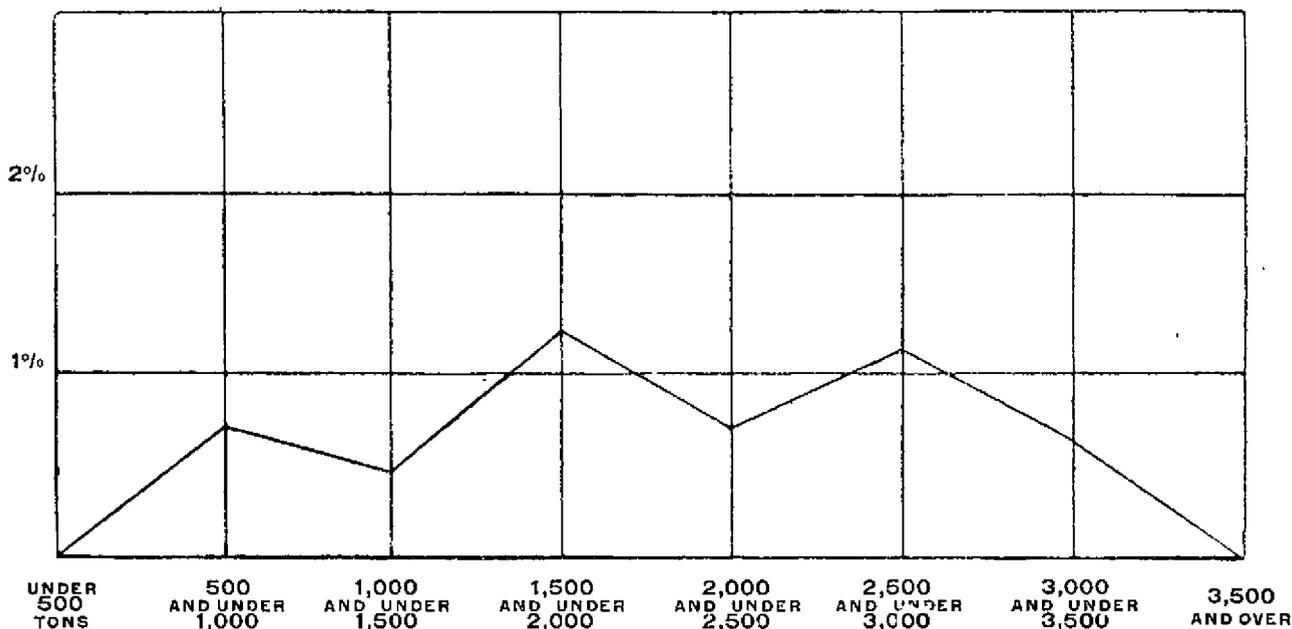

Abscissæ : Magnitude of cargoes.

The object of this diagram is to show how greatly the risk of fire increases with the size of the shipments. The irregularities of the curve are, of course, due to the fact that the data available are numerically too small for a smooth statistical treatment.

## DIAGRAM IV.

Ships missing which sailed to American ports—nature of casualty unknown.

*Ordinates* : Percentage of casualties.*Abscissæ* : Magnitude of cargoes.

The object of this diagram is to enable a comparison to be made with Diagram I, in order that a judgment may be formed as to the probable nature of the causes of the loss of missing ships. The want of smoothness noted on Diagram I is accentuated here.

This is, of course, an old result, having been arrived at by the English Commission; but in view of its importance, and the fact that it was *possible* that Newcastle coal might behave differently to English coal, we have thought it best to reconsider it.

The effect of loading ships in hot weather is clearly shown in Diagram No. 5 below, to which we shall have to return presently. We will merely remark here that no ship loaded in June or July has ever suffered from the heating of Newcastle coal. We consider, therefore, that we have now justified our statement that the accidents in 1895-96 were due to loading large ships with hot coal. Effect of loading in hot weather.

TABLE VII.

SHOWING the Months of Loading of the Sailing Vessels to which Casualties occurred (all cases in Newcastle trade included), from 1888 to 1896.

(To accompany Diagrams V and VI., p. 12.)

DIAGRAM V.

EPOCH 1888-1896.

Heating of cargoes.

*Ordinates:* Number of casualties occurring in total sailing shipments from Newcastle during the epoch quoted.

*Abscissæ:* Time in months of loading.

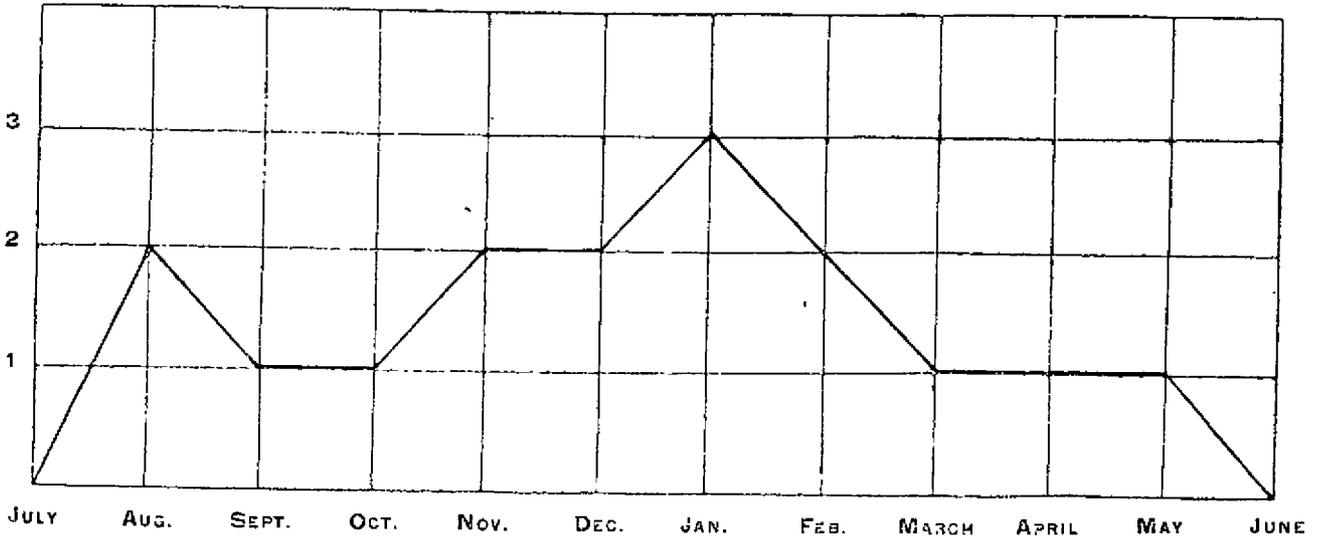

DIAGRAM VI.

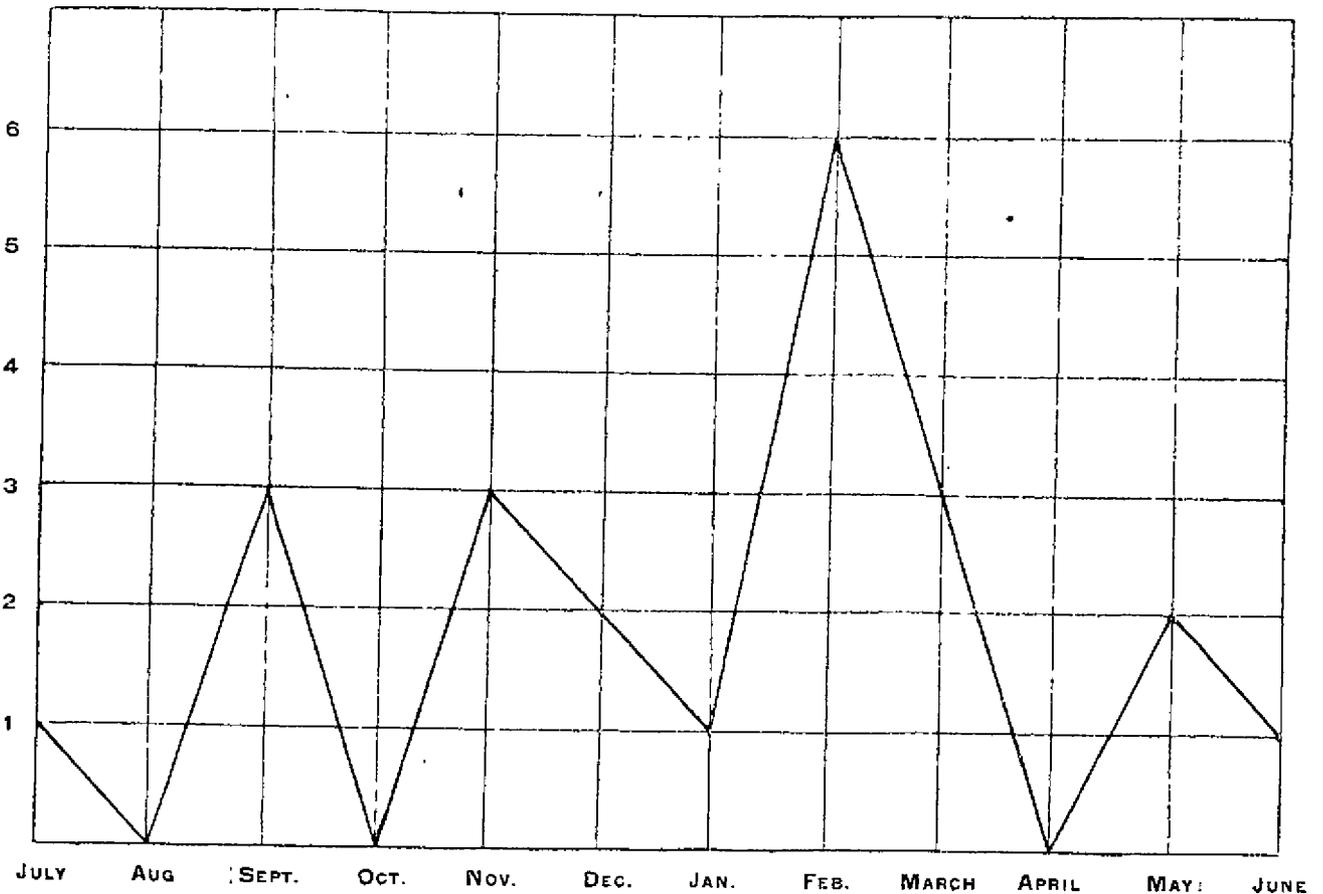

EPOCH 1888-1896.

Vessels missing—nature of casualty unknown.

(This refers to the total sailing shipments from Newcastle for the epoch quoted.)

*Ordinates:* Number of casualties.

*Abscissæ:* Time in months of loading.

We have now shown—

1. That there has been an actual as well as a proportionate increase in the size and depth of ships carrying coal.
2. That the ships whose cargoes heated have, with trifling exceptions, been particularly large and deep.
3. That they were all loaded in exceptionally hot weather; the end of 1895 and beginning of 1896 particularly being one of the hottest periods ever known in the Colony.
4. That the mode of loading ensured a cone of broken coal in the square of the hatchways.

The general theory shows that given these conditions an increase in the percentage of casualties in 1895-96 could have been foretold.

#### *Missing Ships.*

During the years 1888 to 1896 inclusive (nine months), there have been Missing ships. altogether twenty-two cases of missing coal laden vessels, seventeen of which occurred in the American trade, and of which six cases occurred in 1895.

We will now give an account of the tests we have applied in the hope of Attempt to trace probable cause of loss. finding out what was the cause of these accidents. The facts are collected in Table II of Appendix A. In order to find out whether these vessels, as a class, were lost through the firing of cargo, we have made the following statistical comparisons:—

Diagram No. III, p. 10, shows clearly that the percentage of cases of heating increases very rapidly with the size of the shipments. We hoped that some light would be thrown on the cause of "missing" by plotting the percentage cases against the magnitudes of the shipments. Diagram IV, p. 11, indicates the result.

Comparing Diagrams III and IV, the inference would seem to be that the "missing" have not as a class suffered from spontaneous combustion, or if there is any relation between the casualties and the size of the ships as indicated in the diagram, it is of an opposite character to that shown in Diagram III—the larger the ship the less chance of its being "missing."

Another way in which this inference may be checked, is to plot the casualties against the temperatures at the time of loading, or, what comes to the same thing very nearly, to plot the casualties against the times of the year at which the ships were loaded. This was done (Diagram VI, p. 12), and a comparison between Diagram VI and Diagram V will show that the former inference is not exactly correct—for six ships were lost which had loaded in February. In this connection, Table XIII of Appendix L, p. 52, may be consulted.

A circumstance which has a great influence upon the risk of spontaneous heating, is the average temperature during the voyage. The effect of this was Average temperature during voyage.] examined by the English Commission in 1876. With regard to the sailing trade to America, there can be no doubt but that ships sailing to the north of the equator go through much hotter weather than ships which do not cross the equator, seeing that the coal ports on the west coast of South America are considerably south of the line. It might, therefore, be anticipated that there would be a connection between the percentage of ships lost by spontaneous combustion, and the port to which they sailed. The following table was, therefore, prepared, showing the number of ships whose cargoes heated, and the number of ships which were missing, classified according to whether they sailed for ports north or south of the Equator:—

TABLE VIII.

	North of the Equator.	South of the Equator.
Cases of Heating ... ..	10	3
Missing Vessels ... ..	5	12

It appears from the table that out of thirteen ships whose cargoes were known to have heated, ten sailed for ports north of the Equator and three sailed for ports south of the Equator. With the missing vessels, on the other hand, we find that

that five out of seventeen sailed to the north and twelve to the south of the Equator. We have to thank the Secretary of the Commission for suggesting this test to us.

No doubt some other variable, such as the relative amount of ice which would be met with on the voyage according to the time of the year, the prevalence of stormy weather in different months, &c., could be selected as the basis of further diagrams. The objection would be that these variables are not capable of exact specification. Again, it may be asked, why were not Diagrams V and VI plotted against the actual temperatures? The answer is, that this would have involved the obtaining and reduction of the meteorological records for some thousands of ships, and the time which would have been required for this would have delayed our Report by several months. Also, it did not appear that the establishment of a mere probability would have justified the expense and trouble which would have been involved.

Our conjecture, based on the diagrams and general data, is that probably some half-dozen of the missing ships were burned, and that the rest were lost owing to other causes.

We have taken care in Tables I and II of *Appendix A* to supply all the data we possess ourselves, so that others may be in an equally good position to hazard conjectures on this subject.

*Causes of Danger, other than Spontaneous Combustion, to Ships carrying Coal Cargoes—Explosion.*

Explosion.

It will be observed that in the above we have said nothing at all on the subject of explosion. We feel it necessary, however, to add a note on the matter, because we have found an almost complete popular misapprehension in regard thereto. Nearly all of those with whom we have conversed on the dangers to which coal ships are liable have placed the danger of explosion in the foremost rank; whereas, during the epoch considered, there have only been two *known* cases of explosion on board coal-laden ships, and both of these occurred with southern and not with Newcastle coal. The two ships on which the accidents took place were the "Argo" and "Prosperity," both of which were comparatively small vessels. The "Argo," it so happens, was examined by one of us personally immediately after the explosion occurred, and there can be no doubt that the accident was due to an explosion of gas. Details of these two cases may be found in *Appendix A*, page 35.

Now, gas may be given off from coal in two ways: (1) The coal may itself be saturated with gas which has not had time to escape during the interval which elapses between the winning of the coal and its loading on board ship; (2) When coal becomes heated, combustible gases are occasionally evolved, and it is possible for these to accumulate to a dangerous extent. It is for these reasons that all ships are provided with surface ventilation, and if this is fairly efficient there ought to be little or no danger from explosion of combustible gases. It must, however, be admitted that it is a dangerous practice to load certain descriptions of coal at too short an interval of time after it has been obtained from the mine.

*Shifting of Cargoes.*

Shifting of cargo.

Some light may be thrown on this matter by a study of Table III, of *Appendix A*, which details the known cases of shifted cargoes. Although it is admitted on all hands that iron or steel ships require to be provided with shifting-boards, we find that out of eight ships of this kind whose cargoes shifted two were unprovided with shifting-boards, a vastly unusual proportion. (*See Appendix U*, p. 9.) (A shifting-board is a temporary but strong longitudinal partition run down the fore and aft line of the ship through the coal cargo. It is generally made by lashing strong boards to the stanchions of the ship.) In the case of wooden ships, the construction is often of such a nature that the woodwork of the ship forms a sort of natural but imperfect shifting-board, and the necessity for shifting-boards will depend on the degree to which the constructional timbering may be considered to form a shifting-board. (*See Appendix J*, page 42, on the loss of the "Patrician".) There can be no doubt that all iron or steel and most wooden ships ought to be provided with shifting-boards; and this is the position taken up by nearly or quite all the witnesses

witnesses examined. It is of no use, however, to adopt shifting-boards unless the cargo is properly trimmed. Now proper trimming consists in filling the hold of the ship uniformly with coal, and in finishing off the heap of coal at certain points fore and aft by means of a wall of large pieces of coal. A great deal of the evidence we obtained was as to whether the trimming of the cargoes was carried out properly at Newcastle. We do not propose to discuss the detail of this matter at any length, and shall, therefore, confine ourselves more or less to our conclusions—referring the reader to the evidence on which our opinions are based. We must premise that the operation of loading a ship is performed by three different services. In the first place, the loading appliances are under the control of the Railway Commissioners, who carry the coal, and who put the waggons as nearly as possible under the cranes. The working of the cranes is let to a contractor, who contracts with the Commissioners of Railways to put the coal on board at a certain price per ton; this charge being, of course, added to the freightage. Handling the coal on board ship is the duty of another contractor—a master trimmer or stevedore—who contracts to trim the coal at so much per ton. There is no doubt from the evidence we have obtained—

- (I) That the master of a ship can always get the coal trimmed exactly as he wishes, provided he will either personally, or by his officers, take the necessary trouble in superintending that operation. (*See* especially, on this point the evidence of Captain Parkhill, master of the “Scottish Lochs,” question 337, *et seq.* to 370. We were considerably impressed by Captain Parkhill, and feel sure that his evidence is particularly reliable and judicious.)
- (II) That no opposition to the supervision of trimming on the part of the ship’s master has been shown by the contractors or trimmers.
- (III) That, in general, if the trimming is not so superintended there is at least a tendency to hurry and scamp the work; *see* question 383, Parkhill—“If you did not see to the work yourself it might be done faultily? Of course they will not shovel the coals more than they can help.”
- (IV) That it is unfortunately not unusual for the masters and officers of ships to neglect their duty by neglecting to supervise the trimming.
- (V) That in consequence of this many ships have left the Port of Newcastle improperly trimmed. (This view was also taken by the Newcastle Chamber of Commerce in an inquiry held in October, 1894—*See* Appendix M, p. 55.)

Many witnesses were asked what course they would recommend in order to ensure proper trimming. They were almost unanimously of opinion that—

- (1) Licenses should be issued to competent stevedores, and that only such licensed stevedores should be allowed to tender for trimming.
- (2) That a system of Government inspection of trimming should be inaugurated and that it should be the duty of the inspector to report to the local Marine Board any case of imperfect trimming.

Issue of licenses to stevedores, and inspection of trimming.

We have given much attention to these proposals and find ourselves unable to recommend either of them.

With regard to (1) it appears that the ship’s officers are able to secure good trimming if they will take the trouble to do so. The shipping agents are presumably acquainted with the Port, and it is not the duty of Government to say who shall be employed by them and who not.

Comparatively few of the ocean-going ships are owned in New South Wales; nor are their crews citizens of New South Wales.

With regard to inspection, the “Navigation Acts, 1871–1881” really give very limited powers to the local Marine Boards. They can only inspect “on complaint or otherwise,” and after the vessel has been “provisionally detained,” even with regard to the load marks. They have no power to send an agent forcibly on board to inspect anything (*see* question to Crown Solicitor and answer thereto, *Appendix A.A.*, page 62).

Again, if the master and officers of the ship, whose lives depend on seeing that the trimming is properly done, neglect to attend to it, why should it be supposed that a Government official, who has comparatively no interest in the matter, would attend to it better?

Also,

Also, as already stated, the ships for the most part are foreign-owned and foreign-manned. They come to Newcastle for a certain commodity; what they do with it is their business, not the business of the New South Wales Government.

One witness told us that there had been complaints already from foreign owners of the irksomeness of the port regulations at Newcastle, and reminded us of the well-known principle that the less trade is hampered by regulation the better. With this, of course, we agree, and would point out that no inspection of the kind recommended could be made without passing a new Navigation Act; and this could hardly be done reasonably without lengthy consultation with foreign Boards of Trade. Moreover, if trimming is to be supervised, on what grounds could supervision be refused to victualling, reparation of hull or rigging, or any other of the thousand and one precautions necessary to secure a seaworthy ship? Some idea as to at least one of the motives underlying the demand for inspection may be gathered from the evidence of T. Burke (Question 2199, *et seq.* to 2214).

In conclusion, it is with satisfaction that we record that the officers of ships examined by us were unanimous in praise of the working coal trimmers of the Port of Newcastle. This, however, is hardly an argument for the necessity of Government supervision.

There is one aspect of the question of supervision, however, which we examined at some length. It occurred to us that if a system of inspection were inaugurated, the insurance companies might possibly see their way to reducing the rates charged for underwriting. In the event of this being actually done, it was thought that possibly those who benefited might agree to pay the cost of inspection. Nearly all the witnesses, of course, thought that the Government ought to pay, or, at all events, that the class to which they happened to belong ought not to be taxed.

We examined a large number of insurance agents and managers, and they were on the whole inclined to treat the proposal favourably, provided that any recommendations we might make, and which they might happen to endorse, with regard to the prevention of spontaneous heating, were also enforced by inspection.

After considerable time had been spent over the matter, we discovered that the amount of insurance effected in Sydney was so trifling that even in the event of the local Underwriters supporting the scheme of inspection, the general position would not be materially affected. Insurance on hulls is effected in London, as a rule, under an open policy, and might not be greatly influenced by proposals which could only affect, perhaps, one out of the several voyages covered by the policy. We are unable, therefore, to see that the proposed inspection could carry with it any commercial advantage. There is undoubtedly an opening, however, for underwriters to assess their premiums according to the temperature at which the coal is loaded; and according to whether the main hatchways are or are not large enough to allow of the hoppers being passed down them.

## PREVENTION OF ACCIDENTS.

### TRIMMING.

Prevention  
of accidents.  
Trimming.

With regard to trimming, we can only recommend that the owners of ships should issue strict orders to their masters with regard to the supervision of trimming, and that they should provide all, or at least, all iron or steel ships with shifting-boards.

### HEATING.

Heating.

With regard to heating the case is more complex.

#### *Nature of the Coal.*

It appears most distinctly from Fayol's great investigation, in which he divides coal into ten classes, that the kind of coal which is most liable to spontaneous combustion is that kind which is most readily inflamed. The criterion of inflammability employed by Fayol appeared to us to be—perhaps intentionally—vague. The ease with which the coal can be lighted by a flame or in a grate appears in some way to be the criterion, and coals are classified in this respect without any detailed account

account of how the classes are to be separated. Thus we are quite unable to say to which of Fayol's classes any particular bit of coal may be considered to belong, nor is it clear how one would set to work to find this out.

The result, in general terms, is clear enough, however; the order of inflammability given by Fayol is the same as the order of liability to spontaneous combustion, and runs thus—(1) lignite; (2) gas coal; (3) coking coal; (4) anthracite.

Now, Newcastle coal in general is suitable for gas making, and may, perhaps, be classed as (2) gas coal.

#### *Statistics relating to Collieries.*

We have collected the statistics referring to the coal shipments from each colliery, and the accidents which have occurred, and the results appear in Tables VI, VIII, XI, and XII, of Appendix L, pages 48, 50, and 51. Statistics relating to collieries.

There is also a statement handed in by Mr. Binney (Appendices O and P).

Table VIII of Appendix L, page 50, may be regarded as containing the proximate results of the investigation. It appears from this table that the Wallsend, Duckenfield, and Greta collieries alone have done a sufficient over-sea sailing trade to America to allow of the proper application of a statistical method. During the epoch 1888 to 1896, the Wallsend and Duckenfield coals appear to have had 1.34 and 1.13 per cent. of total casualties respectively, while the Greta coal has only had 0.4 per cent. A closer analysis is attempted in Table XI, Appendix L, page 51, whence it appears that in ships carrying 2,000 tons and over, as regards known cases of heating, the Greta coal has met with no accident at all; Wallsend with 1.03 per cent. and Duckenfield with .66 per cent. only. These figures referring to large ships only, loading generally in warm weather, and performing long voyages in warm weather, must be considered as wonderfully favourable. With regard to the other collieries we prefer to draw no inference, the number of shipments being too small to be treated by statistical methods. Percentage of casualties with different kinds of coal.

As a general result of the data collected in this Report and Appendix, and of an inspection of collieries and examination of witnesses, we find as follows:—

- (1.) Those coals which have been shipped in sufficient quantity to be fairly susceptible to treatment by statistical methods have shown themselves to be at least up to the general average of good coal with regard to freedom from spontaneous combustion.
- (2.) There has been no change during recent years, either in the method of mining, or in the character of the coal met with, which throws any light on the casualties of 1895-96.
- (3.) The cause of spontaneous combustion does not appear to us to depend on or to be associated with any particular description of Newcastle coal, nor can we say that any particular coal is dangerous. Cause of spontaneous combustion probably not associated with any particular description of Newcastle coal.

We are, therefore, forced back upon the considerations already advanced in the first part of this Report, in which we sought to explain the accidents of 1895 and 1896. In a word, if accidents are to be prevented we must improve our methods of shipping coal, and must not load very large ships in very hot weather. Location of heating of cargo.

#### *Loading Appliances.*

The system of loading in vogue at Newcastle has two recommendations, and two only. It is cheap and it is expeditious. The practice of dumping 7 or 8-ton loads down a depth of about 30 feet is entirely antiquated, and from the point of view of the underwriter, about as bad as can be imagined. Loading appliances.

There is, we believe, no case on record of a ship's cargo taking fire anywhere except in the square of one of the hatchways; out of the hundreds of known cases of spontaneous heating of English, Foreign, and New South Wales coal—there is actually not a single case where the fire did not first appear under the square of one of the hatches, generally, if not always, the main hatch. We thought we had a case, that of the "Alexandra," but the master happening to arrive in port during our inquiry, we discovered that this case also was perfectly normal (*see* Q. 218-20; 2492.) Location of heating of cargo.

A good many witnesses would have us believe that firing arose from accidents with candles, odds and ends of fuse left in the coal, &c. These views, always vague, may, we think, be dismissed at once, seeing that the square of the hatch is just the place where such accidental fires would not break out. We have, in fact, to deal with a purely Richtersian phenomenon—that of the slow oxygenation of coal, as already explained.

The problem is, therefore, how can we prevent the coal from being broken up as it falls into the hold? or, more generally, how can we load a ship with “whole” coal only?

*Breakage in Dropping from the Screens.*

Breakage in dropping from the screens.

This might easily be greatly reduced by the adoption of some proper appliance, *e.g.*, by the use of an inclined swinging plate acting as a shoot from the screens to the waggons. The plate might be formed of steel laths mounted on flexible material, so as to allow of withdrawal as the coal rises in the waggons.

*Breakage in Waggons in Transit.*

Breakage in waggons in transit.

The breakage produced during the carriage of the coal may, we think, be neglected at present in comparison with the greater breakage at loading and discharging. The remedy is to be sought in getting rid of the idea that any kind of a permanent-way is good enough for a colliery railway.

*Breakage in Loading the Ship.*

Breakage in loading the ship.

This matter has received a good deal of attention, and we will consider in order the things which might be done, and give our reasons for or against them:—

Lowering of hoppers in hold of ship.

(1.) The waggons might be lowered to the bottom of the hold to begin with, and afterwards to the top of the coal as a heap is gradually formed. This is now done so far as is possible, but in many cases the hatches are too small for the hoppers, and in others the jibs of the cranes are not long enough to lower the waggons fairly down the hatchways. A remedy would be to make the jibs of the cranes, at all events, long enough to lower the hoppers where possible.

Alteration of waggons.

(2.) The waggons might be made smaller so that they would go down the hatchways. This is by no means an impossible cure. The objection, however, is that the hopper waggons are otherwise very good and economical, and most collieries have discarded their box-waggons to put in hoppers. To change back to boxes would increase the cost of conveying the coal to the ship's side; would increase the cost of discharging the coal to the ship; and would ruin most of the coal companies who own the waggons used in transporting the coal. We do not think that the slight extra cost entailed by the use of box-waggons would be serious and there would be a gain in the value of the coal as delivered. Although we believe that some of the collieries have been mistaken in discarding the box-wagon for the large hopper, we cannot ask the colliery owners to ruin themselves by instantly replacing their hoppers; on the other hand, we think that the substitution of boxes for hoppers might, perhaps, be made as time goes on, and this would most undoubtedly enable the coal to be delivered in better and more valuable condition, and would reduce the risk of heating (*See especially on the question of box-waggons the evidence of Mr. J. R. M. Robertson, Q. 3,136*).

Alteration of ships' hatches.

(3.) The hatches of the ships might be made larger. We were satisfied that this would be a very difficult reform to make, and unless extra expenditure were incurred in building the ship, would tend to weaken it. There are certain regulations governing the insurance rates, known as Lloyd's rules, which prescribe how the hatch is to be formed. These rules should be altered so as to allow of larger hatches being put into ships. We think it desirable that the authorities of Lloyds, as well as the ship builders and owners, should be conferred with on this matter. Lloyd's rules appear to govern ship building to an almost incredible extent, and are, no doubt, very good; still, they must march with the times, like everything else.

(4.)

- (4.) Appliances might be fitted in the ship so as to allow of the coal sliding—instead of falling—into the holds. A drawing illustrating the working of one of such appliances appears on page 86, and a report by one of us who witnessed the loading of a ship with another of them appears as Appendix Y., p. 61. Our opinion is that both these appliances, in the form in which they came before us, are clumsy and unpractical. On the other hand, we see no reason to believe that the ingenuity of inventors has been exhausted in this direction, and we see no reason why a practical contrivance should not be forthcoming; at present, however, it does not exist.

Loading appliances fitted in vessels.

#### *Reconstruction of the Loading Appliances at the Dyke.*

The possibility of an entire change to more modern methods of loading has been fully considered by us. The first thing that appears is that no blame of any sort is to be laid upon those who inaugurated the present system. At the time the cranes were erected there had been no case of heating of Newcastle coal, and it was supposed, in consequence, that this coal enjoyed an immunity from danger of spontaneous combustion. The question at that time was merely how to get the coal on board as quickly and economically as possible, and this question was and is very perfectly solved by the now existing system. We now know, however, that Newcastle coal *can* heat under favourable circumstances, and the position is therefore somewhat changed.

Introduction of more modern methods of loading.

In the Report of the English Commission will be found a very complete account of the coal-loading appliances in use at that date—1876, and this we do not propose to recapitulate. It will suffice to say that of late years engineers have attempted to solve the problem of loading coal without breakage by proceeding along two lines of thought. On the one hand, arrangements have been made for emptying the waggons into vessels small enough to pass down the hatchways of a ship. These vessels have then been lowered till their movable bottoms arrived within easy distance of the bottom of the ship, or of the top of the coal, and devices have then been used to discharge them automatically. The best example of such an appliance that has come before us is Lewis and Hunter's system, now in use at the Roath Dock, Cardiff. On the other hand, attempts have been made to discharge the waggons into a movable spout, reaching nearly to the bottom of the ship; this system has reached, perhaps, its latest development in arrangements now in use at Cleveland, Ohio, U.S.A.

Lewis and Hunter's system of loading.

Of these two systems we greatly prefer that of Lewis and Hunter for use at Newcastle, and have obtained, through the Agent-General, a report from Sir Leader Williams (an eminent English engineer) on the working of the system at Cardiff. This report (*Appendix Z.*) is entirely favourable, and we know of no reason against installing the system except the enormous expense which would be involved. Not only would the dyke have to be faced by a concrete wall so as to form a concrete wharf (as we are unofficially informed by Mr. Darley, Engineer-in-Chief for Public Works), but the general arrangement of the sidings on Bullock Island and the arrangements for bringing the waggons under the cranes would have to be totally uprooted, and new arrangements made. To this the cost of the appliances is to be added. It appears that the bare cost of the appliances (without provision of power, which already exists) would be £14,879, f.o.b. London, and for this would be obtained two 18-ton cranes capable of serving a berth 300 feet long. We imagine that about three such sets would be required, but cannot say exactly without a personal study of the working of the system. The £50,000 or so thus required would be much the smaller part of the total cost. We do not consider that we are justified in recommending any such expenditure, at all events until the following simple recommendations have been acted upon.

We consider that the jibs of the hydraulic cranes should be lengthened, so that the hopper or box waggons can be lowered down into the holds of such of the largest ships as have hatchways of sufficient dimensions. We cannot do better than print here the answer we received from Mr. Darley to our question on this head. The cost of the proposed alterations would not be very heavy.

Lengthening of jibs of existing cranes.

Department of Public Works, Engineer-in-Chief's Office,  
Sydney, 15 December, 1896.

Sir,

With reference to your letter of 30th ultimo, requesting certain information in regard to the coal-loading cranes at Newcastle, I have now the honor to forward you the following particulars:—

1. Number of cranes—  
15, viz., 12 hydraulic, 3 steam.
2. Lifting power of each—  
2 of 9 and 25 tons capacity.  
6 " 9 " 15 " "  
4 " 9 " " "  
3 (steam) 15 " "
3. Length of jib of each—  
See Schedule attached (overhang over wharf).
4. The length of jib required to enable the coal-hoppers to be lowered down the holds of the largest vessels visiting the port—  
19 ft. 6 in. reach beyond face of wharf.
5. What objections, if any, are there to the jibs being lengthened for this purpose, or new jibs being attached to the cranes in lieu of the present ones, if necessary, to secure that object—

The jibs of the six hydraulic cranes, viz., Nos. 4, 5, 7, 8, 9, 10 can safely be lengthened to make them reach, say, 19 ft. 6 in. beyond face of wharf, which will be sufficient, so long as the load lifted from the lengthened jib does not exceed 9 tons; but if the cranes are ever required for 15-ton loads, then care must be taken to reeve the chains through what will be the inner or original sheave, which must be retained for that purpose.

I have, &c.,

C. W. DARLEY,  
Engineer-in-Chief for Public Works.

The Secretary, Coal Cargoes Commission,  
Chief Secretary's Office.

C. W. DARLEY,  
Engineer-in-Chief for Public Works.

It will be seen that there are at present six cranes whose jibs are long enough, and we believe that in ordinary times these six cranes are sufficient to serve the large ships. On the other hand, we consider that we have shown that there is a marked tendency for the size of the ships to increase; and, moreover, at certain times there is a rush of business. It seems to us, therefore, that the alteration might very well be made at once, and would, at all events, render the arrangements for berthing more simple. When we recollect that it is precisely with the large ships that the danger occurs, it is obvious that they are the ships whose interests ought to be chiefly considered.

*Temperature*

*Temperature at time of Loading.*

Returning to the effects of the temperature at which the coal is loaded, the mean of the maximum temperatures of all the days of loading of the ships known to have heated is 75° Fahrenheit. It is therefore clear that this is too high a mean maximum temperature; how much too high we can hardly say. We may note that the highest mean maximum shade temperature of loading of any ship that fired is 88°, and the highest single maximum temperature 103°. With the greatest diffidence, therefore, we suggest that ships of 2,000 tons burden and upwards should not be loaded—except special precautions to avoid breakage are taken, and unless the coal arrives at the wharf in an exceptionally unbroken condition—on days on which the maximum shade temperature rises above 80°, or the maximum sun temperature above 110°. Of course we know that it will be said that the ships are often loaded at night, when the maximum night temperature is much lower. True; but the coal which has been standing all day, generally in sunshine, is still more or less hot through the greater part, if not the whole, of the night. In short, it may truly be said that there is no finite relation between the temperature of a mixed cargo of coal and the mean maximum temperature of the days on which it is loaded. The scientific method would be to take the temperature of each waggon-load of coal as it came under the cranes; but this, we fear, is quite impracticable. Again, of course, we recognise that it does not matter how cold the greater part of the cargo is if 200 or 300 tons, or even less, is hot. The fact is that the process of loading large ships with coal at Newcastle during the summer months, with the existing appliances, is necessarily fraught with considerable risk. At what temperature the risk vanishes we are unable, with the present limited data at our command, to exactly determine. The temperatures of 80° and 110°, which we have fixed upon, are certainly as high as can be allowed, and it is probable that isolated cases of heating will still occur, even if our suggestion is acted upon. To fix a lower limit would give rise to vast inconvenience.

## SUMMARY OF CONCLUSIONS.

*Liability to Dangers.*

Ships carrying coal cargoes are peculiarly liable to the two following dangers:—

- (1) Spontaneous heating of the coal cargo.
- (2) Shifting of the coal cargo.

(1) Spontaneous heating. The cause of this is to be sought in the absorption of oxygen by coal. This absorption increasing both with the initial temperature of the coal, the fineness of its state of division, the depth of the cargo, and the length and mean temperature of the voyage.

(2) The cause of the shifting of cargo is to be sought in imperfect and insufficient trimming, and the absence of shifting-boards.

*Means for preventing Spontaneous Heating.*

(1) We recommend that the cranes be altered so as to admit of the waggons being lowered down the hatchways of ships, with a view to prevent the excessive breakage of coal which has hitherto taken place. We are aware, however, that the system of loading at present in vogue at Newcastle must be regarded as antiquated, and that the loading of ships cannot be placed on a satisfactory footing until the system is entirely reorganised.

Among the systems which we have considered, Lewis and Hunter's appears to us most suitable, and we should have recommended that this system be adopted at Newcastle were it not for the enormous expense which would be involved in establishing it. For this reason it appeared to us to be desirable that every effort should be made to improve the existing system before incurring the expense of abolishing it.

(2) We recommend that very large ships should not be loaded with the existing appliances on days at which the maximum shade temperature rises above 80° F., or the maximum sun temperature above 110° F.

(3) We recommend that, as at present, surface ventilation only should be employed in connection with cargoes of coal.

*Shifting*

*Shifting of Coal Cargoes.*

(4) With regard to the trimming of coal cargoes, we are unable to recommend that any form of Government inspection or licensing of trimmers should be adopted, as it has been abundantly shown that it is in the power of the masters of ships to secure adequate trimming.

We are of opinion, however, that no iron or steel ship should engage in the coal trade without shifting-boards being provided.

It is right that we should here acknowledge the assistance we have received from the Secretary of the Commission, who prepared, single-handed, the laborious returns contained in this Report and Appendix.

RICHARD THRELFALL, M.A., A.M.I.C.E.,  
President.  
EDWARD F. PITTMAN, Assoc. R.S.M.

WALTER WILSON,  
Secretary,  
28/4/97.

## Letter from the Master of the "Hawaiian Isles."

Newcastle, 2 November, 1896.

Walter Wilson, Esq., Secretary, Royal Commission on Coal Cargoes,—

Dear Sir.

Acting upon your request to write a statement on the heating of a coal cargo taken from this port on board the ship "Hawaiian Isles," I herewith enclose the following:—

On November 1, 1896, the ship was loaded with 2,230 tons best screened coal, 1,070 tons screenings, and 2 tons shale in bags. About 800 tons screenings were dumped in hatch No. 3, and the balance in hatch No. 4. In hatch No. 3 the screenings were levelled off to a depth of 14 feet, and then filled with coarse coal, making in all a depth of 22 feet. The screenings in No. 4 hatch had no coarse coal on top, and laid to a depth of 15 feet. The shale was in the 'tween decks forward. I would mention here that the 800 tons screenings were taken on board in very wet weather; the balance of the cargo was taken in moderate weather, with occasional showers.

On December 28, in latitude 22° 01' N. and longitude 167° 28' W., and the fifty-third day of the passage, smoke was seen issuing from hatch No. 3. On turning the lumps of coal over near the surface the under side was found to be hot. An iron testing-rod was driven into the coal, and after being allowed to remain a few minutes it became so hot as to burn a man's hand. No coals of fire, however, were found.

The rod was driven into the coal in all the other hatches, but no signs of heated coal were discovered.

The steam-pumps were started, and water was pumped into hatch No. 3 for about four hours; the water, when poured on the coal, had the immediate effect of cooling it off. Two days after the pumps were again started, the water being led in trenches over the heated parts and worked for about four hours. After this there was no further need for alarm during the remainder of the voyage.

From the above experience I should say there is little danger of carrying a cargo of Newcastle coal if the ship is properly trimmed with shifting-boards, and at least two of the hatches piped for temperature measurements, and these should be attended to every day and entered in a book kept for that purpose. Then with ordinary care no captain would find his ship on fire as the first intimation that something had gone wrong.

I remain, &amp;c.,

O. KUSTEL,

Master, Ship "Hawaiian Isles," 2,041 tons.

## C.

## Report of Inquiry of the Marine Surveyor, Sydney Underwriters' Association, in the case of the "John Ena."

I, the undersigned Marine Surveyor, made enquiries to try and ascertain the cause of the fire which broke out in the cargo on board the four-masted barque "John Ena," while on a passage from this port to San Francisco, and report that the four-masted barque "John Ena," 2,568 tons, built at Glasgow in 1892, of steel, sailed from the port on 19th September, 1895, loaded with 4,257 tons of Pacific Co-operative Steam Coal Co's Ltd. (formerly the Great Northern) coal.

About 1,200 tons of stiffening coal was put in Nos. 2 and 3 holds on the 6th and 7th September. She commenced loading on the 10th, and finished on the 13th September, 1895.

According to the Government railway records, the stiffening coal arrived at the dyke on the 2nd, 4th, 5th and 8th days of August, and the balance of the cargo arrived at the dyke on the 4th, 7th, 10th, 11th, 12th, and 13th days of September.

The weather reports kept at the Marine Board Office show rain to have fallen on the following dates, viz. :— 6th August, 2 points; 7th, 7 points; 8th, 4 points; 9th, 1 point; 10th, 1 point; 12th, 2 points; 14th, 20 points; 17th, 13 points; 18th, 1 point; 19th, 1 point; 21st, 20 points. Total rainfall during August, 72 points.

THOMAS LAIDMAN,

Marine Surveyor,

Sydney Underwriters' Association.

## D.

## "Republic."

FINDING AND ORDER OF A NAVAL COURT held at the British Consulate-General at San Francisco, on the 30th day of April, and 1st, 2nd, and 4th days of May, 1896, to investigate the circumstances attending the abandonment of the British sailing barque "Republic," of Liverpool, official number 99,314, when on a voyage from Newcastle, Australia, to San Francisco, and the cause of such abandonment, and to inquire into the conduct of the Master, Certificated First and Second Mates, and crew of such vessel.

The "Republic" was a steel vessel, barque rigged, of 2,347 tons registered tonnage, official number 99,314, built at Sunderland in 1891, and belonging to the port of Liverpool.

It appears from the evidence given before this Court that she sailed from Newcastle, Australia, on or about the 22nd January, 1896, bound for this port of San Francisco with the cargo consisting of 3,770 tons of Wallsend coal, mined from the Co-operative Colliery at Newcastle, New South Wales, and a crew of 30 hands all told. After leaving Newcastle fair weather, with but unfavourable winds, was experienced, and the vessel in consequence made poor progress.

The ventilators were kept open continually, and all the hatches were removed during the daytime, the temperature of the hold being taken each day with great regularity by the First Mate. No indication of any heating of the cargo was discovered until the 10th of April, when steam was found to be coming from No. 2 hatch.

This subsided during the day, but increased in volume on the 11th. The master then ordered all the hatches to be removed, and made an examination of the cargo, testing it with iron rods in several places.

He jettisoned from 20 to 30 tons of coal from hatch No. 2. A very large quantity of water was then pumped into the hold on this and the following days.

The heat in the tubes was found to be normal, and this continued to be the case until the 16th. Some of the crew were set to work to dig down in order to get at the seat of the fire, but could not continue the work on account of the smoke and gas, which overcame several of them.

On the 16th a heavy explosion took place, blowing off several of the hatches. On the 17th a sail was sighted, which proved to be the British ship "Hollinwood," and in response to signals made by Captain Hughes, the master, Captain Kidd came on board and promised to stand by the "Republic" and take off the crew in case she had to be abandoned.

Finding it impossible to subdue the fire, which continued to spread, despite the efforts made to control it, the vessel was finally abandoned on the 19th April, and all hands were transferred to the "Hollinwood," the two vessels being at the time in latitude 34 degrees, 44 min. north longitude, 127 degrees 15 min. west.

When the crew left the "Republic" the foremast was settling down and the deck had begun to sink, flames were hursting out of the hatches, and everyone on board, as well as the master of the "Hollinwood," considered it highly dangerous to remain longer on board. All hands were safely landed at this port of San Francisco by the ship "Hollinwood" on the 24th April.

The Court having carefully considered the evidence, finds the "Republic" was well found and seaworthy at the time of her departure from Newcastle, and was fully provided with all the apparatus necessary; that the cargo was well and properly stowed, the ventilation was good and sufficient, and that the vessel was not overloaded; that the master, Seth Hughes, navigated his vessel in a proper and seamanlike manner; that every care was observed on board in attending to the ventilation and in noting the temperature; that the officers and crew behaved in an exemplary manner, and that perfect discipline was maintained on board; and that everything was done that could be done to get the fire under.

In the opinion of the Court the master deserves great praise for the manner in which he performed his duty.

The master and officers are therefore exonerated from all blame.

The Court thinks that if the "Republic" had been provided with facilities for discharging steam into the hold there would have been a possibility of saving the ship and cargo.

The expenses of this Court, fixed at £22 18s. 6d., are approved.

Dated at San Francisco, this 4th day of May, 1896.

J. W. WARBURTON, President of Naval Court and British Consul-General.

F. W. HARVEY, Master Mariner.

JOHN A. BROMLEY, Master of the British ship "Comishead," of Workington.

## THE MERCHANT SHIPPING ACTS, 1854 TO 1894.

At a Naval Court, held at the British Consulate-General, at San Francisco, on the 30th day of April, 1896, Seth Hughes, master of the British barque "Republic," of Liverpool, official number 99,314, being called, sworn, and examined, deposed as follows:—

How long have you been on the "Republic"? Two years.

When and where was she built? Sunderland, 1891.

She was an iron ship? No; steel.

How much coal was put on board at Newcastle? 3,770 tons.

Were you present at the time the ship was loading? Part of the time; but I was sick in the hospital most of the time.

How was the cargo put on board? Tipped into the hold from the coamings of the hatch.

What condition was it in as to size? Mostly large; but some small, mostly in the fore hatch.

What was the state of the weather? Fine dry weather the whole time.

Was the coal wet or dry when it came from the colliery? As far as I saw, quite dry.

What kind of coal was it? It is called Wallsend coal, and came from the Co-operative Colliery.

Do you know whether it came direct from the colliery or not? Direct.

How long was the ship loading? Including the stiffening, about fourteen days.

Had you a full cargo of coal? Yes.

Was that the first cargo of coal you have taken from Newcastle? I have taken five cargoes; four in other ships and one in this.

Were they from the same colliery? Two from the same colliery—one of them in the "Republic."

Had you any trouble with the two previous ones? None whatever.

Did you use shifting-boards; if so, how were they secured? Yes; I had efficient shifting-boards, both in the lower hold and between decks, roved between stanchions.

Did you use rope to secure them? Yes; Manilla ropes in the lower hold only.

Had she a permanent between deck? Permanent, with hatches in midships and along the sides.

Had she any bulkheads? Only one collision bulkhead.

Will you describe the ventilation? Seven ventilators altogether—three forward and four aft.

How many hatches? Four.

Had you surface ventilation? Yes, ample, and mast ventilation.

What appliances had you for taking the temperature of the coal? Three tubes between the hatches.

How many thermometers had you? Two.

Who took the temperature daily? The chief officer.

When was it taken? At noon.

Was it entered in the log daily? Yes.

Was it taken in all three tubes? Yes.

Up to the 10th April, was there any unusual variation in temperature? No.

Do you remember the average temperature up to that date? It was high at Newcastle and shortly after leaving, but rapidly decreased at sea, and was at its lowest just before the 10th.

Was the temperature taken high up or low down? Different places from the bottom to the top of the tube.

What passage did you make? The northern passage.

What sort of weather did you experience after the 10th? Fine weather, but unfavourable winds.

Did you keep the fore and aft hatches open for ventilation? Yes; both all day, and occasionally the aft hatch at night.

When

When was the first indication of increased heat? On the 10th April, when steam was detected.  
 What steps were taken on this discovery? The hold was examined, but no heat was detected.  
 Did you personally examine the hold? Yes.  
 In what part of the ship was the steam detected? The fore hatch.  
 Was any increase of temperature detected anywhere? No.  
 On the 11th of April, when you found the coal much heated in No. 2 hatch, and signs of smoke oozing out, what steps did you take? The coals in the square of the hatch were jettisoned.  
 What quantity did you jettison? About 25 tons.  
 When you had taken these 25 tons out, did you find any increase of temperature? Yes.  
 How did you test it? We drove iron rods down about 10 feet.  
 How long did you keep them down? About ten minutes.  
 What state did you find them in? Much heated.  
 To what distance to the bottom would the rods reach? About 9 feet.  
 What did you do then? We put on two force-pumps.  
 What condition were the pumps in? Good order.  
 How long were you pumping the water in? Until night—about twelve hours.  
 Why did you not use the steam-pump? We thought the others were sufficient.  
 After you had finished pumping, did you sound the bell to see what quantity of water was in the hold? About 11 inches, which increased during the night to about 19.  
 Was all the water pumped in No. 2 hatch? Yes.  
 Did you jettison any more coal after that? No.  
 On the 12th you stopped pumping in water at night—why was that? I thought I had got the fire under.  
 On the 13th, when you found a considerable amount of smoke coming up, did you make any attempt to get at the seat of the fire? The men could not work on account of the heat and smoke.  
 Did they attempt to do so? Yes; and two or three were overcome, and had to be hauled up and became insensible.  
 On the 14th you set the steam-pump to work to pump the water out of the ship;—did you at the same time pump water into her? Yes; with the three pumps, one of which was a steam-pump.  
 When did you cease pumping water in? At 8 a.m.  
 Why did you stop then? We thought the fire was under.  
 Did you take the temperature again at this time? Yes.  
 What was it? After tube, 70°; middle, 76°; forward, 72°.  
 What did you do on the 15th? We kept all battened down.  
 Why was that? We thought we could smother the fire out.  
 Were the ventilators closed? Yes; masthead and all.  
 Were you pumping water in? No.  
 Why not? Because she was all closed up, and we thought we could smother it out.  
 Did you try the temperature that day? Yes; several times during the day, in all the tubes.  
 How did you find the temperature? The after tube, 70°; the middle tube, 75°; and the forward tube, 72°.  
 You say in your protest that there was a great quantity of smoke and gas, especially in the fore part of the hold;—how did you ascertain this? Before we battened it down.  
 What time did you batten it down? About 8 o'clock a.m., in consequence of the temperature being slightly lower than the day before.  
 Had you any explosion that day? No.  
 What did you do on the 16th? Nothing before 2 p.m.  
 Where did you detect the smell of gas? Coming out of the lazarette.  
 Could you have used your steam-pump to inject steam? I thought of doing so, but I had no connection.  
 On how many occasions did the crew work in order to get at the seat of the fire? Several times. I cannot say how often, for they were driven back by smoke and gas.  
 How did the officers and men behave? Very willingly.  
 You say a heavy explosion took place at 7 a.m.;—was it possible for anyone to have gone down into the hold with a light or match which could have caused the explosion? It was quite possible.  
 Did you take the temperature at 7 and midnight? Yes, continually.  
 Can you remember what the temperature was? A hundred in the fore tubes immediately after the explosion, and the same as before in the other tubes.  
 Was the temperature continually rising? Yes, in the fore tube; no change in the other.  
 Did you see any fire after the explosion? No; but the flames of the explosion burnt the main bunt-line.  
 After the explosion, did you pump any more water in? No; it would have been no use to do so.  
 In your opinion, could anything have been done to save the ship after this explosion? No more could be done than was done.  
 What do you think was the cause of the fire? I have no idea.  
 Was the ship insured? I have no knowledge.  
 Had you any interest in it? None whatever.  
 When did you sight the "Hollinwood"? On the morning of the 16th.  
 What was your object in pumping water on the coal after midnight on the 17th? Because we saw the flames from the burning coals for the first time, and I had hopes of keeping the fire down until I could get into port.  
 Did it appear to have any effect? It put the flames out for a time.  
 Seeing the fire had got so much ahead, did you take the precaution of shutting off the sea-cock? Yes.  
 Supposing you had wanted to flood the hold through this sea-cock, would it have been possible? No; because I had no sluice-valve in the collision bulkhead.  
 Where was the intake for the donkey engine? From the same source.  
 From the time the "Hollinwood" came alongside, was any further attempt made to flood the cargo? No; because the donkey steam-pump had broken down, and the fire had got too much of a hold for the other pumps to have been of much use, and there were explosions taking place all over the ship.  
 Had you a steel deck under your wooden deck? Yes.  
 Do you think when you first communicated with the "Hollinwood" that the combined efforts of the two crews could have saved the ship? I do not think anything could have saved her.  
 If the "Hollinwood" had not been in sight, would you have been compelled to leave the vessel as soon as you did? Yes.  
 How long was the "Hollinwood" in company with you? Three days from the time we signalled.  
 When you held a consultation with the crew, were they all of the same opinion that it was no longer safe to remain on board? They were all unanimous.  
 How was the discipline on board? All behaved well.  
 Was anyone materially injured during the fire? There were several injuries—nothing serious.  
 Can you think of anything you wish to add to your protest, or to the evidence you have given the Court? No.  
 How long have you been in command? Fourteen years.  
 What certificate do you hold? Extra master's certificate.  
 Are you a member of the Naval Reserve? Yes, with the rank of lieutenant.

SETH HUGHES.

I hereby certify that the foregoing is the evidence of Seth Hughes, taken before the Court as above described, and duly signed by the witness before me,—

J. W. WARBURTON, President of Naval Court and British Consul-General.

[At 4 p.m. the Court adjourned until the 1st day of May, at 11 o'clock in the forenoon.]

## THE MERCHANT SHIPPING ACTS, 1854 TO 1894.

At a Naval Court held at the British Consulate-General at San Francisco on the 2nd day of May, 1896, W. Williams, first mate of the British barque "Republic," of Liverpool, official number 99,314, being called, sworn, and examined, deposed as follows:—

What certificate do you hold? Ordinary master's.

What is the date of your certificate? 1869

Have you ever been in command of a ship? Yes, sir.

How long have you been on board of the "Republic"? From the time she left home—about eleven months.

Will you state what took place from the commencement of the loading up to when the ship was abandoned? We were about fourteen days loading, including the stiffening; the coal was chiefly large, but a good deal of small in the fore hatch. The coal was quite dry, and the weather warm and dry during the whole time. I was in charge of the loading, and saw most of the coal put in. We had a fine passage all the way, with light winds, fair weather, and everything went well until the 10th of April. On that day we first noticed steam coming up from the fore hatch. At first we didn't think much of it, and opened all the hatches and examined all the cargo. On the 11th we saw steam and smoke in greater quantities coming. We then jettisoned some of the cargo—about 20 to 30 tons—out of No. 2 hatch, and then pumped in water. We thought the measures that had been taken had been effectual, and on the following day we found steam and smoke again, but the temperature was not excessive, and then we pumped water again until night, and then battened down. On the 13th the smoke was coming up in considerable quantities, and we continued pumping water in all day. On the 14th we found much heat and smoke. We kept on pumping until 8 o'clock in the morning. On the 15th there was considerable heat and smoke, and the hatches were kept battened down, and on this day we first saw the "Hollinwood." On the 16th strong smell of gas was perceived, and we opened the ventilators to let it escape for fear of explosion. At 7 p.m. a heavy explosion took place, blowing off the hatches. We then closed the hatches with boards, and left some of the ventilators open for fear of explosion of gas. On the 17th we signalled the "Hollinwood," and the captain came on board in the afternoon, and promised to keep company until after we abandoned her.

By the Court: Have you had any experience carrying coal? Yes; I have carried cargoes many times.

Have you ever carried this Newcastle coal before? Yes; this is the third cargo.

Have you ever had any trouble with fire before? No; but I had one cargo that heated.

Was that Newcastle coal? No.

You were attending to the loading of the ship? Yes.

At any time during the loading, was there any rubbish or sweepings of the deck thrown amongst the coal? No.

In clearing up the hold after your cargo was discharged, was there any ballast left in? No.

Do you remember what sort of lights the trimmers used? Candles.

Do you think it possible some of these candles could have been covered over with coal, say a bunch of them? No.

Do you remember how your shifting-boards were secured in the lower hold? They were lashed with Manilla rope.

Had you a good supply of shovels and coal-baskets? Yes.

When the trimmers finished the cargo, what space had you between the deck and the coal? About 2 feet space amidships, and much more at the ends.

Had you thermometers? Yes.

Were they in good order, and how many? Two, in good order.

Did you yourself take the temperature daily? Yes, throughout the passage.

During the passage, had you any perceptible increase in the temperature until the smoke or steam appeared? No.

Was the temperature about usual, the same as in other ships? About the same.

Had you no indications of any heat? No.

How many ventilators had you? Seven—six large and one small.

As the chief mate of the ship, did you particularly attend to the ventilation of the ship? Yes.

Did you pay attention to taking the hatches off? Yes.

In lifting any of the hatches off during the voyage, did you feel any heat? No.

At any time during the voyage, were any of the men down with lights? No, not to my knowledge.

Were any of the men found smoking down below? No, never.

How many pumps had you on board of the ship? Two force-pumps, worked by hand, and one steam-pump.

Were they in good condition? Yes; splendid pumps.

Had you long rods of iron for probing the coal? Yes.

Did you use these rods at any time before the heating? No.

After the heating, did you probe these coals? Yes.

Where did you probe these coals? In each hatch.

Where did you locate the heat? In the middle of No. 2 hatch.

Is this the hatch where you had most of the small coal? Yes; that and the fore hatch.

Was there no perceptible heat in the fore hatch? We found no heat in the fore hatch with the rod.

When you were loading, do you remember any coals being tipped down the fore hatch? Yes.

What did you do when you found an increase of heat in the cargo? Pumped water into the hold.

Which hatch did you pump water into? No. 2 hatch.

Do you know the greatest amount of water you had in the ship? From 18 to 19 inches.

Did you pump any water out the night before? Yes; about five hours.

How many hours were you occupied altogether pumping water out of the ship? About eighteen hours, with double pumps worked with steam.

What sort of pumps had you? Very large double-action pumps.

What time did you yourself give up hopes of saving the ship? After the second explosion on the 16th of April, as the fire had got beyond our control, unless we could get into port and scuttle her.

Were you during all this time making as much sail as possible? Yes; all sails were set except the mainsail, which was over the seat of the fire.

In your opinion, was everything done that could possibly be done? Yes.

How was the discipline on board? First class; everyone worked well.

It is in evidence that the donkey-engine broke down? Yes.

From what cause? The lower gallaway tubes burnt.

Does your exhaust steam-pipe discharge over the ship's side? Yes.

Do you think you could have managed to turn that steam into the hold? I do not see how it could have been done.

WILLIAM WILLIAMS.

I hereby certify that the foregoing is the evidence of William Williams, taken before the Court, and duly signed by the said witness,—

J. W. WARBURTON,

President of Naval Court and British Consul-General.

[NOTE:—Evidence corroborative of the foregoing was given by other witnesses.]

## E.

## REPORT of the Government Geologist on the Heating of the Cargo of the "Knight of St. Michael."

Geological Survey Branch, Department of Mines and Agriculture,

Sydney, 27 February, 1896.

Sir,

I have the honor to report that I have made two inspections, on the 25th and 27th instant, of the coal cargo of the ship "Knight of St. Michael," and have to report as follows:—

Previous to my visit the cargo had been inspected several times by the Marine Surveyors, copies of whose reports are herewith. From these reports it will be seen that the ship left Newcastle on the 1st February with a cargo of 3,210 tons of Wallsend coal. On the 2nd February the Master took the temperature at intervals between 8 a.m. and noon, and found

found that in No. 2 hatch it rose from 96 deg. to 104 deg. He therefore put into Sydney Harbour, and on the 4th February the cargo was surveyed, and the temperature in No. 2 hatch was found to be 105 deg. The surveyors thereupon recommended the discharge of 300 tons of coal from this hatch.

On the 6th February the surveyors made a second inspection, after the 300 tons had been nearly discharged, and, finding the coals still much heated on the surface, they recommended the discharge of a further quantity of about 500 tons, or until the ceiling was left practically clear.

The cargo was again inspected by the surveyors on the 11th, 12th, and 14th instant, and on the latter date they were of opinion that all the heated coal had been taken out, and that the remainder was fit to be carried on.

On the 14th instant the captain reported that the temperature of the coal in No. 3 hatch was rising; the surveyors confirmed this on the 17th, and also found a slight increase of the temperature in the coal in No. 4 hatch. They therefore recommended that the coal be shifted from hatches Nos. 3 and 4 into No. 2, until the heated coal was reached, and that the heated portion be then removed and sold. On the 21st they reported, after another inspection, that there were no signs of heating in the remainder of the cargo, and it was therefore assumed that the difficulty had been overcome.

Subsequently, however, it was ascertained that the temperature was again rising in No. 2 hatch, and I was then requested to report on the matter.

At about 9.30 a.m. on the 25th instant I found a temperature of 84 deg. Fah. in the centre of the coal, immediately underneath No. 2 hatch, while in the hold near the side of the vessel the temperature was only 77 deg. It was noticeable that the coal contained a large proportion of smalls and dust.

At about 9.45 a.m. on the 27th February I found that the temperature had risen to 88 deg. Fah. in the centre of the coal under No. 2 hatch, while in the hold near the side of the vessel it was 76 deg. At the same hour the temperature of the coal in No. 3 hatch was 79 deg., and in No. 4 hatch it was 73 deg., while the shade temperature on deck was 69 deg.

It is clear from the foregoing remarks that the temperature of portions of the cargo is at the present abnormally high, and there is reason for believing that, if left alone, it would continue to increase until spontaneous combustion ensued. Samples of the coal taken by me have been analysed by Mr. J. C. Mingaye, in the Departmental laboratory, with the following results:—

From No. 2 Hatch.		
Hygroscopic moisture.....	1.	2.
.....	2.65	2.81
Volatile hydrocarbon .....	35.80	35.32
Fixed carbon.....	55.30	54.47
Ash.....	6.25	7.40
	<hr/>	<hr/>
	100.00	100.00
	<hr/>	<hr/>
Sulphur.....	0.535	0.453
From No. 4 Hatch.		
Hygroscopic moisture.....		2.45
Volatile hydrocarbons .....		37.55
Fixed carbon.....		52.30
Ash .....		7.70
		<hr/>
		100.00
		<hr/>
Sulphur.....		0.508

It may be stated, therefore, that the cargo consists of semi-bituminous coal of good quality, but containing a large proportion of dust and smalls. The coal was, I am informed, screened at the pit-mouth, and its present condition is, I presume, due to the subsequent handling.

From the investigations of eminent European authorities, such as Richters, Fayol, Lewes, and others, there can be little doubt (1st) that the principal cause of spontaneous combustion in coal is the absorption of oxygen by the coal, and (2nd) that the most favourable conditions for the self-heating of coal are a mixture of pieces and dust, an elevated temperature, a large mass or volume of coal to act as a non-conducting covering, and a certain volume of air.

These conditions are precisely those that exist in the "Knight of St. Michael's" cargo. The cargo was, I understand, loaded during the abnormally hot weather which prevailed at the end of January, and it is probable, therefore, that it reached the hold with an initial temperature of from 120 deg. to 150 deg. Fah. In loading from the trucks at Newcastle a considerable proportion of smalls and dust has been produced by the fall and by the process of trimming: by the filling up of the hold the volume of coal necessary to form a non-conducting covering has been provided, while just about sufficient air has access to the hold to complete the necessary conditions.

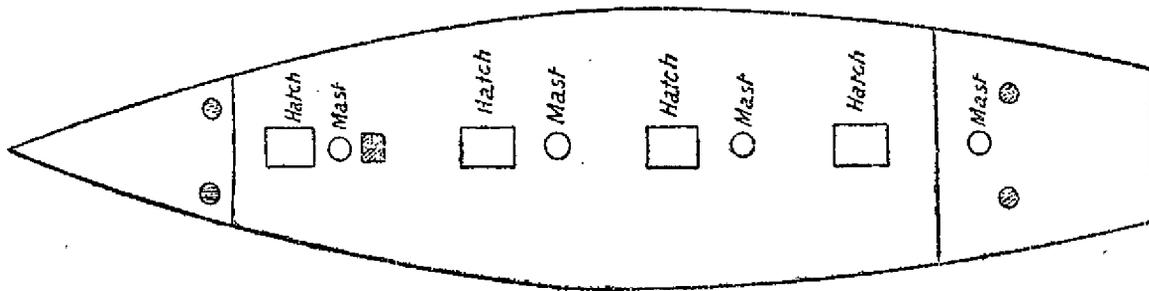

I am of opinion, therefore, that the heating of the cargo of the ship "Knight of St. Michael" is due, firstly, to the fact that the coal contains a large proportion of smalls and dust, and, secondly, to its having been loaded during the abnormally hot weather.

The proportion of "smalls" and "dust" has no doubt been increased by the shifting operations which have taken place since the arrival of the ship in Port Jackson, and I am of opinion that considerable risk would be incurred if the "Knight of St. Michael" were allowed to put to sea with her cargo in its present condition.

I have, &c.,

EDWARD F. PITTMAN,  
Government Geologist.

The Under Secretary for Mines and Agriculture.

Ventilating shafts shown thus  

The Government Geologist to The Under Secretary for Mines and Agriculture. Further report on the cargo of the ship "Knight of St. Michael."

I HAVE the honor to report that I have this morning again inspected the cargo of the ship "Knight of St. Michael."

As will be seen by the report of the marine surveyors, a further quantity of coal (about 500 tons) has been removed, leaving only about 1,500 tons in the ship. About ten days have elapsed since the reduced cargo was trimmed. I find that the coal still contains a considerable amount of dust and smalls, though the proportion is certainly less than on my previous visit. The temperature in the test tube (No. 3 hatch) is 74 deg. I could detect no sensible increase of temperature in the iron rods, and I may add that the conditions which existed on the date of my previous visit have also been modified by the removal of a considerable amount of the mass of overlying coal.

E. F. PITTMAN,  
Government Geologist.

28/3/96.

Extract from *Daily Telegraph*, 7 September, 1896.

The loss of the "Flora P. Stafford."

In the *Daily Telegraph* on Saturday the loss of the British ship "Flora P. Stafford" was announced. Yesterday the details of the disaster were received from Manila. The ship was loaded with 1,964 tons of Seaham coal, from Newcastle to Manila, for Messrs. M'Leod & Co., and caught fire in the Pacific Ocean.

The captain states that at 2 a.m. on the morning of June 6th one of the crew discovered a fire in the main hold. Immediately the matter was reported to the captain efforts were made to extinguish the outbreak, but after two days' heavy work it was discovered that the flames were gaining on the vessel, and that nothing could be done. On the 8th the ship had to be abandoned, and the crew took to the boats, the captain and five men in one, the boatswain and six men in another, and four men in the third. They all steered towards St. Augustine's Island, but next morning encountered a typhoon, and the boats parted company. After several days' exposure the captain's boat sighted land, which proved to be the island of Papua.

## G.

"COLINTRAIVE."

Merchant Shipping Act, 1894.

In the matter of a Preliminary Inquiry before Captain John S. Castle, Inspector for the Board of Trade, into the circumstances attending the supposed loss of the British sailing ship "Colintraive," of Ardrossan, which has not been heard of since leaving Newcastle, New South Wales, for San Francisco, on the 16th day of March, 1894.

*Report.*

In pursuance of my appointment, dated the 4th day of March, 1895, I held a preliminary inquiry as to the cause of the supposed loss of the above-named vessel, on the 12th day of March, at the Waterloo Rooms, Glasgow. Mr. D. McNiven appeared for the Board of Trade, and Mr. James Mackenzie represented the owner, Mr. Hugh Hogarth. Having heard and carefully considered the evidence, I beg to report as follows:—

The "Colintraive" was a British sailing vessel, built of steel in 1892, by Messrs. A. Rodger, & Co., of Port Glasgow, and was registered at Ardrossan, her dimensions being as follows:—Length, 265·3 feet; breadth, 40 feet; and depth of hold, 23 feet; whilst her tonnage was 1,907·44 gross and 1,747·17 tons net register. Her official number was 97,566. She was rigged as a ship, and was the property of Mr. Hugh Hogarth and several others whose names appear on the transcript of the register, Mr. Hugh Hogarth being the managing owner.

There were six ventilators, viz.:—One through the fore-castle into the hold, made of wood, 2 ft. 6 in. by 2 ft. 6 in.; one through the forward deck-house, of similar construction, reaching into the hold; one in pump-well with cowl, and shipped on malleable iron coamings, 3 feet in height; one through fore part of after-house leading into after-hold; and two leading through poop-deck into after-hold, 10 inches in diameter. The wooden ventilators were fitted with skylights on top and canvas covers; whilst those made of iron had wooden plugs and covers. The three iron masts were also fitted as to serve for ventilation when carrying grain cargoes. There being then a few holes in each mast in the hold, each hole being 2 or 3 inches in diameter; and there were caps at the masthead.

The vessel was provided with four boats, two of which were lifeboats, carried aft on beams near deck-house with davits, and two cutters carried on fore deck-house.

In October, 1892, the "Colintraive" commenced to take in her first cargo, which was composed of 3,000 tons of coal and a small quantity of general cargo for San Francisco. She sailed from Glasgow on the 14th, and arrived at San Francisco on the 8th of February, 1893. The coal was secured by shifting-boards which had been supplied by the builders of the vessel, and they extended between the fore and main hatchways from the upper deck beams to the lower beams, and before the fore hatchway and abaft the after hatchway, where the coal was sloped towards the ends of the vessel, they were carried much lower.

Mr. Hogarth stated in his evidence that he considered the use of shifting-boards in coal-laden sailing ships to be very necessary, particularly so in modern ships. I may here state that testing tubes were fitted in the fore and main hatchways, and thermometers were also supplied.

An abstract of the log of that passage has been produced, proving that the temperature of the holds had been carefully taken and registered, showing very little difference from the temperature of the deck in the shade.

From San Francisco she carried a cargo of 3,050 tons of wheat and barley to Liverpool, and then proceeded to Bary, where she loaded 3,070 tons of coal for Cape Town. Captain Raymond, in writing to his owners from Bary, 3rd October, 1893, said:—"I think a thousand long tons might do for ballast: it is just little enough. With 1,019 tons she draws 12 feet only. If we get overweight, no doubt it would do. I think that little enough draught. I shall be careful of shifting-boards." This letter alludes to the ballast to be taken in at Cape Town, before sailing for Newcastle.

The "Colintraive" left Bary for Cape Town on the 20th of October, 1893, and there can be no doubt but that at that time the ship was in a good and seaworthy condition, and she was then valued by her owner at the original cost of £17,920, and insured for that amount, whilst the freight was insured for £2,100, the premium for the two policies amounting to £1,249 for twelve months. She was under the command of Mr. William E. Raymond, who held a certificate of competency as master, No. 39,625, with a crew of twenty-seven hands all told, viz.:—1 master, 2 mates, 1 boatswain, 1 carpenter, 1 cook, 1 steward, 14 able seamen, and 6 apprentices; two of the latter had been fifteen months at sea, and the four others were on their first voyage, two of them having had premiums paid. For a ship of her tonnage, 1,907·44 tons gross, it appears to be a small crew, but taking into consideration that she appears to have been a handy vessel, having double top-gallant yards, no royal masts or yards, with a short bowsprit, and labour-saving appliances on board, I think that she was properly and sufficiently manned. Very little more has been heard of the ship from those on board, but Captain Raymond writes on March 3rd from Newcastle, stating that "he had experienced a fearful hurricane after leaving the Cape, but that he had got out of it all right, and that the ship had behaved splendidly."

Several affidavits which were taken at Newcastle, New South Wales, have been put in. Mr. Herbert Cross states, "He has been several years head manager of the Newcastle Wallsend Coal Co.; that the 'Colintraive' loaded 3,070 tons of that company's coal for San Francisco on the 10th to 14th of March, 1894, during part of which days it rained a good deal. This coal is hard, bright, and bituminous, possessing good qualities for either gas, house, or steam, is free from moisture, and will stand considerable pressure without crumbling, and is therefore well adapted for shipment. It has for the last thirty years been largely shipped to California and West Coast of South America."

"The seam is worked entirely with naked lights, therefore free from dangerous gases; 1 ton weight as broken up for stowage will measure 45 to 46 cubic feet."

Mr. Augustus Bertram, shipping inspector, Newcastle, New South Wales, states, "The Colintraive's draught of water on leaving port to have been 20 ft. 9 in. forward and 21 feet aft, with a freeboard of 4 ft. 10 in. centre of disc awash," and he further states that "she would rise 2 inches on getting into salt water." Under these circumstances she cannot be said to be overladen, but had sufficient freeboard.

With reference to the stowage of the cargo, Johannes Bertram states that "he was the master coal-trimmer of that port, and had been so for many years. I superintended my gang in trimming this vessel; she had no between-decks, but half-deck forward and aft. She took 3,070 tons of coal. There was a space left in the two ends of the vessel for about 700 or 800 tons, and the coal was levelled down there. The coal was taken in by three hatchways, and it was carefully trimmed and in amidships right up to main hatches and deck. There were no other spaces left, save those in the fore and after hold. No shifting-boards were used." If this cargo was stowed, as stated by the above-mentioned Johannes Bertram, with those spaces in the ends of the vessel without shifting-boards, it was not properly stowed, and in the event of the vessel meeting with bad weather there would be nothing to prevent the coal from running at either end whilst the ship was either pitching heavily or scending, and it would naturally go over to the lee side of the vessel, which would give her a list, and thus further increase the cause of the shifting. I have some doubt as to the fact of the vessel having no shifting-

boards. The declaration was made some six months after the "Colintraive" sailed, and it is quite possible the master coal-trimmer may have been mistaken. Mr. Hogarth, the owner, states that "he is confident that the master would not have neglected the precaution of having them put up, as he has known Captain Raymond for twenty-five years, and had the greatest confidence in him." The boards were on board, and some of them had been used with the ballast, and it appears to be almost incredible that an experienced master should fail to use those means to secure the cargo when he had them at hand. The vessel was taken to sea on the 16th of March, 1894, by John Leonard Sweet, a Government pilot, who left her the same day about 4 miles E. by N. from Nobby's Lighthouse.

The cause of the loss of the ship I am unable to account for. It may have occurred through the shifting of the cargo, or by spontaneous combustion, caused, first, from the coal having been shipped in a wet condition; secondly, by the through ventilation from the downcast from the ventilator in the pump-well and up the iron masts; but this must be a matter of mere conjecture.

20th March, 1895.

JOHN S. CASTLE,  
Inspector.

REPORT and Decision of the Local Marine Board, Newcastle, New South Wales, in the matter of the missing ship "Lady Lawrence," Official No. 58,906.

AN inquiry was held by the Board into the condition of the "Lady Lawrence" when she last left this port, and they ascertained that she was an iron ship, of 1,382 tons, twenty-six years old, built in Sunderland, and owned by R. N. Smith & Co., Liverpool, and commanded by Richard Cook, No. certificate, Board of Trade, 92,500, crew twenty-seven all told.

She arrived here from Sydney with 400 tons shale, 200 tons tallow in casks, and about 500 tons general cargo, which latter was landed here.

She took in 1,532 tons of Wallsend coal and left for Valparaiso, but has not since been heard of.

Before commencing to take in her cargo of coal she was visited by the Board inspector and Captain Laidman, marine surveyor for the Sydney Underwriters' Association, who all advised the master, Richard Cook, to shift the shale and tallow out of the bottom of the ship and put it at the ends of her or in the between decks. This he declined to do on the plea that he was acting under his owners' instructions. He was also written to by the Local Board, sending him a copy of surveyors' report, and informed that if he took the vessel to sea under the circumstances it was on his own responsibility.

The vessel was in good trim, the centre of disc being  $2\frac{1}{2}$  clear of the water; she was well fitted with shifting-boards, and had three surface ventilators and a freeboard of 5 feet, and to all appearances the ship was properly equipped.

Office of the Local Marine Board, Newcastle, 15th January, 1896.

W. F. WEATHERILL,  
Secretary.

#### I.

REPORT and Decision of the Marine Board of New South Wales in the matter of the abandonment of the "Girvan," Official No. 99,938.

AN inquiry was held by the Marine Board into the cause of the abandonment of the above-named vessel, and they ascertained that she was a steel barque of 1,230 tons, owned by Mr. David Hunter, and registered in Ayr.

The "Girvan" left Newcastle on the 5th June, with 1,979 tons of coal on board, on a voyage to San Francisco. On the 10th a heavy easterly gale, with heavy cross-sea, was experienced, and the ship laboured very much. At about 5:30 a.m. the next day a very heavy sea struck the vessel, shifting the cargo, throwing her on to her beam ends, and she never recovered herself. The water was over halfway up the main hatch, and heavy seas were washing on board, breaking up to the weather bulwarks.

Efforts were made to get the ship before the wind without avail; the masts were then cut away. At this time Thomas Corigale, carpenter, was washed overboard and drowned.

At 3 p.m. the barque "George Thompson," bound from Sydney to Puget Sound, hove in sight, and she stood by her three nights and two days, and when the weather moderated sufficiently the "Girvan" was abandoned, as there was no prospect of saving her—in fact, when last seen she appeared to be fast settling down.

The crew were landed at Norfolk Island on 22nd June, and subsequently brought to Sydney by the New South Wales Government steamer "Thetis," which was despatched to the island for that purpose.

The Board reported that the abandonment of the "Girvan" was justifiable, inasmuch as the said vessel was in a sinking condition, her cargo having shifted during the exceptionally heavy weather she encountered the previous day.

The evidence at the inquiry alleges that her coal cargo was properly trimmed and stacked at Newcastle; but shifting-boards were not used.

No evidence was adduced upon which to found a charge of default against Joseph Angus, the master, or any other person on board.

In connection with this report the Board wishes to record its appreciation of the meritorious conduct of Captain George Munro, of the barque "George Thompson," for standing by the sinking vessel so long; and also of the mate, Mr. Oscar Jonas Smith, and the boat's crew, who, in three trips, rescued the shipwrecked people when the weather moderated sufficiently to enable them to do so.

Sydney, 11th September, 1893.

GEO. S. LINDEMAN, R.N.,  
Secretary.

REPORT on a Shipping Casualty to the "Patrician."

To the Honorable the Minister having charge of the Marine Department of New Zealand.

I, THE UNDERSIGNED, Edgar Hall Carew, Stipendiary Magistrate, one of Her Majesty's Justices of the Peace in and for the Colony of New Zealand, having been on the seventh day of September, 1896, applied to by Charles Wilford Seymour Chamberlain, Esquire, Collector of Customs at the port of Dunedin, N.Z., for a formal investigation, pursuant to section 240 of "The Shipping and Seamen's Act, 1877," and other provisions of the said Act, respecting the loss of a certain American ship called the "Patrician," of the port of New York, U.S., America, on the twenty-eighth day of August last, in the Tasman Sea, between Newcastle, New South Wales, and Lyttelton, New Zealand, did duly proceed with the said investigation, to wit, on the eighth day of September instant, and had before me and examined on oath divers persons and witnesses, to wit, Edward Robert Sterling, master mariner; John Wilson, master mariner; George Russell Harris, chief mate, "Patrician"; Herbert Martin, second mate; George Ross, chief mate, "Fifeshire"; William Shwatz, A.B.; Charles Petersen, A.B.; the original depositions of whose evidence are hereunto annexed, signed by me, being assisted therein by William Thompson, J.P., master mariner, holding a certificate of competency from the Board of Trade, who was duly appointed by me to act as assessor; and upon such investigation and examination of witnesses as aforesaid, I find and report as follows, that is to say,—

- I. That the official number of said ship called the "Patrician" is 150,171, of which Edward Robert Sterling was master, who holds a certificate of competency, and which ship belonged to Edward Robert Sterling and others, of New York, U.S., America.
- II. That the loss or damage herein more particularly mentioned happened on the twenty-eighth day of August, 1896, on a voyage from Newcastle, New South Wales, bound for Lyttelton, New Zealand, and about latitude  $39^{\circ} 8'$  south and longitude  $158^{\circ} 11'$  east.
- III. That the loss or damage appears by the evidence to have been caused by tempestuous weather.
- IV. That the nature of the loss or damage done was the abandonment of the said vessel, then on her beam ends in a leaky, helpless, and sinking condition. That the insurance on the said vessel is not known here. That the "Patrician" was ship-rigged. Her port of registry New York, U.S., America; her registered tonnage, 1,213. That one person was washed overboard and drowned. And

And I, the said Stipendiary Magistrate, further state my opinion on the matter aforesaid to be as follows :—

That the "Patrician," a wooden vessel of 1,213 tons register, and laden with a cargo of 1,944 tons coal, carrying a crew of fifteen men all told, left Newcastle, New South Wales, on the 22nd August, 1896. According to the evidence, she was then in good seaworthy condition and well found. The coal cargo had been stowed by stevedores, but the vessel carried no shifting boards. On the 25th August the weather became threatening, increasing on the following day to a heavy gale with a high confused sea. The sea swept the decks and heavy spars, one lashed on each side of the deck, broke away from their lashings and washed to and fro athwart ship, striking the stanchions and splitting the covering boards, letting water into the ship's hold. The vessel was on the port tack and was found to be gradually settling down with a list to starboard, and all the pumping which could be done under great difficulties could not get the water down. The gale continued on Thursday, the 27th August, with heavy seas breaking on board, and the ship taking longer and longer to recover herself. The upper spars were cut away to relieve the vessel, and in coming down carried away the mainmast head and fouled the mizzenmast, with the result that the ship became a helpless wreck. On Friday, the 28th August, the gale still continued. The vessel was sighted by Captain Wilson of the steamer "Fifeshire," who bore down upon the "Patrician" and rescued all hands, the ship being abandoned in a sinking condition, and from the evidence there can be no doubt that she would go down within a few hours after the rescue of the men. I am of opinion that the loss of the "Patrician" was due to the heavy gale of wind and high sea and to whatever cause the list of the ship may be attributed.

I recommend that the Government pay the costs of this investigation.

Given under my hand, this sixteenth day of September, one thousand eight hundred and ninety-six, at Dunedin, New Zealand.

(Signed) E. H. CAREW, S.M.

I concur in the above report, and after duly considering the evidence, with the advantage of having had nine years' experience in the coal carrying trade, I am of opinion that Captain Sterling, in not making use of shifting boards in the 'tween deck and lower hold, did not fully preserve the seaworthiness of his vessel to safely encounter the tempestuous weather in which she was wrecked. The cargo, without shifting boards, was right for ordinary weather only. Although it did not appear in evidence that the cargo was seen to have shifted, still it was shown that the vessel was noticed to be gradually listing over, accounted for by the captain to be caused by the water in the hold; but if that had been the cause, the vessel when put upon the opposite tack, as was done, would have gone quickly over on the other side, which she did not do, therefore a sure index to the coal having shifted.

It appears to me that there is as much need for a compulsory shifting board regulation for the safety of vessels carrying coal and grain cargoes as for the compulsory "Free-board rule." I also suggest that a rocket apparatus should form part of the equipment of vessels, in order to project lines in cases of distress, when communication by boat is impossible.

WM. THOMSON,  
Nautical Assessor.

We desire to express our admiration of the gallant conduct of the Chief Mate of the "Fifeshire," George Ross, Boatswain Mouatt, and Quartermaster Martin, who manned the boat that rescued the officers and crew of the "Patrician," and of the assistance rendered to the rescue party by the skillful management of the "Fifeshire," and generally the courage displayed on all sides.

E. H. CAREW, S.M.

### EXPLOSION ON BOARD THE "ARGO."

New South Wales, }  
to wit.

#### PROCEEDINGS OF INQUEST.

AN inquisition indented taken for Our Sovereign Lady the Queen, at the house of Alfred Denson, known as the "Croydon Hotel," George and Argyle Streets, in the city of Sydney, in the said Colony of New South Wales, on the 24th day of July, in the fifty-seventh year of the reign of Our Sovereign Lady Queen Victoria, by the Grace of God of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith, and in the year of Our Lord 1893, before John Chadwick Woore, gentleman, Coroner for the district and city of Sydney, on view of the body of Robert Arfsten, lying dead at the North Sydney Morgue, in the said district of Sydney, upon the oath of Arthur Pollard, Stafford H. Barnes, John Robertson, Richard McIntyre, William Keppie, William Cordingley, William Fitzgerald, William Mitchell, Peter McGlinchey, Richard B. Goff, Joseph Fox, Patrick Fahey, good and lawful men of the said Colony, duly chosen, and who, being then and there duly sworn, and charged to inquire for Our said Sovereign Lady the Queen, when, how, and by what means the said Robert Arfsten came by his death, do upon our oath say, we find that the said Robert Arfsten, on board the barque "Argo," then lying at Neutral Bay, Port Jackson, in the said Colony, on the 22nd day of July, A.D., 1893, died from the effects of injuries accidentally received on the same day through an explosion of coal gas on board the said barque "Argo" on that day.

In witness whereof, as well as the said Coroner, the Jurors aforesaid have hereunto set their hands and seals the day and year first above written.

J. C. WOORE, J.P., City Coroner.	W. CORDINGLEY, WILLIAM MITCHELL, WILLIAM FITZGERALD,	R. MCINTYRE, W. KEPPIE, JOSEPH FOX,
R. B. GOFF, Foreman,	JOHN ROBERTSON.	PATRICK FAHEY.
STAFFORD H. BARNES,	ARTHUR C. POLLARD,	P. MCGLINCHHEY.

New South Wales, }  
to wit.

INFORMATION of witnesses severally taken and acknowledged on behalf of Our Sovereign Lady the Queen, touching the death of Robert Arfsten, at the house of Alfred Denson, known as the "Croydon Hotel," Argyle-street, in the city of Sydney, in the said Colony of New South Wales, on the 24th day of July, in the fifty-seventh year of the reign of Our Sovereign Lady Queen Victoria, by the Grace of God of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith, and in the year of Our Lord 1893, before John Chadwick Woore, gentleman, Coroner for the district and city of Sydney, on an inquisition then and there taken on view of the body of the said Robert Arfsten, lying dead at the North Sydney Morgue, in the said city of Sydney, as follows :—

To wit,—*Albert Schatz*, on oath, states :—I am captain of the barque "Argo," now lying at Neutral Bay; she is coal-laden; she was bound for Valparaiso; the dead body I have viewed in the presence of the City Coroner and jury at the North Sydney Morgue is that of Robert Arfsten; he was 49 years of age; he was born on an island called Fohr, off the coast of Germany, near Heligoland; he was married, leaving a widow and three children; I don't know whether he left any property; he was a man of temperate habits; he was chief officer of the barque, and held the position about two years; I have been captain of the barque since 1st December, 1892; the barque was lying at Pymont Wharf when she was loaded; I put some coal on board at Dalton's Wharf, 170 tons on last Thursday week; last Saturday week I moved to Pymont and started taking in coal, and on Thursday last the ship was full; no dispute arose with the stevedores; the coal was supplied by the Metropolitan Coal Company; I do not know how long the coal had been lying at the wharf; I had no other cargo; I had no explosives on board; the ship was finished at 1 p.m., on Thursday, and I moved away the same day to Neutral Bay, where the vessel now lies; the hatches were left off for ventilation until Friday night; about 4 p.m., on Friday, I put on the after hatch and main hatch, leaving the forward hatch open; I also had three ventilators and gas pipes placed in the main and after hold; I intended to proceed on my voyage on Friday night, but as I could not get my papers I had to wait until Saturday; on Saturday, the 22nd instant, I went ashore about 9 a.m.; everything was well on board when I left, and the deceased was on board quite well and uninjured; I spoke to him as I left; the crew, consisting of seventeen and a passenger, were on board when I left; I got the crew at Hamburg; there was no alteration in the crew here; I had no disagreement with anyone on board during the whole voyage out or here; when I left on Saturday the fore hatch and ventilators were open; I heard something after I had been on shore about twenty minutes; I went on board, and got there about 10.15 a.m.; I found the vessel then in the condition

condition she is now; I did not see the deceased; he had been removed; I did not hear the explosion; from the appearance of the vessel it appeared to be there had been a serious explosion; I cannot account for the damage done; during the time I've been master of a ship this is the second cargo of coal I've had; I did everything that could be done for the safety of the vessel; I do not blame anyone for the explosion; the decks were blown up fore and aft and the fittings destroyed; I cannot estimate the damage done; the vessel was insured for £5,200 in Hamburg; I do not know whether the freight was insured.

*By Foreman:* There were no holes in the pipes put down.

*By Jury:* I was down when the ship was loaded, and saw everything was safe, and so was the deceased and second officer.

*By Coroner:* I am sure no lights were left below.

Sworn and made, at Sydney, 24th July, 1893, }  
before me,—

J. C. WOORE, J.P., City Coroner.

ALBERT SHULZ.

*Daniel Robertson*, on oath, states:—I am manager of the Metropolitan Coal Company's mine at Helensburg, 28 miles from Sydney; last Friday or Saturday week some coal was forwarded, to be placed on board the "Argo," and some was forwarded last Monday; the coal was sent direct from the mine, direct from the pit, and sent on to Sydney; there have been no explosions in the pit; all precautions are taken to prevent explosions; we use safety lamps; this coal gives off more gas than some other coal in the Colony, and it is for that reason we take all necessary precautions.

DANIEL ROBERTSON.

Sworn and made at Sydney, 24th July, 1893, }  
before me,—

J. C. WOORE, J.P., City Coroner.

*Thomas Brentnall*, on oath, states:—I am manager of the Metropolitan Coal Mining Company, corner of Pitt and Bridge Streets, Sydney; I reside at Ashfield; I remember some coal being sent to load the "Argo"; it was sent to Darling Harbour, the first of it last Monday; previous to that she had 170 tons of stiffening; the rest of it was sent direct from the mine, and put on board; none of the coal was lying exposed for any time; it was put on board as fast as she could take it in; it is usual to bring the coal direct from the pit in hoppers, and put it into the ship straight away.

THOS. BRENTNALL.

Sworn and made at Sydney, 24th July, 1893, }  
before me,—

J. C. WOORE, J.P., City Coroner.

*William Muggford Hamlet*, on oath, states:—I am Government Analyst, and reside at Mossman's Bay; this morning, in company with the City Coroner and jury, I went on board the barque "Argo," now lying at Neutral Bay; I saw the decks had been lifted fore and aft, and great damage had been done to the vessel internally; I am of opinion that damage was done by an explosion; it may have been due to three causes: first, the combustion of the occluded gases in the coal, or it may have been due to the chemical changes of the brassy or sulphides in the coal, and the third cause may have been the ignition of coal dust by means of a spark, which might have been spontaneous; in my opinion it was not due to other causes than those I have mentioned; I saw that the vessel was coal-laden; I looked at and examined the coal; I could not tell from its appearance what mine it came from; I heard the evidence of Mr. Robertson and Mr. Brentnall; I heard them both say the coal was brought direct from the pit and put into the vessel as soon as possible; I have made an examination of the gases from the coal of the Metropolitan Coal Company from the mine at Helensburgh; the gas I made the analysis of was of a fiery character and contained fire-damp; I've analysed coal from other mines in the Colony; if the coal had been taken direct from the pit and put into the vessel without being exposed it would be more likely to explode; coal of this nature—the coal I speak of is something similar to coal at Cardiff, South Wales, which I have known to explode; it would be a great advantage to have the coal exposed before loading—for some days before loading; the analysis I made of the coal was about two years ago.

*By Mr. Robertson:* The occluded gases are lighter than air and naturally ascend; if the occluded gases had free access to the air there would not be any accumulation of the gases; the fore-hatch being open the gases would naturally ascend towards there; there might still have been an explosion in the hold; since I was on board I have been to the observatory; I have inspected the barograph indicating the pressure of the atmosphere from midnight on Friday to mid-day on Saturday last, and there was no depression to account for the accumulated gas; a spark might ignite coal dust; I've heard of occasions when it happened sometimes from blown-out shots; I say the explosion may have been due to either of the three causes I've mentioned; it generally takes considerable time for spontaneous combustions to take place; I made an analysis of the Metropolitan coal gas; it was of a fiery character and contained fire damp; in consequence of the nature of gases the Company adopted safety lamps; in my report I said that the gas contained carbonic acid and carbonic oxide which neutralised the explosive character of the gas.

*By Coroner:* A lighted candle or smoking in the hold would be likely to cause the explosion.

*By Jury:* If there was carbonic acid in sufficient quantity it would put a lighted candle out, but fire damp would ignite the gas.

*By Mr. Robertson:* Fire-damp may be breathed for a short time; a man could not remain for any time in it.

WILLIAM M. HAMLET.

Sworn and made at Sydney, 24th July, 1893, }  
before me,—

J. C. WOORE, J.P., City Coroner.

Evidence given through Mr. Michel, Interpreter:—

*Martin Anderson*, on oath, states:—I am a carpenter on board the "Argo"; that was the dead body of Robert Arfsten, who was chief officer of the "Argo," that I saw this morning in the presence of the City Coroner and jury, at the North Sydney Morgue; I was on board the "Argo" on Saturday morning last; I saw the captain go away after breakfast; he went on shore; the deceased, and the remainder of the crew, remained on board; I last saw the deceased alive on the fore part of the ship, after the captain left; deceased was not smoking; about a minute after there was an explosion, bursting up the decks fore and aft; I didn't see deceased at moment of the explosion; I was in the fore part of the ship, forward of the fore hatch; I was standing alongside the cook when the explosion took place; I saw the cook in the fore hatch; he was there about ten minutes, and came up a very short time before the explosion; the cook was not smoking; he had no light; the hatch was open; I didn't see anyone else down there that morning; I had not been down that morning; I do not know what caused the explosion; I saw the deceased dead on the poop just after the explosion at the spot where some blood was shown to the Coroner and jury this morning; I helped to get the body out; I helped to carry the body to the steamer; there was no one but the crew and the passenger on board at the time the explosion took place; there had not been any quarrel between the captain and any of the crew.

*By Jury:* There was no quarrel between the crew and the trimmers.

MARTIN ANDERSON.

Sworn and made at Sydney, 24th July, 1893, }  
before me,—

J. C. WOORE, J.P., City Coroner.

## Evidence given through the interpreter, Mr. Michel.

*Herman Huening*, on oath, states: I am a cook on board barque "Argo," now lying at Neutral Bay; that was the body of Robert Arfsten I saw this morning at the North Sydney morgue in the presence of City Coroner and jury; I was on board on Saturday morning last with the crew when the captain went on shore after breakfast; I went down the fore-hatch after the captain left; I was down about five minutes; I went to get some potatoes; they were immediately under the hatch; I went up as soon as I got the potatoes; there was one passenger; I did not see any of the crew or the passenger down the hold that morning; I was not smoking when I was down; when I came up I went forward to the pump to wash the potatoes; I saw the deceased forward of the main hatch; he was on deck, forward of the fore hatch; he was not smoking; I saw him go aft; while I was washing the potatoes the explosion took place; I did not see deceased then; I was not knocked down by the explosion; Hansen was in the fore-castle; I saw deceased after the explosion on the mid deck, where there is blood; that was pointed out to the coroner and jury; he was quite dead; I helped to remove him; there had not been any quarrel between the ship's crew and the stevedores or wharf labourers, or between the ship's crew and the captain; the crew came with the ship from Hamburg; there were no strangers on board when the explosion took place; I do not know there was any cotton waste on the vessel; I cannot account for the explosion in any way.

*By Jury*: There were a few flames of fire at the explosion; there was a fire in the galley.

HERMAN HUENIG.

Sworn and made at Sydney, 24th July, 1893, }  
before me,— J. C. WOORE, J.P., City Coroner.

## Evidence given through the Interpreter, Mr. Michel.

*Christian Hansen*, on oath, states:—I am a sailmaker of barque "Argo," now lying at Neutral Bay; that was the dead body of Robert Arfsten I saw at the North Sydney morgue this morning in the presence of the City Coroner and jury; I and the crew and one passenger were on board on Saturday morning when the captain went ashore; he went ashore after breakfast; I was standing on the fore-castle hatch; the fore hatch was open; I remained there until the explosion took place; the explosion took place from half-an-hour to an hour after the captain went ashore; I did not see the deceased at the time; I saw him forward near the fore hatch and about two minutes after the explosion took place and lifted the deck; I did not see the passenger; I saw the passenger taken out of the water after the explosion; after the explosion I saw deceased lying dead aft near the mizzenmast; no one had been down to the hold where the coal was that I know of; I can't account for the explosion; there had not been any quarrel with the captain and the crew or the crew and the wharf labourers; I saw a quantity of smoke when the explosion took place.

CHRISTIAN HANSEN.

Sworn and made at Sydney, 24th July, 1893, }  
before me,— J. C. WOORE, J.P., City Coroner.

TABLE VIII.

SHOWING for each colliery the total sailing shipments to America, with the number of casualties from heating, and the number of missing vessels.

Colliery.	Total shipments to America.	Cases of firing or heating.	Number of missing vessels.	Total.	Total casualties as percentage of total shipments.
Wallsend .....	1,118	6	9	15	1.34
Duckenfield .....	355	1	3	4	1.13
Greta .....	252	...	1	1	.40
A. A. Co. ....	84	...	1	1	1.19
Cooperative .....	74	1	1	2	2.70
Lambton .....	47	...	...	...	...
Stockton .....	35	...	1	1	2.86
New Lambton .....	33	...	...	...	...
West Wallsend .....	28	1	1	2	7.14
Hetton .....	27	...	...	...	...
Pacific (formerly Northern) .....	26	2	...	2	7.69
Seaham .....	16	...	...	...	...
Cardiff (formerly South Wallsend) .....	12	(see foot note)	...	...	...
Northern Extended .....	1	...	...	...	...
Mixed .....	...	2*	...	2	...
Burwood .....	11	...	...	...	...
Young Wallsend .....	11	...	...	...	...
Waratah .....	8	...	...	...	...
Newcastle .....	4	...	...	...	...
Wickham .....	4	...	...	...	...
East Greta .....	3	...	...	...	...
	2,149	13	17	30	1.40

The data are too few in number to allow of much weight being attached to the actual numerical value of the percentages.

\* These two shipments were made up as under, but in the reports from which the figures are compiled, they appear as from the Cardiff Colliery, and are included in the twelve shipments from that colliery.

	1.	2.
	Tons.	Tons.
Cardiff .....	920	1,167
Northern Extended .....	1,178	1,785
Pacific .....	...	262
	1,798	3,154

It has not been ascertained in how far the mixing of cargoes affects the above list in regard to the smaller collieries.

TABLE IX.

NUMBER of sailing shipments, under and over 2,000 tons, which left Newcastle for Foreign ports between the years 1888 and (30 September) 1896 :—

Destination.	Under 2,000 tons.	2,000 tons and over.	Total.
West Coast of America .....	1,165	984	2,149
Ports North of Australia .....	239	92	331

NOTE.—On the following comparison being instituted between the figures of the total quantity of coal shipped from 1888 to 30th Sept., 1896, to foreign countries, as obtained from the shipping reports of Messrs. R. B. Wallace and Stokes & Co. (from which the tables in this Appendix are compiled), and as shown in the Custom-house Return (see Appendix "S") discrepancies were seen to occur, and in answer to a question as to the explanation thereof, Mr. Wallace replied as under. We think the suggestion made by Mr. Wallace most probably accounts for the main difference.

	Total Tonnage of Coal shipped.	
	As in Shipping Reports.	As in Customs Return.
West Coast of America	4,362,019	4,326,599
North of Australia	1,216,598	1,234,227
Sandwich Islands	314,422	304,578
Mauritius, Madagascar, and South Africa	87,942	
Mauritius alone		91,547
India and Ceylon	167,208	314,215
New Caledonia	78,497	100,566
South Sea Islands	19,156	20,026
Other Countries (including a few shipments to American Ports)		114,369

Dear Sir,

I am in receipt of your note of yesterday, and really cannot understand the difference in the quantities of coal by my circular and Customs returns. My circular is compiled from the actual quantities of coal shipped by each ship, as per bill of lading, and I am certain is correct. I, however, do not include in the case of steamers the quantity of coal taken in bunkers for consumption on the voyage, and if steamers clear at Customs with both cargo and bunker coal this may account to some extent for the difference in the case of Ceylon, India, and New Caledonia, but I do not remember any steamers taking coal to Mauritius, and the export for that place should agree with my circular.

I regret I can give you no further explanation of the matter.

Newcastle, N.S.W., 7 January, 1897.

I remain, &c.,

ROB. B. WALLACE.

(p. H. NICKISSON.)

W. Wilson, Esq., Secretary, Coal Cargoes Commission, Sydney.

## M.

REPORT of Inquiry held at the Chamber of Commerce, Newcastle, by the Committee on the 8th, 9th, and 10th October, 1891, to ascertain the best means of loading and stowing coal cargoes.

Gentlemen,

Chamber of Commerce, Newcastle, 29 October, 1894.

Owing to the reported shifting of the cargoes, notably of the "Poitalloch," "Cambrian Chieftain," and "Parthia," which were recently loaded with coal at this port, and the fact that during the last four years eight vessels have sailed from this port and been posted as missing, the Committee of this Chamber feel that prompt and effective measures are necessary to save the credit of Newcastle, and to this end have held an independent inquiry as to the best means of stowing coal cargoes loaded here for foreign ports. It was thought that by taking the evidence of captains, shipping agents, stevedores, trimmers, and others interested, some decision might be arrived at which would benefit all concerned. This has been done, and after carefully reviewing the evidence, the Committee have arrived at the following conclusion:—

1. That considerable laxity has been shown by captains, officers, stevedores, and trimmers.
2. That shifting boards and bulkheads, particularly in modern vessels, are absolutely necessary, and their adoption should be made compulsory.
3. That the trimming of all coal cargoes should be under the supervision of the Government.
4. That in no case (as is quite clear from the evidence) has any vessel sailing from this port, carrying Newcastle coal solely, been lost through spontaneous combustion, but by a lamentable degree of carelessness in the supervision of the trimming.
5. That the following resolution, which was unanimously adopted by the Committee, be conveyed to the Colonial Treasurer, viz.:—"That a deputation wait upon the Colonial Treasurer to ask the insertion of a clause in the Navigation Act of New South Wales (now before Parliament) making the use of shifting boards and, where necessary, bulkheads compulsory; and also that the Government supervise the stowage of coal cargoes here."

The Committee hope to inaugurate at an early date a better state of things at this port, and they trust that their action in endeavouring to investigate this matter, fully may meet with universal approval. In the meantime, they would urge all shipowners to give captains strict instructions that their officers supervise the trimming of all coal cargoes at Newcastle.

Yours faithfully

(For the Committee),

D. J. McLEAN,

President.

## N.

## WORKING RULES OF THE COAL-TRIMMERS' UNION.

*Wages*

1. All members of this union shall be paid for their labour at the following rates per hour:—

	DAY.	NIGHT.
Trimming Coal .. .. .	1s. 3d., per hour.	1s. 9d. per hour.
Trimming Coke .. .. .	1s. 6d. ,,	2s. 6d. ,,

Working meal hours, 2s. 6d., when members are actually working that hour: but in case an employer shifts into an empty hatch and runs it up during meal hour, then members shall be paid at the rate of 1s. 3d.

*Chance Work.*

2. Any "chance job" of work lasting three hours or less to be charged:—Day-work, 5s.; night-work, 7s.

*Going out in the Stream.*

3. All members of this union going out into the stream shall be on pay until they are landed on the wharf.

*Working under Current Rates.*

4. Under no circumstances shall any member of this union work for less than the current rate of wages.

*Working on Sundays.*

5. Any member of this union working at any time between the hours of 12 o'clock on Saturday night and 12 o'clock on Sunday night shall be paid at the rate of 5s. per hour.

*Working on Holidays.*

6. Any member of this union working on a holiday shall be paid at the rate of 5s. per hour from 6 a.m. to 6 p.m.

*Tide work and Shift work.*

7. All members of this union employed by foreman coal trimmers, captains of vessels, or other employers of labour at tide or shift work, shall be paid 10s. for the former and 5s. for the latter. The tide and shift money to be equally divided among the gang at work.

*Running up Hatches.*

8. Any vessel with an empty hold coming (in the day time) under the cranes or shoots to load a coal cargo (union labour being employed on board such vessel), the foreman coal trimmer is to be allowed the privilege of "running up" one hatch without employing a gang: but if the said vessel has coal cargo in a hatch besides the one working, then the full gang is to be set on when the first waggon of coal cargo goes into the hold. The words "coal cargo" shall be understood to mean coal, coke, kerosene shale, or any allied substances.

*Vessels loading at night.*

9. In the event of a vessel coming under to load empty at night, the boss may run one hatch, if he can, till 12 o'clock, or may call his gang out any hour before 12 o'clock; but in the event of him wanting his gang before 6 a.m. he must pay them from 12 o'clock. In the event of him shifting to another hatch he must pay his gang from the time of shifting to that hatch.

*Full Gangs to be Employed.*

10. At all times, day or night, a full gang of men must be employed.

*Definition of the term "Gang."*

11. This union does not specify what number of men shall compose a "gang." The term is to signify the full number of men required to do the job.

*Men Discharged by Employers.*

12. (1.) If any foreman coal trimmer discharges any man or men from the vessel whereon he or they are employed, the foreman coal trimmer may not substitute any man or men in the place of those so discharged.
- (2.) But if the foreman coal trimmer should afterwards require more labour he must reinstate those whose services he had dispensed with, and pay them from the time of being discharged.
- (3.) In the event of a boss not being able to get the men discharged he may employ others in their place, and pay them from the time he discharged the aforesaid men.
- (4.) If the loading of a vessel is supposed to be completed and the gang leaves, and the foreman coal trimmer afterwards receives orders to take in more cargo, he may in this case employ another gang to do the additional work.

*Division of Labour.*

13. In the event of a vessel coming under to load, and will take about 20 hours, the first gang must be relieved as near half time as possible, but should the job last (say) 30 or 40 hours a day, a night gang to be employed.

*Non-Members.*

14. (1.) No member of this union may work with a man who is not a member.
- (2.) No member of this union may work for an employer who does not employ union labour.

*Assisting Employers to procure Union Labour.*

15. All union men shall, so far as lay in their power, assist their employers to procure union men if the employer requires them.

*Infraction of Rules.*

16. Should it be proved before a general meeting that any member of this union has violated any of the foregoing rules, or committed any breach of the by-laws, he shall be fined the sum of 5s.

O.

Some idea of the cost of working can be gathered from the unmentioned items of expenditure :—

The interest on the cost of the cranes, engine-houses, and machinery, jetties, electric light plant, railway line, and sidings, &c., at Bullock Island is, per annum .....	£ 13,960
(The question has been raised that the Commissioners are not charged interest upon this capital expenditure, but it is necessary to point out that this expenditure has been incurred by the State and became invested in the Railway Commissioners under the terms of the Railways Act. It is, however, only a small set-off against the many unremunerative works which the Commissioners are called upon to administer, and which are debited to the railway account. It is the State that receives the benefits, as the Commissioners administer a State property).	
Amount paid for shipment of coal, repairs to cranes, &c., per annum, about .....	11,000
The traffic expenses (without cost of controlling staff, printing, &c.) and wages of the coal overseers, berthing masters, shunters, stores and supplies at Bullock Island, equal per annum .....	16,056
The Loco. expenses, including interest on the rolling-stock employed and cost of renewals and repairs, part interest on running-shed, cost of engine-drivers, firemen, &c., amount to per annum .....	20,857
The interest on the proportionate cost of the main line, together with cost of maintenance of line and sidings, interest on cost of duplication of line—Hamilton and Teralla—equal to, per annum .....	16,200
Working and maintenance of electric light plant, engine-house, hydraulic plant, &c. ....	3,600
Total .....	£81,673
The total revenue for twelve months past was .....	£80,000
The total cost of working was .....	£81,673
Leaving only .....	£7,327

towards cost of the renewal of the lines, &c.

Complaint was made that the rates have not been reduced for thirty years past, but as a matter of fact considerable reductions have been made, as, for instance, thirty years ago the rate for 1 mile was 11d., to-day it is 6d. for large or 5d. per ton for small coal. For 4 miles the rate has been reduced from 11d. to 9d. for large and 7d. per ton for small coal; for 7 miles, from 1s. 1d. to 10d. for large and 8d. for small coal; for 15 miles, from 1s. 4d. to 1s. 2d. for large and 11d. small; and for 20 miles, from 2s. to 1s. 3d. for large and to 1s. per ton for small coal.

The representative of the Waratah Company stated that they had two-thirds of all the traction, but did not get one single iota from the Commissioners, &c.

The Waratah Company have shared in the above general reductions, and they have also had special consideration. Four years ago the rate was reduced from 10d. to 9d., a 10 per cent. reduction, the condition applying that they were to send 50,000 tons of coal per annum, and under the general reduction made in March last year this was again reduced to 8d., equal to a 20 per cent. reduction within four years, and small coal, which four years ago was charged at 10d. per ton, is now charged at little more than 6d. per ton.

In addition to the great concessions that have been made in the rates, the accommodation and facilities for working the business have been greatly extended within recent years at the expenditure of a very large sum of money.

The first hydraulic cranes were put up in 1878. The hydraulic plant has been added to and the electric light has since been installed so as to enable shipping to be carried on in a satisfactory manner at night time. As an instance of the facility with which ships are loaded to-day as against thirty years since, it is represented that in 1868 the loading was about 900 tons in three days; in 1896 1,900 tons have been loaded in thirteen hours. It can readily be understood what enormous saving this must be to shipowners, and is of more practical benefit to the colliery owners in competing for business than even a great reduction in the coal-haulage rates, if it were possible to do more than has been done.

With regard to the complaint made that the coal receives rough treatment during traction, it may be mentioned, as already pointed out, that the wagons used are supplied by, and belong to, the collieries; but in many instances they have numerous defects, and for some time past the attention of a number of the companies has had to be very strongly drawn to defects that require attention.

## V.

Testimony of Captain W. H. Eldred, Consul-General for Chile, forwarded to the Royal Commission on Coal Cargoes on the 20th November, 1896.

1. *Experience.*—I went to sea in 1830, commanded a vessel about fourteen years, and settled in Sydney as a merchant in 1854; I was soon after appointed Consul for Chile, and in 1879 was promoted to the higher office of Consul-General for Australia and New Zealand.

I have carried about a dozen cargoes of coal without any disaster. I never used shifting-boards or bulkheads, but was always careful to see the cargo well trimmed.

From 1854 to 1881 I shipped several (say over two hundred) cargoes of coal, more or less, at Newcastle and Sydney for foreign ports, and to the best of my recollection none of them became heated or shifted.

2. *Shifting-boards.*—With grain, especially linseed, I consider shifting-boards indispensable, but not with coal cargoes.

3. *Trimming.*—Coal having a low specific gravity of 1.330 is the liveliest deadweight cargo that is carried; the main body of the ship (unless she be exceptionally tender) should be quite filled by careful trimming close up to the decks to prevent shifting, and make the ship easy at sea; and it is the shipmaster's duty to see that his cargo is properly trimmed.

4. *Bulkheads.*—It is certainly a safeguard to have bulkheads at the extreme ends of the cargo, particularly in ships built with full round lines, but I have never used them, and consider that if the body of the ship is quite filled up to the decks, bulkheads are not absolutely necessary as a rule.

5. *Cause of Heating.* I am inclined to attribute the spontaneous combustion of some cargoes to be more frequently caused by the coal going direct from the mine to the ship's hold in a wet condition, battened down, and not properly ventilated than I do to the generation of gas.

6. *Explosions.*—This is a subject for scientists, and in which I have not had any experience, but I venture to express my strong opinion that the explosion on board the "Argo," in Sydney Harbour on the 22nd of July, 1893, was caused by an explosive that expends its force upwards, with a fuse attached, having been placed in the coal a few feet below the lower deck in the after hatchway. On that occasion the chief officer was killed, and Mr. Chamberlain, a passenger, was blown up and injured for life. My reasons for expressing this opinion are that the explosion occurred within the short space of time of about fifteen hours after the ship was loaded in Darling Harbour, during which period the fore hatch was left open, consequently the air was not excluded from the hold. Some time after the explosion I went on board the ship, when I saw a large hole 7 or 8 feet deep in the coal beneath the after hatchway, from which a few tons had been blown up, but the cargo was not disturbed elsewhere; the iron beams and coamings on the lower deck immediately over the hole were twisted and bent considerably, and the explosion in its natural course to the fore hatchway, which was open, lifted the upper deck with the beams fore and aft, and ruined the ship.

7. *Fired Cargoes.*—I produce from the records of my Consulate-General a list of fifteen coal-laden ships\* that left Newcastle, from the 1st of January, 1890, to the 30th June, 1896, the cargoes of which were either burned or became heated. These casualties by fire appear to me to be very small considering the number of ships that sailed from Newcastle with coal during that period, and will, I think, compare favourably with similar losses of British coal.

8. *Missing Ships.*—I also produce a list of thirteen vessels\* that left Newcastle with coal from the 1st of January, 1890, to February, 1896, inclusive, that have not been heard of since, and it is remarkable that six of these casualties out of the thirteen occurred during 1895, the same number that were missing during the four previous years.

9. *Overloading.*—Shipmasters in their anxiety to earn money for their owners sometimes overload their ships, meet with severe weather, and while scudding, a following heavy sea after passing the stern and lifting it considerably, the ship becomes immersed (say) between the main and mizzen masts, and when it happens to break on board at that moment its force and volume are so immense that the main hatches give way, everything movable on deck is washed overboard, the ship broaches too, and is doomed.

10. *Icebergs.*—It is only reasonable to suppose that some of the ships from Newcastle for Chile that take the Great Circle track collide with ice and are thus lost with all hands.

\* Included in Appendix A.

W.

Letter from the Master of the ship "King David," to the Manager, Wallsend Coal Co., Newcastle.

Ship "King David," Valparaiso, Chile, 28 October 1896.

H. Cross, Esq., Wallsend Coal Co., Newcastle, N.S.W.,—

Dear Sir,

We arrived here all well on the 21st instant, after a rather long passage of sixty-two days, having met with a persistent south, south-east, and east winds for thirty days during our passage, between 39° and 44° south latitude, and 168° and 118° west longitude.

As I promised before leaving your port, I beg to forward you the attached sheets kept showing tests of temperature in a cargo of coal shipped by the Wallsend Coal Company, Newcastle, N.S.W., and carried in the ship "King David" to Valparaiso. On the 29th of July we received stiffening—300 tons in after hatch and 200 in fore hatch. This was shipped quite dry, and kept the same temperature until we commenced to load. We started to load on August 15th, and took in about 1,000 tons in main hatch. This lot had been on the line over night in very heavy rain, and was taken in very wet. At my request the waggons containing the above 1,000 tons were lowered right down the hold, and the first waggon emptied within 3 feet of the keelson. This could not be done aft or forward, the hatches being too small.

Yours, &c.,

ROBERT JONES.

Ship "King David" of Glasgow.—Tests of temperature in a cargo of coal of 3,600 tons, carried from Newcastle, N.S.W., to Valparaiso.

Letter from the Master of the "Bracadale" to Mr. Doddmeade, Co-operative Coal Company.

Mr. Doddmeade, Co-operative Coal Company,—

Dear Sir,

San Francisco, Cal., 27 November, 1896.

I enclose with this a note of changes in temperature of the coal cargo shipped by you on the above vessel in August last. You will note that the temperature practically never exceeded that of the outside air, and this in spite of being shipped under what some regard as unfavourable conditions, the larger part having been drenched by torrents of rain while in transit from the pit and during shipment. I have never been quite able to accept the view that wet promotes combustion, and this instance should strengthen me. I believe we must seek elsewhere for the cause of heating of coal cargoes. You will note that I have only given five-day intervals; the daily readings seemed unnecessary.

You would perhaps like to make this public.

Yours truly,  
H. YOULDEN,  
Master "Bracadale."

Arrived at Frisco.  
At anchor in Bay.

H. YOULDEN,  
"Bracadale."

Y.

On the 17th November I inspected the operation of loading the ship "Frances Fisher" at Newcastle with the assistance of Harper's coal distributor. The "Frances Fisher" is a three-masted steel ship, capable of carrying a cargo of about 2,200 tons of coal; and the coal in this instance was supplied by the Wallsend Colliery.

The distributor was suspended by hooks and chains from the coamings of the main hatch, but owing to the size of the machine, and the position of the fixed vertical iron ladders at the ends of the hatchway, it was found impossible to raise the saddle of the distributor level with the coamings of the hatch. Moreover, the jib of No. 7 hydraulic crane, by which the loading was done, was not sufficiently long to allow of the hopper-wagons containing the coal being lowered through the hatchway on to the saddle of the distributor. The coal was therefore subjected to a fall of several feet on to the distributor when the bottoms of the wagons were opened, and this caused the production of a considerable amount of small coal, in addition to what had already accumulated in the wagons.

The "Frances Fisher" is provided with open 'tween decks, but the cross (steel) beams interfered considerably with the fixing of the distributor, and it was found impossible to extend the side-shoots of the latter under the 'tween decks. The coal was consequently here subjected to a further drop, equal to the height of the lower hold, with a corresponding increase in the production of smalls. Owing to the jib of the crane being too short, the wagons were discharged at one side of the cone which projects from the saddle of the distributor, and, under these circumstances, the cone not only failed to perform the function for which it was designed, but rather aided in the smashing of the coal.

The machine is rather unwieldy, and to this must be attributed the fact that two hours and twenty-five minutes were required to fix it in position.

The coal fell in heaps, both forward and aft of the main hatchway; and as these heaps increased in dimensions and assumed a conical form, the large coal rolled towards the fore and after hatchways, into the wings of the ship, and also into the space under the main hatchway. The distributor, therefore, has an advantage in that it does not produce a cone containing much smalls directly under the main hatch; but on the other hand, it is evident that it produces two such cones, one forward and the other abaft the main hatch. It may be that the coal was not quite so much broken as it would have been if dropped from the wagons without the assistance of the distributor, still, I have no hesitation in saying that there was more smashing of coal than there should have been in view of what is claimed for the machine.

EDWARD F. PITTMAN.

Sydney, 18th November, 1896.

Z.

Sir E. Leader Williams to the Agent-General.

Coal Shipping Appliances.

Dear Sir Saul Samuel,

"Grand Hotel," London, W.C., 3 March, 1897.

I have your letter and enclosure of yesterday's date.

In my opinion Lewis and Hunter's coal shipping appliances at the Roath Dock, Cardiff, which I have known for some time, and which were again carefully inspected by me when working a fortnight ago, are a most efficient arrangement of coal tips, and I consider they give the best known results in diminishing the amount of breakage while loading.

I have only this afternoon been able to get the information required to enable me to give you the cost of the cranes and their accessories.

The

The best and cheapest arrangement is to work the cranes in pairs, as it saves cost of additional accessories and provides for a loading berth 300 feet long. On this basis, two 18-ton movable hydraulic coaling cranes, with the necessary accessories, would cost, including packing and delivery F.o.b. English port, fourteen thousand eight hundred and seventy-nine pounds (£14,879).

The above estimate is exclusive of railway approaches, weighing machines, and the necessary engines, boilers, accumulators, and mains requisite to supply the necessary hydraulic power to work the cranes.

I trust this information will enable you to reply to the telegram, copy of which you enclosed with your letter. I hope to send you my report on Friday morning.

I remain, &c.,

E. LEADER WILLIAMS.

Sir E. Leader Williams to the Agent-General.

Coal Shipping Appliances.

Dear Sir Saul Samuel.

"Grand Hotel," London, 4 March, 1897.

Referring to your letter of the 2nd instant, and my reply of yesterday's date, I beg to report further on Lewis and Hunter's arrangements for shipping coal as used by the Bute Docks Company at their Roath Dock, Cardiff.

The shipments of coal at the Bute Docks, Cardiff, last year amounted to 7,690,205 tons, and in order to deal with such a great export efficiently, the Docks Company and their predecessors have from time to time spent large sums of money in putting down the then best-known means of shipping coal at their docks.

This resulted in their adopting, in the year 1887, the system of Lewis and Hunter, which has worked with so much satisfaction to the trade that they prefer that their vessels should wait to load at those tips rather than go to others, even though of modern date.

I have inspected these cranes several times, more particularly on the 18th February last, when I tested their working with a view to this report.

To give quick dispatch to steamers necessitates loading coal at several hatchways at the same time; and as the hatchways vary in their relative position to each other, only movable coal tips can comply with this requirement. On this system a number of cranes can be employed together, with the great advantage of loading a vessel at various points simultaneously, thus keeping the ship on an even keel.

The vessel under this arrangement does not require moving during the time of loading, and therefore no interference is caused to other ships that are moored adjoining at the quay. The advantage of a fixed quay berth enables import cargoes to be discharged from any hatchway while coal is being shipped at other points.

The result of using several cranes together on one vessel is obviously to give rapid dispatch, enabling steamers to be loaded at the rate of 300 tons per hour, or even quicker if necessary.

The waggons from the collieries are brought first to the dock storage sidings, and then to lines of railway at right-angles with the side of the quay; they are not dependent on fixed points and turntables as is usually the case. The cranes are capable of lifting 18 tons, and work on independent lines of rails of a gauge of 21 ft. 4 in., allowing two lines of railway of ordinary gauge to pass under the opening of the under structure of the crane.

On the upper part of this structure the crane is fixed, and works with a range of from 20 to 40 feet. The crane has a simple but effective derrick motion, which, in common with propelling it along the quay, hoisting, turning, and working the valves at the bottom of the carrying box, is all accomplished by hydraulic power—from 750 lb. to 800 lb. pressure.

Hydraulic capstans are provided, which bring the waggons to the tip-ups, of which there are three to each crane. Hydraulic power then tips the waggon, and the coal is passed with only a small average fall of 2 ft. 6 in. into the carrying boxes, which are of various sizes, the smaller being for bunkering purposes, and the largest (10 tons) for loading.

The crane lifts the box when filled and lowers it into the hold of the steamer until the box is close to the last coal deposited, when by means of the cone valve at the bottom of the box the coal can be deposited in any required position.

This arrangement at the bottom of the carrying box enables the coal to be spread over a wider area in the steamer's hold, expediting and equalising the loading, and diminishing the amount of trimming.

The different sizes of the coal are more uniformly mixed than when it is tipped in the ordinary method in a central heap, when the largest pieces of coal gravitate down the sides of the heap to the bottom of the vessel.

The advantage in the non-breakage of coal deposited by Lewis and Hunter's arrangement, as compared with the old system, is obvious. In some descriptions of coal the gases liberated by breakage form a source of considerable danger to the vessel, and in any case breakage diminishes the value of the coal.

Whether judged from the point of view of rapidity of loading, convenience of working, or maintaining the full value of the coal by non-breakage, I consider Lewis and Hunter's coal shipping appliances the best arrangement now in use.

I have, &c.,

E. LEADER WILLIAMS.

AA.

Secretary, Royal Commission on Coal Cargoes, to the Principal Under Secretary.

Sir,

14 December, 1896.

I am directed to request that you will be so good as to ask the Crown Solicitor to kindly favour this Commission with his opinion on the following point, viz. :—

Under the provisions of Act 45 Vic. No. 6 (Navigation Law Amendment) there is a system of inspection whereby ships are inspected so as to prevent overloading. Is it competent for the Government to extend the inspection to the trimming of the cargoes in the case of coal-laden vessels.—

- (1) In New South Wales owned ships?
- (2) In British ships?
- (3) In foreign ships?

I have, &c.,

WALTER WILSON,  
Secretary.

The following letter from the Crown Solicitor was forwarded to the Commission by the Principal Under Secretary in reply :—

Sir,

Crown Solicitor's Office, Sydney, 7 January, 1897.

I have the honor to return herewith the papers numbered as in the margin relative to the question whether the Government can extend the inspection of ships under 45 Vic. No. 6 to the trimming of cargoes in the case of coal-laden vessels, forwarded for my opinion.

Sections 6 and 20 of the "Navigation Law Amendment Act of 1881" do not authorise the inspection of ships so as to prevent overloading.

A survey is authorised by those sections to be made only where the overloading has taken place, in which case the ship may be provisionally detained by order of the Marine or a local Marine Board, or, where there is no such Board, a Police Magistrate, and thereupon the Marine or a local Marine Board may appoint a person to survey the ship, and report thereon to the Board.

The present system of inspection to prevent overloading not being authorised by statute, it follows that the inspection cannot be extended to the trimming of cargoes in the case of coal-laden vessels.

I have, &c.,

GEO. COLQUHOUN,  
Crown Solicitor.

The Principal Under Secretary.

## CC.

## Summary of conclusions of the English Royal Commission appointed to inquire into the Spontaneous Combustion of Coal in Ships, 1876.

1. That certain descriptions of coal are intrinsically dangerous for shipment on long voyages.
2. That the breakage of coal in its transport from the pit to the ship's hold, the shipment of pyritic coal in a wet condition, and, especially, ventilation through the body of coal cargoes, conduce to spontaneous combustion, even though the coal may not be unfit for conveyance on long voyages.
3. That spontaneous combustion in coal cargoes would be less frequent if regard were had by shipowners and underwriters to these facts.
4. That when coal is being carried on long voyages the temperature in the various portions of the cargo should be tested periodically by thermometer, and registered in the log.
5. That, with a view to guard against explosion, free and continuous egress to the open air, independently of the hatchways, should be provided for the explosive gases, by means of a system of surface ventilation, which would be effective in all circumstances of weather.
6. That in order to make known the descriptions of coal liable to combustion, the Inspectors of Mines should be instructed to hold inquiry into all cases of spontaneous combustion occurring in cargoes of coal taken from their respective districts, exporters being required always to record on their specifications the denomination of the coals forming the cargo.
7. That no additional legislation with reference to the conveyance of coal by sea is required, unless for the purpose of giving effect to our proposals with regard to the inquiries by Inspectors of Mines, and to the fuller specification of coal entered outward at Her Majesty's Customs.

## ABSTRACTS AND TRANSLATIONS OF LITERATURE CONSULTED ON THE SUBJECT OF THE COMMISSION'S INQUIRY.

- (1.) Trans. Inst. Naval Architects, 1890, Vol. 31, p. 204: "The Spontaneous Ignition of Coal Cargoes;" and Journ. Socy. of Arts, 1892, Vol. 40, p. 352: "The Spontaneous Ignition of Coal and its Prevention." By V. B. Lewes.

From 1875 to 1883, 57 coal-laden vessels were known to be lost from spontaneous ignition of their cargoes, whilst during the same period 328 were missing from unknown causes, a large percentage of these losses being undoubtedly due to heating.

These, again, formed but a very small percentage of the cases in which the cargoes heated and fired, but in which the vessels were saved.

*Influence of carbon in producing heating.*

The least absorbent coal will take up one and a quarter times its own volume of oxygen, whilst with some coals more than three times their volume of the gas is absorbed.

The absorption is very rapid at first, but gradually decreases, and is influenced by temperature.

Mentions well known case of ignition of charcoal during grinding.

Air dry coal absorbs oxygen more quickly than wet coal.

*Action of the bituminous constituents of the coal.*

The absorbed oxygen begins to combine first with the carbon and hydrogen of the bituminous portions.

This activity increases with rise of temperature.

The effect of rise of temperature can be realised from the effect which it has in the ignition of oily waste or rag.

Mineral oils do not produce this effect.

It may be days before the rise of temperature becomes sensible, but when a sufficient temperature is reached the oxidation proceeds with remarkable rapidity, and in a few hours the point of ignition is reached and the mass bursts into flame.

Cotton, greasy with boiled linseed oil, ignited in 1 hour 15 minutes when kept at 54° to 76° C.

With olive oil the cotton ignited in 5 hours, at the same temperature; at a rather higher temperature the ignition was much more rapid.

Spontaneous ignition is not due to the exudation of heavy oils from bituminous coal.

*Action of pyrites.*

Considers that the pyrites theory is dead.

If the air is dry the pyrites undergoes but little change at ordinary temperatures, but in moist air it rapidly oxidises.

Some coals most prone to spontaneous combustion contain only eight-tenths of 1 per cent of pyrites, and rarely more than 1½ per cent. It is clear that this cannot be the only cause of ignition.

Pure iron pyrites is largely used commercially, and when free from carbonaceous matter may be kept in a state approaching to powder in heaps containing many hundred tons, and although undergoing continual oxidation, the author had been unable to trace a single case of heating, much less of a rise of temperature which would approach the igniting point of coal.

Whenever pyrites is mixed with finely divided carbonaceous matter, heating and ignition is of frequent occurrence.

The igniting point of various kinds of coal, as determined by the author, is as follows:—Cannel coal, 370° C.; Hartlepool coal, 408° C.; Lignite, 450° C.; Welsh steam coal, 477° C.

Considers that Richters under-estimates the effect of pyrites, in that he does not take account of the fact that under certain circumstances sulphur may be liberated, and the igniting point of sulphur is only 250° C.; so that the presence of free sulphur would lower the igniting point of the coal by considerably over 100°; in addition to this, of course, the pyrites causes the disintegration of the coal.

In same paper, read by the author in 1892, the following is inserted:—"Under certain conditions the oxidation of masses of pyrites first gives rise to the formation of ferrous sulphate and sulphur dioxide, with liberations of sulphur, and my early experiments led me to believe that, inasmuch as sulphur has an igniting point of 250° C., this free sulphur might play an important part in the action by lowering the point of ignition. Later experiments, however, show that this could only take place with large masses of pyrites undergoing oxidation, and that with the amount present in coal, if the air were present in sufficient quantity to oxidise the pyrites, the small trace of sulphur liberated would be oxidised to sulphur dioxide at temperatures as low as 60° C. This oxidation of sulphur at low temperatures is not a generally known action, but my experiments show that it takes place with considerable rapidity."

Notes the disintegrating process of carriage on the railway:—

"The coal first shot into the vessel, by reason of the distance which it has to fall, is broken down into small lumps, and having to bear the impact of the succeeding load falling upon it from a height rapidly becomes powdered into slack, whilst the succeeding loads falling in on the cone so formed get more or less broken down, so that by the time the cargo is all taken in a dense mass of small coal is to be found under the hatchway, and it is invariably at this point that heating takes place, as the large surface exposed fresh to the air by the breaking down of the coal causes rapid absorption of oxygen and consequent rise of temperature. This sets up chemical combination between the oxygen absorbed by the coal and the hydro-carbons and coal brasses.

"The combination of the brasses with oxygen causes the swelling of the oxidised mass and splitting up of the coal, fresh surfaces are exposed, and more absorption of oxygen takes place, and the igniting point of the sulphur-vapour and sulphur compounds distilled out of the pyrites is reached, and rapidly raises the temperature to the igniting point of the coal. It is only in cases where large quantities of dense coal-brasses are present that this latter action can take place, as in the ordinary case, where 1 or 2 per cent. only of pyrites are present, the sulphur-vapour distilled out from the pyrites is oxidised to sulphur dioxide at temperatures far below the point of ignition of sulphur-vapour, and in such cases the heat of absorption and oxidation of the bituminous portions of the coal is amply sufficient to raise the temperature to the requisite 400° to 500° C."

Quotes

Quotes statistical results of English Royal Commission, as to influence of size of cargo and destination. A most important cause of spontaneous combustion appears to be the exposure of ships to the heat of the tropics:—

"A well-loaded cargo of any coal would be safer than a cargo of Welsh steam coal in which a quantity of dust had been produced during loading.

"The idea that the percentage of pyrites present is any indication of the liability to spontaneous combustion must be entirely discarded, as experiment shows that many coals poor in pyrites frequently ignite, whilst others rich in them are perfectly safe.

"A much surer guide is to be found in the quantity of moisture present in an air-dried sample of coal, which is a sure index to the absorptive power; the higher the amount of moisture held by the coal after exposure for some time to dry air, the greater will be its power of absorption for oxygen, and the greater, therefore, its liability to spontaneous heating and ignition."

The chief causes of the firing of coal cargoes are the following:—

1. Increase in tonnage of the cargoes.
2. Shipping through the tropics.
3. The kind of coal of which the cargo consists.
4. Size of the coal; small coal being more liable to spontaneous ignition than large.
5. Shipping coals rich in pyrites whilst wet.
6. Ventilation of the cargo.
7. Rise in temperature in steam colliers, due to introduction of triple-expansion engines and high-pressure boilers. (Illustrated by some statistics).

#### Recommendations.

1. The coal should be as large as possible, free from dust, and with as little "smalls" as can be helped. It should contain when air-dried not more than 3 per cent. of moisture. (In his later paper he advances this very tentatively: "My own experience, however, leads me to think that if air-dry coal does not contain more than 3 per cent. of moisture, and when powdered and heated to about 250° F. in an oven for three hours, does not increase more than about 2 per cent. in weight, it may be looked upon as a safe coal to store in bulk.")
2. No coal should be shipped to distant ports until at least a month has elapsed since it was brought to the surface a the pit's mouth. Every precaution should be taken to prevent breaking up of the coal whilst being taken on board and on no account must any large accumulation of fine coal be allowed under the hatchways. When possible, the coal should be shipped dry, as external wet, by producing oxidation of the pyrites, causes disintegration.
3. Precautions to be taken on board coal-laden ships:—The coal compartments should be made gas-tight. When the coal has been taken in it should be battened down, and the hatches should not be again opened until the vessel reaches her destination, the only ventilation allowable being a 2-inch pipe just inserted in the crown of each coal compartment and led 12 feet up the nearest mast, the top being left open. This would be quite sufficient to allow free egress to any gases evolved by the coals, but would not allow undue access of air.

Recommends that alarm thermometers be introduced into the body of the coal.

Also that carbonic acid should be compressed at a pressure of 36 atmos. and condensed in steel bottles, which should be distributed amongst the coal. The bottles to be closed by fusible metal plugs.

100 cubic feet of gas can be condensed in the liquid state in a steel cylinder 1 foot long and 3 inches diameter, and it has been shown that a ton of coal contains air spaces equal to about 12 cubic feet; therefore, one of these cylinders would have to be put in for every 8 tons of coal, and these would be distributed evenly throughout the cargo.

It is no use to pour water on the top of a fired cargo, because the fire is generally near the bottom of the mass of coal. The most effective way to apply water would be to have four 3-inch pipes laid along the floor of the coal compartments, about 6 feet apart; these tubes having a  $\frac{1}{4}$ -inch hole bored in the upper side every foot or so, and each pair of pipes coming through the bulk-head and connecting on to two 6-inch pipes passing through the side of the vessel, the sea water being prevented from entering by means of screw-valves. As soon as the alarm thermometer gave notice that heating had reached a dangerous point, these valves could be opened and the lower portion of the cargo drenched with salt water. This, evaporating rapidly, would give large volumes of water-vapour, which, passing up through the heated coal, would lower its temperature, but would not be nearly as effective as the carbonic acid method before advocated.

To prevent the heating and ignition of stores of coal on land, and ready for use in bankers, recommends the dressing of the coal with a little tar or tar oil.

Acknowledges indebtedness to Richters, the English Royal Commission, and Mr. Martels.

#### Discussion.

Prof. F. Elgar said that from 1875 to 1883, more than one-third of the lives lost on over-sea voyages from ships of 300 tons measurement and over, registered in the United Kingdom, were lost from coal-laden vessels.

With regard to the missing vessels, knew the difficulty that might arise from the fine coal and dirt choking the pumps when there was water in the hold of the ship, and the ship had perhaps a heavy list in consequence, so that the pumps could not be properly worked, and the vessel readily cleared and righted.

Between the years 1881 and 1883, there were twenty-three known losses of vessels from spontaneous combustion of coal, but only one of these was a steamer. A good many of the other vessels were built of wood. The effect of age and deterioration upon these old vessels may, therefore, in some cases, be accountable for their loss.

Suggests that one cause of heating in old wooden ships is the impossibility of keeping holds dry.

With the addition of the 23 vessels referred to, 86 coal-laden vessels were known as having foundered or were missing. Out of these 86, 33 were steamers, and out of the 33 steamers, 24 went down with all hands, so that it is not possible to know with certainty how the losses occurred.

With regard to the nine steamers, whose loss formed the subject of inquiries, it is known that none of them were lost from spontaneous heating.

Under the American law, all ships registered in the United States are obliged to be fitted with steam pipes throughout their holds, for the purpose of extinguishing fire.

Mr. E. Eckersley, Inspector of Machinery in the Navy, said his experience was that moisture was one of the great causes of loss at sea. One of the practical rules at the Admiralty was that you must not put your coal into the ship during wet weather.

Another practical question was that if you buy coal from your merchants, and there is 10 per cent. of water in it, instead of about 4 per cent., which is the ordinary thing, you pay a very large percentage for water, and that percentage will increase as the price of coal goes up; and if there is 10 per cent. in some of the coals which we buy abroad,—say in China, at £5 per ton—an enormous amount of money is spent on that which is really injurious.

#### Professor Lewes in reply.

As far as the absorption of oxygen goes, you find that moisture stops it to a very great extent, but there is no doubt that moisture makes the pyrites crumble up the coal and so exposes a larger surface; and you also find that moisture, when the coal has already got in its oxygen, may aid the action by bringing about closer contact between the oxygen and hydrocarbons of the coal, and under those conditions there is no doubt, as Professor Elgar has stated, that the moisture, after the occlusion of the oxygen has taken place, would be a distinct drawback.

With regard to the use of steam-pipes, considers it better than pouring water on top of the coal.

Mr. Stromeyer raised the following point: Why does not the rise in temperature of the coal cause the occluded gas to escape?

Lewes, in reply, admits that the problem is curious; but says that when the temperature rises the oxygen combines with the coal, so that the coal loses its store of oxygen, and it can then begin taking in fresh oxygen, and, therefore, though the tendency of a rise in temperature by itself is to cause the gas to be ejected, still, as a secondary result of a rise of temperature, namely, the conversion of oxygen into carbonic acid, the possibility of more absorption of oxygen is set up.

In the paper of 1892, Professor Lewes took advantage of the earlier one, to include some of the information collected on the firing of coal in bunkers, and it is noted that the temperature of the coal varies very considerably in regard to its proximity to boilers and the air channel round the funnel casing.

As to the liability of certain coals to heating, it is also said that "up to the present time the action has been so little understood that no such differentiation was possible; but with a clear conception of the causes which lead to heating, it should be quite possible to do so."

NOTE.—The general opinion expressed during the discussion of Professor Lewes' paper in 1890 was that his advice as to the preparation of the coal for loading was good, but that his carbonic acid scheme was impracticable.

## (2.) Metallurgy: Fuel. By John Percy (1875).

Does not consider that moisture increases the absorption of oxygen, but it does increase the disintegration of pyrites.

It appears, from the experiments of Richters and Reder, that when there is no rise in the temperature of coal piled in heaps and left exposed to the air during nine or twelve months, it undergoes no sensible change in any respect, and that, on the other hand, when the coal becomes heated, it suffers precisely the same kind of change as was found by Richters to be effected in coal by heating it in contact with atmospheric air to a comparatively low temperature, namely, loss of carbon and hydrogen by oxidation, and increase in the absolute weight of the coal owing to the fixation of oxygen.

Richters' results quoted and discussed.

Richters found that the absorptive action of coal upon oxygen is very much greater when it is first mined.

The following table shows results of Richters' experiments:—

TABLE showing the Changes which take place in Coal, when it is heated to from 70° to 80° C., in contact with Atmospheric Air, and with Moisture.

Treatment to which the Coal was subjected.	Chemical Composition of the Coal per cent. calculated exclusive of Ash.			Ash per cent. in the Coal.	Per 1,000 parts by weight of Carbon.		Calorific power of Ash-free substance of the Coal.	Increase per cent. in—		Decrease per cent. in—

Nos. I and II were caking coals, but No. III was non-caking (Sandkohle), and did not yield coke, properly so called.

The caking power of No. I (a) being estimated at 1.4, that of No. I (b) was 1.4

The caking power of No. II (a) being estimated at 2.0, that of No. II (b) was 1.6

Nos. I (b, c), II (b, c), and III (b, c), did not sensibly differ from Nos. I (a), II (a), and III (a), respectively, either in the yield of coke or specific gravity.

The calorific value of Nos. I (b), II (b), and III (b), was reduced by about 2.62 per cent., 3.61 per cent., and 3 per cent. (2.28 per cent., 3 per cent., and 3.61 per cent.), respectively.

The coals operated upon by Richters were all from the carboniferous system in Silesia, and had previously stood for a long time in a loosely covered vessel.

Richters found that the quantity of oxygen absorbed by different coals, under the same conditions, is proportionate to the quantity of water which they absorb. He states, also, that from his own oft-repeated observations, sunlight lessens or retards the absorption of oxygen by coal.

"The oxidation of the organic substance of coal by atmospheric air appears to be generally impeded rather than promoted by the presence of moisture, if we admit that the results recorded in the last table under the head of 'Decrease per cent. in Carbon and Hydrogen, suffice to justify a conclusion on the subject, for in every instance, except one relating to hydrogen at the bottom of the last column on the right, less of those elements was oxidised by contact with atmospheric air in the moist than in the dry state. But, on the other hand, the oxidation of iron pyrites in coal by atmospheric air is favoured by moisture, if, indeed, moisture be not absolutely essential to that action at ordinary temperatures. Richters found that coal poor in sulphur absorbed less oxygen in the moist than in the air-dried state, and, on the contrary, that coal rich in sulphur absorbed less in the air-dried than in the moist state."

Ferrous sulphate is the first product of such oxidation, and this is gradually converted into ferric sulphate.

As shale, which consists largely of silicate of alumina, is intermixed with coal, the atmospheric oxidation of iron pyrites in the latter may give rise to the formation of feather-alum, a double sulphate of iron and alumina.

No coal in Great Britain is more liable to such ignition than the Ten-yard or Thick coal of South Staffordshire.

It is to be noted that this Ten-yard coal, which formed the subject of Percy's inquiries, contains only a small proportion of iron pyrites, usually not more than is equivalent to a half per cent. of sulphur.

"It was reserved for Richters to substitute fact for opinion, and to demonstrate by experiments, which, in my (Percy's) judgment, are conclusive, that, generally, the spontaneous ignition of coal is due to the heat developed by atmospheric oxidation of the organic substance of coal, and not to that resulting from the oxidation of iron pyrites."

## (3.) Dingler's Poly. Jour., Vol. 239, 1881. "On the Spontaneous Combustion of Coal." By H. Hædicke, of Hagen.

Quotes Richters' papers in 1868-9-70, and his results.

Mentions the influence of pyrites in breaking up the coal, and traces the chemical changes which occur during the oxidation of pyrites.

Points out that the decomposing pyrites may act as a carrier of oxygen to the coal.

Describes long series of experiments made by author by passing pure oxygen over coal and over pyrites at a high temperature.

Notes that in pure oxygen pyrites catches fire at a temperature about 200° C.

Prepared his material by taking small coal and impregnating it with ferrous sulphide.

When the coal was tested alone it caught fire at from 260° to 300° C.

Experiment works if you use atmospheric air as well as if you use a mixture of steam and oxygen.

Using pure sulphate of iron the temperature of 200°C. was sufficient to produce lively combustion.

It appears from these experiments that sulphur plays the same part in the combustion of coal as it plays in the combustion of matches. It is satisfied with a lower temperature of ignition in the coal.

Mentions that coal in which small quantities of pyrites are finely distributed is more liable to spontaneous combustion than other coal.

Some speculation as to the role played by moisture in conjunction with pyrites on the spontaneous combustion, but this speculation is not supported by any facts.

Mentions that ventilation of coal cargoes has been found to be dangerous.

Also found that oily rags and similar matters sometimes placed in coal bunkers and holds form a source of danger.

- (4) Dingler's Polytechnisches Journal, vol. 247, 1883. "On the Spontaneous Combustion of Coal." (Abstract from the Comptes Rendus de la Société de l'Industrie Minérale, 1882, p. 66.)

Quotes Fayol. The temperature of ignition of dusty material is as follows:—Lignite, 150° C. : gas coal, 200° C. ; coke, 250° C. ; anthracite, over 300° C.

After heating pyritic coal at 200° C for four hours the coal had taken up 6 per cent. of oxygen, and the pyrites only 3½ per cent.

Made following experiment:—900 g. of powdered coal and 3,350 g. of powdered pyrites were heated together in same vessel, but in separate dishes. As the temperature rose to 150° C. they behaved equally, but the pyrites remained unaltered at this temperature while the powdered coal rose in temperature rapidly until in a few hours it spontaneously inflamed.

When heated above 200° C. the coal took fire in forty minutes.

Further experiment showed that addition of pyrites in no way increased the spontaneous combustion of the coal.

Large masses of coal were apparently free from heating.

- (5.) Transactions of the Fed. Inst. of Min. Eng., vol. 3. Paper by W. F. Clark and H. W. Hughes, on "The South Staffordshire Coal Field, &c.—Spontaneous Combustion," p. 45.

Three agencies at work—oxidation of organic constituents, iron pyrites, and pressure.

#### *Iron Pyrites.*

Influence merely indirect by raising temperature through oxidation and assisting in disintegration of coal.

#### *Oxidation of Organic Constituents.*

Refers to Richters as having proved the direct oxidation.

Absorption of oxygen is favoured by heating, moisture, fine division, and absence of light. (?)

#### *Action of Crushing.*

Small amount of heat generated; coal ground small and hence rendered more liable to direct oxidation.

As against the view that oxidation of iron pyrites is the primary agent in producing combustion, notices the fact that the "sulphur" coal of the South Staffordshire coal-field, which contains large quantities of iron pyrites, never takes fire spontaneously.

States it is in seams most free from iron pyrites that spontaneous combustion takes place.

Bituminous coal is more liable to spontaneous combustion than other varieties.

- (6.) Trans. Fed. Inst. Min. Eng., 1892, vol. 3, p. 789. "The Causes of Spontaneous Combustion of Coal, and Prevention of Explosions on Shipboard." By M. V. Jones.

In order to prevent the disintegration and trituration of the coal into small dust, and thereby to lessen the liberation of the hydro-carbon gases, and so to minimise the danger of explosion from the ignition of the gases and the formation of material for oxidation and spontaneous combustion, the author proposes that ships should be divided by a fore and aft bulkhead dividing the ship longitudinally in two halves, together with four or six transverse bulkheads. The idea is that in this way the rolling of the cargo of coal will be reduced.

The writer expresses an opinion in favour of the absolute necessity of careful stowage of cargo in smaller divisions in the hold, and consequently to prevent the formation of dust and gas by the disintegration of the coal.

#### *Discussion.*

Professor J. H. Merivale considers that Fayol had conclusively proved that the spontaneous combustion occurred among the small coal and not among the large coal.

With reference to the division of the cargo, Professor Merivale thought that was a matter of importance and a step in the right direction, but he was inclined to think that the depth of the bulk of the coal had a good deal to do with the matter, and if any great advantage was to be obtained from reducing the size of each separate compartment, the depth should be reduced as well as the breadth and width. The great depth produced crushing and consequent heating, and this would occur equally whether the breadth and width were small or large.

(Nothing of great importance contributed either in the paper or discussion.)

- (7.) Trans. Fed. Inst. Min. Eng., vol. v, 1892-3, p. 10. "Spontaneous Combustion in Coal Mines." By Joel Settle.

The paper and discussion deal entirely with gobfires and their prevention.

- (8.) Trans. Fed. Inst. Min. Eng., vol. v, 1892-3, p. 392. "The Spontaneous Combustion of Coal." By Herbert W. Hughes.

Conclusions similar to those in paper by the author, in conjunction with W. F. Clarke, vol. 3.

Refers to Mr. Durand as the only writer of recent years known to him, who attempts to prove that pyrites plays the most important part in promoting spontaneous ignition.

Quotes Richters, Leves, Percy, and Fayol.

Fayol determined order of inflammability as (1) lignites, (2) bituminous coals, (3) caking coals, and (4) anthracite.

"Fayol proved by experiments that when the size of the particles was 1 centimetre, the powder of lignite, bituminous coal, caking coal, and anthracite ignited at 400° C., but that when the size of the dust particles was reduced to ½ millimetre, combustion took place in the three former classes at 200° C. but not with anthracite. With particles of the last-mentioned size, bituminous coal ignited at as low as 150° C., and lignites at 100° C. When in the state of impalpable powder, he was able not only to ignite lignites, but also several varieties of the free-burning bituminous coals at a temperature of 100° C."

Soft, black, sooty coal is far more liable to fire than that of a harder nature.

Maximum effect of iron pyrites in disintegrating the coal and producing a slight rise in temperature is exerted when it occurs in the form of a dark amorphous powder finely disseminated through the coal.

Coals most liable to spontaneous combustion are the highly oxygenized semi-bituminous varieties, containing a large proportion of moisture.

(9.) Trans. Fed. Inst. Min. Eng., vol. iv, 1892-3, p. 481. "Spontaneous Combustion in Coal Mines." By Arnold Lupton.

"Any large heap of ordinary bituminous coal is liable to spontaneous combustion—say, one, 10 feet thick, and 30 or 40 feet square. The larger the heap and the smaller the coal, the greater the liability to fire."

A small heap of 3 or 4 tons of slack is likely to take fire in consequence of contact with a hot surface, such as that of a flue or steam pipe.

"It has been found by experiment that in some cases great heaps of shale, containing a large percentage of iron pyrites, have taken fire through the decomposition of the pyrites; but the amount of pyrites in the coal-mines is too slight to have any appreciable effect in heating the coal."

*Discussion.*

Dr. Bedson thought the influence of iron pyrites must be regarded as of an entirely secondary character, its oxidation and consequent disintegration aiding, inasmuch as this resulted in the increase of surface exposed to the air.

He had succeeded in igniting coal dust at 140° to 150° C.

Mr. Binns said the coals which belonged to the lignite and brown class were very much more liable to spontaneous combustion than bituminous coals in England, and that point was explained by Prof. Clowes, of Nottingham, in a recent lecture, in which he said the moisture in coal was a large and important factor in this relation.

He believed the first ignition was caused by certain hydrocarbons in the coal, which took fire at very low temperatures.

Mr. Smith believed the character of the roof had a great deal to do with gobfires, and he thought they were induced by a bind roof.

(10.) Instn. of Civil Engineers, 1890, vol. 101, p. 129. "The Barry Dock Works." By John Robinson.

Barry Dock is situated on the north shore of the Bristol Channel, between Barry Island and the mainland, 7 miles south-west of Cardiff, and 31 miles east of Swansea.

Contains a description of the hydraulic coal tips employed at the Barry Dock for the purpose of loading ships with coal.

*High-level Tips.*

At the commencement of shipping, an anti-breakage box is suspended at the end of the shoot from a hydraulic lifting and turning jib-crane, fixed near the top of the iron framing, at one corner next the dock. The coal drops into this box, which is lowered into the hold of the vessel, and emptied by the withdrawal of a bolt from a hinged flap at the bottom. To the bolt releasing the flap-door is fastened a chain fixed on deck, thus making the discharge of the box self-acting. By means of the box, a cone of coal is formed as high as the point of the shoot, so as to avoid breaking the coal by dropping from the shoot into the hold of the vessel. The anti-breakage box is then swung out the way, and the coal allowed to slide from the shoot on to the cone, and into the hold, where it is trimmed. The shoot is tapered towards the point, to check the sliding of the coal, and has a single door across, near the end, for regulating the same; and the butt end is pivoted to give the shoot a somewhat greater range with respect to the hatchway.

On the underside of the shoots, immediately below the screens, are hinged doors to allow of single screening, double screening, or the coal to pass unscreened. As much as 400 tons have been shipped in one hour at one of the high-level tips, in the ordinary course of working.

*Low-level Tips.*

When commencing to load a ship, the box is filled with coal from the shoot, and lowered into the hold. A cone is thus formed, which both preserves the bottom of the ship from damage and lessens the breakage of the coal.

In all arrangements for tipping South Wales coal, it is most desirable to prevent rapid motion of the coal, or its being dropped from a height, as this description of coal is easily broken, causing considerable loss in its value.

Mr. Robinson in reply to discussion on his paper.

Some of the steam-ships frequenting the Barry Dock were called self-trimmers. They had two large hatchways with feathered wings, and there was not much more to do in the way of trimming coal than levelling down. The carrying capacity of those vessels ranged from 1,200 to 1,800 tons.

The paper contains full drawings and explanations of the method of working the tips, and, together with the discussion, constitutes a most valuable contribution to the engineering of coal loading.

(11.) Trans. Am. Inst. Min. Eng., vol. 4, 1875-6, p. 54. "Fires in Mines: their Causes and Means of Preventing them." By R. P. Rothwell.

Refers to Richters as proving the absorption of oxygen and the formation of carbonic acid and water, while another portion of oxygen enters into an unknown state of combination with the coal and proportionately increases its weight.

It has also been found that the quantity of oxygen absorbed by different coals, under similar conditions, is proportional to the quantity of water they absorb.

Numerous experiments seemed to prove that sunlight always lessens or retards the absorption of oxygen by coal.

Quotes following table from Richters' work:—

Degree of self-inflammability.	Iron Pyrites %	Water %	Character of the Coal.
Class I. Difficultly self-inflam. ..	1. 1.13	2.54	Easily friable.
	2. 1.10 to 3.04	2.75	Very compact.
	3. 1.51	3.90	"
" II. Of medium self-inflam. ..	4. 1.20	4.50	Firm, schistose, bright.
	5. 1.08	4.55	Hard, but very brittle.
	6. 1.15	4.75	Moderately tender.
	7. 1.12	4.85	Outwardly very like (1).
" III. Readily self-inflam. ....	8. 1.00	9.01	Moderately tender, schistose.
	9. 0.83	5.30	" soft, "
	10. 1.35	4.85	" " " "
	11. 0.84	5.52	Not stated. Yielded only 2.5 per cent. of ash. From the same pit as No. 10, but from a different seam, remarkable for its great self-inflammability.

Considers that spontaneous ignition of coal is greatly facilitated by, though not altogether due to, presence of iron pyrites.

The oxidation of iron pyrites splits up the coal and renders it more pervious to oxygen.

Refers to the unfavourable influence of coal dirt, rag, or cotton waste saturated with vegetable or animal oils.

(12-13.) Trans. Am. Inst. Min. Eng., vol. 8, 1879-80, p. 181. "On the Relations of Sulphur in Coal and Coke." By J. P. Kimball. (Paper which should be read by those about to analyse coal.) Followed by a paper on the "Atmospheric oxidation or weathering of coal," by same author.

Quotes Richters as having shown that the absorption of oxygen is in proportion to the available hydrogen present in the coal.

The condensation of oxygen is supposed by Richters to precede the chemical oxidation of the coal, and the amount of oxygen capable of being thus physically absorbed under the same conditions is to be measured by the amount of hygroscopic water which the coal is capable of absorbing after having been dried at 100° C. The

The oxidation of coal was proved to be accelerated by rise of temperature, and a moderate temperature long continued produces the same effect as a higher temperature for a shorter period.

According to Richters, coals possessing the highest power of absorption are those which oxidise most rapidly and evolve the greatest amount of heat.

Author considers Richters underestimated the possible heating effect of the oxidation of pyrites, and expresses a strong opinion of the importance of the pyrites action in heating.

- (11.) *Trans. Am. Inst. Min. Eng.*, vol. 12, 1883-4, p. 317. "On Differential Sampling of Bituminous Coal Seams." By J. P. Kimball, Lehigh University, Bethlehem, P.A.

Refers merely to matters of analysis and methods of sampling coal, which is a matter, it is said, requiring great care.

- (16.) "Fires on Coal Ships: their Causes and Prevention." By J. C. Firth. (Read before the New Zealand Institute, 6th July, 1896.)

This paper is largely compiled from the report of the Government Geologist of New South Wales on the "Knight of St. Michael," and from scientific papers by other writers.

The use of coal distributors for the prevention of the formation of coal-dust under the hatchways of ships is recommended, but no information is afforded in regard to the apparatus.

- (17.) "Spontaneous Combustion and Explosions occurring in Coal Cargoes, &c." By Thomas Rowan.

From a careful examination and comparison of the cases of spontaneous combustion of coal cargoes given in the report of the English Royal Commission of 1876, the author thinks "it is demonstrated that in the majority of cases, ignition has been inaugurated by the oxidation of the iron pyrites, commencing at some particular, although capricious spot; that the heat so generated has gradually accumulated and accelerated the oxidation, and that sufficient heat has been transmitted to start (it may be) carbonaceous oxidation as well: that in the confined conditions of the coal holds, where this had been taking place, the heat so produced has likewise determined, in parts of the cargo, the destructive distillation of the coal, evolving thus products of a highly inflammable and explosive nature; and these actions have often finally culminated in the cargo's suddenly 'bursting out into flames all over.'"

He recommends a system of "abstractors" scattered throughout the coal holds, at different levels, to draw off any gases evolved by chemical action.

- (18.) *Engineering*, 21st August, 1896.

Contains a description and drawings of machinery for loading coal, in use at the Erie Railway Docks of Cleveland, Ohio. The coal passes from a special cylindrical waggon tip through shoots, which, it would appear, enter the hold of the vessel some distance through the hatchways.

Extracts from "Science and Art of Mining," August, 1896, vol. 6, No. 25. (Received from Mr. John Dixon, Government Examiner of Coal-fields.)

#### *Spontaneous Ignition of Coal.*

(19.) "Professor Dr. Medem traces spontaneous ignition to the oxidation of iron pyrites, and as no coal is entirely free from this sulphide of iron, the cases the doctor brings under notice become all the more interesting.

"Professor Dr. Medem, in the course of a treatise on the spontaneous combustion of hay and coal, gives the following account of the causes of this phenomenon and methods that have been proposed for its prevention and suppression:—

"The simplest form of spontaneous ignition is exhibited by dry, spongy platinum, and is due to the absorption and condensation of oxygen in the pores of the metal. When exposed to a current of hydrogen gas, chemical combination immediately sets in, raising the temperature sufficiently to ignite the stream of hydrogen.

"In the case of charcoal a pyrophoric tendency is only manifested when some of the volatile hydrocarbons have been left behind in the distillation process and enter into combination with absorbed oxygen. If, however, such charcoal be freely exposed to air, the external portions speedily lose this property owing to the pores becoming saturated with air, but these will regain their pyrophoric character if powdered so that the internal layers are enabled to absorb oxygen.

"As the process of chemical combination only goes on in the interior of a heap, the best way to arrest it is to spread the charcoal out, since attempts at ventilation by blowing or drawing air through the mass will only result in increasing the combustion. Every time the charcoal is broken up the danger of ignition will recur, down to the time it is ground to powder; but the powdered charcoal once "killed" by exposure to air never regains its pyrophoric properties.

"Hard coals, brown coals, and the like are subject to two dangers—explosion and ignition—each having a separate cause. Explosion is due to the liberation of fire-damp following on a decrease in atmospheric pressure, whereas ignition results from the oxidation of the iron pyrites contained in the coal when exposed to the action of oxygen and moisture. The danger is the greater the finer the state of division of the coal, and coal stacked above ground is particularly liable. Attempts made to reduce the danger by ventilating the stacks have failed in this case also, on account of the increased amount of oxygen thereby introduced into the interior of the mass, and accordingly the coal is stacked as tightly as possible in order to exclude the air.

"Strangely enough, the practice of ventilating the coal-bunkers of ships has not been altogether abandoned, notwithstanding Liebig's impressive warning given as far back as 1806, and neglect in this particular has frequently led to lamentable fatalities. Since 1865 no less than ninety-seven coal-laden vessels have been destroyed, and the lives of some 2,000 seamen sacrificed through spontaneous ignition of the cargo."

#### *Moisture in Coal.*

(20.) "In a recent paper by R. S. Hale of Boston, on "Determining Moisture in Coal," the author recommended thorough experimental investigation of the matter, and the adoption of some standard method which will be used in testing boilers, and claimed that there were many errors in previous examinations. He cited several tests in detail, and gave the following as his conclusions:—

1. That if we use a large sample we must dry it a long time to dry the interior, and before the interior will begin to oxidise.
2. If we allow lumps to remain in the sample, the lumps will not have lost their moisture when the fine coal has begun to oxidise.
3. If we pulverise the coal, this will of itself cause a certain loss. It has not been thought necessary to experiment on this.
4. If moisture corrections are to be allowed, a standard method should be adopted, giving the method of selecting the sample, the method of crushing the lumps in it, the size screen it must finally pass through, the precautions to be taken if any time elapses between its selection and the moisture determination, the size of the sample on which the determination is finally made, the method, temperature, and time of drying."

- (21.) Lloyd's Rules and Regulations for the Construction and Classification of Vessels.

Examined in connection with the suggestion regarding the alteration of ships' hatchways to enable coal waggons to be lowered down the hold.

## (22.) "Etudes sur l'Altération et la Combustion spontanée de la Houille exposée à l'air," H. Fayol, (Bulletin de la Société de l'Industrie Minière). Vol. VIII (2nd Series, 1879.)

M. FAYOL, as Engineer Director of the Collieries of Commentry and Montvicq, has had unusual opportunities for the study of the behaviour of coal on a large scale, and has collected in this paper accounts of a vast number of experiments made on large quantities of material, and hence possessing a quite unique value.

The memoir, of which the following is a very brief abstract, professes to be no less than a complete treatise on all that concerns the coal industry. The first part of the paper is devoted to the study of the alteration of coal when exposed to air at different temperatures. The second part refers to a variety of experiments on the action of gases, water, and various reagents upon coal. The third part deals with a study of the action of heat in the absence of air.

The coal of Commentry, on which the majority of the experiments were made, is a coal used in the manufacture of gas. It comes from a seam free from fire-lamp. The ash content of the coal averages about 7 per cent., but as the coal is not very homogeneous, the maximum and minimum ash contents are 15% and 5% respectively. The impurities are (1) clay, (2) sulphate of lime, (3) pyrites. The content of pyrites is on an average less than 1 per cent., but in special samples it may rise to 5 per cent. The colour of the ash is white or grey. The slack produced at the mine is converted into coke, and the coke ovens afforded the desired opportunity for maintaining large quantities of coal for experimental purposes at various high temperatures. The slack contains in the main from 12 per cent. to 13 per cent. of ash, which is reduced by washing to about 7 per cent. The washed slack gives 62 per cent. to 63 per cent. of coke, which is sufficiently hard to be employed in high furnaces.

Besides the coal of Commentry, a large number of other coals were examined by M. Fayol. These samples were obtained from other collieries in France, from England, and from Germany.

*Experiments on the action of air at different temperatures.*

This is probably by far the most extensive series of experiments that has ever been made upon this subject, extensive not only in the number of samples examined, but in the length of time during which the samples were under examination. The examination was extended to the following points:—

- (1.) The change of weight of the coal.
- (2.) The coking power.
- (3.) The agglomerating power.
- (4.) The gas-making quality.
- (5.) The illuminating property of the gas.

Complete series of experiments were made on thirteen samples of coal.

With regard to change of weight, each sample was examined for 240 days at temperatures of 50°, 100°, 200°, and 400° C.

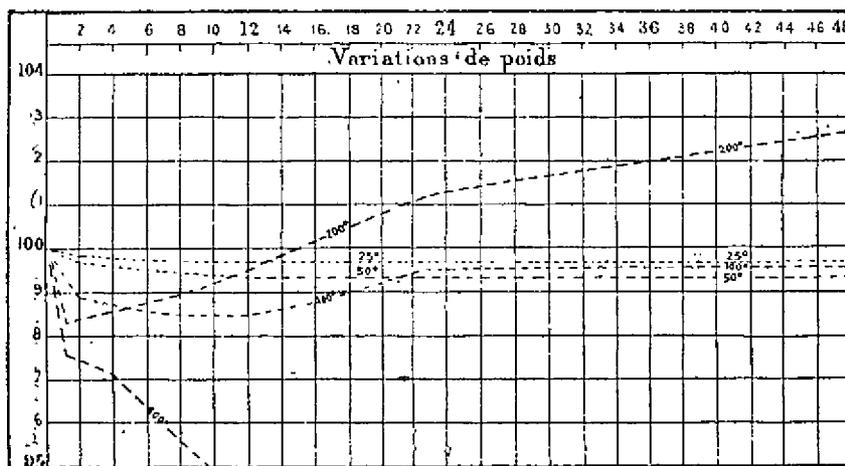

The coking power was examined over a period of 240 days and after exposure to temperatures as above, and similarly with regard to the other observations.

The results of this enormous work are illustrated by a number of diagrams which make the history of each sample singularly clear and complete. It is impossible to do justice to these researches in this abstract, and we must limit ourselves to a consideration of the summary of results obtained, which appears in M. Fayol's paper under the title of Article 3.

Under the action of air between 25° and 400° C. all the coals examined behaved in a similar manner as to change of weight—(1) They began by losing a small portion of their weight; (2) they soon recovered this and often attained a weight considerably exceeding the initial weight; and (3) finally, after a certain time, at the upper temperatures, the weights began to diminish again and to then go on decreasing indefinitely. The losses and increments of weight are not the same for all coals; but the nature of the coal has no sensible influence on the time history of the variations. We find that anthracites, gas coal, and lignites appear in the same class. The state of division of the coal has a considerable influence on the change of weight. These changes are produced in proportion more slowly as the coal is presented in larger fragments. The temperature plays the chief part in these changes. Each of the three periods indicated above is in proportion shorter and in proportion more strongly marked as the temperature becomes higher. There is an extraordinary parallelism of the effect of air upon all the samples of coal examined, so much so that these effects may be represented by a "general diagram."

These results may be illustrated by the following diagrams —

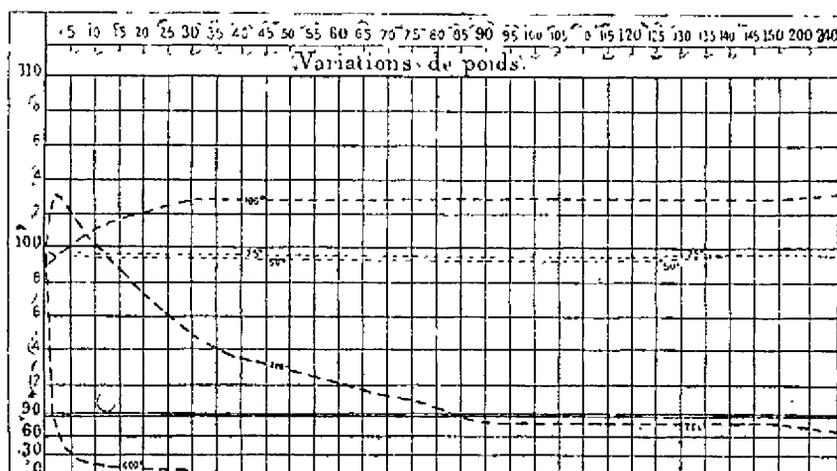

Mean of the whole of the results obtained with all the coals examined (in powder).

Ordinates: Weights on any arbitrary scale.  
Abscisse: Time in hours.

Mean

Mean of the whole of the results obtained with all the coals examined (in powder).

Ordinates. Weights.  
Abscissa: Time in days.

The following summary taken directly from M. Fayol's paper will give an idea of the phenomena observed:—

	Temperature of the air.				
	25° C.	50 C.	100° C.	200° C	400° C.
<i>First Period</i> —First decrease of weight.					
Maximum loss per cent. ....	0.53	0.81	1.50	1.60	?
Time at the end of which it took place.....	15 days.	24 hours.	12 hours.	1 hour.	?
<i>Second Period</i> .—Increase of weight per cent. (reckoned from the minimum to the maximum).					
Total increase .....	0.20	0.20	4.70	5	?
„ time of exposure to air .....	150 days.	150 days.	240 days.	8 days.	?
<i>Third Period</i> .—Second decrease of weight per cent (after leaving the maximum weight).					
Loss .....	0	0	0	30	100
Total time of exposure to air .....	240 days.	240 days.	240 days.	240 days.	15 to 20 days.

The relative inflammability of different kinds of coal was examined in a manner which however is not more particularly explained. It appears that by inflammability is meant the ease with which a fragment of coal can be set on fire by being placed in the flame of a candle, and the freedom with which the coal will continue to burn when withdrawn from the candle. The samples are classified in ten classes between "Bog-head," whose inflammability is denoted by 10 and anthracite, whose inflammability is denoted by 0. This property, in M. Fayol's opinion, is of great importance in determining the liability of coal to spontaneous combustion. It appears that at 400° C. every kind of coal loses in a few minutes its inflammable properties; at 200° C. this property will remain almost unimpaired during five to seven days, after which it diminishes rapidly; at a temperature of 100° C. the inflammability is not sensibly impaired, in a time less than one and a half to two months, and it entirely disappears only at the end of about four months. "Bog-head" shows an extraordinary resistance in this respect.

There is a remarkable parallelism between the luminosity of the gas obtained from various samples of coal, and the inflammability of pieces of these samples. In order to set coal on fire it is not always necessary to put it in contact with flame or with a body in ignition. On many occasions coal which was exposed to air at 200° to 400° C. took fire spontaneously.

#### *Summary of the effects produced by air upon the physical state of coal.*

The colour and appearance of the coal were not changed by keeping it at any temperature up to 75° for a period of eight months. At 100° C., on the other hand, the fragments appear to be gradually converted into cinder at their edges; and at 200° and at 400° C. the change takes place with increased rapidity.

The hardness of coal did not appear to be affected up to a temperature of 75° C. after a year's exposure to air. At 100° C., after twenty to thirty days the friability of the coal increases. After a year at this temperature the coal becomes so friable that the grains may be crushed under the pressure of the fingers; at the same time the structure changes, becoming granular. At 200° C. the same changes occur as at 100° C., but very much more rapidly. At the end of fifteen days the coal becomes converted into dust. At 400° C. the coal is disintegrated and reduced to powder at the end of several hours, if in the meantime it has not melted.

Several observations appear to show that as the weight of the coal increases the density diminishes. The density was measured by preparing a solution of sulphuric acid of the same density as the samples to be examined and then measuring the density of this solution. For a given kind of coal there appears to be a relation between the density and the ash content. We may even utilise this relation to evaluate the relative proportion of ash in similar coals.

Besides coal certain other combustibles were examined, and they all appeared more or less to resemble coal in their behaviour under the influence of air and high temperature.

Chapter 3 refers to various experiments made upon coal, amongst the most important of which are those as to the action of various gases. It appears from these experiments that hydrogen and carbon dioxide have no action upon coal.

Samples of coal were kept for more than two years in water at ordinary temperatures without any sensible change either in the appearance of the coal or in its properties. Oxygen, on the other hand, is rapidly absorbed in a manner which does not appear to differ sensibly from that in which the same phenomenon was observed to occur by Richters. The action of water on coal at high temperatures was also studied. After 100 days immersion in water at from 50° to 90° C., no sensible change was produced. At 100° C. the agglomerating power and the illuminating power were not sensibly impaired; the appearance of the fragments was not appreciably modified. In a sealed tube at 400° C., that is to say at a pressure of 300 atmospheres, the grains of coal became fused into a single piece, which was dense, compact, and had a metallic appearance. The gas produced from this product had no illuminating power.

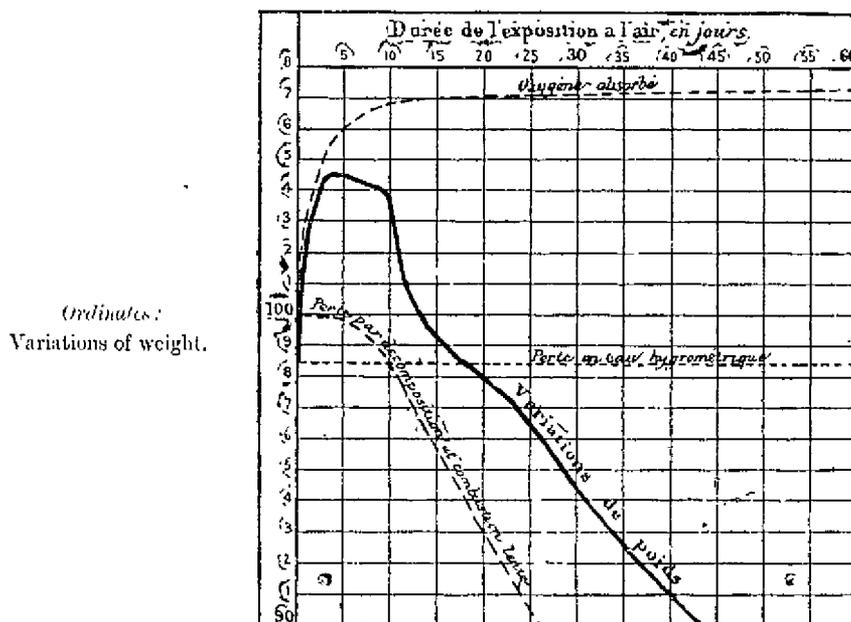

The action of acids may be passed over.

A long series of experiments was made by calcining coal at different temperatures, but as these have no appreciable bearing on the present inquiry, they may be omitted.

We may note, however, that M. Payol considers that the power which a coal possesses of evolving gas is a function of the temperature, and such as to persist even at ordinary temperatures. "Placing some of the Commentry coal in the upper portion of a graduated tube inverted over mercury during a month, I only obtained half a litre of gas per 100 grammes of coal at a temperature of 100° C. At 400° C. the rate of gas liberation was 5 litres in twenty-four hours. At a red heat it was 32 litres in fifteen minutes. The gases liberated, however, have a composition which depends upon the temperature, and may even change completely between the beginning and end of the same distillation."

Chapter 5 contains a summary of the results obtained up to that point. It is noted that when coal is exposed to air it is capable of absorbing a considerable quantity of oxygen, and that this absorption is favoured by high temperature within certain limits; but, on the other hand, a rise of temperature favours the loss of hygrometric water, and also the decomposition and slow combustion of the coal. The increments and diminutions of weight which have been referred to as occurring in coal under various circumstances are the differential result of these different phenomena. An estimation was made of the extent to which the different factors determining the change of weight of a sample of coal influence the final result. This is clearly shown by the diagram.

Coal of Commentry (in powder) exposed to air at 200° C.  
Components of the curve of the variations of weight.

The question as to whether oxygen is chemically combined with the coal as opposed to being merely physically absorbed by it is left somewhat undecided. It is, of course, shown that a considerable quantity of oxygen enters into chemical combination, but whether the whole of the oxygen does so is not made very apparent.

The action of pyrites, on the behaviour of coal under the influence of oxygen, was made the subject of special examination, but the previous results were obtained with coal containing only up to 1 per cent. of that substance.

The second part of the paper is devoted to a study of the spontaneous combustion of coal. A great number of observations appearing in this division, being in complete accordance with what is known to everybody interested in colliery matters, may be omitted. With the Commentry coal no spontaneous combustion has occurred with heaps less than 2 metres high; on the other hand, when the height passes 4 metres, spontaneous combustion nearly always occurs. These remarks, of course, apply to slack—that is to say, fragments passing a sieve having holes 20 mm. wide.

In order to study the circumstances attending the spontaneous combustion of coal, experiments were made on large heaps of coal placed under special circumstances; for instance, in order to study the effect of the height; a heap was made 40 metres long and 6 metres high at one end, tapering away to nothing at the other. The breadth at the top was in all cases 1 metre, while the breadth at the base was determined solely by the natural inclination at which the coal would stand.

The following conclusions, amongst others, may be mentioned:—

- (1.) In shallow layers the coal does not heat.
- (2.) Rise of temperature increases with the height of the heap.
- (3.) Towards a height of 3 to 4 metres the temperature rises continuously, and then falls away again without having passed 60° or 70° C.
- (4.) When the heap is 4 metres high, or over, the temperature continues to rise. During the third month steam is generally observed to be given off, after this a colourless but strongly smelling gas makes its appearance, and after several days smoke breaks out from a point which is generally situated about half-way up the slope of the heap. Sectional drawings are given showing the isothermals of the heap at different times. It appears from these observations that the point of highest temperature is situated immediately under the deepest or highest part of the heap and near the ground.

"From whatever part of the mine it comes, whatever may be its ash content, or the nature of the ash, coal piled up in the air heats in approximately the same manner and appears in its heating to follow laws which are approximately constant. Atmospheric influences—cold or heat, drought or damp—have not been sufficiently marked to be sensible."

The inflammability of coal at different temperatures was tested in a long series of experiments, using small volumes of coal and exposing them to the influence of air more or less heated. These experiments were confined to coal in the form of dust, though the receptacles containing the coal were considerably varied. It appears that at 100° C. the gas-making coals took fire in about five hours; at 150° they fired in about two hours; at 200° in about forty minutes; and at 400° C. in as little as one minute. The inflammability of anthracite coals was very much less than of the gas-making coals. For instance, the anthracite from Marias took four hours at 200° C. before it inflamed—that is to say, it is more than four times less inflammable than gas coal, as judged by this criterion. The order of inflammability in hot air of different kinds of coal may be stated as follows:—(1) lignite; (2) gas coal; (3) coking coal; (4) anthracite. This is the same order of inflammability as had already been obtained in experiments made by placing the coal in contact with a flame.

Spontaneous combustion takes place more easily and more rapidly the higher the temperature. At 400° C. all combustibles take fire—lignites instantaneously, anthracites after thirty to forty minutes. At 200° C. anthracites only catch fire in a state of powder; bituminous coal alone catches fire in large vessels. At 150° lignite in dust is the only combustible which fired in each of the three containing vessels employed. At 100° C. lignite alone will fire in large grained powder. The flaming coals only catch fire in impalpable powder. At 75° none of the samples caught fire.

The state of division of the coal has a great influence on the spontaneous combustion. Thus, in fragments of 1 centimetre and over none of the coals took fire except at 400° C. Dust composed of fragments measuring half-a-millimetre took fire at 200° C., except in the case of anthracite. When the coal is in a state of impalpable powder, whether it be lignite or gas coal, it will catch fire at 100° C. Pieces measuring 1 centimetre will not catch fire at 100° C. unless there be several of them. A single piece will not catch fire. On the other hand, a piece measuring 10 centimetres on the side

[did

did catch fire. This latter broke up under the action of the heat, and it was in the cracks, probably in the dust lying in them, that the fire started. At 400° C. the coal broke into flame at the surface of the fragments, or at the surface of the dust in the case of those vessels filled with dust. At 200° C. and below, in the case of dust, the fire did not break out at the surface, but at a depth of 1 or 2 centimetres. A crust is formed at the surface, from which smoke is given off after a certain time, and on breaking through the crust it is discovered that the coal below it is incandescent.

By placing a thermometer in the mass of coal undergoing observation the temperature at various points could be exactly ascertained, and it appears, from many experiments made in this connection, that the following table will represent, with tolerable approximation, the temperature at which the various kinds of coal catch fire:—

Lignite catches fire at about	150° C.
Gas coal	200°
Coking coal	250°
Anthracite	above 300.

Too much weight, however, must not be attached to these numbers, because small quantities of coal are liable to undergo considerable variations of temperature by the operation of trivial causes.

Some interesting experiments were made by heating coal in different states to various initial temperatures, and then placing the samples thus prepared in the air at ordinary temperatures. For instance, slack was heated in a stove to a temperature between 100° and 140° C. This was then exposed to air (under a roof) in a heap measuring from 1 to 1½ metres high, of pyramidal form, and having a volume of about 4 cubic metres. After two days of exposure to air smoke was observed to be given off on the southern side. It came from a depth of 5 to 10 centimetres, and a thermometer thrust into the heap at this point indicated from 265° to 275°. This fire was put out by removing the hot coal. Thirty days afterwards smoke was given off at another point without the heap actually catching fire. The temperature here was 195° C.

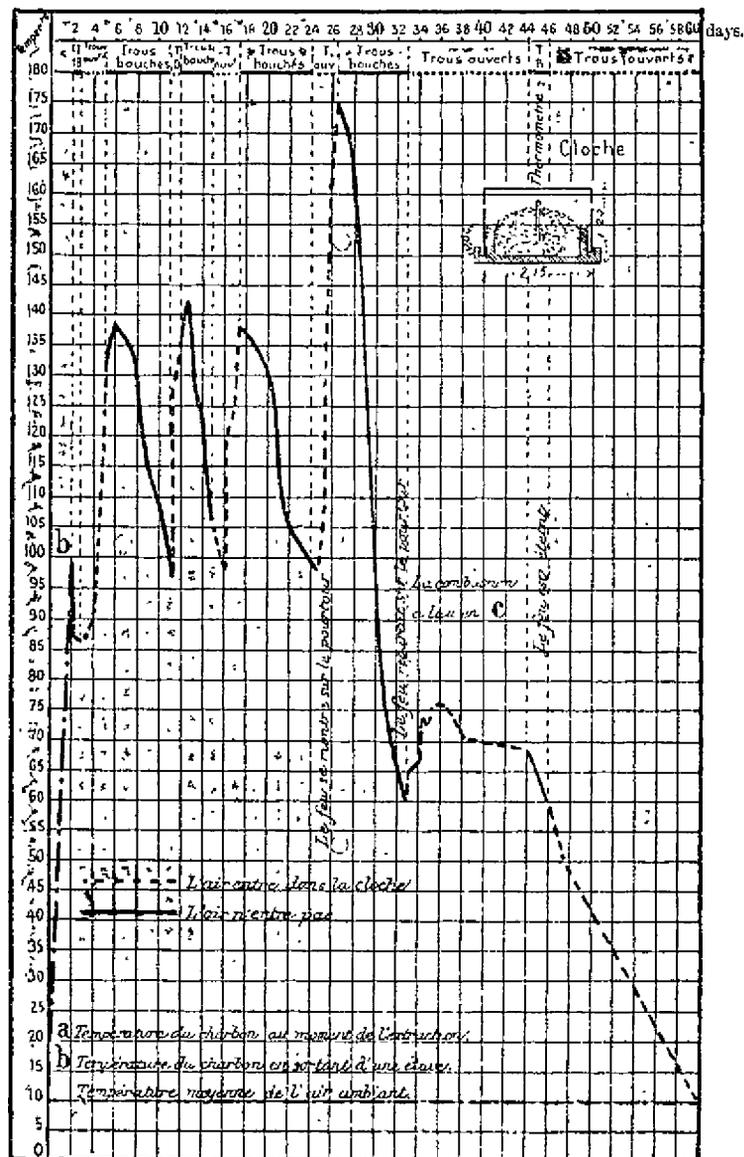

The following conclusions were drawn from the experiments made in this manner:—If a heap is made (in free air) of coal previously heated to a temperature a little above 100° C. fire will break out at the end of a few days. When the initial temperature is between 60° and 100° sometimes there is an increment, sometimes a diminution, of temperature. Below 60° C. the heap always cools to the temperature of the surrounding air.

It must be remembered, of course, that these numbers only refer to heaps containing a few cubic metres.

In all cases spontaneous ignition is preceded by the evolution of a characteristic odour: then yellow smoke appears at a certain point on the surface, generally about half way up the heap. At this moment, in the neighbourhood of the point at which the smoke appears, the temperature is generally from 100° to 150° C.

Perhaps the most conclusive experiment which has yet been made as to the influence of air on the spontaneous combustion of coal was made in the following manner:—A conical heap containing 2 to 3 cubic metres was placed on the ground and surrounded by a ditch which could be filled with water. A cover large enough to surround the heap and fit into the ditch was provided in such a way that the heap could be hermetically sealed from the external air after the manner of a gasometer.

In one experiment the coal was heated to a temperature of about 100° C to commence with. The cover was maintained constantly in position, but certain air holes with which it was provided were alternately opened and closed, and the temperature variations following the opening and closing of these holes were carefully studied. This heap was observed for sixty days, and it will suffice to say that when the holes were opened the temperature rose and when the holes were closed the temperature fell. By leaving the holes open for two days spontaneous combustion was superinduced. The fire was put out by closing the holes and allowing the temperature to fall to 60°.

It appears that this experiment may be performed on a very small quantity of material; even one hectolitre will suffice provided it is initially heated to between 100° and 120° C. The experiment succeeds perfectly with coal in grains from which the dust has been removed. It succeeds fairly well with large and square coal; not so easily with ordinary slack. In this latter case the dust which fills up the interstices between the pieces opposes the penetration of the air.

We have seen that air is necessary for the spontaneous heating of coal. It must not, however, be concluded that the more air the more rapid the spontaneous combustion. Air may influence the phenomena in two ways (1) by supplying oxygen it may favour oxidation and therefore heating (2) by carrying away the heat which is produced it may prevent the temperature rising. It is this last action which prevents the heating of slack exposed to air in thin layers and which also prevents the heating of heaps composed of large fragments. This action is illustrated by several experiments which need not be described.

#### *Influence of Moisture.*

The influence of wet weather on coal heaped at the mouth of the mine has not been sufficiently sensible to be remarked.

Several experiments made with the object of estimating the action of moisture have shown that this action either does not exist or is very slight. A large number of heaps measuring from 2 to 12 cubic metres have been made under sheds and in dry galleries. These heaps were composed (1) of slack recently extracted; (2) of coal previously dried in stoves without passing a temperature of 40° C; (3) of the same coal not dried, but watered in order to render it damp though not wet. Every day, during several months the temperature of these heaps of coal was observed, in no case did it pass 50° C. dry or wet. The heaps behaved in a practically identical manner.

It appears to result from these experiments that moisture does not favour the spontaneous ignition of coal.

We know, moreover, that slack which has been washed (for coke making), heaped up in a wet state becomes less altered and less heated than the unwashed slack. Although these results may be attributed to the presence of a smaller proportion of dust in the washed slack, it does not appear to be on that account less evident that humidity does not cause a rise of temperature.

Finally, the rapidity with which coal heated to above 100° C. catches fire, when it must be dry, shows that the presence of moisture is not a necessary condition of spontaneous combustion.

All the facts observed at Commentry appear to indicate that dampness prevents heating rather than favours it. It has, in fact, an action analogous to that of water or neutral gases in protecting the coal against contact with air.

Notwithstanding, there is a strong current opinion that dampness does act as a cause of combustion. It is possible that damp does, in fact, act indirectly by breaking up the coal and so facilitating its reduction to dust, and thereby favouring the action of the air.

An important remark is made as to the susceptibility to spontaneous combustion as affected by the presence or absence of dust. It appears that if the coal is in sufficiently small particles to ensure the requisite relation between the surface and the volume, the presence of dust hinders rather than assists spontaneous combustion. That this must necessarily be the case is obvious, and that it is the case has been observed at Commentry.

It appears that when coal is classified according to its susceptibility to spontaneous combustion the list is the same as that previously given as representing the inflammability of the coal. Thus, lignite is the most susceptible to spontaneous combustion, then gas coal, then bituminous coal, and lastly, anthracite.

#### *Action of the impurities of Coal.*

The author considers that pyrites has only a very slight influence on the spontaneous combustion of coal, in support of which opinion he mentions the following experiments:—

- (1.) Coal containing large quantities of pyrites and in small fragments, was exposed to very damp air at a temperature between 35° and 45° C for twelve months. At the end of that time the pyrites began to break up.
- (2.) Observations were made on heaps (containing 5 cubic metres) composed as follows:—One-third part of coal dust, one-half to one-fifth of pyrites, one-fifth to one-half of clay sand. In every case the temperature at the middle of the heap did not pass 50° C, which is the temperature which it would have attained if the heap had been formed of coal only.

The heating of heaps of slack at Commentry does not appear to have depended in any measure on the pyrites content.

#### *Final deductions.*

- (1.) That the first essential cause of spontaneous combustion of coal is the absorption of oxygen from air by the coal.
- (2.) That the best conditions for the spontaneous heating of coal are: a mixture of fragments and of dust, a high temperature, a large quantity of coal, and a certain proportion of air.
- (3.) The conditions opposing spontaneous combustion of coal are: storing the coal in large pieces, preserving a low temperature, stacking small quantities, and ensuring either complete absence of air or very effective ventilation.

#### *Means employed to prevent Spontaneous Combustion.*

The method formerly adopted to prevent the spontaneous combustion of slack was to ensure that no heap should remain in existence for more than a certain time. Later on attempts were made to prevent the spontaneous combustion of large quantities of slack by ventilation. Experience, however, has shown that although ventilation when excessive is effective, yet in practice whenever an obstruction or an interruption occurs in the ventilating appliances spontaneous combustion occurs much more quickly than if the heap had not been ventilated at all. For instance, in a conical heap of coal 2 metres high, the temperature at the centre of which varied from 120° to 150° C, a fagot was thrust in in such a manner that one end stuck out in the air. At first a slight cooling was produced, but after a short time the temperature again rose and the fagot caught fire in the course of several days. On pulling out the fagot the combustion was stopped, on replacing it by a fresh one the combustion recommenced.

A means more simple and more sure of avoiding spontaneous combustion of coal consists in not allowing the heaps to be very high. During the six years that it has been customary at Commentry to pile the coal in masses not exceeding 2.5 metres, there has not been a single case of spontaneous combustion. The coal, it is true still heats and becomes altered in a certain measure, but it does not catch fire. The temperature at the centre of a heap 2 metres high does not ordinarily pass 40° or 50° C.

A better method of preserving the coal would be to immerse it in water, but any impermeable covering—clay, or very fine powder, or wetted coal-dust—would certainly give excellent results.

#### *Spontaneous combustion on board ship.*

M. Fayol generally endorses the conclusions arrived at by the English and Belgian Commissions of 1876, with the following notes and exceptions.

The English Commission considered that certain coals take fire more easily than others. Fayol considers that his experience shows that the most dangerous coals are those which are at once friable and rich in illuminating gas. Experiment has shown that these coals are the most inflammable, and the inflammability may be tested either by the laboratory method indicated in the account of his experiments in hot air, or by holding grains of coal in a flame, or by simply kindling the coal in an ordinary fire-place.

- (1.) The most inflammable coals are the most dangerous, and they are the coals which generally contain the most oxygen.
- (2.) The Commissions have attributed to pyrites and to moisture a great importance (*sic.*) I have proved, on the contrary, that pyrites has only a very secondary action, and that moisture tends to hinder spontaneous heating rather than to help it.
- (3.) The Commissions came to the conclusion that ventilation was disadvantageous. Fayol points out (what is, of course, perfectly well known) that a ventilation can be got sufficiently good to prevent spontaneous combustion. As to whether such a ventilation is practicable on board a ship, he gives no information. He appears to lean rather to the view that a proper treatment is a complete deprivation of air. (4.)

- (4.) It is pointed out that it is quite possible for a small portion of a cargo of coal to become so hot as to distil off inflammable gas without the coal at the surface or the sides being appreciably high in temperature. It is clearly necessary, therefore, that some means should be adopted for removing explosive gases thus formed.
- (5.) Fayol considers that water in the liquid or vapourous state is preferable to carbon dioxide as a means of putting out fire.

"I have had many opportunities of observing how difficult it is to extinguish large masses in flames. A small quantity of water increases the combustion instead of extinguishing it, in consequence of the property which incandescent coal has of decomposing water. The free hydrogen and the oxide of carbon, resulting from the decomposition of the water, catch fire, burn and develop much heat."

The rest of this long memoir is taken up in the consideration of the application of the principles above laid down to colliery practice.

- (23.) "Note sur les Incendies dans les Houillères," by M. Durand, Engineer of Mines, at Doyet, Allier. (Bulletin de la Société de l'Industrie Minérale) Vol. XII (2nd Series, 1888.)

The object of this paper, coming four years after M. Fayol's publication, abstracted above, is not exactly clear. M. Durand, however, considers that Fayol did not take into account sufficiently the action of pyrites, but after a lengthy discussion on this matter, he finally admits that the chief cause of fire is the absorption of oxygen. It appears, therefore, hardly profitable to follow him in his reasoning in favour of the action of pyrites, especially as his conclusions, which are practically unsupported by fresh experiments, are matters of opinion rather than anything else.

M. Durand undoubtedly shows that pyrites, alum schist, &c., can be caused to heat spontaneously. This, however, is not the question at issue. The idea that pyrites may play an important role in the spontaneous combustion of coal by the inflaming of sulphur liberated during the decomposition of that substance, appears to have originated with M. Durand. That this is the case is likely enough, but M. Durand offers no experimental evidence of the catching fire of coal from this cause.

- (24.) "Incendies dans les Houillères," précédés employés pour les prévenir et les éteindre." Notes by M. Nesterowsky, Engineer in the Russian "Corps des Mines." (Bulletin de la Société de l'Industrie Minérale) Vol. VII (2nd Series, 1878.)

M. Nesterowsky visited a large number of French mines in order to inquire into the method of working them, in the interests of the Russian Government. His conclusions are those to which any intelligent engineer would have been led, and he does not appear to add anything to what had been previously established.

[Translation.]\*

- (25.) "On some alterations which coal undergoes by heating"; by Dr. E. Richters, Chemist in the Mining School of Waldenburg. (Dingler's Polytechnisches Journal, Vol. 190, page 398, December, 1868.)

Through the comprehensive and interesting researches of Fleck, Stein, Grundmann, Varrentrapp, Sauerwein, and others, the attention of chemists has been directed in modern times in an increased degree to the study of coal, and more particularly to the circumstances which determine its greater or less suitability for different technical purposes; I hope, therefore, the following account of observations on this subject may not be without interest.

If we heat at a temperature of from 180° to 200° C. coal powder which has been previously dried in a desiccator until its weight becomes constant, an increase in weight soon becomes apparent. For instance, according to the experiments which I have hitherto made, after heating for twelve hours the weight may increase by several per cent.; in twenty hours the increase of weight has reached its maximum, and any further heating then produces a diminution in weight. Coal which has gained in weight resembles unheated coal in little more than in appearance. The differences between heated and unheated coal are:—(1) The heated coal has a greater specific gravity than the unheated; (2) the chemical constitution is different; (3) heated coal differs entirely in its behaviour when heated to a red heat from ordinary coal; (4) the coal which has been heated abstracts moisture from the atmosphere much more freely than the normal variety.

With regard to (1) and (2), reference may be made to the table of analyses which accompanies this communication.

The heated coal, as I shall call it for convenience, gives no coke when heated in a crucible, even in the case when the coal was originally of an excellent coking variety. The alterations which its appearance undergoes by heating to a red heat are so inconsiderable as to be almost unnoticeable. If coal is quickly heated it foams up in an extraordinary manner, very similar to the manner in which silicic acid which has been separated from silicates by acids will foam up when carelessly heated. The gases which are given out, carrying with them particles of carbon, burn with a non-luminous flame. If the coal is heated in a closed crucible until the evolution of gas has entirely ceased, then any farther heating, if not too long continued, only produces a very small diminution of weight.

Under dry distillation the products at first obtained cause litmus paper to turn permanently red. The coal behaves in this respect like wood, or like turf or brown coal. Alkaline vapours are only given off later on during the distillation. The formation and separation of tar does not take place.

When two grammes of heated coal were exposed in an open watch-glass, first for fourteen and then for thirty-six hours, to the not very damp air of the laboratory, the increase of weight amounted, in the first instance, to 3.3 per cent., and in the second to 4.8. Exposing these samples for fifteen minutes in a drying oven heated to 105° C. caused the original weight to be recovered in both cases. The same coal, previously dried in a desiccator, experienced an increase in weight amounting to 1.3 and 1.8 per cent. during fourteen and thirty-six hours respectively.

If we compare the chemical composition of coal which has been dried in a desiccator with that of the heated coal, it appears that the latter has lost considerable carbon and hydrogen, but has gained considerably in oxygen (and nitrogen?). It appears, therefore, to be certain that by the process of heating a portion of the carbon and hydrogen disappear, and oxygen is taken up. The further question then arises as to whether the two first-named elements go off together as hydrocarbons, or whether they are previously oxidised to carbon dioxide and water; and, further, whether oxygen is simply condensed upon the coal by surface action, or whether it becomes chemically united with it. In order to answer the first question, 2 grammes of coal were taken and placed in a V-shaped tube, and this was brought into a drying oven in such a manner that the two free ends of the tube stuck out through the lid of the oven. (The coal used in this experiment was obtained from the 21st level of the Carl-George-Victor mine in Waldenburg). One limb of the tube was connected through drying tubes containing sulphuric acid, soda lime, and chloride of calcium, with the gasometer; the other end of the tube was connected with tubes containing chloride of calcium and soda lime. I heated this coal for 10 hours to 190° C., and during this time kept up a slow stream of air through the tubes. The result was that the weight increased by 4.21 per cent. The following table will show the result of this experiment:—

Coal dried in the desiccator.	Heated coal.	104.21 parts by weight of the heated coal, containing, consequently.
86.82 per cent. C. ....	82.19 per cent. C. ....	85.65 parts C.
4.26 " H. ....	3.38 " H. ....	3.52 " H.
6.40 " O. (& N) ....	11.96 " O. (& N) .	12.47 " O. (& N.)
2.52 " Ash. ....	2.47 " Ash. ....	2.57 " Ash.

The coal accordingly lost by heating .74 per cent. of hydrogen and 1.17 per cent. of carbon. On the other hand, it gained 0.07 per cent. of oxygen. The water which made its appearance in the chloride of calcium tube weighed .118 grms., corresponding to .66 per cent. of hydrogen. The increase in weight of the soda lime tube was 0.092 grms., corresponding to 1.25 per cent. of carbon. The result of this experiment is to show that by heating the coal in air there is complete oxidation of the hydrogen and carbon which it loses.

\*We desire to thank Dr. Helms for assistance in preparing this translation. We believe that this is the first time that Dr. Richters' work has been translated as a whole, though it has been frequently referred to and quotations from it made (especially by Percy—"Fuel.")

The next question is as to whether the oxygen in the coal is mechanically condensed upon it or whether it is chemically united with it. Certain circumstances appear in favour of the former, and others of the latter, hypothesis. In favour of the former view, it may be mentioned that the heated coal when dipped into water gives off a great many more bubbles than unheated coal, and also in the first stages of heating in the crucible we have a vigorous evolution of gas. On the other hand, the abovementioned behaviour of coal by heating, the strong acid reaction of the product of dry distillation and the considerable increases of specific gravity, make it probable that oxygen becomes chemically fixed in the coal. I hope to make further experiments on this subject, and in settlement of the question as to whether the nitrogen of the atmosphere has anything to do with the matter.

With regard to the following table and data therein contained I must make the following remarks:—The samples of coal "a," "b," and "c," coming from the 4th, 23th, and 24th levels of the Carl-George-Victor Mine at Waldenburg, were heated for twelve hours at the same time. The increases of weight were 4.24 per cent., 4.45 per cent., and 4.07 per cent., respectively. The samples of coal "d," "e," and "f," coming from the 6th, 3rd, and "B," level of the Gustave Mine at Waldenburg, were heated for twenty hours. The increases of weight of these samples were 4.62, 3.92, and 3.24 per cent., respectively. During a further heating of five hours duration, after which analysis was made, the samples of coal had fallen in weight,—“d” by .67 per cent., “e” by .63 per cent., and “f” by .77 per cent.

The term "red hot residue," used in the table, applies to coal which had been heated until the gas evolution had completely ceased, and refers, of course, to the substances then left behind. This residue appears to be constant since its oxygen content increases with that of the heated coal.

The specific gravities were determined by a pyknometer at a temperature of 19° C.

Coal.	Chemical composition of the dried coal.				Chemical composition of the heated coal.				Weight of residue obtained on raising the heated coal to a red heat	Composition of red hot residue.				Specific gravity of dried coal.	Specific gravity of heated coal.

(26.) "Contributions to our knowledge of the relations of coal and oxygen"; by Dr. E. Richters. (Dingler's Polytechnisches Journal, Vol. 193, page 51, July, 1869.)

In vol. 190, page 398, of this journal, Part I, December, 1868, I have drawn attention to certain peculiar alterations which coal undergoes when kept for some time at from 180° to 200° C. It was shown in that article that powdered coal heated to the abovementioned temperature begins by taking up oxygen, and losing carbon dioxide and water, but the weight of the oxygen so taken up is greatly in excess of the carbon dioxide and hydrogen which evaporate, so that the net result is a very considerable increase in weight. I noted further that the increase in weight reaches its maximum after about twenty hours heating. This is, however, only true for coal of that composition, which, in the communication quoted is denoted by the letters "d," "e," and "f." The increase in weight appears from my farther researches to depend in general in an inverse proportion upon the oxygen content of the coal. A coal which contains 4.81 per cent. of oxygen, which is a very small quantity, after seventy-two hours continuous heating, gained in weight by 8.45 per cent.

The contents of my former communication is besides importantly supported by a later communication by Hindrichs, which, at the same time, and as I think, entirely completes it.

I allowed powdered coal which had increased in weight by heating to remain for forty-eight hours under the bell-glass of an air-pump exhausted down to 22mm mercury pressure. This powdered coal maintained its weight, including the increase of weight, a proof that I had to do with true oxidation, and not with mere absorption. The former observations made me think that oxidation processes, similar to those occurring on the heating of coal, would take place at ordinary temperatures, but, of course, more slowly. Varrentrapp has shown (D. V. J., vol. 178, p. 375), that coal absorbs oxygen at ordinary temperatures, and that it gives off carbon dioxide at higher temperatures. Since one of the processes taking place when coal is heated will go on by itself at ordinary temperatures, and under normal circumstances, it appeared probable that the other, namely, the absorption of oxygen without the formation of carbon dioxide, would also take place at ordinary temperatures, most probably, however, more slowly and gradually. This then would lead to the conclusion that coal by lying a long time in the air would become altered in a manner similar to the manner in which it is rapidly altered by heating.

I have carried out sixteen experiments on samples of coal of different quality which aimed at the determination of the absorption of oxygen at ordinary temperatures. In these experiments I made use of two forms of apparatus, the one consisting of a glass tube open at one end, and capable of being closed at the other by means of a tap; and the other of an apparatus which has already been constructed and described by Dietrich for the conduct of volumetric gas analysis, and more particularly for the determination of carbon dioxide. In the glass tube, containing 50 to 75 c.c., a weighed quantity of coal of known specific gravity was introduced and packed tight by means of a small asbestos stopper. The open end of the tube was then dipped below mercury, and the tap at the upper end allowed equilibrium to become established between the external and internal pressure. After standing for one hour, during which the temperature of the room had remained constant, the tap was closed, and the volume, temperature, and height of barometer were noted. When using Dietrich's apparatus (the capacity of which was previously ascertained, and of which the lead condensing worm was replaced by a glass tube) the flask intended for an evolution of gas was employed as a receptacle for the coal. I will give a detailed account of three of the abovementioned experiments, partially because they were continued for the longest time, and partially because the earlier experiments had made me aware of several sources of error which afterwards I was able to avoid.

- (1) Experiment made with the Dietrich apparatus—Using 50 grms. of powdered coal from the Jacob level of the Theresien shaft, which had been lying in a loosely-stoppered bottle exposed to the air of the laboratory for two months, the following results were obtained:—

4 May, Morning, 10 o'clock, beginning of experiment. Vol. 218.2 c.c. at 15.75° C. and 717.3 mm. barometric pressure (= 194.8 c.c. under normal conditions).

4 May, Evening	218.5 c.c. at 15.75° C. and 715.1 mm. (= 194.4 normal c.c.)
5 " Morning	209.6 " 12.50° " 724.1 " = 190.0 "
5 " Evening	212.0 " 15.75° " 724.1 " = 191.0 "
6 " Morning	208.6 " 13.00° " 720.7 " = 188.8 "
6 " Evening	212.2 " 15.25° " 715.0 " = 189.0 "
7 " Morning	210.4 " 14.75° " 715.0 " = 187.8 "
8 " Morning	210.8 " 18.00° " 715.0 " = 186.0 "
8 " Evening	212.6 " 21.00° " 717.3 " = 186.2 "
10 " Morning	201.4 " 16.00° " 721.8 " = 180.8 "
10 " Evening	207.0 " 21.50° " 720.7 " = 181.9 "
11 " Morning	202.0 " 18.00° " 717.3 " = 178.8 "

It appears, therefore, that in 168 hours—that is, seven days—16 c.c. of gas, measured under standard conditions, were absorbed. In order to show that the gas which had been absorbed was only oxygen, 6 c.c. of a solution of pyrogallic acid in concentrated alkali was brought into the calibrated tube after the rubber tube which closed the upper portion had been opened. The rubber tube was then immediately closed, and the solution was distributed as well as possible by moving one tube in and out of the other. The volume, after it had remained standing for twelve hours, was read. The residue and the air confined in the tube, reckoned as atmospheric air, should have contained 24.9 c.c. of oxygen, but 23.1 c.c. was all that was absorbed. The experiment can make no great pretensions to accuracy, but sufficiently serves its purpose.

(2) Experiment in the calibrated glass tube and with 20 grms. of coal powder from the Robert level of the Theresien shaft. This sample had been dried in a desiccator and until its weight remained constant, and then been immediately removed into the slightly-warm tube through which, until it was cold, a gentle stream of dried air was passed:—

Commencement of experiment, 23 May, 12 o'clock midday. Volume of air 37 c.c. at 19° C. and 726.8 mm. pressure = 33.1 normal c.c.

24 May, Morning	35.0 c.c. at 17.00° C. and 726.8 mm.	= 31.5 normal c.c.
24 " Evening	34.8 " 17.00° " 726.8 "	= 31.3 " "
25 " Morning	34.2 " 17.00° " 725.2 "	= 30.7 " "
25 " Evening	34.2 " 17.50° " 722.9 "	= 30.6 " "
26 " Morning	33.8 " 17.00° " 718.4 "	= 30.1 " "
26 " Evening	34.2 " 19.00° " 716.2 "	= 30.0 " "
27 " Morning	33.3 " 18.00° " 718.4 "	= 29.5 " "
27 " Evening	33.3 " 21.00° " 721.8 "	= 29.4 " "
28 " Morning	32.5 " 18.75° " 724.1 "	= 28.9 " "
28 " Evening	32.6 " 20.00° " 724.1 "	= 28.9 " "
29 " Morning	32.2 " 19.05° " 724.1 "	= 28.6 " "
29 " Evening	32.2 " 20.50° " 721.8 "	= 28.4 " "
30 " Morning	31.6 " 19.50° " 724.1 "	= 28.1 " "
31 " Morning	30.2 " 19.00° " 724.1 "	= 26.9 " "
31 " Evening	30.1 " 18.50° " 722.9 "	= 26.8 " "
1 June, Morning	29.8 " 17.25° " 725.2 "	= 26.4 " "
2 " "	29.3 " 16.00° " 729.7 "	= 26.5 " "

From this date the volume remained constant. The original 33.1 c.c. of air contained 6.95 c.c. of oxygen, from which 6.6 c.c., or 95 per cent., had been absorbed.

(3.) Experiment with the calibrated glass tube and 20 grms. of coal powder from the Carl level of the Theresien shaft. The air was saturated with moisture during the whole period of the experiment.

Commencement of the experiment, 22 May, 9 o'clock morning. Volume of air = 60.6 c.c. at 19.75° C. and 722.3 mm. pressure = 52.4 normal c.c.

22 May, Evening	60.0 c.c. at 19.00° C. and 722.3 mm.	= 52.1 normal c.c.
23 " Morning	58.4 " 17.50° " 726.8 "	= 51.4 " "
23 " Evening	58.2 " 17.50° " 726.8 "	= 51.2 " "
24 " Morning	57.2 " 17.00° " 726.8 "	= 50.5 " "
24 " Evening	57.2 " 17.00° " 726.8 "	= 50.5 " "
25 " Morning	56.4 " 17.00° " 725.2 "	= 49.7 " "
25 " Evening	56.5 " 17.50° " 722.9 "	= 49.4 " "
26 " Morning	56.0 " 17.00° " 718.4 "	= 48.8 " "
26 " Evening	56.6 " 19.00° " 716.2 "	= 48.8 " "
27 " Morning	55.4 " 18.00° " 718.4 "	= 48.1 " "
27 " Evening	55.4 " 21.00° " 721.8 "	= 47.6 " "
28 " Morning	54.1 " 18.75° " 724.1 "	= 47.1 " "
28 " Evening	54.3 " 20.00° " 724.1 "	= 47.2 " "
29 " Morning	53.8 " 19.50° " 724.1 "	= 46.7 " "
29 " Evening	53.8 " 20.50° " 721.8 "	= 46.4 " "
30 " Morning	52.8 " 19.50° " 724.1 "	= 45.9 " "
31 " Morning	51.9 " 19.00° " 724.1 "	= 45.2 " "
31 " Evening	51.7 " 18.50° " 722.9 "	= 45.3 " "
1 June, Morning	51.4 " 17.25° " 725.2 "	= 45.2 " "

Of the 11 c.c. of oxygen which were contained in the original volume of air, 7.2 c.c. were absorbed. A further absorption followed, as the three last columns show. There was then no further absorption. (Compare Experiment 2.)

Similar results were obtained when air saturated with moisture was employed instead of dry air. However, under the influence of moisture there was a considerable evolution of carbon dioxide, which was not to be expected when dry air was employed.†

Observations were in general made at a quarter-past 8 o'clock morning and evening—that is to say, they were separated from one another by twelve-hour intervals, and after the temperature of the room had remained during at least one hour fairly constant, or had, at most, only varied  $\frac{1}{2}$ ° C.

However inclined one may be, from the small differences between the readings of the morning and of the evening of any given day, to conclude that no absorption goes on during the day time, it appears to me still to be doubtful whether my observations allow this position to be taken up with security.

This conclusion will be evident if it be remembered that, although considerable quantities of gas were employed, the settlement of this question depends upon the correct determination of fractions of a cubic centimetre, in addition to which there were a number of other sources of error, which appear sufficient to account for the difference between the results obtained in the evening and morning in another manner.

I may mention (1) that during the day the temperature was continually changing; (2) the high coefficient of absorption of coal for radiant heat obviously affects the temperature of the air in the apparatus, and so may cause a difference of temperature between the latter and the air in the room, amounting perhaps to about 1° C. The influence of this upon the result may be considerable, as may be verified by anyone who will make the calculation.

It is remarkable that at the beginning of an experiment, even when this occurs during the daytime, a very appreciable alteration of volume takes place. It continues for about the first thirty-six hours, and then, during the day at all events, it is no longer to be observed with certainty. It must also be mentioned that, on the other hand, some absorption was clearly observed to take place if the apparatus was shielded from the influence of daylight by covering it with black paper or in any similar manner; also, in so far as the influence of light upon the phenomena of absorption is concerned, and in spite of experiments extending over months, I have not succeeded in arriving at positive and, in every respect, certain results. I feel still impelled to a conscientious communication of such results as were obtained, as they possibly may induce others who have an opportunity of working under more favourable conditions and with instruments better adapted to the ends, to take up these experiments so as to settle this interesting question definitely. So much, however, follows from my observations with full certainty, namely, that perfectly dry coal, as well as air-dried coal, is able to absorb oxygen without exhaling carbon dioxide, both from dry air and from air saturated with water vapour.

I shall show in another communication that in this behaviour of coal we have the key to the explanation of a whole series of phenomena, which without this key can hardly be explained. I must not omit to draw attention, however, to an objection which may be raised against the above conclusion, namely, that the oxygen is absorbed not by the coal itself, but by

\* Here, as in the following experiment, the glass tube was surrounded by black paper on the day named, in order to eliminate the action of light.  
† I note in connection with this matter, that if the oxygen combines with calcium, a given volume of oxygen gives rise to the same volume of carbon dioxide; so that a formation of carbon dioxide at the expense of the oxygen of the air can give rise to no change in the volume of the latter.

by the pyrites which is present with it. If we calculate the total ash content of the coal as if it were ferrous sulphide, we find that the coal from the Carl seam contains '81 per cent., from the Robert seam '42 per cent., and from the Jacob seam '36 per cent. of pyrites. These coals, therefore, are extraordinarily poor in pyrites. Moreover, pyrites is quite unaltered in dry air. In moist air, however, it does absorb a certain quantity of oxygen, but in very small proportions, so that if we mix an indifferent substance—for instance, quartz sand—with the pyrites, so as to make a mixture having the same pyrites content as the above-mentioned coals, it appeared that, in the first case, no oxygen was absorbed, and in the second only a very small quantity, even when the mixture was left for a very long time with a measured volume of air.

## CHAPTER II.

It is well known that both ordinary coal and charcoal act in a reducing manner upon compounds rich in oxygen. During this process a portion of the oxygen goes into combination with the coal, so that after treatment with oxidising substances the coal is richer in oxygen than it formerly was.

My attention was almost solely directed to the action of ferric salts upon coal, for reasons which will appear from the content of the next memoir. I will, however, give the following account of the experiments:—

The oxidising action of ferric salts is, quantitatively considered, exceedingly variable. Very strongly acid solutions of ferric sulphate were scarcely reduced at all. Ferrous sulphate, however, in contact with air acted more powerfully as an oxidiser, especially if to the solution of the salt there was added a small quantity of an alkali. Ferric chloride was, especially when warm, a fairly active and energetic oxidiser, and was itself decomposed so as to precipitate ferric hydrate upon the surface of the coal. Ferric hydrate can, of course, be removed by treatment with a little dilute acid. Ferric acetate behaves in a similar manner. Dilute nitric acid has some action in the cold, the velocity of reaction increases as the temperature rises, and then the acid behaves as a powerful oxidiser. The weight of the coal considerably increases, and its properties are proportionately altered.

After the action of the ferric salts upon the coal was completed, the latter was treated with a small excess of dilute sulphuric acid in order to separate any ferric hydrate which might have been formed, and the results were only accepted as proving anything and included in this paper if the coal on analysis gave a pure white ash.

In order to show that the alterations which the composition of the coal undergoes by successive treatment with ferric salts and dilute sulphuric acid are not to be ascribed to the action of the latter, I digested samples of the same coal for long periods of time in the sulphuric acid alone, and then determined its elementary constitution. (See analysis 3 in the following table).

In the following collection of results, I have set down the composition of ash-free-coal in order that a better view may be obtained of the phenomena. The ash content of coal dried at 100° C. is added. At the bottom of the columns are placed with positive or negative signs the numbers giving the increase or diminution of weight which the coal undergoes by the action of the different reagents:—

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
C	84.76	84.85	85.02	84.76	84.31	84.45	83.06	84.20	81.23	81.15	82.78	83.82	84.17	83.56	82.08	83.11	83.10	82.00	79.96	
H	5.37	5.29	5.38	5.28	5.26	5.25	5.33	5.23	4.89	4.85	4.60	4.95	5.02	4.89	4.72	5.29	5.02	5.09	4.66	
O	9.85	9.81	9.90	10.58	10.49	10.30	10.71	10.38	13.83	11.00	12.58	11.23	10.81	11.55	13.25	11.63	11.55	12.01	15.38	
Ash	7.33	7.62	6.13	6.99	6.26	6.49	6.49	6.72	6.78	3.08	3.90	3.71	4.06	3.04	3.14	3.37	2.40	2.38	2.60	
			-1.3%	-0.2%	+0.2%	-0.4%	+0.5%	-1.6%	+3.19		+0.9%			-0.10%	+1.24%			+0.45%	+3.41%	

The coals examined came from the mines of the Waldenburg district. Coals (1) and (2) came from the 6th seam of the Erb-stollens; (3) the same, digested for two days with dilute sulphuric acid; (4) the same, digested eight days with a solution of ferrous sulphate and half an equivalent of potash; (5) the same, treated for three days with a solution of ferric acetate; (6) the same, treated for fourteen days with a solution of ferrous sulphate; (7) the same, digested with a solution of ferrous sulphate to which a few drops of caustic potash had been added; (8) the same, treated with a solution of ferric sulphate; (9) the same, treated for two days with gentle warming, with a solution of nitric acid containing 14% of N.O<sub>3</sub>. After treatment with acid the coal was boiled six times with a solution of carbonate of soda, until the filtrate, at first brown became of a clear yellow colour. The unaltered coal gave 69% of very hard baked coke, but the coal after treatment with nitric acid gave 71% of a coke which was scarcely sintered. (10) coal from the "Bestelloetz des Wrangelschachtes Niederbank"; (11) the same coal treated like No. 7; (12) the same coal treated with exclusion of air, by a solution of ferrous sulphate; (13) coal from the "Bestelloetz des Wrangelschachtes Oberbank"; (14) the same coal treated at ordinary temperatures with a dilute solution of ferric chloride; (15) the same coal treated on the water bath for two days with a solution of ferric chloride; (16 and 17) coal from the Carl seam of the Theresien mine; (18) the same, treated with ferric chloride, like No. 13; (19) the same, treated with nitric acid, like No. 9. The unaltered coal gave 68% of very much sintered coke, whilst the coal which had been digested with nitric acid gave the same quantity of loose and pulverulent coke.

The numbers show, without exception, an increase of the oxygen content of the coal consequent upon treatment with oxidising reagents.

The amounts of reduced ferrous hydrate, which were determined by the use of ferric salts and potassium permanganate, are not given, since the reaction took place in open dishes or beakers, and the results are affected by the presence of air.

## CHAPTER III.

In continuation of my first communication on the behaviour of coal at a temperature of about 180° C., I will here add several important observations which refer to the behaviour of charcoal under similar circumstances.

I heated powdered charcoal from pine wood on a watch-glass in a drying-cupboard up to a temperature of 105° C. This was done after the charcoal had been previously dried until its weight became constant at 100° C. After a short time I noticed an appreciable increase in weight, which, however, neither in these nor in the researches which are about to be described, attains to such dimensions as in the case of coal. The temperature was gradually raised to 150° C., and the charcoal was weighed from time to time. After thirty-six hours heating the increase in weight was 2.46 per cent. The charcoal was then left for forty-eight hours under the receiver of an air-pump, which was exhausted down to a pressure of 22 mm. When I allowed the air to re-enter the receiver the charcoal absorbed moisture from it, which again increased its weight. After long heating at 100° C., however, the original weight, including the increment of weight through the former heating, namely 2.46 per cent., was exactly recovered.

The second sample of the same charcoal gave, under similar treatment, an increase of 1.83 per cent. This sample was then placed in a platinum bowl, was covered with boiling water and was heated for three hours in a water bath. It was then collected upon a weighed filter and again dried at 100° C. It was found to have recovered its former weight, including the increase of 1.83 per cent.

Charcoal from oak and beech, which I prepared myself in platinum crucibles, behaved in a quite similar manner; after heating for thirty-six hours between 105° and 150° C., the increase of weight was 1.51 for the oak charcoal, and 1.61 for the beech charcoal.

When charcoal is treated either at ordinary temperatures, or after warming, with a solution of a ferric salt, the same kind of phenomenon is observed as in the case of coal. In this case, however, and in consequence of the extraordinary power of absorption possessed by charcoal, it is exceedingly easy to fall into mistakes. This remark applies more particularly to the application of ferric chloride, which is reduced in the most rapid manner. The ferric chloride is decomposed partially into ferric oxide, which coats the surface of the charcoal, and into hydrochloric acid. The former may, however, be removed by treatment with an excess of hydrochloric acid, but the latter remains partially absorbed and can be completely driven out neither by prolonged boiling with water nor by boiling with a solution of sodium carbonate.

In order to determine the amount of hydrochloric acid remaining in the treated coal I boiled the latter with a solution of sodium carbonate in a platinum dish, evaporated to dryness, covered the contents with a layer of the same salt, and heated the whole to a high temperature until the charcoal was destroyed, a thing which very easily occurs. The residual mass was then exhausted with water saturated with nitric acid, filtered and subjected to a chlorine determination by silver solution.

From

From the results of these experiments the equivalent quantity of chloride of sodium was calculated, and this was then subtracted from the observed (by difference) oxygen content. This was necessary, since in the final analysis the residual ash only showed very small proportions of chlorine, showing that the chloride of sodium had been appreciably volatilised at the tolerably high temperatures employed. The following table gives the results of the experiments which have hitherto been made. —

	20	21	22	23	24	25	26			27
							a	b	c	
C .....	89.09	88.62	85.68	85.94	88.74	89.39	84.13	84.35	84.24	87.49
H .....	2.77	2.81	2.34	2.57	2.67	2.77	2.63	2.61	2.62	2.72
O .....	8.14	8.57	11.98	11.49	8.59	7.84	11.49	11.08	11.29	9.79
Ash .....	1.58	1.59	1.64	1.23	0.67	1.40	1.75	1.96	1.85	.....

These numbers give, with the exception of 26 (compare below) a percentage composition of the ash free substance of charcoal; (20) and (21) refer to pine charcoal dried at 100° C.; (22) refers to the same charcoal which increased 2.46 per cent. in weight by heating, and was then kept under the air pump for forty-eight hours; (23) the same, which increased by heating 1.83 per cent., and was then treated with boiling water; (24) the same, which had been digested for two days with a solution of ferric sulphate; an increase in the oxygen content is not clearly visible; (25) the same charcoal treated with nitric acid only for two days, and then boiled out with sodium carbonate. After subtracting from the difference, .62 per cent. chloride of sodium, the remainder represents the oxygen content; (26a and b) the same charcoal which had been digested for two days with ferric chloride, and then further treated with nitric acid, and sodium carbonate; (c) represents the mean of the measurements made upon (a and b); (27) is the ash free substance of (26). The oxygen content was obtained by subtracting 1.87 per cent. of sodium chloride from the difference.

If we admit that the circumstances attending the increase of weight which charcoal undergoes by heating are to be attributed to an oxidisability similar to that which coal exhibits owing to the presence of hydrocarbons, or hydrocarbon oxygen compounds, a new light will be thrown upon many peculiarities of charcoal.

So far as the time at my disposal permits I intend to return to the study of this subject, and hope to make further communications about it; meanwhile I give here without any comment the results of my observations.

(27.) "On the Alterations which Coal undergoes when exposed to Air." By Dr. E. Richters (Dingler's Polytechnisches Journal, vol. 195, p. 315, 1870).—Slightly abbreviated translation.

The alterations which coal undergoes by lying in air have formed the subject of many technical chemical researches. These researches are characterised by the fact that they have all been directed rather to the elucidation of the alterations which coal undergoes with regard to its heating power and so forth than to the chemical changes taking place in it. It is known that the longer coal has been exposed to air the richer it becomes in oxygen and the poorer in hydrogen and carbon, but it remains to be determined whether the increase and diminution of the elements mentioned are relative or absolute. The researches of Fleck, Grandmann, Reder, and Thompson are referred to in connection with the weathering of coal at considerable length.

"We know that coal always absorbs oxygen quickly at upper temperatures, slowly at ordinary temperatures. The chemical and other changes which the combustible substance of coal undergoes under the first condition has already been established by me. On the other hand, at ordinary temperatures the absorption of oxygen is, in so far, a matter which in no way assists us in understanding the chemical changes which are consequent upon it. Whether and how far the carbon or hydrogen is the cause of the oxidising action of the oxygen; whether the action of the latter is not essentially confined to the formation of carbon dioxide, which is then absorbed by the coal; and whether, further, the absorption is a chemical or more or less physical process, are all questions which are of the greatest interest for a critical examination of the phenomena of the weathering of coal."

"I shall offer several observations which appear to me to be of importance for throwing light upon the first of the questions propounded above. If we heat coal-dust to a temperature from 180° to 200° C., the weight at first increases rapidly in a very marked manner; carbon dioxide and water are then separated, and oxygen is taken up in greater proportion than is required for the oxidation of the carbon and hydrogen. After a certain time the oxygen absorption, and with it the alteration in weight, comes to an end. If we continue to heat the coal, at first there is a small diminution in weight, but after a while the weight, as well as the chemical composition of the coal, becomes constant, or, rather, the variations which the coal still undergoes are so small that in an experiment which was continued for six days a good chemical balance was unable to show any further variation. If we examine the constitution of coal which has been heated up to the point of maximum absorption of oxygen, we find that the oxygen and hydrogen are present approximately in the same proportions as in water. This interesting behaviour of coal brings to light two important phenomena. It shows firstly that the carbon of the coal is endowed with a very variable degree of oxidisability, and makes it, in the second place, probable that there is a perfectly definite relation between the absorption of oxygen and the content of disposable hydrogen in the coal, since with the vanishing of the latter the oxygen absorption comes to an end. The first circumstance agrees with the view which is generally taken by chemists that the carbon in coal exists in two different chemical forms. We may say that the coal is a mixture of pure carbon with obscure organic compounds containing carbon, hydrogen, oxygen, and nitrogen. These carbon compounds are sometimes grouped together under the name of "bitumen." The rapid evolution of carbon dioxide which takes place when the coal is first heated may be attributed to the oxidation of the carbon of the bituminous constituents, while the relatively much smaller evolution of carbon dioxide which succeeds may be attributed to the oxidation of the more difficultly oxidisable carbon."

This view may be supported by a consideration of the similar phenomena occurring during the absorption of oxygen by wood and the products to which it gives rise.

Saussure, the distinguished chemist, noticed that dry oak wood absorbs oxygen and gives out carbon dioxide without causing any alteration in the volume of gas in which it is contained. Similar researches made by Liebig are also mentioned.

"If we bring damp brown coal, either freshly obtained or which has been exposed for a considerable period to the air, we find that carbon dioxide is formed, and at the same time, oxygen is taken up. The brown coal which was used by me in these researches was of two kinds—(1) a fibrous lignite exhibiting the original wooden structure very clearly, and (2) a completely formed brown coal; both of them free from pyrites:—

1. Lignite.	2. Completely formed brown coal.
55.97 % C.	53.64 % C.
5.65 % H.	5.32 % H.
36.02 % O. + N.	32.81 % O. + N.
2.36 % ash.	8.20 % ash.

"Sample (1) contains 1.12 % and sample (2) contains 1.22 % of disposable hydrogen.

"These samples, when moistened and exposed to atmospheric air over quicksilver, absorbed oxygen. For instance, 10 grammes of lignite, in six days, absorbed 4.3 c.c. of oxygen and formed, at the same time, 3.6 c.c. of carbon dioxide. The completely formed brown coal absorbed in the same time 4 c.c. of oxygen and gave up 3.1 c.c. of carbon dioxide. These observations confirm my anticipations.

"Wood in which hydrogen and oxygen are present in about the proportions of water, and which, therefore, does not contain disposable hydrogen, form, in contact with air, carbon dioxide without taking up oxygen. Brown coal, which contains free hydrogen, absorbs oxygen without giving up the equivalent quantity of carbon dioxide, behaving in this respect like ordinary coal, though the phenomenon is less strongly marked.

"On

"On the ground of these observations we come to the following conclusions, which are of importance for our knowledge of the behaviour of coal in the presence of oxygen:—

"(1) The peculiarity of coal, when heated to 190° C., in taking up oxygen, depends almost entirely on the fact that the coal contains disposable hydrogen. This is oxidised in presence of a certain quantity of carbon. On the one hand water is formed, while on the other oxygen takes its place directly in the composition of the coal; (2) the carbon of coal when exposed to oxygen at a temperature of 190° C. behaves in a totally different manner, in that the smaller part—5 to 6 % per cent. only—of the whole weight combines, forming carbon dioxide. The remainder is only slightly or not at all altered by oxygen at that temperature.

"It is to be noted that both these conclusions refer exclusively to the oxidation of coal at upper temperatures, since, however, we observed precisely the same relations existing during the oxidation of coal at ordinary temperatures, there is very strong evidence that the processes of oxidation at both high and low temperatures are essentially similar.

"During the heating of coal, as well as at ordinary temperatures, oxygen is absorbed. That, in the latter case, the absorption of oxygen is related to the disposable hydrogen in the same manner as in the first case, is made clear by the behaviour of wood and its decomposition products.

"It is also clear that the content of disposable hydrogen is diminished when coal is exposed to air in a manner similar to that in which it is diminished when the coal is heated."

It may be shown with certainty that carbon dioxide is formed at ordinary temperatures just in the same way as it is formed at higher temperatures, and, in both cases, when the more easily oxidised portions of the carbon come to an end, the oxygen absorption reaches its maximum.

The assumption that the more difficultly oxidisable carbon behaves with regard to oxygen at low temperatures, differently to the way in which it behaves at high temperatures, would contradict all experience.

It cannot be maintained that the absorption of oxygen at ordinary temperatures is merely a physical process, still the surface action of the coal is perhaps not to be neglected.

We must distinguish between the tendency which the coal has to absorb oxygen and the intensity with which oxygen is at first actually absorbed. It appears to be not improbable that in the earlier stages the absorption of oxygen is a purely mechanical process, and that this precedes the chemical combination.

The quantity of hygroscopic water which coal actually takes up when exposed to air saturated with water vapour at 15°C. was determined for more than 100 samples by heating them to 100°C. until the weights became constant. The percentage of hygroscopic water thus liberated varied from 2 to 7.5, but the power of the coal for condensing hygroscopic moisture did not appear to be related to its structure in any determinate manner. The condensing of hygroscopic water on the surface of the coal, however, shows very clearly the condensing power possessed by coal. If we examine the quantity of oxygen which different coals absorb from the air, under similar circumstances, we find that there is a very close connection between this quantity and the power of the coal for condensing moisture. In order, however, to obtain complete and decisive experimental results in this connection it is necessary that care should be exercised in selecting coal which has been freshly obtained, and has not been lying in contact with atmospheric air.

Fresh coal, after it has been pounded, ground, and sieved, gives an apparently dry powder, although this is saturated with moisture. About 20 grammes of this powder are taken and brought into contact with air in an 80 c.c. absorption tube, and a quantity of water is introduced above the quicksilver in order to saturate the air with moisture. In carrying out comparative experiments the following points are to be observed:—(1) All the absorption tubes must have the same capacity and the same diameter. (2) The subdivision of the samples of the coal must be about equal. I employed coal which, by powdering and sieving, was reduced to the size of poppy-seeds, and freed from dust. (3) The experiments must, so far as is possible, begin at the same temperature and at the same time, and are best all made in the same room.

"The absorption of oxygen by the freshly-prepared coal begins at once and goes on rapidly. The volume of the absorbed gases, though not proportional to the surface action of the coal as indicated by its hygroscopicity, are, nevertheless, very dependent upon it. I intend to make a further communication in greater detail as to the results of this experiment, and will, therefore, confine myself in this place to the statement of the quantity of oxygen absorbed during the first twenty-four hours by 20 grammes of different samples of coal, a quantity which varies between 2 and 9 c.c. I may, however, mention certain circumstances which appear to me to strengthen my position in considering that at first the absorption of oxygen is chiefly mechanical."

(The observation on which reliance is placed appears to be that the oxygen absorption is at first very much more rapid than is the case later on.)

It is noted that Varrentrapp has shown that when coal is exposed, at ordinary temperatures, to a stream of air, carbon dioxide is formed. It is suggested that carbon dioxide may have been originally condensed upon the surface of the coal, and that it is gradually removed by the stream of air, its place being taken to some extent by oxygen. In order to clear up this point certain special experiments were made which rendered it probable that the continued absorption of oxygen is not to be explained by assuming that it merely takes the place of carbon dioxide condensed upon the surface of the coal.

"Coal absorbs carbon dioxide with the greatest readiness. The volume of this gas which is taken up in a given time is often greater than three times the volume of oxygen which could be taken up. Samples of coal whose absorptive power for oxygen has almost vanished, so much so that 20 grammes will only take up about 1 cubic centimetre of oxygen, will absorb in a few hours at least their own volume of carbon dioxide. If a sample of coal saturated with carbon dioxide is brought into contact with atmospheric air, we find at first an increment of volume as if the carbon dioxide is given off. Soon, however, the volume again begins to diminish. If, at the same time, a small bulb containing caustic potash is introduced in the absorption tube, or if the sides of the latter are moistened with a solution of caustic potash, the absorption of the oxygen goes on very quickly, as does the separation of the carbon dioxide which, of course, forms a compound with the caustic potash. If we leave samples of coal saturated with carbon dioxide for thirty-six hours under the receiver of an air pump exhausted to 2 inches of quicksilver, the greater portion, but not all, of the absorbed carbon dioxide is given off. If a sample of coal which has been so treated is then saturated with moisture and again put into an absorption tube it begins to take up oxygen with the same avidity as when it was freshly prepared, and this whether any potash is present or not. If potash is present, however, we soon discover that a certain quantity of carbon dioxide has been liberated, which shows that the absorption of oxygen is at first accompanied by a separation of carbon dioxide, and that this carbon dioxide will again be taken up by the coal in the absence of any other substance capable of absorbing it.

"If coal which has been saturated with carbon dioxide is boiled for half-an-hour in water and is then air-dried, so that it remains saturated with hygroscopic moisture, it is found to have recovered its original absorptive properties.

"Coal which has been exposed for a long time to the air until it has lost its power of absorbing oxygen behaves in a completely different manner when the foregoing experiments are performed upon it. For instance, when exposed under the receiver of an air-pump it does not by any means recover its original power of absorption, though this power is still partly restored by boiling out with water. Carbon dioxide is either not absorbed at all by such coal or in only very small proportions.

These observations show that the small absorptive power of coal which has been lying for a long time in the air does not depend upon a condensation of carbon dioxide upon its surface, and other conclusions may also be drawn. Amongst these may be mentioned the following:—

"We may now explain the experiments of Varrentrapp. The coal which has lost its power of absorbing oxygen may, nevertheless, absorb large quantities of carbon dioxide, and, on the other hand, when this coal which contains carbon dioxide begins to take up oxygen the process is accompanied by a separation of carbon dioxide. Now, this process is not very noticeable when the experiment is carried out in closed tubes, but it becomes noticeable when the experiment is performed by Varrentrapp's methods.

#### *Influence of heat on the process of oxidation.*

I have formerly shown that a rise of temperature is the most important determining circumstance of the process of oxidation. It is not, however, necessary to use a temperature which lies far above 100° C., though the higher the temperature the greater the acceleration of the process. In pursuance of these experiments I heated coal for fourteen days on the water bath at from 70° to 80° C. The first sample of coal increased in weight during this process by 1.01 per cent., the second sample by 0.2 per cent., and the third by 0.35 per cent. The constitution of these three samples of coal is given by the three tables of analyses accompanying this paper. The composition of the same samples after fourteen days heating is indicated by the analyses 1', 2', and 3'. In all cases there was a diminution in the carbon and hydrogen content and an increase

increase in the oxygen content, exactly as in ordinary weathering. The caking power of sample (1) was diminished from 1.4 to 1.1, of sample (2) from 2 to 1.6; sample (3) was a so-called "sandkohle" which does not give coke. The quantity of the coke did not appreciably change, and the specific gravity certainly did not. The heating power of sample (1) fell by 2.62 per cent.; of sample (2) by 3.61 per cent.; and of sample (3) by 3 per cent.

"Samples of coal employed in these researches had remained for a long time in loosely stoppered bottles, so that the absorption of oxygen at ordinary temperatures only took place very slowly. As a control, check analyses of the unheated coals were made after they had suffered fourteen days longer exposure. The fact that during this time the composition of the samples did not undergo any variation, shows clearly that the increase in oxygen and loss in carbon and hydrogen is really to be attributed to the higher temperatures to which the coals were exposed.

"There appears to be a certain contradiction between the observation that oxidation goes on more rapidly at upper temperatures, and our thesis that oxidation follows a preliminary surface condensation of oxygen. This apparent contradiction is, in my opinion, easily cleared up if we distinguish clearly between oxidation and mere absorption. The first goes on more rapidly at upper temperatures, the latter at lower temperatures. If the coal has been saturated with oxygen at lower temperatures, the condensed gas combines only gradually with the substance of the coal, and only in proportion as the latter process advances can new quantities of gas be taken up. When, however, coal which is saturated with oxygen is heated, a portion of the gas is evaporated; but the greater part enters into chemical combination, and does so more rapidly as the temperature is higher. The surface action, however, neither undergoes any appreciable change, nor produces any result at all comparable with the chemical action. (?)

#### *Influence of moisture on the absorption and on the oxidation of coal.*

"The greater number of technologists are of opinion that moisture has an important aiding action in the weathering of coal." (Thompson's researches are mentioned in connection with this point.) "That moisture may, under certain circumstances, aid the oxidation of coal is not to be denied; but the action of moisture is very complicated, and is influenced by various circumstances, and is not so generally prejudicial as Thompson's observations would lead us to imagine. I will communicate the result of a few experiments made upon this subject.

"If we take two tubes, and into one of them introduce air dried and into the other moist coal, both being freshly won, the first absorbs oxygen much more rapidly than the second. If, in addition, small bulbs containing fused chloride of calcium are introduced alongside of the dry sample of coal so that the coal gets gradually drier, the intensity of the absorption of oxygen becomes greater. The same is the case if the coal has been dried for a day over sulphuric acid, although during this process a very considerable quantity of oxygen must certainly have been taken up.

"If instead of fresh coal we take two samples of coal with different surface properties, both of which have been exposed to the air for a long time and which have lost their power of absorption to a great extent, and expose them to the drying action of sulphuric acid, both of them recover to some extent their absorptive power. That coal with the greater surface action recovers most completely.

"If we dry coal at 100° C., and cool it in a desiccator, and place it in an absorption tube, it is found to absorb gas with extraordinary rapidity. This gas consists in part of nitrogen (from 12 to 21 per cent., from the mean of many experiments). Coal which has been dried at ordinary temperatures also takes up nitrogen, but in smaller percentages, at the same time as it absorbs oxygen.

"All these experiments indicate only a relative increment of the power of absorption by the removal of moisture, and establish in so far the view which has been taken in the former work as to the nature of surface action. They also show that a dry coal will take up a larger volume of gases than one which is merely air dried, before the absorptive power of the two samples sinks to the same level.

These researches, however, still leave unanswered the question as to how far the moisture is disadvantageous for the chemical action of the oxygen upon the coal. I had hoped to be able to give a definite answer to this question, but I have not succeeded in coming to a positive decision.

"We have just seen that both freshly-won coal and coal which has been lying for a long time in the air can be caused to absorb oxygen with increased avidity by a preliminary drying over sulphuric acid. If we leave the coal in contact with air until 20 grammes of it can only absorb one-half a cubic centimeter in twenty-four hours, then moisten it with water and expose it again in the absorption tube, we find no increment of the volume of air in the tube, as might be the case if the water took the place of a portion of the gas which was mechanically associated with the coal. In making these experiments, however, there is generally observed a small absorption of oxygen, and if in addition chloride of calcium is introduced as a drying agent the absorption goes on with renewed intensity.

"These observations would seem to support the assumption that water assists the process of oxidation; but on repeating the experiment several times—that is, first wetting and then drying the coal by means of chloride of calcium—we finally reach a state at which no further increment of absorptive power is to be observed.

"We may, however, approach the question by inquiring whether the action of water on the decomposition of coal is not to be attributed to the consequences of secondary action. Many coals contain pyrites which is only oxidisable in the presence of moisture. This process is undoubtedly of importance, even if it is regarded only as indirectly introducing active material for the oxidation of the coal."

(The well-known action of pyrites in breaking up the coal and exposing fresh surfaces is then described. The question as to whether ferrous oxide can act as a carrier of oxygen to the coal is discussed, and it is considered that the small quantity of this substance which is present can only account for a very small part of the action.)

"If we take two samples of coal (one of which is rich and the other poor in pyrites), after they have been lying in the air for a long time, and introduce them into the absorption tube in a wet state over mercury, the first begins to exhibit a tolerably rapid and enduring absorptivity, which I must attribute to the action of the pyrites alone, since the power of absorption of the other sample is not in the least increased, but, on the contrary, diminished. Samples of coal containing 3.04 per cent. of sulphur, which had been exposed to the air in a state of powder for eight months, behaved as follows:—When air-dried they absorbed in nine days 3.0 c.c. of oxygen. A second sample, containing 1.08 per cent. of sulphur, absorbed in the same time 4.9 c.c. When these samples were moistened, the first in nine days absorbed 6.5 c.c., and the second only 3.8 c.c. of oxygen. The coal, therefore, which was poorer in sulphur, absorbed less oxygen when it was wet than when it was air-dried, but on the other hand the coal which was richer in sulphur absorbed oxygen more readily when it was wet.

"An agreement with the assumption that the moisture of coal exercises only a small and slightly favourable action on the oxidation of coal appears from the result of the following investigation.

"Referring to the samples of coal mentioned above, which had been heated for fourteen days, three other samples of the same coal were taken and were treated in the same manner, except that during the day they were kept damp in a water oven. The altered composition, variation of weight, &c., are shown in the following table:—

1.		2.

Coal (3') alone has been altered more under the influence of moisture than in the corresponding experiments which were made without addition of moisture, and, indeed, this coal is distinguished by a larger percentage of pyrites from (1') and (2'), which were less altered. As, however, the conditions under which we assume the pyrites to be effective, are for the greater part here excluded, owing to the special mode of the experiment, I do not feel inclined to ascribe the further advanced oxidation of the coal to that substance; but I believe that in the majority of cases the often stated favourable influence of moisture upon the decomposition of coal must be ascribed to the oxidation of the pyrites and the secondary symptoms connected therewith, so that coal containing little pyrites will be decomposed, viz., oxidised, at least as quickly, or even more so, when air-dry than when in a moist state. Of this, as also of the purely mechanical effect of water, which may be specially apparent if coal is lying in very large heaps, I shall speak in my next paper on the spontaneous ignition of coal.

In the former communication I referred to the fact that daylight appears to hinder the absorption of oxygen, without, however, venturing to consider the matter as concluded, on account of the numerous sources of error which were incidental to my inquiry.

In these experiments I worked almost entirely with old coal, which, as the further researches show, absorbs gas very slowly. In my later researches (which were made under more favourable circumstances, in so far that the temperature was subject to a variation of only from 8° to 10° C. and that the absorption tube was completely guarded against the direct action of the sun) I have completely confirmed my former observations upon coal of the same character. Coal which has been freshly mined absorbs oxygen with such intensity that the small influence of light escapes attention.

I will confine myself here to a repetition of my former statement, namely, that since old coal absorbs oxygen only slowly, as was formerly mentioned, the diminution in volume of the atmosphere surrounding the sample of that coal during daylight goes on very slowly, in fact vanishingly so under certain circumstances. This phenomenon, therefore, would square better with the hypothesis of mechanical absorption than with the theory that the absorption is a process of oxidation.

(28.) "On the alterations which coal undergoes by exposure to air"; by Dr. Richters (continuation of former paper). (Dingler's Polytechnisches Journal, Vol. 195, page 449, 1870.)

This communication consists, for the most part, of a theoretical discussion of the causes which lead to the spontaneous heating of coal, and though it is believed that the modern view as to the cause of heating was developed for the first time in this paper, still the views herein set forth may now be regarded as almost the commonplaces of the subject. It will therefore, be sufficient to abstract the paper instead of translating it.

The paper begins with a consideration of the then existing theories of spontaneous heating, and it is shown that they are wholly vague and unsatisfactory. This remark applies alike to those theories which assume that the heating is due to some kind of decay of the coal similar to that which is undergone by hay during the process of fermentation, and also to the theories based upon the supposed action of pyrites.

Richters' argument against the supposed important action of pyrites in connection with the spontaneous combustion of coal is based upon a calculation of the possible amount of heat which can be liberated by the oxidation of a normal percentage of pyrites. For this purpose a sample of coal is considered containing 1.01 per cent. of pyrites, and it is shown by a reference to Dulong's experiments on heats of combustion, that in this case, under the most favourable circumstances, the temperature of the coal could not possibly be raised above 72° C. In order that this may be the case, it is supposed that the heat of oxidation of the iron pyrites is the same as that which would be produced by the combustion of the iron and of the sulphur separately. This, of course, is a vastly excessive estimate. It is also assumed, for the purpose of arriving at an upper limit, that the combustion takes place instantaneously and nothing is allowed for any loss of heat. It is pointed out that in practice the oxidation of pyrites requires at least a year for its completion, and, secondly, it is argued that the heat developed by this oxidation can never be sufficient to account for the spontaneous combustion of coal. On the other hand, arguments are given in favour of the view that the immediate cause of heating is to be sought in the absorption of oxygen by the coal, and for this purpose several very definite statements are made as to the quantity of heat rendered available by the oxidation of various kinds of coal.

It is a preliminary necessity to show the quantity of oxygen which is absorbed by coal under various circumstances, and the result of a number of experiments made upon 20 grammes of coal roughly powdered, dried in the air, but still saturated with hygroscopic moisture, are appended.

The following table shows the amount of oxygen which is absorbed during consecutive periods of twenty-four hours:—

No.	1 Coal with 5.15 per cent. water.	2 Coal with 5.20 per cent. water.	3 Coal with 5.25 per cent. water.	4 Coal with 2.54 per cent. water.	5 Coal with 3.10 per cent. water.
	cub. cent.				
1	9	9.1	7.2	3.0	5.0
2	8.2	9.0	7.0	2.8	4.7
3	5.0	5.6	6.3	1.5	4.0
4	3.4	4.0	5.0	1.5	3.8
5	3.0	3.6	4.6	1.5	3.8
6	3.4	3.0	3.9	1.4	3.5
7	2.4	3.0	3.9	1.2	3.1
8	2.7	2.8	2.8	1.2	2.9
9	2.7	2.6	2.9	1.0	2.6
10	2.0	2.6	2.4	1.2	2.5
11	2.0	2.5	2.0	1.0	2.0
12	2.0	2.3	2.0	0.9	2.0
	45.8	50.1	50.0	18.2	39.9

The argument proceeds as follows:—"Since 20 grammes of air-free coal occupy a volume of about 15 c.c., it follows that samples 1, 2, and 3 absorbed in twelve days more than three times their own volume of oxygen. Sample 5 absorbed two and a half times its volume, and sample 4 only one and a quarter times its volume."

Since the temperature of ignition of the coal examined does not appear to have been exactly determined, Richters relies upon an argument drawn from the analogy between the behaviour of coal and the behaviour of charcoal, about which more appears to be known. (The date of the paper is 1870.)

Let us compare the power of absorption of charcoal with that of coal. In powder factories it is customary to grind charcoal in large drums (by means of bronze spheres) to an impalpable powder. This charcoal absorbs atmospheric air, and more particularly the oxygen, not indeed in larger quantities than the lump charcoal, but with exalted eagerness—so much so, that the charcoal always heats and not infrequently takes fire. Now, according to Saussure, one volume of box-wood charcoal absorbs 9.25 volumes of oxygen. Since the weight of a cubic centimetre of the charcoal examined by Saussure was 6 grammes, we see that 20 grammes would absorb 308 c.c. of oxygen, or about six times more than was absorbed by coal (samples 2 and 3) in twelve days.

Now it is known that this absorption of oxygen is sufficient to raise the temperature of the charcoal to its firing point, which, according to Violette, lies between 400° and 600° C. for a charcoal which has been carbonised at a temperature between 432° and 1,000° C.

Let us assume that if the quantity of oxygen absorbed is diminished in the ratio of one to one-sixth, the heat which is liberated will also be diminished in the same ratio. Assuming that the same amount of heat is liberated by coal as by charcoal when the quantity of oxygen absorbed is the same in both cases, and also that the mean firing temperature of charcoal is 500° C., it appears that coal (samples 2 and 3) would, during twelve days, rise in temperature to an extent represented by  $\frac{500}{6}$ , that is, through 83°. This, of course, is on the assumption that the specific heat of coal is the same as that of the charcoal, and that no heat is lost in any way.

These assumptions made by Richters appear to be rather large, and perhaps account for the fact that some people have failed to regard his researches as conclusive.

In practice, of course, a certain quantity of heat which is developed passes away, but in Richters' opinion this is more than compensated by the increased activity of absorption which goes on as the temperature rises.

"In a former communication I have shown that three different kinds of coal which were exposed to a temperature of about 70–80° C. lost 3.6 per cent. of their heating power. The same effect takes place if the coal is heated for two or three days to about 105°, and in several hours if it is heated to 150° C.

Let us calculate theoretically the quantity of heat liberated by the coal during fourteen days' heating while it was losing the 3.6 per cent. of its heating power:—

Oxidised to carbon dioxide .....	1.76 per cent. C. = 140 calories.
"    water .....	0.16 "    H. = 55 "    "
Oxygen absorbed, forming water remaining in the coal.....	2.12 "    = 91 "    "
	286 "    "

This table shows that for 1 lb. of coal 286 units of heat are liberated. If this heat were solely employed in raising the temperature of the coal, that temperature would amount to 1,100° C.; or, more correctly, the coal would quickly be raised above its firing temperature, and would then burst into flame. It appears, therefore, that the heat which is liberated is quite sufficient to raise coal to its firing temperature. Whether this temperature will in any specific case be reached or not will depend (1) upon whether the coal can obtain a sufficiency of oxygen; and (2) whether the heat developed at each temperature can or cannot pass off as quickly as it is generated."

The influence of the size of the coal, the intensity of its surface attraction for oxygen, the influence of the shape of the heaps of the coal, and similar matters, are fully discussed.

It is perhaps a little difficult to estimate the merit of this discussion, since it has now become almost instinctive with students of the behaviour of the heating of coal, but it does not appear that the discussion here referred to differs from that which would have been expected from any reasonable and competent observer.

- (29.) "Is it possible that the Combustion of Coal can be assisted by the addition of Water"; by F. Fischer. (Dingler's Polytechnisches Journal, Vol. 210, page 233, 1873).

Fischer discusses the problem as to whether more heat can be got by the combustion of wet coal than by the combustion of dry coal, and comes to the conclusion that under all circumstances the addition of water will reduce the temperature of burning coal.

He recommends that dust-free coal should also be burnt dry, but admits that, for obvious reasons, it may be desirable to damp very dusty coal.

The proposition as to the relative temperatures produced by coal burnt dry and wet is substantiated by calculations based upon the data of thermo-chemistry.

- (30.) "On the Prevention of Spontaneous Combustion of Coal at Sea"; by T. W. Bunning. (Transactions of the North of England Institute of Mining and Mechanical Engineers, Vol. xxv, part 2, page 107. April, 1876.)

Quotes Captain Scott, a man of great experience, to the effect that spontaneous combustion invariably occurs under the hatchway.

There is a description of Captain Scott's method of dealing with fires under the hatchway, which consists in gradually lowering a wooden trunk, after the manner of a caisson. This is well illustrated by means of a diagram. The idea is to allow of the driving of a shaft through the heated portion of the coal, and the wooden trunk acts in such a manner as to prevent the coal falling into the hole dug out. Captain Scott appears to have used this method with success, but from the illustration the workmen seem to be engaged in shovelling red-hot coal, amongst which they are standing. To protect them from getting burnt buckets of water are lowered for them to stand in while at work.

Captain Scott considers that it is useless to pour water over a heated cargo of coal, because the effect of water is to cause the coal to coke at the surface and thus prevent the water from penetrating. This is illustrated by the experience of the master of the "River Boyne."

Mr. Bunning notes the necessity for testing the temperature of the coal under the hatchway by means of iron rods, pointing out correctly that tubes placed in position for thermometric testing will frequently be quite cool, whilst coal right in the centre of the square of the hatchway has become heated.

The most important part of this communication is the discussion, from which the following is taken:—

Captain Steinson pointed out that his experience went to prove that all the ships which had been burnt had been ventilated, and mentioned some instances.

Mr. John Glover, who also communicated his opinions to the English Royal Commission of 1875-6, mentioned that his researches showed there was no special time for loading which ensured freedom from danger. Let the ships be loaded how and when they might, in wet or dry weather, still they fired; and ships had been known to fire when loaded by baskets as well as when loaded by tip. He mentioned thirty-seven days after loading as the shortest time for ships to fire, and the longest period was 190 days; the average was sixty days. He thought that if coal could be shipped perfectly dry, or dried by passing hot air through it when shipped, spontaneous ignition would be considerably retarded. Mr. Glover also proposed a plan for extinguishing fire by means of carbonic acid.

Mr. Steavenson's experience went to show that the most impure coal was the most liable to ignite. When very clean coal was heaped there was not the slightest fear of its taking fire.

Mr. Thorpe said, in confirmation of Mr. Steavenson's remarks, that he had had a good deal to do with accumulations of pure iron pyrites, containing 50 per cent. and under of sulphur, and neither in large pieces nor in the form of dust was it liable to spontaneous combustion. Neither in Spain, where it was usually very dry, nor in Norway, where there was a good deal of moisture, had the pyrites ever fired; and, moreover, these remarks applied to many thousands of tons then lying in Spain and Norway unsaleable.

Mr. Glover, who had stored pyrites for thirty years, said that he never knew of a case of spontaneous combustion either of Norwegian or any other kind. He had known sulphur pyrites from the Cleveland Ironstone Mines, with no coaly matter in connection with it, and obtained apart from the coal measures, to ignite spontaneously in a few days, almost as soon as coal brasses.

Mr. Mitcalfe said he had particulars of about 150 ships which had been burnt at sea, and he believed there were only two amongst the number which were not ventilated.

Mr. Wallace said that Mr. Steavenson's suggestion of putting coal in air-tight bunkers might be effectual.

Captain Scott insisted on the importance of using iron probing-rods as well as thermometers for testing the temperature of coal.

A pamphlet by Mr. E. Cooper Rundell is quoted, from which the following may be noted:—Out of 587 sailings from South Wales ports during a certain period in 1873 there were 7 casualties, or about 1.19 per cent.; whilst during the corresponding period of 1874, out of 589 sailings there were 10 casualties, or 1.7 per cent.

During the period in 1873, out of 1,133 vessels which sailed from the United Kingdom there were 23 casualties from heating, or about 2 per cent.; whilst in the period of 1874, out of 1,240 sailings there were 50 casualties, or about 4 per cent.

Mr. Rundell attributed the increase in the number of casualties between 1873 and 1874 partially to the operation of the Coal Mines Regulation Act, 1872.

(Discussion continued in Part III, Vol. xxv.)

Captain Scott mentioned a curious case of combustion which occurred on board a ship laden with small gas coal. She went out apparently safe, but when the cargo was being discharged there was found under the hatchway a quantity of coke from 2 feet to 18 inches in thickness, and on going through this they came to an immense cavern with a heap of ashes at the bottom.

The President (Mr. Lindsay Wood) considered that wherever wood was in contact with coal it added very considerably to the danger of spontaneous combustion.

Note:—The discussion, though extremely interesting, is practically superseded by the report of the English Royal Commission, the evidence before that Commission containing much of the information elicited during the discussion.

- (31.) "British Columbia Mining Record," October, 1896, Vol. II., No. 13.

A brief reference is made to a coal loading appliance erected by Messrs. Dunsmuir and Sons, at their Wellington Wharves, Canada. The coal is carried from the hopper by means of an endless apron to a heavy telescopic tube, of four pieces, which it is said can be contracted or extended by the man in charge. As the tube gets filled up, the bottom section is slightly raised, allowing the coal to fall gently out. An engine of 25 h.p. is employed to manipulate the machine, but the amount of power actually used rarely exceeds 10 h.p. Only one man is required to work the machine, which is controlled entirely by the movement of three levers, located on a bridge commanding a clear view of the operations. Further tests of the machine were to be made.

## LIST OF WITNESSES EXAMINED.

	PAGE.
Barfield, Captain William, ship-master.....	69
Beeston, John D., shipping manager.....	12
Bertram, Augustus, inspector, Marine Board, Newcastle.....	7
Bewick, George, shipping manager, &c.....	46
Binney, Frederick W., secretary, Newcastle-Wallsend Coal Company.....	88

Whittaker, John, trimmer.....	31
Williams, Captain David, shipping manager.....	25
Williams, Captain Thomas, ship-master.....	100
Wycherly, George, trimmer.....	51

ROYAL COMMISSION TO INQUIRE INTO THE CAUSE OF THE DANGERS TO WHICH VESSELS CARRYING COAL ARE SAID TO BE PECULIARLY LIABLE, AND AS TO THE BEST MEANS THAT CAN BE ADOPTED FOR REMOVING OR LESSENING THE SAME.

MINUTES OF EVIDENCE.

THURSDAY, 27 AUGUST, 1896.

[The Commission met at 2.30 p.m., at the University.]

Present:—

PROFESSOR RICHARD THRELFALL, M.A., PRESIDENT;

And EDWARD FISHER PLITTMAN, Esq., A.R.S.M.

Captain Francis Hixson examined:—

1. *President.*] You are the President of the Marine Board? Yes.
2. How long have you held that position? Since the inception of the Board in 1871.
3. Were you connected with the marine service before that? Yes; as far back as 1863.
4. During that time, you have known of ships laden with coal which have left the Port of Newcastle and which have never afterwards been heard of? Yes; between the years 1888 and 1896, about 31 coal-laden vessels, out of 3,221 which sailed from Newcastle, were never afterwards heard of. In the year 1889, a vessel named the "Pacific Slope" left Sydney for Shanghai, with 1,119 tons of coal, and was never afterwards heard of. These are the only ships I know of as missing.
5. Was any inquiry held in respect to either of those ships? In most cases inquiries were held, but no information could be elicited to account for the loss—whether from the coal cargoes or from the ordinary perils of the sea. All that can be reported in such cases is, as to the seaworthiness of the vessels at the port of departure. A vessel named the "Girvan" left Newcastle within the years mentioned, and was lost in consequence of the shifting of her cargo. The crew were saved, and landed at Norfolk Island.
6. It was clearly proved that the coal had shifted? Yes; the crew were saved when the vessel was on her broadside and gradually sinking. It was during heavy weather.
7. Was that loss the subject of inquiry? Yes.
8. Can the evidence be obtained from your office? Yes.
9. Do you know of any other cases of ships which have been known to sink through the shifting of the coal cargo? That is the only case on record.
10. Is there any means of inspecting the trimming of the vessels as regards their coal cargoes? Yes; the ships are usually inspected by officers of insurance companies, and by an officer of the Marine Board, but the whole process of loading and trimming is not supervised.
11. It is possible, then, for a fault in trimming to escape attention? Yes, by the means that have hitherto been in existence.
12. There is no complete system of inspection? No; not during the whole process of trimming. The custom of the service is for the captain or one of his mates to be in attendance to see that the trimming is properly done. It is, perhaps, more important than anything else to the ship master and all concerned to see to this, not only for the safety of the vessel, but for her sailing qualities and fitness to encounter bad weather.
13. Those who inspect the ships are then, first, one of the ship's officers; secondly, an officer belonging to an insurance company; and thirdly, an inspector of the Marine Board? Yes; the inspectors of shipping are constantly about watching to see how the work is going on, but they do not stand by one ship and see the whole of the loading.
14. Is it necessary to use any special precaution in trimming the coal? I think great care should be exercised, and where possible shifting-boards should be used. Shifting-boards are often used both here and in England, but there is no law necessitating their use. We have lately been in correspondence with the Board of Trade in England on the subject, and they tell us there are no regulations as to the compulsory use of shifting-boards for coal cargoes.
15. I understand a shifting-board is one that runs fore and aft of the vessel? Yes; for preventing the coal on one side getting to the other.
16. In your opinion, would it be desirable that legislation should enforce the use of such boards? We have lately had complaints from English shipowners about the supervision exercised in this Colony to which ships are not subjected in England. They state they comply with all requirements at the port of departure, and think it hard they should be interfered with at a place to which the ship does not properly belong.

Captain  
F. Hixson.

27 Aug., 1896.

Captain  
F. Hixson.  
27 Aug., 1896.

17. They think that if the officers, whose lives depend upon the safety of the ship, see that the work is properly done, it is causing unnecessary trouble to have Government supervision? That is practically it. They complain of being put to inconvenience and expense at mere visiting ports. Most of the ships we have referred to are English owned—very few are foreign-owned, and very few actually belong to the Colony.

18. It might not be possible to enforce regulations on foreign-owned ships? No; we do not possess the power to do so, except in the case of overloading. If a foreign vessel is considered dangerous, we do not refer to the shipping company, but to the Consul for the country to which the ship belongs;—but there is power under the Navigation Acts to insist that a vessel shall be in a seaworthy condition before leaving, so far as overloading is concerned.

19. You would not be prepared to recommend that any legislative interference be brought to bear upon the question of trimming? I should prefer, in place of our taking the lead here, to follow what is done in the old country, where, although our experience is great, theirs is of course much larger.

20. *Mr. Pittman.*] You were saying that there is an officer of the Marine Board who watches the loading of ships at Newcastle; does he take any responsibility in the matter;—if he saw the trimming being carried out in what he conceived was not a safe way, would he interfere? Certainly, but his duties are principally concerned in seeing that the vessel is not overloaded so far as her marks are concerned. Each vessel has what is called the "Plimsoll mark," and the main supervision is to see that she is not overloaded. We infer that all the interior work of the ship—the details of loading—are better performed by the master and officers, than by any Government interference.

21. Can you say that it has frequently happened that officers have had to draw attention to what was considered improper trimming of coal cargoes? I could not say very much on that subject. I know, as a rule, that any suggestion or objections made by Marine Board officers to the masters of vessels are invariably attended to.

22. Have you any knowledge or experience in connection with the work at the hydraulic cranes? I have none.

23. Can you tell me who is responsible for that work? The cranes belong to the Railway Department, but there is a contractor to whom the letting and working of the cranes is actually given over by the authorities.

24. You cannot say for certain whether the Department exercises any supervision over them? I do not think there is any supervision. I think the contractor is bound to keep the plant in order. His object is to effect quick dispatch.

25. The thirty-one vessels which you mentioned as never having been reported to arrive at their destinations between the years 1888 and 1896, do not include any cases where the fate of the vessels has been actually known? No.

26. *President.*] Will you tell us what you know of fires that have occurred on coal laden ships? The latest experience, perhaps, is that of the "Ellen A. Read."

27. That ship, I understand, was bound for Manila? I think it likely. She was discovered to be on fire a day or two out from Newcastle, and made towards Sydney. We had a message from Broken Bay to say there was a ship on fire making her way to Sydney. We sent the pilot ship, "Captain Cook," which is fitted with fire appliances, and as soon as possible she got to work and put the fire out, by cutting up the deck in two or three places, and throwing down large quantities of water.

28. Was any inquiry held in that case? No; she was a foreign vessel. We do not hold inquiries in cases of foreign vessels. The captain told me he obtained his coal from different collieries at Newcastle. It was just prior to the strike that lately occurred. He managed to scramble together a cargo, but could not tell me from what mines.

29. Did you learn where the fire broke out first on board the "Ellen A. Read"? Yes; on the surface, near the main hatchway. The coal was nearly up to the deck, and the only means of getting at it was by breaking up the deck. The decks were a good deal injured, but otherwise the vessel was not seriously affected.

30. Did it come within your knowledge how the fire broke out, or was suspected to have broken out? The captain could not tell any more than that the fire had broken out.

31. It has been suggested to me that in some cases the coal trimmers leave their candles in such a position amongst the coal that it is very difficult for them to get at the candles afterwards to extinguish them, and they do occasionally leave them actually alight to burn out themselves;—have you ever heard of that? I have not had any actual experience of it, but I can quite understand such a thing happening. There are certain portions of the vessel where it is necessary to have light, and it is very possible that lights may be left, negligently, burning. Officers of the ship should certainly be on the look out for that.

32. Have you had experience of any other fires in coal cargoes? There was a vessel called the "Knight of St. Michael" that put into Sydney lately from Newcastle, with her cargo heated. It did not actually catch fire, but the captain found the cargo so hot that he bore up for Sydney, and the coal was taken out of the ship without any great damage being done.

33. Did you hold any inquiry in the matter? No; the ship was placed in the hands of certain surveyors here, who advised in the case, and by their directions the cargo was taken out.

34. You can give us no further information about the "Knight of St. Michael"? No; I cannot give you any positive information.

35. And there was no inquiry? No; the Marine Board does not hold inquiries unless there is serious damage to a ship or loss of life has been occasioned.

36. Are there any other instances you know of? There was a German barque, called the "Argo," on board of which, in the year 1893, there was a very serious explosion. There was loss of life in that case, and a Coroner's inquest was held. This being a German vessel, and although seriously damaged, we had no jurisdiction to hold an inquiry.

37. Can the evidence of the Coroner's inquest be obtained? I presume the Coroner can supply it.

38. The accident, I believe, occurred in Sydney Harbour? Yes.

39. There was no evidence collected except that taken at the inquest? No.

40. Do you know of any other cases? There was the case of the schooner "Prosperity," on which a serious explosion occurred, and some people were injured a good deal.

41. How long is that ago? In 1895. The vessel was lying in Woolloomooloo Bay, and she had only had

Captain  
F. Hixson.  
27 Aug., 1896.

had her cargo on board a short time. The explosion occurred, as they mostly do, unexpectedly, whilst the captain was being rowed towards the vessel, which he was about to take to sea. We held a partial inquiry into this case, and we found that the vessel's hatches were on, with the exception of what is known as the booby hatch, a small hatch in the fore part of the vessel. The explosion occurred just about daylight. There had been an anchor light hoisted, and there was a tendency to believe that when this light was brought down on deck and taken to the galley and blown out the explosion occurred. We could not positively prove this, in consequence of the injured men not being able to give evidence for some weeks, and eventually they disappeared, and we could not find them. They were taken to the hospital, and when discharged we could not trace them. They were invited to come and give evidence. I believe in this case the gas must have come out of the booby hatch, and there must have been a train of gas to the galley; and when the lantern containing the light was opened I am inclined to think the train was fired. The vessel was head to wind, and the booby hatch was under the top-gallant fore-castle.

42. Can you give us any idea as to the distance from the galley to the booby hatch? About 10 to 15 feet.

43. That would be a great distance for a train to form? Yes; but I speak without having any scientific knowledge on the matter. That was my common-sense view of the occurrence.

44. Do you think the men did not wish to give evidence? I am rather inclined to think so.

45. I may take it, in regard to the case of the "Prosperity," there is no information to be obtained? Yes.

46. You can assure us that your inquiry was so unsatisfactory that it is not worth while for us to go into the evidence obtained? I think not.

47. Are there any other cases within your recollection? As far as my personal experience is concerned I do not remember any more. There was a case I would like to bring to the notice of the Commission. That was of a British barque, called the "Republic," which loaded from Newcastle some time ago. She carried a large quantity of coal—nearly 4,000 tons—and was a long time on the voyage. I imagine the greater the cargo and the longer the voyage the more the danger.

48. From spontaneous combustion? Yes, or heating. The cases of the "Argo" and "Prosperity" were, however, peculiar, inasmuch as the explosions took place soon after the coal had been put into the vessels. In the case of the "Republic" all went well for a considerable time, and then the captain found the cargo was heated.

49. Was there an inquiry held? Yes, at San Francisco. There appear to be two opinions as to the treatment to prevent these explosions. The one approves smothering the cargo as much as possible; the other advocates very strongly extreme ventilation. In the case of the British barque "Republic" it almost looks, from reading the evidence, that if the smothering process had been adopted, the fire would have been kept under much longer than it was. They actually dug into the cargo and stirred it up, and provided all sorts of means whereby the air could be supplied. It seems as if the steps taken to put the fire out made matters worse.

50. Did they not begin to stir the cargo about until the fire had broken out? They began to stir the cargo when heat was discovered. They jettisoned about 30 tons of coal because of the heat. When they pumped water down, the smoke became so intense the men had to abandon their work.

51. The fire actually broke out then when they began to stir up the coal? Quite so.

52. Is the evidence very complete upon this point? I do not know whether it is very complete. The report of the inquiry was sent out to us by the Board of Trade.

53. Of England? Yes; it was held by the British Consul in San Francisco, and the Board of Trade, in accordance with custom, and in response to our application to be furnished with all information, sent the report.

54. Is it printed? It is typewritten, and I can supply you with a copy.

55. Have you recollection of any other such cases? I do not remember any more information that I can give you just now.

56. *Mr. Pittman.*] The two vessels—the "Argo" and "Prosperity"—were, I think, loaded with different coal altogether to the other vessels referred to—the coal was from the south? Yes.

57. Coal known to contain a great deal of occluded gas? They were coals received in Sydney from one of the southern mines.

58. I think it is a well-known fact that the particular mine from which those two coal cargoes came is known to be a fiery mine, in which safety lamps are used? I understand that is the case. The coal is very excellent, but very troublesome.

59. In the case of the vessels which you mentioned as having disappeared, and which were never heard of after their departure, I understand the coal cargoes were from Newcastle? Yes.

60. Where, so far as you know, there are no mines in which explosive gases are so common as to necessitate extra precaution? It was thought so. It is only during the last two or three years that we have had a suspicion of Newcastle coal. The two cases—the "Knight of St. Michael" and the "Ellen A. Read"—are quite recent ones from Newcastle.

61. You would distinguish, would you not, between the two cases—one where heat is produced, and explosion in the other? Yes, I think there is a difference.

62. *President.*] Have you formed any idea as to why it is only within recent years that this trouble has arisen? I have no scientific knowledge of collieries, but I have a vague opinion that the further you penetrate into the earth, the more the gases are found in the coal.

63. Do you consider that the trouble has arisen from a change in the quality of the coal, or a change in the manner of loading it into the ship, or in the treating of it while on the ship? I could not say, but, of course, latterly the trade has increased; there is more coal handled and more liability of explosions.

64. Perhaps it is not loaded so carefully? I have heard it remarked that in the loading by the hydraulic cranes all that is thought of is speed, and the coal is dropped from a great height.

65. You have seen yourself that the coal is roughly handled? Yes, they put it in as fast as they can. It is a matter of expedition, as far as I can see. The coal does, in some instances, fall from a great height.

66. Have you seen this yourself, or is it what you have heard? I have seen the coal dropped from a good height. It is lifted up high enough to get over all the impediments of the ship, and then swung round.

67. How far do you think it drops? The larger the ship the deeper the fall. In some cases 25 to 30 feet, or even more than that. Sometimes it would drop from the top of the crane to the bottom of the hold, but, of course, the drop becomes less as the vessel is filled.

Captain  
F. Hixson.  
27 Aug., 1896.

68. Would it be possible, in your opinion, to adopt some measure which would reduce the smashing of the coal by falling from a great height, and which would not, at the same time, be commercially impossible on account of expense? I am afraid the only way to do it would be to lower the coal until it is level with the hatch, but that would take up some time.

69. Would it take twice as long? Yes; I should think it would double the time. There would be the time taken up in lowering, and also in raising afterwards.

70. We may understand from you that the prevention of the evils which may occur from the dropping of the coal—supposing evils do so occur—would be a source of expense? I think so.

71. It would, perhaps, double the expense of loading the coal? It would, certainly, increase it very materially.

72. Is it ever the custom to load coal by pouring it through shoots into the hold of the ship? That practice is pretty well abolished. It used to prevail at Newcastle. There were several shoots there, but I do not think it prevails to so great an extent at the present time. The Australasian Steam Navigation Company at one time had shoots. From my knowledge of Newcastle, which I only visit occasionally, I think the custom of shooting the coal into the vessels is now almost obsolete.

73. Have you any idea as to the reason why it has become obsolete? The coal had to be taken to a high level for the purpose. Now it is run along a rail and hoisted at the ship's side.

74. It is, in your opinion, to save expense that the method of shooting has been abolished? Yes; and to secure expedition. The present hydraulic cranes take up 7 or 8 tons, or even more than that, in a single truck.

75. How long ago is it since the practice of loading through shoots was abandoned? It has been gradually brought about since the extension of the Bullock Island works at Newcastle.

76. From about what date? About twenty years ago, or more. The works at Bullock Island have increased gradually, and the other places have become superseded. What now is the general cargo wharf at Newcastle was the place where all the coal used to be shipped.

77. I wish to obtain an idea as to whether it would be possible to connect the recent calamities to coal-laden ships with some specific change in the method of loading or otherwise of handling the coal;—am I to understand that the shoots have been abolished so long that that would not explain the difficulty? I do not think the different mode of shipping the coal has had much to do with the explosions.

78. You do not know of any specific change in the method of handling the coal during the last two or three years? Between the years 1888 and 1896 it has all been handled the same way, or, if not all, the greater part.

79. Since when have the accidents chiefly begun to occur? During the last eight years. The wharf at Bullock Island was commenced about twenty years ago, and that did away with much shooting of the coal. The change is not complete—there is still a little loading done by shoots.

80. *Mr. Pittman.*] There has been a gradual change? Yes.

81. *President.*] If we could connect the cause of the trouble with some change in the procedure of handling the coal it would be of the greatest importance? I think the change has been so gradual that I could not attribute the explosions to it.

82. The greater part of the coal is now loaded by means of cranes and dropped into the hold? Yes.

83. That was not the case twenty years ago? No; but now we ship a very much larger quantity than we did then.

84. *Mr. Pittman.*] Do you think it possible that the very large increase of late years in the number of ships which have suffered from spontaneous combustion in their coal cargoes may be directly connected with the increase in the tonnage of coal carried by the vessels? To a great extent.

85. Is it not supposed to be a fact that large cargoes undergo spontaneous combustion or heating more frequently than small cargoes? Certainly. I think the larger the cargo of the ship and the longer the voyage the greater is the risk.

86. There is a distinct increase in the average of coal cargoes as regards size during the last ten years? Certainly.

87. *President.*] It is within your knowledge that the size of ships has increased within the last ten years? I may say enormously.

88. Is it also within your knowledge that the larger the ship the more frequent the accidents, or is that merely your impression? I may state positively that the larger the cargo and the longer the voyage the greater the liability to accident.

89. Have you read the report of the English Coal Cargoes Commission? I have not.

90. You have not that report in your office? No.

91. Is there any further way in which you can assist the Commission? I do not know now, but if the Commission require me again I shall be glad to give any information I may be in possession of.

[Witness withdrew.]

WEDNESDAY, 2 SEPTEMBER, 1896.

[The Commission met at 2.30 p.m., at the Custom House, Newcastle.]

Present:—

PROFESSOR RICHARD THRELFALL, M.A., PRESIDENT;

And EDWARD FISHER PITTMAN, Esq., A.R.S.M.

Mr. Thomas Brooks sworn and examined:—

Mr.  
T. Brooks.  
2 Sept., 1896.

92. *President.*] You are the surveyor for London Lloyds? Yes; for the Port of Newcastle.

93. How long have you been Lloyds' surveyor? About ten years. I have been a resident of Newcastle for thirty years.

94. With experience of maritime matters all that time? Yes.

95. You are aware of the object of this inquiry, I presume? Yes.

96. Have you had any particular experience of any combustion or explosion occurring in any of the ships which you have had under your notice at Newcastle? Not of combustion, but of heating before combustion took place.

Mr.  
T. Brooks.  
2 Sept., 1896.

97. Will you please give us any information you can as to the cases which have come before you? During this year two cases came under my notice—the ship “Morna” and the barque “Invermay,”—both British vessels.
98. Let us take the “Morna” first? She received her stiffening coal in Sydney.
99. She did not come under your notice during that part of the transaction? No; she had already received her stiffening coal some three weeks previous to my examination.
100. Can you give us the date of this event? It was on the 27th March, 1896, when my attention was called to her as Lloyds’ surveyor to examine the condition of the cargo while lying in the harbour at Newcastle.
101. What did you find? I found that she had a quantity of stiffening coal—between 700 and 800 tons—on board. I was informed that was the amount. The captain called upon me and told me he had received instructions from his owners to put tubes down the hatches, so that he could test the temperature daily on his passage, and while doing so he found the stiffening coal heated.
102. Was that with regard to the stiffening coal or the cargo generally? The stiffening coal only. He found the heat so excessive that it caused alarm, and he consequently waited upon me to examine it and advise. I did so, and found the coal in the way of the main hatch, in the lower hold, in a conical heap, just as tumbled down from the baskets.
103. The coal was loaded from baskets? Yes; taken in from the coastal steamers. After taking the top off the coal I sunk down into the coal right in the centre of the hatch, about 8 feet, and buried a thermometer, and after about fifteen minutes I found the temperature 110 degrees.
104. What did you do then? I tried the after hatch in the same manner, and found a temperature of 86 degrees.
105. In which hatch was the larger heap? In the main hatch. The temperature on deck at the time was 76 degrees Fahrenheit. I then advised the master to discharge the heap out of the main hatch.
106. Did he take your advice? Yes.
107. Your advice was practically a command? Not necessarily so; the advice was carried out at all events. The coal was taken out right down to the ceiling of the ship.
108. Was it taken out of the ship? Yes, right in the square of the hatch. There were 120 tons taken out of the main hatch. The coal was dug into at each end and the thermometer buried, and I found the temperature there normal.
109. After 120 tons had been taken out, the remainder had a normal temperature? Yes; I tested the coal at both ends and on each side, and found the temperature was normal.
110. What do you call normal? The same as on deck—76 degrees. This clearly indicated the heat was all in the square of the hatch, where it was all very small coal and dust—absolutely dust.
111. You noticed that? Yes; not only dust, but excessively moist.
112. Did you notice whether the coal in the wings and fore and aft was smaller or larger coal? Much larger coal. The small and dust seemed to accumulate in the cone in the square of the hatch.
113. Is the coal dropped from a considerable height in loading from baskets? Yes; I should think it was coal dropped from a coastal steamer about 25 to 30 feet out of the baskets.
114. Do you know what coal it was? It was Wallsend coal.
115. You know, as a matter of fact, that it was Wallsend coal? Yes; I invited the shipping manager of the Wallsend Coal Co. to visit the ship with me, and I pointed out to him the small coal and dust that existed.
116. He went with you? Yes.
117. What is his name? Captain Cross.
118. The Chairman of the Marine Board? Yes.
119. Was the small coal caked at all where the heap was hot? There was a slight tendency to cake. There was a smoke or vapour escaping from the fissures of the coal when we sunk down, in several places, like the smoke coming from a cigar.
120. What about the after hatch? That was somewhat similar, but the temperature was not so great.
121. Was the high temperature confined to the square of the hatch? Solely, and in the midst of the small coal.
122. It is essential to take the temperature right in the middle of the cone? Yes.
- 122½. The spot at which the temperature was highest was the spot where the coal was finest? Yes; the conclusion I came to was that it was the continual dumping of one basket-full on top of the other, and the accumulation of small coal and dust that created the heat.
123. Did you move the cargo out of the after hatch? When I tested the temperature on deck it was 78 degrees, and 83 degrees in the coal.
124. That was not a very serious rise? Not very, in view of the heating in the main hatch, but we thought it best to be on the safe side, and 120 tons were moved out of the square of the after hatch.
125. *Mr. Pittman.*] The same as out of the main hatch? Yes, about that; and the temperature was reduced to the same as on deck.
126. *President.*] That concludes the story of the “Morna”? Yes; so far as the coal is concerned.
127. Did she reload with coal? Yes; with Wallsend coal.
128. And did she arrive safely at her destination? Yes.
129. Will you kindly give us the information with regard to the “Invermay”? She also received her stiffening in Sydney.
130. Of what coal? Wallsend Company’s coal—in two hatches, the main and fore hatch.
131. What was the date she arrived here? The day I first visited her was the 10th April. She received her stiffening coal of between 500 and 600 tons in Sydney, but I am not quite certain as to the quantity. The captain was alarmed at the heat of the coal when sinking the tubes for taking the temperature. He thought it was too hot, and I was called upon to advise. The temperature I took that day was 85 degrees, after sinking into the coal as quickly as possible before the heat could escape.
132. How did you sink? By men with shovels, in about a quarter of an hour, and buried the thermometer in the face of the coal each side of the hold, and covered it up. I found the temperature 98 degrees.
133. *Mr. Pittman.*] In the main hatch? Yes; and in the fore hatch the temperature was only 86 degrees. That was pretty well normal. We did nothing with the coal in the fore hatch, considering it was all right. In the main hatch about 100 tons were taken out—just this cone was removed.
134. *President.*] Was this also finely crumbled and powdered? Yes.

Mr.  
T. Brooks.  
2 Sept., 1896.

135. And damp? Yes; in both ships I drove iron rods down, in addition to the sinking, and allowed them to remain for about twelve or fourteen hours. Three feet from the ceiling or skin of the ship the temperature was normal. About 6 feet up the temperature was quite up to that indicated by the thermometer, as far as we could tell.

136. Three feet from the skin means 3 feet up from the bottom of the ship? Yes.

137. When you drew out the rods, did you lower the thermometer? No; we knew the temperature only by feeling the rods.

138. Three feet from the bottom the temperature was normal? Yes; and about 6 feet up the rods were much heated and damp. Three feet above that it was normal again. The heat was in the centre of the heap.

139. *Mr. Pittman.*] How much coal was taken out of the "Invermay"? There were only 72 tons discharged.

140. *President.*] Did anything further happen subsequent to her reloading and going away? The master was quite satisfied when this was taken out. The coal was tested each side of the square of the hatch, and the ship went on with her loading and arrived safely at her destination.

141. With what coal did she load? The Wallsend Company's.

142. Are there any other cases you can inform us about? No.

143. Have you formed any idea as to the cause of the heating? I have.

144. Will you favour the Commission with your opinion? I have a theory which to my mind should be carried into practice. In the first place, I think the coal should not be loaded into the ship within ten or twelve hours after coming out of the mine. I think it should remain in the waggons for a time to allow the gases to escape. In the second place, I think some means can be devised, and very simply, to prevent the great breakage.

145. That would also have the advantage of increasing the value of the coal? Of course. It can easily be done by an appliance to prevent the accumulation of smalls and dust in the square of the hatches.

146. Can you suggest any appliance? You can use coal-distributors to prevent coal-dumping in one particular spot, and let it run away.

147. That would lead to some extra expense in loading? I do not think so.

148. Would you be prepared to propose a plan that steredores or trimmers could carry out? There are conveniences in existence now, if they will only use them.

149. Which of these appliances would be the most suitable? I have only seen one. They are all so simple, with a view to prevent the coal being dumped down continuously from 7-ton waggons in one spot.

150. It would cost more to trim if loaded in that way? I do not think so. I do not think it would cost the trimmer more. The Commissioners for Railways let a contract for the shipment of coal, and the contractor's object is to get rid of it as soon as he can. The trimmers have a contract, and their object also is to get rid of it as soon as they can.

151. The trimmers are not connected with the shipping contractors in any way? No. A waggon with 7 or 8 tons of coal is hoisted, and the coal dumped down in the middle of the hatch, one waggonful after another. The trimmer comes along and takes the big lumps of coal away, and leaves the small coal in the square of the hatch. When the coal is dropped into the bottom of the ship, if it cannot run away here, there, and everywhere, you will always have this accumulation of dust, and while that exists there will be fire. If they want to save the reputation of the coal trade they must adopt some means of distributing the coal properly.

152. *Mr. Pittman.*] If it took longer to ship the coal when a distributor was used the contractor would want a higher price? If there was a proper distributor fixed the coal contractors could ship as quickly as they do now.

153. *President.*] You consider it is the business of the colliery-owners to see that the cargo is stowed properly? It is their place to see their commodity is landed in good order and condition.

154. *Mr. Pittman.*] You have no doubt coal could be shipped as quickly? It might cost a half-penny a ton more, but what is that compared to the loss of a ship and of lives.

155. *President.*] Would it take much longer to load? No; it could be done just as quickly.

156. As the Railway Commissioners own the cranes, might they not insist on the ships being loaded with proper appliances? They would have to include trimming also, because trimming is the important point, after all.

157. You consider the trimming is even more important than proper loading, to avoid the dumping? The whole thing is in the trimming. The steredore or trimmer should be compelled to have proper appliances to distribute the coal to prevent it being dumped in one place. The Railway Commissioners finish their part when they deliver the coal over the ship's hatch.

158. Have you known of any system of ventilation being adopted in the hulls of the ships? Most modern ships have surface ventilation, which is the only useful method.

159. It is not customary to provide any other than surface ventilation? No; none of the ships leaving this port have other than surface ventilation. I think it would be a source of danger. From my experience, the tubes for taking the temperature do not indicate the true temperature within 5 to 10 degrees.

160. On what do you base that opinion. Experience. In the "Morna" the tubes gave 10 degrees less than in the middle of the coal.

161. *Mr. Pittman.*] Do not the tubes go down the sides of the hatchway? In the after part. The master puts the tubes at the end of the hatch for convenience sake. They cannot be put in the centre.

162. *President.*] Are accidents more frequent in large ships than in small ones? Decidedly so; the larger the ship the greater the risk. Twenty years ago, when we had small ships, we never heard of these things.

163. The increase in the size of the ships is, then, in your opinion, the cause of the increase in the trouble? Yes; the larger capacity of the ships.

164. Do you think that is sufficient to account for it? Yes.

165. Do you know, as a matter of fact, that the larger the ship the more likely the cargo is to heat? That is my confirmed opinion.

166. Is it your experience? Yes, also.

167. Have you noticed any greater tendency to fire on the part of one coal than another? I do not think there

there is any difference. If the coal is shipped large it will keep well. Some coal when dropped will easily crumble to pieces, and I think that coal is most dangerous which is easily reduced to powder. I have a strong opinion, also, that coal should not be loaded in excessively wet weather.

Mr.  
T. Brooks.  
2 Sept., 1896.

168. Is that based on experience? Yes.

169. Have you known that cargoes loaded in wet weather have been particularly liable to spontaneous combustion? I cannot single out one particular cargo, but, where moisture exists, fire is more easily created.

170. All coal contains a certain percentage of moisture? I admit that. Modern ships now have very large hatches, about 12 feet wide by 15 to 20 feet long. We may have a downpour of rain, but the coal continues to be loaded and the hatches are kept open. It tends, to my mind, to create heat, always having in view the large accumulation of small coal that exists in the square of the hatch.

171. That is your impression—you have no direct knowledge that such is the case? No; except in the case of the "Morna." She loaded the stiffening coal in Sydney in wet weather.

172. Did the "Invermay" load in dry weather? I think so.

173. *Mr. Pittman.*] You said that you thought it advisable that coal should stand for some time before being loaded, so that the gases might escape;—have you any knowledge that gases do escape from Newcastle coal when standing? There are gases, more or less, in all coals, and you find the gas oozing out in a mine before the coal is won.

174. In the Newcastle mines? Yes, in several of the mines in the district.

175. Do they use safety lamps? No; it is not sufficient to require that.

176. *President.*] It has been suggested to us that the hatches of ships might be made large enough to lower the waggons right down into the hold—in your opinion, would that be of advantage? It would be to a certain extent, but the expense of converting ships' hatches would be prohibitory, and ships' hatches would require to be specially constructed for loading by the method of lowering the waggons into the hold. The main hatches of modern vessels are large enough to allow of this being done.

177. It would not prove a complete cure of the evil? No.

178. It has been pointed out that there is sometimes a large quantity of fine coal in the waggon before it is emptied into the ship, so that the fine coal is not always formed from the dumping into the hold? No; it comes from passing over the shoots, and the friction of traction.

179. Is it a custom, do you know, to intentionally load small coal in the bottom of the trucks? No; I believe it is the desire of the proprietors to load good coal.

180. *Mr. Pittman.*] You are not familiar with Spencer's distributor? I have seen it once or twice. It works very well. It avoids the accumulation of dust in the hatch. If you get over that point you will solve the problem.

[Witness withdrew.]

Mr. A. Bertram sworn and examined:—

181. *President.*] What is your name? Augustus Bertram.

182. And your profession or business? Shipping Inspector to the Local Marine Board.

183. How long have you been in that position? Nineteen years the 1st of next month.

184. Does your duty include the watching of the loading of ships with coal? No; it has nothing to do with that. It is simply to inspect the ships' equipments, and see that they are not overloaded.

185. Are there officers of your Department that do watch such loadings? No.

186. You have merely to see that the ship is seaworthy? Yes; that her equipments are in good order, that she is not overloaded; and of late years I have been in the habit of inquiring as to her ventilation.

187. For all you know, a ship may go to sea with a coal cargo absolutely untrimmed? So far as I could swear to.

188. It does not come within your duty to examine into the trimming? No.

189. Are there any officers whose duty it is to examine into the trimming of coal? It is all done by private stevedores.

190. It is absolutely left to the stevedores, the captain, and the officers of the ship? Yes.

191. Have you had experience of any ships whose coal cargoes have heated? No; I have never specially inspected them. I have been aware of one or two lately. I have looked at them casually, but not as part of my business.

192. Is there any information which you could give to the Commissioners in regard to this inquiry? I am afraid not in any way. I look, as a rule, when I get aboard a ship, to see if she has any shifting boards, but as far as the trimming is concerned, we have nothing to do with it.

193. Can you insist on the use of shifting-boards? No. As a rule they are put up. I just note in a diary whether they have them or not.

194. You have no power to insist on any special appliances being used? None at all.

[Witness withdrew.]

Mr. J. Russell sworn and examined:—

195. *President.*] What is your name? James Russell.

196. And your business? General contractor.

197. You have a contract occasionally for loading at the cranes? Yes.

198. How long have you been in that business? Thirty-seven years.

199. You have had contracts for loading ships with coal for thirty-seven years? Yes; since the cranes started.

200. Where does your contract begin? The Government places the coal, and I hoist it on board the ship.

201. The Government delivers you the coal at the ship's side, and you lift it on board? Just so.

202. You are at liberty to lift it in any way which seems good to you within the means of the cranes? Yes; in the usual way of shipment.

203. Is there any stipulation in the contract as to any particular method of loading? No.

204. You can do as you like? Yes.

205. The usual method, I believe, is to provide trucks with movable bottoms. The trucks are lifted above the hatch, and the coal dropped into the hold? Yes.

206. Do you ever lower the trucks down through the hatch? Yes; where it is practicable.

207.

Mr.  
A. Bertram.  
2 Sept., 1896.

Mr.  
J. Russell.  
2 Sept., 1896.

Mr.  
J. Russell,  
2 Sept., 1896.

207. You have nothing to do with the trimming of the coal; your work is done when the coal is put on board? No; trimming is a different thing altogether. However, I contract for that too.
208. It is a matter for separate agreement? Yes.
209. Do you usually trim the ships which you load? Very often.
210. Your contract for trimming is with the owners or masters of the ships? Yes.
211. Would it be possible for you to supply us with a list of those ships which you have loaded with coal? Yes.
212. Would it be very much trouble to prepare such a list? No.
213. Could it also be stated with what coal the ships were loaded? Yes.
214. It is all filed in your office? Yes; in the books.
215. You would describe yourself as a stevedore, I presume, would you not? Yes.
216. I suppose you are unable, personally, to superintend each individual loading? I am always there or about.
217. So that you practically rely on yourself to see that the loading is carried out satisfactorily? Yes.
218. A certain amount of evidence has come before us, and an overwhelming amount collected some years ago in England, which tends to show that the source of spontaneous combustion, and nearly always of heat in coal cargoes, is the small coal under the hatchways—is that your experience? Sometimes; but how do you account for it when, supposing the running of the coal is from the main hatch down to the fore hatch, and the coals are then taken into the fore hatch, and the two ends at the bottom meet and are nothing but lumps, and those ends take fire, and not under the hatch.
219. Have you any evidence of a case in which a fire has originated among the large coals and not among the small? Yes.
220. You have definite evidence of fires which originated among the large coal as distinct from the small coal? Yes.
221. In those cases was the coal wet or dry? I could not say.
222. *Mr. Pittman.*] Is it not a fact that there are master trimmers or stevedores in charge of each separate ship? Yes.
223. In giving us the list of vessels asked for, could you give us a list of the stevedores in charge of each? Perhaps I could not do that. I could give you a list of most of them. I think I can satisfy you as far as ships are concerned that have come to grief.
224. *President.*] Supposing, however, we considered it was desirable to reduce the breakage of the coal in loading? I am anxious to do that whenever I can get a chance.
225. Supposing some appliance were adopted to reduce the breakage by dumping, would that increase the expense? Yes; you would need to make the cranes to apply to that work. The ships that I have lowered the waggons into the hold of have had large hatches, both long and wide. The trucks carried 9 or 10 tons of coal.
226. Is it possible to adopt some means of allowing the coal to slide quickly down into the hold of a ship? Yes; I have done it hundreds of times myself. I have had a platform like that formed in the centre, with arms for the purpose of shifting the coal away.
227. With what result? It saves trimming. It spreads the coal.
228. Does it save breakage? There is nothing will save the breakage more than lowering down the ship's hold.
229. It would not be practicable, I presume, to make the waggons very much smaller? That could be done.
230. Would that lead to an increase of expense in the carriage? Tremendous, not in the carriage, but in alterations.
231. When the rolling-stock is increased, could not smaller trucks be obtained? There is a big difficulty in the way. There is only one hatch where they could go down. They could not go down the fore and aft hatches.
232. It would be practicable to lower the waggons into the main hatch but not into the fore and after hatches? Yes.
233. Would it be practicable to adopt any loading appliance at the fore hatch which would have the effect of reducing the breakage of the coal? You could get nothing into the hatch, because the stays go right across the hatch.
234. So that you could do nothing but use baskets or drop the coal from the deck? Yes.
235. It would not be practicable to give up loading from the fore hatch? That would put the ship to expense by trimming up from the main hatch.
236. The coal does not drop quite so far in falling down the fore hatch? In some cases further, because we can lower the waggons down the main hatch.
237. There is, in your opinion, no way of loading coal through the fore hatch so as to avoid breakage? Not with the present appliances that the Government have.
238. Are there any known appliances that would enable this to be done? I do not know of any.
239. *Mr. Pittman.*] It would be impossible to use the distributor in the fore hatch? There is no room for it.
240. *President.*] Would it cost more to load the coal if such appliances were used? I believe it would, from what I have seen.
241. Can you give us any idea how much more? I believe it would cost from 1d. to 1½d. a ton more.
242. Will you tell us how much it costs now to load the coal—the average price? You are speaking of the trimming.
243. No; of the contract under which you undertake to load the coal? One penny and a sixteenth a ton. You cannot lose much time at that price.
244. *Mr. Pittman.*] So that it would add very considerably to the price to use the distributor? Yes; more for the trimming and more for the shipment.
245. Would not the distributor assist in the trimming? I do not think so.
246. The effect of the distributor would be to disperse the coal from the centre towards the sides of the ship, would it not? To a certain extent.
247. The effect of the distributor is to tend to reduce the heap in the centre of the hatch, and to cause the coal which would otherwise be in the heap to fall towards the wings? You would need to put the distributor in the wings.
248. The distributor would tend to cause the coal to move towards the wings? It must be in the wings.
- 249.

Mr.  
J. Russell.  
2 Sept., 1896.

249. *President.*] How do you then explain the statement that it would cost more to trim the coal if the distributor were used? You could only ship a few waggons when you would need to pull this thing up. The coals would not run after half-a-dozen waggons. You would then have to shift the distributor, and take a piece out.
250. That would lead to extra expense? Yes.
251. You have already tried some of these appliances? Yes.
252. Could you describe any? I have tried the planks and plates.
253. You have made use of such appliances as you could get together? Yes.
254. There are patent appliances, are there not;—are they of any service? There are some. There has been one used, but never with any success.
255. Not with any success? No.
256. From what point of view—that of the loader who desires to get the coaling over quickly, or of the owners, who wish to have the coal as little broken as possible? The captains won't have them on board.
257. Do you know why? They take too much time to load.
258. Captains are anxious to get the loading done as quickly as possible? Yes.
259. Why is that—in order to get to sea? Yes.
260. And you are anxious to get it done as quickly as possible, because at a penny and a sixteenth per ton you cannot afford to waste time? Yes.
261. It is in everybody's interest that the coal should be loaded as quickly as possible? Yes.
262. It is nobody's interest to see that the coal is not broken? It has been loaded the last thirty-five years the same as to-day.
263. Those who are on the spot have an interest in getting the coal on board as quickly as possible in spite of any other consideration? That is so.
264. These accidents have occurred chiefly during the last eight or nine years? Yes.
265. Have you formed any idea as to why it is that these accidents have been more prevalent recently? Only that the ships are so much larger and contain a bigger body of coal. If the ships were properly ventilated there would be no fear of gases accumulating amongst the coal.
266. In your opinion has the gas that accumulates anything to do with spontaneous combustion? If the coals are well ventilated I do not think there is any fear.
267. Is that a matter of impression or experience? If there were a current of air through the ship I do not think there would be any fear of fire.
268. That is your opinion? Yes.
269. Perhaps you have never thought about this matter very carefully? I have times out of number. I have said they ought to put *spires* in the main hatch to ventilate it.
270. Some of the ships loaded by you have afterwards come to grief? Yes.
271. Can you give us an instance? The ship that came into Sydney with her coals on fire—the "Knight of St. Michael."
272. You loaded her? Yes.
273. Did you see her loaded? Yes; I was on board.
274. Was the coal loaded from the cranes in the usual way? Yes.
275. Was there anything abnormal in the weather—was it wet or dry? I think it was dry.
276. Was it very hot? It was warm.
277. How long did you take to load the "Knight of St. Michael"? I could not tell you from memory. It would be about 1,000 tons a day.
278. How many tons were there on board? I think she had about 4,000.
279. She would have taken about four days to load? Yes, perhaps not so much, as they worked night and day.
280. Did you trim the coal on board? Yes.
281. Can you let us have the names of the men employed in the trimming? Yes.
282. Were they under any supervision other than your own? I have a foreman for that purpose—to look after nothing but the trimming.
283. Was he in attendance during the whole time she was being trimmed? Yes.
284. Was there any inspection of the state of the cargo by the captain before she left? No; when the ship was in Sydney I asked the question if there was any fault with the trimming, and they said no.
285. You asked specifically if there was any fault in the trimming? Yes.
286. There was no inspection here at any time;—I suppose your foreman reported to you all was correct? Yes.
287. You did not yourself see that all was correct? Only in a casual way.
288. *Mr. Pittman.*] You said that the use of a distributor would save to some extent the breakage of the coal—would it not save it to a very large extent? I do not think it would. It might save in one way, but would not save when you consider the time it would take.
289. It is not a question of time—it is a question of efficiency. I want to know, not from your point of view as a contractor, but from the point of view of public safety, whether it would not very largely save the coal from smashing? It might not to such an extent as you imagine. There are many difficulties, because of the waggons. The big waggons you must keep up a certain distance before you can let go the door. If you had a distributor the coal would fall heavily at the first.
290. Supposing you could get a distributor to act well, would it not, in your opinion, effect a very large saving in the production of smalls? It would have to be something different to what we have here.
291. You do not think there is a distributor here that would? No; the only thing we have here is Spencer's from Glasgow. It is similar to Harper's, but not so large.
292. What does Harper's weigh? Three or 4 tons.
293. And Spencer's? Twenty-five cwt. I do not think more.
294. It is united in the centre, and can be unhooked? Yes.
295. *President.*] I suppose if you were paid a suitable price it would be a matter of indifference to you how you loaded the coal? It would not matter.
296. It would be a matter of indifference whether you dumped the coal at a penny and a sixteenth or loaded it properly at (say) double that price? I do not think we can make any difference. The only thing you can do is to lower the coal down the ship's hold.

- Mr. J. Russell.  
2 Sept., 1896.
297. That seems to be a question of either altering the waggons or the ship. I take it that it would be easier to alter the waggons than the ship? You could not do that very well. The distance that these waggons have to travel would make it an expensive affair.
298. No doubt it would increase the cost of carriage, but apparently there is no remedy to be suggested that would not involve increase in cost? It would involve great cost either way.
299. What is Newcastle coal worth on an average per ton landed at the ship's side? Seven shillings and sixpence.
300. The extra expense of about 1d. per ton would possibly make a considerable difference in the handling of the coal? I do not think it could be handled much cheaper than it is, unless you alter the whole thing and get the cranes built for the particular purpose, and have very large hatches right out to the wings. The A.A. Company have got shoots, and the coals suffer more breakage thro' than at the cranes. I have never had any accident with them.
301. There has been a good deal of evidence to the effect that the accidents on board ships are caused through having fine coal and dust together in the main hatch? The A.A. Company's coals are fine, and very easily broken. Their shoots are much higher than the cranes.
302. As a matter of fact, do they break the coals as much as the cranes? Yes, and more.
303. And accidents do not occur with them? No.
304. Have none of their ships been on fire? None.
305. Have you loaded the coal from the shoots for the A.A. Company? Yes; I take the coals there as well as at the cranes.
306. Mr. Pittman.] Distributors are used here occasionally, are they not? I think Spencer's affair has been used about three times, and Harper's once. It was taken out of the ship as being a failure. I was not there at the time.
307. Suppose the captain of a ship were to propose to use a distributor, would you raise any objection to it? No; I would be always ready to assist the ship.
308. But you would be losing money by loading the ship with a distributor? Yes.
309. And you would have no objection to losing it? I do not object to lowering the coal down with a distributor, but there is so much work attached to it—lifting it and putting it on board the ship. We could not go on for ever using it without coming to some arrangement with the Railway Commissioners. If the Commissioners wanted it done it would be a matter for them and me to settle.
310. President.] It could be done by entering into a different form of contract? Yes; the Commissioners are always glad enough to further the port. I had a talk with Mr. Eddy about the same thing, and he was agreeable to do anything to save the coals.
311. Mr. William Hudson, an employee of Messrs. Russell & Co., was then called in, and informed by the President that the Commission required specific evidence in support of the statement made by Mr. Russell that he knew of certain cases in which fire had originated on board ships amongst the large as distinct from the small coal and dust, and in a position away from the hatch.
312. Mr. Hudson stated he thought Mr. Russell must have been referring to the "Ellen A. Read," which, he said, was not trimmed by the firm.
313. The President also required him to furnish a list of the ships which had been loaded by Russell & Co., giving particulars as to the tonnage of the vessels, the date of loading, the amount of coal carried, the kind of coal, the name of the master, stevedore, or trimmer who trimmed the cargo, etc., as would be asked for by letter from the Secretary, since the year 1888.
314. Mr. Hudson said the information would not take long to prepare, but he would have to find out the names of those ships to which accidents had occurred.

[Witness withdrew.]

THURSDAY, 3 SEPTEMBER, 1896.

[The Commission met at 2.30 p.m. at the Custom House, Newcastle.]

Present:—

PROFESSOR RICHARD THRELFALL, M.A., PRESIDENT;  
And EDWARD FISHER PITTMAN, Esq., A.R.S.M.

Captain Parkhill sworn and examined:—

- Captain Parkhill.  
3 Sept., 1896.
315. President.] You are Captain Parkhill? Yes.
316. You are the master of a ship now in port? Yes; the "Scottish Lochs."
317. Is she an English ship? Yes.
318. What kind of ship? An iron ship.
319. What is her size? Her tonnage is 3,930.
320. You have been in the coal trade for some time? Since I went to sea.
321. How long ago? Twenty years.
322. Have you ever had any trouble with heating? The only trouble I ever had was when I was a second mate. We had a cargo of North Country coal which heated.
323. Did you form any opinion as to the cause of heating? I formed an opinion it was because of the ventilation of the hold.
324. So that you do not believe in ventilation? I think ventilation only helps the coal to heat.
325. You have never had any trouble with Newcastle coal? No; I have carried four cargoes.
326. Where did you carry them to? San Francisco—three cargoes of Wallsend and Greta coal.
327. You have had them both wet and dry? On the last occasion I loaded Wallsend coal it was in very wet weather, and the water was almost dripping out of the trucks.
328. Had you any difficulties with it? It did not, I believe, heat with us. The temperature was normal all the way.
329. You did not ventilate it in any way? Only the hatch ventilation. Our ship is very well ventilated. We have about fourteen or fifteen surface ventilators.

Captain  
Parkhill.

3 Sept., 1896

330. In your opinion, it is desirable to have surface ventilation? I think so.
331. To get rid of the gas? Yes.
332. Will you tell us what procedure you adopt in loading the coal on your ship? Every time I have loaded here it was in the ordinary way.
333. At the cranes? Yes.
334. You have employed one of the stevedores of the port? Yes.
335. Who have you employed? Russell & Company this time, Dalgety's people last time, Sullivan the time before that, and I think it was Russell loaded us the first time.
336. On no occasion have you had any trouble? No; I always have the cargo very well secured with shifting-boards.
337. Do you give personal supervision to the loading? I see that the work is done to my own satisfaction.
338. That is the business of the inaster of a ship? Yes, of course. And during the progress of the loading I always keep one officer looking after that the whole time, and go occasionally myself to see how things are going on.
339. Do you see that the coal is well packed in the wings? Yes, to see that no empty spaces are left in the coal.
340. Have you or your officers ever had to complain of the loading? Not much, only just occasionally. The special thing is to see that the trimming is done properly. They seem to trim fairly well. You have less trouble with the trimming here than in England.
341. Are they very careless? No; they will do what you tell them very readily.
342. Have the stevedores been willing to meet you? I have never had any difficulty.
343. You have no complaint to make? No; I have always had the coal as I wanted it.
344. Have you had the coal dumped down the main hatch? Yes.
345. You have never taken any precaution to spread it? No; we have had no appliances for that at all.
346. Do you take the temperature of the coal? We do that every day.
347. Have you ever observed any tendency to heat? Nothing out of the ordinary. When you have a high temperature on deck, you will find the temperature rise slightly, but not abnormally.
348. There appears to be good reason to suppose it is the pounding of the coal into fine dust under the main hatch that gives rise to spontaneous combustion? I think so.
349. In spite of that you have never taken any precaution to prevent it? I always thought the Newcastle coal was safe. It is only this time I have heard of it taking fire spontaneously. Several kinds of coal at home are very liable to go that way.
350. Have you on this occasion taken any extra precaution in consequence of these reports? No; the only extra precaution I was going to take was to lower the waggons down the main hatch.
351. You are going to take that amount of extra precaution? Yes.
352. In regard to the fore and after hatches, that, however, cannot be done? No; the hatches are too small. Where we have not a large body of coal we carry all the cargo in two hatches nearly. The ends are practically empty.
353. In the end hatches, you have to dump the coal? Yes; we cannot lower the waggons down.
354. Is it possible for the distributors to be run down the fore and after hatches in such a way as to shoot the coal through the 'tween decks? Yes.
355. Do you think it a feasible and reasonable thing to have some sort of slide passing through the 'tween decks? They have much the same sort of thing only in a different way. They run the coal along iron shoots. They have to make a pile and shoot it over the pile.
356. That would increase the expense of loading? I daresay it would. I could not say positively.
357. It has been pointed out that owing to ballast being carried fore and aft, it is difficult to get the spreader to work without the first lot of coal put down the main hatch being thrown upon the ballast? The ballast is invariably carried amidships, unless they have some cargo already there. They must get the main hatch clear first. You cannot take a big ship to sea that is only ballasted in the ends.
358. There is no reason whatever why the ballast should not be amidships? The ballast should be amidships.
359. Supposing for any reason, it is not amidships? There is no reason why the ballast should not be amidships.
360. There is no reason why the ballast should be fore and aft? I should say not. I invariably carry the ballast amidships. In fact, I have never seen it carried any other way.
361. I understand it is the practice to sweep out the lighters, where coal is loaded from lighters, and to throw the sweeping down the main hatch? I have never loaded in that way. I have always loaded from the cranes, or, at home, from tubs.
362. Do you think that tubs load coal with less breakage than cranes? I do not think they do.
363. It has been suggested that in certain cases arrangements are made by the stevedores that captains of ships should pass over the supervision of the stowage for some pecuniary consideration? I do not know; I have never heard of it. Such a thing has never come to my knowledge. It is a thing I look upon as of the most importance that the ship should be properly stowed.
364. Such a thing has never come to your knowledge? I have never known of such a case. I do not think I ever came across a man quite so foolish.
365. *Mr. Pittman.*] You mentioned that you had carried four cargoes of coal from this port? No, three; this is the fourth time now.
366. Can you recollect whether any of those were loaded in very hot weather? No; I have loaded in November, April, and July. They were all in medium cool weather.
367. Do I understand that when you were having your ship loaded with coal, you personally supervised the trimming? Decidedly so.
368. You think that is the duty of the captain? Yes; I think it is the duty of every master to see that his ship is properly loaded.
369. So that you have the stevedore in charge under personal inspection? Yes; and I invariably keep one officer—generally the second—looking after the stowage.
370. You do not find the trimmers make any objection? I have never had any difficulty with them at all. The ship is being trimmed by Russell now. At other times I have taken the stevedores I thought best. I have always found they have met my wishes.

- Captain Parkhill.  
3 Sept., 1896.
371. *President.*] Do you think it possible for a stevedore who wished to load badly to slum his work? I do not think so.
372. You think the cargo could not be badly loaded? Not with proper supervision.
373. It is possible to have sufficient supervision? Yes; in large ships like mine, you must look after the stowage to make the ship easy. The stevedores will sometimes run too much coal into the lower hold. I have to keep my 'tween decks well filled up. If I did not, her centre of gravity would be too low.
374. Do you think the use of shifting-boards is essential? I think it is. It is absolutely necessary.
375. Do you think the shifting-boards should be the whole depth of the 'tween decks? I have them about 6 feet in the 'tween decks. We have 3-foot shifting-boards, and I put two boards in the lower hold close up to the beams.
376. Have you formed any opinion as to the cause of the increase in casualties here during the last few years? I have formed an idea that most of the ships are lost through getting hove down in bad weather and the coal shifting.
377. In some cases, at all events, the coal is not as well and carefully loaded as on your own ship? I know of cases where masters of ships have left here without shifting-boards.
378. Can you mention such a case? I cannot from memory. I have read of several cases here lately.
379. That would be the fault of the master of the ship? It may be his fault or not. It may be that he cannot provide shifting-boards. He may not be allowed to go to the expense.
380. Not be allowed to buy them? I cannot say: I am only presuming that.
381. It would, however, be either his or the owner's fault? Quite so. I know in my case anything that I said was wanted the owners are quite willing to bear the expense of.
382. You have never had any difficulty in getting stevedores to do just as you wanted them to do? Exactly so.
383. If you did not see to the work yourself, it might be done faultily? Of course they will not shovel the coals more than they can help.
384. Have you formed any opinion as to the cause of heating of the coal? I do not know, unless it is on account of the small coal in the bottom of the main hatch, under the heap. I think that coal shipped wet, and getting much broken, is more liable to spontaneous combustion than when shipped dry.
385. It has been suggested that in some cases the cooks on board ship are not allowed to throw the ashes from the galley fire overboard, and so they put them down the main hatch? There must be mighty little discipline then.
386. What does your cook do with the ashes from your ship? Puts them into a pail and takes them ashore. I would not let him throw the ashes down on top of the ballast.
387. Have you anything about which you would like to inform the Commission? I do not think so. I have had practically no experience with cargoes heating, except in that one case, seventeen years ago.
388. Of English coal? Yes; Northumberland coal.

[Witness withdrew.]

Mr. J. D. Beeston sworn and examined:—

- Mr J. D. Beeston.  
3 Sept 1896.
389. *President.*] What is your name? John Denison Beeston.
390. And your business? I am shipping manager to the Australian Agricultural Company.
391. How long have you been in that position? About six or seven years.
392. Has your experience been limited to that time in shipping matters? I had experience as a youth in a wharfinger's office, berthing ships, and since that time I have always taken an interest in shipping matters.
393. What is the nature of your duties in connection with your position? To arrange all matters in connection with the shipping of the company's coal. We ship at private shoots.
394. You have your own shoots? Yes.
395. You ship entirely from those shoots? With very few exceptions. With coal that we do not ship there we have nothing to do, except the business part.
396. With regard to the coal that you ship at your private shoots, is it part of your business to attend to the trimming;—are you responsible for the trimming? We are not responsible.
397. Does the company undertake the trimming of the coal? The ship employs the trimmers.
398. The ship's master? Yes; the same as at the dyke.
399. He employs the stevedores? Yes.
400. Have you ever been down in the hold of ships during the time they have been loading from the shoots? Frequently.
401. You have seen the trimmers at work? Yes.
402. Is it in your experience that they trim imperfectly;—can you give us any idea as to whether the trimming, as a rule, is well done? I would not like to say, as a rule, it is done imperfectly. I have seen some cases that I would call rather bad trimming.
403. Were there cases where the officers of the ship allowed the trimmers to do as they liked? My experience is that officers as a rule seem to take very little interest in it.
404. Is it their business to see that the trimming is properly done? It seems to me the contractor just gets the coal below the hatches and brings the ship down to her marks, and that is all the shipmaster and officers seem to care about in the majority of cases. I have known some officers to go down and see themselves to the trimming.
405. Is it possible for an officer who is anxious on the subject of the trimming to see that it is well done? Yes.
406. There is nothing to prevent him from going below to ensure the proper trimming of the cargo? Not that I can see.
407. There is no opposition on the part of the trimmers? No; I should not think so. There is nothing which would prevent me from going down if I were in a similar position. I have heard it said that trimmers would throw pieces of coal, but I think it is only talk.
408. You have never known such a thing to be done? No; I have not known it to be done. I have heard it talked about. I do not know whether I heard it said it had been done or it might be done.
409. You have heard it suggested that trimmers would regard such conduct on the part of the officers supervising the trimming as interference? Yes; I have heard that said at an inquiry at the Chamber of Commerce here some time ago into the shifting of coal cargoes.
410. Who said it? A man named Bertram, a master stevedore.

411. What do you consider constitutes bad trimming? Under the 'tween deck stringers, etc., should be filled up, not scamped.
412. They are not filled up? Not always; one particular case came under my notice. The ship was loaded. I got down the fore and after hatches, and there was room for me to stand up in the wings above the coal. That, to any practised hand, is a clear case of bad trimming, where the coal in the middle of the ship is high up, and nothing in the wings. The fore and after walls of the main hold were not backed up by the other coal much above the 'tween decks.
413. That would be a typical case? In my opinion it would.
414. Have you had any experience in regard to the heating of cargoes? No.
415. None of your coal cargoes have heated? Not that I have heard of. One vessel with our coal is missing; we cannot tell what has become of her.
416. A vessel loaded with your coal? Yes.
417. What was her name? The "Trinidad." Lloyds are seeking for information about her. She is now over 150 days out bound to Caldera.
418. How long ought she to have been out? Not more than sixty days.
419. Did you superintend the trimming of her cargo? No, I did not superintend it. I think I was down the vessel's hold once. When I have been down in any case it has been out of curiosity, and to form an idea of the number of empty waggons I could reckon on getting; it was not with a view to inspect the trimming.
420. Was the trimming, as far as you remember, satisfactory? Yes, I think it was.
421. Who was the stevedore who trimmed her? Ryan.
422. Was the coal shot down from the tips to the bottom of the lower hold? Yes.
423. Did she have a cone under the main hatch of broken, smashed-up coal? I do not know that it was smashed up more than is usual.
424. I suppose the coal fell 25 or 30 feet? This vessel was only a small one, carrying about 1,000 tons.
425. How far would the coal fall? It would be about 17 or 18 feet.
426. Were shifting-boards employed? Yes. When she came alongside she had shifting-boards right across the square of the main hatch, but I instructed the mate to take these boards out from the main hatch, as they would have broken the coal, and they would not stand by the time the hatch was run up. They would have been knocked down, and would have been no benefit to the ship. It would have thrown the coal on one side and given the ship a list. I told the mate we would stop tipping before the hatch was quite run up, and give him an opportunity to put up the top shifting-boards. One or two were put in, but they did not seem to take very much time about it. They may not have been put in well. I do not think they are necessary right in the main hatch.
427. They were left elsewhere? Yes.
428. You can think of no reason why the ship "Trinidad" should have come to grief more than any other ship? No; she was an old ship, but her hull was strong. She took the ground for a short time in loading, but not to any extent to account for the loss.
429. Was she owned here or in England? In England. One thing I remember, there was a strong smell of ammonia in the ship. She had had a cargo of guano on board previously, but I do not know whether that would interfere with her in any way.
430. With regard to the stevedores here, can you say whether, on the whole, they do the best they can under the circumstances, or is the rate paid so small that they must necessarily scamp the work where possible to do so? I think the rate paid makes it necessary for them to save some of the labour. I do not know that it would make the conscientious men scamp the work.
431. There is a temptation for them to scamp the work if not watched? I should think so. Some of the stevedores seem to take a good deal more pains than others.
432. It has been suggested that some system of licensing the stevedores would be of advantage in such a way that the licenses could be cancelled in the case of frequent mishaps occurring;—do you think such a system as that would have any advantage? I think it would.
433. Do you see any reason why they should not be licensed—would it interfere with the trade of the port? I do not think so, if there was a sufficient number of them licensed so as not to cause a monopoly.
434. Is the actual trimming a matter which requires a certain amount of skill, or could any man strong enough trim coal? It requires a little skill that might be picked up in a very short time. It is like most other work, you want to get used to it a little.
435. An ordinary strong, willing labourer could learn, I presume, in a week to be a competent trimmer? If he were among good men.
436. He might not learn to work as quickly, but he would learn to do the work properly? Yes.
437. We have heard of cases of candles being left among the coal by the trimmers when the candles have been in a position in which they could not easily be recovered;—have you ever heard of such a case? I have never heard of such a thing happening. It strikes me as a thing very likely to happen.
438. You have never heard of a case in which it actually occurred? No. It has struck me that the men might knock live ashes out of their pipes.
439. The men trimming a ship would not have much time to smoke? They make time to smoke. They have regular times for knocking off for their beer, at 11 and 4 o'clock.
440. We have also heard, incidentally, that in some cases trimmers work twenty-four hours straight on end;—is that the case? I suppose you would call it twenty, taking out meal-hours.
441. Do you think a human being could keep in full possession of his faculties for twenty hours? I would not like to keep a man employed that length of time and expect him to do his work properly.
442. What is the reason for this extraordinary length of employment—what is the cause at work which makes such a thing usual? I think it used to be a rule of the Union that a man who started a ship should go right on with her. I think that is one of their rules; or, if she worked at night, to go on for the first night.
443. So that it was really by the trimmers' own wish? Yes.
444. What is the motive that would lead a man to deliberately put himself in such a position? They get 6d. an hour more for night-work than for day-work, and a man who wants to make money would rather work night-work than day-work.
445. It occurs to me that if a man has done nineteen hours' work in the hold of a ship he would not care much whether the ship was properly trimmed or not;—do you agree with that? Yes.

Mr.  
J. D. Beeston.  
3 Sept., 1896.

- Mr. J. D. Beeston.  
3 Sept., 1896.
446. Has it been the custom to ventilate the cargoes which have been loaded from your shoots? Not anything more than the usual ventilation in a ship.
447. Do they ever put ventilating pipes down? No.
448. Do you put down pipes for testing the temperature by thermometers? No; that is a matter for the ship. I have noticed it frequently in the ships of late years—the last year or two.
449. It is a matter entirely for the master? Yes.
450. You have been singularly free from casualties yourselves? Yes.
451. You have never had a case of spontaneous combustion? Never one reported to us.
452. Nor of heating? Not reported to us. There is one case that I thought was favourable to heating, judging by the theories held as to the shipping of wet coal and coal freshly hewn. A ship in port at the present time loaded last February twelve months during boisterous and wet weather. We were short of coal at the time, and some of the coal was brought straight from the pit and tipped into the ship. On the other hand some of it was standing in heavy rain, and was saturated with water. On the captain's return here I asked him whether he had had any signs of heating, and he said none whatever.
453. Where did he take the cargo to? Valparaiso. Most of our foreign coal goes to South America.
454. Have you known of a case of your coal heating which has not been officially reported to you? No.
455. You have absolutely heard of no case of the kind? No; I have not. Of course, some of the ships have never come back, but I have asked a good many of the captains.
456. Do you think the loading from the tips enables the coal to be loaded with less breakage than from the cranes? No; it has its advantages in some ways and its disadvantages in others. I think it would be subject to the same amount of breakage. Some people hold that it would cause more breakage at the shoots than at the cranes, it is a matter of opinion.
457. What is the advantage of loading from the shoots? When you have a higher level it is much quicker. We can ship it quicker there than at the dyke. Our company have had shoots ever since they started.
458. It does not require the same expenditure of time? No.
459. What are the drawbacks connected with loading from the shoots? Sometimes we have not sufficient height with the big vessels; sometimes the shoot will be a few feet higher than the hatch, and the coal is dropped a little more.
460. What is your idea as to the cause of the increase in casualties during the last few years? I could not come properly to a conclusion as to the cause of it. It seems veiled in mystery.
461. Is there any other matter about which I have not asked you in regard to this subject which you could lay before the Commission? Nothing I can think of just now.
462. *Mr. Pittman.*] Is the shoot adjustable in any way? It is adjustable, but we like to have the shoot fixed so that the coal will run gently down it. Sometimes it is higher than the coamings of the hatch, and when the ship gets lower on being filled we use a lower shoot. We have two levels.
463. Would it not be possible to use some sort of telescopic arrangement on the shoot? I hardly see how it could be done with our shoots. I have heard of it in some of the tips at home.
464. On something after the same principle as the travelling cash system used in the shops in Sydney, where the ball holding the money falls down an inclined plane and drops into a stocking;—something like that might be adopted to prevent the coals falling any great distance? I do not know whether we could make anything that would stand the weight. There is a good deal of wear and tear.
465. What are your shoots made of? Iron.
466. Could not a telescopic arrangement be made of iron? That would only increase the breakage; the coals going down in a smaller compass would be liable to more breakage.

[Witness withdrew.]

Captain H. Porter sworn and examined:—

- Captain H. Porter.  
3 Sept., 1896.
467. *President.*] What is your name? Harding Porter.
468. You are master of a ship? Yes, the "Avonia."
469. Now in port? Yes.
470. We understand you have had at some past time a case of heating of coal cargo? I had a ship burnt up with me in 1875, but not from Newcastle.
471. You never had any heating with Newcastle coal? I never loaded here before. This is my first visit to Newcastle.
472. What coal was it? It was loaded in America. Cumberland coal they call it there. It is a semi-bituminous coal.
473. What was the name of the ship? The barque "Senator."
474. Did the cargo heat? Yes, it caught fire.
475. Will you kindly favour the Commission with a short account of what occurred? In those days we used to ventilate. I had a platform in my ship, and down ventilators connected with it. We took in wet coal for stiffening. It was raining heavily at the time. The coal was fine. I think it was having wet, fine coal and underneath ventilation that caused it to burn.
476. How long was she in loading? About eight days.
477. As far as you know, it was the fine, wet coal being exposed to the draft of air from the through ventilation that did the mischief? Yes.
478. You have no reason to suppose anyone left a light in the hold? No, that was impossible. The fire was in the main of the ship close to the ventilators. The ship had been eighty days out before we knew of the danger.
479. How was the fire discovered? The first thing we discovered was smoke coming up through the poop, and we found fire down below. We dug down and found the whole of the middle of the cargo afire. We discharged over 200 tons overboard, and kept filling in with water. At last it burnt out just at the water's edge, and we had to leave her in boats.
480. Was she a wooden ship? Yes; and half an hour after we came away she was all ablaze.
481. Is it your practice, in carrying coal cargoes, to use shifting-boards? Not with the ship I am now in. I would if I had a tender ship.
482. You are in a safe ship? Yes. Her stanchions are 2½ to 3 feet wide.

483. They are practically shifting-boards? Yes.
484. Have you been satisfied with the way in which the stevedores do their work in this port? So far, I am very well satisfied. He has only been working two days.
485. Do you personally supervise the trimming of the coal? Yes, I look every day. I tell him what I want done.
486. He has shown a disposition to meet you? Yes.
487. Is there anything about which you would like to inform the Commission? I think the way they have here of putting the coal into the ships is very bad, in having to drop so far.
488. What would you propose as an improvement? I would have tubs that would hold a ton or two, that could be lowered down into the hold.
489. A skip? Yes. In my own case now, the coal drops about 30 feet.
490. That is too far? Yes; when the first coal drops to the bottom it must be in a fine state.
491. You think that would increase the danger from fire? Very much so.
492. And also would diminish the value of the coal? Yes.
493. Would you, as a man of business, be prepared to pay a little more for the loading of the coal provided you could get it into the ship without breaking it? If I were buying the coal I should certainly prefer to have it in a large state.
494. You would be prepared to pay a little more? Yes.
495. Have you had any experience with patent methods of distributing the coal? No.
496. You suggest that the coal should be lowered in small quantities and gently? Yes; lowered into the hold. I should suggest as a preventive of fires that coal should not be shipped wet.
497. From your former experience you are inclined to think the wetness of the coal had something to do with the fire? It tends to heat the coal.
498. That is your impression? Yes; I have only my own impression.
499. There is a large amount of evidence taken before the English Commission on that point, but the Commissioners, I think, were not very certain of the intrinsic effect of moisture? I cannot say.
500. *Mr. Pittman.*] What is the name of the stevedore who is loading your vessel now? Sanderson.
501. A master-trimmer? Yes; I made a contract with him.
502. Can you recollect what time of the year you loaded the cargo of Cumberland coal in the ship "Senator"? I left in the middle of June.
503. It was in hot weather? Yes; very hot crossing the equator.
504. Especially at the time you were loading? Not so very hot then. It was in Spring weather, probably such as we have here now, perhaps a little warmer.
505. What was the tonnage of the coal? I think I had 1,600 tons.
506. Was the fire under the main-hatch when it broke out? Yes, and under the poop-hatch. It was in both of these places.

[Witness withdrew.]

II. Ford sworn and examined:—

507. *President.*] What is your name? Henry Ford.
508. What are you? Master stevedore and coal-trimmer.
509. How long have you been in that business? In the stevedoring business between twenty and 30 years.
510. Have you ever been a working coal-trimmer yourself? Yes; in Victoria. I have worked right through, in Victoria, Sydney, and here.
511. You take contracts to load ships with coal? Yes.
512. It is the business of the master of the ship to put his ship in position at the wharf? Yes.
513. It is the business of the crane contractor to hoist the coal on to the ship? Yes.
514. It is your business to stow the coal? Yes.
515. It is, I understand, a matter for the master of the ship whether he will employ shifting boards or not—it is not a question which comes before you? It is not left to the trimmer.
516. You are paid so much a ton for stevedoring? Yes; according to tender.
517. What is about the average price per ton? At the present time there are many prices—2½d., 2½d., 2½d., 3d., and 3½d.
518. What is, in your opinion, a fair average price? Between 3d. and 3½d.
519. And for that you can afford to trim a ship perfectly? Yes, properly; as it should be trimmed.
520. What, in your opinion, is the chief cause of faulty trimming? Taking the ship too cheap. When a man sees he cannot make anything out of the trimming he puts the ship under the crane and runs up every hatch. In so doing, he only has to employ about two men. When he gets the coal run into every hatch the ship is pretty well down to her mark.
521. He runs the coal into each hatch as full as it will go? As full as he can run it.
522. Before he begins to trim at all? Yes.
523. He only employs two men during that part of the process? Yes; when he comes to the main hatch of the vessel, where he should trim the body of the ship full, she does not take enough coal to fill her body up properly. They slum the ship by doing this. They cannot turn to and fill the body of her, else she would be below her mark.
524. You mean to say they put too much coal in the fore and after hatches? Yes; they run the ship up too much in those hatches by taking this cheap work.
525. They do not put enough coal into the main hatch to fill the ship properly amidships? No.
526. Is it not usual to fill the ship fore and aft? No; it is usual to fill the body of the vessel, and if you have any space left the coal should come from fore and aft.
527. It makes the ship sail better? It makes her safe.
528. What do you consider to be the proper way of setting about trimming? I consider to load a vessel properly you should put her under the crane at the main hatch; run up that hatch, and get it high enough to put your plates in; put on all the men you want to trim the ship and fill her body first.
529. Keep on filling in the main hatch? Yes, until you get the body of the ship practically full; then shift into the after hatch and put the ship down to her draught there; then go into the fore hatch and finish the vessel off.

Captain  
H. Porter.  
3 Sept., 1896.

H. Ford.  
3 Sept., 1896.

- H. Ford. 530. Is the process of building the wall in trimming a comparatively expensive one? It is expensive, because while you are building the wall you could be filling up; but the ship would not be so safe.
- 3 Sept., 1896. 531. Is the building of the wall a matter requiring skilled labour? Yes.
532. Nobody but a competent person is to be entrusted with that work? No. They should build walls in all ships. When you have built the wall you put the other coal up against it, and it is solid; whereas, if you have no wall, you throw the coal anywhere about the ship.
533. There are, I presume, plenty of competent trimmers available in the port? Yes.
534. There is no difficulty in getting them? No; not if you pay the wages.
535. What are the wages? One shilling and threepence day-work; 1s. 9d. night-work.
536. We have heard, and it has been corroborated, that sometimes the trimmers desire to work for twenty hours continuously? That lies with the employer.
537. Do you ever employ men trimming for twenty hours continuously? I have done it occasionally, such as at the time of the big strike before this, when there were so many ships under the cranes, and it was difficult to get men.
538. Is it a rule with the trimmers' Union that the men who begin the day-work trimming should have the privilege of getting the night-work? No.
539. Is there anything in the rules of the Union that would lead trimmers to desire to work for twenty hours on end? No. They are supposed to work ten hours, and then another shift comes on, which is relieved in the morning, if the ship takes thirty hours.
540. There is no doubt that some of the trimmers do work twenty hours? In the same boat.
541. What is the cause of that? Some of the bosses get a class of men and keep those men on day and night, instead of taking other men and relieving them.
542. Is it by the desire of the men or the masters that they are kept on? By the desire of the men as well as the masters.
543. The men employed like to have the advantage of the additional 6d. an hour? Plenty of them do.
544. You never employ the men like that yourself? I always give the men ten hours, and then put on another shift. If we cannot get trimmers we have to keep them on extra time.
545. It is not your practice to allow men to work more than ten hours if you can help it? No.
546. Are you of opinion that when a man has worked at trimming for fifteen hours he is in a condition to work any longer? If he does ten hours of trimming he is quite tired enough. He is not much good after that.
547. He is liable to be careless? Yes.
548. It is quite competent for a master to give that degree of attention he desires to the loading of vessels? Yes.
549. Would you be disposed to put any obstacle in the way of the master of a vessel who desired to superintend the trimming? It is right he should do so, and to send his officers down if he cannot be there.
550. Would your trimmers be disposed to resent the intrusion of any ship's officer? No.
551. We have heard stories of trimmers threatening to throw pieces of coal at ship's officers in the event of their interfering? I have never heard of it.
552. Did you ever hear a whisper of such a thing? No.
553. It has never happened in your experience? No.
554. You would give the captain or his officers every facility of inspection? Take his instructions, and trim accordingly.
555. You would consider the master was responsible for seeing his ship trimmed properly? Yes.
556. You know of no particular reason why he should not have the work done exactly as he likes? No.
557. There is nothing to prevent him getting the ship trimmed exactly as he wishes if he will only take the trouble to look after it? No.
558. Is it customary for the master or officers of a ship to take the trouble to see that the ship is properly trimmed? I have had several vessels where the mates have been sent down. I have had second mates sitting down below for several hours; go up and come down again and watch. At other times I have never seen an officer or captain down the hold.
559. I suppose a vigilant officer should certainly assure himself that the trimming was done properly? He should do.
560. There is nothing to prevent him doing so? No.
561. He would not be built out? No.
562. With regard to the method of loading from the cranes, evidence has been forthcoming to the effect that when cargoes heat they do so in consequence of the smashing of the coal into dust under the main hatch, owing to the practice of dumping the coal from a great height;—in your opinion, is it possible to make use of any of the contrivances in existence to avoid breakage? In Spencer's, I think it is, the coal falls on a very heavy iron plate and tumbles down below; and when they take the plate out you have to fill up the hatch just the same. I cannot see that this plan is any improvement.
563. Have you ever tried it? I have seen it tried.
564. Where working? At the Island.
565. Have any of these methods of distributing been tried by you? No.
566. You simply allow the coal to be dumped and then trimmed? Yes, but I do not believe in it.
567. What would you consider to be an improved method? I should propose that each colliery proprietor should have a certain kind of waggon made to carry 5 tons, and these small waggons should be lowered down to the ship's bottom.
568. Would waggons to carry 5 tons be small enough to be lowered? Say 4 tons. Some ships have very large hatches. I have a ship now where I lower the waggons.
569. How many tons are there in the waggons which you lower? The Wallsend, I think, run about fourteen to the 100 tons.
570. If the waggons were made to only carry 4 or 5 tons, you think that, in the majority of instances, they could be lowered into the fore and aft hatches? They could if they were not so long and broad, and were made a little deeper.
571. There would be the increase of cost for new waggons to be considered? Yes.
572. Would it cost more to load from such waggons? It would not make much difference, or but very little.

H. Ford.  
3 Sept., 1896.

573. Would it make much difference to the crane contractor? It would make a little difference to him. There are boxes used, two of which go to one waggon. They make a little difference in loading vessels.
574. More is charged for loading from boxes? I do not know; we charge just the same.
575. It would make no difference to you? No.
576. I understand the average price the crane contractor charges is one penny and a sixteenth per ton;—supposing the system you propose were adopted, would it increase the cost by a half-penny per ton? No; it would cost very little—it would cost about one-eighth.
577. The chief source of expenditure would be in the building of the waggons in the first instance? Yes. You can put what patent you like down the hold; the coals come on to it, and it causes smashing.
578. Supposing you loaded the wings with the distributor, what is to prevent your trimming the coal under the main hatch from the wings? If you trim the coal from the distributor into the wings, you would have to trim the wings into the main hatch again.
579. With regard to Harper's appliance, is that a feasible one? Not in all ships.
580. In what sort of ships could it be used? It would be feasible in ships with open 'tween decks.
581. In iron ships? Many iron ships have close 'tween decks.
582. So that that method might be adopted in some ships and not in others? Yes.
583. It seems to me that it would save breakage to a considerable extent? It would. It would cost more, because you would have to trim back from that under the hatch again.
584. You charge about 2½d. a ton for trimming? I never do a vessel under 3d. a ton.
585. Supposing you had to trim with an arrangement of that sort, what would you charge? It would cost, I suppose, another half-penny per ton to trim the coal back.
586. It would improve the quality of the coal somewhat? Yes.
587. Do you suppose it would improve the quality to the extent of a ¼d. a ton? I should think it would, and also make more work for the trimmers. If we had waggons that could be lowered until we came up to the hatch, and then put in our plates, that would save the coal.
588. Is there any reason why open hatches should not be made in the 'tween decks? They should all be open, not only for the trimming, but for the men in case of accidents.
589. As a means of exit? Yes. I have seen vessels run into while loading at the dyke. Speaking of fires, I can give you a little light on the subject. Vessels come here with general cargo and put it out on Queen's Wharf. She is then ordered down to the cranes, and has to leave perhaps in a hurry, so as not to lose her turn at the dyke. I have seen cases where the holds have not been properly swept up, and they have all sorts of rubbish and bits of matting swept under the keelson, and there it lies. This old matting, I think, is a great cause of many ships catching fire.
590. Does every ship have old matting in her? Most of them, and bits of wood from the cargo of the ship. I always get the captain to have the lower hold properly swept up. In taking coals out coming from home there may be a certain amount of English coal down the fore peak, and I have asked the captain to have it shifted. Leaving it there so long, and putting our Newcastle coal on top, is likely to cause fire.
591. Why? Because it has been lying there so long.
592. Does that make it more likely to catch fire? The longer the coal has been lying the more likely it is to catch fire.
593. That is your impression? Yes. English coal is very gassy, and our coal is not.
594. *Mr. Pittman.*] If it has been lying there so long, would it not have had time to get rid of its gas? Not if it had been covered up.
595. What is the depth of the present waggons? Somewhere between 6 feet and 6 feet 6 inches.
596. Does it not occur to you that a great deal of the smalls that find their way into the hold of a ship are produced from the coals having to fall into these deep waggons? Yes; it would certainly break the coals up.
597. If you increased the depth of the waggons there would be a greater quantity of "smalls" before the coal got to the ship's side? Of course, the lower you drop it the more it would break.
598. In some collieries they make the sides of the waggon as low as possible to prevent breakage;—to increase the depth of the waggon would be bad, would it not? Not for the fore hatch. Supposing you took the wings of the waggons off, and made the sides square with the bottom, they would then hold about 3 or 4 tons.
599. To make the sides perpendicular? Yes.
600. Coal falling down an inclined plane is not so liable to breakage as when it falls perpendicularly? No.
601. To make the waggons higher would increase the quantity of "smalls" before they got to the ship's side? I do not think it would increase it much.
602. *President.*] Have there been any accidents to the ships which you have loaded? No, sir.
603. None of the ships loaded with coal by you have suffered from heating of cargo or shifting of cargo? No.
604. How many have you loaded? A good many.
605. A suggestion has been made as to whether it would not be a good plan to license the master stevedores such as yourself? I believe it would.
606. Would you make it so that the license could be easily obtained by anyone having sufficient experience in the business? Quite right.
607. And do you think it would be a good plan to take the license away from anyone when the ships loaded by him met with more than a certain percentage of accidents? Yes.
608. That would give the stevedore a definite interest in loading the ships properly? In making him look after his work as it should be. There are men working on the wharfs as labourers who have never trimmed coals in their lives. Some of them have cards printed and introduce themselves to captains as stevedores. The agents at this port know who the stevedores are, and should recommend them to the captains. The first thing you are told when you go into an office is that the cheapest man gets her, and then when you have taken a contract, you contract 2 per cent. of the ship's cargo for nothing.
609. You contract 2 per cent. for nothing? The ship has to carry 2 per cent. on her cargo for wear and tear of discharging. They reckon they lose a certain amount taking in and putting out. It used to be 2½, but I believe it is 2 now, because I have had it stopped off in a contract.
610. Supposing you trim 100 tons of coal, do you mean to say that you only get paid for 97½ tons? Yes; it

- H. Ford.  
3 Sept., 1896.
- it is 2 per cent. now. These stevedores, as they call themselves, are allowed to be employed by the agents, who let the captains take them, and they do the work cheaper. I consider it is the agents' duty to point out to the captains who are the proper stevedores. At the time of the last inquiry, about three years ago, when a ship was lost, Mr. Finch, of Wallace's office, said that the boss trimmers were not paid sufficiently to do the work. Mr. Finch was the self-same man to ask me to cancel my agreement with the "Inveruie." He offered me £5 to cancel my agreement with the captain of that vessel. I was getting 3d. per ton for the trimming of her, and he said he could get it done for 2½d., all baskets and gear being found.
611. What are the baskets for? To put out the captain's ballast at the ballast wharf or into lighters. A set of baskets would cost £2 16s. I said "No." I was doing the sister ship at the time, the "Inveramsey." I think it is nearly time the stevedores had some protection.
612. Do you consider the trimmers themselves are paid sufficiently? I always make it a practice to pay the trimmers what they ask. At one time Mr. Russell proposed to take the hatch away from the men.
613. What do you mean by that? The meaning of that is—an empty vessel comes under the crane and you run that hatch up. You only want one or two men to run it up before you put on your full gang of men.
614. What do you mean by taking the hatch away? Say you put the ship under now. The trimmers would allow you to run up that hatch. As soon as it is loaded up the full body of men go on. Mr. Russell wanted to take that hatch away from the men so that he could run up the three hatches before he put the men on.
615. So that he could do what you explain as bad trimming? Yes.
616. When did that custom introduced by Mr. Russell come into force? About three years ago.
617. To sum up what you say, you consider the trouble has arisen from under-cutting in contracts, the stevedores not being able or willing to do good work at the price? Yes; they cannot do the work for the money. It is a matter of impossibility.

[Witness withdrew.]

J. Gallagher sworn and examined:—

- J. Gallagher.  
3 Sept., 1896.
618. *President.*] What is your name? James Gallagher.
619. What are you? I have been a coal-trimmer for about thirty years.
620. As a working trimmer? I was only a working trimmer for two years. I have been twenty-nine years as a stevedore.
621. Are you a stevedore now? Yes.
622. Are you actually in work now, or have a ship loading? I have not a job on hand to-day.
623. What price do you consider a fair thing to take a ship at? It all depends on the class of ships to begin with.
624. What do you consider a fair price? I am well acquainted with the prices that are paid. I consider the men that are trimming vessels are getting a remarkably good price.
625. What is a fair price? Threepence a ton for the English iron ships, 3½d. or 4d. for American vessels.
626. Wooden vessels? Yes.
627. Have you ever known any cases of bad trimming? For the last five or six years, I have been bothered all the time about bad trimming. It has been rung in my ears about vessels going out of this port with bad trimming.
628. Have you ever seen a vessel start away badly trimmed? Dozens of them.
629. What do you consider constitutes bad trimming? In the first place, a vessel, we will say, of 2,000 tons burden or measurement, according to her build, comes into this port. She is supposed to carry 4,000 to 4,300 tons of coal. She takes portion of her ballast out, and is brought to the cranes. The stiffening coal of that vessel will be from 1,500 to 2,000 tons, with only one man employed.
630. Two thousand tons of stiffening coal? Yes; one man is not sufficient for that quantity of coal. After she receives that 2,000 tons, she goes back to the ballast wharf, and takes out the balance of her ballast. She is brought again to the cranes, and that vessel will have 2,900 to 3,000 tons of coal in her without any labour.
631. Is that method customary in the port? Stevedores have made it customary.
632. Do they put the coal as far as they can into each hatch? Until it gets to the top of the hatch.
633. They do not start to trim until they get each hatch filled up? That is where they make the mistake.
634. The effect is to make a cheaper job for the stevedores? Yes; most decidedly.
635. Supposing the captain of the ship was up to his work, and said he would have it done properly, would the stevedores resist? Captains seem to take no interest in this matter, nor the officers. I consider the captain should instruct his officers to pay attention to the loading of the coal cargo.
636. What is the reason why they do not; is it on account of ignorance or carelessness? I do not know. That is where the bother lies. The captain should be responsible, personally, for his own vessel.
637. You say he pays no attention? No.
638. It has been suggested that occasionally captains agree to keep out of the way for some pecuniary consideration? That is quite correct.
639. Have you known of such a case? Many of them. I have never done it myself. Captains do shake their hands on three or four sovereigns for that purpose.
640. The less the stevedores are interfered with by the captain the more they can make on the contract? Yes.
641. Would it be of advantage to license stevedores? The work would be done no better.
642. Can you suggest any way in which it can be ensured that the work will be properly done? By having a competent man. Coal-trimming requires bone and sinew. There is no art or science in it. It requires a competent leader to carry that work along.
643. The master will naturally give a contract to the man who will do the work at the lowest price, provided it be done well? Decidedly.
644. Supposing a master gives a contract to an incompetent stevedore, what can be done? His work will be done far better than if he gives it to a good man as a rule.

J.  
Callaghan.  
3 Sept., 1896.

645. You mean to say the work is done better by incompetent than by competent stevedores? I am positive. An incompetent trimmer does his work to gain the favour of the captain on the return voyage. The good man, as soon as he receives the captain's cheque, does not care whether she returns or not.
646. You mean to imply there is a ring of good men? I do. I am not a man that belongs to the Stevedores' Association. I am one of the best men in New South Wales as far as coal cargoes are concerned.
647. There is a ring formed lately among stevedores? Yes; it is a ring of seven among fourteen. If you go to any of the agents connected with vessels in this port that have gone out coal laden, and look over their books, you will find that James Russell has lost four ships out of six; Taylor and McNeil, two out of six; Hans Bertrand, three out of six; Marsden, two out of six.
648. You are on oath? It can be proved by the books of the agents.
649. Your opinion is, I understand, that there is an association of stevedores who are chiefly responsible for the loss of ships? Yes; I mean that.
650. Can you suggest any way in which they can be persuaded to do their work better? The only suggestion I can make to better Newcastle as a coal port is that captains of vessels should instruct their officers to pay attention to the loading of their vessels, and not leave it in the hands of men that the skippers employ.
651. It would be competent for any officer, if he took the trouble, to assure himself that the ship was properly loaded? Yes.
652. When the ship is not properly loaded, it is primarily the fault of the officers? That is quite right.
653. *Mr. Pittman.*] You said just now that if stevedores were licensed it would not improve matters? Not at all.
654. Supposing the license were arranged so that when more than a certain number of vessels were lost loaded by a certain stevedore, he should lose his license;—would that do good? That would be a very good cure. But now this agitation has been going around Newcastle for the last six or seven weeks, you will find there will be no more vessels lost. They are very particular now.
655. *President.*] They are getting very particular? Yes. I have found out they have been doing the right thing, which they have neglected for years past—not filling the body of the ship.
656. I thought the body of the ship ought to be filled up? They never fill them. An iron ship can take her cargo and go down to her water-line, with lots of space, and stevedores know that. In the main body of the ship, where they ought to be trimmed, the master-trimmer says to his men "come out of that, you are only wasting time, there is plenty of room in her." They know the ship has plenty of room and they need not be particular about filling up.
657. The cargo of coal to be put on board, will not fill the ship? They know that, and they are not going to waste money.
658. Do you know of any specific accident that has occurred when such a thing has happened? For over twenty years I have watched it, and stevedores will say "come out of that, we cannot waste time, there is plenty of room in her."
659. And they have to come out? Yes.
660. Then that coal may not be trimmed at all? They leave room for 25 tons on each side of her body. They do not allow the trimmers time to trim her.
661. With regard to the question of heating of coal cargoes? Heating of coal cargoes! I will call it burning of coal cargoes, and I can prove it. Here is a coal trimmer's candle-stick [*witness produced a trimmer's candle-holder, and described the manner in which it is fixed in the vessel during the progress of trimming*]. When the candle burns down, it falls and rolls over. That candle will burn and the coal over it will catch. I have witnessed it, and put it out. That candle will burn for twenty-five to thirty minutes. That bit of candle is the cause of fire.
662. Have you seen it yourself? I have had three ships fire.
663. Mention them? A barque called the "Eversham," twenty-five years ago, Captain Williams; the next, an American barque, "Wealthy Penalton," Captain Penalton; the other's name I forget.
664. Did you see the candle fall on board the ship whose name you forget? I did not see it fall, but it fell.
665. How do you know? By the smoke that arose to the surface.
666. You knew the coal was on fire? When we noticed it we had a bucket of water and applied the water to it.
667. You noticed the coal was on fire, and you assumed it was due to the candle, but you did not see the candle in this case? It was there I am positive. Something between January and February recently, the "Dayspring," a missionary vessel, came in about the same time as the "Ellen A. Read," for 260 tons of South Wallsend coal for her own consumption. In taking in those coals, the candle fell.
668. Were you on board? No; I was not on board. The candle fell and no person noticed it for a while, but they saw the smoke rising, and when they looked they saw through the cracks of the coal that they were afire and well burning. They brought a bucket of water and put it out.
669. They got the fire under satisfactorily? Yes.
670. *Mr. Pittman.*] Did you ever hear of a case of coal cargo heating and not bursting into flames? Not Newcastle coal.
671. Did you ever hear of the case of the "Knight of St. Michael"? Yes, Wallsend coal; but I never believed a word of it.
672. If I tell you I saw and tested it, would you say you did not believe that? Practical knowledge and science are two different things.
673. If I tell you I tested that cargo and found it heated? It was not from the coals. It was from a lighted candle.
674. There was no candle there;—there was no fire at all? Something wonderful for Wallsend coal to be on fire. Sometimes you can smell or pick a piece up of what the miners use for blasting. You can smell the powder.
675. Such heating might occur, although you have never heard of it? I remember some seventeen or eighteen years ago there was a vessel that was supposed to be on fire. I maintain that Newcastle, New South Wales, coals are not those which catch fire by themselves.
676. *President.*] Can you mention some ships which have come to grief from bad trimming? I cannot exactly

J.  
Callaghan.  
4 Sept., 1896.

- exactly mention names. In the agents' offices—Mr. R. B. Wallace's and Mr. Stokes'—they would have all those vessels. I can give an instance. The "Indian Empire" left here some eight or nine months ago. The letter said she was thrown on her beam ends, and it took twenty-one days to right her. The letter was a private one from a friend to a friend in Newcastle. The agents of these vessels should be the best persons to give the information as to vessels lost, and as to who trimmed them.
677. Are the working trimmers likely to slum the work in spite of the stevedores? They never slum the work. They do the work fair, if the stevedores help them.
678. So that the fault lies with the stevedores? Yes.
679. You said something about a ring; for what purpose is that organisation? It is only four weeks old. Probably you have heard of a deputation that waited on Mr. Reid to ask him to license stevedores.
680. What is the object of the association—to get certain people registered? Their object is this; there are seven in and seven out, and the seven in say, "We will get it all and leave the others."
681. It is an association for business purposes? Yes; to carry on bad trimming.
682. You surely cannot mean that? It is an association to carry on bad trimming.

[Witness withdrew.]

FRIDAY, 4 SEPTEMBER, 1896.

[The Commission met at 2:30 p.m. at the Custom-house, Newcastle.]

Present:—

PROFESSOR RICHARD THRELFALL, M.A., PRESIDENT;

And EDWARD FISHER PITTMAN, Esq., A.R.S.M.

Captain R. C. Perry sworn and examined:—

Capt.  
R. C. Perry.  
4 Sept., 1896.

683. *President.*] What is your name? Robert Charles Perry.
684. You are master of the "Ellen A. Read"? Yes.
685. How long have you been so? About five years master of that one ship.
686. Have you ever had much trouble with the heating of coal? The cargo took fire.
687. How long ago? About the 1st May I put back. I arrived at Sydney on the 3rd.
688. When did you load? We finished loading about the 28th April. I have not the date with me; say the 30th April.
689. What was the first sign of the fire that you discovered? Smoke coming out of the forward ventilator, near the main hatch.
690. What steps did you take? We put water down the ventilators. The fire was getting worse, and I bored holes in my deck and flooded it, and the water ran down. That checked the fire a great deal.
691. You did not stir up the coal, or try to throw any overboard? We could not do that. We could not get at it.
692. You simply poured water down? Yes, the best way we could.
693. What coal was it? West Wallsend.
694. Was it a good quality of coal? That I have no way of telling.
695. Was it large coal? Large before they put it in, but it was fine when we got it up.
696. Was the coal dropped in when being loaded? Yes; they dropped the coal from the top of the hatch.
697. Who was the stevedore? Taylor and McNeil.
698. Did you pay any attention, personally, to the stowing? I was there all the time. I was not down the hold.
699. Had you any officer down in the hold? The mate was down occasionally.
700. It is part of your duty to see the ship properly stowed? We can hardly tell about that. We have to leave that to the stevedores. We do not know how to train coal. There are very few ship-masters who know how to stow coal.
701. I presume most ship-masters would know if the ship were filled? Very few ships can carry full cargoes.
702. You see whether the ship is full where she ought to be? Full amidships is the proper thing. My ship is steady if we fill amidships.
703. Your officer saw that was done? Yes; it was done to my satisfaction.
704. The stevedores have always been quite willing for you to see everything that was going on? Yes.
705. Always willing to put the coal where you wanted it? Yes; it is my duty to see that the ship is trimmed properly, whether the stevedore likes it or not.
706. Where do you think the fire broke out? Somewhere a little forward of the main hatch.
707. Not immediately under the main hatch? Anywhere within 8 or 10 feet forward of the main hatch.
708. You can say distinctly that the fire did not break out immediately under the main hatch? Yes; I am quite sure it did not exactly under the main hatch.
709. What was the distance from the main hatch? About 5 feet forward of the main hatch.
710. You were not burnt aft of the main hatch? No; nor under it.
711. You are quite sure it was not under the main hatch? Not exactly. At the same time, this fine coal runs several feet fore and aft of the main hatch.
712. You consider it broke out within 5 or 6 feet? It is impossible to tell exactly.
713. Still, it was in such a position that small coal could have run that distance? Oh, yes.
714. Have you ever had any previous experience of coal catching fire? No; not of that kind.
715. What was the weather like when the coal was taken in? Some wet; but mostly fine.
716. Still the coal was somewhat damp? Yes; one or two days we had damp weather.
717. The coal was neither very large nor very small, I suppose; it was ordinary coal? Yes, the usual size; but we do not take particular notice about that; we seldom do; but large coal is better.
718. Did you take the temperature at all before the coal heated? No; I did not.
719. Do you make provision, as a rule, for taking the temperature? No; I never had a ship heat before.

720. Did you form any idea as to the cause of the outbreak? My opinion is that the coal was loaded too quickly from the mines. It was at the time of the strike, and she was loaded very quickly. The drop of the coal is too far.

721. Did you ever before get a cargo direct from the mines? No; I cannot say I have. I have no way of knowing.

722. *Mr. Pittman.*] Did the fire break out in the whole coal in your ship? No; it did not.

723. What evidence have you of that? Our surveys fore and aft.

724. It was told to us that the fire broke out in the large coal—the whole coal? I could not say that. It was just forward of the main hatch, where there were lots of fine coal.

725. You think it possible the fine coal produced by dumping ran along? Yes.

726. There was no evidence at all to show the fire was in the whole coal? No; the drop would amount to 25 to 30 feet. When you drop coal 30 feet and there were 1,000 tons down that hatch, you can judge for yourself what it is like. In Cardiff they have square boxes holding about 4 or 5 tons, which are lowered by a crane into the bottom of the ship.

727. Please describe what they do at Cardiff? They let the coal from the top of the jetty into a shoot. They have a box holding about 4 or 5 tons, which is lowered by a crane from the shoot down to the bottom of the ship, or nearly so, and the coal is let out at the bottom of the box. They do this until they get a certain quantity into the ship.

728. Is the crane by which they lower the box stationed on the wharf? Yes.

729. *President.*] It is a combination of crane and shoot? Yes.

730. The coal must first be taken from the trucks and put into the shoot? The trucks are hoisted on to the jetty, then run out into the shoot. At the end of the shoot is the box, which is filled and lowered down. They can stop the run of the coal in the shoot.

731. And when they get the coal a certain height in the ship? They leave the boxes and shoot it in.

732. What is the maximum drop that they give the coal in Cardiff? I do not know. I could not say exactly.

733. Do they drop it 10 feet? It does not drop more than 7 or 8 feet from the shoot to the box.

734. And when they give up the box? It drops 10 or 15 feet.

735. Does it take very much longer to load the coal in that way? We do not use it, perhaps, more than a day.

736. It probably does take a little longer? Yes; it does.

737. Can you inform us where we can obtain particulars of this method? Not unless from Cardiff.

738. Who are the shippers there? Cory Brothers are large shippers there. I loaded with Wilson, Son, and Company the last time.

739. In your opinion, is the method you have just described a satisfactory way of loading coal? Yes.

740. You think it entirely satisfactory? As regards saving the coal from being broken up. I like the way of loading here better than at Cardiff. There is only one objection—the breaking of the coal.

741. It is rather more expeditious? I do not know that. It is cleaner than in Cardiff. They screen the coal as it goes into the ship.

742. *Mr. Pittman.*] They screen it underneath the shoot? Yes. Your deck is covered with fine coal, and you have to stop and wash it down.

743. Do the same arrangements exist at other places? Mostly all are on the same principle. There may be a little difference. They all shoot it down, both at Berry and Cardiff.

[Witness withdrew.]

Mr. J. M. Hyde, sworn and examined:—

744. *President.*] What is your name? John Mullen Hyde.

745. And the nature of your business? Shipping and colliery agent.

746. How long have you been in that business? A little over twenty years.

747. In Newcastle? Yes.

748. Have you had any experience outside of Newcastle? No.

749. Has any case of spontaneous combustion or explosion ever occurred on any of your coal-laden ships? Not that I am aware of.

750. That is with ships loaded with coal from the Stockton, Wickham and Bullock Island, and Greta collieries? No.

751. No cases of spontaneous combustion or heating? No.

752. Nor of explosion? Not that we have heard of.

753. Have you had a case of cargo shifting, or, at any rate, vessels loaded with these coals reported missing? I think there is one missing, the "Suakim." She was posted as missing.

754. She has never turned up? No.

755. How long ago is that? Some eight years ago.

756. Do you remember what stevedore loaded her? I do not.

757. Where can I find that out? From the shipping agent's office.

758. Who was the agent? I think R. B. Wallace.

759. Is there a general office where such information can be obtained? No.

760. Is there no office in which information is recorded as to the names of the ships and the agents, &c.? Yes; you can find out from the Custom House.

761. We could then discover from the agents the names of the stevedores? Yes.

762. Though you have not had any experience of casualty with your own ships, I presume you have taken some interest in the matter of missing ships? I have noticed they have been missing one way and another.

763. Have you formed any idea as to the heating of coal cargoes? Yes. My opinion is that coal that contains a good amount of pyrites is more liable to combustion. That is where it is dumped down and broken up and gets wet.

764. In regard to pyrites, is your opinion derived from something you have read or been told, or is it from your own experience? We notice that ships which contain such coal are the ships which meet with accidents.

Capt.  
R. C. Perry.  
4 Sept., 1896.

Mr. J. M.  
Hyde.  
4 Sept., 1896.

- Mr. J. M. 765. Which collieries send out coal containing a large amount of pyrites? The West Wallsend, Wallsend, and Brown's.  
Hyde.
- 4 Sept., 1896. 766. Are those the collieries which have led to the greatest number of accidents? I think you will find that that is so.
767. Do you know of any analyses that have been published of the coals coming from the various collieries? Yes.
768. Where are they published? I have a list of them now.
769. So that you have a definite reason for stating that those coals contain more pyrites than others? So far as we know, by looking at it.
770. Does not the analysis tell you? No.
771. If it is a complete analysis, it should mention the amount of pyrites? They are pretty well all the same; there is very little difference, but in the coals themselves there is as much difference as night from day.
772. If one coal contains more pyrites than another, it must on analysis yield a greater percentage of sulphur than the other? I avoid analyses. You find companies pick out a decent piece of coal for the purpose.
773. So that the published analyses are incorrect from bad sampling? I think so.
774. And that, though the analyses published do not show that the West Wallsend and Wallsend coals contain an excess of sulphur, you, nevertheless, believe they do? I think so; they only show a trace in the analyses.
775. You have noticed that those coals have led to trouble? Mostly those coals, with an occasional cargo from one or two of the other pits.
776. Do you mean that you have come to the conclusion that pyrites has something to do with the accidents? I think so.
777. You argue from the accidents to the pyrites, not from the pyrites to the accidents? Yes.
778. You are aware, of course, that a large amount of investigation has been made in regard to the influence of pyrites? In what respect?
779. As to its tending to increase the liability to spontaneous combustion? Yes.
780. All experiments, so far as I know, which have been made, have given a negative result—showing that pyrites has had little to do with it? I have never seen that.
781. You have no definite analytical information to set up against the experiments I refer to. It is a matter of impression with you? Yes.
782. We have heard something about trimmers leaving candles among the coals—is that within your knowledge? I have heard, in the case of a steamer, some years ago, that a candle, supposed to be fastened to the mast, was left when trimming, and that four or five days after the steamer got to sea, it was found to be on fire. There was smoke issuing out round the mast, which was a wooden one. The coal was Newcastle coal.
783. What was the name of the ship? The "Easby."
784. They were not able, I presume, to trace the fire precisely to the candle? They put it down to the candle being left there.
785. How did they know that the candle had been left? I do not know. That was the report that got about at the time.
786. Was any man's name associated with the occurrence, particularly? There was a man accused of it—one of the trimmers.
787. I presume he denied it? Yes.
788. It could not be brought home to him? It would be no use pursuing the matter. He may have left it there by accident.
789. It is not very difficult to make a mistake of that kind? It is easy enough; men scamper out in a hurry at the last moment.
790. And forget their candles? They are very apt to.
791. Do you think, that even supposing a candle were left, it would be sufficient to set fire to a cargo of coal? It seems hardly likely, unless there was something else to assist it.
792. Did you ever see a candle set fire to a lump of coal? It depends on what coal it is.
793. Any kind of coal. Supposing you wanted to light a heap, do you think you could do it with a candle? Yes; you can light a bit of Western Australian coal with a match.
794. Could you do so with Newcastle coal? I have never tried it.
795. Do you think you could light it with a candle? I do not think it.
796. Even under the most favourable circumstances? Not with a candle alone.
797. Mr. Pittman.] Who were the analyses made by that you refer to? By Messrs. Dixon, Abel, Watt, Liversidge; mostly by Mr. Dixon.
798. None of these show more than a trace of sulphur in the coal? Nothing more than 1 per cent.
799. That is getting into big quantities? [No answer.]
800. President.] Have these analyses been prepared to the order of the colliery proprietors? By the various companies, and have been collected from them at different times.
801. Mr. Pittman.] The samples were collected by some officers of the collieries? It would be taken by some of the officers and sent down to the Government Analyst.
802. President.] Can you give us any information as to the cause of the shifting of coal cargoes? It is in the trimming.
803. Tell us why you think the cargoes shift? I think a good deal is due to not having shifting-boards, and to bad stowing.
804. Do you think shifting-boards essential? I think so, and the majority of captains I have asked about them have been of opinion they should be used.
805. Either in wooden or iron ships. Some ships seem to require them more than others? It depends upon which way they are going to trim the ship.
806. Are shifting-boards of advantage in iron ships? Yes; a great benefit.
807. The use of shifting-boards depends, I understand, upon the captain of the ship; the trimmer has nothing to do with it? No.
808. How is it that trimming is done badly;—it seems so easy to trim well? I consider you ought to have

have someone to supervise the trimming. A trimmer takes a contract for a ship, and there is nobody to look after him.

809. Why does not the master of the ship look after him? He has to be on shore on business.

810. What has he to do? He has so much to look after. Some captains see the ship trimmed.

811. There is nothing in the operation of trimming to prevent a captain or mate from seeing that the ship is properly trimmed? Nothing to prevent him. Many of the trimmers will scamp the work if they get the chance, unless they are looked after.

812. They would not prevent the officers of the ship from looking after it? I do not think so.

813. In your opinion, then, the captains have no excuse for not doing so beyond that they are busy on shore? Yes.

814. Is that a valid excuse? It is in some cases.

815. From your experience, as a shipping agent, you can see that many captains are too careless, too reckless to trouble themselves about it? I would not put it as strong as that. They may be wanted ashore, and have to look after other business.

816. If you owned a ship, and you found the captain did not attend to the trimming, would you describe his conduct as careless? Certainly.

817. You would propose to remedy that by having some method of inspection? Yes; there should be somebody to supervise the ship.

818. Somebody in the employ of the Government? An independent man.

819. How many such persons would be required for the port of Newcastle;—you would want one almost for each ship? He could go backwards and forwards. It would take him all his time to look after a couple. They are working night and day.

820. How many ships are loaded at once? Sailing ships—on an average, seven or eight.

821. It would need four or five inspectors, at all events? Yes.

822. What sort of payment do you think would be requisite to secure competent inspectors? I should say you would want one head man, and he should have three or four under him.

823. Can you give us any idea for what a reliable man could be obtained for the purpose? I could not say.

824. Unless an inspector were well paid, he would be subject to continual temptation to take bribes from the stovedores? He would be open to that.

825. The inspectors would have to be given definite powers, would they not? Yes; you would have to give them full power.

826. Would that supersede the captain in the command of his own ship? I should say they should consult the captain, and he would tell them how he wanted his ship loaded.

827. They would take the captain's work off his shoulders? Yes.

828. In the event of the captain declining to have them on his ship, what would you propose? It depends upon the law. They could only go on a British ship.

829. Who should defray the expense of these inspectors? I do not know.

830. Will the coal trade bear an extra 1d. per ton? I do not think it. I should think it would be for the insurance offices to do it.

831. In your opinion, the insurance offices should have to bear this expense? It would pay them to do it.

832. Why do they not look after the loading now; is there anything to prevent them? I do not think they could have the power at the present time unless an Act were passed.

833. Have they ever tried to have any supervision? Not that I am aware of.

834. It does not look as though they wanted it? No.

835. Do you think that some stovedores intentionally slum their work? There are good trimmers amongst them and bad. I would not let some of them on board a ship.

836. Is the price paid for trimming so low that it is impossible for men to do a good job? It has been good lately. A man takes a contract, he knows what he has to do, and should be made to do it. I do not believe if the price were raised to any extent that you would get any better trimming done. They would simply benefit themselves. They would slum the work just the same whatever the price.

837. Is 3d. a ton a fair wage for trimming? It entirely depends upon the ship. It ranges from 3d. to 3½d, unless the ship has 'tween decks right through.

838. A witness has told us something about a ring of trimmers in Newcastle—can you tell us anything about it? I do not know that there is any special ring. They put in a tender for a ship and get as many as they can. They do not divide them. It is every man for himself. If one man could get all the ships he would take them.

839. Did you ever receive a tender yourself so low that it would be impossible for the work to be done honestly? I have a line of steamers, and I am sure the men cannot make much out of it. The tender is too low.

840. Do you supervise the trimming thoroughly? The captain and mates always look after it.

841. Have you had good supervision? We have often had to jacket them for not trimming properly, but officers and others can make them do what is wanted.

842. It is in the power of the officer if he is willing and anxious to get the ship properly trimmed? Yes.

843. What would be the effect of licensing trimmers? You would get ships properly trimmed and good trimmers to undertake to do the work.

844. Is trimming a difficult thing? The trimmer puts in at a low rate, and employs a lot of men not fit for the work—not workmen at all. There is a good deal of that going on.

845. You think licensing would have the effect of securing, at all events, competence on the part of the trimmers? You would get good men. Make them pay so much for it.

846. Pay a fee for the license? Yes; they are well able to pay it.

847. What would be the object of a fee? You would get reliable men then—men fit to undertake the work.

848. In the event of a ship meeting with an accident owing to the trimming, would you consider it expedient to withdraw the license? For bad trimming, I would cancel the license.

849. In the event of a ship being lost, you could not say positively that the cargo had been badly trimmed? You cannot account for all ships lost by bad trimming.

850. You would advocate supervision and licensing of the trimmers? Yes.

Mr. J. M.  
Hyde.

4 Sept., 1896.

- Mr. J. M. Hyde.  
4 Sept., 1896.
851. We have heard that some of the men employed in trimming work twenty hours on end? I have known them work thirty.
852. What is the reason for such an extraordinary thing? It was the time of the strike. They went right through the ship, and some men were there thirty and thirty-two hours. They started at 6 o'clock in the morning, and were finished by dinner-time the next day. They would get an hour or an hour and a half's sleep on deck while the hatches were being run up.
853. Is it the wish of the Union that the men who commence the ship should go through with it? I do not think so now. Usually they work twenty-four hours if the ship has to work at night.
854. Is it their own wish, or the wish of the employers? It is the wish of the men.
855. The object being to get the extra pay for night work? Yes.
856. You are of opinion there is considerable laxity in trimming? Yes.
857. That laxity is due to want of supervision by the captain and ship's officers? Yes.
858. That the master trimmers have a distinct monetary interest in slumming their work? Naturally.
859. That a remedy can be provided by efficient inspection in the hands of Government and by the issue of licenses to duly qualified persons? Yes.
860. With subsidiary regulations? Yes.
861. Do you think the coal trade would stand any increase in the cost of loading coal? I do not think it would. They want a reduction.
862. Coal, I suppose, costs to produce at the mouth of the pit some 4s. or 5s. a ton, does it not? It varies a good deal.
863. Four shillings or 5s. would not be out of the way as the cost of coal per ton at the pit's mouth? Over 6s. in a good many pits.
864. The coal costs to win some 3s.? 2s. 11d., I think—2s. 10d. or 2s. 11d.
865. Mr. Pittman.] So that the colliery proprietors are losing money? We are losing money at Stockton now.
866. President.] What do you sell the coal at? 9s., less 2½ per cent.
867. You sell it at 9s., and I understand it only costs 6s.? In some cases. The Stockton costs 9s. Ours comes to very nearly 9s. when we have finished with it. We only made a few hundred pounds last year, as you can see by the balance-sheet.
868. It looks as if in most cases there should be a good profit, and as if an extra expense of 1d. per ton would not make much difference? I think the traction is too high now.
869. Mr. Pittman.] Do you not think the coal trade could be loaded with another 1d. a ton;—do you mean to say there are no collieries to stand it? They are not making any profits now.
870. In some cases it would be possible? In some pits. You could not put it on them and not on others.
871. President.] Do you mean to say an extra 1d. a ton would shut up some pits? They are making nothing at it now. We do not clear a penny.
872. Supposing it might be shown that by incurring an additional expense of 1d. a ton, you improved the loading of the coal, do you think the coal trade would be able to struggle on? The Commissioners undertake to ship the coal, and they do not ship it; they sling it in.
873. Do they enter into a contract? Yes; to bring the coal from the colliery and ship it.
874. You think the present method of loading is not satisfactory? Well, I do not see how you can improve it, except they insist on lowering the waggons. Lately they do it sometimes, but at night-times they never do it.
875. A fall of 20 feet must be injurious to the coal? Yes.
876. Would the coal be more valuable to the steamers if it were not smashed? Certainly.
877. Do you think the dumping smashes it? Yes.
878. Do you think it deteriorates in value by 1d. a ton by the smashing? It would if going into a yard, where it is screened and they can only sell the large coal, but not where it goes right into works where it is wanted.
879. So if it were not smashed up, the coal merchant would make more money? Yes.
880. But if you were supplying steamers, it would not make much difference? It would make no difference.
881. Do you think that if it became customary to treat the coal better, so as to keep it in a larger condition, your customers would be willing to pay another 1d. a ton without thinking they were being hardly used? I do not think they would pay anything further. They would think it would make very little difference. They would put the price on to others.
882. They would pass the increased cost on to someone else? Yes.
883. It would make no difference to them? No.
884. Do you know of any improved method of loading which you could recommend? I know this, the companies would never go in for smaller waggons.
885. Why not? Because they have their own rolling-stock.
886. Mr. Pittman.] Does that rolling-stock belong to the companies? Yes.
887. President.] It would involve too great an outlay to alter the rolling-stock? Yes.
888. What is a waggon worth? I suppose about £60 or £70 each, for iron waggons. You might have 400 of these.
889. I suppose the new type of waggons proposed would cost about something the same? Yes; you would want more.
890. You are not able to recommend any improved system of loading? Not unless they had that patent loading machine in the hatch which breaks the fall of the coal.
891. Spencer's machine? Yes.
892. It would cost a little more to load that way? Yes; they would have to pay more for the trimming.
893. More for the trimming? Yes; trimmers will always demand more.
894. Why is that? They say it is humbugging work shifting the shoots about.
895. Would it increase the expense ½d. a ton? I could not tell exactly.
896. Would you consider a 1d. a ton as a fair thing to state as the probable increase in cost for trimming and loading? You would want fully a 1d. more.
897. Would 1½d. a ton cover it? That would cover it. The ships would have to carry the gear, or hire it here, and that would have to be paid for.

898. Is not the gear inexpensive? Still they would have to get it made. Some men would have a monopoly of them.

899. Do you think they would serve the purpose of preventing the coal being powdered under the hatchways? Yes.

900. *Mr. Pittman.*] How would you propose to deal with the fore and after hatches? The only way you could do would be to put them sideways in the fore hold. You could not put them lengthwise in some vessels.

901. Would it be impossible to use Spencer's machine in some hatches? In some ships you could use it. You would have to have the concern made to suit the different ships.

902. What do you think of Harper's distributor? I have never seen it; I have only seen Spencer's. Spencer's would distribute the coal better in the wings, and save the coal from breakage, but the coal would have to be dumped to fill up the hatch as is done now.

903. Is there anything you would like to bring before the Commission? I do not think there is. No doubt the hot weather we had had a good deal to do with ships catching fire. In one steamer we had, we pulled two men out of the hold in a state of collapse.

904. Do you think the hot weather might cause the men to be careless? The men could not do their work down the hatch. These two men collapsed, and had to be brought out. It was an iron steamer. You could not put your hand on the coal, it was so hot, through being in the sun.

905. You could not put your hand on it? You would take it off pretty quickly.

906. Something has been said about commissions being paid to captains by stevedores to let them alone when trimming? I have heard of that.

907. Did you ever hear of anything of the nature of a 5 per cent. commission as between stevedore, agent, or captain? Some of the agents get their commission.

908. What for? For giving the stevedore the business.

909. Does the captain of the ship ever touch any of that commission? I do not think so; he does not get the chance. Some agents have their own stevedore, and they always recommend him to the captains, and in nine cases out of ten he gets the job, but what their arrangement is, we do not know.

[Witness withdrew.]

Captain D. Williams sworn and examined:—

910. *Mr. Pittman.*] What is your name? David Williams.

911. What are you? Shipping manager to the Union Steam Navigation Company.

912. Have you been long in that position? I have been here twenty-two years.

913. During that time you have had considerable experience, I presume, in the shipping of coal cargoes? Yes; we have shipped a good many.

914. Has anything struck you in connection with the method of shipping coal here that would tend to explain the number of accidents that have happened from the heating of cargoes? I do not know anything about the heating of cargoes. It is a matter to which I have not given much notice.

915. Are you acquainted with the methods adopted here in the trimming of coal cargoes? I think the method here of trimming the coal is all right, if the master and officers of the ship would look after it.

916. You think it is the duty of the captain or officers to take the responsibility? Oh, yes, and to see that the ship is packed in the middle. These modern vessels are always liable to shift their cargoes unless they have a bulkhead at the end. When the "Poltalloch" came back here with her cargo shifted, I was called upon to survey her, and I made a pretty careful survey. Although the coal amidships had not been properly trimmed—not within 15 inches of the deck—it had shifted but little, but the coal had shifted at the two ends.

917. You think then, as a rule, the captains do not interfere with the stevedores? I do. I recommend they should wall the ship off with bulkheads.

918. *President.*] With wood or iron? Wood.

919. *Mr. Pittman.*] The trouble, so far as the shifting of coal cargoes is concerned, could be remedied by proper supervision? Yes. They do not square the ends of the coal at all. The cabins and fore-castle are all on deck, so that there is so much more space below that it is almost impossible to keep the coal from shifting without a bulkhead under the 'tween decks in the lower hold just abaft the lower hold, and on the fore part of lower hold forward.

920. Do you think the stevedores are inclined to slum their work for the sake of making more money? That is natural. They are sure to do that if they get a chance. We have never had any trouble with trimming.

921. Do you keep a special stevedore in your employ? We tender; but one man has had our ships now for the last ten or fifteen years.

922. Who is that? McNeil. It used to be McNeil and Taylor.

923. You found his trimming satisfactory? Yes.

924. Has any trouble occurred with any ship trimmed by him? One case only, I think. It was the "Lady Lawrence." The general opinion was that the ship was never going to reach her destination.

925. Was that since McNeil left Taylor? Before. Taylor is dead now. I think the vessel loaded partly with shale.

926. What was the nature of the accident? I should imagine she turned over. There must be a lot of precaution used in these modern ships.

927. Was the "Ellen A. Read" trimmed by McNeil and Taylor? She was supposed to have been fired by a donkey-engine.

928. The fire was forward of the main hatch? Under the donkey-engine house, I believe; but I am only speaking of what I have heard.

929. Can you suggest any remedy for inefficient trimming? Only by the supervision of the officers.

930. Do you think the appointment of Government officers would be of advantage? I do not think so. If I were a master I should not care about a Government man coming to see whether my ship was made seaworthy. I think a master should be able to do that for himself.

931. *President.*] Is it customary to employ bulkheads? They do not use them.

932. The usual procedure is merely to taper the coal off? Yes.

933. That is generally considered to be sufficient? In my opinion it is not sufficient.

- Capt. D. Williams.  
4 Sept., 1896.
934. Have you had a definite case in point in which it did not appear sufficient? Yes; sometimes the coal stands on end 30 feet.
935. Do you consider that the configuration of the coal cargo is affected by the working of the ship? I do.
936. How much would you consider the keelson might rise or fall in regard to a line drawn through the deck? A ship lying in still water shifted her bottom 3 inches. When down to her marks forward and aft, the Plimsoll mark was 3" clear, showing the vessel to have come up in the middle that 3 inches.
937. Which ship? The "King James."
938. The bottom shifted 3 inches amidships? Yes. In a head sea I should think it would move 6 inches.
939. That would shake the cargo down? It would cause friction by grinding the coal together. On account of the vibration in steamships, I do not think they will deliver coal as large as sailors.
940. You cannot carry coal in such large pieces? We do not deliver in such large pieces.
941. You have no remedy to propose in regard to bad trimming? No more than proper supervision—to see the coal properly stowed.
942. It is impossible for the Government to make an unwilling captain supervise the stowing? Quite so.
943. There is nothing to make him if he will not do so himself? No.
944. It has been suggested that occasionally stevedores bribe the captain to leave them alone? There is no doubt about that. Many captains, I daresay, are open to that sort of thing, and owners are greatly to blame for it. To-day there may be seventy or eighty ships in the harbour, and you would find a good large percentage of them are paying not more than £10 a month, and the owners expect a man to be honest.
945. You think captains are underpaid? I do.
946. Do you think that any form of certificating stevedores would have a good effect—that is to say, that certificates should be issued to competent men under certain regulations to be determined upon? I do not think it would be a good thing. I think it would cause too much of a monopoly for those obtaining certificates.
947. Is it not possible that regulations might be so framed as to prevent those not competent from obtaining certificates, but which would not raise any obstacle to those who were competent? I do not think you could do it. It would be very harsh to make a man employ whoever the Government thought fit to do his work. There are lots of vessels running here trimmed by their own crews. Most of the Sydney vessels are trimmed by their own crews.
948. But not deep-sea ships? They generally employ a stevedore. I do not think the certificate would be any advantage; the stevedores would soon combine, and put the trimming up to a price that would be exorbitant. I think a fair competition does no harm.
949. I understand there are so-called stevedores who are not competent? But they employ a man who is competent.
950. So that there are no incompetent stevedores? I do not think so. It is a matter of rushing the ships to make money out of them.
951. The stevedore has a pecuniary interest in doing the work badly? Yes; there are lots of ships that run in 1,500 or 1,600 tons of coal without a man on board.
952. There is no remedy except for the captain and officers to take some pains with the work? To see that it is properly done.
953. Do you know of any system of loading other than that in vogue here? I have loaded coal in the north of England where they load coal quicker than we do here.
954. How do they load there? Through a shoot. They lower the waggons on top the same as here. These waggons can be lowered down the hold, and should be.
955. Some of the waggons cannot go down the hold? Most of the modern ships will take them down the hold.
956. Down the main hold, but not the others? The quarter and fore hatches are much smaller, but I think that is the only remedy to stop smashing.
957. To lower the waggons right down? Yes.
958. We have some reason to believe that it would be impossible for many of the collieries to afford to buy fresh waggons of a smaller size? They would have to do it.
959. Is it impossible to make the hatches of a ship larger? No; they could easily specify the hatches to be made larger. They would have to do that when building the ship.
960. Would it be a serious trouble to cut the hatches of the ships in existence? I should not think so.
961. Do you know of any nautical reason why hatches of ships should not be made large enough to allow all waggons to pass down? They approve of large hatches now. It keeps water off the deck, and a good high, large hatch leaves more room to work, and is more convenient. They made ship's hatches small to get more accommodation on deck. They carry now all their passengers and crew on deck.
962. So that from the point of view of the sailor there is no reason why hatches should not be made large enough to allow waggons to go down below; that is obvious in the case of new ships, and old ships might have their hatches altered? It would be expensive.
963. Would it cost some hundreds of pounds to alter the hatches for the purpose? No, it would not. A hatch could be altered for from £70 to £100 if clear of the houses on deck. The "Geneva M. Tucker," now in the harbour, had a new main hatch put in her. It cost £75. It is 25 feet by 12 feet, which would take any waggon. It is a splendid job, and was done in New Zealand some years ago.
964. So that there is no reason why the hatches should not be made large? Not a bit.
965. Neither on the score of expense or convenience? No, I don't think so. If the colliery people wanted to ship their coal properly they should go to the expense of getting a few small waggons until the hatch was run up.
966. I suppose you would not be prepared to suggest the alteration of the fore hatch and the aft hatch sufficiently to allow the waggons to pass down? Yes, I would, if the hatch was clear.
967. There is no reason why they should not be altered? Not a bit.
968. *Mr. Pittman.*] To take the large trucks? Yes; the trucks want the hatch to be 12 feet by 14 feet, I think. That is not very large.
969. *President.*] Would the alteration be more trouble in a big iron ship? No; it would be less. You have the iron beams to rivet to.

[Witness withdrew.]

Mr.

Mr. W. H. Cremor sworn and examined :—

Mr. W. H.  
Cremor.  
4 Sept., 1896.

970. *President.*] What is your name? William Herbert Cremor.
971. And your business? Coal-trimmer.
972. Are you a member of the Coal-trimmers' Union? Yes.
973. Do you hold any office in that Union? No.
974. Have you ever held an office in that Union? I have been secretary on two occasions.
975. For how long were you secretary? Eighteen months on the first occasion.
976. And on the second? I think about fourteen months; but I could not exactly tell you.
977. Are the officers elected by the members of the Union? Yes; by ballot.
978. Were you a candidate on the last occasion? No.
979. Did you resign your office? I resigned four years ago.
980. And have not been a candidate for office since? No.
981. I understand you work at coal-trimming? I am a practical coal-trimmer, working at it for my livelihood.
982. I understand it is a somewhat precarious business, in that you are not sure of getting work every day? It is all chance work.
983. How many days a week do you average? I averaged about 30s. a week last year.
984. How many days a week? Say three days a week; that would be 36s.
985. Would that be a fair average for most coal trimmers? A very good average.
986. Are there more trimmers in the port of Newcastle than are required? There are upwards of fifty more than are required to do the work of the port. That is in our body, and twenty or thirty outside of us.
987. It has been represented to us that in many cases the stevedores, or the men who contract for the trimming of a ship, have a direct pecuniary interest in slumming the trimming;—is that the case? In many instances.
988. In your experience, have you known, as a matter of fact, the work to be slummed in certain cases? It has been.
989. That is to say, the stevedore has ordered the men out of the ship before he should have done? If you will allow me to explain in my own way it may be better, as I cannot give you a full explanation of how trimming is carried out in the way you are asking me. I think one of the causes of the shifting of coal cargoes from the port of Newcastle is in putting too much stiffening in the vessels. Many vessels come over to the crane to take in stiffening. They may require 500 or 600 tons of coal, which would be quite sufficient to keep them from losing their equilibrium when shifting from the coal wharf to the ballast wharf. Through the rapacity of the boss coal-trimmer he tries to get a greater amount of coal than is required into the vessel, so as to get a greater profit, and he has not the labour to perform the work.
990. The boss trimmer tries to put too much stiffening coal into the ship? Yes.
991. That is to make more money? Yes.
992. Is more money paid for putting in stiffening coal than for the general cargo? No, they get the same price all through. Plenty of ships are endangered by the coal not being trimmed from the bottom, by dropping the coal indiscriminately into the vessel. In some vessels there are flanges 4 or 5 feet. If the coal is not trimmed from the bottom underneath these flanges; if you heap coal up and it is not trimmed in these recesses at the bottom of the vessel, when she gets into the trough of the sea the bottom of the coal shifts and there is a tendency for the coal to fall. The labour should be put on in taking in stiffening.
993. Too much coal is put into the ship before labour is put on to trim? Yes, when the ship comes under to take the remaining portions of the coal, the body of the ship is made too large—is taken too far forward.
994. The main hatch is taken too far forward? Yes, in many instances; they make a big main hatch. When the main hatch is made too big, the wall is made perpendicular very often.
995. The forward wall? Yes; the consequence is that when they come to the fore-hatch—generally the last hatch to be trimmed—sometimes they drop the required amount of coal right underneath the fore-hatch.
996. There is not sufficient coal then to back up this wall? Then the boss coal-trimmer generally pricks the wall or knocks it down to minimise the danger.
997. He makes it sloping? Yes; therefore, my argument is, if the main hatch were smaller and the fore hatch of a ship plugged, thus stopping the fore hatch up and allowing the coal to run on the plates from the 'tween decks, the vessel would be safer and the coal properly levelled in the ends of the ship.
998. *President.*] In your experience have you known a case in which the sides of the ship in the neighbourhood of the fore hatch have not been properly trimmed or filled with coal? In the neighbourhood of the main hatch I have known it.
999. The cause of that, I understand, is from the contractor being unwilling to spend more money in wages? That is the case.
1000. He therefore orders the men out before the work is completed? Yes.
1001. Is it competent for a captain of a ship to insist on having the work done properly in spite of the stevedores? The captain in many cases does so, but very often he sends an officer below who has no idea as to the practical part of coal-trimming.
1002. You think the officers of a ship are very often unable to give proper supervision from want of knowledge? Yes; I am quite certain of it.
1003. Do you think the difficulty could be overcome by proper inspection? Yes, by a practical man—one who thoroughly understands the work. In the old times the vessels were filled tight, and they arrived safely.
1004. Has the trimmer any pecuniary interest in slumming his work? None whatever. The longer he is there the more he gets.
1005. Some witnesses tell us that many trimmers will work for at least twenty hours;—I think one said thirty hours? I will tell you the reason of that. On these wharves men are employed by bosses constantly. They are not employed all round. Some stevedores have eight or nine men whom they keep going. The men do not get work from anyone else. A man may only get one job a week, which would last twenty to twenty-five hours, at a steamship, and may amount to 30s. or 35s. He depends on that stevedore for a living.

- W. H. Gremor.  
4 Sept., 1896.
1006. You have had considerable experience of trimming? I have had thirteen or fourteen years in Newcastle.
1007. It is pretty hard work? Yes; it is very hard work.
1008. What sort of state are you in physically after you have done twelve hours' continuous work? If I work for twelve hours, I want to get a wash and go straight to my bunk.
1009. Do you think a man who has worked hard for twelve hours is to be trusted to do fair and honest work for another eight hours? They are trusted, and they give satisfaction.
1010. In your experience, do the skippers of ships, as a rule, pay proper attention to the loading of their ships? Of late years they do on account of the great loss of coal-laden vessels.
1011. They have become aroused to the necessity of it? Still it is not carried out as it should be.
1012. Is it the exception or not for an officer to do his best to superintend the loading? I think they do their best, but they have no practical idea of looking after it like the man whose business it is.
1013. The remedy you propose is the appointment of a Government inspector? Of a practical man.
1014. How many inspectors would be required for the port? One for the day and one at night.
1015. To do the whole work? Yes. Vessels do not finish at the same time. Where he wants to be most is in the body of the ship.
1016. So that to an expert man very little superintendence would suffice? Yes; if you have a man to inspect the body of a ship you can always get at the fore and aft hatches of the modern built ship.
1017. They can be examined at any time? Yes, at the buoys even.
1018. Would it be necessary, in order to make the inspection of any avail, for the inspector to have powers placing him above the captain in regard to this particular work? Would that make the Government responsible for the loss of the ship?
1019. You admit there is a difficulty? There is a very great difficulty, if the Government would have to take the responsibility for the safe arrival of the vessel, but it would show that the Government had done its part.
1020. You think, for the safety of the ship, there should be expert supervision? Yes.
1021. No doubt occasions may arise when officers may be deluded or deceived, but that would be the exception? I consider in many instances they are deluded. Officers are never down at the finish of the main hatch in the lower hold.
1022. *Mr. Pittman.*] There is nothing to prevent their being there? No; but when in close quarters they should remain.
1023. If it is possible for a trimmer it is possible for an officer? They do not go down.
1024. *President.*] It has been suggested that trimmers may throw coal at ships' officers in the hold? That was stated at a conference of coal-trimmers, held at the Chamber of Commerce, and was uncalled for.
1025. Is it untrue? Yes.
1026. Have you ever heard of any such thing being done? No, sir; no man insults anyone who goes into the hold to do his duty.
1027. Do you refer to the members of your society or to the trimmers generally? To the trimmers generally along the dyke.
1028. Do you consider the prices at present paid to stevedores sufficient to enable them to do a fair job? That is left to themselves.
1029. I understand they get from 3d. to 3½d. a ton? That is a fair price for some of the vessels, but I know for a fact that 4½d. or 5d. would not be enough for others—wooden vessels with closed 'tween decks.
1030. Is as much as that paid for trimming? Yes.
1031. Even then it does not leave a great margin for profit? Not a great deal.
1032. *Mr. Pittman.*] Is that paid in Newcastle? It has been paid—4d. and 4½d. for close 'tween-deck vessels.
1033. *President.*] We have had several witnesses say that 3d. or 3½d. is a good price? That would refer to large modern vessels. Once they get under the crane the men continually drop coal into them.
1034. As a possible explanation of the firing of coal cargoes, it has been said that trimmers leave their candles down among the coal? I think the firing of coal cargoes is beyond my ken.
1035. Such a thing does occasionally happen? I have never known it to happen since I have been trimming in any vessel I have been on. When a candle drops from a candle-stick some one extinguishes it.
1036. Is it not possible you might get walled off from your candle? No, your candle is always in front of you.
1037. There should then be no excuse for a man leaving his candle in the hold among the coal? No excuse. We sometimes pick up substances of this kind. [*Witness handed in piece of a fuse used in mining.*]
1038. Is that left among the coal by the miners? It comes in the waggons. It consists of gunpowder. Once there was a bag of stuff found in the coals which was set on fire.
1039. A bag of powder? I do not know; it was fusible matter.
1040. *Mr. Pittman.*] You think that may get into the coal without the miners knowing anything about it? I do not know how it comes there—we find it there.
1041. *President.*] You have occasionally found powder? Yes.
1042. The powder used in compressed cartridges? No.
1043. You do not mean to imply that anyone could have been wicked enough to put a bag of explosive matter among the coal purposely? I do not know how it came there. A man called Davis picked it up. I think it was in the "Industry." The men were well nigh suffocated by the smoke from it.
1044. Have you had experience of either Harper's or Spencer's machines for distributing the coal? No; I have seen Harper's tried to be worked, but I think it was a dismal failure.
1045. What about Spencer's? I have never seen Spencer's.
1046. You have had no practical experience with these appliances yourself? No.
1047. I suppose some of the trimmers on the dyke have had experience of them? I think only one man—Whittaker.
1048. Have you ever trimmed a cargo of coal that afterwards heated? I do not remember one.
1049. So that you cannot give us any information about the trimming of a cargo which has heated? No. I have never trimmed a vessel that has afterwards been lost.
1050. Is there any other matter you would like to bring before the Commission? I think the stevedores should be licensed, and be examined by a practical man as to their competency to trim a ship. The inspectors could be the examiners.
- 1051.

1051. Is it proposed he should pay for the license? By all means. It would pay the Government for the inspector's salary.

1052. What would be the effect of a license do you think? I think no man should put in a tender unless he is licensed. Men come from the back blocks and start as stevedores, and influence may be brought to bear upon the captain to employ them, or the captain may do so from economical ideas of his own, and he is not made aware of the incompetency of the men he is employing by his agent. I have known for a fact where a man came from Mudgee and tendered for the trimming of a vessel, and was successful in getting it.

1053. You have known of a man without previous experience obtaining a contract for trimming? Yes.

1054. Although himself incompetent, I presume the men he employed would be competent? They were in many cases incompetent. An incompetent stevedore does not care so long as he gets a vessel down to her marks.

1055. The object of licensing them would be to secure better trimming? Yes.

1056. It would have the same effect as the appointment of inspectors? Yes.

[Witness withdrew.]

Mr. A. Wallace sworn and examined:—

1057. *President.*] What is your name? Alan Wallace.

1058. I understand you are the agent for Spencer's system for distributing coal? Yes.

1059. You claim that the use of the Spencer distributor will prevent the pounding up of the coal when dropped in the hatches? Yes.

1060. It has been suggested that even when this distributor is used, it will have to be removed while yet there is a large space unfilled in the hatchway, and that the coal would have to be dumped down into that space finally, just as in the usual way? Not if the apparatus is properly used. There is no reason why the few waggons that will be required to fill up the square of the hatch might not be lowered on to it. It is a matter of only 3 or 4 feet.

1061. That would necessitate trimming back from the heap? Trimming back from the ends of the distributor.

1062. It would rather, therefore, tend to increase the amount of trimming, and necessarily the cost of trimming? It would increase the trimming in the hatchway, but reduce it in the wings.

1063. So that it would leave the total amount of trimming about the same as now? I have a statement showing the time occupied in loading ships as at present, and with the use of the distributor.

1064. Have you used the distributor in this port? With several vessels.

1065. Is there a particular line of ships for which the use of it is specified? Yes, the Firth line.

1066. Is there one of the Firth line in port just now? Not at present. It could be arranged for the distributor to be used, if desired, in a vessel.

1067. Could it be arranged that the Commission could see an exhibition of the use of one without expense to the Commission? Yes.

1068. *Mr. Pittman.*] Does that particular line always use Spencer's distributor when the vessels come here? Yes.

1069. *President.*] How many times have you used it? Six times since August, 1894.

1070. Has there ever been any trouble with the shifting of cargo, or of spontaneous combustion, in cargoes loaded by means of this distributor, either here or in England? Not that I am aware of.

1071. Would you be aware if such had happened? I should most probably be aware.

1072. It has been suggested to us that the hatches of ships might be made larger, so as to admit of waggons being lowered; do you know of any reason against that? None whatever.

1073. You are acquainted with ships? Yes.

1074. In your business? Yes.

1075. You are a shipping agent? Yes.

1076. Is there, from a commercial point of view, any objection to the making of larger hatches? I don't think so, as long as ships are built according to Lloyd's rules.

1077. Do they specify the size of the hatches? I think not, because hatches are of all sizes.

1078. Would you be inclined to raise any objection if asked to increase the size of the hatches of your ships? With the main hatch, I should think it would not be a matter of importance. With the fore and after hatches it depends a great deal on the occupation of the deck space—the deck-houses and distribution of winches and working gear of the ship. The fore and after hatches are invariably smaller than the main hatch.

1079. Would you charge a royalty in the event of Spencer's distributor being adopted in this port? Yes; I presume so; but could not say without referring to my principal in the matter.

1080. Have you any idea as to why it is not more universally adopted? I have no idea. I have put it before insurance companies, and they say it would be a good thing, but they do not seem inclined to insist upon it. It was through the insurance companies putting up their premiums that first drew my attention to the distributor.

1081. Do the insurance companies here lower their rates for ships loaded with the distributor? I have not heard anything from them to that effect.

[Witness withdrew.]

WEDNESDAY, 9 SEPTEMBER, 1896.

[The Commission met at 2:30 p.m. at the Custom House, Newcastle.]

Present:—

PROFESSOR RICHARD THERELFALL, M.A., PRESIDENT;

And EDWARD FISHER PITTMAN, Esq., A.R.S.M.

Mr. J. May, M.E., sworn and examined:—

1082. *President.*] What is your name? Jonathan May.

1083. And your business? Lecturer on coal-mining at the Technical College here. I am a mining engineer and colliery manager.

1084. What experience have you had in coal-mining? As a boy, up to the age of about 17, I followed the usual occupation of boys in mining.

1085:

W. H.  
Cremor.

4 Sept., 1896.

A. Wallace.

4 Sept., 1896.

J. May.

9 Sept., 1896.

- J. May.  
9 Sept., 1890.
1085. Where was that? In the north of England—County of Durham. From 17 to 21 I studied the principles of mining under a gentleman who was mining engineer for the Duke of Cleveland. I hold the highest diploma—first-class certificate—as a colliery manager, under the English Act; and from that age up to the present I have had control of mining operations in every official capacity.
1086. With regard to spontaneous heating of coal, have you read the work of Richters on the subject? Only extracts; I have read Lewes more particularly.
1087. What work of Lewes do you refer to? Only those papers which he laid before one or two different societies.
1088. Did he write a book on the subject? They are only fugitive papers.
1089. Have you had any personal experience in investigating the cause of spontaneous combustion? Only what crops up in our institutes.
1090. You have made no laboratory experiments? No, not of any consequence.
1091. As a matter of fact, your opinion is drawn from Lewes and other writers on the subject? Yes, principally.
1092. And you have no practical knowledge of the matter? I have made no personal investigation to compare with those of Abel, Percy, and Lewes.
1093. Do you subscribe to the theory put forward by Richters and Lewes that the cause of heating is from the absorption of oxygen by the carbonaceous matter of the coal? Yes, I am perfectly satisfied with that theory; it is now generally accepted.
1094. Do you consider that the presence of moisture is of any consequence as a factor in heating? Decidedly.
1095. Does the presence of moisture increase the liability to spontaneous combustion? It does increase the liability, according to the experiments of Richters and Lewes.
1096. Do you consider that the action of moisture in promoting spontaneous heating is traceable to the decomposition of pyrites, or do you consider it has a specific action? I would not like to say what its specific action was, except that its result has been to increase the danger of spontaneous combustion.
1097. Can you give me any fact to justify that? Not having made any experiments, I only take the later conclusions arrived at by Lewes, Richters, Abel, and Percy.
1098. With respect to the conclusion arrived at by the English Commission in 1876, you are of opinion that later researches have shown that the influence of water is not to be neglected in considering the chances of spontaneous ignition? Yes.
1099. Can you give us any information in support of that? I think researches have been made in regard to the different classes of coal and different degrees of moisture by Abel. These will be most reliable.
1100. You are more particularly accustomed to the handling of coal? Yes; the chemical portion, I think, is best left to expert chemists.
1101. Do you admit that the pulverising of coal during the process of loading into ships is of importance in regard to the question of spontaneous combustion? It is of very considerable importance.
1102. Do you consider that the finer the coal the more likely it is to spontaneously heat? Yes, distinctly; because it is generally reckoned that if you take 100 bushels of charcoal and pulverise it, it will almost invariably take fire on exposure to the atmosphere. Oily waste becomes similarly oxidised.
1103. Can you suggest any means that might be adopted to lessen the breakage of coal when put on board ships? I think something might be done almost from the beginning. It is just possible that mining appliances will be improved. The old-fashioned tippler, or kick-up, throws the coal forward, and it gets very much smashed; but the side tippler—and both can be seen in practice in the district—causes very much less breakage.
1104. If the spaces between the bars of the screen are of the same size, will not the coal reach the trucks in the same condition by whatever means it is loaded from the skip? The pieces may be large enough not to go through the screen, but they receive such an immense amount of smashing on the screen that, when they get to the trucks, they are pulverised. Then there is the pulverising journey to the wharf, and again when the coals are dropped, perhaps 30 feet, into the hold. The whole process is one of making small coal, from the screen to the hold of the vessel.
1105. Can you make any suggestion as to the way in which coal might be more gently lowered into the hold of a ship without causing any great increase in the expense of loading? You might adopt the same method as is used at Cardiff and Tyne Dock.
1106. What method is adopted there? They have a subsidiary box, which the coal is loaded into and then lowered gently into the hold of the vessel. They have a spout, and the truck lets the coal into that spout, and then into the box.
1107. And that is done until the hatch is nearly full? Yes.
1108. Though that method will no doubt reduce the breakage of the coal, it will add to the expense and the time occupied in loading? The additional expense should be paid for three or four times over by the increased value of the coal.
1109. For what purpose would it be of increased value? Because large coal is always more valuable than small.
1110. We have been informed that large coal would be of no greater value for steamboat purposes, and a great deal of the trade consists in supplying steamboats? That may be; but the larger the coal, I think its commercial value will be greater.
1111. You do not agree with that opinion, that the coal would be of no greater value for steamboats? It is altogether opposed to all I have been taught. We are always very anxious and careful to get the best coal at the mines. The miners are paid for large coal only.
1112. So that you think whatever extra expense may be incurred in the process of shipping which you propose, that expense would be more than recouped by the increased value of the coal? Distinctly.
1113. Supposing that arrangements were made for lowering the first portion of a ship's coal into the hatches by means of subsidiary boxes, can you tell the Commission what additional appliances at the dyke would be necessary? That is simply a matter of mechanical arrangement.
1114. Would you be prepared to give a definite engineer's opinion as to the alterations at the dyke which would be necessary? Yes; given sufficient time to examine the site.
1115. Are you prepared to do so now? Yes. If you look into the report of the English Commission you will probably see it. The Cardiff authorities would no doubt be able to supply you with particulars.
1116. Which authorities? The officers connected with the harbour there, or the Marine Board.

1117. *Mr. Pittman.*] Do you know of any objection that would hold in regard to screening at the wharf? I am afraid it would not do. Mr. J. May.  
9 Sept., 1896.
1118. Can you tell me why? Speaking as a practical mining engineer, it would not be thought of.
1119. Are you not aware that it is done at Cardiff? That may be possible. There are more private people there. One particular firm may be shipping a large amount of coal, and it would probably pay them to screen that coal at the wharf if they could get accommodation, but where you have so many different companies it would not do. With a firm like the A. A. Company, if they had sufficient ground, I could understand it. To get all the firms to work in one groove like that would be difficult.
1120. *President.*] To work harmoniously, you mean? Yes.
1121. *Mr. Pittman.*] You think the question of space of very great weight? That would be an important matter, but you can see the difficulty in having twenty or thirty firms doing a thing like that. You could not get them to work together.
1122. *President.*] Have you had any experience of distributors? Not personal experience, but I can quite see the idea is a possible one.
1123. Is there any matter which you would like to inform the Commission of? I would like to point out the danger of allowing cotton-waste to drop into the holds of vessels, and of putting the sweepings of the wharfs into the vessels. These sweepings include the grease dropping from waggons.
1124. Is there anything else? I am perfectly satisfied in my own mind that the idea as to the danger of pyrites is practically exploded.
1125. That is a matter of impression with you? It is a matter of distinct conviction.

[Witness withdrew.]

Mr. J. Whittaker sworn and examined:—

1126. *President.*] What is your name? John Whittaker. Mr. J.  
Whittaker.  
9 Sept., 1896.
1127. You are a coal-trimmer? Yes.
1128. How long have you been a coal-trimmer? Between England and here, a little over forty years.
1129. Where were you born? At Liverpool.
1130. When a ship arrives for coal, what is the first thing you do? Take out so much ballast and put in stiffening.
1131. How much stiffening coal, as a rule, would be necessary for a ship going to load 4,000 tons of coal? I should think about 1,000 tons.
1132. Where should that coal be put? If it could be done, it would be best down the main hatch.
1133. Why can it not always be put down the main hatch? The ballast may stop it.
1134. Cannot the ballast be moved aside? If the captain will do it. The stevedore wants to get his coal into the fore and aft hatches.
1135. Why does he prefer to put his coal into the fore and aft hatches? So that he can put more coal in with less labour—perhaps with one or two men.
1136. In your opinion, stiffening coal should be put down the main hatch? Yes.
1137. It is to the interest of the stevedore to put it down the fore hatch and the aft hatch? Yes.
1138. Does that lead to the trimming being less perfect than if put down the main hatch? Yes, because the men are not there to trim the stringers in the fore and aft hatches. There is no labour put on to trim.
1139. Cannot that labour be put on afterwards? No, not to get at it very well, because they run the main hatch up when she comes under the crane again with those two men.
1140. In your opinion, the stiffening coal should be put down the main hatch, and the trimmers should be put in at once to trim the coal as it goes down? To trim the stringers right along.
1141. That would make more work for the trimmers? Yes, and make the cargo safer.
1142. Supposing the stiffening coal has been put in, and the ship has come back to take her full cargo, will you describe what is done then? If she has taken the stiffening in the fore and aft hatches, she starts in the main hatch, and the men should be put on from that time.
1143. How much coal should be put down the main hatch for a 4,000-ton cargo? That depends how far they carry the wall between the forward and main hatches; some men carry the wall further than others and straighter.
1144. Is that a matter which is settled by the captain, or the stevedore? By the stevedore.
1145. Can you give us your opinion as to how much coal ought in reason to go down the main hatch with a cargo of 4,000 tons? Say 2,000 tons, or close upon it, would be quite sufficient to go down the main hatch.
1146. Supposing the stiffening coal has been already put down the main hatch, would you go on filling up the main hatch when the ship comes under the crane again? Yes, sir.
1147. You would take nearly the whole cargo through the main hatch, and only put a comparatively small part down the fore hatch and after hatch? Yes. It lies with the stevedore how big he makes his main hatch. Some men will take the wall further forward than others. Some men have different ideas as to how large a main hatch should be.
1148. Which system would lead to the best trimming? The smallest main hatch with a sloping wall, so that there would be more coal to put down the fore hatch to back the wall up.
1149. That would have the effect of getting more coal into the two ends of the ship? Yes.
1150. Why does a small main hatch lead to the best trimming? By making a big main hatch you leave less coal for the fore hatch to back up the wall between the main and fore hatches. It does not matter about the aft part of the main hatch, because the aft hatch and the coal from the main hatch will meet in most ships, so that the wall is always backed up. It is in the forward wall where the danger is, through there not being enough coal to back it up. The reason for making a big hatch is this—when you have finished the aft and main hatches, and you come to the fore hatch, the stevedore knocks the labour off and keeps perhaps four men on just to put the plates ashore. Very often there may be no work in that hatch except to knock the top of the heap off and level it down. They usually have twelve men for a ship.
1151. Independently of any question of labour, you consider a ship is safer with the wall built nearer to the main hatch than stevedores are accustomed to build it? That is the only way to trim a ship. [Witness, with the aid of a diagram, then explained the manner of building and the position of the wall between the main and fore hatches].

- Mr. J. Whittaker.  
9 Sept., 1896.
1152. If the wall is put too far forward, the balance of the ship's cargo which can be put down the fore hatch, consistent with keeping the ship trimmed, will not be sufficient to support the foot of the wall? That is it.
1153. *Mr. Pittman.*] Do you build a wall between the main and after hatches? Yes; but you see the hatches are so much closer.
1154. *President.*] Supposing that what you consider the proper method of trimming were adopted, would it cost the stevedore more in wages to trim? Yes.
1155. Do you find that those stevedores who take work at a low price do worse work than other contractors? That is a thing I could not say anything about. I do not know what prices they get for the work.
1156. Have you any opinion about the matter? I have an opinion that the man who takes a cheap job at anything must slum it somewhere to make it pay.
1157. Have you known a ship to be badly trimmed in the port of Newcastle? Yes, the American ship "Hanz Morise."
1158. Who was she trimmed by? Hestelow and Williams, I think it was.
1159. What was wrong with her? She was a close deck ship, and by some means or other the captain found out the ship was not properly trimmed, and he sent for McNeil and Taylor to get them to trim the ship right, and it took about fourteen men between nine and ten hours to do it.
1160. Were you one of them? No, sir, I only went on board to see her.
1161. She was not properly trimmed in the wings and lower hold? Yes.
1162. There were spaces left in the wings and lower hold? Yes.
1163. So that the cargo could shift? Yes.
1164. Was that the fault of the stevedores or the captain? The stevedores.
1165. How do you know? Because he ran that ship up all over before the men came on. They ran up the three hatches, and when the men came on they could not get properly at the wings to fill them. It is a dangerous thing, if the wings of the main hatch and right along to the fore and aft hatches are not filled.
1166. Did you see, in this particular case, that the hatches were all run up before these men were put on? Yes, the three hatches.
1167. What is the longest time you ever worked? I have worked sixty-five hours at one ship.
1168. Why was that? I was working for some men who were doing the ships for themselves—what they would call a co-operative body. The men working for the other stevedores were threatened if they came and worked for these men, but we took no notice. There was me and Robert McAuliffe; we did the work; we were not fit to work, but we stopped there for that length of time. There are men working thirty hours.
1169. Do the stevedores insist upon the men working such hours, or is it by the men's own wishes? A stevedore employs a certain body of men, and when a steamboat comes under the crane and takes thirty hours, the men are kept on. I have worked thirty and forty hours, and my flesh was very crumbly and curious after it. Ten hours is long enough.
1170. How many days a week can you expect to get work;—do you work three days a week? I do not work three days a week. There may be reasons why I do not get work three days a week. The average man gets three days a week.
1171. When you get a job, you like naturally to make the most of it? Yes, you do.
1172. Is that not the cause of your working so many hours? The stevedore has it in his own hands. He can relieve you if he likes.
1173. Do you not like to work as long as he will let you, if you can get extra pay? Not at all times.
1174. Sometimes? Sometimes a man will work if he has had no work for a week.
1175. So that he might ask the stevedore to allow him to stay and work a double shift? It would be no good his asking him.
1176. Did you ever ask a stevedore to keep you on? Never in my life, and I do not think any other man did it.
1177. Surely a stevedore would lose money by keeping a man on for so many hours? I think he would. I have had many an argument about not relieving us, and getting a fresh gang on.
1178. You think a stevedore will, in some instances, keep you working more than ten hours, because he believes he can get more work out of you than out of a fresh gang? That is just so, but it is a foolish idea.

[Witness withdrew.]

Mr. A. Gardiner sworn and examined:—

- Mr. A. Gardiner.  
9 Sept., 1896.
1179. *President.*] What is your name? Archibald Gardiner.
1180. And your business? Civil and mining engineer.
1181. Where were you born? In Scotland.
1182. You are a lecturer at the Technical College, Newcastle? Yes.
1183. What do you lecture on? Mine surveying.
1184. You have nothing to do with shipping? Nothing.
1185. Have you had anything to do with coal-winning? Yes. I have a certificate as a colliery manager. I was manager at two of the mines in the district for some years.
1186. I understand you have made special experiments with the heated cargo of a ship which returned here? Yes.
1187. What was the ship's name? I think it was the "Morna."
1188. What happened to the "Morna"? I do not know anything about the ship. The coal was sent to the Technical College by Dalgety and Company.
1189. It was a case in which the stiffening coal heated? I believe so.
1190. What did you do with the coal? I experimented with it.
1191. In what way? I tested it to see whether we could get it up to ignition point.
1192. By heating it? Yes; and put it under conditions similar to those it would be under in the hold of a ship. We heated it up to only 500° Fahrenheit, as we had not a thermometer to go higher.
1193. And what was the result? The coal was not at all altered.

1194. With what object was that experiment? To see if it was possible at a moderate temperature to ignite the coal by heating. We then damped the coal and tried it again. The heat rose very rapidly up to 210°, and remained at that until the moisture evaporated.
1195. What did you conclude from that experiment? I concluded there were no grounds to say the cargo heated or would endanger the ship.
1196. Have you made any other experiments? Some years ago I was manager in India where the coal was full of pyrites, and it was a great trouble. The gob heated rapidly. When the debris was not packed up against the roof of the mine, leaving a cavity, it heated. The coal was of the same general character as the coal in the Newcastle mines. I also found that small heaps left in the Indian sun outside the mine heated in a very short time. The analysis of the coal was similar to that of the Newcastle mines.
1197. Have you made any experiments as to the effect of pyrites in causing heating? Yes; it was due to the pyrites that the India coal heated. It was due to the decomposition of the pyrites that heated the gob.
1198. How do you know it was due to decomposition? Pyrites there occurs in the coal in a different way to what it does here. It occurs in little pockets, and decomposition sets in very rapidly. You could see the effect of these pockets on the outside of the coal.
1199. You observed the pyrites decomposing? Yes, from day to day observation.
1200. Have you any direct evidence of the dependence of the heating upon the decomposition of the pyrites? We expected that.
1201. You took it on trust? Yes; we believed it was the cause.
1202. Have you any reason to suppose that the coal from some mines in this district tends to heat more than others? The coal in general is not coal that I should say was at all dangerous to carry by sea.
1203. Most of the fires have occurred with West Wallsend coal, have they not? Yes, I believe that is so.
1204. Does the West Wallsend coal, to your knowledge, differ conspicuously in character from the other coals in the district? It does not.
1205. Does it contain more sulphur? I don't think so.
1206. You know of no physical or chemical difference between the West Wallsend and other coals? No; I do not. I have examined the West Wallsend coal, and its analysis is familiar to me.
1207. *Mr. Pittman.*] Are you prepared to say it is not a more friable coal? It is not a more friable coal. It is very much of the same nature. It is not more friable than that from the Stockton Colliery.
1208. Some of the coals from collieries near Newcastle are more friable than those from the Minmi or West Wallsend seams;—is not the Greta coal harder than the West Wallsend? Yes.
1209. Is there any other coal besides the Greta which is firmer than the West Wallsend? The Great Northern is a harder coal.
1210. If you dropped a piece of West Wallsend coal and pieces equal in size from the Great Northern and Greta mines from a height of 30 feet, would you expect the West Wallsend to crumble more easily than the others? Yes, that is, it would break easier, but I would not say crumble.
1211. *President.*] Is the West Wallsend coal firmer than the A. A. Company's coal? The West Wallsend is a harder and firmer coal than the A. A. Company's.
1212. So that the A. A. Company's would break more easily? Yes.
1213. And yet the A. A. Company have had no accidents? I am not aware that they have.
1214. Have you formed any opinion as to the reason why this particular coal has apparently given rise to this trouble and the A. A. Company's not? I have thought the matter over a good deal, but I have not any materials to enable me to come to any definite conclusion in the matter. I must say I cannot understand how that is so with the West Wallsend more than with the A. A. Company's. I am not of opinion that any of the district coals would be dangerous cargoes to carry.
1215. *Mr. Pittman.*] Coal from Newcastle generally? Yes, that it is not a dangerous cargo. There may be more occluded gases contained in the West Wallsend and Seaham coals than in those nearer town.
1216. *President.*] That is only a probability? Yes.
1217. Is the coal won in a different way in West Wallsend? No; the practice of winning is very much the same. There is a slight modification during the last year or two in the system of working.
1218. What is that? A tendency to leave larger pillars.
1219. *Mr. Pittman.*] Nothing to cause greater crushing in the coal? No, but the workmen use more powder in the mining of the coal now than was done some years ago.

[Witness withdrew.]

Mr. J. Dixon sworn and examined:—

1220. *President.*] What is your name? John Dixon.
1221. You are Government Examiner of Coal Fields? Yes.
1222. How long have you been in that position? About six weeks.
1223. You have had considerable experience of coal fields before then? Yes. Fourteen years as inspector.
1224. What are your duties as Government Examiner of Coal Fields? Principally looking after Royalties and applications for coal lands. I have been doing inspections all the time besides.
1225. During your term of service have you had to make any inspection of ships whose cargoes of coal have heated? No.
1226. Have you had any experience of the heating of heaps of coal? I have.
1227. In this district? Yes.
1228. Will you kindly mention a typical case? I have seen on two occasions in the district where coal has heated in the pit.
1229. Where it has been stowed as rubbish? Left in the gob.
1230. It is very usual for coal to heat in the gob? It is not usual, but I have known of two cases where it has done so.
1231. Was the coal finely powdered? Yes.
1232. Was it damp? Yes, when it was put in.
1233. Do you think that was the cause of the heat in those cases? My opinion is, and I know I am in opposition to scientists, in this, that it is the iron pyrites that causes most of the trouble.
1234. Why do you think it is the pyrites? It is on one side of the big fault in the district, and it is the most peculiar place I have ever seen for pyrites. I have seen them the size of a dinner plate come out of the bottom where they have been thrown back into the gob.
1235. Where was the heating you refer to? In the A. A. Company's and Ferndale pits.
1236. And in both those places pyrites was a conspicuous feature? Not a bit of doubt about it.

Mr.  
J. Dixon.  
9 Sept., 1896.

1237. Was it conspicuous in the gob itself? Yes.
1238. The gob contained more pyrites than the gob generally does? More than usual.
1239. Was the gob wet or dry? The coal was thrown back wet on the first working.
1240. That first coal contained this pyrites? It generally lay near the bottom; in fact it was on the bottom.
1241. This is in opposition to scientific theory? In opposition to some scientists. Those that I have read do not take much account of pyrites.
1242. You made no direct experiments, I suppose, to verify your theory? I have taken particular notice of it during some years—that peculiar place on the side of that fault, just on account of the pyrites.
1243. And there you have noticed that heating is a matter of frequent occurrence? Yes. I have noticed that small coal as closely as possible for thirteen or fourteen years.
1244. In the same pit? In the same pit, but not the same pyrites.
1245. Have you noticed in all cases in which heating in the gob occurred that pyrites was present, or only in some cases? Only in those cases I referred to.
1246. In the two heated gobs? Yes; both on the same side of the fault.
1247. Does pyrites occur in most gobs? It may to some extent, but not to the extent of the cases I am speaking about.
1248. How many gobs will there be which have pyrites to the same extent as the two gobs which heated? I don't say only two. There have been acres of that old working shut off, and the same feature with regard to pyrites obtained in every bord.
1249. Are there any other collieries in which that fault occurs? Not the same fault.
1250. So that it would only be in those two collieries in which that immense accumulation of pyrites would occur? Yes.
1251. And the gobs which are formed of coal containing this pyrites are very liable to heating? Yes.
1252. And no other gobs in the district have been known to heat? No.
1253. And no other gobs in the district are known to have the same pyrites? Not to that extent.
1254. *Mr. Pittman.*] Your opinion is based on the fact that where you noticed heating you noticed pyrites? Yes.
1255. You are not prepared to say from your own experience that the heating was due to the pyrites? No; I have never known what we may term an active flame. There was another condition brought to bear upon it, and that was about 6 inches of clay shale, almost of the consistency of putty, came down and carried a lot of moisture—a wet blanket I call it—and the moment that moist stuff came down the chief bord had to be shut off because we would get an active flame.
1256. *President.*] How long after the fall of clay? Not many days.
1257. The clay would allow the heat to accumulate? Yes, keep the heat in.
1258. In what respect does the pyrites you refer to differ from what are called brasses? You sometimes get them in great lumps as large as a man's head, but this pyrites was like an ordinary dinner plate. I have seen them beautifully put together—little square blocks of coal where this stuff had been running through and cementing them together.
1259. *Mr. Pittman.*] You know gob fires are very common in the old country? Yes.
1260. Have you sufficient experience of gob fires there to say there is always present an excessive quantity of pyrites? As a matter of fact, we had no gobs in the part where I was brought up in the old country. It was what was called the Hutton seam in the north of England, it was too precious to leave in the pit.
1261. Have you formed any opinion as to the heating of coal cargoes? I have tried to form some opinion. Say, for instance, a ship takes in a few hundred tons of coal in Sydney and comes up here, and then wet coal that has been reduced to "smalls" is put on top, you get the wet blanket I speak about.
1262. *President.*] You think the wet coal keeps the heat in better than the dry coal? I think the wet coal does the business.
1263. The effect of damp in the coal would be to make the coal more non-conducting of heat? It would simply cause fermentation, if you can allow that expression in the matter. Every little cell of the coal broken in the hold of the ship is giving off gas. Then with the coal going down there a certain amount of heat is created and will be retained, and by and by it will burst into flame.
1264. Do you mean the wet coal would act as a blanket? It would hinder the gas that has been occluded from escaping.
1265. What has that to do with what you call fermentation? If you get gas there which has accumulated, a certain amount of heat is given off all the time.
1266. You do not know, as a matter of fact, whether ships that have first taken in dry coal and then loaded wet coal are more liable to fire than those which have loaded all dry or all wet? I do not know, but that is my impression.
1267. As to the loading of coal, can you give us any opinion as to which would be the best way of preventing the breakage at the least expense? In the first place I believe the coal should not be sent away out of the pits in large lumps. They had a saying in the North of England when I was a boy, if you dropped a large lump of coal into a ship's hold you made about a thousand small ones. They reckoned small sized coal was better carrying to the port and better cargo on ship board. It looked better coal at the journey's end when it went in reasonably small. The lumps were not more than 14 or 16 pounds in weight and I think they got good results from it.
1268. What part of England was that? North of England. Our shipping port was Sunderland.
1269. I suppose it is just as easy to send coal out of the mine moderately broken up as in large lumps? Yes. I have seen them roll a lump as large as two men could move. If that goes into the ship's hold like that, there is a grinding process, and you break, perhaps, ten thousand cells with it.
1270. You think it really makes more dust and "smalls" than if broken into fairly reasonable pieces? That is my idea.
1271. You do not consider, I presume, that to limit the size of the lumps of coal put out from the pits would be a sufficient cure? No. I think there should be something done to put it out of the waggons into a shoot, instead of dropping it straight down the hatch in the way they do.
1272. You would have a shoot down the hatch? A shoot entering the hatchways, and then have a check shoot, the coal to go from one to the other.
1273. Do you think that could be adopted economically? I think so. I think it would be the most economical thing you could get. It simply means two pieces of wrought iron. 1274.

1274. A wrought-iron tube bent zigzag? Yes; it would make but little "smalls."

1275. You would only have one turn in the shoot? Yes.

1276. Do you think there would be any possibility of reducing the size of the waggons, or would that involve too great an expense? It would. If you reduce the length and breadth of the waggons, you would have to increase the height, and to do that would cause a lot of breakage at the screens. It would then amount to the same thing.

1277. It has also been suggested that the hatches might be made larger; do you think that would be a serious matter? I think it would in the building of some ships. It is rather an awkward thing getting a waggon down a hatch; it is an ugly thing to go through. I think it could be arranged by shoots or spouts to put the coal in with little breakage.

1278. Would that be better than the box system, in which the waggon is tipped into an intermediate box, which is then lowered? That would entail a lot of extra work. I remember a time here when they used to wheel it on board with barrows.

1279. You think the box system would involve great expense? It would.

1280. It would mean, practically, discarding the cranes? It would.

1281. *Mr. Pittman.*] The objection raised to distributors is, that the main hatch would have to be filled up in the ordinary way of dumping; to use the zigzag spouts, would save the coal in the wings but not in the hatchway? It would be an easy matter to shoot the coal and let it just fall down into the centre and beneath the hatch. It is only a question of a few small waggons to put down. It does not leave the main hatch or any other hatch particularly empty if you have anything to distribute it around. The coal will naturally be falling into the lowest level all the time.

1282. *President.*] Would it be possible to have waggons carrying suitable boxes for lowering down the hatches until the hold was somewhat full? They have some of the box-waggons yet in two compartments. They would go down the hatch.

1283. Why should not enough of those be provided to fill the vessel sufficiently to make a conical pile under the hatch? The difficulty would be how to manipulate the waggons at the collieries. You would want to know where you were filling into the vessel. There may be three or four collieries filling in the same ship, and the difficulty would be to provide the waggons accordingly. Boxes are out of date. They are getting rid of them as quickly as possible. The hopper is all the go now.

1284. Why, because it will carry more? We used to have the wooden boxes, but they took a lot to keep in repair.

1285. Suppose some alteration had to be made? Then the boxes would be the thing. I was in Wollongong a short time ago, and I noticed them loading a steamer. They had an immense shoot, and they used to keep that shoot pretty well filled. They had trimmers below trimming each box full. The coal going down the shoot was dependent upon what was taken away at the bottom, and it seemed to have an easy slide.

1286. To work such a system here would necessitate the entire recasting of the system at the dyke? The A. A. Company have something like it. They load a lot at their own shoots; they send very little to the dyke.

1287. But the chief trade is done at the dyke? Yes.

1288. I believe the contractor for the cranes gets now 1½d. per ton? Yes.

1289. Can you form any idea as to what extra expense would be incurred in loading the first few hundred tons from boxes instead of from the hopper, and lowering them down the hold? I cannot. It would take more time.

1290. Would it cost much more? It would cost more, and they would have to be very cautious the boxes did not catch anywhere.

1291. Would it cost half as much again? I daresay it would.

1292. Would it cost twice as much? I don't think so. I have watched them loading with the boxes, which have been wobbling about, and the man has enough to do to knock the bar up and get the coal to shoot fair over the hole. The boxes have to be tipped up at one end.

1293. Perhaps it would be better to have the boxes made with movable bottoms? That would be better still.

1294. We may say it would cost from ½d. to 1d. per ton more to adopt a more gentle method of loading? Yes.

1295. Do you think the trade of the port would suffer if it were found necessary to raise the price of coal 1d. a ton? No, I do not; nor with another 1d. on the top of that.

1296. There is no reason, therefore, why the colliery owners should not charge 1d. a ton more to pay for the extra care in shipping? There is no reason, in my opinion. Every care should be taken to preserve the lives of the poor sailors. I think everybody should try to make it easy for them. A 1d., or even 6d., should not stand in the way if it will make things better.

1297. With the additional care, the destruction of the coal would be reduced in lowering it into the holds of ships, and with it the risk of fire? That is my opinion.

1298. Do you think the Commission would be justified in making such a recommendation as has been indicated in regard to lowering the coal by boxes? I think you would be perfectly justified.

1299. Where would you begin to attack the trouble? I would begin at the pit.

1300. What would you do at the pit? Get them to send small coal away. If you can put large coal into the hold there is less fear of it than with the small coal, but the trouble lies in the way it is shipped. The large coal causes the mischief. I think you would then get a better class of coal.

1301. *Mr. Pittman.*] The larger the coal the greater the smashing? Yes.

1302. What means could be adopted to induce the colliery proprietors to send out smaller coal? They have simply to tell the men to do so. It is a great burden on the men filling large coal.

1303. *President.*] Should we recommend that the proprietors be advised or coerced in this respect? Advise them first of all. In large blocks of coal going away from the pit there may be a good amount of iron pyrites. I have known large lumps break at the mine, and exhibit 14 or 15 pounds of iron pyrites.

1304. Do you think proprietors would be willing to be advised in the matter? I do.

1305. You think moral suasion would be sufficient? I do.

1306. It would be quite unnecessary to pass regulations for the purpose? If they see the force of it I think they would soon do it.

Mr.  
J. Dixon.  
9 Sept., 1896.

- Mr. J. Dixon.  
9 Sept., 1896.
1307. *Mr. Pittman.*] What do you think a fair size to stipulate the coal should come from the mine? I think a cubic foot would be large enough for all purposes.
1308. There is no object gained by having it larger for trade purposes? No; it would show a better result at the far end, no matter where they carried it, if it were smaller. There is the rolling of the ship to be considered—the settling down of the coal and the grinding. They generally say where there is action there is heat.
1309. *President.*] Would it be inflicting much hardship on the colliery proprietors to insist on (say) the first 500 tons of a 3,000 tons cargo being loaded from boxes? It would entail a great hardship. They have not many boxes now.
1310. They are discarding them? Yes. When the companies first got them they used to be costly—£100 for a waggon and boxes.
1311. What would they cost now? They could get them for half that; but they all go in for the hoppers, both in the old country and here. I think it would be rather a difficult matter to get them to take to boxes kindly. At the mine you have a wide hopper waggon, and you can have a wide screen and get more space to clean the coal. That is where the trouble comes in. It could be done by making more screens, and having a screen for each box, but that would mean more tip-ups at the top of the pit. That would be a direct expense on the colliery proprietors. The more spread you can get on a screen the better and cleaner the coal you can get over. With a small screen a great deal of foreign matter would pass over.
1312. It has been suggested that there should be inspectors appointed to see to the loading of ships, and that they were properly trimmed;—have you thought of that? I think that would do good, if they were men up to their work.
1313. It seems that owing to captains and officers having so much work, or being too anxious to get ashore, or from some other cause, they do not supervise the loading of their ships properly? That is correct.
- 1313½. And that it is to the interest of the contractor to put the coal on board as quickly as possible? I can understand that.
1314. And that consequently some form of inspection would be advisable? I think it would be a wise thing to have.
1315. Such inspectors would be in a very responsible position, and their remuneration would have to be sufficient to place them beyond temptation? They would have to be beyond suspicion.
1316. Have you any idea what they should receive? £300 a year each.
1317. You think honest men could be got for that? I think so. Our inspectors are only getting £270, and they have a responsible position.
1318. Are they exposed to the same temptation? I do not know where the temptation comes in.
1319. The temptation is very obvious;—the stevedores merely wish to be left alone, and will pay for that? I would have the inspectors teetotallers.
1320. Are you a teetotaller? I have been a teetotaller for twenty-eight years.
1321. Have you any idea how many inspectors would be required? I have not thought the matter out.
1322. Do you see any objection to the proposal from the point of view of Government interference? I think it would be quite right. When I saw it mooted in the papers I thought it was the right thing.
1323. Do you consider colliery proprietors are benefited by your inspection? I think so.
1324. They do not object to it? They have kicked once or twice. All inspectors will get their kicks.
1325. The trade has not been hampered by it? No; some people look on inspectors as spies—spying their work. As Englishmen, we do not like the name of spy.
1326. With what object would they be spying? Perhaps going about where it was thought they should not be. It is all right if you can get men that will act honestly—men to be looked up to. We have men in this port who understand coal-trimming enough to become inspectors, and good sound men too.
1327. Would you have a head inspector, with subordinates? I would give one man a classification above the others, so that they could report to him. If they all reported from their own standpoint, things would get into chaos.
1328. There should be a head man and subordinates? Yes; supposing you gave the head man £300, and the others £250, I think you could get good men for that.

[Witness withdrew.]

THURSDAY, 10 SEPTEMBER, 1896.

[The Commission met at 2:30 p.m. at the Custom House, Newcastle.]

Present:—

PROFESSOR RICHARD THERELFALL, M.A., PRESIDENT;  
And EDWARD FISHER PITTMAN, Esq., A.R.S.M.

Mr. A. Ross sworn and examined:—

- Mr. A. Ross.  
Sept., 1896.
1329. *President.*] What is your name? Alexander Ross, junior.
1330. What is your business? Colliery manager.
1331. What colliery do you manage? The Wallsend Colliery.
1332. It has been shown that several of the ships whose cargoes have heated have been loaded with your coal;—do you know of any reason why your coal should be particularly liable to lead to those accidents? I am not aware, sir, that the loss of those vessels has been due to that fact—to over-heating or firing. I certainly have heard of ships on our coast having become over-heated, but I cannot see any reason for it.
1333. There is no question of your coal having over-heated in the case of the “Knight of St. Michael”? I have no knowledge of that, and would like to say I have had a very large experience in this district in managing coal mines, extending over nineteen years—twelve years with the Newcastle Coal-mining Company and seven years with my present Company. I have also a knowledge outside of that of ten years, or about twenty-nine or thirty years’ experience in coal-mining in this district.
1334. Are there any particular deposits of pyrites in your mine? There are some; the same as in all coal mines in this district.

1335. Neither more nor less in yours? I cannot say that there are more than I have observed in others. The percentage of brasses or pyrites is not at all large with our mine.
1336. Have you any analysis of coal from your mine? Not taken by myself.
1337. I presume the company has obtained analyses at different times? I believe they have.
1338. From whom could those analyses be obtained? I think Mr. Binney, the secretary, will have them. I think there was an analysis taken at or about the time when the "Knight of St. Michael" was in Sydney. We ship a very large quantity of coal to foreign parts, and I do not know that we have had an excessive number of heated cargoes, considering the amount we send away. I daresay we send from twelve to fifteen, or more, ships away per month.
1339. In loading your coal, do you send out very large pieces? Not extra large.
1340. I presume you do not differ from other collieries in that respect? I do not ask the miners to fill excessively large coal. I have always looked upon very large coal as being a factor tending to make more small coal, not only in the waggons when coming over the screen, but again in the ship's hold.
1341. Do you find a ready market for the small coal from the screens? We have a very large output of 500 to 600 tons a day of small coal.
1342. Where does that go to? I do not know where it goes to.
1343. Is it shipped abroad or not? I think it is shipped principally in coastal steamers.
1344. Who can tell us where it is shipped? Captain Cross, the shipping manager of our company.
1345. It has been suggested that the breakage of the coal might be reduced by lowering the first quantity down into the hold of the ship instead of letting it drop from the coamings of the hatch. In order to accomplish this it would be necessary to have small waggons for the first portion of the cargo;—is there any very grave objection to that from your point of view? There would be with us, I am afraid.
1346. What is the objection? We have such a large quantity of rolling-stock—720 7-ton waggons. With our large output of fully 1,400 to 1,500 tons of large coal it would mean a very large increase of capital cost to have to make waggons for the first loading of ships.
1347. Could your present waggons be modified or altered in any way? No.
1348. If that proposal were carried out it would mean that you would have to buy more waggons? Make or buy more.
1349. Can you give me any idea of the cost of a waggon with three boxes, holding 3 to 4 tons each? Wood or iron?
1350. Either? With wooden boxes it would cost from £50 to £60 each.
1351. Each waggon with boxes would cost £50 to £60? Yes.
1352. Can you suggest any other way in which the breakage could be reduced in dropping into the ship's hold? The only way I could suggest is having distributors or shoots in the hold of a vessel to lessen the speed of the coal in falling—that is, for the first 400 or 500 tons.
1353. So that you would distribute the coal to the side, and then trim back under the hatch? Yes.
1354. Does that appear to you to be the most feasible way of reducing the breakage under the hatch? It does. Either that or by increasing the size of the hatch, to allow the present rolling-stock to go down lower. It does occur to me that the great heating power comes from immediately under the hatchway, and of course the small coal generates heat much more rapidly than the large.
1355. Supposing the distributor were adopted, would that increase the cost of loading? It would increase it somewhat. I have not seen a distributor, and would not have much idea as to what the cost would be.
1356. Supposing it increased it 1½d. per ton for the first 1,000 tons, would it be a matter of impossibility for the coal trade to stand that? If it is finally relieved of the heating, I don't think 1d. or 1½d. would be grumbled at by whoever the party might be who had to bear it.
1357. Is it a fact that at the present time you are unable to insure your ships? That I cannot say.
1358. Supposing that by spending, say, 1½d. per ton in loading part of the cargo the insurance rates were reduced, it seems reasonable to think that the final result might be more favourable than the present prices? Yes, I quite agree with that.
1359. You have fires, of course, in the gobs in your mine occasionally? I have never had a fire in any mine that I have had any connection with in my life.
1360. It is very usual to have fires in gobs? It is not very usual in this district. I only know of one single instance that is attributable to spontaneous combustion.
1361. *Mr. Pittman.*] What colliery was that in? The A.A. Company's.
1362. In which pit? The No. 2.
1363. Is that the sea pit? No; the Borehole Pit.
1364. Can you tell us approximately how many waggons would be required, having two boxes, to carry out the system of lowering the first portion of the cargo into the hold of a ship? We have 720 waggons to keep our trade going, and to load the first 500 tons of a shipment would require, approximately, one-fourth of that number.
1365. 180 waggons? Yes.
1366. Yours may be regarded as the largest colliery in the district? The largest in the Colony.
1367. So that number may be regarded as the maximum? I do not say that.
1368. It is reasonable to suppose that no other colliery would require a larger number? I do not think any colliery would require more than that quantity—say 200 waggons.
1369. *President.*] What is the capital of your company? £100,000.
1370. All paid up? I think so.
1371. *Mr. Pittman.*] If capitalised, the cost of the waggons would represent £450 a year at 5 per cent.? Yes.
1372. *President.*] In what position is the coal trade just now;—is it in a flourishing condition? It is flourishing, but that is attributable to our unfortunate three months' strike. We are doing the trade that accumulated during that time. Up to the present we have had, so I am informed by our secretary, very few, if any, orders from foreign parts since we started.
1373. So that, although there is somewhat of a boom at present, it is not really favourable trade? No; there is no doubt the strike has thrown back the fine trade that was beginning to grow in Newcastle.
1374. Where is the coal obtained from now? I cannot say. There was a splendid boom and increased confidence beginning in the Newcastle district in regard to foreign trade up to the commencement of that strike. I could not keep pace with it. It was gaining on me every day, although we had such a large output.

Mr. A. Ross.  
10 Sept., 1896.

- Mr. A. Ross. 1375. *Mr. Pittman.*] Did you notice in the newspapers last week an account of the "Flora P. Stafford" being abandoned on account of her cargo taking fire? Yes.
- 10 Sept., 1896. 1376. Do you know whether that vessel was loaded from your colliery? I do not; I do not think so, however.
1377. *President.*] Is there anything you would like to lay before the Commission? Going back to your first question as to whether I could attribute a reason why our ships fired, I do not, in the first place, attribute it to the presence of iron pyrites, from my long experience in the coal trade in Newcastle, and seeing such large quantities of iron pyrites heaped up and alongside of coal-heaps. While I have had several small-coal heaps fire spontaneously, I have never observed iron pyrites in heaps fire at all.
1378. You are referring to iron pyrites alone? There was a certain mixture of small coal with the iron pyrites.
1379. But the greater part was iron pyrites? Yes; there is a very small percentage of iron pyrites in our seam, as well as in all seams in our district, but all, more or less, have iron pyrites in them. The fires which have occurred lately have been first attributable, in my opinion, to the grinding of the coal into a fine state under the hatchway. I believe, but cannot speak from experience, that improper trimming has very often had a great deal to do with the rubbing of the coals in the cargo when the ship is rolling about at sea, and creating heat. It has been my experience, in observation, that most ships that have been missing or have taken fire have been loaded, in our greatest heat—during our summer months. Many days last summer the sun was 130°, and then at night a heavy shower of rain might come and moisten the coal, thus generating heat. I know that opinion is adverse to that of many best authorities. We have at our mine a very large wooden hopper containing about 3,000 tons of small coal when filled. I have, before any rain, experimented in that hopper to ascertain the heat—not by a thermometer, but by a rod of iron; and also after a shower of rain—not immediately after, but a fair time after.
1380. What do you call a fair time? A few days; sometimes I have gone as long as a week after and found much more heat generated after rain, and have also found the heat ease off if the weather continued fine.
1381. Was the heat generated at a point to which the damp could have penetrated? It could percolate right through the small coal. It is about 40 to 50 feet thick in the centre. The rain passes right through the small coal.
1382. Does it? It does.
1383. You have tested the heap of small coal after it has been sodden by rain, and have found that within a certain length of time thereafter the heating has been greater than under similar circumstances, when the coal was dry? Yes; when I have found that I have eased off the coal in the hopper. I have three roads underneath it.
1384. Would there be any chance of your being able to place that hopper of coal at the disposal of the Commission, or is it in daily use? It is not in daily use, and I have not the least objection, but permission must be first obtained from our secretary. Large quantities of coal are shipped in Newcastle by night, and there must necessarily be a deposition of dew. I have found the lighter the rain the greater the heat in my hopper. After a very heavy rain I have not taken the trouble to test it. The lighter the rain the more probability there was of heating.
1385. What you call light rain was sufficient, I presume, to allow the moisture to get into the coal? Yes.
1386. You refer to ships having been lost chiefly when loaded in very hot weather;—is that the result of real experience, or is it an impression you have formed? It is really from observation with the secretary, Mr. Binney. I think the "Knight of St. Michael" was loaded during the greatest heat wave we experienced last summer. I think the cargo of the ship following was heated: it heated coming from Sydney to Newcastle. She was stiffened in Sydney.
1387. *Mr. Pittman.*] The "Ellen A. Read"? I think that was the name. I think her first shipment was shipped here during a very hot day and sent to Sydney.
1388. *President.*] Is there any record kept of temperature? Not, I believe, in Newcastle. The Observatory in Sydney has telegrams every day from Newcastle as to rain and heat.
1389. It is a fact, of course, that the firing and heating of coal cargoes has become greater in recent years? I must admit that from what I hear.
1390. Have you any idea as to the cause? Last summer was the hottest I have experienced.
1391. This trouble started before last summer? I attribute it to the fact of our ships becoming much larger than they were. It was a very rare occurrence in years gone by for a ship to reach 2,000 tons in Newcastle; now it is not a rare occurrence to have them 4,000 tons. A large number come between 3,000 to 4,000 tons. I do not know how many ships have loaded with our coal during the last few years, but I have a list of the quantities of coal shipped during the last sixteen years.
1392. *Mr. Pittman.*] Have you been down the Borehole Pit? Very frequently.
1393. Did it strike you there was an incontestably larger amount of pyrites in the coal there than in any other pits you are acquainted with? It did not.
1394. Did you notice the pyrites occurred in large saucer-shaped aggregations? I noticed that.
1395. Do they occur frequently? No, not very frequently. I never saw the fire really burn there. In conversation with the manager, he and I agreed it was owing to the increased richness of the coal going towards Newcastle.
1396. *President.*] What do you mean by increased richness? The Borehole Pit is about 2 miles from Newcastle; and as they come towards Newcastle the seam thickens, and also increases in richness.
1397. What is richness? In giving more gas per ton.
1398. *Mr. Pittman.*] In having more hydro-carbons? Yes.
1399. It is a semi-bituminous coal? Yes.
1400. Were the heaps of slack in which the fires you speak of occurred on the surface? Yes.
1401. The fires were not due to the presence of an abnormal amount of pyrites? I do not think so.
1402. Have you known fires occur in the heaps of slack at the other collieries in the district? I have known others, but they were only really heaps of slack by itself. I do not think iron pyrites was mixed through them.
1403. They were similar coals to your own? Yes.

[Witness withdrew.]

Mr.

Mr. H. Harper sworn and examined:—

Mr.  
H. Harper.

10 Sept., 1896.

1404. What is your name? Henry Harper.  
 1405. And your business? I am a mining engineer.  
 1406. Are you engaged practically in that profession in Newcastle? Not now; but I have been all my life.  
 1407. You are, I believe, the proprietor of an appliance for spreading coal in vessels? Yes.  
 1408. What is it made of? Iron entirely.  
 1409. The idea is to provide a channel to shoot the coal down slowly into the hold? Yes, instead of dropping down the main hatch it is shipped on to the apparatus and runs where required.  
 1410. Have you ever loaded a ship with this appliance? No; we have always had nothing else but opposition from the stevedores and all interested in the shipment of coal.  
 1411. Why are they opposed to it? I suppose they think it is going to reduce the labour; that it is going to do away with the cost of trimming. It will, no doubt, do that when properly used.  
 1412. Why should stevedores be opposed to it on those grounds? Because they would, perhaps, have to do the work at a reduced rate.  
 1413. We have heard that a difficulty lies in the time occupied in getting the appliance in and out of the ship? It can be put down with four men in half-an-hour. It can be taken out in branches between the intervals in the shipping of the waggons.  
 1414. You have never had a fair trial of it? No; we have had it altered and made ready to put in the ship at any time.  
 1415. You have already made an attempt to put it on board a ship? Yes; but there was a misunderstanding between the captain and me about a beam that was across the ship. The hatch was big enough—16 feet in length, but the beam reduced it to 11 feet.  
 1416. Can you only use it in a large hatch? We can work it now in a 12-foot hatch.  
 1417. By what width? 9 feet.  
 1418. So that you could work it in a hatch that was too small to allow a waggon to be lowered through? Yes.  
 1419. Could you work it, as a general rule, in the fore and after hatches of a ship? If we make any more we could make them a little smaller. It is only necessary to put one end in those hatches.  
 1420. What is the cost of your apparatus? About £60 to £70.  
 1421. Would that include patent rights? Yes, everything.  
 1422. Who would you regard as a possible purchaser of the apparatus? I would sooner let it on a royalty. There is so much opposition to it, and shipping is a bit out of my line.  
 1423. So that you would charge a royalty to the stevedores who made use of it? That is it, sir.  
 1424. It seems fairly obvious that with this apparatus the coal would have to be trimmed back to fill up the well of the hatch? Its own gravity will bring it in. As we take the sections off the coal will run back into the main hatch under the apparatus.  
 1425. You consider the coal will not require to be trimmed in? Not the slightest bit.  
 1426. *Mr. Pittman.* What is the material point of difference between your patent and Spencer's? I have never seen Spencer's.  
 1427. What is the weight of your machine? About 35 cwt.  
 1428. We have been told it weighed 3 or 4 tons? Nonsense; Morrison, the maker, will tell you.  
 1429. Perhaps the first machine you made was heavier? No, sir; we have only made one.

[Witness withdrew.]

Mr. W. Marsden sworn and examined:—

Mr.  
W. Marsden.

10 Sept., 1896.

1430. What is your name? William Marsden.  
 1431. What is your business? Stevedore.  
 1432. Did you take part in a deputation to the Premier on the 20th August last? Yes.  
 1433. What was the object of that deputation? To try to better the position of the stevedore and the working classes generally.  
 1434. Does that include the trimmers? Yes.  
 1435. Are your interests and those of the trimmers identical, or in opposition to each other? They are identical, I should imagine.  
 1436. You are paid so much per ton for trimming? Yes.  
 1437. You pay the trimmers so much an hour? Yes.  
 1438. The amount of money you make on a job depends on the difference between what you pay the trimmers and what you receive for the work? Yes.  
 1439. It looks at first then as if your interests were exactly opposite? Yes, it does, but we proved they are not in the co-operation we made when we went to the Premier.  
 1440. You refer to the two trimmers on the deputation? Yes.  
 1441. What was it you went to the Premier to obtain? To try to bring about the licensing of stevedores, if possible, for stevedores to go through a proper practical examination.  
 1442. Why were you anxious to have the stevedores licensed? Because Tom, Dick and Harry come from the bush, go to an agent who gives them a ship and very often nobody gets any money from him and sometimes you never hear of the ship again.  
 1443. We have had a list prepared of casualties from shifting cargoes, would you be surprised to learn that the names of well-known trimmers occupy a very conspicuous place in that list? Quite correct, that man does 50 ships to anybody else's one.  
 1444. Which man do you refer to? Mr. Russell. I am of opinion that no matter how some ships were trimmed they would shift coal.  
 1445. It was solely in the interest of the safety of the ships that you called on the Premier, to prevent them being trimmed by incompetent people? Another thing, the stevedore does not finish his work as he should do. I admit it myself. The ship may be safe but she could be made a little safer, made perfectly safe. I know very well there are jobs, with the competition that exists, where you have to use every point imaginable to get that work done to make it pay.  
 1446. You must not pay your trimmers too much I suppose? I pay them the highest rate going. I have knocked off sailing ships.

1447.

- Mr. W. Marsden. 1417. I cannot see that the issue of a certificate will prevent stevedores slumming their work? Not if you have a proper practical man to see the ships thoroughly trimmed.
1418. Your proposal involves the appointment of an inspector as well as the issue of certificates? Yes.
- 10 Sept., 1896. 1419. Was that part of your proposal to the Premier? Mr. Reid said he would not protect either the stevedores or the trimmers, but he would protect the lives for the future, if our statements were true.
1450. Did you ask Mr. Reid to adopt the system of inspection? I do not think we mentioned it; but our ideas were that.
1451. Your proposal would have the effect of reducing the competition in stevedoring business? I believe it would.
1452. There would be money in it for somebody? I do not know that there would be money in it. I reckon if it came to the point the Government could classify ships for trimming.
1453. So that there would be a Government rate for trimming? Yes; the Government at one time gave all the trimming to Mr. Russell.
1454. That was sometime ago? Yes.
1455. The effect of licensing would be to reduce the number of tenderers? I believe it would; it would keep a lot from going into the field that were not qualified.
1456. The people who come in from the bush obtain work by putting in absurdly low prices? Yes, as a rule, and they clear away without paying their men.
1457. The adoption of the licensing system would benefit you financially? Certainly; better than what I am now.
1458. Mr. Pittman.] Have you ever used a distributor at all? No, sir.
1459. Or seen one used? No; I have seen the machine, but have not seen it used.
1460. President.] Have you any objection to using such appliances? I have no objection so long as I am paid for it.
1461. Do you mean to say it costs more to use these machines? A lot more.
1462. Can you explain how you know it would cost much more to use them? I have seen it landed on board, but I have never seen it in the hatchway.
1463. How long would it take to lift on board? Spencer's patent I know, I should think it would take an hour or two to rig it up properly.
1464. How much does it weigh? The centre part of it, I suppose; about two tons.
1465. Do you know the whole thing only weighs 35 cwt.; I do not see how it would take an hour to lift that on board? It would take me an hour. Some men might do it quicker.
1466. One person might not be able to lift it on board, but it could be done by mechanical appliances? Yes.
1467. Would it take an hour then? I would not like to say much about it; I have never put it on board.
1468. Suppose some similar sort of appliance had to be used in ships above a certain size it would lead to extra expense? Yes.
1469. You trim for about 3d. to 3½d. a ton, do you not? I think, as a rule, it is a good deal less.
1470. What is the price? I put in tenders at 3d. per ton, and I cannot get them for that. I think they average between 2d. and 3d. per ton at present.
1471. Would 1d. extra a ton cover the cost of using the distributor? The men we employ have rules that you have to pay them while you are running up the hatch, and we should have to pay the same with this machine.
1472. Mr. Pittman.] You have to pay for labour you are not using? Yes.
1473. Is it not a fact that some of the stevedores do not employ the men while they are running up the hatch? This last three or four years the rules have been lying dormant. Since the strike they have brought these rules forward again. We discussed them at a meeting last Monday night, I think it was.
1474. Do not some of the stevedores at the present time run up the hatch without employing trimmers? Yes; the question is still at issue.
1475. President.] So that there are some stevedores who pay and others who will not? Some do not pay. The trimmers are trying to force their rules on us, and we should have to get extra money to pay them.
1476. In fact they are trying to squeeze you, and you would have to squeeze the ship-owner? Yes.
1477. You say the rules have been in abeyance for four years? Yes. When we take on labour we are not allowed to sack the labour.
1478. You mean to say you are not allowed to sack a man who is incompetent or a drunkard? Yes; I have power then.
1479. Under what circumstances have you not power to sack him? You are not allowed to sack a man now while the hatch is running up and then take him on again after the hatch is run up.
1480. You have to keep him standing idle while the hatch is running up? Yes, unless you have something else for him to do connected with trimming.
1481. We have had a great deal of evidence to the effect that many stevedores are in the habit of making what the trimmers consider an unprofitable contract; and then trying to make money by not putting labour on until the hatches are absolutely run up? The stevedores have the last three or four years been putting an extra quantity of stiffening into ships, no doubt. In the matter of stiffening, they give the stevedores the privilege of putting up one, two, or three hatches, whichever he likes.
1482. I suppose putting the coal in for stiffening is the same operation as for the other portion of the cargo? Yes.
1483. Mr. Pittman.] Is there any rule of the Union whereby a stevedore employing a certain number of trimmers to commence the trimming of a cargo must keep all the men on to the finish of the work? That is in the rules—that is the gang rule.
1484. We have been told that certain men have worked for as long as thirty hours trimming a ship;—is there any rule of the Union to explain why that is? No; there is a rule which says they should not do it.
1485. Is it their own wish to work thirty hours at a time? I am almost sure it is their own wish, as a rule.
1486. Is it not against your interest as a master trimmer to employ a man who has been working over eight hours—is it not a fact he cannot do such good work then? It is.
1487. Why do you sanction a custom that leads to the employment of a man as long as thirty hours? There are little things that crop up I don't care to mention to anyone. When there is a bit of a rush on he

he won't come for you, and when I get my own men I keep them, and let them stop on as long as they like. I have a steamer, the "Argus." My men went there yesterday at dinner-time and only worked four hours. I relieved them at 7 o'clock; this morning I relieved that gang at 6; at night I relieve them again at 6; to-morrow morning I relieve them at 6, and that gang will finish her.

Mr.  
W. Marsden.  
10 Sept., 1896.

1488. Do not the men complain about having the work taken from them? In many instances; but not since we discussed the rules.

1489. They are kept on because the master trimmer finds a difficulty in getting other men to suit him—is that it? Some bosses get a gang of men, and a good gang perhaps, and get them used to their boats, and don't care about taking on any, perhaps, inferior men.

1490. They would sooner employ men absolutely unfit for work by reason of exhaustion than take on fresh men? That is so. The bosses are having a meeting on Saturday, I think, over the full-gang rule. Many ships come in from sea, and you go to a hatch that only wants eight men to trim it, but perhaps the main hatch wants twenty men, and you have to have the twenty from the start.

1491. *Mr. Pittman.*] That is what they want to force upon you? They did it for many years, but they have not been doing it for the last few years.

1492. They want you to pay twelve men while remaining idle? Yes. I have been one of those but all night and never struck a blow, and got paid for it.

1493. *President.*] You have been a working trimmer yourself? Yes, twenty-four years; in nothing else but the coal trade.

1494. You know the ins and outs of the business? I was one who helped to make the rules. Where the trouble comes in is that there are two different classes of labour here; one class works for 1s. an hour, the other class for 1s. 3d. and 1s. 9d.

1495. *Mr. Pittman.*] What do they pay the first class for night-work? 1s. 6d.

1496. Are those men skilled trimmers? No; they are here to-day and gone to-morrow. I have seen them trimming, and they have shipped in the same vessel that they trimmed.

1497. *President.*] Have you heard of any accidents to ships in which you have been engaged? Yes.

1498. Can you mention a case? The "Ben Cruachan."

1499. Did you trim her as stevedore or as working trimmer? As stevedore.

1500. Was there any abnormal smashing of coal on that ship? No. She had coal in the forepeak, but I would not swear whether it was Newcastle coal or not. The fire occurred in the forepeak in the harbour.

1501. Was it due to a lighted candle, do you think? We were not down the forepeak.

1502. You do not know anything about it? I know something about a lighted candle. I happen to be the gentleman referred to by one witness in regard to a lighted candle on the "Easby," which it was thought caught the bulkhead at sea.

1503. What happened on the "Easby"? A lighted candle was left, and she fired in the bulkhead.

1504. Did you leave the candle alight? I got the blame for it. I denied it. I don't believe I did or I should tell you. I was on the "Aristomenes"; she was on fire. I have taken notice of all the ships which have had fires in the harbour, and the fires have been in the forepeak, or under the transom, or in where the dunnage stuff lies.

1505. Do you mean to say the majority of ships afire in the harbour have fired in places other than under the main hatch? Yes.

1506. Is that from your own experience? I have just quoted ships.

1507. And you attribute them to the rubbish thrown fore and aft? I would not like to express my opinion as to how some fire.

1508. You do not mean to imply that they have been purposely set on fire? I do not know whether I am liable for expressing my opinion that way.

1509. *Mr. Pittman.*] Did the "Ben Cruachan's" cargo heat simply, or was she afire? Afire.

1510. You do not know whether it was due to the coal? It might have been a light dropped down; in fact, they did not know themselves.

1511. You could not get any satisfactory information as to whether the fire originated amongst the coal spontaneously? No. There is one thing I have noticed in the coal, and that is the fuse. I got a piece to-day a foot long. It was sticking out of the corner of the hatch, and it was dry, and I put a match to it and it went off. Sometimes you see it four or five times a day—fuse left in the coal that never went off.

[Witness withdrew.]

Mr. W. R. Logan sworn and examined:—

1512. *President.*] What is your name? William Robert Logan.

1513. And your business? I have no business. I am a retired public officer. I was Sub-Collector of Customs at Newcastle, and have just retired from the Service.

Mr.  
W. R. Logan.  
10 Sept., 1896.

1514. *Mr. Pittman.*] Were you for many years in the Service? Forty-nine years and five months; twenty-seven years and five months in the Customs, and twenty-one years in the Immigration Department, and one year previously in the Executive Council Office. I was transferred from the Immigration Department to the Customs in 1869.

1515. Did you have a large knowledge of the coal trade during your term of office here? Nothing except what was obtained from the facts put before me—the statistics in connection with the clearing of the vessel's cargo of coal. I never left the office from one week's end to another.

1516. Can you tell us anything about the heating of coal cargoes? Only that I had some correspondence with the Board of Trade some time ago in regard to the loss of the "Gowanburn," "Colintrave," and others, and I could obtain the papers for you. They sent out to ask me to make certain inquiries. They were holding an inquiry, or about to do so, and asked me for information, which I obtained.

1517. *President.*] How long ago is this? In 1894, I think.

1518. Did the inquiries refer to the shifting of cargoes or to heating? They wanted to find out the cause of the fatalities—whether they were due to the shifting of cargo or other cause. We went so far as to obtain statements on oath from various experts with whose evidence we sent a diagram showing the section of the vessel in each case, the way she was loaded, and how she was loaded, from information obtained from stevedores and others.

1519.

- Mr. W. R. Logan.  
10 Sept., 1896.
1519. *Mr. Pittman.*] Can you give us any satisfactory reason why trimmers are sometimes employed for as long as thirty hours continuously? Perhaps it is because they want to get the trucks empty as quickly as possible for the colliery.
1520. Do you not think they would get them empty more quickly if they employed men in shifts? You would suppose so. I could not tell you the exact reason. The ships are obliged to take a certain quantity of coal every day under the regulations.
1521. They would ship a greater quantity if they worked in shifts? Yes.
1522. The men get greater pay at night? Yes. It creates a monopoly of work to a certain number of men.
1523. You do not know why the master trimmers adopt the practice? I cannot give you any information on this point. It may have been to try to reduce the time of vessels loading. We used to give a ship perhaps an hour to get alongside, and another hour to get away, but for the rest of the time tonnage rates were charged.
1524. How much used you to charge a ton? Half-penny a ton per day for a certain period, and  $\frac{1}{4}$ d. later on. The charges are regulated by the "Wharfage and Tonnage Rates Act, 1880." That Act is administered by the Superintendent of Public Wharfs in Sydney, but here, I was appointed to collect the rates, with the assistance of the Railway Berthing Master and a wharfinger appointed independently of the Railway Department over at Stockton.

[Witness withdrew.]

Mr. J. O'Sullivan sworn and examined:—

- Mr. J. O'Sullivan.  
10 Sept., 1896.
1525. *President.*] Your name is John O'Sullivan? Yes.
1526. And your business? Stevedore.
1527. Have you any other business? No.
1528. How long have you been a master trimmer? Over thirty years as a stevedore—twenty years as a master-stevedore.
1529. Have you ever had a ship lost trimmed by you? Only one. She had 650 tons of shale and tallow in the bottom of her.
1530. Under the coal? Yes; the coal was on top.
1531. *Mr. Pittman.*] Kerosene shale? Yes.
1532. *President.*] Is it known what became of her? She was never heard of. I told them she would never reach the other end.
1533. What made you think so? The last of the coal would make her shift either way; she was cranky. Captain Fisher was the master of the ship.
1534. Was it a ship called the "Cumbrae"? Yes, that's the name.
1535. In your opinion, she was too tender? Yes; there was not an ounce of room in the ship, and the captain insisted upon putting the coal in.
1536. So that it was too high up in the ship? Yes.
1537. Was she loaded in that manner by the captain's orders? Yes; he made me a present of a new hat for getting the coal in.
1538. What is the amount of the captain's "new hat"? As much as they can get, but all masters are not alike.
1539. What does it generally amount to? I cannot say. The "new hat" they get from me does not amount to much.
1540. What is the usual price paid? I should say £5.
1541. What is the stevedore's object in giving the captain a "new hat;" is it for not looking after the job? I could not really say what it is.
1542. When is it given? At the completion of the work, I suppose, if it is given.
1543. So that it would include the captain's good offices in leaving the master trimmer alone? Certainly it would.
1544. You have never given the captain a "new hat"? I cannot say that I have not given a "new hat" on different occasions, but very seldom.
1545. As a matter of fact, it would be necessary, or else you would lose the job? You may have a good and easy ship, and you might give the captain a "new hat."
1546. When you might legitimately give the captain a present? Yes.
1547. Because a stevedore gives the captain a present, it does not necessarily mean that the captain has sold the trimming to him or left him alone? Not at all. Some masters of ships will never look after the trimming; another will send an officer down. There are not many of this sort, you can generally do as you like.
1548. Was the captain of the "Cumbrae" one of that sort? He was a very careful man.
1549. He made a mistake then? He did. He was a careful man; I have loaded ships that Captain Fisher was master of four times.
1550. Have you loaded any cargo that heated? I do not know of any.
1551. Did you ever see the "Garsdale"? Yes.
1552. She was an iron ship of 1,645 tons register, loaded with Wallsend coal in December, 1895;—you have forgotten her? Did I load her?
1553. You appear as having done so—she arrived at Valparaiso with cargo heated? Oh, yes; I loaded the "Garsdale."
1554. Was she loaded in the usual way? Yes; I was there most of the time she was loading.
1555. The cargo was dropped down the main hatch? Yes.
1556. Is there not an excessive quantity of fine coal produced by that practice? Yes.
1557. She was loaded in hot weather? I cannot remember the month.
1558. On December the 10th, 1895? It would be in the hottest weather we have.
1559. What is your opinion as to the use of the distributor? I think no ship should be trimmed without it. If the small coal is the cause of heating, then no ship should take her cargo in without it.
1560. Suppose small coal is not the cause of heating, what would you put it down to? I should think it might possibly be from dropping a candlestick while the men are at breakfast. I have had to send men home for leaving a candle alight in the hold. I have found candles burning in the coal—not the coal, but the wick.
1561. Once or twice? Not more than three times altogether.

1562. Still, for every time you discovered it, you might have failed to discover it? It might have happened a good many times.

1563. I understand it is a thing that might very easily happen? When it comes to the last bit of candle it may drop, but they immediately put it out.

1564. If they see it? They must see it, because they are working by the candle, and they put a fresh candle in.

1565. Each man has his own candle? Yes, and candlestick.

1566. Do the men often leave the candles burning in the hold? They would do so unless you had proper supervision. I send a man home when he does it.

1567. You get rid of him? Yes, for a time, and then put him on again. They sing out, "Put your candles out," when they knock off for meals.

1568. Do you think a cargo could be set on fire by a candle? I have never tried it, and cannot say. It seems to me that ninety-nine times out of a hundred a cargo would not be set on fire by a candle. I have seen at the dyke the carbons drop from the electric lights right on top of the coal in the waggons, and then tipped immediately into the ship. Captain Porter, of the "Avonia," saw it happen.

1569. Was the carbon hot? It dropped down red hot. I saw that happen the other night. If it dropped in with the smoke and dust you would not notice it was afire when it came into the ship.

1570. But if any fire did occur it would get put out by the other coal? You would think so.

1571. Why is there so much opposition on the part of other master trimmers to the use of the distributor? It is harder to trim a ship with it. It costs more money to trim a ship with it.

1572. If it were made compulsory to trim a ship by the use of a distributor, it would have the effect of increasing trimming prices? Yes.

1573. The opposition on the part of master trimmers would then disappear? Of course it would. I have used it half a dozen times. I got  $\frac{3}{4}$ d. a ton more for the trimming.

1574. Does that  $\frac{3}{4}$ d. a ton go in wages to the trimmers? Yes, it costs more money.

1575. It costs more for labour? It takes longer, and you have the expense of putting it in and taking it out; you have to dig it out of your ship's main-hatch when nearly done.

1576. Have you had any sign of an accident when using this distributor? There is no possibility of an accident with it if you know how to put it in and how to use it.

1577. There is no difficulty about using it at all, with the exception of the extra trouble involved? The captain of the ship had got instructions to put it up. They showed me what to do with it, and afterwards there is no trouble, only the extra time. When the ship comes under you have it ready.

1578. Can you put Spencer's distributor into the fore-hatch as well as the main-hatch? The smaller portion of it.

1579. So that you can reduce the breakage in the fore and after hatches, as well as in the main-hatch? Just as well.

1580. What does Spencer's apparatus weigh? The big sheets, I should imagine, weigh a ton.

1581. What about Harper's apparatus? I would not like to say anything about it.

1582. You have not used it? I am not likely to.

1583. Why not? Not from what I have seen of it; but he tells me he has altered it now. (Witness here described the use of the appliance by means of a diagram.)

1584. Is there any reason other than mere prejudice why the master trimmers do not like to use the distributor? They do not like to be bothered with it. Some of the master trimmers never look at the ship getting trimmed; they never go down the hold; they don't know the way down the ship's hatch.

1585. What was the object of the deputation to the Premier? I do not know. I would not go with them.

1586. Supposing they attained their object, in allowing only licensed stevedores to load a ship, would that lead to reduced competition? Of course.

1587. That might reasonably be accepted as leading to contracts for trimming being obtained at higher prices? No doubt.

1588. What, in your opinion, was the object of the deputation? Some while before that they wanted us to take ship and ship about, and I said, "No." I do not know what their object was: I would not join them.

1589. *Mr. Pittman.*] You say you have actually trimmed several ships with this distributor? I have trimmed, I think, about six.

1590. You have trimmed all that have been trimmed? Yes.

1591. And the extra price you received was  $\frac{3}{4}$ d. per ton? Yes. I would not trim a ship with it without getting  $\frac{3}{4}$ d. above the regular price.

1592. Are you prepared to say definitely that you can properly fill a ship in the fore-hatch with one of these distributors? You can only put your shoot on one end; the fore end is always blocked up.

1593. But they are practicable? No doubt about it.

1594. Have the ships which you have trimmed with the distributor had average-sized fore-hatches? They were small enough.

1595. Smaller than the average hatch? Yes; the main hatches were a good size, but not the fore hatches.

1596. What size were the fore-hatches? Not more than 10 feet long, I suppose.

1597. We have seen some fore-hatches less than 10 feet? Iron ships have generally 10-foot fore-hatches; some 15 feet.

1598. *President.*] We have heard some curious stories about men working thirty hours together;—can you tell us how it can be to the advantage of the employer to allow men to work such long hours? No man should be allowed to work more than twenty hours at the outside.

1599. Can a trimmer keep to his work for twenty hours? He can.

1600. He can keep working fairly well? They have worked forty and forty-five hours. They have never worked for me like that, as a rule. If a man starts at 6 o'clock, I let him work to 12 at night.

1601. That is eighteen hours? I have had plenty work a day and night.

1602. And have they been able to work? Yes.

1603. That is a wonderful physical feat? Coal trimming is not so heavy as other work. Men have a sit down for an hour while the hatch is running up; or an hour and a half.

Mr.  
J. O'Sullivan.  
10 Sept., 1896.

- Mr. J. O'Sullivan.  
10 Sept., 1896.
1604. And during their meal times? Yes. The men are not working the twenty hours. There is scarcely any hatch of a ship that will take twenty hours to load.
1605. What is the reason for allowing a man to work even as long as twenty hours;—does it pay you to keep them at work for that time? If men go on and don't start in the morning at 7 o'clock they growl. If you send them off at night, they say they don't get a night at the ship. The men themselves growl. They look for it, and demand almost to work at night.
1606. Are you conversant with these rules [handing witness the rules of the Trimmers' Union (*Appendix N.*), which he read]? Yes; those are the Union rules—the rules the trimmers work under.
1607. Is there anything in those rules to lead you to employ them for such long hours? Nothing.
1608. They simply like to work? Yes; if you send them home they are annoyed, and say, "Why don't you give us a show to work at night?"
1609. Night work being rather better paid for than day work, they like to get it? Yes.
1610. It has also appeared before us that trimmers do not get more than three days' work a week? Oh! yes they do. Some of them get more work than that. Some of them do not; some of them are drunk as soon as they get paid. They are not fit to go to work again.
1611. Supposing a man to be reasonably sober, he can look forward to more than three days work a week? I have had men receiving £4 15s. a week ever since the strike.
1612. It has been suggested that a comparatively easy way of compelling, to a certain extent, proper trimming, would be to put bulkheads fore and aft? A bulkhead, in my opinion, is worth nothing in a ship if the coal is put down as it should be. English coal is much heavier than ours, and you would have to keep shifting the bulkheads.
1613. You do not believe in the bulkhead method? You would have to have movable ones. If the coal is trimmed properly it can't shift.
1614. Whose business is it to see the ship trimmed right? The stevedore's.
1615. Is it not the captain's business? He should send an officer down.
1616. Does he as a rule? In many cases they don't.
1617. Is that on account of the "new hat"? I should not say so. It is carelessness in some cases. They tell the officers to look after it, and in many cases they do not. An officer may get a bottle of grog not to look after it. There are many shipmasters who will go down themselves.
1618. There is nothing to prevent them going down if they desire to? Nothing whatever.
1619. And you would always try to meet your skipper, would you? I like to see him go down. He knows the work is done satisfactorily, and you are satisfied.
1620. It has been proposed that inspectors should be appointed to see that ships are trimmed properly? I think the appointment of inspectors would be a good thing.
1621. I suppose there would be no difficulty in finding suitable men? Not at all.
1622. What do you suppose suitable men could be obtained for? A man would want £4 a week to take the job, that is, a good man, and that would be quite enough for him.
1623. How many inspectors would be required to look after the trimming? It would only take two—one for day and one for night.
1624. Could they do it all? There are only ten cranes as a rule working. The coastal steamers are all loaded in the daytime, and have bulkheads and compartments; you would not want to look after them. All you would have to attend to would be sailing ships, and there are never more than ten working. One man could go down once before dinner and once after dinner to see that everything was right. A practical man who knows where they could do any dodging is all that is required.
1625. Would it not be pretty hard work for two men? I don't think so.
1626. It would mean twelve hours a day? He would not be working; he would only be going around looking. A practical man knows where a ship should be filled, and knows what coal she wants.
1627. Would such men have to be obtained in this port? There are plenty of men in Sydney that have the desired knowledge.
1628. Do you think stevedores would be opposed to the appointment of inspectors? Some of them would. Any man that did his work properly would not care.
1629. Do you think captains of ships would object? I am sure they would be very pleased with it, for the simple reason they would know there was some proper supervision. I think captains would be very willing to pay portion of the expense.

[Witness withdrew.]

FRIDAY, 11 SEPTEMBER, 1896.

[The Commission met at 2 o'clock p.m. at the Custom House, Newcastle.]

Present:—

PROFESSOR RICHARD THRELFALL, M.A., PRESIDENT;

And EDWARD FISHER PITTMAN, Esq., A.R.S.M.

Captain H. R. Cross sworn and examined.

- Capt. H. R. Cross.  
11 Sept., 1896.
1630. *President.*] What is your name? Herbert Robert Cross.
1631. You are Chairman of the Marine Board? Yes.
1632. Is there any power which would enable you, by means of your position, to see that the trimming of ships was properly carried out? That would depend entirely whether it comes under the amended Navigation Act, which deals with unseaworthy ships. I doubt it. It has never been attempted.
1633. In your opinion, would an improperly trimmed ship be unseaworthy to a certain extent? If it could be ascertained that she was improperly trimmed.
1634. Does not the present Act give you power to go on board a British ship? As regards trimming it would be useless unless the work was watched from the first.
1635. *President (after reading sub-section 4 of section 2 of the Act 45 Vic., No. 6.)* It will be admitted that this Act covers action against improper loading and ballasting? According to the wording of it, there is no question it does, but it has never been exercised.

1636.

1636. How many inspectors do you suppose would be necessary to supervise the trimming of the port? There are, say, a dozen ships loading at one time, night and day, and so long as trade is brisk you would want an inspector for every ship almost. You would want a relay of inspectors so that the night men could relieve the day men.

Capt.  
H. R. Cross.  
11 Sept., 1896.

1637. It does not come within your duty to inspect the loading of coal? No.

1638. It is really a matter of impression as to the number of inspectors that would be required? Yes, but to carry the inspection out fully, I maintain that for a person to swear to proper loading of a ship he must be there from the commencement of the loading to the end, and that is a duty which should devolve upon the captain and officers, as in the loading of any other kind of cargo. The safety of the ship is their care and responsibility.

1639. As a matter of fact, they do not properly supervise the trimming of a ship? I cannot say that. I should be very sorry to say they did not do their duty.

1640. It may be taken they do not supervise the loading. I think the evidence on that point is final? I think it is mostly left to the trimmers, but not in all cases; there are captains and captains.

1641. *Mr. Pittman.*] Are you prepared to say that one inspector could not supervise the trimming of three ships alongside one another? He might be able to go from one ship to the other. The loading is continuous, and a man could not be there all day and night.

1642. *President.*] Do you think ten inspectors—five for the day and five for the night—would be able to cope with the work? We will say they would.

1643. One witness has mentioned two, is that number too small? It is nonsense.

1644. *Mr. Pittman.*] Did you notice the account of the loss of the "Flora P. Stafford" in last week's newspaper? No.

1645. We wish to know with what coal she was loaded? The Wallsend Coal Company, of which I am manager here, did not load her.

1646. *President.*] Have you formed any opinion as to the cause of the heating of coal cargoes? I cannot say I have any particular theory of my own. There is a diversity of opinion as to the cause that leads to spontaneous combustion.

1647. There is an impression abroad that Wallsend coal has been particularly unfortunate in regard to accidents of that character;—is that borne out by your own data? No. You will find that, considering the large number of vessels we have sent out on long voyages, the proportion of accidents is not greater than with the ships loaded with coal from the other collieries.

1648. How many tons of coal do you load in a year for long voyages? About 300,000 tons.

1649. For foreign ports? Yes; our business is almost confined to foreign ports, the voyages averaging from forty to sixty days or more. We send to the West Coast of South America and California.

1650. Do you ship any coal to Sydney? Yes, bunker coal for local steamers, and sometimes to provide ships with stiffening. We have a steamer of our own for that purpose.

1651. Is that included in the 300,000 tons? Yes.

1652. Then you have to subtract from the amount the coal used locally? It is a very small part of it. You could say 300,000 tons for the foreign trade for the last few years, at any rate.

1653. You are not prepared to say your coal is more likely to heat than the coal from other collieries? Certainly not.

1654. Which do you consider to be the colliery doing the next largest business to yours? There are the A.A. Company, the Laubton Company, the Newcastle Company, and the Co-operative Company, but that does not approach us so nearly as the others do. We stand at the top of the list as to quantity.

1655. *Mr. Pittman.*] And the Duckenfield? Yes; Brown's comes up to us closer perhaps than some of the others I have named.

1656. *President.*] We have observed that there seems to be unnecessary breakage of the coal at the screen in falling into the waggons;—would you have any objection to an experiment being made at your colliery with the object of preventing that? That is a matter for the colliery manager. I would not interfere with that.

1657. The maximum breakage occurs, without doubt, in dropping the coal from the coamings of the hatch down to the bottom of the hold? Undoubtedly it does, and it is for that that some remedy should be provided. It is quite necessary to adopt some means to prevent the direct fall of the coal at the initial part of the loading of a ship. It stands to reason that falling from so great a height smashes it.

1658. Whatever might be adopted, it seems, would lead to increase in expense;—would the coal trade, in your opinion, stand an extra expense of 1d. a ton, or would that ruin the trade? No; someone else would have to pay for it.

1659. It would not make any difference to the coal trade? Not to the trade. It would make a little difference, perhaps, in the price paid to the trimmer.

1660. We have heard that the insurance companies will not insure coal coming from some of these collieries; can you get your coal insured? That matter does not come within my province. The purchasers of the coal are mostly in England or Scotland, and they look to the insurance.

1661. To whom should we apply for information regarding that? To Mr. Binney, the Secretary of the Wallsend Coal Company, in Sydney.

1662. It has been suggested that the size of the waggons might be reduced, or that the waggons might be replaced by others having three or four boxes sufficiently small to go down the hatches of the ship? That would involve too much expense.

1663. To the colliery owners? Yes.

1664. What method would you suggest, then, of reducing the breakage? The main hatch of these large vessels are capable of admitting our present waggons to be lowered. If this is done, a very great deal of breakage would be avoided. The fore and after hatches—there are three generally—are not likely to be altered, because there is not space enough on the deck. In the trimming of coal, there should be a lot of coal trimmed fore and aft when the main hatch is filled, to fall upon when the fore and aft hatches are filled, instead of falling upon the ship's bottom.

1665. So that you would actually run the coal from the main hatch to the fore and after hatches? That would be a matter for proper trimming; they do not trim that way.

1666. It seems a long way to run the coal? It can be done with plates.

1667. Are you quite right in saying the majority of ships have main hatches large enough for the trucks to go down? Yes, in the modern ships; not in the smaller ones. 1668.

- Capt. H. R. Close.  
11 Sept., 1896.
1668. Ships of what tonnage? Ships over about a thousand tons register.
1669. Supposing the main hatch of a ship is not large enough, would it be a serious matter to make it large enough? It would mean cutting away the deck and beams.
1670. One captain showed us a hatch that had been enlarged at a cost of £60—would you consider that excessive? No.
1671. Is there anything you would like to lay before the Commission? Yes. Of the known losses I think you will find a number the result of bad trimming; their cargoes have shifted. I think there are more losses from that cause than from burning. The question comes in, also, whether the increase in the size of the ships of late years has not some bearing upon the heating of the coal cargoes. There was forty years immunity from anything of the kind, and it was considered there was no chance of Newcastle coal firing. There is a large breakage under the present system of loading which might be remedied, either by lowering the coal down into the hold, or by using some mechanical means of spreading, such as Harper's, or Spencer's. I could not say which would be the most desirable; it would be invidious for me to do so. Trimmers themselves admit they cannot trim properly, or do not do so, because, they say, they are not paid enough. That came out in evidence before the Chamber of Commerce.
1672. Did you take evidence there as a member of the Chamber of Commerce? I gave evidence; I did not take it. Perhaps the heating of the iron sides of a ship during the time of loading or waiting in port for some weeks may be a contributing cause to the heating of the coal. On very hot days, I should imagine, if the hatches were not kept off, there would be a tremendous heating in the hold. There is another point. Many vessels going to the West Coast of America go round the south of New Zealand, where there are some very dangerous outlying islands and rocks, and who can say but what they have run on them. Going to California, they have to thread their way through coral islands. It is not reasonable to attribute the loss of vessels to the cause of heating alone. The holds of vessels should be perfectly clear of rubbish and dirt, and the remains of old dunnage wood and matting.
1673. Whose business is it to see to that? The ship's business. Ships should also have proper surface ventilation. There should be some space between the top of the coal and the deck above; not too much, because you must carry the coal pretty high up amidships to keep the ship all right.
1674. Suppose the ship was not ventilated, what would be the effect? The effect would be to possibly produce heating.
1675. You consider that want of ventilation might be the cause of heating? It is a matter that should be carefully attended to. Nearly all large ships are provided with ventilators on deck. Where the weather will permit it, captains should take off the hatches. One of your witnesses has said that Wallsend coal contained a larger amount of pyrites than some of the others; it is a fact that the Wallsend coal has been singularly free from iron pyrites.

[Witness withdrew.]

Mr. G. Bewick sworn and examined:—

- Mr. G. Bewick.  
11 Sept., 1896.
1676. What is your name? George Bewick.
1677. And your business? I am the shipping manager for the Caledonian Coal Company and the Seaham Colliery.
1678. And you are also Chairman of the Chamber of Commerce? Yes.
1679. How long have you been engaged in the coal trade? Between twenty-six and twenty-seven years.
1680. You recently held an inquiry at the Chamber of Commerce in regard to the loading of coal? Yes; in 1894.
1681. Were you on the committee that drew up the report? Yes.
1682. Did you investigate the question of the heating of coal cargoes? We did not.
1683. Did you investigate the question of the trimming of coal cargoes? Yes.
1684. Did you come to the conclusion that the trimming, as a rule, was carelessly done? We agreed to that.
1685. Who did you consider was responsible for that trimming? We considered that the competition was responsible to a great extent, and also the trimmers in not carrying out their contracts as we thought they should have done.
1686. There is no supervision to make them? No proper supervision on the part of the officers of the ship.
1687. It has been pointed out that the officers of the ship are so much engaged that it is impossible for them to supervise the trimming? The captain has a great deal to do on shore, but I do not think the ship's officer has; his position is on the ship.
1688. Do you think any system of Government supervision in the matter of trimming would be of advantage? I do.
1689. Was that the conclusion that the Chamber of Commerce came to? Yes.
1690. You made a recommendation to that effect? Yes.
1691. Did your recommendation extend so far as to suggest who should pay for that supervision? No; it did not.
1692. Did you contemplate that matter at all? We did; and we came to the conclusion that the supervision should be paid for by the Government in the same way as they pay for the supervision of the loading of a ship as regards her marks.
1693. And they recoup themselves for that by harbour dues? Yes; at the present time vessels to be loaded pay  $\frac{1}{2}$ d. per ton register, per day, while occupying a crane.
1694. The Government receives that? The Railway Department.
1695. Does the money received cover the interest on the amount expended on the wharves? I should think it does.
1696. You have no means of ascertaining that? No; any large ship will pay from £5 to £6 a day while lying at the wharf, and smaller vessels have to pay in proportion to their tonnage.
1697. There is no reason, if the harbour dues will go far enough, why they should not be used for the purpose of defraying the expense of the inspection of coal-trimming? That is my opinion.
1698. You cannot say whether there is a credit or debit balance? No.
1699. With regard to careless trimming, do you attribute it partially to the competition amongst the stevedores that you referred to? Yes.
1700. I understand the trimming prices average from 2d. to 3 $\frac{1}{2}$ d.? 3 $\frac{1}{2}$ d. I think is about the highest price paid.

1701.

Mr.  
G. Bewick.  
11 Sept., 1896.

1701. We have had some trimmers say they cannot afford to load under  $3\frac{1}{2}$ d., and others who admit they can trim for  $2\frac{1}{2}$ d.? Yes.
1702. The trimming must necessarily be scamped at such low prices? With modern ships, I think anything under 3d. a ton is too little to do the work properly.
1703. Are you acquainted with trimming? Yes, I have often spent some time on the dyke.
1704. I suppose you have talked with reliable trimmers, and have got an idea as to how much they make? Frequently.
1705. It is on that you base your opinion? Yes.
1706. The trimmers themselves apparently are anxious for some sort of inspection; I suppose one reason for that is that they would really get more work to do? I suppose the idea is that the best men would probably get more work.
1707. Any interference by a supervisor or inspector would operate in their benefit in the direction of increasing the amount of trimming work? I think so.
1708. *Mr. Pittman.*] Were the dykes made by the Railway Commissioners or the Works Department? I think the dykes were originally made by the Works Department, and handed over to the Railway Commissioners some few years ago. The Commissioners do all the haulage and shipping of coal. They take the coal from our collieries, and put it on board at a certain mileage rate.
1709. Have you any experience with the putting of coal on board by means of distributors, such as Spencer's? I have seen Spencer's patent at work once, and I was to have seen Harper's twice, but, unfortunately, the thing did not get into the ship. My own idea with regard to placing the coal on board ship is that it should be lowered by waggons into the bottom of the hold where practicable. I practically demonstrated that in the case of the "Windermere," where I had the waggons lowered down two of the hatches and the coal placed at the bottom of the hold. The two other hatches, the fore and aft, were not large enough to admit of the waggons going down. The captain had boards placed across the 'twecn deck hatches, and let the coal drop on them instead of into the bottom of the hold, and then roll from there. If a vessel has not a sufficiently large hatch, the coal should be shipped on to some contrivance at the top of the hatch, so that it will slide or roll into the bottom.
1710. Do you think the process of loading by means of a distributor entails an extra amount of trimming? Not if the distributor were workable, I should think not.
1711. There is the question of filling up the hatchway when loading with the distributor. The hatchway is left empty, and the same trouble would occur when filling it up? If the vessel has sufficiently large hatches, I should load the hatchway first in the way I have described.
1712. In the case where you are not able to lower the waggons into the hatch, what would you do then? I have not considered the subject very carefully, but I should not think it would increase the cost. It might a little, but not a great deal.
1713. *President.*] In regard to bad trimming, what remedy did you propose when you were sitting at the Chamber of Commerce on the matter? We proposed that the Government should be asked to appoint inspectors. We proved beyond a doubt that there had been great laxity in trimming. There was no question about that. Our opinion was that the stowage of coal was a serious matter, and we thought it should be supervised by Government officials.
1714. Did you form any idea as to the number of officials that would be required? We did not. I should say half-a-dozen at the most.
1715. Have you any idea as to what they should be paid? £250 to £300 a year, I should think, would be a fair salary for a man doing that work. You will understand it would be necessary to have men at night.
1716. That was the best remedy the Committee could offer? Yes.
1717. It has also been suggested that stevedores should be licensed. Was that matter contemplated by the Committee in any way? That matter did not come before us. It was not mentioned at that time. I see no objection, personally, to licensing stevedores, provided it does not create a monopoly, when it would be hard on the ship-owners.
1718. Setting aside the question of monopoly, do you think it would be of advantage or otherwise? If they were licensed whom would they be responsible to? The fact of their being licensed would hardly affect the matter, unless they were responsible to someone.
1719. If they did bad trimming their license could be taken away? Yes; but there would have to be someone to say there was bad trimming.
1720. That might be the loading inspector? Yes.
1721. With regard to the expense, I suppose the coal trade is going to benefit by this inspection? I do not know. Not to a very great extent.
1722. Who would benefit by it? The insurance companies, I should think.
1723. Does that not mean that the coal trade would, as I understand the insurance companies will not insure the ships? They will, at high prices.
1724. Practically, you cannot get them insured? We can; but most of the insurance is done at home. I have nothing to do with the insurance, that is arranged by the purchaser in England. I do not know what rate is paid; but I understand the rates have been increased on Newcastle coal.
1725. That is to the disadvantage of the ship-owner? Yes.
1726. Then it makes the expense of carrying your coal greater than it would otherwise be? Yes.
1727. Therefore the coal is more expensive when it arrives? Yes.
1728. Therefore it is inimical to the interests of the Newcastle coal trade? The advance of the insurance rates, unquestionably.
1729. Does it not, then, seem fair to you, supposing that inspection is going to be successful in preventing accidents and reducing insurance rates, that the coal trade should bear part of the expense? Well, the purchaser of the coal would have to bear part of the expense.
1730. That is a matter between you and your customer? Yes.
1731. Supposing the extra expense amounts to 1d. or  $1\frac{1}{2}$ d. a ton;—is that going to destroy the coal trade? It would not destroy it; it would affect it.
1732. In what way would it affect it? The coal trade could not stand it.
1733. What is the present price of coal, on an average, delivered at the ship's side? The present price varies from 6s. 6d. to 7s. 6d. a ton.

- Mr. G. Bewick.  
11 Sept., 1896.
1734. Taking the average price at 7s., supposing we increase the cost by 1d. per ton, that is a little over 1 per cent.? Yes.
1735. Would that increased charge seriously affect the coal trade? I do not say seriously.
1736. You said it would affect it? The coal trade could not stand anything more. The coal trade is already overburdened and could not stand any more.
1737. Is it not more overburdened by the increased cost of insurance and by the destruction of a considerable portion of the value of the coal owing to its pounding, than it would be by an additional charge of 1d. per ton? It is overburdened by the very high charges we have to pay before we get the coal into the ship.
1738. *Mr. Pittman.*] Do you think the cost of inspection would amount to 1d. a ton? Oh, no.
1739. *President.*] Would the cost of the supervision, extra trimming, and extra expense at the cranes amount to 1d. or 1½d. per ton? The ship pays for the trimming; we have nothing to do with that.
1740. *Mr. Pittman.*] What is the total annual output from the port? About two millions and a half tons. It might not be so much this year on account of the strike.
1741. *President.*] Do you think the expense of inspection and change in the method of loading could possibly amount to £10,000? No, it would not.
1742. So that a 1d. per ton would fairly cover the whole expense? Yes.
1743. Have you ever had any accident with the coal from the collieries in which you are interested? Yes.
1744. Can you give an example? The "Hollinwood."
1745. Loaded in December last year? Yes; she finished loading on the 9th December. She put into Lyttleton with a heated cargo.
1746. She was trimmed by Russell and Company in the usual way? Yes.
1747. The coal would have been dropped from the coamings of the main hatch as usual? In that case, yes.
1748. Do you remember whether the coal was wet or dry when it was put on board? I think it was wet weather when she started loading, and it was wet when she finished loading.
1749. *Mr. Pittman.*] Would the hatches have been open all the time? The hatches would have been open while she was taking in the last lot of coal. I think it was taken in during very hot weather. She took in stiffening on the 23rd November.
1750. *President.*] Was it the stiffening that caught fire, or the other part of the cargo? From the representations we had, it was the centre of the coal.
1751. You do not know whether it was under the main hatch or not? No, I do not.
1752. Would the centre of the coal mean under the main hatch? Not necessarily. I mean the centre between the deck and the bottom of the ship.
1753. It might have been under the main hatch? Yes.
1754. Have you had any other accidents? The "Ellen A. Read."
1755. Was she loaded with your coal? Yes.
1756. With West Wallsend coal;—is that one of your mines? Yes; the West Wallsend, Waratah, and Seaham.
1757. *Mr. Pittman.*] The "Hollinwood" was loaded with West Wallsend coal? Yes.
1758. *President.*] What is the output of the West Wallsend Company? About 400 tons a day.
1759. What is the average output of the Wallsend Company? About 1,500 tons a day.
1760. We have heard it suggested that the cause of the fire on the "Ellen A. Read" was a donkey engine;—did you hear anything about that? I think that is not at all unlikely. I cannot believe the "Ellen A. Read's" cargo fired through heat.
1761. Why? I think it would have blazed out before she left here. I am inclined to think the coal was alight before she got away. I believe it likely she was set afire, accidentally of course.
1762. By the donkey engine? Either by that or some other cause.
1763. Do you think so because the fire occurred so soon? Yes; that is one other reason.
1764. Where was the donkey engine? It was placed just between the fore and the main hatch. I did not see the ship; that is how it was explained to me.
1765. On the deck? On the main deck.
1766. So that the heat would have to get through the deck to get to the coal? Yes.
1767. Through wooden boards? Yes.
1768. I suppose those boards would be 2 inches thick? An inch and a half, or an inch and a quarter.
1769. There would have been a little space between the deck and the coal? There might have been a little; it depends on whether she filled up or not.
1770. *Mr. Pittman.*] The "Knight of St. Michael" left about the same time from Newcastle seriously heated? Yes. In the case of the "Senator Versmann," she received her stiffening coal on the 21st April, before the strike, and she started to take in the balance of her coal on the 12th August, nearly four months afterwards. The captain informed me he tried the temperature of the stiffening when it was in. He also tried it when the vessel started to load, and he found it exactly the same. She had been lying in port for four months with the hatches on, and the coal had not heated. I am at a loss to understand the heating of this coal. The coal is perfectly and thoroughly cleaned by means of a travelling belt of about 100 feet in the case of the West Wallsend coal.

[Witness withdrew.]

Mr. W. McNeil sworn and examined:—

- Mr. W. McNeil.  
11 Sept., 1896.
- 1771.] *President.*] What is your name? William McNeil, of the firm of Taylor and McNeil.
1772. You are a master trimmer? Yes.
1773. Have you had considerable experience in that business? Yes, twenty years here.
1774. Do you consider it possible for a master trimmer to slum his work, if he wishes;—is there anything to prevent him? If the officer of a ship does not take any interest there would be nothing to prevent him.
1775. Do the officers usually take an interest in the work? Not as a rule.
1776. It is left to the stevedore? Yes; but there are any amount of conscientious officers who see that the ship is trimmed alight.
1777. What is this transaction which takes place between the captain and the stevedore, known as the captain's "new hat"? I have never been mixed up with anything like that. We have always been a cut above that.
- 1778.

1778. You have never presented a captain with a "new hat"? I have; but it is nothing to do with the business. I have presented clerks with a "new hat" if they do me a favour. With masters of ships that I have been doing business with the contracts have been carried out to their satisfaction as a general thing, and we always part as good friends as when we started.
1779. It has been suggested that the trimming of ships would be more efficiently and effectively carried out if there were some sort of supervision by Government inspectors? It would be no good. We work night and day, and to put an inspector at each ship the cost would be enormous.
1780. An inspector would not have to be on board a ship the whole time she was being trimmed? He would want to make a visit every three or four hours.
1781. He could look after three ships? He might possibly look after six.
1782. How many cranes are there? Fifteen.
1783. Numbered from one to fifteen? Yes.
1784. So that there could be fifteen ships loading at one time? There are the A.A. Company's shoots and at Stockton.
1785. The whole of the cranes and shoots are not generally busy at once? At times they are. I cannot see how an inspector could interfere with the master and officers of a ship. You cannot legislate to take away the authority of those men who have passed an examination by the Board of Trade to fulfil those duties. There may be two ships in this port—one may take her lower hold full, with the balance in her 'tween deck, and the other may take very little over a half, and have her 'tween decks full fore and aft;—how would an inspector be there? Overloading is a thing that any man can judge, but the sailing qualities are different.
1786. *Mr. Pittman.*] How does a stevedore judge at the present time? By experience; he does the work under the supervision of the master.
1787. What is to prevent the master making the same representations to the inspector? I do not see where the inspector comes in.
1788. To provide against bad work? If the owners had the interests of the port at heart they could do that without the assistance of the Government.
1789. *President.*] We have been told that master-trimmers do dishonest work, and to prevent that inspection has been suggested? I think the Sydney underwriters will cover my work before any other man's in New South Wales. I have never had any mishap.
1790. What rates are now being charged? I am not interested in insurance.
1791. Are you aware they will not cover the ships at all? I can't help that.
1792. Have you any objection to the use of the distributor? I use them myself when it suits me; but not those abortions they have at the Dyke, because they can never be used.
1793. Which do you refer to? Either Spencer's or the other.
1794. Neither of them is any use? Neither of them has been used to finish a ship with.
1795. One witness said he had used Spencer's to load six ships with? He partly loaded the ship, but he never finished a ship with it. One he tried and tore it to pieces in getting it out, and he never completed it since. The distributor must do good, because it will distribute the big and small coal away from the centre of the hatch, but the ideas that these men have are not adapted to this port.
1796. What kind of appliance do you use? I am going to rig mine up on Monday, to get to work on Tuesday morning. I am going to load the "Carnarvon Castle," partly with coal and coke. Mine is on the same principle as Spencer's, only worked with small plates instead of big lumps of iron. I am going to load with coal and coke, and that coal has to be loaded level, and covered with mats before the coke goes on top of it.
1797. Are you going to use the distributor for putting the coke in? No; I cannot. Coke does not require a distributor.
1798. *Mr. Pittman.*] What does Spencer's apparatus weigh? I suppose each piece weighs about 2 cwt.
1799. What is the total weight? I could not tell you. It knocks the coal all to pieces. The rivets, instead of being countersunk, are left up, and the lumps of coal get knocked to pieces by the time they get to the bottom. The "King James" was the first serious fire we had here. It was entirely the fault of Captain Drummond.
1800. Why was it his fault? He had about 40 or 50 tons of Cardiff coal, but I forget the exact quantity, and I wanted him to discharge it, and he would not. He boarded it over, and we stiffened the ship at No. 3 and No. 1. She was a new iron ship. We ran No. 3 up with stiffening.
1801. With Wallsend coal? Yes. From the time that stiffening was put in until she came back to load we had continuous wet weather, and during the time I was loading her it rained continuously. Nobody dreamed of anything like a fire in Newcastle before that.
1802. The coal was thoroughly soaked? Yes.
1803. The Cardiff coal as well? Yes, and the fire originated in the Cardiff coal.
1804. Not in the square of the main hatch? No, according to the evidence I read from San Francisco. The Cardiff coal reached to what you might call the square of the main hatch.
1805. Where there would be a great deal of fine coal from the loading of the ship? Yes.
1806. It might have been the fine coal, and not the Cardiff coal, that fired? We put it down to the Cardiff coal.
1807. That was because you had never had an accident with Newcastle coal before? Yes.
1808. Was she a large ship in those days? Yes, very large. It was her first voyage. I wanted the captain to sell the Cardiff coal, but he would not.
1809. *Mr. Pittman.*] She was burnt at sea? Yes, close to Frisco.
1810. *President.*] She was about one of the largest ships that came to this port at that time? Yes.  
[Witness withdrew.]

Mr. R. A. Buhl sworn and examined.

1811. *President.*] What is your name? Robert Albert Buhl.
1812. And your business? I have been a stevedore here a few years.
1813. Have you ever been a trimmer yourself? Yes; I am about the oldest one at present.

3—§

Mr.  
W. M'Neil.

11 Sept., 1896.

Mr.  
R. A. Buhl.

1814. 11 Sept., 1896.

- Mr.  
R. A. Buhl.  
11 Sept., 1896.
1814. It has been brought before us in evidence that there is a great deal of careless trimming done in the port? I believe there is.
1815. It has been suggested that the practice of giving the captain a "new hat" has something to do with that;—have you heard anything of that? Not in my time; it is only a new thing.
1816. You did not give captains "new hats" in the old times? They would not be mean enough to take it.
1817. They are now? So they tell me; but I never had one.
1818. You do not know how much the "new hat" costs? There are different prices, of course.
1819. Would £5 be a fair price for one? I daresay.
1820. It has been suggested that inspectors might be appointed to inspect the trimming;—does that seem to you a good idea? I think that would be a very good idea.
1821. Is there anything to prevent the inspection being efficient? Not if the man knows how to inspect.
1822. Do you think he could inspect six ships? Two could do it in the day and one at night, because they would not all finish a hatch at the same time.
1823. Do you think a man could efficiently inspect six ships? He could.
1824. It would not be too many? I have worked that many myself.
1825. Three inspectors for the day and three for the night would be sufficient? At night time you have only got perhaps two, three, or four ships. There would be a great urgency if there were five working at night.
1826. So that in general one inspector would do at night? Yes; it is mostly steamboats that load at night. It is very seldom you see one or two deep-water ships loading at night.
1827. As a trimmer you would have no objection to inspection? No.
1828. I suppose there is no doubt the captain and officers of a ship ought to superintend the trimming? I have been for years and never saw a captain or mate in the hold, and I never had one accident. I have trimmed some companies for eleven, twelve, and fourteen years. There is a company for whom I have trimmed over fourteen years. There are six ships in that line.
1829. What line is that? The China Navigation Company. I did the A.S.N. Company from 1867 to the day they were sold.
1830. Accidents occur generally in sailing ships? As a rule they go very long voyages.
1831. *Mr. Pittman.*] Steamers take their coal in bunkers? They coal them in the hold just the same.
1832. Is there anything in the peculiar build of ships that makes some require different styles of trimming to others? There is.
1833. Could that be considered an objection to the appointment of inspectors—would an inspector be able to know what kind of trimming was required? Yes, if he understood his work. I can give you an instance that happened last year. The "Poltalloch," was trimmed here, and badly trimmed. She was a peculiar ship in her 'tween decks. She had four big hatches and there was no 'tween deck between some, and in one place the 'tween deck came right up to her coamings. When they loaded the coal into that ship, she was never trimmed all along.
1834. *President.*] The coal had never been trimmed in the 'tween deck? Never. I went down in the aft hatch and came up the fore hatch. She went on her beam ends. I took 500 tons out of her lower hold and put it in her 'tween decks.
1835. It has been suggested that stevedores should be licensed so as to prevent incompetent stevedores from tendering;—do you think that would be a good plan? I think it would.
1836. Were you one of the deputation that waited on the Premier? No.
1837. Were you at the meeting at which the deputation was appointed? Yes.
1838. You were one of those who voted for the appointment of the deputation? I was asked to go there, and I went.
1839. With regard to the long hours which some of your trimmers work,—is that chiefly by their own wish or by yours? I would never keep a man on longer than ten hours, except in cases for perhaps five or six hours to finish a ship; but it is very seldom done. I see twenty to thirty hours mentioned; it is nonsense.
1840. Do you know of any reason why the distributor should not be used more than at present? I watched one, and I could not see what it was good for.
1841. *Mr. Pittman.*] Was that Spencer's? Yes. They had to dig the coal off and hoist it out and it was never put in any more.
1842. *President.*] We have been told that Spencer's apparatus has been used to load six ships? It belongs to foreign people who sent it out. I used to do their ships, but when they sent it out, I would not do them.
1843. Why not? It was a bother. I could have an easier distributor than that, by taking three spars and putting plates on them, and then you can run your coal where you like. With the other you must have the crane to hoist it and to lower it down.
1844. It would increase the trimming? It is a great waste of time. The crane has to be paid for for lifting it in and out.
1845. So that you think the Spencer distributor wants to be improved? It wants a lot of improvement. If they could make it to go into every ship and catch the coal at the coamings of the hatch it would be alright.
1846. What about Harper's apparatus? I have not seen that. It is on the dyke, but I have not seen it put together. I think it is something similar.
1847. Do you think a distributor can be made to work? It can be made to work.
1848. Do they load a ship safer? I don't know. I don't think so.
1849. Does it take twice as long to load a ship with the distributor? Yes; you have to dig it out of the coal. Spencer's patent will not go into a hatch if it is not a big hatch. I cannot understand how all these accidents have taken place this last four or five years.
1850. You have no idea as to the cause? No; unless it has been the wet weather and the sun being very hot.
1851. And the bad trimming? That is only through bad management. I have had twenty-eight years at it, and I have not had an accident. It is a thing that ought to be remedied.
1852. What is the cause of bad trimming? Perhaps a grocer's clerk or man may know an agent, who says to the captain, "This is our stevedore," and some of the men do not know the ends of a ship.

1853. Have you formed any idea as to the reason of the shifting of cargoes and the heating of cargoes? We have so many more stevedores; anybody can be a stevedore now.  
 1854. You put it down to incompetence? Yes.  
 1855. These people put in prices at which it is impossible to do a fair job? Yes.  
 [Witness withdrew.]

Mr.  
R. A. Buhl.  
11 Sept., 1896.

Mr. G. Wycherly sworn and examined :—

1856. *President.*] What is your name? George Wycherly.  
 1857. What is your business? Coal-trimmer.  
 1858. A practical trimmer? Yes.  
 1859. You have been called as a witness at your own request? Yes.  
 1860. You have something which you wish to communicate? Yes.  
 1861. Will you kindly say what it is? It is in regard to the slum trimming. The boss trimmers are the fault of it. If they make a profit of £10 out of a vessel at one time, they want to make £11 the next. They make it out of the labouring man or slum the ship, and they connive in every shape and form to slum. They won't put the labour where it should be put.  
 1862. You mean to say they run the hatch too full before putting the men on? Yes.  
 1863. Is that done by all stevedores? Yes.  
 1864. Are they all alike in that respect? They all do the same.  
 1865. Are you a member of the Coal-trimmer's Union? Supposed to be. They are reorganising the union.  
 1866. Are you an officer of it? No.  
 1867. Were you an officer of the old union? No, sir.  
 1868. How long have you been a coal-trimmer? About fourteen years.  
 1869. What you have to say is that the greed of the stevedores leads them to put on insufficient labour to trim the ships? Yes.  
 1870. It is the captain's business to see that the ship is trimmed properly, is it not? I should think the officers of the ship ought to do that. The men do the trimming, and if there was anybody to watch the work the stevedores are of no consequence at all. I have known them to have as many as four vessels in at a time, and you never see the stevedore down the hatch. They pull down shifting boards and all manner of things to form temporary 'tween decks to keep the men working. When a vessel has close 'tween decks, I have gone away aft, and when I have come back there has been a hole there which was not there when I went down.  
 1871. You mean to say they break a hole through the 'tween deck occasionally? There was no hole when I went down, and there have been plates let into the hatch.  
 1872. *Mr. Pittman.*] Perhaps there were movable boards there? There are ships that way.  
 1873. *President.*] A general statement, such as you make, does not carry much weight; can you name any particular ship that was not properly trimmed, so that we can investigate the matter? I never knew there was to be an inquiry, so I never took any notice of the names of the ships. I have come out of the ships and have thought it my duty to tell the captain, but would not on account of being afraid to be victimised by the boss trimmers.  
 1874. You cannot mention any particular ship? No.  
 [Witness withdrew.]

Mr. G.  
Wycherly.  
11 Sept., 1896.

Mr. W. F. Ossinger sworn and examined :—

1875. What is your name? Willaw Fletcher Ossinger.  
 1876. You are the mate of the "Ellen A. Read"? Yes.  
 1877. It has been suggested to us that the fire on the "Ellen A. Read" was caused by the donkey engine? I don't think so.  
 1878. Would you kindly tell us where the donkey engine was? It is in the aft part of the forward house.  
 1879. Would that bring it about over the fire? The fire was abaft that, where it was located first. It would be about 15 feet forward of the hatch where the donkey engine is.  
 1880. And the fire broke out aft of the hatch? About 5 or 6 feet aft.  
 1881. So that it would have been about 20 feet from the donkey engine? Yes.  
 1882. Was there any question of anybody throwing hot ashes down? Not possible.  
 1883. You had the hatch closed? Yes.  
 1884. Was the donkey engine at work when the ship was being loaded? Yes; part of the time.  
 1885. Do you think anybody could, out of mischief, have put hot ashes down? I don't think so.  
 1886. You do not believe the donkey engine had anything to do with the fire? No.  
 1887. How thick are the deck planks? Five inches.  
 1888. The heat could not get through that very well? No, and an inch of cement on that and then 1½ inch tiles.  
 1889. Under the donkey engine? Yes.  
 1890. And the coal did not come quite up to the under side of the deck there? I suppose the coal was perhaps 1 foot or 15 inches clear of the deck.  
 1891. *Mr. Pittman.*] Did you form any idea as to the cause of the fire? No sir; I was on deck when the fire was discovered, at 1 o'clock in the morning. The fire worked forward all the time to the ventilator. At first the captain suggested that somebody had set her on fire. I said it was impossible, because nobody could get down below. The day before, on the Friday, we stowed some fenders and baskets, and there was no sign of smoke or fire then.  
 1892. The fire was on top of the coal? Yes; it was on the surface.  
 1893. *President.*] Was it burnt down a foot from the surface? I suppose about a foot.  
 1894. You can form no idea of anybody, from improper motives, putting a light down? It was impossible for anyone to do so.  
 1895. *Mr. Pittman.*] Before the hatches were put on? I never thought of such a thing; the idea never occurred to me before.  
 1896. *President.*] When your ship is being loaded do you watch the work? I go down below when they run the hatches up.  
 1897.

Mr. W. F.  
Ossinger.  
11 Sept., 1896.

Mr. W. F. Ossinger. 1897. It has been suggested that the Government should appoint inspectors to inspect the trimming—would you object to that? No; I would not object to it. Some stevedores in this port do not look after their business properly I understand. We have never had anybody but McNeil, and he looks after his business properly.

1898. Supposing an Inspector were to find out from the captain the way he wished his ship trimmed, it would not worry you for him to assure himself that the captain's work was carried out properly? Not at all, sir: to satisfy the captain is the principal part of my duties—to obey his orders implicitly. I have been with a good many coal cargoes, and they used to build a platform over the ship and put ventilators over the hatches. I think it is a good idea to have ventilators.

1899. You think it a good idea? If I had anything to do with it, I would have ventilators. I have known a quantity of coal to catch fire after heavy rain, on the dock at Alexandria, Virginia.

1900. How long after? Six or eight weeks after.

1901. It got very wet, and then six or eight weeks after, it caught fire? Yes.

1902. Was that bituminous coal? We call it soft coal, what they use for making gas.

1903. The fire was attributed at the time to the rain? Yes, sir.

1904. Was it small or large coal? It was mixed. There was a considerable lot of fine coal—it breaks up very easily.

1905. How much coal was there? I suppose between 300 and 400 tons.

1906. Did it catch fire in the middle? It caught fire in the centre of the coal.

[Witness withdrew.]

FRIDAY, 25 SEPTEMBER, 1896.

[The Commission met at 2:30 p.m. at the Custom House, Newcastle.]

Present:—

PROFESSOR RICHARD THRELFALL, M.A., PRESIDENT;  
And EDWARD FISHER PITTMAN, Esq., A.R.S.M.

Mr. J. Gregson examined:—

Mr. J. Gregson. 1907. *President.*] You are Mr. Jesse Gregson? Yes; Manager of the Australian Agricultural Company.  
25 Sept., 1896. 1908. How long have you been in that position? Twenty-one years.  
1909. And during that time the management of the collieries has come under your control? Yes; under my supervision.

1910. Do you know of any cargoes of coal which have come from any of your collieries having heated? I cannot say I do.

1911. We have a good deal of evidence to the effect that one of the causes of the heating of coal cargoes is the breaking up of the coal which takes place in loading. I understand the coal is broken up just as much in loading from your shoots as from the cranes? I imagine that is so.

1912. Have you given any attention to the matter of loading coal? Well, I have, but not with any result. It has never forced itself upon my attention as being a necessary thing to attend to.

1913. You cannot suggest any improvement that could be adopted whereby the coal might be loaded with less breakage? No means occur to me. I have heard of patents that have been proposed for the purpose of breaking the fall in some way, but we have never introduced them, and I have never heard of their coming into general use.

1914. Who are the chief purchasers of your coal? We send a proportion to the west coast of South America, but the greater portion goes to intercolonial ports—in fact, a large part goes to Sydney.

1915. What is the coal used for that is taken to the west coast of South America? Generally for gas.

1916. It does not matter, then, whether the coal is broken up or not? I presume not.

1917. You would have no reason to anticipate obtaining a higher price for it in the event of it being landed in better condition? No; we have had no complaint on account of it having been broken.

1918. Any expense incurred to avoid breakage would be a dead loss? Yes; so far as we are concerned.

1919. If the price of coal were raised 1d. or 2d. a ton to the consumer, would there be a likelihood of the trade being driven away? I doubt it very much. I could not see that a 1d. or 2d. would have the effect of driving the trade away, but any material rise would not be possible. I think it is generally admitted that any rise in price would be injudicious, and would probably have the effect of discouraging trade.

1920. It has been suggested that inspectors should be appointed to see to the trimming of ships;—have you heard that proposal spoken of? I have heard it mentioned. Personally, I have not very much to do with the loading of vessels, and it is only within the last few months that these questions have cropped up.

1921. Would there be any objection, from your point of view as a colliery proprietor, to the appointment of inspectors to see to ships being properly loaded? I should say not.

1922. There would be the question of who should pay for the expense. It would, I suppose, in the first place, be a charge upon the shipping interest? Upon the ship, no doubt.

1923. And that might react in a desire to reduce slightly the price of loading? Or in discouraging trade, which would be equivalent.

1924. Have you any idea of the margin of profit shipowners work upon? None whatever.

1925. It is safe to take it as being pretty narrow? They tell us so, not only in regard to the foreign-going vessels, but in the intercolonial trade.

1926. It has been said that in order to avoid breakage a remedy would lie in the lowering of the waggons of coal down the hatchways of the ships, but at present either the hatches are too small for that purpose or the waggons too large, and it has been suggested that there might be a return to the old form of box waggons to overcome the difficulty;—would there be any objection to that from your point of view? I think that would be very objectionable.

1927. Why do you think so? The hopper seems to be the most convenient instrument for dealing with coal, and there would be a loss of labour and time in shipping the same quantity of coal from two receptacles than from one. It would tend to add to the expense, but if it were clearly necessary for the purpose

purpose of safeguarding life or property the expense should not be taken into account. Unless it can be shown that it would be advantageous, it would be objectionable.

1928. It would put the colliery proprietors to some expense? A little; I do not think very much.

1929. Would you not have to provide new waggons? We would have to do that.

1930. That would be a source of expense? No doubt, if the old hopper waggons were to be condemned; but that, I take it, would scarcely be proposed.

1931. I only wished to hear your views as to what would be the effect, from your point of view, of insisting upon a partial change to the box form, so that the first portion of the cargo could be lowered? That would be objectionable if it were only a partial adoption of that form, because you would have the different classes of waggons to provide for in the sidings and at the pit.

1932. Would it be so inconvenient to load that way as to cause a considerable increase in the expense? I do not think it would—it would be more the hampering of the trade that would be objectionable. The efforts of a manager are to facilitate shipping and other work rather than to hamper it.

1933. There appears to be a necessity for some remedy, and whatever remedy is proposed, it would seem, must cost something? It does not matter about the cost, to my mind, if it can be shown that it is requisite to save life.

1934. Would it increase the expense very much if some portion of the coal was loaded from the waggons into hoppers, and the hoppers then lowered into the hold? It would double the handling, and have the effect of breaking the coal as well as being expensive.

1935. You have been a good deal troubled by fires in your Borehole mine? Yes.

1936. *Mr. Pittman.*] You do not seem to have any difficulty in keeping them in check? No.

1937. *President.*] Have you had any trouble with fires in your sea-pit? No; it is comparatively new. There have been waste heaps of small coal and rubbish about the district, and there have been cases where they have lain for years without taking fire, and then have subsequently taken fire without any apparent reason. The fires in the Borehole pit have occurred, I understand, in the gob, but we have never been able to make an examination to see how or why.

[Witness withdrew.]

Mr. G. Hewison sworn and examined:—

1938. *President.*] What is your name? George Hewison.

1939. And what is your business? Shipping and general commission agent.

1940. Have you had any connection with the Ferndale Colliery? Yes. I was the secretary of the last, but I represented one of the four proprietors by power of attorney.

1941. Your chief business is as shipping agent? Yes.

1942. And as such you have something to do with the insurance of cargoes? Yes; I am an insurance agent also.

1943. Can you tell us what premiums you charge for the insurance of cargoes of coal between here, say, and San Francisco? I have had very little to do with that.

1944. Can you tell us whether you charge more now than you used to charge four years ago? There is very little insurance done in that line now. I have had very little insurance on cargoes to do with.

1945. Are the premiums the same now or less than they were four years ago? I cannot say.

1946. I understood you to say you were an insurance agent? I was an insurance agent, but it was generally for hull risks. The business I was connected with more particularly had a floating policy, under which all cargoes were insured.

1947. Do you insure ships now? I have had no business in that line for five or six years.

1948. So that you have neither insured ships nor cargoes for five or six years? No; I know nothing about the rates.

1949. Have you had anything to do with the loading of ships? I came here for that purpose about thirty years ago. I had a large fleet of vessels that I used to load regularly. I was one of the principal shippers of coals in Newcastle.

1950. Did you do your own trimming, or did you have it done by a stevedore? In both ways—both by the stevedore and by the crews.

1951. Which was the most satisfactory way? I could not find fault with either.

1952. Did you have a case of shifting or heating of cargo in any of the vessels you loaded? I was here as agent for the Black Diamond Line, principally—a line that used to carry coals to Wallaroo, South Australia. There were about twenty vessels engaged in the trade, and I had to load those vessels, and I had to purchase the coal and do all the shipping business. There were eighteen vessels belonging to the Black Diamond Line, and over those I had full control in every way. The coals that I preferred shipping were generally small coals, and I have been told there was heating in the small-coal cargoes.

1953. That is between here and South Australia? Between here and Wallaroo, South Australia.

1954. Was there any case of heating sufficient to be serious? No, never. On one occasion, I am told, there was a vessel that I remember had a cargo of small coal, which made a long voyage of between thirty and forty days. When her cargo was being discharged it was found to be unpleasantly hot in the hold.

1955. What ship was that? I think it was the "Bosphorus."

1956. On what date was the occurrence? It is twelve to fourteen years ago.

1957. Where did the coal come from? I cannot tell you now. I used to buy small coal and mixed cargoes. I would have four or five different coals in one vessel.

1958. Was there any explanation or suggestion as to why this particular cargo heated? It was supposed to be on account of the long passage. The vessel was slightly leaky, and the sea-water tended to heat the cargo more than anything else.

1959. The vessel was leaky? She was leaky on that occasion.

1960. Can you recollect whether the coal was hottest where it was most moist? I cannot say.

1961. Have you had any other cases of heating? Only slightly. The cargoes would get hot, but not very hot. That was the hottest cargo I heard of.

1962. Did you have any experience of cargoes shifting? No, never. I never heard a complaint from one of our masters of any cargo shifting.

1963.

Mr.  
J. Gregson.  
25 Sept., 1896.

Mr.  
G. Hewison.  
25 Sept., 1896.

Mr.  
G. Hewison.  
25 Sept., 1896.

1963. Did your masters always attend to the trimming themselves, or did they leave it entirely to the stevedores? They attended to it, to see their vessels trimmed; it was their duty to do so. My own opinion is that small coal is more liable to heat than large coal. At one time we had a heap of 15,000 to 20,000 tons lying at Wallaroo, and it took fire in the heart of the stack.

1964. The coal caught fire? Yes, the coal caught fire, and it was found necessary to cut a trench through the heap and lay a line of pipes—15-inch, I think—from the mine pumps to convey water to extinguish it.

1965. What was the theory of the cause of the fire in that case? That a cargo of coals saturated with salt-water had been put in that very spot where the small coal had nearly ignited.

1966. How long ago is that? About thirteen or fourteen years ago.

1967. On whose authority was it said that the fire broke out at the spot where the cargo of coal saturated by salt-water was? The party receiving the coal at Wallaroo. It was said that the fire broke out just where the cargo of this vessel—I do not know the name of the vessel now—had been put, and that the cargo was landed in a very wet condition.

1968. Was that the heated cargo you referred to, or another case? Another case.

1969. There is no reasonable doubt in your mind that the fire originated among that particular cargo of coal? Not the slightest.

1970. It has been suggested to us that very often the captains of ships have so much to do ashore that they have no time to attend to the trimming;—is that true? I do not suppose the captains will attend to the trimming personally, but they have officers, and, speaking from an owner's point of view, it is the duty of the captain and officers to see that everything is done in connection with the trimming and everything else in connection with the vessel to ensure her safety, and it is certainly the captain's and officers' duty to see the cargo properly trimmed. I always thought so, and I had a very large power over it.

1971. A large power to do what? Everything in regard to the vessels under my charge.

1972. What has the mate to do when the ship is in harbour that would prevent him looking after the trimming? He has to see generally to the stowing. I consider it is the second mate's duty to see the cargo properly stowed—the officers generally, both chief and second; the captain can hardly be expected to be in the hold himself.

1973. As a matter of fact, it has appeared before us that, as a custom, the officers leave it entirely to the stevedore? Yes; and the stevedore leaves it to the men. The stevedore ought to be responsible that the vessel is properly trimmed.

1974. A suggestion has been offered that inspectors might be appointed to, in reality, do the duty of the captain and officers;—do you think there would be any objection to that? I think there would be a great objection on the part of the owners; they already pay the captain and officers for the work.

1975. What is the pay of captains of sailing ships? In our employ the lowest was £17 a month. We had steamers as well, and we used to pay the captains £25 a month.

1976. What is the usual rate of wages now to captains of sailing ships? I cannot say. I have been told £10.

1977. Do you know what the wages are that are paid to the mate and second officer? We used to pay our chief officers £9 and £10, and the second officers about £8, on an average.

1978. Do they get those wages now, do you think? I do not think so; but with coasting vessels, it is not much under that.

1979. Do you know anything of the custom for a stevedore to make a present to the captain of a ship in order that he might be left alone in the trimming? Not to my knowledge.

1980. Have you ever heard of it before this minute? I have heard talk of it. I think a captain would be very foolish to go to sea with a vessel not properly trimmed.

1981. Would the stevedore or trimmer be likely to place any obstacle in the way of the captain's attending to the trimming of his ship? I do not see how they possibly can; the captain is master in his own ship.

1982. Is there any profit made in the shipping trade;—do sailing ships pay a handsome dividend? I do not think they pay much now.

1983. They have paid well? They have paid well, there is no doubt. Freight is not one-third of what they used to be. I have paid as high as 22s. 6d. and 23s. for a cargo from here to South Australia, where now you can send coals for 6s. or 7s. With regard to inspectors, speaking from an owner's point of view, the charges made in this port are considered sufficiently high already. The captain, with his officers, are the proper parties to see after the loading and trimming of their vessel. The captain knows exactly what his vessel will carry; how she ought to be trimmed—so much by the stern and so much by the head. If he engages a stevedore he may trust to him to carry out the work properly, still his officers ought to see that the work is properly done. If inspectors were appointed, I do not see how they could carry out the work. There may be fourteen or fifteen vessels loading at the cranes at one time.

1984. They would not all be deep-sea ships—some would be intercolonial? Perhaps a few of them might be intercolonial. There might be a dozen others. The inspector could not possibly be with them all, and the question is, who is to pay the inspector. I am pretty sure the coal proprietors would object, and the owners say they pay their masters and officers already to see to all that.

1985. *Mr. Pittman.*] What does that argument amount to when we have evidence to show that the captains do not do their work? They are amenable to the owners in that case.

1986. But when the work is not done, what satisfaction is that to the public—

1987. *President.*] Or to the people who risk being drowned through it? The captain runs the risk of being drowned himself.

1988. *Mr. Pittman.*] Your argument is that captains are paid to do the work, but when they do not do it, what remedy is there? I cannot say.

1989. If the Government think that, although captains may be paid to look after the work, they do not do so, you cannot blame them for appointing inspectors of their own to see that the work is properly carried out? If the Government intend to take the loading of ships, that is a different thing. If a man does not do his work, and the Government is going to take his place, the Government will have bear it.

1990. If the ship-owners do not get the work done under present circumstances, would it not be a fair thing, in the public interest, to take steps to ensure it being properly done? I think the inspection will go so far by and bye that we shall have to get inspectors to see that the inspectors do their work.

1991. If the Government undertook to provide inspectors they would obtain men who would see that the work was done? I consider the captain and officers ought to know the trim of a vessel better than any other person—better than an inspector.

1992.

1992. Is it your opinion that captains do see that trimming is properly done? If the captain shirks his work, or does not perform his duties properly, I have nothing more to say.

Mr.  
G. Hewison.  
25 Sept., 1896.

1993. Do you think he does or does not do so? I have never had occasion to find fault with it, and I have had a large experience.

1994. You do not know of any case where a captain has left the supervision of the work of trimming to the stevedore? I really do not. I have often had captains come to me and speak of the stevedore, and I have never known a case where a captain neglected his duty.

1995. *President.*] You already have inspection to see to the loading of a ship as regards her marks? Yes.

1996. As an owner, would you object to an inspector seeing that a ship was not loaded below her load-line? No, decidedly not; it costs nothing.

1997. I take it your position is that, as an owner, you would not agree to anything that would increase the expenditure? Certainly.

1998. Would you rather anything than that? Decidedly not. I do not believe in sending a vessel to sea to be lost for the sake of the insurance money. That would be a dishonest arrangement. I should think the captain and officers have sufficient regard for their own lives not to go to sea in a vessel they knew was going to be lost.

1999. *Mr. Pittman.*] Do I understand, Mr. Hewison, that you contend the supervision of trimming is properly done at the present time, and that there is nothing wrong? I do not say that nothing happens. A trimmer may perform his work badly, but I consider it is the captain's duty to see that he does do his work right.

2000. Have you ever known or heard of a case of faulty trimming? Not in my own experience, and I have sent away hundreds—I may say thousands—of vessels from here, and I have never had a vessel lost.

2001. And you have never known a captain who failed to supervise the trimming? I have never known a captain to do so. Oh, yes; I had two vessels lost. One was driven ashore and another went down in a fearful storm.

2002. It might have been possible for one of your ships to go to sea without your knowing whether a captain had personally supervised the trimming? It might.

2003. As a matter of fact, you are not in a position to say, from your own knowledge, that captains have in every case supervised the loading of their own cargoes? I am not.

[Witness withdrew.]

Mr. R. West sworn and examined:—

2004. *President.*] What is your name? Richard West.

2005. And your business? Foreman coal-trimmer for James Russell and Company.

2006. How long have you been in that business? About six years.

2007. You were a practical trimmer before that? Yes, previous to that.

2008. Your business now is to superintend the trimming? Yes.

2009. Do the captain and officers of a ship interfere with you in the trimming at all? Sometimes; not in every ship.

2010. In the majority of ships do they or do they not? They generally tell me how they want the ship trimmed, and we have to trim the ship to their ideas.

2011. Do they ever go down to see the work, or do they leave it to you? Generally one of the officers or mates is down below.

2012. That is the usual practice? Yes.

2013. Do you consider the supervision of the ships perfectly satisfactory—is it complete? Yes.

2014. It is your business to trim to the captain's orders? Yes.

2015. *Mr. Pittman.*] Have you ever seen a case where an officer of a ship has not been down? Yes.

2016. In many cases? A great many.

2017. Where there was no supervision by the officers at all? Neither by the officers or crew.

2018. *President.*] So that you could trim exactly as you had a mind to? When we go aboard a ship the captain generally tells us how he wants the coal shot. In many cases nobody comes to see that it is done.

2019. It is your object to get the ship loaded as fast as ever you can? Yes.

2020. I suppose a cheap way of doing that is to run as much coal into the ship as you can before you start to trim? It all depends on what kind of ship it is; if it is an open ship you have to do that.

2021. If it is not an open ship? You want to trim the lower hold as soon as ever it is blocked.

2022. You generally tip the coal from the coamings of the hatch—you are not often able to lower the waggons? No.

2023. You have lowered them on occasion? Yes.

2024. Can you give the Commission any idea as to what extra cost would be entailed to lower the waggons down the hold? A ship running 120 waggons would do that in from eight to ten hours; to lower the waggons down the hold would take something like twelve to fourteen hours.

2025. From that we can assume the increased cost? Yes.

2026. It would take about two hours longer? From two to four.

2027. How many men would you have employed during that time? At present, working under the Union rules, there would be six men.

2028. How much would they be paid? One shilling and threepence an hour; provided you have no coal in any of the other hatches; if there is, you have to have the full gang—that may be twelve to fourteen men. We are working under the Union rules at the present time.

2029. So that it would be fourteen men at 1s. 3d. an hour? 1s. 3d. in the day and 1s. 9d. at night.

2030. The maximum possible extra cost would be £2 12s. 6d. in the case of a ship running 120 waggons? Yes.

2031. How many tons would that be? It all depends upon what coal it is. If it were Duckenfield coal it would be about 1,000 tons, and Wallsend coal about 800 tons.

2032. In about 1,000 tons there would be an outside extra cost of £2 12s. 6d. to lower the waggons down the hold? Yes.

2033.

Mr. R. West.  
25 Sept., 1896.

- Mr. R. West. 2033. What are the wharfage dues? Half-penny per ton per day on the ship's registered tonnage; but there are some new rules spoken of—I do not know what they are. At one time, if a ship went twenty minutes into the second day she had to pay a full day's wharfage; a ship carrying 1,000 tons would be about 600 tons tonnage.
2034. She would pay 600 half-pence a day? Yes.
2035. The total extra cost would be under £3? Yes.
2036. On the basis of a ship running 120 waggons? That would be a large ship going about 2,500 tons register. The 120 waggons are only to run the hatch up before you actually start shovelling the coal.
2037. About £3 12s. would be the extra cost for labour and wharfage dues, in that case, in lowering 120 waggons into the hold of the ship instead of dumping the coal from the coamings of the hatch? Yes.
2038. Would it pay the crane contractor to lower the waggons into the hold if he were asked to do so? I do not know if it would pay him; he does do so.
2039. He always does so whenever he is asked? If he can get the waggons down the hatch.
2040. Have you had any experience with any of the patent loading apparatus? No; I have seen a couple of them.
2041. Are they any good? I do not think so.
2042. Do you know that apparatus [*handing witness photograph of Harper's patent distributor*]? Yes, sir; but it was not like that when it was tried; it has been altered since.
2043. Does it look a likely thing to use? You can use it in some ships with very large hatches.
2044. You could use it in those ships in which you could lower the waggons—is that what it amounts to? Yes.
2045. In that case there would be no advantage in using it? No.
2046. How is it hung up? To the ring-bolts under the deck, or in the coamings, wherever they may be situated.
2047. Are there always convenient places to hang it to? No; some ships have no rings, and you would have to take a turn round the stanchions.
2048. Have you seen ships loaded with Spencer's apparatus? I have not worked it, though I have seen it put in.
2049. Did it appear to go in alright? I have seen the hatch run up first, and the patent put on top of the coal.
2050. Where? Two ships at the Dyke—two of the Firth line; I cannot think of their names.
2051. Who loaded them? Sullivan loaded one.
2052. The coal was actually dumped into the hatch first, and then Spencer's distributor put on top? Yes, in the aft hatch; in the main hatch it was there before the coal was put in. In the aft hatch the coal was run up, and the patent put on top.
2053. What was the object of that? They used it as plates to slide the coal down.
2054. Would it be any better than ordinary plates? Not so good, it would be more trouble. We mostly use a spar across the hatch. The most troublesome are the box waggons. You have to let them go high, and the whole lot of coal comes out at once.
2055. They would be easier to lower down the hatch? Much the same. They take the same room as the hopper-waggons—they have the tip chains.
2056. Although you may let the coal out of the hopper slowly, it must still fall the depth of the vessel? Yes.
2057. And that fall breaks it up? Yes; it breaks a good deal of it up.
2058. Do you recollect the details of the loading of any of the cargoes you have loaded which have heated afterwards? Several.
2059. The "Cedarbank" loaded in 1893, did you load her? Yes.
2060. Was she loaded with Wallsend coal? Yes.
2061. And at the cranes in the usual way? Yes.
2062. Was there anything special about the weather at the time of loading? I hardly remember that.
2063. You do not remember any particular circumstance? I remember how she was loaded. The coals were loaded up to about 18 inches or 2 feet from the deck. There was surface ventilation fore and aft of the ship. That coal was on the ship a considerable time.
2064. How long before she sailed? Over six months. She got dismantled.
2065. Three months for the time of loading and on her voyage, and three months in Sydney? Something like that.
2066. Did you know the cargo of that ship fired? I did hear she arrived at 'Frisco on fire.
2067. Do you remember any other circumstance? No.
2068. She was dismantled? She got outside, and the masts buckled and bent.
2069. Why was that? Bad weather and bad spars.
2070. Do you remember the ship "Alexandra"? Yes, I loaded her.
2071. Do you remember anything about her particularly? It was raining very heavily while she was loading. A heavy squall blew her adrift from the Dyke, and did a lot of damage.
2072. Did it damage the ship? Yes, some of her gear. She got foul of another ship, and part carried away.
2073. Do you remember where the fire broke out on that ship? Between the two hatches.
2074. Would that be too far away from the main hatch to be in the dust-heap that accumulates under the main hatch? I have not seen a dust-heap accumulate under the main hatch.
2075. There must be an accumulation of small coal there? It all goes together.
2076. Does not the big coal roll away? A certain portion.
2077. On the whole, the "smalls" stay under the hatch? Yes.
2078. Did this fire occur sufficiently near the main hatch for it to have been in the "smalls" generally left in the neighbourhood of the main hatch? Right clear of it. I understand the ship caught fire where the coal was trimmed.
2079. That ought to have been good-sized coal? Yes; you shovel the big and the small away together.
2080. They would not have shovelled dust probably? No.
2081. Do you remember anything more about that ship? No; only that it rained very heavily.
2082. Was the weather hot, do you remember? It had been hot a little previous to that, but not after.
- 2083.

2083. That was last year? Yes; three of them loaded at the same time. It rained when the three loaded, and the three caught fire. Mr. R. West.  
25 Sept., 1896.
2084. Which were the other two ships? The "Brablock" and "Republic."
2085. *Mr. Pittman.*] You, perhaps, remember having to go away from your work with wet clothes? Yes; I was sick at the time. I was sent home, and it was raining all the time.
2086. *President.*] The three ships were the "Alexandra," the "Brablock," and the "Republic"? Yes; and it rained when the "Hollinwood" was taking her stiffening in.
2087. That was the end of last year, or the beginning of this? Yes.
2088. The general tendency of the weather was to be hot? Yes.
2089. Otherwise they were all loaded exactly in the same way? Yes.
2090. Do you know where the fire broke out in any of them, except the "Alexandra"? No, sir.
2091. In the "Republic" it broke out in the No. 2 hatch;—do you know anything about that? No.
2092. You cannot tell us anything about the "Hollinwood"? No; only that she was loaded in wet weather.
2093. Could we find out where the fire broke out in the "Hollinwood"? I am not certain whether she did fire or only heat.
2094. Did you load the "Knight of St. Michael"? Yes.
2095. What was the weather like when she was loaded? It was fine when she started—when she took her stiffening in it was fine and very hot. She went over to Stockton at the ballast wharf, and laid with her hatches off—the same hatches that the stiffening was in, and there came a thunderstorm.
2096. That was during that very hot week? Yes.
2097. That storm came on the Tuesday night? The day she took her stiffening in, at 11 o'clock at night. It was 112 degrees in the shade that day.
2098. Did you load the "Morra"? Yes; I think so.
2099. Do you recollect definitely whether you loaded her or not;—she caught fire in the harbour? That was only lately. She came up from Sydney with stiffening.
2100. Do you know anything about her? We loaded her. The trouble was over before I went to load her.
2101. It was in the stiffening coal only? Yes; the stiffening coal heated.
2102. She was loaded by Russell & Co.? Yes.
2103. Do you know anything of the "Invermay"? I did not do her.
2104. Did you load the "Ben Cruachan"? No.
2105. Or the "Easby"? No.
2106. Do you know anything about the "Dayspring"? I know nothing about it.
2107. Have you noticed, before this inquiry commenced, that the ships which heated were those which had been loaded while wet? Yes.
2108. Hot and wet, shall we say? There was one ship, the "Drumcraig." She was left in our charge, because the crew had to go to Sydney on account of having fever. They got orders to put stiffening in, and there was nobody to look after the ship. They put too much stiffening in the No. 1 hatch. When we were finishing loading her, they cut through that hatch, and it was quite hot.
2109. How many days after the stiffening was put in? Something like three weeks. The men could not stand on it to work the coal back.
2110. What kind of weather was it? Very wet, while she was loading—when she took the stiffening in.
2111. Was it hot too? I could not say.
2112. Was that in the summer or winter? It was in the summer time.
2113. Have you any other experience of heated cargoes? Several; with nearly every ship, if it is wet weather, when she takes her stiffening in, and if we have to shift that coal, we find it very hot—if it has been taken in in the rain, or rain has got to it.
2114. Is it decidedly your opinion that wet has something to do with the heating? It has a good deal to do with it. We have plain facts; all those ships loaded in the rain have fired.
2115. Do you think sulphur has anything to do with it? I do not know. I do not believe very often there is sufficient surface ventilation in the ships.
2116. That does not alter the heating? It does not give the air a chance of getting up and down. Everyone of the "bank" line has been trimmed to 18 inches or 2 feet up from the deck, and nothing ever happened to them, except the "Cedarbank," neither the shifting of cargo or anything else.
2117. Do you notice any difference in the coal;—is it the coal from any particular colliery that generally heats, or does the heating occur indifferently? The worse trouble seems to be in the small pits—the South Wallsend and the Cardiff coal. The "Alexandra" and "Brablock" loaded with that.
2118. You have not noticed yourself, before this inquiry began, any special relation between the pits and the heating of the coal? Oh, yes.
2119. Which pit do you consider gives the coal most liable to heating? It seems to be the Cardiff coal and the West Wallsend. We very seldom have any trouble with the Wallsend coal.
2120. Is the Cardiff a hard or soft coal? Very hard.
2121. And the West Wallsend? Something similar.
2122. Have you noticed any relationship between the heating and the smallness of the coal;—does it occur under the main hatch where the coal is, in general, broken up? As a rule, we never have any trouble in the main hatch after it is once blocked. It is only in the ends where we have to cut down. The main hatch is filled right up, and the ends have to be levelled off.
2123. You have no means of knowing, as a rule, whether the stiffening has heated or not? No.
2124. You are speaking almost entirely of stiffening coal now? Yes. With the other coal we are not at the ship long enough to know whether it heats or not.
2125. Is there anything you would like to bring before our notice in regard to heating? I do not think so, only it has been in most cases through rain.
2126. Or anything about trimming? The master trimmers, I see in the papers, are crying out about the price. It is not a matter of price. They get what they ask for the work, and it is the captain's and officers' place to see that the work is done properly.
2127. You think it is the fault of the captains that the work is not done properly? Yes; if our people were getting 1s. or 2s. per ton the work would be done no better. Inspection would be no one man's job,  
or

- Mr. B. West. or three or four; it means about twenty men. It is no use any inspector going to a ship after she is finished to see if she is properly trimmed; he must be there the whole time the ship is loading and down the hold, and if the ship is working at night there must be a man to relieve him.
- 25 Sept., 1896. 2128. Several witnesses tell us a man who knows his business could look in now and again? It is no use whatever.
2129. *Mr. Pittman.*] Do you not think they could supervise three ships alongside one another? No, sir; you must be there the whole time. I am foreman for Russell, and it takes me all my time to watch them.
2130. *President.*] How many have you to watch at a time? Sometimes I have three or four.
2131. If you can watch them, I suppose another could? I cannot; I have to trust to the men.
2132. In your opinion, there would have to be some twenty inspectors? If the ships work night and day, you would want two for each ship.
2133. *Mr. Pittman.*] Under those circumstances, are you not drawing your wages unjustly, while pretending to do the work? I do the best to my ability. We always have one man on each ship to carry on the work if I am not there. I cannot watch the lot. I could not swear each ship was trimmed as it ought to be. We got it done as well as we can.
2134. *President.*] It is to the interest of the stevedore to do as little trimming as possible? Yes.
2135. He has a pecuniary interest in not doing it well? The way things have been going lately, we have tried to do our best.
2136. That is on account of the trouble that has arisen? Yes; on account of the missing ships.
2137. Do you think the trimming has improved in the port within the last few years? Greatly, since I have been here.
2138. It is the object, of course, of the men engaged in trimming to be employed as long as they can at 1s. 3d. an hour? You would think so, but as a rule, it is not.
2139. Why? They seem to try to get away as soon as they can.
2140. Do they not want to put in as much time as possible? They want to put in time, but, at the same time, if we are not there to watch them—
2141. They will not shovel the coals unless they have got to? That is it.
2142. Have you ever known a case in which the captain has been bribed to stand aside and allow the ship to be trimmed without supervision? No, sir. I have known captains, if they give the work, to accept something out of the trimming.
2143. That comes to the same thing? I cannot see how it comes to the same thing.
2144. It is in the nature of a commission? Yes. I would like to say that there is lots of rubbish thrown down many of the hatches when they finish off. Sometimes there will be lumps of tar and oakum, and kerosene, that have come off the rigging and rigging screws shovelled up and put down the hatches.
2145. Who does that? The crew, and they sweep all the rubbish up and throw it among the coals.
2146. Should not the officers and captain prevent that? Sometimes you load a ship and do not see the captain at all.
2147. What about the mate? He tells them to sweep it up, and does not seem to take any notice. A lot of shifting-boards are not sufficiently strong—1-inch beams put right across the hatch—and as soon as you let go the waggons of coal it breaks them up into matchwood.
2148. And this gets carried down with the coals? Yes.
2149. *Mr. Pittman.*] As a kind of tinder-wood? Yes, it would help a fire on.
2150. *President.*] It has been said that some of the stevedores would like to be licensed, in order to prevent incompetent men from tendering for the loading of vessels;—do you think that would be a good plan? I think it would save a great deal of this competition, and they would not have to cut a man down, and they would not be in such a hurry to get the men away.
2151. The effect would be to decrease the competition, and raise the price for trimming, and you think that would enable the work to be done better? I think so. If you got more for your work you would not be in such a hurry to get out of the ship, but the masters get what they ask for the work, and the officers should see that they do it. A good many of these ships have donkey-boilers standing over the deck where the coals are. We are loading at present a little French vessel, and the deck is so hot we could not put our hands on it. The coal is right up against that. We have had cases where a ship has been on fire while loading, on account of the donkey-boiler.
2152. Were the decks of wood? Yes; the coals out of the donkey-boiler set the ship afire in the 'tween deck.
2153. *Mr. Pittman.*] You say the deck is hot yet in the vessel you are loading? Yes; she is loading at No. 7 crane.
2154. What is the thickness of the deck? About 3 inches. There is an iron deck underneath.
2155. The "Ellen A. Read's" deck is 5 inches thick? The donkey-boiler is in the same position as in the "Ellen A. Read." In the vessel that fired the first thing we knew was that she was all ablaze. The coals had burnt through the wooden deck and dropped down.
2156. *President.*] How long ago is this? Some three or four years ago.
2157. The coals from the donkey-boiler burnt through the deck? Yes, and she fired.
2158. Do they ever work the donkey-engine at sea? Yes.
2159. To work the ropes? Yes.

[Witness withdrew.]

Mr. John Price sworn and examined:—

- Mr. J. Price. 2160. *President.*] What is your name? John Price.
- 25 Sept., 1896. 2161. And your business? Coal-trimmer.
2162. Are you a member of the Coal Trimmers' Union? Yes.
2163. Are you an officer of that Union? Yes.
2164. What position do you hold? I am the treasurer.
2165. How long have you held that position? Since we have started again, and I held the same position previously.
2166. It is by your own wish you appear before the Commission? Yes.

2167. Will you kindly tell the Commission what you want to lay before them? I understood the Commission would ask me questions, and that I only had to answer them. Mr. J. Price.  
25 Sept., 1896.
2168. In the case of a witness who volunteers his information, we wish to leave it to him to state what he considers of sufficient importance to lay before us? What I consider of so much importance is the shifting of coal cargoes, and the only way that can be got over is by our colliery owners doing their own trimming in deep-water ships. My reason for that is that, in the first place, you will have no master, only the colliery proprietor to please. It is not whether the ship does or does not pay then. If you are a foreman you will not have to trust to what you make for your employer to keep your position. If you are a stevedore, it will not interfere with the gains that the companies make out of that ship or not. I consider the coal ought to be trimmed, and the trimmers paid as they are in England and Wales.
2169. How are they paid in England? By the ton.
2170. Would you rather be paid by the ton than by the hour? I should prefer it.
2171. How would it make a difference to you? We should get what we earn then. At present we do not. The middleman receives the benefit, not the labourer.
2172. Who is the middleman? The stevedore.
2173. He receives the benefit? Yes.
2174. Your proposal is that the colliery owners should add the business of stevedoring to the business they have at present? Have an inspector of their own.
2175. I understood you to say that the colliery proprietors ought to load the ships—that is to say, they should become stevedores? No; the trimmers would be the stevedores, and the colliery proprietors would have their own inspectors.
2176. *Mr. Pittman.*] They would be in the position of stevedores? Yes, with this exception—that it would not matter to them whether the ship paid or not. They would not be forfeiting their position in any way. They would be there to see the work done thoroughly well, and by so doing their company would have the chance of insuring their cargoes, which, I am told, at present they cannot do. They would file a plan of every ship they finished and leave it at the office, showing how that ship was trimmed.
2177. *President.*] Is there anything else you would like to mention to us? There is nothing else I wish to speak about. The firing of coal cargoes is a bit above my knowledge.
2178. Your evidence is to the effect that you think the trimming would be better accomplished if it were done under the supervision of the coal proprietors than that of the ship-owners or ship-masters? Yes.
2179. That is precisely what you want to say to us? Yes.
2180. Are you quite sure you have said what you wanted to say? Quite sure, sir.

[Witness withdrew.]

Mr. T. Burke sworn and examined:—

2181. What is your name? Thomas Burke.
2182. And what is your business? Coal-trimmer.
2183. How long have you been a coal-trimmer? Eight years.
2184. How old are you? Thirty-two years.
2185. You have come here recommended by Mr. Dick? Yes.
2186. I understand you have some information, which you think might be of service to the Commission? Yes.
2187. Will you kindly lay what you want to say before us? I will give all the information in my power, as far as my practical knowledge will enable me. I have both discharged coal and trimmed coal in vessels. I think by getting a 20 to 26 feet fall in the main body of a ship, there is a certain amount of breakage in the coal, and it leaves the small coal in a heap, and all the big coal rolls away to the side, and there is no chance for the air to get to the small coal. The air travels through the big coal, but not through the small.
2188. Do you consider the presence of air tends to help combustion, or to hinder it? To hinder it. I think if the air did not get to it, it would fire. I think there is neglect at the mines in allowing miners to put a certain amount of combustible in the coal that comes to the ship. In regard to one instance, the "Industry," there was a bag of powder, and about 5 to 6 feet of fuse. The men did not know what it was, and cut a bit of the fuse and put it upon the bag and off it went.
2189. The fuse? No, the powder. There is neglect, both of the coal-trimmers and stevedores about candles. Sometimes when meal hour comes, we have a candle stuck on the beam, with the candle half through the candle-stick, and as soon as we hear it is dinner, we run away and neglect our candles.
2190. Have you ever done that yourself? I have, sir. I have neglected my candle, but nothing ever occurred from it. On one occasion, when I was putting up a wall, my candle dropped out, and when I came back, the coal was a little heated.
2191. Have you ever been walled off from where a candle was left? No, sir.
2192. Is it possible for a coal-trimmer to drop his candle in such a place that he could not get back to it afterwards? He might fill up the place where it dropped, and not notice it.
2193. Has that ever been done, do you think? It might have been; it is quite likely to occur. I have only one point to say about the shifting of coal cargoes. We are trying to get over the difficulty as well as you gentlemen.
2194. Who are we? The coal-trimmers of Newcastle.
2195. The Coal-trimmers' Union? Yes.
2196. Are you an officer of the union? Yes; a committeeman.
2197. And what is your union going to do? We are trying to get over the difficulty by putting on the labour when the coal first goes into the ship in order to trim it. Before, there used to be 1,500 to 2,000 tons of coal put into a ship, without any labour being put on, bar one man, and one man cannot trim that amount of coal down below. Certain spaces in the ship want filling up, and these spaces were neglected. Captain Cross, at the Chamber of Commerce, asked one of the stevedores what he meant by making a ship pay, and he said, "To run up the fore hatch, and knock the top of it off."
2198. *Mr. Pittman.*] You mean to say the stevedores are in the habit of running up the hatches before they put on the men to trim? Yes, sir.

Mr.  
T. Burke.  
25 Sept., 1896.

- Mr. T. Burke.  
25 Sept., 1896.
2199. *President.*] The Union want to make the master trimmers put on more men? The Union are trying to get Newcastle back the good name it once had. It has got a bad name, and it is put on the trimmers.
2200. On the contrary, witnesses all agree that it is not the fault of the trimmers? We get the blame.
2201. It has not appeared so before us? I am not saying it is our fault, but we are blamed for it.
2202. You are quite wrong in that. The men have been universally exonerated. You had a strike in connection with this matter the other day, which lasted a few hours? Yes.
2203. Was that an attempt to improve the trimming? To improve the port.
2204. You actually struck to improve the port? Yes; by gaining a name for the port we gain a point for ourselves. The ships have not been properly trimmed at the present rate the stevedores get for their vessels.
2205. What you want to say is, that the Union are taking steps to endeavour to obtain the employment of more labour on trimming for the good of the port? Yes.
2206. That is precisely the object of the Union? Yes.
2207. For the good of the port? For the good of the port, the good of ourselves, and the community at large.
2208. Is there anything else you wish to say on that point? No; only that when we were working under the Union rules before there were less casualties than since this system of cheap work started.
2209. When did this system of cheap work start? As near as I can say, three or four years ago.
2210. You were better paid before this? Yes; and the work was better done.
2211. You get 1s. 3d. an hour for day work; what did you get four years ago? We got the same, but we were put on before the hatches were run up.
2212. You worked more hours? Yes.
2213. Owing to the competition amongst the stevedores, the labour employed is reduced to a minimum? Yes.
2214. It is the object of the Union to force employers to use more labour—that is about what you want to say? Exactly.
2215. Have you anything else to say with regard to that? I have nothing else to say with regard to shifting. I was a seaman on board the "Riverside," and her cargo heated.
2216. Where did she come from? She left Newcastle bound for Wilmington.
2217. Where did her cargo heat? In the main hatch. I was one of the crew, and we had to discharge at San Pedro.
2218. The heating was not noticed at sea; it was while you were discharging? Yes.
2219. Was it on fire, or merely very hot? It was so hot you could not hold it in your hand.
2220. Did you notice whether that coal was much broken up or not? It was small coal stuck together in the wake of the main hatch.
2221. That might be caused through the heating? I think it would be.
2222. Do you remember whether it was damp or not? It was not damp when I got hold of it. It might have been damp when it went into the ship.
2223. It was not steaming? It was hot.
2224. Was it hot and damp? No.
2225. So that it sweated and steamed when you took it out? It smoked a bit.
2226. Did it steam? I could not exactly tell you. I know it smoked when you were breaking through it.
2227. How long ago is that? I could not really tell you. As near as I can say it is about ten years ago.
2228. How long had the ship been at sea—about sixty days? About sixty days, I think—between fifty and sixty.
2229. Were you in port when she took the cargo on board? I shipped here in her.
2230. Was it in hot weather or wet weather? It was summer time; hot weather.
2231. You cannot remember whether it was showery or not? No.
2232. Are there any other circumstances in connection with heating which you would like to lay before us? No, sir.
2233. Is there anything else you would like to tell us? No. What made me come here was I thought the case of the "Industry" was neglected. I never saw it in print.
2234. You are quite sure you have said all you wanted to say? Yes, sir.

[Witness withdrew.]

FRIDAY, 2 OCTOBER, 1896.

[The Commission met at 2:30 p.m. at the Chief Secretary's Office, Sydney.]

Present:—

PROFESSOR RICHARD THRELFALL, M.A., PRESIDENT;  
And EDWARD FISHER PITTMAN, Esq., A.R.S.M.

Captain T. Laidman sworn and examined:—

- Capt. T. Laidman.  
2 Oct., 1896.
2235. *President.*] What is your name? Thomas Laidman.
2236. And what is your business? Marine surveyor to the Sydney Underwriters' Association.
2237. How long have you been in that position? Five years.
2238. And before that? I was a shipmaster. I was at sea from 12 years of age.
2239. It is your business now to inspect ships for the purpose of insurance? Yes.
2240. Do you inspect ships loaded with coal? I inspect them to see that they have shifting-boards, and that they are insurable risks.
2241. You do not take any particular notice in regard to the cargo of coal? No; but I do of the shifting-boards in every sailing vessel that goes out.
2242. Do you insist on shifting-boards? We do not insist upon them. If they will not put them up we do not make them, but there is then some difficulty in insuring the coal.

2243.

2243. Would you charge different rates if shifting-boards are not in? I cannot say. The underwriters do that, but they are nearly always put in.

2244. Do you survey ships both in Newcastle and Sydney? I am supposed to be in Newcastle, but at present Captain Hall is away, and I am relieving him. I shall be in Newcastle to-morrow.

2245. Do you know anything as to the rates charged on ships carrying coal? No; that is out of my province. I merely see whether the ship is good, bad, or indifferent, and report to my employers, the underwriters.

2246. *Mr. Pittman.*] Will you tell us on what lines you base your report? If I think a vessel is in a very bad state in regard to the hull, equipment, &c., I advise the underwriters to have nothing to do with it. It rests with them whether they choose to accept the risk or not.

2247. Do you report also on the question of her being properly trimmed? No; I do not do that. I cannot say whether she is properly trimmed or not. I was called upon to inspect the trimming in one case about two years ago, and I condemned it, and it was trimmed over again.

2248. Do you mean to say insurance offices take no notice of the fact of a vessel being badly trimmed or not? I cannot say whether they do or not. We never heard of any of this bad trimming or the shifting of cargoes until the last four or five years—until so much competition set in. They only get half the money they used to.

2249. The insurance offices have no other survey to go upon than yours? No.

2250. And cannot know whether a vessel is badly trimmed or not? No. If I knew a vessel was badly trimmed I would make an inspection.

2251. Otherwise you would not inspect the cargo at all? Not the cargo of coals; in fact, I have so much other work to do in Newcastle and Sydney. We have got instructions to report on every sailing ship, whether shifting-boards are up or not. The majority of them are putting them up. We have a record of them at the underwriters' office.

2252. The tendency now is for all vessels to put them up? There are only ten that did not out of 209. Iron and steel vessels require them much more than wooden ones.

2253. *President.*] Do you think the chance of a coal cargo shifting through being badly trimmed increases the risk? Yes.

2254. How do you account for it that your employers do not take a survey of the condition of the coal cargo? You would have to be down the vessel's hold pretty well all the time.

2255. It is so important a matter that I should have thought steps would have been taken by underwriters to see that the cargo was properly stowed;—can you explain why they do not take such steps? I cannot explain that; you will have to ask them.

2256. They do, I presume, insure cargoes of coals, do they not? They are getting very chary about it lately on account of so many missing ships. There have been six ships missing lately—vessels above suspicion—all with shifting-boards up.

2257. You do not survey the condition of the coal cargo in any way? No. When I go to-morrow, I shall go below to inspect the shifting-boards, and to see whether they are up to my satisfaction or not; if they are not, I remind them of it. With reference to the "John Ena," which took fire between Newcastle and Frisco, I got official reports from the railway office, Newcastle, and from the Marine Board, as to the weather, and I found it was raining while she was loading.

2258. Is it your opinion that the wetting of the coal had a bad effect upon it? It would not have a very good effect. I have taken coals from Liverpool, but never had any trouble.

2259. Did you take them wet or dry? I took my chance with it. I think the cheap trimming has got something to do with the loss. I used to go to sea from Newcastle, and we used to pay 3<sup>d</sup>. and 4<sup>d</sup>., and now they are doing the work for 2<sup>d</sup>. a ton.

2260. You think it cannot be done properly for 2<sup>d</sup>.? It cannot be done. We never had any of this trouble when we paid a fair rate, but now there are so many amateur trimmers—men who know nothing about it, and I know most of the men personally.

2261. *Mr. Pittman.*] Why is it, with information like that, the insurance offices do not take steps to see that the cargoes are trimmed? I know the underwriters do not care about touching the coal risks on account of the losses.

2262. *President.*] How long is it since they began to avoid coal cargoes? During the last four or five years.

2263. Not since the Commission was appointed? Oh, no. I would like you to see the underwriters about that; they will give you better information.

2264. In your opinion, shifting-boards are necessary? Decidedly; more especially in modern vessels; they cannot be filled. They are nothing but large tanks. Wooden vessels do not require them so much, because of the heavy timbers, keelson, &c.; there is so much displacement. An iron vessel's hold is simply a huge tank. The trimmers are getting a little frightened now, because when a vessel is lost, they say so-and-so trimmed her, and it is a sort of discredit to the men, and they are more particular about it.

2265. How long is it since they began to be more careful? Since the loss of vessels. Last year we had six lost, and the year before that, four. That is home ships; and the singular thing is they are nearly all iron and steel vessels.

2266. That may be simply because they are the largest ones? Yes; during the last five years, I am quite safe in saying that from Newcastle there are only two wooden vessels missing that we cannot account for; all the others are steel or iron ships, new and old.

2267. Do you believe the majority of ships that have been missing have been lost through shifting of cargo or through general unseaworthiness? They were seaworthy when they left Newcastle. The "Cumbræ" was a new vessel, and she went out of Newcastle, and we have never seen her since.

2268. Was she an iron ship? No, steel; there are no iron ships built now.

2269. Was the "Cumbræ" a large ship? No; a barque of about 1,200 tons. She had some tallow and shale in her as well as the coal. Age seems to make no difference, whether 30 years or 12 months old, they go away, and we know nothing more about them.

2270. It has been suggested to us that it would be of advantage to have Government inspectors appointed to inspect the trimming? I think it ought to be so, and a professional man—a man who knows his work.

2271. You approve of the suggestion? Yes, I do. There was the "Lady Lawrence," she had a lot of shale on board; I looked at it, and asked the captain to shift it.

2272. She was too tender, was she not? Yes;

2273.

Capt.  
T. Laidman.  
2 Oct., 1896.

Capt.  
T. Laidman.  
2 Oct., 1896.

2273. *Mr. Pittman.*] There is a case where you did inspect the cargo;—did I not understand you to say you did not inspect cargoes? That was only in regard to the shale; it was in the wrong place.

2274. How did you come to know about the shale? I went on board and saw it. I reported the matter to the Marine Board in Newcastle.

2275. You found it out by going below? By going aboard. I was not satisfied with my own opinion, and I instructed the Marine Board, and their inspector, and the Harbour-master and I went together. I thought you alluded to inspecting coal trimming.

2276. We wish to know how the insurance offices can judge by your report whether they can insure a cargo or not? Perhaps you had better ask them.

2277. *President.*] Have you a form, on which you write your report, with you? No; when I go to Newcastle I make a report on so many vessels, about ten or a dozen, as to their age and qualification. We have a classification or code.

2278. You fill up a form? We fill up a form.

2279. Can you procure one of those forms? Yes; if you will write to the Secretary of the Marine Underwriters' Association.

2280. I must ask you to send me one of the forms you fill up, so that the Commission may know exactly what questions the insurance offices consider necessary to be answered by you? It would not be made public?

2281. Certainly not, if it is not wished. Anything that is desired to be confidential will be regarded as such? The information that Captain Hall and I give is confidential—for the insurance offices alone.

[Witness withdrew.]

Mr. J. H. Storey sworn and examined:—

Mr.  
J. H. Storey.  
2 Oct., 1896.

2282. *President.*] What is your name? James Henry Storey.

2283. And your business? Shipping and insurance agent.

2284. With what insurance companies are you connected? The South British Fire and Marine Insurance Company and the Ocean Marine Insurance Company.

2285. What kind of position do you hold in connection with those companies? Agent for both.

2286. Are you the manager for either of them? My firm are the agents.

2287. You insure ships and cargoes? Yes.

2288. What relation has the Sydney Underwriters' Association to your companies? The two companies I represent are members of that association. Briefly, the association is for the protection of underwriting interests generally in the Colony, and for communicating with underwriting institutions all over the world.

2289. Captain Laidman tells us he is in the habit of making reports for the Underwriters' Association? That is so.

2290. Are those reports transmitted to the special companies who are interested? Yes; his report of all the surveys he has made is every week sent round to every office in the association. It is a confidential report.

2291. Is it on that report you base the rates you charge? Not the rates; but it is on that the underwriter carries on his business, in fact, as to whether he will take a risk or not.

2292. You have, of course, varying rates for different risks? We work on a tariff of rates for all the world, agreed to by the association. That is one of the objects of the association.

2293. Would the rates charged for a new steel ship be the same as for an old wooden one? No; there is a classification of ships.

2294. Is coal an insurable cargo? It is and it is not. Up to within the last ten years coal from Newcastle was looked upon as one of the best risks an underwriter could take, but the conditions have so seriously altered within the last ten years, and especially within the last year or two, that practically underwriters, in this Colony at all events, refuse to take them.

2295. On any terms? Almost on any terms. As an instance, I was asked to insure a cargo the day before yesterday, and with some difficulty I placed it at 4 per cent., instead of the usual rate of 1½ per cent.

2296. Was that with a steel ship? It is a good first-class iron ship.

2297. You would be more inclined to insure a cargo of coals to one port than to another? Some underwriters look upon coal risks to what are called eastern ports—Manila and China—as better risks than those going to America, but two of the last ships which fired have been bound to Manila. I insured the cargo of the "Flora P. Stafford." She was burnt recently, and I paid the loss yesterday.

2298. *Mr. Pittman.*] Can you tell us what was the rate that was charged on that vessel? It was the ordinary rate of 2 per cent. to Manila. The rates vary, according to the ports they go to.

2299. *President.*] Was that rate for the ship or cargo? The cargo.

2300. What would you charge on a coal-carrying ship? Very few of the ships which carry coals to foreign ports are insured in this Colony. We have no large mercantile marine; the vessels are small. These large ships are insured in England.

2301. Would you refuse to insure a ship engaged to carry a cargo of coal? Undoubtedly we would to foreign parts; Newcastle coal especially.

2302. Is that a matter in which your practice has changed within the last few years? Yes.

2303. Has it changed since this Commission has been appointed? No.

2304. It has been alleged that the rates have gone up since the Commission was first mooted—that it had been the cause of a rise in rates? I should say not.

2305. There is no truth in that statement? I do not agree with it.

2306. Supposing the rates had gone up since the appointment of the Commission, would you have known about it? Oh, yes. The rates on coal cargoes from Newcastle have risen to the present height during the last six months.

2307. *Mr. Pittman.*] Four per cent. is almost a prohibitive rate? Yes.

2308. *President.*] What is the war rate? Underwriters here have very little experience in war rates. England has not been engaged in war for many years, and we are practically ruled by London. If there

is any prospect of war our Association arranges with the London Association to advise what war rates are payable, and the same would be charged in Sydney. When the Japanese and Russians came to close quarters after the Chinese war we charged whatever was charged in London.

Mr.  
J. H. Storey.  
2 Oct., 1896.

2309. Suppose the usual rate was 2 per cent., would the war rate amount to 4 or 5 per cent. ? I would not like to say.

2310. I suppose there is a good deal of difference in the risk a ship carrying coals runs, according to whether the coal is well trimmed or not ? It is the duty of our surveyor in Newcastle to see that the ship is properly loaded and properly fitted with shifting-boards. That is almost a *sine qua non* whether the risk is taken or not.

2311. Who is your surveyor in Newcastle ? Captain Laidman.

2312. He has just told us it is not part of his duty to survey the stowing of the cargo ? I must qualify what I said. He does so only in a general way. He is there to supervise anything that affects underwriters, and his duty is to go on board the ships and see, not exactly to go down the holds for the purpose, that the ship is a fair risk for insurance.

2313. The safety of a coal-ship depends, eminently, on the care used in stowing the cargo, and yet the insurance companies who take those risks apparently exercise no precaution to assure themselves that the trimming is done properly. While that is so, I absolutely fail to understand the principle upon which insurance is done ? To a certain extent there is that laxity. There are no positive instructions given to surveyors to see that the trimming is done properly. To a certain extent, the underwriters take it for granted that the ship is stowed properly ; that the captain will not go to sea unless he has got his ship in trim ; that the Marine Board inspector will see to it.

2314. The Marine Board have nothing to do with the trimming—they have simply to see that the vessel is loaded according to her marks. Would it not be to the interests of insurance companies if some inspection of trimming was instituted ? Possibly it might, but the difficulty would be that no two ships trim alike. The master of a ship might say, " My ship will not be safe if she is trimmed as you want her." I think in a way we should raise a hornet's nest around ourselves.

2315. The shipmaster tells the trimmer how he would like the ship trimmed, and the question now is whether some sort of inspection with a view to seeing that the captain's orders have been carried out should be instituted ;—it is not a question of setting up anybody in opposition to the captain, but to appoint someone to see that the trimming is really done ? Against that is this, that practically the bulk of the insurance on coal cargoes is done in England. The business is not offered to the companies here. The coal is purchased in England, and the purchasers arrange the insurance in England. There is not the volume of business to offer to the Colonial offices to make them bother about the matter. Now and again cargoes are offered.

2316. Do not the English offices have representatives here ;—if they have no means of supervising or surveying in the Colony they must be taking unknown risks ? I am inclined to think that most of the coal cargoes are insured at Lloyds underwriters.

2317. Have they an agency here ? No.

2318. Do Lloyds, in London, accept these risks without any supervision of the loading whatever ? I can only account for it that they do, because the English offices represented here are like ourselves, adverse to taking them.

2319. As a matter of fact, do most coal cargoes succeed in getting insured, or do they fail to get insured ? That I cannot tell, but I should imagine they do get insured, otherwise the business would not go on. One of the reasons why we asked for this Commission was that we saw recently in English papers that shipowners were experiencing difficulty in getting their underwriters to cover ships coming for coal cargoes. It is a very serious matter to the trade of Newcastle.

2320. Would it affect you as an insurance agent, or as Chairman of the Chamber of Commerce, if the trade of Newcastle suffered in that way ? It was in my position as Chairman of the Chamber of Commerce that induced me to move in the matter. As far as the other is concerned, we do so little business in that way that it would be of little importance.

2321. What would be the result of a refusal of English underwriters to cover ships coming here for coal ? I can see nothing for it but that the ships would not come.

2322. Where would they go to ? They would have to seek employment somewhere else. The rates for freight would have to advance considerably in order to tempt shipowners to pay extra insurance. They would demand such a high rate for freight in order to pay the extra insurance that the shipper or consumer of coal would look elsewhere for the supply instead of coming to Newcastle.

2323. Do you know where the consumers of coal would go for their supply ? They would go elsewhere.

2324. Where is elsewhere ? We have been told Japan can supply any quantity of coal ; North America can supply coal.

2325. When you approached the Premier in connection with this subject, had you in your mind any idea what ought to be done in the matter ? My suggestion to the Premier was that the Commission should consist of scientific men. I am satisfied in my mind that the cause is to be found by scientists, and that it is not a question of stowing or trimming—I refer, of course, to coal firing.

2326. Of course you are aware that almost any remedy means the expenditure of money ? Unfortunately, you cannot do anything without money.

2327. We have had several witnesses before us who assure us the coal trade could not stand another 1d. or 2d. a ton ; the shipmasters inform us the owners can hardly make both ends meet ; the trimmers say that such a price is paid for trimming that nothing is made out of it ; the crane contractor assures us the minimum possible amount is paid for his trouble ; everybody agrees that something is required to be done, but nobody wants to pay for it ;—can you make any suggestion ? I believe it is purely a matter for the scientific mind. That is only my own opinion, of course ; but I do not see the slightest difference in the condition of the coal or the trade of Newcastle compared to what it was ten years ago. The ships undoubtedly are larger, but they do not carry much more thickness in height of coal. The ships of the present day do not draw much more water than they did ten years ago. The height of a ship's hold is not much more than it was ten years ago ; therefore a ship does not carry much more thickness of coal. The coal is shipped in precisely the same way—it is not broken any more. It is trimmed exactly as it was ten years ago. I thought the cause was that, perhaps, the coal in the mines had come from a greater depth, but Mr. Gregson assures me it is nothing of the kind. The coal is at no greater depth, and it is hewn in exactly the same way ; therefore, I think, it is purely a matter for scientists.

2328.

- Mr. J. H. Storey.  
2 Oct., 1896.
2328. Assuming a remedy has been found, upon whom should the cost fall;—should the underwriters be asked to reduce their rates, subject to certain conditions that might be specified? If the underwriters could be satisfied that coal cargoes would be similar risks to what they were ten years ago, they would not ask for higher premiums.
2329. What would it take to satisfy underwriters that any recommendations we might make would be likely to render the shipping of coal more secure;—how could we secure their co-operation now? I am afraid the only thing underwriters would do is to say, "Let us have the experience," and if they see the coal cargoes go all right, they will reduce their rates again. It was thought the shifting boards were the cause of the trouble; but they were tried, and have not resulted in any remedy at all.
2330. Meanwhile, who ought to bear the expense, in your opinion, supposing recommendations involving expense were made? If, for instance, you came to the conclusion that the coal should not be dropped into the ship's hold, but should be lowered and gradually spread out, that would necessitate a greater charge being made by the Government for the crane. It would have to find its own level, and the expense would have to be borne by the parties shipping the coal, and would, eventually, be paid by the consumer.
2331. Would you consider that an increased expense in loading of 1½d. or 2d. a ton would make any serious difference to the coal trade of the port? I would hardly like to put my opinion against those of people better acquainted with the trade of Newcastle. They know to what extent they can go to compete with other parts of the world.
2332. Coal now, I believe, costs to raise some 5s., and I cannot think that a difference of 1d. a ton would seriously affect the trade? I should not think so myself. Coal is cheaper now than it was ever before, which, I think, is a great deal due to the competition. I have held the opinion for some time that there is no occasion to sell coal so cheap, but, as I said, I would not like to put my opinions against those of men who are trying to sell their coal in other parts of the world. My own impression is that coal is too cheap, and that the trade can bear the trivial expense you have suggested.
2333. It has been suggested that in order to lower the coal down into the hold, the hatchways of ships might be altered, but we understand there are some very strict rules in regard to hatchways, and objection might be raised to their enlargement? You would immediately come into opposition with Lloyds' rules in regard to the building and construction of ships.
2334. Are Lloyds' rules so fixed that everything must give way before them? Lloyds' shipping register and rules of ships is one of those old London institutions which is sworn by all over the world. It is almost an absolute necessity for an English ship to be classed at Lloyds' to enable her to get freight for cargo.
2335. It would be quite out of the question to persuade Lloyds to alter their rules to allow of hatchways being enlarged? I do not think they would entertain it. You will get ships from other parts of the world with which Lloyds have nothing to do.
2336. So that for foreign ships the objection based on Lloyds' rules would not apply? No; but foreign countries have all got institutions based on the same lines as London Lloyds.
2337. You think the objection made to the proposal to alter the size of the hatchways has some foundation? I should say so, most certainly. If you make a ship with big hatchways to carry coals, you might destroy her capability for carrying other cargoes. I should think the bigger the hatchways the weaker the ship.
2338. That is expressed by Lloyds' rules;—are you interested yourself in coal-mining operations? Only as shareholder.
2339. Are you on a board of management? No; I am simply a shareholder.
2340. I may sum up your evidence, to some extent, as follows:—There is some difficulty experienced by owners of coal cargoes in getting them insured; that difficulty has increased greatly during the last ten years; it has become acute during the last six months; and, so far as you are concerned, the only thing that would induce you to bring down the rates would be to find that the accidents to coal-laden vessels ceased to occur; until then no proposal on our part would induce you to alter your rates? No; I think we would await the result of your recommendation.
2341. Mr. Pittman.] In connection with what you said just now in regard to the height of the bulk of the coal in the hold not having increased during the last ten years;—do you know that as an absolute fact? The depth of ships built for oversea purposes has to be guided by the ports they go to. They could not come out of Newcastle drawing more than 22 to 23 feet.
2342. Could you not have a ship constructed so that you could have a greater depth of coal in her hold, and yet built so as not to draw more water than a ship of lesser depth? That is a question for shipbuilders and experts. As I have already said ships are now built to carry larger cargoes; they have greater length and breadth, far greater than in proportion to the depth. The depth of water at the various ports in the world has to be considered; take Newcastle, for example, a shipowner knows that there is only from 22 to 23 feet of water on the bar.
2343. President.] Have you had brought under your notice any of the appliances for the loading of coal in ships? I have never seen them; one has been brought under the notice of the Underwriters' Association within the last month or so.

[Witness withdrew.]

Mr. J. St. V. Welch sworn and examined:—

- Mr. J. St. V. Welch.  
2 Oct., 1896.
2344. President.] What is your name? John St. Vincent Welch.
2345. And what is your business? Marine underwriter and fire underwriter.
2346. On your own account, or in connection with a company? As representing the Commercial Union Assurance Company of London.
2347. Do you represent that company alone? Yes.
2348. Do you insure cargoes as well as ships? Yes.
2349. Do you insure coal cargoes? Not now; we have not done so for some years.
2350. When did you give up insuring coal cargoes? About six or seven years ago.
2351. What was the reason for that? It was on account of so many ships being unaccounted for.
2352. And you do not, consequently, like the business? No; there were so many ships missing.
2353. Have you entirely ceased to insure coal now? Yes.
2354. When did you entirely cease? I think about six years ago—five or six years ago.
2355. Does your company in London still insure coal coming from English ports? Yes.

2356. But it will not insure coal sailing from Newcastle? They have insured in London some cargoes, I believe, within the last few years, since I gave up writing them here.
2357. Have they given up writing them now? I am not aware. I know they had a risk on a coal ship from Newcastle about eighteen months or two years ago. They do not advise me of the risks they take in London. They would be full cargoes, and would not affect me. It was a ship called the "Poltalloch."
2358. Do you insure ships that carry coal from here? No.
2359. Is it on account of the cargo that you do not insure the ship? Yes.
2360. Is there any difficulty in getting coal cargoes from English ports underwritten? I should not think so. There are always underwriters there who will take almost anything. There is great competition in London.
2361. It would not be true to say that it has become impossible to insure coal cargoes only since the appointment of this Commission, some two months ago? Oh, no.
2362. Is it more impossible to do so now than it was before? I do not think so.
2363. It is about the same? Yes.
2364. In fact, you would have nothing to do with coal ships before this Commission was appointed? I have not touched coal cargoes for five or six years.
2365. Speaking generally, do underwriters decline to touch coal cargoes? Yes. I know it is extremely difficult to get coal cargoes insured here.
2366. Did the other companies begin to hold off six years ago, do you know? Not so entirely as they have lately.
2367. What does lately mean? Say within the last two or three years. These things gradually arise. They gradually woke up to the fact.
2368. Supposing the Commission were able to make certain recommendations which, in their opinion, would lead to greater security for coal cargoes, I presume you would wait to see how those recommendations turned out before you would make any difference in the policy which dictates your underwriting? I should begin at once to take coal cargoes if certain recommendations were carried out which are what I think necessary. I have my own ideas as to what is the cause of these ships missing, or what I think is the cause.
2369. If the precautions were taken which commend themselves to you, would you be inclined to make a reduction in the rates at once or wait to see the results? I would make the reductions at once.
2370. Would you kindly inform us what it is you think might be done in order to induce you to underwrite coal cargoes? I think, in the first instance, that one of the main causes of the losses has been the imperfect stowing of the cargoes; the want of use of shifting-boards; and the improper trimming—the lack of proper trimming, principally through the want of side hatches in the 'tween decks. When the coals are piled up in the middle of the ship, and the ship gets to sea and begins to roll, the coals will go over to one side, and the ship will go on her beam-ends and founder. I think that has been the cause of the loss of the bulk of the ships. I may be wrong, but I believe that is the cause. Further, I think there should be another alteration in the way of stowage, which may possibly be the cause of the firing on board ships. That is, the coals are dropped from too great a height into the hold. There are too much "smalls" and fine dust formed, and perhaps the coals are wet at the time, and I think that possibly leads to spontaneous combustion. I think the greater number of vessels are lost through want of proper supervision in the stowing, not only from the want of shifting-boards but the want of proper trimming and the use of side hatches in the 'tween decks to ensure proper trimming.
2371. What steps did you take six years ago, when you used to insure coal ships, to see that they were trimmed? We used to have the services of a surveyor, or got a certificate from the surveyor that the cargoes were properly trimmed. One of the difficulties in seeing that a cargo is properly trimmed, I understand, is that the trimmers are in the habit, if they know that anyone is going to make an inspection, to throw up a wall across the ship, across the coals, and the consequence is you cannot see the spaces left behind this wall of coal. I have asked officers sometimes whether they have not, for their own safety, inspected the trimming, and their reply was it was as good as their life was worth; it was so easy to drop a lump of coal down.
2372. The matter of trimming makes no difference to you now that you do not insure coal? Yes.
2373. Supposing an inspector were appointed whose business it was to, practically, do the captain's duty for him—to see that the trimming was properly done; from the evidence already given there seems to be no doubt he could inspect efficiently? Could they do it efficiently?
2374. I think there is no doubt they could? A great deal of what I am now saying is hearsay, as it necessarily must be in my business. I am told that one of the causes of want of good trimming is the reduction in the price of trimming. It used to be 4d. a ton, and within the last few years it has been brought down to 1½d. or 2d. I think the Coal Trimmers' Union held a meeting some few months ago at which they passed a resolution stating that the loss of many of these ships was due to improper trimming, but, of course, there was then the question of the non-unionists arising—the employment of men who were incompetent trimmers.
2375. In the event of the trimming being satisfactorily inspected, would it make any difference to you in the terms on which you would be willing to underwrite these ships? Yes; if we could know it was thoroughly and efficiently done.
2376. You would be prepared to make a reduction? Yes; where the use of shifting-boards was adopted.
2377. With reference to the heating of coal cargoes, supposing the Commission were enabled to lay down rules which would increase the safety of the coal cargo, would that make any difference to you? Yes, I think so; though I do not think that so many of the ships that are missing have been lost through firing or heating. I see that in the last twelve months, from September, 1895, to this date, there have been only two ships actually on fire carrying Newcastle coal, and I think five have reached port with cargo heated. For the six years previous, I can only find cases of two ships with Newcastle coal having been on fire. I am speaking of oversea ships.
2378. Would you, as an underwriter, be willing to make a reduction in your rates, provided that certain conditions to improve the safety of the ship were carried out? Certainly.
2379. You would be willing to give a certain amount of encouragement in that direction? Yes; and only too glad to do so, because I do not want to throw away good business.

Mr. J. St. V.  
Welch.  
2 Oct., 1896.

- Mr. J. St. V. Welch.  
2 Oct., 1896.
2380. Take the case of a ship sailing to San Francisco—what rate would you charge per cent.? Four per cent., if I took it at all.
2381. That would be on the value of the coal at San Francisco? Yes.
2382. Would £1 a ton be a fair value for the coal there? I do not know what coals are selling at now in 'Frisko, but I suppose it would be 15s. to £1 on to the price in Newcastle.
2383. So that £1 would be a reasonable price for a ton of coal in San Francisco? I do not know what they are selling there for now, but I should think it would be something like 20s. I would not like, however, for that to go forth to the world as my valuation.
2384. To what would you be prepared to reduce your rate, provided the great risk were ameliorated? To 30s.
2385. From £1 to 30s.? Yes.
2386. So that there would be a saving of 2½ per cent. on insurance rates? Yes.
2387. Two and a half per cent. is 6d. in the £, and supposing that £1 be the value of a ton of coal at San Francisco, there would be a saving in underwriting expenses amounting to 6d. per ton? Yes.
2388. Would you wait until you saw how the proposals of the Commission turned out before you made any reduction, or would you be prepared to make a reduction at once in favour of those ships which adopted any suggestion we might feel it our duty to make? At once, if the suggestions of the Commission put forward were such as commended themselves to my judgment.
2389. So that you would act on your own judgment? Yes.
2390. *Mr. Pittman.*] Who was the surveyor who used to act for you when you insured coal cargoes; was he the surveyor of the Marine Underwriters' Association? No; we used to have our own surveyor. I have not been a member of the Association for many years.
2391. Did that surveyor you employed actually inspect the trimming of the coal—did he give you a certificate that the coal was trimmed to his satisfaction? He had a special surveyor, who used to give him an official certificate of having inspected the trimming.
2392. There really was an inspection made? Yes.
2393. You did not trust to the surveyor without knowing that he actually took steps to satisfy himself that the coal was trimmed? No.
2394. *President.*] You were going to tell us something about the ship called the "Poltalloch"? I spoke of her, particularly, because it was the only ship brought specially under my notice since I gave up taking risks on coal ships. I found the insurance had been effected in our London office—that is the head office—and I made some inquiries about her. I was told the mate reported that when she was at sea the striking of the coal against her sides when she rolled was like the discharge of heavy artillery, and that you could walk all round the coal in the wings of the ship and fore and aft, showing that the trimming was absolutely inefficient.
2395. *Mr. Pittman.*] That would have been remedied if she had had side hatchways in the 'tween decks? Yes; if there had been shifting boards and side hatches. The shifting boards would prevent one-half of the cargo going to the other side of the ship, and if there are open side hatches the coal from the 'tween decks will find its way down gradually and trim the ship, thus they are bound to fill the lower hold in the wings. What I mean by side hatches is that there should be three or four streaks of board taken up all round the ship in the 'tween decks, and the coal would filter down into the lower hold and fill the spaces in the wings.
2396. *President.*] Some captains say they like a space left under the 'tween decks—it makes their ship safer than if filled up? It depends on the build of the ship. In the old days you could fill a wooden ship with coal on account of her greater buoyancy.
2397. The side hatches in the 'tween decks might not be a cure in every case. I understood you to say that one of the conditions that you would impose before you underwrote a ship was that there should be side hatches in the 'tween decks? I think it would be a cure in every case.
2398. No matter what the nature of the ship? I think so. I think the existence of these open spaces below is the great danger that leads to ships capsizing and foundering.
2399. You would have the open space right up against the ship's skin? Yes; a few streaks of the deck taken out.
2400. Is that your own idea, or have you heard it mooted by anybody? I have talked over this frequently with sea captains, and I have been engaged in this business as underwriter for twenty-three years, and I have formed my opinions from that.
2401. Have you heard any objections to it in any way? I have never heard it objected to.
2402. Is there anything in Lloyds rules to make it objectionable? Not that I know of.
2403. Has it ever been done to your knowledge? Oh, yes, in many of the home coal cargo ships.
2404. Do you know of any ships in which that precaution was taken, and to which an accident afterwards occurred? That I cannot say, because I have not been writing coal from any of the English ports for many years. My business has been in Australia. The ships that carry coals from here are ships that are not specially fitted for carrying coals.
2405. What are they? Ships that bring out general cargo from England and either go to San Francisco with coals, and then to take wheat home, or else load here with wool. They are not ships specially fitted for carrying coal.
2406. Is not any ship suitable for carrying coal? She is if they make her suitable, and if she has proper ventilation.
2407. That is surface ventilation? Yes.
2408. You do not advocate ventilation through the coal? No.
2409. The variations to make an ordinary ship suitable for coals would be very small? Yes; very small. It is merely a question of providing these side hatches and shifting-boards, and seeing to proper trimming and stowing, and preventing the accumulation of fine dust in the hatchways. I think that is the whole secret of it.
2410. As far as the provision of side hatches is concerned, that is not a serious matter? No.
2411. Either in a wooden or an iron ship? I should say not.
2412. Some ships have open 'tween decks? Yes.
2413. Would you rather insure such a ship than one with close 'tween decks? I think I would not; the weight would be more evenly distributed in a ship with 'tween decks.

2414. Your idea is to have 'tween decks to ensure distribution and side hatches to ensure packing in the wings? Yes. Mr. J. St. V. Welch.

2415. Have you any views about the building of the walls in the fore and aft of the ship to prevent the coal shifting? I do not think they make much difference. The pitching of the ship has not much to do with it. I have talked that matter over with old ship-masters, and they do not think that has much to do with it. 2 Oct., 1896.

2416. The chief trouble is in the rolling? Yes.

2417. In your opinion, the shifting of the cargo is a more important matter to deal with than the heating? I think so. I have been in communication with our London underwriter, Mr. Saunders, about this matter, and he is regarded as one of the greatest authorities in England on underwriting. He wrote on the 28th December to the effect that "no doubt a great change has come over the coal business, resulting in the loss of several vessels. The cause has not been discovered, but I do not think it can be because the chief part of the vessels are built of iron and steel, as these vessels are regularly employed in the coal trade from this country (England), and carry their cargoes better than wooden ones. I believe it is some change in the nature of the coals, such changes occur from time to time with North of England and North Wales' coals, which now and again appear to reach a seam very subject to spontaneous combustion. There are certain coals here which cannot now be shipped, as no one will write them." He recommends "that inquiries be made to ascertain from which collieries the coals in missing and burnt ships came, to see if any particular mines can be 'spotted,' and then to see if their coals are of a different nature to those formerly produced." And, later on, said, "It was a pity the use of shifting-boards could not be made compulsory." In the case of two ships, particularly, when the masters returned to port, they said their ships had been saved from foundering by shifting-boards. The "Parthia," which sailed for Valparaiso in 1894, arrived dismasted, and on her beam ends, and the captain said that, in his opinion, she was saved by the shifting-boards. Again, the "Caradoc," which put back in January, 1895, was saved, the captain said, by shifting-boards. I see there were nineteen vessels between January, 1889, and April, 1896, missing.

2418. Where did you get the information from? I have been compiling this for years, and lately a list was prepared by a manager of an insurance company here, Mr. De Gyulay, and a paper was read by him recently before the institute of which I am president; it is also from that I get the information. The ships which have reached ports with their cargoes shifted, or have been known to have foundered from that cause number ten.

2419. I understand your position is this, that at present the insuring of either coal ships or coal cargoes is found to be bad business to touch? Yes.

2420. In the event of the trimming of coal cargoes being better carried out, and to your satisfaction, and proper precautions being taken against those causes which lead to heating, you would be prepared to resume the business of underwriting coal ships? I should be only too glad, because one likes to get all the sources of business one can—that is, good business. I used to write these cargoes to San Francisco freely some years ago.

2421. What used the rate to be then? When I came here first, in 1873, we used to get 40s. per cent., and that was brought down by competition to 30s. or 35s. until attention was drawn to the great number of ships missing.

2422. That was six years ago? Yes; it gradually dawns upon one. You cannot possibly state the exact date you began to find the trade not a safe one to go on with. I suppose the first time I began to notice the trade was becoming very bad would be, probably, more than that—eight or nine years ago.

2423. If an insurer came to you now and insisted on your underwriting a coal cargo, what price would you name? If I were compelled to do it on account of other business I would accept 80s. to £5.

2424. Per cent.? Yes. I think you might say 4 per cent. You must not take that as being in accordance with the percentage of losses on sailing ships. If you could get a full average line on every ship that sailed, I dare say it would be safe to do the business at that, but you may have to cover the very vessels that are lost. It was the number of ships lost and the loss of life that moved me to get a return called for in the House twelve months ago, and I suppose it was that that drew attention to this matter. I have been trying to stir up public attention to this in the papers for the last four or five years.

[Witness withdrew.]

Mr. S. H. Smith sworn and examined:—

2425. *President.*] What is your name? Samuel Hague Smith.

2426. And what is your business? Manager of the New Zealand Insurance Company.

2427. Do you insure ships and cargoes? Yes.

2428. Do you insure coal ships? Not now, unless it becomes a matter of absolute necessity.

2429. If it is a matter of absolute necessity, what rate do you charge? From 4 to 5 per cent., according to the destination of the ship.

2430. How long is it since you began to discontinue this business? I suppose about twelve or eighteen months.

2431. Is it true you have only given up insuring coal cargoes since the appointment of this Commission? No, previous to that; from the time fires occurred.

2432. Is it chiefly on account of fires, or on account of shifting of cargo that you do not care for the business? Both.

2433. Which do you consider to be the most serious evil, the shifting of the cargo or its spontaneous ignition? They are both of great importance.

2434. You cannot tell us which it is that has operated most unfavourably? The fires, unquestionably.

2435. Would you now decline to insure either ship or cargo of coal? Yes.

2436. Supposing the Commission were enabled to make some recommendation, for instance, that some stringent inspection of the trimming of ships should be exercised, would that enable you to reduce your rates in any way? Yes.

2437. Would you wait to see how it worked, or would you be able to make a small reduction immediately? I would make it immediately if it were carried out.

Mr. S. H. Smith.  
2 Oct., 1896.

- Mr. S. H. Smith.  
2 Oct., 1896.
2438. Have you any system of inspection of the trimming of a ship now? Nothing, except the report occasionally from the surveyor of the association we have.
2439. Captain Laidman? Yes.
2440. You go by his report? Yes.
2441. He never makes a report as to the trimming, I understand? He does not.
2442. There appears to be no kind of inspection as to trimming? I think there is some, because Captain Hall has frequently reported in his reports to the association that shifting-boards are used in certain vessels, and they give a certain degree of safety.
2443. Shifting-boards may be used, but yet the trimming may be very badly done? Quite so; the trimming itself is not inspected.
2444. What is the reason of that;—you find it good to inspect in some particulars, but not in others? Simply because it would require more men than could be paid for by the amount of business. One man could not possibly do it with the inspection of the other vessels.
2445. Now you do not care about it because you do not insure these vessels? I care very much about it, because I want to have the business again. I should be quite willing to get proper inspection or survey of the ship, but the cost would be too great for us to do for ourselves.
2446. As it is important for the ships to be trimmed properly, it ought to pay you to have them inspected? We have no power; we have no control. I do not know but what the Marine Board there is the only body that could do so.
2447. You have a power in this way, that you could refuse to underwrite? Many of the cargoes are covered at home.
2448. Are they not so particular in London? You can insure almost anything in London.
2449. At a reasonable price? At any price. It is not a matter of price whatever at Lloyd's. The bulk of the ships are sent from home, and their cargoes are insured under open policies, and all they know is that a cargo of coal was shipped, and there is an end of it. As to the terms, this one particular business may be a loss, but others are a profit.
2450. They have the advantage of average, and are able to reduce the rates? Yes; the volume of business is larger. It is a very important thing in the loading and trimming that shifting-boards should be used.
2451. I understand the use of shifting-boards is very usual now? Yes; they are used very much now.
2452. It would be difficult to find a ship that would put to sea without shifting-boards? I think many of them use them, but very often captains are cut down in their expenses.
2453. Is the rigging of shifting-boards an expensive matter? It is not; but every bit of rope they have to account for.
2454. Owing to the profits of the trade being so low? Yes; many of the ships are run very bare.
2455. What sort of inspection would satisfy you—would Government inspection satisfy you? It would.
2456. Who ought to pay for it;—would it be worth your while? No; it would not; we are not getting enough premiums to do that. I think the ship ought to. In reference to fires in the harbour, we send down an engine, put out the fire, and render every assistance we can, but we cannot charge that to the ship; the fire brigade office cannot make any charge whatever. I suggested to Mr. Reid some time ago, before this Commission was formed, that some action should be taken in reference to that. The vessel and cargo are saved, but no charge can be made on the ship.
2457. Who pays the Government? The insurance offices, who have an interest in the cargo, pay.
2458. If the vessel had been lost, you would have had to pay the insurance? Yes; for the cargo. The ship is insured in London.
2459. In the event of there being Government inspection, can you suggest any way in which that inspection could be paid for? That is a difficult question. There is comparatively a small amount of insurance effected in Sydney, therefore, it would not do for the insurance companies to pay for an inspection from which they derived no benefit. I do not think the volume of premiums is sufficient to justify the insurance companies paying for it.
2460. I understood you to say you would be glad to insure the ships if you could get the business back? Yes; but the volume is not sufficiently large.
2461. We understand it is somewhat difficult for a shipmaster to see that the trimming is properly done? I think the stevedore who engages to load the ship wants to do it as cheaply and as quickly as possible, and, therefore, there is not the proper care taken.
2462. So that you would have Government inspection? I think so; and have the Government pay for it.
2463. And have the Government pay for it? I think the shipowners would save a large amount in premiums, and should pay something for it.
2464. Could that be levied by means of harbour dues? I should think there should be a special charge for inspection.
2465. It is already alleged the harbour dues in Newcastle are very high; is that the case? I do not know. It is always said the charges are too high.
2466. Have you ever had a cargo, which you have insured, on fire? I have not.
2467. What we want to know is whether in the event of certain suggestions of the Commission being adopted, you would be prepared to reduce the rates of insurance? We would make a reduction.
2468. Would you do that at once, or prefer to wait? We would do it at once.
2469. You would have confidence in the Commission to that extent? There is no doubt about that. There is an impression that the coal is taken from the mine or pit, and is not exposed to the air long enough before it is put on board, and often it is very wet; and that the coal falls from so great a height that it smashes and becomes so pulverised that it generates combustion.
2470. What sort of reduction would you make? At least 50 per cent.
2471. You would go down from £4 to £2? Yes.
2472. Would the insurance be reckoned on the value of the coal here or on its value when landed? On the value here with expenses and profit added; the freight is insured separately.
2473. It comes to the same thing in the end? Yes; but it goes under a separate policy.
2474. What is the freight per ton on coal from here to San Francisco? It varies so much, and depends on the ship. The arrangements are made at home generally. I suppose the rate would be as low as 15s., or it might be lower than that in emergency.

2475. If we took the price of coal at not less than £1 a ton, that would be on the safe side? I should think so.
2476. It would not be less than that? No.
2477. A reduction in the insurance rate on that £1 by 2½ per cent. would come to 6d. per ton? Yes.
2478. So that supposing the ship-owner could get the insurance rates reduced by 6d., and he had to pay 1d. per ton more to load his coal, he would make a profit of 5d., is that so? Yes; but I do not think it would increase the expense to have a proper method of spreading the coal. It would be done almost as quickly.

Mr.  
S. H. Smith.  
2 Oct., 1896.

[Witness withdrew.]

FRIDAY, 9 OCTOBER, 1896.

[The Commission met at the Chief Secretary's Office, Sydney, at 2.30 p.m.]

Present:—

PROFESSOR RICHARD THRELFALL, M.A., PRESIDENT;

And EDWARD FISHER PITTMAN, Esq., A.R.S.M.

Captain W. Barfield sworn and examined:—

2479. *Mr. Pittman.*] What is your name? William Barfield.
2480. You are the captain of the ship "Alexandra"? Yes.
2481. I understand she caught fire before she arrived at San Francisco? Yes.
2482. What year was that in? This present year.
2483. Were you present in Newcastle when she was loaded? Yes.
2484. Do you remember what kind of weather it was then? We had very unsettled weather. There were continual southerly bursters, and there was a lot of electricity in the air.
2485. Was it in the summer time? Yes.
2486. Can you state whether the cargo got wet at all? Not more than usual; only just when the southerly bursters came on.
2487. Were there heavy showers? Yes.
2488. Whereabouts did the fire take place in the ship? In the No. 3 hatch to the mainmast.
2489. Had she four hatches? Yes.
2490. Was she a four-masted ship? No, she had only three masts.
2491. Did the fire occur under the No. 3 hatch? Yes; from the after part of the No. 3 hatch to the mainmast.
2492. It is not true that the fire occurred away from the square of the hatchway, and that it was only between the two hatches? No.
2493. It actually occurred below the No. 3 hatch? Yes; and mainmast.
2494. What is the tonnage of the vessel? 1,297 tons.
2495. What weight of coal did she carry? 1,923 tons.
2496. What is the depth of her hold? Twenty-two feet.
2497. Was the fire extinguished? The ship was scuttled in 'Frisco.
2498. What colliery did the coal come from? The Cardiff colliery, Newcastle.
2499. The ship was loaded by Mr. Russell? Yes. I have carried two cargoes of the same coal. The voyage before I went to Honolulu, and there was no heating. Both times the ship was trimmed splendidly.
2500. Do you remember whether, in the case of the other cargo, there was rain or not while the ship was being loaded? The weather was more unsettled in the case of the latter cargo, but the voyage before there were showers. There was no particular quantity of rain in this last cargo. In loading in Newcastle, my idea is that the coal goes so quickly from the mine that the rain has very little effect. The coal may be taken out of the mine in the afternoon or at noon and by midnight it is on board the ship.
2501. The cargo might become wet by the rain falling through the hatches? Yes. All the time we were loading the weather seemed to be very unsettled, and there was a wonderful lot of electricity in the air, and every twelve or forty-eight hours there was a southerly burster. I had no pipes down my cargo, therefore I could only take surface temperature. The temperature in the hold never exceeded 87 degrees, and even when I first smelt gas, I could get nothing more than 75 or 76 degrees. I smelt gas in the afternoon, and at 5 a.m. the following morning the ship was in flames.
2502. Did you ever have a cargo of coal heat before? No; I have only carried two. I have had coke, but not more than two coal cargoes.
2503. Did you personally supervise the trimming? There was always myself or an officer. I always had an officer looking on to see that it was properly trimmed.
2504. Do you think it is the duty of the captain, or one of the ship's officers, to do that? Yes; most of us always do so. In the trimming of coke I very often put on an overall and have a look at it myself, but with coal I trust to the officer. With Mr. Russell's trimming of the two cargoes I have had, I had no fault to find whatever.
2505. The trimmers never refused to carry out the instructions you gave them? No; just as I wanted the ship loaded, so it was done.
2506. *President.*] Was much coal loaded down the No. 3 hatch? I loaded the ship principally in the No. 3 and main hatches, and just trimmed her by No. 1 and No. 4. She would take ten or fifteen trucks down the after hatch and the same quantity down the fore hatch.
2507. Can you give us any idea of the amount of coal that went down the No. 3 hatch? I should think about 800 tons.
2508. Was there a heap of dust there? I did not notice any particular dust. The Cardiff coal I loaded seemed to be a very large coal. There was a certain amount of dust, but nothing particular.
2509. The coal was dropped from the coamings of the hatch? Yes.
2510. Out of hoppers? Yes; most of the hoppers we loaded with were not those in which the bottom came out, but were emptied from the front.
2511. *Mr. Pittman.*] Was the fire well away from the donkey-engine? There was no donkey-engine.
2512. *President.*] Did you put iron rods down? No.
2513. The coal would have got wet on the surface? Yes; a certain quantity of water went down.

Capt. W.  
Barfield.  
9 Oct., 1896.

[Witness withdrew.]

FRIDAY,

FRIDAY, 16 OCTOBER, 1896.

[The Commission met at 2:15 p.m. at the Chief Secretary's Office, Sydney.]

Present:—

PROFESSOR RICHARD THRELFALL, M.A., PRESIDENT;

And EDWARD FISHER PITTMAN, Esq., A.R.S.M.

Mr. C. F. Stokes sworn and examined:—

- C. F. Stokes. 2514. *President.*] What is your name? Charles Frederick Stokes.  
 2515. You have some experience as a shipping agent, I believe? Yes, for a good many years.  
 16 Oct., 1896. 2516. You do no insurance business, I suppose? Yes, I do.  
 2517. Has there been any difficulty lately in insuring ships loaded with coal? Yes, considerable difficulty I can hardly get a cargo insured at all.  
 2518. Do you insure cargoes yourself? No.  
 2519. Not at any price? No.  
 2520. How long is it since you gave up insurance of that kind? Some little time.  
 2521. What does that mean? I suppose about two months.  
 2522. Is that about the time the Commission was appointed? Perhaps so; I suppose about that.  
 2523. Was it the appointment of the Commission that influenced you in giving up insuring coal? No, I think first of all the objection commenced in England, and filtered out to the Colony.  
 2524. Sometimes you act as insurance agent, and at other times you endeavour to obtain insurance upon ships? Yes, as agent in both instances.  
 2525. So that you see both sides of the matter? Yes. The difficulty now is to get vessels insured carrying cargoes of coal.  
 2526. Do you act as an insurance agent for any company? Yes.  
 2527. Is it the firing or the shifting of cargoes that you are chiefly afraid of? I do not know which it is. A number of ships are missing, and from what cause we do not know.  
 2528. In the event of this Commission making certain recommendations for the proper loading of the cargo, so as to minimise the risk from firing, would you be prepared to take up the business of insuring coal-ships again on the recommendations being adopted? It is hard to say. One would want to know what would be recommended.  
 2529. You would not make any change at once simply on the adoption of the recommendation? I do not think so.  
 2530. Suppose an inspector were appointed to see that each individual cargo was properly trimmed? That might make a difference, but I think the objection would still exist until that measure were proved efficient.  
 2531. So that you would wait until the inspection proved efficient? I am afraid we would.  
 2532. Have any ships been lost for which you have acted as agent? There have been ships missing.  
 2533. With regard to the trimming of the cargo, would you consider it was the duty of the captain and officers to see that it was carried out? Yes, certainly; every captain and officer should make sure the ship was properly trimmed.  
 2534. It has been abundantly brought before us that captains do not attend to it, and it has been recommended that the Government should appoint inspectors to see that the coal is properly trimmed,—in that case, would the shipowners be prepared to contribute towards the expense of any inspection? I think it is the captain's duty to attend to it; or if not his, it is the duty of the officers, and they owe it to the owners to see their cargo is properly trimmed.  
 2535. The fact seems to be that they do not? I think, as a rule, if an officer is any good he does see to it.  
 2536. From the evidence we have had, I think there is no question they do not, and I ask you whether it would not be in the owners' interest to make some contribution towards the cost of inspection? It might be, but I hardly think it is a fair thing to ask them to do when these men are paid to do it. I have heard a lot about the greater fall there is for the coal now. Ships built nowadays carry a much larger cargo, but I do not think the fall is greater. The length of a ship now makes her carry a much larger cargo with less draught than with the old ships. I think the increased amount of coal may have to do with the trouble. Then again there is the question as to whether there has been any alteration at all in the seam of coal; that has not been gone into yet.  
 2537. *Mr. Pittman.*] With regard to your statement as to the depth of the hold, do you know that as a fact, or is it an assumption? I know it as a fact. Twenty-five years ago I loaded a ship called the "Ellen Stuart," and she carried 1,600 tons of coal, and drew 23 feet of water. There is a greater fall there than with a ship carrying 4,000 tons now, which would draw about 22 feet.  
 2538. *President.*] What you state is really an impression, I suppose. You have never looked into the matter in detail? No; but I do not think these latterday ships draw so much in comparison;

[Witness withdrew.]

Mr. T. J. Bush sworn and examined:—

- T. J. Bush. 2539. *President.*] What is your name? Thomas James Bush.  
 2540. And your business? Gas engineer.  
 16 Oct., 1896. 2541. You are engineer to the Australian Gaslight Company? Yes.  
 2542. How long have you been in that position? Nearly eighteen years.  
 2543. And during that time you have had considerable experience of heaps of small coal? Yes.  
 2544. How much coal do you store at your Kent-street works? Not much over 5,000 tons.  
 2545. Do you often have 5,000 tons of coal in stock? Yes, generally 5,000 tons.  
 2546. Of small coal? Mixed—small and large.  
 2547. How deep are the heaps? At Kent-street 14 ft. 6 in. is the deepest we ever had.  
 2548. Have you ever had a fire in the coal at Kent-street? Only one small one. It was in a bunker, and I attributed it to the heating of ashes and spent lime underneath the floor.  
 2549. It was not a case of spontaneous combustion? No.

2550.

2550. How much coal do you keep in store at your Mortlake works? About 8,000 tons; we have had some put outside.
2551. Have you ever had a fire there? Yes, frequently.
2552. A case of spontaneous combustion? In all cases.
2553. What is the depth of the coal at Mortlake? Twenty feet.
2554. Is the coal there under cover? All under cover; the 8,000 tons is under cover.
2555. Is it under cover at Kent-street? Part is under cover, and part is in the open.
2556. How much is under cover at Kent-street? About 2,500 tons.
2557. So that the coal is kept, practically, in precisely the same condition at Kent-street as at Mortlake, except that the heap at Mortlake is rather deeper? That is the only difference.
2558. Is the coal left to lie longer at Mortlake than at Kent-street? It is not left to lie so long at Mortlake; we are obliged to shift it. Some coal has been on the wharf in Kent-street for fourteen or fifteen months—since last June twelve months.
2559. From what colliery do you obtain your coal? For the last three years from the A. A. Company's.
2560. Does the same kind of coal go to Kent-street as to Mortlake? Yes.
2561. Precisely the same? Yes.
2562. What, in your opinion, is the difference which would account for the coal at Kent-street remaining cool, and that at Mortlake heating? It is nothing else but the depth; that is what I attribute it to—the difference between 14 feet and 20 feet.
2563. Whereabouts does the heating commence? Near the bottom, as a rule, so far as I can judge. I may say there is a slight difference in the unloading of the coal. In the one case it is unloaded in baskets which are tipped over, and the coal falls down the heap.
2564. Where is that? At Kent-street. The coal is tipped from the baskets and kept rolling down. At Mortlake it is unloaded in skips holding about 11 cwt. The skips are tipped into a truck, and the truck is taken into the store and tipped on to the heap opposite to where the elevators are. If the coal is coming in quicker than we are using it, it is worked back from the heap.
2565. The coal could not, however, be much more broken up by the fall than it was before it went into the store? I do not think it could be. It is small coal, and in some cases nearly all dust that we get.
2566. Do you notice whether it does get broken up by that extra fall? I take extra precautions not to break it up.
2567. At Mortlake, I understand, the coal is more likely to be broken? Yes. In the olden days we used to allow it to fall as it liked, and when it fired I thought that had something to do with it; so I started casing the coal down, but we still had fires.
2568. It made no difference? No.
2569. Have you any reason to suppose that wet coal is more likely to fire than dry, or *vice versa*? I have no evidence; I could not say whether it had.
2570. You have no experience in that direction? No. It is a most difficult matter to say whether the coal that took fire was wet when it was put into the store.
2571. Do you take any precaution to keep the coal dry while you are unloading it from the ship? No. We have to take the coal as it comes. It may be wet when it arrives.
2572. Is it ever wet with sea-water? Never with sea-water; rain-water may get into the trucks.
2573. *Mr. Pittman.*] I understood you to say that at the Kent-street store the coal is partly uncovered? Yes; part of it is uncovered and part under cover.
2574. So that if water had an effect in aiding spontaneous combustion, the Kent-street storage should be more liable to spontaneous combustion than the Mortlake? It has had a thorough saturation with rain. Coal has been out in the weather for twelve months, and must have had a lot of water through it, but it has not shown signs of heating.
2575. *President.*] There are several thousand tons in the store at Kent-street? I think there are 5,000 tons at the present time.
2576. Covered over? No; half covered over, and half in the open.
2577. Have you ever had the heap of coal in the open heat? No.
2578. At neither Kent-street nor Mortlake? No. We had some coal at Mortlake outside, but that never fired.
2579. How long does it take for the coal to heat after it has been put in the store? From six to nine months.
2580. It never heats in less time than that. It may heat, but not fire.
2581. Have you been able to connect the heating with the temperature at which the coal arrived? No; I have not noticed it; I have never tried the temperature of the coal at all.
2582. It was very hot last summer, and some thunder showers occurred, which, it has been said, seemed to have a disastrous effect on coal cargoes;—did you have any trouble about that time? No; our last fire was, I think, about March or April; the coal must have been in the store a long time before that. At that time I was getting coal in in very small quantities. As a rule, I like to empty the store once every twelve months, and I generally do that in the summer-time, which is our slackest time of the year, so that we should have had very little coal coming in.
2583. So that you were not in a good position to notice any extra trouble? Just so.

[Witness withdrew.]

Mr. T. Croudace sworn and examined:—

2584. *President.*] What is your name? Thomas Croudace.
2585. And what is your business? General Manager of the Scottish Australian Mining Company.
2586. What mines does your company hold? The Lambton, Burwood, and Durham. We have also copper mines both here and in Queensland.
2587. You represent the proprietors here? Yes.
2588. Have you had any trouble from any of your coal catching fire? No, not any, and we have sent some millions of tons of Lambton and a great deal of Burwood coal away, and have never had a single complaint of any kind as regards firing, or anything in connection with heating.
2589. *Mr. Pittman.*] And no vessels missing? None at all.

T. Croudace.  
16 Oct., 1895.

2590.

- T. Croudace. 2590. *President.*] The New Lambton is a different mine? Yes.
- 16 Oct., 1896. 2591. Is that owned here? That is owned by Sir George Dibbs and the Honorable Alexander Brown.
2592. Have you had any trouble with the firing of gobs in your mines? None whatever.
2593. Or even of the heating of the gob? No. Sometimes at Burwood you may feel some of the slack or small coal, which is thrown back on the separation principle from what we call the round coal, slightly warmer under certain conditions.
2594. How many tons do you ship every year? The last year or two we have not been doing so much, on account of the strikes, but we used to average between 200,000 and 300,000 tons a year.
2595. Have you any idea as to why heating of coal on board ship has become more prevalent of late years? I think so.
2596. Would you kindly give us the advantage of your opinion on the matter? In the first place, I would remark, that many years ago (say) twenty or thirty, the system of getting the coal by the miners was much more perfect than it is just now. They used to undercut and nick up each side, and wedge down the coal, and only in narrow places used they to shoot. At that time the coal was much larger, much freer from being shattered to powder by the operation of blasting. During the last few years, ever since the 5s. a ton time, when we got men from all quarters of the Colony to become miners, we practically quarry the coal. The amount of undercutting or curving is not so properly carried out, and the nicking is very frequently entirely ignored, and blasting powder is used in its place. The consequence is—and I do not hesitate to say this—the coal is much more shattered and broken up. Where the coal is not absolutely small it is so cracked and disintegrated that it is more liable to be broken afterwards, when it passes from the screens into the waggons, and then into the very large vessels that are used nowadays to what used to be used, comparatively, a few years ago. We had not so many foreign ships then. A vessel of 1,000 tons was a large vessel, now we consider one of 2,000 or 3,000 tons quite an ordinary vessel, and only look upon one of 5,000 or 6,000 tons as a large vessel. You can see, in the first instance, where the lesser quantity was carried there was a much less depth of hold, and much less fall for the coal to be broken. Now, there is such an immense depth of hold in the larger vessels. I suppose I am within bounds when I say that from the top of the coamings there is a fall of 30 feet.
2597. *Mr. Pittman.*] What do you think it was in the old times? From 12 to 15 feet at the outside—the bigger ones. Vessels have undergone in themselves a difference in their construction. I maintain that the coal is much more broken up now, and begets a much greater quantity of very small coal than what it used to do, and it is only, so far as my knowledge goes, within the last few years that we have heard of any spontaneous combustion taking place.
2598. *President.*] How many years? I should say within six or eight years at the outside.
2599. It is not worth while going further back than that for the purpose of comparison? No. There was a sort of interval between the smaller vessels and the large ones, but even when carrying 1,500 to 1,800 tons we did not hear of any spontaneous combustion. With coal in large blocks, I should say it would be absolutely impossible, even with a 5,000 or 6,000 ton vessel, to have spontaneous combustion, but where you disintegrate and break up the coal and have nothing but small, there the power of oxidation is so rapid that you may have, and will have, a much more ready and simple means of obtaining spontaneous combustion. Then, again, it depends on the character of the coal, and the time at which it is shipped. Small coal is most favourable, also damp and hot weather, to spontaneous combustion. I do not exaggerate when I say that if in going along the wharf in hot weather you put your hand on an iron vessel you will take it off much more rapidly than you put it on. There is the heat to account for it, and the pressure of the immense body of coal, which, instead of being, as formerly, 10, 12, or 14 feet in depth, is now from 20 to 25 feet, and pressure in itself creates heat. I think these are elements all conducive to spontaneous combustion.
2600. You say the coal used to go out in larger pieces? Much larger; there was more large coal.
2601. Do you mean more large pieces, or that the largest pieces were larger than they are now? The larger pieces were much larger than now, and there was much more large coal than now.
2602. By falling down the hatchway of a ship are these large lumps not liable to be broken up and to pound the coal beneath them to a very great extent? That has been put to me before, but we always aim at getting large coal. If you commence with moderately small pieces of coal and drop them a distance they will break into, comparatively, much smaller pieces; whereas, if you drop a very large piece of coal it will break into two or three pieces, but still each of those pieces will be large coal.
2603. But, still, it will break the coal it falls on? Not so much as you may think. I am known as the "large and clean coal" manager in our district.
2604. Is not an ordinary principle of mechanics involved? You would think so; but if you will observe it carefully, I have no hesitation in saying there is a resistance of one large piece to another, which small coal will not give. As a corroboration of what I say, we have sent away some millions of tons from our Lambton colliery, and have never once known or heard a remark of heating or firing.
2605. Can you get the ships carrying your Lambton coal insured? Oh, yes.
2606. You have never any trouble about getting your coal insured? No; not up to the present time.
2607. Where does the coal chiefly go to? We have sent it all over the Colonies, and to San Francisco, Manila, India, China, and the west coast of South America.
2608. Do you know what rates you are paying for insurance to San Francisco? I could not tell you now. Our cargoes are generally arranged for in London.
2609. You do not know whether you are paying 30s. or 80s.? I would not like to express an opinion without referring to the office.
2610. They might be paying 80s.? I do not see why, when we have never had any complaint. Some of the collieries have had complaint. Some of them appear, so I am told, to produce a high demand for insurance.
2611. Have you ever had any trouble from faulty trimming of your coal cargoes? So far we have not had any fault of any kind.
2612. You have no control over the trimming? No; the captain of the ship attends to that.
2613. So that your coal is, practically, trimmed by the same trimmers as other companies' coals? Yes, entirely.
2614. You do not favour or influence captains to employ certain trimmers? No; I would not do such a thing.
2615. Your coal is absolutely loaded in the same way and trimmed by the same trimmers as other people's coals? Yes; absolutely the same.
- 2616,

T. Croudace.  
16 Oct., 1896.

2616. The depth of vessels' holds has increased during the last twenty years? Oh, yes.
2617. Do you think the depth has increased during the last seven or eight years? I do. We have had larger vessels within the last two or three years than before.
2618. Do the large vessels have deeper holds than the small ones? Yes; as a rule.
2619. We have had several witnesses who say they do not? I mentioned just now about the different construction of vessels. Some are much larger, and have not such deep holds as others of the same capacity.
2620. Is the depth from the coamings of the hatch as great on some of the larger ships? The coamings are considerably higher in some of them. There was one in Darling Harbour, which, besides having about 18 feet of draught, was an immense height out of the water, and the moment I saw her I said we should not get that vessel under our cranes at Newcastle, and I telegraphed up to our shipping manager to say the vessel would be coming up, and to see what was best to be done; and they had a great deal of measuring and gauging before they could get her well under the swing of the crane.
2621. What cranes are they? The hydraulic cranes.
2622. The public cranes? Yes.
2623. In your opinion, the breaking up of the coal has a great deal to do with its heating? I state as an absolute fact, both gained from experience in the old country and from general knowledge, that coal will absorb much more rapidly the oxygen from the air when in a broken condition than it will when in a solid condition. If you are going to fire a gas retort you will not fire with big lumps, because the gas is not produced rapidly enough. Therefore, in a gasworks you will find they crush or break the coal up, or use unscreened coal, so that the gas may be given off rapidly and the work carried on freely.
2624. You mention the breakage at the mine;—I take it, from our point of view, that is immaterial, because the small coal is sifted out at the screens? No; the men use much more powder, and whilst you imagine that (say) the 2-foot cubes are solid, they are so shattered by the force of the powder that at the next fall they separate into a dozen different pieces.
2625. I presume you agree that the chief smashing occurs in falling down the hold? Yes.
2626. Supposing some means were adopted to first fill up the hatch carefully, so as to form a heap there, would the coal be so much broken up afterwards in the loading? If some pains were taken with the loading of the vessel, instead of rushing so many hundreds of tons in at the shortest possible time, much better results would be given. If any machine or slides were used liberally and properly, and the waggons lowered where the hatchways were big enough to allow the waggons to go down, there would be much less breakage.
2627. Supposing that upon the recommendation of this Commission, or from other reason, the coal first put in the vessel was lowered down the hold so as to form a heap, that would, I presume, add to the expense somewhat? I do not think very much.
2628. Who would pay for that expense? I suppose the ship.
2629. Supposing it cost 1d. a ton to lower down the hatchway the first 500 tons of a 2,000-ton cargo, would you be prepared to reduce the price of coal to cover that expense? At the present moment the price of coal is so low that any attempt to put even the small sum of 1d. upon it would have to be resisted. We are working the coal purely for the benefit of those who are employed.
2630. Are you not paying a dividend? No; we are not—not for some time past.
2631. You cannot afford to be charged another 1d. a ton? We could not. Competition is so keen, and some inferior coal is produced, and coal is obtained from abroad, that Newcastle will have trouble enough to hold its own.
2632. Am I to understand that the coal trade would be ruined by the imposition of 1d. a ton? I could not say that, but I do say that the proprietors cannot afford to pay it. We pay already a most exorbitant price for haulage and the shipping of the coal. We pay 9d. at one colliery and 10d. at another for round coal; small coal is subject to 20 per cent. less. We provide our own waggons, and the Government hauls and breaks them, and we have to repair them, and we provide half the railway.
2633. I understood you to say that if some pains were taken with the loading the result would be better. Everybody will agree with that, but who is to meet the extra expense. We wanted to hear your views from the position of a proprietor, whether, supposing a cargo could be made practically safe at an expense of 500 pence for a 2,000-ton cargo, it would not be worth the while of a proprietor, in view of the extra benefits that would accrue, to be prepared to meet that extra expense? The custom has been, for all the years I have known, for the ship to bear the expense of trimming. The Government do the haulage and shipment from the collieries, and we are compelled to use the Government cranes; and I contend, beyond any doubt, that the present price is exorbitant, and will not allow of anything being charged on the coal proprietors. I do not think the cause of the loss of all these ships is due to spontaneous combustion; I think that has been much exaggerated. I think you will find, in all probability, it will arise as much from indifferent or bad trimming. I think what you are aiming at could be met without any very great expense at all by the Government taking more care to have the waggons lowered on to the coamings of the vessels, and then the trimmers to have shoots or any other arrangements they like to adopt for taking away the dead fall of the coal.
2634. Do you sell your coal to a foreign customer carriage paid? We sell it f.o.b.
2635. He has to pay the freight? Yes; and all the other expenses. If we send the vessel away on our own account, then, of course, we pay the freight.
2636. If you put the price up to a foreign customer something under a half-penny a ton to meet the extra expense of loading, is that going to drive the trade away from Newcastle? I would not say that. We would rather have nothing to do with the trimming of the coal.
2637. Nobody could assert that an extra half-penny a ton would drive the trade away from Newcastle? No; it would not. It is my individual opinion that it would be a great improvement if the Government would take over the trimming and provide proper trimmers—men accustomed to the work—and a man to supervise these trimmers. The captain of each vessel would have to control the work in regard to the stability of the ship. The Government foreman or boss trimmer would see, or undertake to see, that each vessel was properly and thoroughly trimmed. I may tell you it is about as hard an employment as a labouring man can adopt, and is more disagreeable than coal-mining. In the summer months it requires a strong man to remain in the iron and steel vessels. Trimmers ought to be well paid, and, of course, justly treated. I think that will give much more security to vessels than what we have had.
2638. Your recommendation is that the Government should go into business as master trimmers? That the Government should simply complete a certain portion of the work.

2639.

- T. Croudace. 2639. Not do it all? They haul and ship the coal for the proprietors, and we pay a very high rate for that. I think that should be extended by the Government putting trimmers into the vessels, and having a foreman trimmer to see that the work is done.
- 16 Oct., 1896. 2640. In other words, they should go into business as stevedores? Yes, practically that is so. I think it would give greater security, and there would be less strikes.
2641. I suppose the way in which strikes would be prevented would be by paying the men better wages? I do not know that, because we had as many strikes under high wages as under low wages in the coal trade.
2642. Do you imagine that if the Government took up the matter of trimming the cost would not be any higher than at present? The more middlemen you have in any business the more the cost, and you would do away with the middleman. Trimming is purely a work of manual labour, and I think trimmers should be a well-paid class of men.
2643. Do you consider the trimming would cost more or less under the system you propose? I certainly should think it would not cost more, and probably it would cost less.
2644. You think that out of what is now the stevedore's profit the inspection could be kept up and the whole machinery of a Government department worked? I do.
2645. Is it a matter of experience that work is done by the Government more cheaply than it is by private individuals;—can you mention any instance where Government work is done more cheaply? No; there is too much red-tapeism about Government work; but here I do not propose to have any red-tapeism in connection with it. I think if you consider the matter it will bear very considerable force. A captain now either calls for tenders or asks an agent what stevedore he would recommend for trimming his vessel. Supposing he calls for tenders, there is competition among the stevedores, and they may take it at too low a price. I have been a large employer of labour for many years now, and I have found that too low a contract is the worst thing you can enter into. The men will scamp the work. I maintain that a fair price ought to be paid for trimming to ensure it being efficient, and it will pay a shipowner to do it. All the Government would do is to simply have the men there to move from one vessel to another, with a foreman trimmer amongst them, who would get 1s. or 2s. a day extra for supervision. The captain would not be freed from his responsibility, but he would still have to control the trimming so far as the stability of the ship was concerned.
2646. What price should the Government do the trimming at? I should think 3d. a ton. Some vessels are much more difficult to load than others, therefore would require more. Some would load 1,000 tons in half the time that another would.
2647. Are the ships now loaded at 3d. a ton? I think many of them.
2648. Are they ever loaded for less than that? They may be.
2649. Supposing the Government established a general rate of 3d., those paying less now would then have to bear an additional expense? Yes; but I believe they would get much more efficient work done.
2650. Then who is to pay this difference? The ship.
2651. Are there large profits made in shipping now? No.
2652. They are very small profits? Yes.
2653. Competition has run the business down so that there is hardly any margin, as in your own business? Yes.
2654. You cannot afford to pay any more, because your profits are so small? Yes.
2655. How then can the shipowner? Because he could be assured of much more efficient trimming.
2656. Would he be able to recoup it by reduced rates of insurance? I think so.
2657. Have you any idea of the rates that are charged on coal to San Francisco? I could not say unless I had the office-books here.
2658. The chief trouble has been caused by the shifting of cargo, in your opinion? Yes.
2659. You believe that has been due to the fact of the coal not being carefully trimmed, possibly through the work being got over as rapidly as possible? I do. It would be unfair to assume that the vessels missing have been burnt. You have a clear instance of some listing over when they came back to port through imperfect trimming.
2660. *Mr. Pittman.*] Can you say how long ago it is since you had a cargo to insure for foreign parts? Our business for foreign parts is done in London.
2661. Was the insurance effected in London? I think it would be effected in London.
2662. Do you find any difficulty in getting insurance here? We very rarely charter ships here. I may say we never do.
2663. Do you know that it is a matter of impossibility to insure coal here at the present time? Some coal I do.
2664. Any coal from Newcastle? I do not know that it applies to any coal.
2665. You stated that the haulage and other charges in connection with the shipment of coal were exorbitant? I did. We have been complaining to the Railway Commissioners for months or years past.
2666. Is that merely an impression, or have you gone into a calculation, basing the charges upon the interest on the capital expended in the work? I have made a calculation of the cost of a locomotive, the keeping her in order, the time of the engineer, fireman, and guard, and that of the pointsman at the junction of our private lines with the Government lines, the weighman and officials. I have taken the actual cost at which the contract is let by the Government to the crane contractor, and as far as possible tried to get what would be a fair proportion to put to terminal charges.
2667. Did you allow anything for the cost of reclamation at the Dyke? The terminal charges include the formation of the Dyke, the erection of the cranes, and the sidings.
2668. What do you suppose the reclamation cost? I do not think I could say offhand.
2669. *President.*] Did you know at the time you made your calculation? I got some rough estimate. I think it was laid before Parliament. I know private firms are doing their shipping at a great deal less cost—the A. A. Company and J. and A. Brown at Mimini.
2670. Is there anything to prevent your using your own shoots? We bought some land for the purpose and the Government would not allow us to have them. We were stopped by an Act.
2671. The Government forced you to use their cranes? Yes; we bought the land specially, and it has been lying idle ever since. It is a narrow strip, 3 or 4 chains wide and about 20 chains long, on Bullock Island.
2672. Your object was to load your own coal? Yes.

2673. Was the object of the Act to compel you to use the Government cranes? That was practically it. The late Mr. Moriarty said it would never do to give up such an important interest as the coal trade; it was highly profitable. We asked for a reduction in Mr. Goodchap's time. T. Croudace.  
16 Oct., 1896.
2674. Whatever is done, I presume the expense will ultimately fall upon the customer? Not always. Sometimes you have to bear an expense that the customer does not bear.
2675. The general effect of an increase in expense would be to make the coal dearer to the customer? Not if there is a very strong competition moving.
2676. I understand you are making nothing out of the business now? We are not.
2677. Suppose another ld. a ton were put on, would the customer bear that or you? I should say, at the present moment, the company would bear it.
2678. You would then be losing more money than you do now? Yes.
2679. Why do you supply coal if you are losing money? Supposing I managed the colliery as an independent man, I would not hesitate to stop selling the coal at an unprofitable price, but it is different where there are more than one or two controlling powers. Once in the trade you cannot well retire from it, but hold on in the hope that it will get better.

[Witness withdrew.]

Mr. W. G. Dixon sworn and examined:—

2680. What is your name? William Gordon Dixon. W. G. Dixon.  
16 Oct., 1896.
2681. And what is your business? General Manager for the Alliance Marine and General Assurance Company (Limited).
2682. Do you underwrite coal cargoes? I have been doing so.
2683. Do you do so now? No.
2684. When did you give up doing so? Just recently.
2685. How long ago? About two or three months ago.
2686. Before the appointment of this Commission? Yes.
2687. Was it in consequence of the appointment of this Commission? No, it had nothing to do with it.
2688. Do you underwrite ships carrying coal? Not if I can avoid it.
2689. I suppose it was a pretty good business before this trouble occurred, was it not? I cannot speak previous to 1892. I may tell you our loss ratio since 1892 is 170 per cent.
2690. A loss ratio of 170 per cent. would mean that you paid nearly 1½ times your premiums in losses? Yes; if our premiums were £1,500, we would have paid £2,500 or £2,600.
2691. Since 1892 this has occurred? Yes; from 1892 up to four or five months ago.
2692. So you went out of the business simply on account of the losses? I never cared for the business, but insurance offices are in this position;—if you have a client who has a lot of good business, and he brings along a coal-ship, you are bound to take it. I put the rate up, and was getting 4 and 5 per cent. They grumbled at it, and I said, "I should be glad if you will place it elsewhere," and they got it placed in Frisco at a much less rate.
2693. You were charging 4 and 5 per cent. to San Francisco? Yes.
2694. How much does that come to per ton? I have never worked it out.
2695. Mr. Pittman.] When you stopped insuring cargoes, did you do so altogether, or were you prepared to insure cargoes from some collieries and not from others in Newcastle? There was one colliery for which I was charging a higher rate than for the others. I charged all Newcastle coal 4 per cent.; southern coal, except the Metropolitan, 3 per cent.; and there was one colliery in Newcastle for which I charged 5 per cent.
2696. President.] The Wallsend? Yes.
2697. Mr. Pittman.] Are you prepared to insure coal cargoes from some collieries, like the Lambton, for instance? No; I still prefer to be without cargoes altogether.
2698. President.] You would not make an exception in favour of Lambton coal? No; there is nothing I know of to lead me to do so. Coal cargoes from an underwriter's point of view are rather inferior to other cargoes, in this way: If the vessel gets into any trouble, and there is a general average and a towage of £2,000, the coal cargo is of such low value that it comes very heavy on the insurance in the proportion we have to pay. The coal cargo may be valued at £2,000 only, and the cargo, the ship, and the freight have to contribute ratably towards the expense. The value of the cargo being so low it makes the policy for £2,000 bear so much more than in the case of a ship with a general cargo worth £100,000. [Witness handed in a list of coal-laden vessels from this Colony to which casualties had occurred since 1888, prepared in the office of his company.]
2699. We shall no doubt make recommendations with a view to increasing the security of both the ship and cargo. In the event of our doing so, would you be prepared to make any difference in the rates that you would charge on ships adopting the measures which we laid down, or would you wait to see how they turned out? Are you speaking about the shifting or the heating?
2700. Both of the shifting and the heating of cargoes? Provided I were satisfied that proper steps were taken—that shifting-boards were put up and the cargo properly trimmed—if I had to take coal cargoes in connection with other business, I should be inclined to make a reduction.
2701. You would not take the risks as a general thing? No; because our experience has been so fatal with these coal-ships.
2702. If we had to recommend an expense it would strengthen our position, if we knew that that expense could be recouped by a reduction in insurance rates? I should certainly be inclined to make a reduction on the rates I have mentioned if these proposals were carried out, but the bulk of the cargoes are insured in other parts of the world. Up to 1894 I was of opinion that the shifting of cargo was the prime cause of all the vessels being posted missing, but immediately after that there were posted as missing three vessels which had shifting-boards—the "Cumbrae," the "Florence," and the "Menai," and then came a long list of vessels with cargoes on fire, or which had heated. There have been twelve to date since September, 1895. The "John Ena" was the first; I had her, and I had the "Alexandra" and the "Brablock." In addition to these twelve, four others were posted as missing, the cause of loss being unascertainable. I am now forced to the conclusion that firing has been the primary cause of the vessels being posted as missing, and that the shifting of cargo has been a secondary cause.

2703.

- Mr. W. G. Dixon. 2703. *Mr. Pittman.*] You do not regard the shifting of cargo as such an important matter? I do consider it a very important matter, but I think, if the facts were known, the bulk of the vessels missing would be found to have been lost by fire.
- 16 Oct., 1896. 2704. As an insurance manager, you are inclined to regard the losses from shifting of cargo as less numerous than those from fire? Yes; I do so from the experience I have had myself; we have known of so many lately being on fire. In the recent case of the "Patrician," it was the want of shifting-boards that caused her loss. She was going to New Zealand, and the inquiry there found that that was the cause. I will show you how bad these ships are for us. The "Alexandra" and "Brablock" were both bound for 'Frisco, and fires were discovered when they were near their destination. They both got into port all right, with a certain amount of coal burnt, but the loss was 61 per cent. on the "Alexandra," and on the "Brablock" it was 25 per cent.
2705. *President.*] Does that mean the loss on the percentage of the whole value? The percentage of loss on the cargo. There were only about 20 tons of coal burnt, the rest was all absorbed in expenses in putting the fire out and scuttling the ship, and pumping the water out of her, and from selling the coal at damage value. With an ordinary cargo it would not have been nearly so heavy.

[Witness withdrew.]

Mr. T. J. Watters sworn and examined:—

- Mr. T. J. Watters. 2706. *President.*] What is your name? Thomas Jolly Watters.
2707. And what is your business? Marine insurance business.
- 16 Oct., 1896. 2708. You are the manager of an insurance company? Acting general managing underwriter.
2709. Of what company? The Sydney Lloyds.
2710. That is an ordinary insurance company? Yes.
2711. It is not like London Lloyds? It is after the same principle. It is an underwriting body with a number of members who sign for each risk they accept, and they share in equal proportions the risk and the profits.
2712. It is different in that respect to an ordinary insurance company in which a corporate body undertakes the underwriting? Yes; the whole of the members join in, one cannot stand out.
2713. They are obliged to underwrite? Yes.
2714. And for the same price? Yes.
2715. With London Lloyds, I think, it is optional? Yes.
2716. You are half-way between a company and London Lloyds? Yes.
2717. Do you do any business in insuring coal cargoes? Not a great deal.
2718. Do you insure coal-ships? Very few of them.
2719. Used you to insure them? No; we never did.
2720. You do not like the business? No; we do not like it.
2721. What is the reason of that? On account of having so many losses in the trade, and through other companies finding the business was not paying them. My late principal was opposed to those risks, and I follow in his footsteps.
2722. For how many years have you held off coal cargoes? We have not underwritten them except in a few instances.
2723. Since when? Since Sydney Lloyds started in 1882.
2724. From the inception of the business you disliked coal risks? Yes.
2725. And you do not take them unless you are obliged to for the sake of other business? We would not take them.
2726. Supposing you were obliged to insure a cargo to San Francisco, what rate would you charge? At the present time we would not charge less than 60s. per cent.
2727. Would you make any difference according to the colliery from which the coal came, or would you charge that for all coal? We would charge that for all. I do not think we would make any difference. That is a matter that would be laid before the Committee for its decision.
2728. In the event of the Commission making some recommendations to obtain greater security for the ships against both the shifting and firing of cargo, and steps being taken to ensure those recommendations being carried out, would you as an insurance manager be prepared to take coal risks at a lower rate, or would you wait to see how the recommendations turned out? We would wait.
2729. It would make no immediate difference to you? No.
2730. *Mr. Pittman.*] Your action in this respect would be largely dependent on the fact that you do not care about this class of business? Yes; that is just it. We would not go on with it unless we knew absolutely that it was paying other companies.
2731. If you were in the habit of taking this class of business, the competition would force you into reducing the rates? Yes, it might do so in that case. In one or two cases we have to take the risks. Some of our shareholders or members of the association at times ship coal. We do their other business, and therefore have to take this. We had one case lately, the "Patrician," that was lost, but we would rather have been without the risk.
2732. She had no shifting-boards; did you not satisfy yourselves that she had shifting-boards;—you have a surveyor? Yes.
2733. I suppose he reported that she had not shifting-boards? Yes; it was a short voyage—only to New Zealand; the season of the year was good and everything was in her favour. In cases like that many vessels go away without shifting-boards.
2734. Have you come into possession of any information in regard to heating of coal cargoes that might be of assistance to the Commission? No; I have not.
2735. With regard to the shifting of cargo, have you had any experience beyond that of the "Patrician"? No; that is the only one.
2736. Was the "Patrician" lost through want of shifting-boards? I do not know. She met with very bad weather.
2737. That was the finding of the New Zealand inquiry? Stress of weather, I think, principally.

[Witness withdrew.]

Mr.

Mr.  
W. A. Gibb.  
16 Oct., 1896.

Mr. W. A. Gibb sworn and examined:—

2738. *President.*] What is your name? William Alexander Gibb.  
 2739. And your business? Insurance manager.  
 2740. Have you been in that business long? About twenty-seven years.  
 2741. Do you do marine insurance business? Yes.  
 2742. Do you underwrite ships carrying coal or their cargoes? Occasionally.  
 2743. Do you like the business? No; I do not like the business of a certain class.  
 2744. What class do you not like? I do not care for vessels over 1,000 tons.  
 2745. You think they run a greater risk? I think so.  
 2746. Is that the result of experience in paying losses? Fortunately, I have escaped paying losses, and I think the reason of that is through taking care in choosing my risks. I object to large vessels on account of the loading.  
 2747. What is wrong with the loading? They tumble the coal down the batches. I may be wrong in my opinion, but I think the loading of the coal from such a height causes a great deal of dust, and that accumulates in the biggest part of the vessel, and when it is closed up it may generate gas and cause the loss of the vessel. I also take fire risks, and I know it is the dust in a flour mill that we look upon as a great danger. Coal vessels are not loaded close up, and there are usually vacant spaces in her where dust can accumulate in considerable quantities.  
 2748. Are you more afraid of the cargo firing or shifting? The shifting of cargo is the cause of a lot of the trouble, I believe. I would not take a vessel unless she had shifting-boards.  
 2749. Do you think the trimming is sufficiently well done? I think so. I have inquired into it, and I am satisfied that the trimming is done. It is not in the trimming. I fancy it is in the cargo itself and the way it is put in. If they have not shifting-board, it is a very considerable risk. I find that in the space of seven years fifty-two vessels in the coal trade have had accidents of one sort or another. Twelve of those we know have been on fire.  
 2750. During the last seven years? Yes. There are also nineteen of them missing, and eighteen of the nineteen were large vessels, considerably over 1,000 tons.  
 2751. Are the large vessels more likely to be affected from the shifting or the heating of the cargo? It is the cargo heating, in my opinion, to which they are more liable. They have more vacant space for this dust to collect. They are likely to have more dust, because the hold of the vessel is so much deeper, and the throwing down of the coal a distance of something like 30 feet causes dust.  
 2752. Are the ships deeper now than they were eight or ten years ago;—have the coals further to fall? Oh, yes; of course. A vessel of 1,000 tons has not the depth of hold of one of 1,500 or 2,000 tons.  
 2753. *Mr. Pittman.*] Do you know that as an absolute fact? I know that as an absolute fact. I have been long enough in marine insurance to know that a vessel of 1,500 tons has a deeper hold, as a rule. Of course, you find exceptions when a vessel is built with a light draught, but, as a rule, a vessel of 1,500 or 2,000 tons has a deeper hold than a vessel of 1,000 tons.  
 2754. It has been said that such is not the case? If I had a Lloyds' register I could point it out to you. I have made inquiries, and find at home where they load coal they use Spence's distributor to avoid the breaking of the coal.  
 2755. *President.*] Would it make any difference if the coal were loaded with the use of that or any other reasonably good distributor? I would be inclined—in fact, I would take lines in these large vessels if the coal were put in that way. I believe, myself, that the cause of the loss is more from firing than the cargo shifting.  
 2756. *Mr. Pittman.*] Do you make any difference in regard to certain coals at Newcastle? I would treat them all the same. There is a good deal said about one particular mine, which, I think, is rather unfair.  
 2757. Do you know of any mine in Newcastle that is so exceptionally good that you would insure the coal from it without hesitation? I should not make any exception for Newcastle coal; the only exception I should make is in favour of the South Coast coal.  
 2758. You prefer it to that of Newcastle? Yes.  
 2759. *President.*] Supposing the Commission recommended some course of treatment in the loading and general shipment of the coal that would, in their opinion, minimise the dangers to which these cargoes are liable, would you be prepared to reduce your rates if those provisions were carried out, say, under inspection, or would you prefer to wait to see how the matter turned out? We have our opinions, and they might not be at all altered by your recommendations. If I thought, after seeing your recommendations, that they were in the right direction, I would be prepared to take lines, and I would take them at a reduced rate. I might not take as large a line in these big vessels as in the smaller ones, still I would, to the extent of assisting the trade, by giving the thing a trial. If your recommendations were carried out, I certainly would be prepared to do that.  
 2760. *Mr. Pittman.*] Would you be prepared to extend your insurance to larger vessels? Yes; I would, if your recommendations were carried out.  
 2761. *President.*] And you agreed with them, of course? Exactly so.  
 2762. Providing you agreed with them, and you were assured they would be carried out, you would not wait to see the result? No; I would make a start at once, and, if they took the trouble to carry out what was recommended, I would make a concession in the rates, because the rates now are very high for the insured and very low for the insurance company.  
 2763. Supposing you had to insure a cargo to San Francisco, what rate would you charge? At present, from Newcastle, we get 80s. That is double what we got before.  
 2764. You do bad business even at that? I have not done any bad business. I have had the good fortune never to have paid losses. I have never gone into large vessels. As soon as they were offered and I saw the tonnage, I said, "No; shifting-boards or no shifting-boards." I certainly would go in for any of these large vessels if they carried out the recommendations of the Commission. I qualify that by saying I would like to see the recommendations to know whether I could go the whole way.  
 2765. What would a substantial reduction mean in your case? I should certainly go in for a reduction of 1 per cent. Before any trouble occurred we got 40s. from here to America, and they doubled that.  
 2766. *Mr. Pittman.*] I suppose the rate would really settle itself by competition, would it not? It would settle itself by competition if the trade was shown whether it was paying or not. I would be prepared, on the recommendations of the Commission being carried out, to make a reduction of 1 per cent. If after four or five years other companies found the business was a good thing, they might force the rate down lower still.

[Witness withdrew.]

Mr.

Mr. C. Danvers sworn and examined:—

- Mr. C. Danvers. 2767. *President.*] What is your name? Charles Danvers.  
 2768. And what is your business? Manager of the North Queensland Insurance Company.  
 2769. Do you do a marine business? Yes.  
 16 Oct., 1896. 2770. Do you underwrite coal ships? We have been doing so for the last ten years.  
 2771. Do you do so now? Yes, at a rate.  
 2772. What is your rate? It depends on the class of ship. A vessel built in 1868 I would write at 2 or 3 per cent. cheaper than I would a modern tank of about 2,000 or 3,000 tons. The rates range from 3 to 9 per cent.  
 2773. Nine per cent., I presume, is absolutely prohibitive? Yes.  
 2774. Have you ever had an insurance at 9 per cent.? In two cases I have got 9 per cent.  
 2775. What for? One was in the case of a big ship, whose name I cannot remember now, and there was a small line in the case of another large one.  
 2776. It was not a big matter? No, it was not. She was a big ship with an enormous cargo.  
 2777. Of coal? Yes.  
 2778. *Mr. Pittman.*] Did she get into port? I do not think she has arrived yet.  
 2779. *President.*] Where was she going to? The west coast of South America.  
 2780. Is that considered a better or worse risk than with a ship going to Manilla? I consider it a far worse risk.  
 2781. Why? It is a rough voyage; to Manila would be a smooth voyage.  
 2782. It is not so hot—do you mean that? I have no objection to the heat at all.  
 2783. Are you chiefly afraid of the heating or the shifting? The shifting.  
 2784. You do not trouble about the heating very much? The heating never troubles me. I have never believed that missing vessels have fired.  
 2785. For a good ship of 2,000 tons going to San Francisco laden with coal, what would you be prepared to charge? Five per cent.  
 2786. Supposing the Commission were able to make some recommendations for the better security of the cargo and better provision against fire, and there was a system of inspection to see that those recommendations were carried out by ships loading at the port of Newcastle, would you be prepared then and there to make a reduction in the rates, or would you prefer to wait to see the result of the recommendations? If it was proposed to insure a coal cargo, and the client could produce to me a Government certificate that the coal was loaded and trimmed in a proper manner, and that proper shifting-boards were used, I would take it at half rates.  
 2787. That is, you would reduce your rate of 100s. to 50s.? Yes.  
 2788. *Mr. Pittman.*] 100s. is high, according to the evidence we have had? I have stuck out for my own rates, and if I could not get them I would allow the business to go. I have been able to get my rates on coal risks.  
 2789. *President.*] Is there anything you would like to lay before us? I do not think so. My opinion is that one of the main causes of the loss is from the way in which the coal is put into the ship. The height the coal falls is too great.  
 2790. The height affects the heating? We have to take that also into consideration.  
 2791. That is not the stowage? The stowage is the chief thing. Some firms in Newcastle, I know, put on men to trim who know nothing about it.  
 2792. Did the appointment of the Commission have any influence on you as regards the rates you charge? No; I have charged these rates for the last twelve or eighteen months.  
 2793. It made no difference? It made absolutely no difference at all.  
 2794. Are you a member of the Underwriters' Association? Yes.  
 2795. You have a surveyor at Newcastle? Yes.  
 2796. He gives you information about shifting-boards, but nothing else? He simply advises whether shifting-boards are put into the ship or not.  
 2797. *Mr. Pittman.*] And generally as to the state of the hull? Whether she is a first or second class risk.  
 2798. *President.*] He does not report on the trimming at all? I do not know that he is competent to report on the trimming.  
 2799. Would it not pay insurance people to have someone to report on the trimming? The rates all round are too low, and we should have to get an expert to report on the trimming.  
 2800. Trimming seems to be a simple matter? No, because vessels are built so differently, and require to be trimmed differently.  
 2801. Your object is to have a good risk, and yet you only examine it on one side—why do you not examine it from all sides? I think it is simply because our man is not competent to give a report upon the trimming.  
 2802. In your opinion, are big ships worse risks than small ones? Yes; especially the vessels built the last four or five years—big flat-bottomed ships.  
 2803. Why? Some of them are so very stiff that they have to carry their coal higher up in the vessel, and not having so deep a keel they are more liable to capsize when the cargo shifts. They have perfectly flat bottoms, while the old-fashioned ships have deep keels, and, therefore, a greater hold on the water.  
 [Witness withdrew.]

WEDNESDAY, 21 OCTOBER, 1896.

[The Commission met at 2:30 p.m. at the Chief Secretary's Office, Sydney.]

Present:—

PROFESSOR RICHARD THRELFALL, M.A., PRESIDENT;  
 And EDWARD FISHER PITTMAN, Esq., A.R.S.M.

Mr. L. R. Mitchell sworn and examined:—

- L. R. Mitchell. 2804. *President.*] What is your name? Leslie Ronald Mitchell.  
 2805. And what is your business? I am the manager of the China Traders Insurance Company.  
 21 Oct., 1896. 2806. Do you insure ships? No, not sailing ships; we insure the hulls of steamers.  
 2807. Do you insure the cargoes of sailing vessels? Yes.

2808.

L. R.  
Mitchell.  
21 Oct., 1896.

2808. Do you insure coal cargoes? Yes.
2809. At a price? Yes.
2810. Do you make a distinction according to the port to which the vessel is sailing? Not so much now as we used to do when the rates were lower. Previous to the casualties which occurred early this year the rates were lower than now, and with the increased rates we do not mind so much where they go to as we do in regard to the coal they load.
2811. Do you make a distinction according to the coal? Yes, as regards the colliery from which it comes.
2812. What is the lowest insurance rate you charge on any coal? The lowest rate we charge is 3 per cent. on sailing vessels.
2813. For what coal do you charge that? Southern—not Newcastle.
2814. You do not charge as low as 3 per cent. on Newcastle coal at all? No; the rate we would charge on Newcastle coal would be more than that. Three per cent. is the rate for Southern coal only.
2815. What is the rate for Newcastle coal? The current rate here is 4 per cent. for the best Newcastle coal.
2816. Would you make any exception in favour of the Lambton Colliery? Yes, I would.
2817. What rate would you charge on Lambton coal? That is what I call the best coal; the rate would be 4 per cent.
2818. What would you charge on Wallsend coal? I prefer not to write Wallsend coal at all. The ordinary rate is 5 per cent. for that coal.
2819. The many more accidents that have resulted to ships carrying that coal may, probably, be attributable to the larger trade, and not to any difference in the coal itself? If we could get an insurance on the whole of the cargoes it would not be so serious a matter for us.
2820. If they do not lose a greater percentage of cargoes than other collieries you ought not to charge different rates,—is that not so? We look at the fact that the greater number of cargoes that have burnt spontaneously, as we think, have come from the Wallsend Colliery; that being the case, we naturally charge them higher rates than we would those collieries whose coals have been free from spontaneous heating.
2821. Do you attribute the accidents chiefly to firing or to shifting of cargoes? You will understand that we are guided greatly by the London rates, and, for instance, if I can get a premium paid me cheerfully at 4 per cent. I would not do the business for 3 per cent. If they fix a certain rate in London we follow that as far as we possibly can. Of course, you must not take the fact of my charging what I can get as altogether my opinion. I am simply trying to get as much income for my company as possible. If other companies combine and say 5 per cent. is a fair rate for Wallsend coal, and do not take it at less, and 4 per cent. for other Newcastle coals, and 3 per cent. for Southern coals, that may not express my opinion, although I follow others who get those rates. I would be foolish if I did not do so.
2822. Do either you or your principals attribute the losses mainly to heating or to shifting of cargoes? Losses have occurred from both causes; we know that.
2823. Are you, or the people whose views you represent, more afraid of the shifting than the firing? We are more afraid of the shifting than the firing; I admit that.
2824. This Commission may make some recommendations both in regard to providing against the shifting of cargoes and against spontaneous combustion, and in the event of a guarantee being given you that those recommendations were carried out (say) under inspection, would you be prepared to reduce the rates at once, or would you wait to see what resulted? The rates would come down at once, provided the Government were to take that step.
2825. What would you consider a fair reduction—from 4 per cent. to 2½ per cent.? Yes; I consider 2½ per cent. a fair thing. I have written risks to the extent, perhaps, of 100 within the last three years. The rates got for the majority of those risks were considerably lower than the present high rates; they were more like 2 or 2½ per cent., principally to America, where most of the coal is exported. I, perhaps, have been more fortunate than my neighbours. My results show a profit of 66 per cent. on that business within the last three years over an average on 100 ships.
2826. I can take it that you or your company would be inclined to make a reduction in the rates in that event? Quite so.
2827. And it might amount to as much as a reduction to 2 per cent.? Yes.
2828. *Mr. Pittman.*] You said the rate on Southern coal was now 3 per cent.;—what was the normal rate of insurance on Southern coal? As low as 30s. per cent.
2829. Has the rise in the insurance rate on Southern coal simply occurred on account of the firing of Newcastle coal? Absolutely; and also through the fear that people entertained when the explosions occurred with the Metropolitan coal. When I spoke of Southern coal you will clearly understand I did not include Metropolitan coal; that is practically uninsurable at the present time.
2830. So that Southern coals have had to pay a higher rate lately simply from the fact of Newcastle coal firing? Yes. Many companies have had instructions from head office to decline coal risks altogether.
2831. *President.*] How long ago is that? Within the last six months.
2832. Not on account of the appointment of this Commission? Oh, dear, no. I might say I have always made it a *sine qua non* in insuring coal that shifting-boards are placed in vessels of more than 1,000 tons. I had one experience—the “Caradoc.” She had to put back in distress; she met with bad weather, and was leaky. When the captain came into port he said that if it had not been for the shifting-boards he was satisfied the vessel would have been lost, she heeled over so much. The rates that I have given you are the rates I charge. I have had to write risks at lower rates, but that was in consequence of having given a cover before the strike took place in Newcastle. I made a fixed arrangement at certain rates and the assured held me to the terms of my cover. If it had been new business I would have charged the rates I have said.

[Witness withdrew.]

Mr. T. M. Tinley sworn and examined:—

2833. *President.*] What is your name? Thomas Matthew Tinley.
2834. And your business? Manager of the United Insurance Company.
2835. Do you insure coal cargoes? We have done very little with coal cargoes within the last twenty years.

T. M. Tinley.  
21 Oct., 1896.

- T. M. Tinley. 2836. Do you insure hulls? Yes.  
 21 Oct., 1896. 2837. Do you insure the hulls of coal-laden ships? We have, occasionally. There are so few in the trade which are owned here.  
 2838. So that you really have somewhat little business with coal cargoes? Comparatively little. We gave it up twenty years ago; but that was not due to the same causes as are operating now. We have taken lines occasionally, but very few.  
 2839. It is rather out of your general line of business? It has been of late.  
 2840. You do not feel inclined to continue it again? I do not mind, if it will pay at a price, and after we gain by the experience of others.  
 2841. What price would you charge now if you had to insure a coal cargo? We have taken one or two lines at what is supposed to be the current price—4 per cent.  
 2842. Why do you say "supposed to be"? Because they can get it if they ask for it. So few are inclined to take the business.  
 2843. You mean there are so few offices prepared to do it at any price? Yes.  
 2844. In business, you have, occasionally, to take such risks in connection with other matters, whether you like it or not? Sometimes we have; but it so rarely happens that I can hardly call it a practice or a rule.  
 2845. How many hulls do you insure in the course of a year carrying coal? Not more than, perhaps, three or four. They are locally owned, and, strange to say, they are never lost carrying coal.  
 2846. Those are only the local boats? Yes.  
 2847. Not deep-sea boats? They are owned at this port.  
 2848. Where do they carry the coal to? They may go to America or to Mauritius.  
 2849. Suppose the Commission made recommendations for the better stowage of coal cargoes, and for providing against spontaneous combustion, and supposing some guarantee were given that those recommendations would be carried out under inspection, would you be prepared to reduce the rates at once, or would you wait to see what happened? I could hardly say. It is just what my Board would determine. It is more than probable that we should be inclined, if we thought there was a greater prospect of cargoes going better, to take lines. We would not take them indiscriminately.  
 2850. You discriminate somewhat between the coals now, do you not? We do now, as a rule. I do not mind taking wooden vessels carrying coal; I think they are better for coal carrying than the iron ones.  
 2851. Are the locally owned vessels wooden ones? Yes. There are very few in the trade. Nearly all the locally owned vessels have passed away.  
 2852. *Mr. Pittman.*] Do you discriminate between the coals from different collieries? We should probably do so only from the experience of others. We should be guided by them.

[Witness withdrew.]

Mr. W. H. Rowsell sworn and examined:—

- W. H. Rowsell.  
 21 Oct., 1896. 2853. *President.*] What is your name? William Henry Rowsell.  
 2854. And what is your business? I am the manager of the Globe and Mannheim Insurance Companies.  
 2855. Do you insure coal cargoes? Not at present.  
 2856. Used you to do so? I used to do so very largely. I have not done any extensive business for over ten years.  
 2857. What was the reason of your giving it up? One reason was that the principal business was with the East, and export business with the East has diminished very considerably of late years, and the export to 'Frisco and Mauritius is very irregular.  
 2858. You say the export is irregular? So far as our business is concerned. I have only had small cargoes.  
 2859. Do you insure the hulls of ships? No; I do not take sailing hulls.  
 2860. You take the hulls of steamships? Yes.  
 2861. Whether they carry coal or not? Yes.  
 2862. Do you make an extra charge in the event of their carrying coal? No; we do not ask them on a time policy; and then, of course, the vessel is free to trade and run in any trade. We do not go into the question of cargoes, as a rule.  
 2863. How many coal cargoes do you insure in the course of a year? I have only taken one cargo recently, to Mauritius—just a few hundred pounds. I decline them now.  
 2864. On what grounds? Both my head offices have instructed me they prefer not to take them, unless in connection with some special business.  
 2865. *Mr. Pittman.*] That is the London office? One is the London office; the other is a leading Continental office.  
 2866. *President.*] What has been the cause of the increase in the rates—the heating or the shifting of the coal? The losses that have occurred, and the heavy claims in connection with average too.  
 2867. Has it been on account of the foundering of ships through the cargoes shifting or through the heating of the coal—have your people formed any opinion on that point? They have not expressed it to me, but I have my own opinion.  
 2868. What is that? I think the shifting of cargo has been the cause in some cases, but that the firing has been the more frequent cause.  
 2869. Supposing the Commission were to make some recommendation for the better stowing of cargoes, and for the better prevention of spontaneous combustion, and you were to receive some guarantee that these recommendations were to be carried out under inspection of some kind, would you be prepared to at once reduce your rates, or would you wait to see the result? I am simply an agent for the companies, and should have to get instructions from my head offices. At present my instructions are not to take coal cargoes. With the increased rates now charged, I am of opinion we should venture to take small lines. I have been an underwriter for the last twenty-five years in Sydney. Twenty years ago I would take coal cargoes to Hongkong and Shanghai at 30s. per cent., to 'Frisco at the same rate, and to Mauritius at 22s. 6d. Now the rates are more than double that, I do not touch the business at all.  
 2870. *Mr. Pittman.*] What do you call the rates now? About 5 per cent. to 'Frisco. I have not had occasion to go into the eastern rates, but I should think about 3 or 4 per cent. 2871.

2871. *President.*] You cannot answer my question as to what you would be prepared to do in the event of the recommendations of the Commission being carried out? I do not think my head offices would immediately resume the business; they would wait to see the result. They might authorise me to take some small lines if they thought your recommendations were such as they approved.

W. H.  
Rowsell.  
21 Oct., 1896

2872. They would be inclined to wait and see what was the result? Yes; I think so. They are conservative offices, and are not always in the front to take up new business.

2873. Have you any matters which you would like to bring before the notice of the Commission? I wanted to make a suggestion in reference to the loading of cargoes. I think that the skips are not lowered enough into the holds, so far as I have seen. A great deal of dust and small coal are made, and sometimes these skips are loaded after a good deal of rain, and there is water in the skips. At all events, the coal is very wet, and if that is all broken up into small coal and stowed into the hold of a ship, I think it would be worth while making inquiries as to the result—whether heating would not arise, and even combustion. That is one cause that I imagine might originate fire. I have been in Newcastle in exceedingly hot weather, when you could hardly touch the skips because they were so hot; and with small coal heated to such an extent and dropped into the hold, there might be some chemical result from that. I fancy it would be worth inquiring into; but your experience may be able to decide that. Shifting-boards are of service in large ships. In a ship with 'tween decks, if two or three streaks of the 'tween decks were taken up, sufficient to allow the coal from the 'tween decks to work into the lower hold, the vessel would work in so solid that I do not think there would be any shifting of cargo.

2874. Some ships would not stand that, it would make them too stiff? Yes.

[Witness withdrew.]

Mr. A. F. Robinson sworn and examined:—

2875. *President.*] What is your name? Augustus Frederick Robinson.

2876. And what is your business? Merchant and Lloyd's agent for Sydney.

2877. You are agent for London Lloyd's? Yes.

2878. You insure cargoes of all kinds, do you not? We do not do any insurance here at all. We simply act as agents for London Lloyd's in the matter of settlements of claims or surveys, and arrange for the survey of damaged goods.

A. F.  
Robinson.  
21 Oct., 1896.

2879. Would you advise your principals about the coal cargo business, for instance? I have not advised them specially about it.

2880. Do London Lloyd's insure coal cargoes? Oh, yes.

2881. And also ships carrying coal? Yes.

2882. Do you know what rates they are charging now? I do not know at all; we are not advised of the rates.

2883. So that you are not able to give us any information as to the transactions of Lloyd's? No, I cannot. They do not come before me, except in the case of claims payable here, and that would not be the case in coal cargoes. If they are insured in London, they would be payable in London or at destination, but principally in London. As regards Sydney, we have little or nothing to do with coal ships or their insurance, because anything of that sort would come before the Newcastle agent for Lloyd's.

2884. Who is that? Mr. Stokes.

2885. Have any instructions been sent to you with regard to coal cargoes? No; I have had no instructions.

2886. You are agent, I see, for certain other companies? Yes; in the same way as we are agents for Lloyd's—for the settlement of claims, not for taking risks.

2887. Have you had any experience with regard to coal cargoes in connection with those other companies? The only time I was called in at all was in the case of the "Knight of Saint Michael," which put in here in distress. I was called in by the captain, as Lloyd's agent, to appoint surveyors to have the cargo surveyed, which I had done, in conjunction with his agents.

2888. Are you able to give us any opinion as to the attitude of your insurance companies in regard to coal insurance? No, I could not do that, because they have not written to me in any way about it.

2889. *Mr. Pittman.*] You are not in a position to say whether there is any truth in the statement in yesterday's paper about the insurance companies having decided to decline all risks? No; I have not heard of anything beyond what I saw in the paper yesterday.

[Witness withdrew.]

Mr. C. J. Royle sworn and examined:—

2890. *President.*] What is your name? Charles John Royle.

2891. And what is your business? Insurance agent.

2892. Do you write ships? Yes.

2893. Do you write cargoes? Yes.

2894. Coal cargoes? No; we used to.

2895. When did you give up doing so? Some years ago.

2896. You have not made any difference in your determination in that respect because of the appointment of this Commission? No.

2897. If you had to take a coal risk, what rate would you charge;—I understand, although you may not wish to take them, business occasionally makes it necessary for you to do so? We will take a ship if she only has one-third of the cargo coal as ballast or trimming.

2898. You would not take a whole coal cargo? No.

2899. Supposing it were necessary for you to take a cargo of coal going to San Francisco, what rate would you charge? I would not take it; I would rather lose the business.

2900. And the same as regards the hull? Yes.

2901. Either with a sailing vessel or a steamer? Yes.

2902. Have you had ill-luck with coal cargoes? We did years ago.

2903. So that you have been drawing off this business for some years? Yes. I have underwritten for five Companies—the Standard Insurance, the Marine Insurance of London, Queensland Lloyd's, Southern Lloyd's

C. J. Royle.  
21 Oct., 1896.

- C. J. Royle. Lloyd's, and Melbourne Lloyd's. I am no longer agent for the Marine Company. Queensland Lloyd's and Southern Lloyd's have been incorporated with other companies; but neither Melbourne Lloyd's nor the Standard of New Zealand, for which I write at the present time, will take these cargoes.
- 21 Oct., 1896. 2904. Is your opinion on this point final;—are your companies guided by you in this matter, or have you instructions not to take them? Both.
2905. Your duty and your inclination go together? Yes, and my profit; I get a commission on profits.
2906. Supposing this Commission were enabled to make recommendations which, in their opinion, would be likely to lead to increased security, both as against shifting of cargo and as against heating, and that some sort of inspection were arranged whereby you could obtain a reasonable guarantee that the recommendations would be carried out,—would you thereupon be inclined to resume this business, or would you wait to see what happened? I should feel inclined to resume the business; I should recommend that the business be resumed.
2907. You would resume the business at a reasonable rate, possibly? I think so.
2908. What would you consider a fair rate—50s. to 60s.? I could not tell you. The rates at present are just anything you like to charge, and no doubt a certain rate would pay.
2909. If you could get enough business? Yes; there is so much insured in London, it is no use taking a single cargo.
2910. Most of the insurance business is done in London in connection with this matter? Yes; because, I believe, it is utterly impossible to write it here.
2911. I suppose, if you would consent to write, you would get business here? I presume so, provided our rates were not higher than London.
2912. *Mr. Pittman.*] At what rate do you take a steamer with one-third cargo of coal? We had an instance the other day. We had a cargo of general goods to the Cape. The tariff rate is 25s., and the insurer said he had 700 tons of coal, which was about one-third of the cargo. We charged 35s., or 10s. extra for the small proportion of coal. We did not really look upon it as an extra risk; but other companies fell in with us, and we took the risk at 35s.
2913. *President.*] What was the size of the ship? About 2,000 tons.
2914. And she took how much coal? Between 600 and 700 tons.
2915. Not enough to constitute a source of danger? No.

[Witness withdrew.]

Mr. E. S. Chapman sworn and examined:—

- E. S. Chapman. 2916. What is your name? Edward Shirley Chapman.
- 21 Oct., 1896. 2917. What is your business? I am an insurance manager.
2918. Do you underwrite ships? Yes.
2919. And cargoes? Yes.
2920. Do you underwrite coal cargoes? Yes, occasionally.
2921. At what prices do you underwrite them? At various prices—from 20s. up to 60s. and 70s.
2922. What cargoes do you underwrite at 20s.? Intercolonial and coastal.
2923. And with regard to deep-sea cargoes? I have been writing cargoes to Singapore. I have not been writing to 'Frisco and South American ports for some years.
2924. Why? Because they resulted in such terrible losses.
2925. You consider that there is less danger in the voyage to Singapore? It has treated me better.
2926. Is that because it is a shorter voyage? It is a short voyage, but not such a good voyage.
2927. In what way? I mean to say that to American ports there is more open sea.
2928. But as far as spontaneous combustion and shifting go? As far as the results to me were, I think Singapore cargoes have been better. That is why I occasionally do them, but I do very little in them at all.
2929. Am I to understand you do not do more than you can avoid? I do not do any if I can avoid it. I do not suppose in the last twelve months I have had two cargoes.
2930. Do your principals accept your advice as to what is to be done in this matter, or do you receive instructions from them? Sometimes we receive instructions and sometimes it is left to us. One company will tell us, "Do not touch coal under any pretence whatever"; another company will leave it absolutely to me. My idea is that the whole trouble is due to bad stowing.
2931. As opposed to heating? Yes.
2932. The Commission have it in mind to possibly make some recommendations regulating the better stowing, and to provide against spontaneous combustion; and it has been suggested that some sort of inspection should be adopted in order that the advice of the Commission should be carried out;—in the event of that being done, would you be prepared to reduce your rates, or would you wait to see what resulted? I think, probably, most of us would make a reduction on those cargoes that were loaded under special inspection.
2933. Subject to our special regulations? I think if the rate to a certain port were 60s. we should rebate 5s. per cent. for those ships loaded under inspection.
2934. Who would get that rebate? The people who ship the coal.
2935. The shipowner or the merchant? The merchant—the buyer of the coal—and to that extent it would benefit the mineowner and the trade. I am on the Committee of the Sydney Underwriters' Association, and I think there is no doubt we would make that recommendation. I can only speak for myself, but I think there is no doubt about it.
2936. You already have an inspector? We have our Marine Surveyor in Newcastle, and he is instructed to see that shifting-boards are put up; but many ships go away without shifting-boards.
2937. In spite of his inspection? Yes. If the coal is insured with me, I could say, "I consider your policy null and void if you go to sea without shifting-boards"; and I could stop it that way, or they could go to some one else. We can only bring moral suasion to act; and if the coal is insured in London or elsewhere, the surveyor can only recommend shifting-boards being put up, and if the captain will not do so, there is an end of it.
2938. Is it not very unusual with large iron ships to put to sea without shifting-boards? It is occasionally done. We get our surveyor's reports every week, and here and there you see that shifting-boards are not put up.
- 2939.

2939. How do you account for shifting-boards ever being omitted; I am not referring to the old style wooden ships, which practically have natural shifting-boards in their stanchions;—is it a matter of expense? I do not think so.

E. S.  
Chapman.

21 Oct., 1896.

2940. Or of great trouble? No.

2941. There seems to be an absolute unanimity of opinion as to the necessity of using them, and I cannot understand how it is they are omitted? I think it is occasionally on account of the obstinacy of the captain. Some owners look at every penny, and the captain might say, "I am not instructed to put them up, and I will not go to the expense of £2 or £3 to do so."

2942. Is there anything you would like to bring before the Commission? My opinion is that if an inspector were appointed it would be a great thing indeed.

2943. An inspector for the trimming? Yes, specially for the trimming, and to see that proper shifting-boards are put up. If shifting-boards are put up improperly they are useless.

[Witness withdrew.]

WEDNESDAY, 11 NOVEMBER, 1896.

[The Commission met at 2:30 p.m. at the Chief Secretary's Office, Sydney.]

Present:—

PROFESSOR RICHARD THRELFALL, M.A., PRESIDENT;

And EDWARD FISHER PITTMAN, Esq., A.R.S.M.

Hon. Alex. Brown, M.L.C., sworn and examined:—

2944. *President.*] What is your name? Alexander Brown.

2945. And what is your business? I am Managing Director of Dalgety and Company.

2946. Have you any interest in collieries? I am interested in collieries.

2947. Are you a colliery owner? I am.

2948. Has any coal from any of your collieries heated in transit? No.

2949. What are your collieries? The New Lambton. We also represent the Dudley colliery.

2950. Do you superintend the trimming of coal? No.

2951. Is the South Lambton colliery the same as the New Lambton? The South New Lambton is the same.

2952. Is that your colliery? Yes; it is the new name the Commissioners have given to it.

2953. Do you insure your coal yourselves, or is it insured by the purchaser? It depends upon the transaction; if the coals are purchased at home the purchaser insures, but if the transaction is completed at Newcastle, we would probably be the insurers.

2954. Where does most of your coal go to? It finds its way to foreign ports, some to Java and Honolulu, but the export from the South New Lambton mine has fallen off very considerably.

2955. You do a considerable oversea trade? Yes.

2956. Have you noticed any increase in rates since the appointment of this Royal Commission? There has been an increase in rates of insurance, but I cannot say it is due to the appointment of the Royal Commission.

2957. I may be misinformed, but I think I heard it said that you made a statement in the Legislative Council that the rates of insurance had risen since the appointment of the Commission? I said the appointment of the Commission would probably lead to an increase in the rates of insurance.

2958. I understood you were reported as saying it had already led to an increase? I do not think I said so. All I complained of was that it was giving an unnecessary notoriety to an incident that, in my judgment, was not of grave consequence.

2959. What was not of grave consequence? The firing of coal cargoes.

2960. How many coal cargoes do you suppose have been known to have fired during the last three or four years? It is difficult to say, but taking an average on five years shipping, the result, so far as I have been able to ascertain, was about one-half per cent., and that represented every kind of disaster—the act of God, errors of navigation, firing, and everything else.

2961. We have a list here showing what ships have been lost, and, I think, if you would care to look at it, you will see the matter is one of considerable importance? I understand that recently there have been more cases of firing of coal cargoes than in the past, but taking an experience of over twenty-five years, and an average of losses of all kinds for the last five years, of coal ships to foreign ports, the matter is not of grave consequence compared to the risks that are run.

2962. Perhaps some judgment on that point may be formed by considering the insurance rates? Not necessarily.

2963. Do the insurance companies object to insure coal for any reason other than that it is a bad risk? They are ready to seize any opportunity to put up the rates.

2964. Does not competition tend to keep the rates down? Not necessarily, because there is a union of interests with the underwriters.

2965. I am to understand you consider the rates have been put up unnecessarily? I do; I think the increase in rates by 100 per cent. is absolutely unwarranted.

2966. You have either to pay those rates or you cannot get the coal insured? No doubt.

2967. So that it would be to your benefit if the rates were reduced? Undoubtedly.

2968. Supposing the rates were reduced from 80s. per cent., which is about the rate we understand that is charged now, down to, say, 40s.? That used to be the figure.

2969. And I suppose we may consider the value of a ton of coal when landed at Manila or San Francisco would be about £1? Yes.

2970. And 2 per cent. on that would amount to about 5d.? Yes.

2971. Then there would really be a saving of about 5d. on a ton of coal in insurance? There would be.

2972. It has been demonstrated to us that by making an alteration in the mode of loading the coal, the chance of spontaneous ignition could be very much reduced, and representatives of a number of insurance companies have informed us that in the event of certain recommendations that might be made by us being carried

Hon.  
A. Brown,  
M.L.C.

11 Nov., 1896.

Hon.  
A. Brown,  
M.L.C.  
11 Nov., 1896.

carried out, they would be prepared to reduce their insurance rates. Any proposal we might make would undoubtedly increase the expense of loading, and we want to hear from you, from the point of view of an insurer and owner, whether you consider you would be recouped to some extent by a reduction in the insurance rates? I should take it that any expense of that kind would be very hardly borne just now, considering the low price of coal.

2973. Any recommendation we might make would not, I should think, increase the cost of loading more than  $\frac{1}{2}$ d. a ton, and I want you to tell me whether I am right in supposing that, in the event of the insurance on a ton of coal being reduced by 5d., and the cost of loading increased by  $\frac{1}{2}$ d., there would be a profit of 4 $\frac{1}{2}$ d. a ton? Undoubtedly.

2974. *Mr. Pittman.*] We have evidence of at least twelve vessels having had their cargoes fired within the last twelve months;—do you not think that is an important thing, setting aside the question of the percentage on the total losses? I think it is all theorising in a matter of this kind. My conception of the circumstance is this: That the coals are loaded now in very much larger ships than they used to be, and the accidents have occurred principally to those ships loaded in the summer-time, and the coal so loaded, after being exposed to a great heat, has had much to do in developing this difficulty during the past twelve or eighteen months.

2975. Do you not think that if the losses of ships from the heating of coal cargoes were put before you in actual numbers of, say, twelve in a year, you would not regard it as really a serious matter? It is no doubt a question that wants consideration.

2976. It sounds much more serious when you say that twelve vessels were actually lost than when you say the losses amount to only one-half per cent. of the total number of vessels that sailed? No doubt, but I do not think, when compared to Cardiff coals, the number is so great. I quite agree that the subject is one that demands attention.

2977. *President.*] You use the word "theorising";—in what connection do you do so? In regard to finding out what is the best thing to do in connection with this firing of coal cargoes.

2978. You consider any conclusion we come to will be based on theory? Necessarily.

2979. Are not all conclusions in human life based on theory of some kind? No.

2980. Supposing we find that a cargo is fired from a certain cause, and it is absolutely demonstrated to us what that cause is, you may say it still remains a theory whether that cause will act or not, in the same way as a navigator theorises when taking an observation of the stars? He is not in the same position. Take, for instance, the "Nautical Almanac"; there it is demonstrated beyond doubt, five years hence, as to what will absolutely occur.

2981. There is the theory that things will go on as at present? No.

2982. It is an absolute theory. I say this because you seemed to use the word "theorising" in a disparaging way? No, I did not. I did so rather from the facts adduced by the previous Commission that sat about twenty years ago, where, after careful evidence was taken, the conclusions they came to were all theories.

2983. Have you read the report? Yes.

2984. You remember an important recommendation that coal should not be ventilated? I do.

2985. It was shown that those cargoes which had been ventilated had fired;—what theory was there in that? That was an absolute theory that possibly the firing in coal cargoes might be avoided by not ventilating them. Subsequent conclusions go to show that ventilation is satisfactory.

2986. We have no evidence to show that ventilation is satisfactory under any circumstances, except surface ventilation? Have you the papers in regard to the "Morna," which went to Valparaiso, and whose cargo heated whilst in port. The cargo was ventilated, and I fancy the facts adduced by the master goes to show that the results of his voyage across the Pacific showed the advantage of having ventilating appliances in the hold of a ship.

2987. *Mr. Pittman.*] We have certainly had no evidence to prove that? I will supply you with a copy of the data. The circumstances were these: The ship, when in Newcastle, no doubt had heated coal on board, and the temperature of the hold ran up to 130°, and representations of mine were made to the Wallsend Company to remove the coal, which was done, and fresh coal was substituted. The master said he had ventilating appliances on board at the instance of the owners. He took the daily temperature on the voyage across, and in no case did it exceed between 70° and 80°; it kept very even right through. I understood from my correspondence that the owners, as far as my memory serves me, attributed this fact to the ventilating appliances in the hold of the ship.

2988. *President.*] I think you can take it as established, both before the English Commission and before ourselves, that imperfect ventilation is an evil to be avoided. A certain amount of ventilation above the coal is necessary in order to carry off the gases to avoid explosion, which is a totally different thing to spontaneous heating, and subject to totally different laws. It has been suggested to us that good, perhaps, would result from having some inspection of the trimming at Newcastle. The members of this Commission are very much opposed, personally, to any Government interference of any sort; but the witnesses have been almost unanimous on that point, and we should like to hear what you think of it? I do not think it would be of any advantage whatever; it would be a source of unnecessary expense.

2989. It is one of the points that I think I may say the insurance companies are absolutely unanimous upon, and the adoption of inspection would be one of the causes that would induce them to lower their rates—

2990. *Mr. Pittman.*] To lower their rates without waiting to see the result? What would the inspector's duties be—to see the coal trimmed on every ship, or to see that shifting-boards were put up?

2991. *President.*] To see that the whole stowing was properly done. It has appeared to us, incontestably, that the captains, who ought to see to this, do not do so? Some of them do.

2992. Some do, but many do not? I cannot see that any service of that kind would be satisfactory.

2993. We are loth to make a recommendation of that kind, but when everybody speaks so very distinctly upon the advantages of it, I may say, personally, I have been almost converted;—what is your objection to it? I cannot see that good could possibly come of any inspection of that kind; it is relieving the master of the responsibility that devolves upon him.

2994. *Mr. Pittman.*] But what if the master does not carry out his duties? I suppose it is the same in regard to the navigation of his ship; but what can be done?

2995. It is not quite the same thing;—we have asked the question what can be done if the captain does not

not perform his duties, and the reply has been, "Appoint an inspector to see that it is done"? You can only do it by legislation.

2996. *President.*] We are not quite clear about that? I do not see how you could do it otherwise. It would be difficult for foreign ships.

2997. I think the Navigation Act gives power in the case of British vessels; it gives power to see that ships are not overloaded, and I think the provisions of the Act are sufficiently wide to cover this inspection;—what reason have you, other than the sentimental one, to make against the inspection? I think it would be an unnecessary charge to place upon somebody, whether the Government or otherwise; and then, again, I think you would want more than one inspector.

2998. We should want about three, I think, so far as we can ascertain? I doubt very much whether they could give efficient service in connection with trimming, for instance, as to how a ship sails. The master knows this exactly, and better than an inspector.

2999. *Mr. Pittman.*] He could tell the inspector? Yes.

3000. The inspector's duties would be simply to see that the captain's instructions were carried out? I think it would be absolving the captain of an obligation that devolves upon him.

3001. The inspector would merely be held responsible for the work being done according to the captain's wishes? I can only go back to the original point. I think you are unnecessarily relieving the master of the ship from an obligation that devolves upon him.

3002. How can you say unnecessarily if the evidence shows he does not do his duty in that respect? I confess myself surprised at the evidence.

3003. *President.*] I think there is no doubt about it that in many instances masters do not? My experience is that in 90 per cent. of the cases they are always particularly anxious about the trimming of their ships; some even go down the holds.

3004. You say "even"; they cannot inspect without going down the holds? "Even" is perhaps superfluous; they do go down the holds to see to the trimming.

3005. Such very positive opinions have been expressed, both by the insurance companies and by the master and working trimmers, as to the advantages of inspection, that I cannot see myself that any harm could be done by trying it for a year. We understand it would cost about £350 for each man, or, roughly, about £1,000 a year. I think the Navigation Act already gives the necessary powers, but if not, no doubt the Government will be prepared to give what powers are required? There is no doubt this trimming has been a matter of misfortune in connection with the port generally. The rates now paid by owners are very small to what they were.

3006. *Mr. Pittman.*] The inspection would be a check at once on cheap trimming? Yes. I know we pay very much in excess in one case to what others pay.

3007. *President.*] I take it you have no real objection to inspection other than the objection we have and everyone else has, that the Government should not do what might be considered other people's business? That is my objection.

3008. Still, after all, that is a theoretical objection? Yes.

3009. You have no absolute objection you can advance over and above that? Nothing, except the less we interfere by legislation in connection with the British mercantile marine the better. I think the rate we are going on with this kind of thing tends to drive the trade into foreign hands. Practically, British ships are built, manned, provisioned, and sailed by Act of Parliament.

3010. Has the inspection of the loading marks had a hampering effect on shipping, or the reverse? I do not think it has affected it very much.

3011. Would you propose that inspection against overloading should be abolished? No, I do not think I should.

3012. Do you think the inspection of trimming is likely to create more interference than that? It only adds to it.

3013. I think, as far as we can learn, that the inspection against overloading has been satisfactory; that it has not interfered with the rights and liberties of shipowners? I think they have frequently ignored it.

3014. Have you anything you would like to lay before the Commission? No, I have not.

[Witness withdrew.]

Mr. N. Meadon sworn and examined:—

3015. *President.*] What is your name? Nicholas Meadon.

3016. And what is your business? My rank is Fleet Engineer in the Royal Navy.

3017. How long have you held that rank? Over three years. I have a total service of twenty-eight and a half years in the Navy.

3018. We understand you have had considerable experience of heating of coal in bunkers? I have, of course, naturally had experience of the stowage of coal in bunkers in Her Majesty's ships, and I am familiar with the appliances for ventilation.

3019. Have you ever had any case of heating of coal in bunkers under your notice? I have had a case of explosion of coal gas, but not of heating; that is to say, of excessive heating—dangerous heating.

3020. A rise of temperature is frequent? A rise of temperature is not of necessity dangerous.

3021. Do you think wet coal is more likely to heat than dry coal? I do, undoubtedly. I think moisture is a contributory.

3022. Is that based on your experience, or is it merely an impression? To be strictly accurate, I cannot say it is practically based on actual experience; it is an opinion.

3023. It appears likely that the self-heating of coal is very much facilitated if loaded in a hot state or placed near a hot surface, such as a steam-pipe;—has your experience borne that out? I should think that was beyond doubt.

3024. Have you had an actual experience of loading bunker coal in hot weather? I have loaded it in the tropics—at Singapore—in an air temperature of over 90° in the shade, without ill effects.

3025. You have not noticed it to heat more readily after that? No. My experience is with coal which is ventilated. It is stowed in coal-boxes which are ventilated by two systems of tubes, one of which supplies fresh air and the other to remove the gases or impure air.

3026.

Hon.  
A. Brown,  
M.L.C.

11 Nov., 1896.

Mr.  
N. Meadon.

11 Nov., 1896.

- Mr. N. Meadon.  
11 Nov., 1896.
3026. Am I to understand that the tubes are actually led through the mass of coal, or is it simply surface ventilation? In the case of an ordinary coal box, according to the regulations, it is filled up to the lower edge of the beams, and a clear space is left in that way between the surface of the coal and the deck above, and it is intended this shall give a means of admitting the air to the upper portion of the coal boxes. One or more pipes are fitted, and these act as up-takes, and convey the gases or impure air to the funnel casings. The other system is usually connected with the ventilators or to the bulwarks of the ship, where louvres are fitted, and that system brings fresh air into the coal.
3027. On to the coal or into the coal? The orifices are not quite at the top, but some few feet down. There is no distribution attempted.
3028. It is below the surface of the coal? It may be a few feet.
3029. Not more? No; of course it depends upon the height of the box itself; it may be one-third of the distance.
3030. It practically is only surface ventilation? Yes; the down-take ventilation, I believe, is usually taken somewhat lower.
3031. Two or three feet only? A few feet only.
3032. What is the depth of the boxes with a ship such as the "Orlando"? The "Orlando" would be a ship with a protective deck. She would have boxes above that deck and others below, the deck makes a division between the boxes. The depth of the upper boxes may be, perhaps, 6 feet, and the lower ones would, probably, be 15 feet.
3033. So that there is no great depth? No.
3034. How much coal will a box hold? They would vary very considerably. You may have a box holding 100 tons or running down to 30 or 25 tons.
3035. So that one of 100 tons would be rather a large box? It would be a fair sized box. I do not say they would not be even larger.
3036. You do not load the great masses of coal such as are loaded on coal ships? No. We have temperature tubes fitted for the insertion of thermometers, which go down to the bottom of the box, the end being in a deck socket.
3037. What sort of tubes are used? Wrought-iron tubes with an internal diameter of about 3 inches, just big enough to allow the ordinary thermometer to pass down freely without risk of injury. They are about an eighth of an inch thick, galvanized.
3038. Have you had experience of a considerable rise in temperature as tested by thermometers in these tubes? I have, but I have always been able to find a sufficient cause for it in the surroundings of the coal box—the fact of its being close to a boiler.
3039. In using tubes of that size and thickness, there is a danger that although heat may be generated at one particular point of the tube, from the conduction of the tube a larger portion of it may be heated, so that there would be a difficulty in localising the heat; in your experience, do you have any difficulty of that kind? I should not attach very much importance to it because, after all, it would be only a question of so many feet in a vertical direction. What I should consider of importance would be the localisation of heat in a horizontal direction.
3040. How do you do that? By having a certain number of tubes. In the case of a box of 30 tons you would only have one tube in the centre, and the bigger the box the greater the necessity for increasing the number of tubes.
3041. Have you ever tried pouring water into a box of heated coal? No, I never had such a high temperature as that.
3042. Or steam? No; the objection to steam would be it would of necessity raise the temperature of the coal.
3043. The English Commission of twenty years ago expressed an opinion to the effect that steam was apparently, next to water, the most efficient means of putting out fires? In the case of an ordinary cargo, it would displace the air and shut off the supply of oxygen.
3044. Have you had any experience of the heating of coal from Newcastle or heard of dangerous heating either in Her Majesty's ships or otherwise? I have not.

[Witness withdrew.]

Mr. C. T. McGlew sworn and examined:—

- Mr. C. T. McGlew.  
11 Nov., 1896.
3045. *President.* What is your name? Charles T. McGlew.
3046. And what is your business? Coal merchant, and general merchant, and shipping agent.
3047. Have you anything to do with Newcastle collieries? We are agents for the Northumberland Colliery.
3048. Have you any connection with any of the southern collieries? Not at present. We had with the South Clifton; we gave it up last June.
3049. You were in the position of agent for the proprietors? Yes.
3050. Where is the Northumberland Colliery situated? Fassifern.
3051. Do you do any over-sea shipping, or is it merely local trade? It is mostly local and intercolonial. We have done a little Honolulu trade, but only about one shipment in three months.
3052. I take it you can speak for the proprietors—you are here as agent for the proprietors? Yes.
3053. Have you had any difficulty with any of the coal from your collieries catching fire or heating? Not any.
3054. Have you lost any ships through shifting of cargo? No, we never did, because we attend to the trimming.
3055. Always? Yes, in each instance.
3056. In what way? Through our foreman trimmer. We pay a little extra for the trimming, and he sees that it is done properly.
3057. Do you keep the foreman trimmer permanently engaged? No, he is the man who had our contract.
3058. Who is that? I think a man named Stewart.
3059. You pay him something extra to see that the work is well done? Yes.
3060. But does he not contract to do it? Yes; but we always gave him a gratuity to see that it was properly done.
- 3061.

C.T. McGlow.

11 Nov., 1896.

3061. It is not a competitive contract? No.
3062. Do you always get satisfactory trimming in that way? Yes.
3063. Do you insure the coal you ship to Honolulu? Yes.
3064. What rates are you paying for insurance now? I do not know now—I think 5 per cent. If we had an inspector to see to the trimming, the insurance people say they would do it at 50s.
3065. When did they tell you that? They have always told us so.
3066. Insurance agents have informed you that if there was an inspector they would reduce the rates? Yes.
3067. As representing the coal proprietors, do you see any objection to a system of inspection? No; it would not come on the coal at all. It would come on the shipowner. He might object, because he would probably say, "My officers are good enough to see the ship is properly trimmed."
3068. The expense of shipping the coal would be increased? But very little.
3069. The shipowners would probably try to get it out of somebody else? If they got less rates of insurance they could afford it.
3070. Do you pay the insurance? Yes; they might say to us, "You are paying less insurance and can give us the coal at a little less price."
3071. So that ultimately you would pay for the inspection? Ultimately we would.
3072. Do you insure the coal only without the freight? No; we insure the freight as well.
3073. The coal and freight together would come to about £1 a ton? Yes.
3074. If you pay a rate of 5 per cent. on that, your insurance comes to 1s. a ton; and if the rate were brought down to 40s. instead of 50s., you would save about 7d.? Yes.
3075. Supposing it cost 1d. a ton more to load under inspection, you would come out of the transaction with a balance of 6d. a ton? Yes; on those figures.
3076. What is wrong with those figures? The insurance offices may say they will do it now, but when it comes to actually dealing with the matter they may alter their minds. It is very well for them to say they will do such and such a thing if we take such and such an action; but if we are made to do it we may be left in the same position as now.
3077. Will not competition have the effect of making them reduce their rates? Not so much with insurance offices. They bind together, and if they take an insurance they always lay it out; they keep very little themselves. If they take a thousand pounds, they would perhaps write £200 themselves and give £800 away, and owing to that system they are able to keep rates at pretty well what they like.
3078. In the long run, surely they must be subject to competition the same as everyone else;—we have had men before us who say they would snatch at the business, but they are afraid of it just now? So they are. I think myself that if a system of inspection were adopted, and a certificate given to the Customs that the vessel was properly trimmed, and that no vessel should clear without that certificate, vessels would not be lost the way they are at present.
3079. You are aware there is not only the question of trimming but of heating, and we may have to make some recommendations to vary the mode of loading at Newcastle;—supposing we were able to make such a recommendation as to increase the price of loading 1d. a ton—you now pay 1½d.—that would be well within the 6d. saved on insurance? Quite so; I should be very pleased if such a thing could be done in our intercolonial business. When they drop the coal down a distance of 30 or 40 feet, it stands to reason it makes a lot of fine dust.
3080. If your intercolonial cargoes do not fire, why should you be glad to have the breakage reduced? I would rather give another 6d. a ton and not have it broken.
3081. Could you get it? I could get it this way—there would not be so much small in it.
3082. Many people tell us the coal is used for steam purposes and they cannot get more for it? In a great many cases you can. There is a great deal of coal sold for yard purposes.
3083. In the intercolonial trade? Yes; in Melbourne and Adelaide many of the intercolonial shipping companies have yards; and I am perfectly sure if they can turn out their coal free from "smalls" it would be worth more money to them.
3084. We have so many witnesses who say it would not? My experience in Sydney is this: I have found the Mountain coal, which had less small coal than Newcastle, was driving us out of the market. We devised a scheme of erecting screens on the wharf in Sydney. We got them erected and took out a patent for them, and we screen the coal because of the excessive quantity of "smalls" caused by the breakage at Newcastle in falling into the vessel's hold. We sell that small coal at 4s. and we pay 7s. a ton for it.
3085. Can you say what percentage of coal is converted into small coal by this process of loading? That all depends upon the class of coal, but I should say about 10 per cent. would cover it.
3086. *Mr. Pittman.*] Could you give us the exact figures from your books? Yes. Your witnesses are right in this way: where coal is not used for yard purposes—say for steamers—it goes into bunkers. At the same time large coal gives better results in bunkers than small.
3087. If you are supplying a ship, can you get a better price for large than for small coal? Yes, of course.
3088. Do you supply ships with coal? We have done so; we are not doing so at present, except at Newcastle. The steamship companies, such as the Adelaide Steamship Company, Cowlshaw Brothers, and the Union Company ask us for prices for screened, unscreened, and small. If unscreened will do them as well as screened, why do they take the screened?
3089. *President.*] They do take the screened? Yes.
3090. I take it that your evidence is to the effect that you see no objection to a process of inspection from your point of view either as a coal merchant or coal owner? Not at all.
3091. And that you consider any small increase in the cost of loading would, probably, be recouped in the event of coal being less broken up? I am sure of it, especially for foreign shipment.
3092. Especially for foreign shipment? I think so; I am not speaking of steamers and bunkers, but that going away in sailing ships.
3093. As to the intercolonial trade, you know of your own knowledge that you would be able to get more money for coal less broken? Yes. Steamship companies send a great deal of their coal to yards. They can only do it in the other colonies on account of it requiring large tonnage to carry the coal. All the steamship companies in Melbourne, Adelaide, and Western Australia have coal yards and sell to private consumers,

C. T. McGlow. consumers, who will not take small coal. They cannot burn small coal, and therefore that coal has to be screened and it has already been paid for as large coal.

11 Nov., 1896. 3094. Have you anything you wish to bring before us? No; I think the cause of the ships being lost is through the competition between the trimmers causing inferior work, and that could be done away with by a system of Government inspection.

3095. That, of course, would have to be paid for by someone; you do not suppose it should be done by the Government gratuitously? I cannot see why the Government should pay for it; I do not think the Government ought to do so. It is for the benefit of the insurance companies, or, in other words, for the benefit of the ship-owner, because he would pay less premium on the insurance of his vessel.

[Witness withdrew.]

Mr. F. W. Binney, Secretary of the Newcastle Wallsend Coal Company, made the following statement:—

F. W. Binney. 3096. In regard to coal firing my opinion is that coal that is at all subject to firing would always fire; that you would not find that one cargo fired out of 100, and that others escaped. I think that which contributes to the heating, or danger of firing is partly the breakage of the coal in shipping, or through its being shipped in wet weather. I think there has been an impression that the losses have been very much greater in proportion than what they have been. I have had a statement (*Appendix O*) made of the quantities of cargoes shipped from Newcastle beginning in 1887 up to September, 1896. The Wallsend Company have loaded 1,308 ships, with cargoes of 2,555,371 tons. I give the like particulars with regard to other companies. I have had an analysis (*Appendix P*) prepared from the statement of ships to which casualties have occurred, which appeared in the *Insurance Record*, and it appears the total number of mishaps to Wallsend cargoes was 20 vessels, and the number fired out of that number was only three. I have had a statement (*Appendix Q*) prepared of vessels that loaded coal at the same time as the "Knight of Saint Michael." Every cargo of our coal that goes from Newcastle takes coal from every part of the mine. My object in mentioning that is that the statement shows vessels loaded on the same day as the "Knight of St. Michael" was loaded. These vessels had coal taken at identically the same time, and all arrived at their destination safely without any complaint. The coal came from the mine under the same conditions. As to the liability of small coal to firing—28 years ago we used to make "nut" coal—that is, we used to screen the coal over again after it had passed over the screens the first time. The refuse was put into a heap, and that heap fired on the very first wet weather we had after we made the heap. We gave over doing this, because it did not pay at the time. In making our "C" pit railway—the pit is disused now—we made it of refuse coal, 20 years ago, and it has fired so recently as 12 months ago after very wet weather. The small coal hopper at Wallsend has been in use since 1880. The coal has heated at times, but it has never been on fire. Mr. Ross told me he had to empty it, not on account of the heating, but to do some repairs to the uprights which were giving way. The hopper has never been empty but once since it was erected. With regard to insurance, I am not able to give you any information first hand, because the company does not ship, and, therefore, we have no occasion to insure. The buyer pays for the insurance. Even in cases where we draw from the purchaser against bank credits, we are generally notified that the insurances are effected by the bank.

In answer to questions put to Mr. Binney by the Commission in writing, he stated the Wallsend Company would have no objection to the appointment of inspectors to see that the trimming was carried out, but the company had no power, as they sold the coal delivered at the cranes, and after that had no further responsibility. The company did not ship unscreened coal, and he did not know of any case where unscreened coal was shipped, certainly not to foreign parts. He did not think a higher price could be obtained for coal less broken than at present. It reached the consumer quite large enough. The company had never had any request for unscreened coal except for the use of steamers in the intercolonial trade. The coal, he had heard, was much broken in unloading at San Francisco, and when the rough treatment at the port of discharge was considered, any good gained in saving the breakage would be done away with. Some method of distributing the coal when being loaded was desirable, and he thought the only way that could be brought about was by the Railway Commissioners enforcing a regulation for that purpose, but as against that the Commissioners insisted upon a very large quantity of coal being shipped every 24 hours.

[Witness withdrew.]

Mr. J. R. M. Robertson sworn and examined:—

J. R. M. Robertson. 3097. *President.* What is your name? James Robert Miller Robertson.

3098. And what is your business? Mining engineer.

11 Nov., 1896. 3099. Are you interested in any coal properties? Yes.

3100. Do you represent the owners, or are you in the position of inspector or viewer? Both.

3101. For what collieries do you represent the owners? The Waratah, West Wallsend, and Killingworth, in Newcastle; and in the south the Mount Kembla, South Bulli, and Coalcliff, and Bellambi as viewer.

3102. You have some evidence which you think may be of use to the Commission? I have come to give you what evidence I can that may enable you to form some conclusion in the inquiry you are holding.

3103. What evidence is there you wish to bring before us? I think if you let me know what you want, I daresay I could give you some information. I was much irritated at seeing the evidence of Mr. Hyde at Newcastle in connection with one colliery I represent; it was entirely malicious and spiteful, and without foundation or truth.

3104. You refer to the newspaper report? Yes. I preface the statement by saying I do not know whether the report is correct or not.

3105. You wish to contradict some reported statement of Mr. Hyde? It is reported that he had frequently had cause to complain about the pyrites in the West Wallsend coal. In the first place, Mr. Hyde never was at West Wallsend, and had nothing to do with West Wallsend, and knows nothing about it. I question very much if he would know pyrites if he saw it in the street. He never had any cause to make complaint. The paper said he coupled Wallsend, West Wallsend, and Minmi together.

[Question and answer No. 765 read by the Secretary.]

3106.

3106. Is that what you object to? Yes, *in toto*. In fact, no analysis would give you any information as to the amount of pyrites that coal contains. The pyrites is aggregated in the form of nodules.

3107. You mean the analysis would give you the sulphur and iron, but not the pyrites? Certainly; if it were an ultimate analysis. I apprehend that pyrites is not distributed through the coal at all; it is segregated in lenticular nodules. There is very little pyrites in Newcastle coal. The greater portion of the pyrites that I have seen in Newcastle coal does not decompose on exposure to the weather. It contains nothing like the quantity of pyrites, even in the nodular form, that I have been accustomed to in the coals of Britain. I do not consider that Newcastle coal is a coal that is liable to spontaneous combustion.

3108. Is that not rather a question of opinion? I think it is a matter of fact.

3109. We have a record of a number of ships whose cargoes have fired? It does not follow because a ship's cargo fires that it is a coal liable to spontaneous combustion. I say again, and most emphatically, that Newcastle coal is not a coal liable to spontaneous combustion, such as I have known in Britain. I have never yet known of Newcastle coal firing in gobs.

3110. *Mr. Pittman.*] You mean to say on fire, but is it not liable to fire? Any coal will fire if given the opportunities.

3111. If a certain number of ships' cargoes of Newcastle coal have developed spontaneous combustion, how can you say they are not liable to do so? I think it is not peculiarly liable to spontaneous combustion.

3112. Peculiarly? I think it is not coal at all liable to spontaneous combustion. I think the causes of spontaneous combustion, applying to Newcastle coal, are mechanical or remedial causes. I have never yet seen Newcastle coal fire in gobs as I have seen it at home.

3113. Not at the Borehole mine? I have never seen it fire in bords. I have never seen it fire in heaps.

3114. Have you ever heard of it firing in gobs? Never in a mine, except in one case, where it was due to crushing at a fault at the A. A. Company's pit. It was due entirely to mechanical causes. It was at a fault where there had been evidently pressure and the coal crushed in a crevice, and the moment it got access to air it absorbed oxygen and fired, but that was not in a gob.

3115. It is at what is called a gob? It is quite a peculiar circumstance. It is not a gob. It was in a fissure near a fault.

3116. Do not run away with the impression that we do not want to get information, but when a statement is made, we, as ordinarily intelligent men, are not prepared to accept that statement unless it is backed up. I want to get at whether what you say is merely an opinion or not. You said you had not heard of spontaneous combustion in gobs in any case, and then you remember a case where the firing was not due to ordinary spontaneous combustion? I said I never heard of any case of spontaneous combustion in gobs.

3117. With regard to the crushing, for that statement to be of any use, we must know why you say the firing was due to crushing? It was in a crevice near the large fault that crosses the Borehole field, and Mr. Turnbull, the manager, explained that it was in a crevice, and this crevice was filled with dust and small coal, very much like a crevice you occasionally get at the Metropolitan mine from which large quantities of dust are ejected. It was altogether a peculiar case.

3118. We have seen that place, and Mr. Turnbull gave us quite a different account of it? It is a matter that occurred several years before our visit to the colliery.

3119. The same thing is going on at the present moment, and he explained it in a totally different way? I am not the author of the statement. It was not, however, a gob fire.

3120. It is not knowledge of your own? It is not knowledge of my own. Outside of that I do not know of any gob fires in Newcastle. I do not know of any actual field where there are such large quantities of coal stowed away in the gob. In the old country there are very few cases where, if there was the provocation that exists in Newcastle, you would not have gob fires. If it was a coal liable to spontaneous combustion it would fire in the colliery workings. It does not fire in the colliery but it fires in the ship, therefore, I think the causes are probably more due to the treatment the coal gets after it leaves the colliery. Any coal will fire if you give it proper provocation. Southern coal is coal that no one can say is liable to spontaneous combustion, but if you get very large heaps of it, as in the old days when they filled up the gullies with small coal, exposed to the weather, it will fire, beginning near the bottom.\*

3121. *President.*] Have you any theory or opinion as to the firing on board ship? I do not think there need be any theory as to the causes of spontaneous combustion—those are well enough known. I blame the treatment that the coal gets after leaving the colliery.

3122. You mean the loading? The treatment in the waggons. There is unnecessarily rough treatment during the traction; the shunting at the dyke and in the loading; also, of course, in the trimming, probably that may be included in the loading.

3123. Do you consider the breakage in transit is important? I do, I think it is very great—unnecessarily so.

3124. In what way? In the conveyance and facilities of loading at Newcastle. We have a wedge-shaped waggon which I load carefully at the colliery, and no unnecessary breakage takes place. It is delivered into the railway people's hands, and it is subjected to an unnecessary amount of violence and rough treatment. The waggons are very roughly shunted, and every shunt of course shakes the coal, and it subsides down in the waggon like a wedge. The way it is loaded is not altogether creditable, in fact, I think it is most discreditable.

3125. The loading at the crane? Yes; I think it is almost rougher than it used to be, and probably there is a reason.

3126. What is the reason? Some seven to nine years ago the contractor for the cranes had about 2½d. a ton for loading; now it has been gradually reduced until it is only 1½d. Wages are not lower, and the consequence is the man has not time to give proper care to the loading. He would lose money if he loaded in the way I think it ought to be loaded.

3127.

\* ADDED (on revision):—A circumstance that forcibly appeals to me as evidence that Newcastle coal is not of itself liable or prone to ignite spontaneously is that the same coal must possess the same properties and character under similar circumstances. If it ignites at one time spontaneously, it will always do so under similar conditions. As Newcastle coal is not one that ignites in the gob when the conditions favourable for ignition are present, or a coal which in bulk or under normal conditions heats or ignites when stored in bulk, I maintain that it is not coal that is *per se* liable to ignite spontaneously. I know of coal from seams in Britain which under similar conditions never fails to ignite, and the coal referred to does not contain any iron pyrites. When I see a colliery loading say six hundred ships with the same coal, none of which ignite, I maintain that that coal is not of itself liable to spontaneous combustion, and when I hear that the 601st ship from that colliery ignites, I would be disposed to look for the cause of this outside of the coal itself—to some circumstance or combination of circumstances connected with the hauling or disposal of it after it had left the colliery, and when it was beyond the care or control of the colliery-owners, or probably to some cause inherent in the ship!

J. R. M.  
Robertson.

11 Nov., 1896.

3127. How do you think it ought to be loaded? It cannot always be accomplished, but where ships have proper hatches the waggons ought to be lowered down into the hold, that is if distributors are not used. I think in the matter of loading that distributors would be of great service.

3128. Do you know of any good form of distributor? I have heard of two, but I would not like you to go away with the opinion that I pinned my faith to either; but any distributor must take that form (*pointing to photograph of Harper's patent*) or that of a travelling band. Any form that would distribute the coal evenly over the hold would be of importance. I wish to advocate no one patent. I have heard of two forms of cone distributors that I certainly think would be of great advantage.

3129. Have you seen them at work? No, I have not; I have seen an account of them, but I have not seen them at work.

3130. We do not see how the distributor is going to save the coal from being broken under the hatch? It would prevent a great deal of the destruction of the coal; it would prevent the enormous drop that I have seen from the waggons. I am quite sure it must have dropped 40 feet.

3131. What is wanted is to build up the heap of coal under the main hatch carefully? You have to lower down the waggons to do that.

3132. In some cases the hatch is too small for that, and you must have some other method? In that case you must have a distributor.

3133. But that leaves the space under the hatch unfilled? You can reverse the distributor. Very few of the large ships have small hatches.

3134. We have seen a number where the big waggons could not go down? There are a large number of box waggons. I have 200 of them.

3135. In what colliery is that? The Waratah has about 200 box waggons, and at the other collieries I have another 100, and I am rather partial to them.

3136. Why do you prefer them? They are easier in loading. A smaller quantity falls at a time. I think the coal is discharged in a better condition. The coal will stand rougher usage in the box waggons, because the hopper waggons are wedge-shaped, and when they get a smashing the coal subsides.

3137. Why do the other collieries go in for the hopper waggons;—many witnesses have told us they are discarding their box waggons? In replacing the waggons we get them from home, and they do not know anything about box waggons at home. In taking over the Waratah Colliery we took over the waggons; we did not build the waggons; but I rather like them.

3138. I do not quite gather why you consider other collieries are getting rid of them? Because nearly all the waggons are imported from home.

3139. I suppose they could make one as well as the other? The box waggons are all of wood. They would never think of importing box waggons.

3140. Is there no reason of expense or durability? I have both kinds, and the hopper waggons are certainly not cheaper, and I am quite sure they are not more durable. I prefer the box waggons. All the new collieries have got their waggons imported from home.

3141. The hopper waggons? Yes.

3142. Supposing an extreme case—that the Commission recommended that the hatch should be run up from these box waggons,—would that inflict very great hardship on the collieries? It would, because a number of collieries have not got box waggons. The A. A. Company, Wallsend, and others, never had any box waggons.

3143. Do you suggest that distributors should be used as an alternative? I think that would be a preventive. We cannot shut our eyes to the fact of the very large class of ships now, having enormous coal space. That is an important factor favouring spontaneous combustion. Another thing I have thought of that might assist, and that is to cease loading coal and to cover up the hatches during heavy rain.

3144. Have you any definite fact that you could give us that wet coal is more liable to fire than the same coal dry, but otherwise under the same conditions? The "Hollinwood" that we loaded, was loaded during very heavy rain, and I remonstrated with our men in Newcastle for doing so, and strange to say, the very hatch that loaded during the heavy rain heated.

3145. *Mr. Pittman.*] We have evidence of three or four such cases of ships loaded in wet weather? I can see a chemical reason for it.

3146. *President.*] What is that? The water would supply the oxygen for the carbon that would be evolved from the coal in fine division.

3147. Do you mean to say the water would be decomposed by the carbon? I do.

3148. That is your scientific reason, that water would be actually decomposed by the carbon? I think it is feasible that water might suffer decomposition under certain conditions of heat and pressure and, at all events, it might be the medium of conveying oxygen to the coal and so begin the process of heating.

3149. That carbon would decompose water? Forming water and carbonic acid by heat and pressure.

3150. It is a question of carbon decomposing water not of forming water. I understand you to mean that the presence of water would provide oxygen for combination with the carbon? I have no doubt it would under circumstances of heat and pressure. I have no doubt that a decomposition could take place by supplying oxygen to coal.

3151. That is to say, the carbon would decompose the water? Yes. There would be a process of decomposition and a process of synthesis taking place, and other compounds are formed. I am absolutely certain that with two heaps of coal of the same size and from the same mine—the one wet and the other dry,—the one wet would show a tendency towards heating that the other would not. Water seems to be a potent factor.

3152. That is merely an impression, not borne out by actual observation? Not further than the fact of these several ships in this state heating.

3153. *Mr. Pittman.*] You know from your own experience on commissions, that we must discriminate between evidence based on fact and that on opinion? I can only tell you the fact of the "Hollinwood." The No. 2 hatch loaded during very heavy rain, and she went in a fortnight or three weeks afterwards to Dunedin, and that hatch was reported to have heated. I do not know really whether the coal heated or not. It was simply reported, and I presume we must take that as evidence.

3154. *President.*] I understand you to say that you have an impression, based on chemical knowledge and observation as far as possible, that wet favours heating? Yes. I think a very essential thing is the trimming. For several years past there have been complaints of improper trimming. In other cases the ships have not been sufficiently provided with shifting-boards or side-hatches, where the coal could be perfectly trimmed.

3155. It has been suggested by many witnesses that trimming would be more satisfactorily carried out under some form of inspection;—are you in favour of that? Yes; I think that very likely the trimming would be better done if it were subject to neutral inspection.

3156. That means Government inspection? I think the Government would be the proper parties.

3157. Who would have to pay for it? Certainly not the coal owners. They have nothing to do with the coal after it arrives at the dyke. I should say the shipowners ought to do that. It is their duty to trim, and they pay for the trimming. I have no doubt the owners at home would willingly pay a trifle towards inspection when they knew the trimming would be done properly.

J. E. M.  
Robertson.  
11 Nov., 1896.

3158. Do you insure the coal that you sell? Always, if we ship it ourselves.

3159. And you now have to pay very high rates? When I say that, it is only in some circumstances. The great bulk of our coal is sold, and the parties who buy send the ship, and we have nothing to do with the insurance. Probably nineteen out of twenty cargoes would be done in that way. Frequently we get a cable telling us if we can charter a ship and deliver C.I.F. at a certain foreign port, to do so. In that case, if a ship were available within the limits, we would charter, and then we would insure.

3160. So that under some circumstances you have to insure? Occasionally.

3161. If the insurance rates were reduced, you would in that case reap some benefit? Very little.

3162. Somebody would? I do not know. Those that insure certainly would, but it makes very little difference to us, because if the insurance rates are 60s., 40s., 35s., or 30s., we would add it on to the price.

3163. You make the customer pay? Yes. With the great bulk of the trade we know nothing of the insurance. The buyers charter the ship, and we simply charge for the coal, f.o.b., at Newcastle.

3164. In the case of any further expense in the loading, would you put that on to the customer too—supposing it cost another 1d. a ton, say, to be done properly? That should be paid by the Commissioners. They have already reduced it to 1½d., and they gave the coal-owners no credit whatever for it. They charge the same now for hauling and loading that they used to do at the time when it was 2½d. or 2¼d.

3165. They have not reduced their charges? Not one single fraction. It is 10d. a ton within the limits. They have made a few alterations for collieries that have been established subsequently that are notoriously within the limits; but for this limit of 7 miles the same price is charged.

3166. Can you give us any idea as to whether the Railway Commissioners are making a big profit or not from the coal business? I know perfectly well what the coal costs to draw, and, unfortunately, I am one of those that have suffered most by it. I do two-thirds of all the traction in one case, and I did not get one single iota from the Commissioners. They managed to get the owners of the Waratah Colliery, some years ago, to purchase locomotives, and take down their coal to the main line, and formed large sidings there. We continue this, and just pay the same as others in the same radius. We get nothing for the 1½ miles.

3167. Why is that? Simply because they are autocrats.

3168. *Mr. Pittman.*] You are of opinion they are making large profits? I am. I should be glad to take the contract for the traction of Newcastle coal and make large concessions. I know perfectly well what it costs to draw coal and to pay for the expenses of shipping and shunting.

3169. *President.*] There is the first cost of the cranes at the Dyke to be taken into consideration? The Commissioners did not pay for that, the country paid for it. The Harbours and Rivers Department put them up and handed them over to the Commissioners free.

3170. *Mr. Pittman.*] You are of opinion that the charges made by the Commissioners for shipping coal gives them a considerable profit, taking into consideration the expenses they are at and the interest on the capital expended at the Dyke and other places? If you tell me that the Commissioners pay interest on the capital expended you have been misled.

3171. You are of opinion they are making large profits? I am. I know the traction is far too much. I know places where the same work would be done for just about one-half. I am drawing several hundreds of thousands of tons a year in the south, and ship that under 3d. a ton, including all the shunting and shipping. I do not object to the Commissioners making a profit. They are working the railways on commercial lines, but they are charging the same now as they charged for the same radius over twenty-five or thirty years ago, and large reductions have been effected in their outlay during the last five or six years.

3172. *President.*] During that time have the Commissioners put down any extra plant or has any expense been incurred on additional plant? I do not think the Commissioners have put down any extra plant.

3173. Has anybody during the last five or six years? I do not think so. I think you will find from inquiries that all the cranes were put down some four or more years ago. I understand the railway account is not debited with interest on the expense in Newcastle Harbour. I do not object to the Commissioners making money over the coal, but I think the coal-owners who pay rates that ought to give a large profit should have had some concessions made to them when the Commissioners were effecting their savings. If we had reductions equivalent to the savings, then I would at once have said we could afford to pay 1d. a ton extra to ensure thorough stowing and loading.

3174. I do not say that it would be 1d. I suppose you agree that there is undue carelessness in loading and trimming? Certainly.

3175. And that both these can be removed at a certain expense? Yes.

3176. You say the Commissioners should bear the expense of loading. Ought the Government to bear the expense of superintending the trimming? I do not know that I should go so far as to say that. I do not know that I could say the Commissioners should pay the extra expense of trimming. I think the ship-owners should pay for the extra expense of getting their ships well trimmed; but the ship-owners might become perfectly careless and might throw over the whole onus and responsibility in thus having the power taken out of their hands.

3177. I do not think any recommendation made would lead to such a result? I only made the observation on the premises. There is a little matter with regard to the "Ellen A. Read" I should like to mention. She is one of the ships registered as having taken fire. Undoubtedly there was a fire, but I do not think it was at all caused by spontaneous combustion.

3178. What reason have you for that? The coal first of all fired contiguous to a hatch under a ventilator. The crew was in a mutinous state up to the date of sailing. The coal had not heated a few feet or inches below that fire. I inspected it, and I do not think that one of the surveyors will say it was caused by spontaneous combustion. She was a fire, I believe, before she left Newcastle. It was just on the surface. Spontaneous combustion would never occur at the top of the coal; it would be hot below. I inferred it was a case of accidental firing. I do not say how, because it was never investigated. I think, outside the coal altogether, the trouble is pretty much in the traction, shunting, loading, and trimming, probably a little due to the construction of some of the ships. Some are rather weak, and work in a sea-way. In these, I think, the cause of spontaneous combustion may be found. It is in the treatment of the coals after they leave the colliery and out of colliery control.

3179.

- J. R. M. Robertson.  
11 Nov., 1896.
3179. *Mr. Pittman.*] Do you know anything of Harper's distributor? Nothing more than from a photograph. I think it could be improved.
3180. You have not seen it at work? No.
3181. We were led to expect you would recommend it to us? Mr. Harper wrote to me and sent a photograph of it. He asked me if I could get any ships to use it; but, as a matter of fact, I have no power to do so. I spoke to two of the captains, but they seemed to be indifferent about it. I should have been very glad to give it a trial, and should be glad to give any likely distributor a trial.
3182. There was no reason for assuming you would recommend it to us? I could not do so. I do not think it would be altogether proper for me to be specially pledged in favour of any distributor. I can see at once it could be improved.
3183. *President.*] You never expressed yourself as being inclined to recommend it? Never at all.
3184. Did you undertake to recommend it to the Commission? I never heard of it until this moment.
3185. We have been very much misinformed? I never heard of it until this moment. I never saw it, and would not recommend anything I had not seen.
3186. It is absolutely untrue that you undertook to recommend this to the Commission in any way? Perfectly untrue. I am glad you mention it, because I could not advocate any particular form of distributor. I would take the best. I am rather inclined to the travelling band for ease and facility. They are very easily moved about; made either of gutta-percha, india-rubber, or other material, and the coal would be carried away at a rapid rate, and there would be no fall. [*Witness mentioned that he had taken the temperature in the hold of a vessel loading at the same time as the "Republic," in February last, and found it to be 120°.*]

[Witness withdrew.]

WEDNESDAY, 18 NOVEMBER, 1896.

[*The Commission met at 2:30 p.m. at the Chief Secretary's Office, Sydney.*]

Present:—

PROFESSOR RICHARD THRELFALL, M.A., PRESIDENT.

And EDWARD FISHER PITTMAN, Esq., A.R.S.M.

Mr. S. E. Laidley sworn and examined:—

- S. E. Laidley.  
18 Nov., 1896.
3187. *President.*] What is your name? Shephard Edgcliff Laidley.
3188. And what is your business? General Manager of the Co-operative Colliery.
3189. Have you had any of your coal heat in transit? Yes, at the beginning of the year—for the first time in thirty years.
3190. In what ship was that? The "Republic." She was loaded between the 13th and 17th January, and the 18th was the hottest day known in New South Wales so far as recorded at the Observatory. Our shipping manager wrote down and said that the trimmers on the side facing the sun could not work, the vessel was almost red hot.
3191. Was the temperature of the hold taken? No.
3192. That was the only case of heating? Yes. There is another vessel, the "Cumbrae," which is missing. We know nothing about her. She loaded in February, 1895, and took in here, before going to Newcastle, some 505 tons of shale and 150 tons of tallow.
3193. Can you tell us whether there has been any change in the manner of working in your colliery during the last few years? There has not been, except that the bords are a little different in width.
3194. Will you explain it to us? I am not competent to tell you.
3195. Have the pillars been diminished? They have been strengthened.
3196. *Mr. Pittman.*] The bords have been widened and the pillars strengthened? I could not say, but everything has been done to prevent creeps and dangers of that kind.
3197. *President.*] Have you got into a different kind of coal? No, we have not. We have been working the same coal for thirty years. I have brought here two analyses, made in 1879 and 1891, and they vary but very little.
3198. How were those samples taken? Some of our customers wanted to know what the coal was like.
3199. They were samples taken by the company? Yes. We have a 3-inch splint in our band, and it was taken out of that in the latter case, but in the former one we do not know.
3200. You do not know whether they are particular samples or represent a general average? I could not tell you. Mr. Pittman made a report about our coal, and he spoke very highly of its purity for coke making.
3201. Do you, as a rule, insure the coal? No, the bulk of our coal is sold direct, we have nothing to do with the insurance.
3202. The purchasers insure? Yes.
3203. They give you rather less for the coal than they would if they had not to pay insurance? Not at all.
3204. Supposing they pay now 5 per cent. insurance;—that increases the cost of coal to that extent? Yes.
3205. Supposing they had not to pay 5 per cent., they would be able to afford to give you a little more for the coal? Probably they would. Before this trouble of the heating of coal cargoes, we always had the same price proportionately with the hewing rate.
3206. Supposing the insurance rate were reduced 2½ per cent., there would be a profit of 2½ per cent. saved on the insurance? We would not get a pennyworth more for our coal.
3207. It would be in favour of the trade generally? Yes.
3208. If you did not get it in one way you would in another? It would have the effect of increasing the consumption on better terms.
3209. It is not unlikely we may make some recommendations which, presumably, will have the effect of reducing the rates of insurance, and we wanted to know whether you would participate, either directly or indirectly, in that reduction? No; we would not.
3210. But the trade will participate? I think so.
3211. The coal is very much broken up now in loading? Yes.
3212. Supposing the coal were less broken, would you get a better price for it? Probably we would; we would not have so many complaints.
3213. I am speaking now of the deep-sea trade? Yes; foreign coal. We have had a great many complaints about the smallness of the coal in the cargoes.
3214. Where do those complaints come from? San Francisco. 3215,

3215. It has been reported that they unload badly at San Francisco? Yes; it gets as much rough handling as it does here in the loading. S. E. Laidley.
3216. That is a matter which concerns the purchaser? Yes. 18 Nov., 1896.
3217. The important point is whether you would be likely to get a better price for your coal if rather less broken? I think we would, because the small coal is absolutely useless to the retail coal merchant. Where they get over 20 per cent. of small coal, they complain about it; they expect 20 per cent.
3218. That is an enormous percentage, considering the coal is screened? Yes; even going from Newcastle to Sydney, the percentage is very high.
3219. It is not unlikely we may find it desirable to recommend some system of inspection of the trimming;—is there any objection to that, from your point of view? No; so long as we are not held liable for the payment of the inspector. I think the ship-owner is the man who ought to pay that. The shipping managers are always making complaints about the way the ships are being scamped.
3220. There is no actual objection to inspection, from your point of view as a coal owner? Not at all. We would advocate some independent inspection.
3221. Have you any objection to it being Government inspection? None whatever.
3222. What sort of inspection would you propose yourself? I would propose Government inspection. I think it is a far more satisfactory way to let the Government take these matters up. I think it would be done very much better if they had a hand in it. This coal of ours, I may say, adjoins the Wallsend, and they have had more cargoes fire than any other. We have the identical seam; there is only a fence between us. The only difference is that we work the rise of the coal, and theirs is the dip.
3223. Is your coal similar in analysis to the Wallsend? Yes, exactly. You could not have a coal more similar. We are the only two that compare. The other coals are not like ours at all. We have a small lease of the Wallsend. That is why I cannot understand why they should have such a preponderance of fires in their cargoes compared to ours.
3224. Perhaps the larger output may account for that? We have put out 5,000,000 tons in the last thirty years, and that is the only case that ever happened to us.
3225. Is there any different way of getting the coal? None whatever. The Miners' Association would never allow it—that is, any radical difference.
3226. Is there anything you would like to lay before us? I think the waggons should be lowered. There is breakage when the coal goes into the vessel 25 feet deep. It would break blue metal. I think there is a great necessity for shifting-boards if a vessel is over a certain capacity.
3227. I think that is the universal opinion? I think a great many of the cases put down to spontaneous combustion have been due to shifting of cargoes. I believe in the coal distributor to get rid of the accumulation of small under the hatch.
3228. Have you any objection to loading with the distributor? None whatever.
3229. Have you ever seen one? I have never seen one, but I quite understand it would distribute the coal all through the ship evenly. If there is any leak it is always through the hatchways, and the wet will get on the small coal.
3230. Have you had any experience of the effect of wet on the heating of coal? No; we have never had a fire in our mine in the gob coal or any coal during its existence. There has not been the slightest sign of firing.

[Witness withdrew.]

Mr. B. Chadwick sworn and examined:—

3231. *President.*] What is your name? Benjamin Chadwick. B. Chadwick.
3232. What is your business? I am secretary to the Pacific Co-operative Coal Company. 18 Nov., 1896.
3233. What are your duties in connection with that position? I have the general management of the company.
3234. Do you manage in Sydney? Yes.
3235. Not at the mine? No.
3236. Has any of your coal given trouble by heating? Only in two cargoes, and they are the two largest cargoes we ever shipped.
3237. Will you kindly tell us about them? The "Royal Forth" sailed about the 13th June, 1895, for San Francisco. It was one of the largest cargoes that ever left Newcastle. She had 4,558 tons of coal, and we were informed the cargo was heated on her arrival in San Francisco.
3238. Was there much damage? We do not know. We sold it f.o.b. at Newcastle, and had no further interest in it.
3239. You did not hear any detail? No.
3240. Do you remember what sort of weather it was when she loaded? I made inquiries—it was fine.
3241. Was the cargo ordinary-sized coal or small coal? It was the ordinary best coal.
3242. Had it been obtained in any way differently from your general practice? Not the slightest—in fact, the coal is sometimes on the dyke, and we do not know in what vessel it is going into.
3243. Is there anything more to say about that ship? No; the next case was the "John Ena." She left about the 14th September, 1895, for San Francisco, and she had 4,257 tons. That vessel, I was told, had to jettison 60 tons of the cargo.
3244. Was that coal loaded in fine weather? I could not say. It would not be very warm. I do not know whether it was dry or not.
3245. Do you know of any special reason why that coal should have heated? No; except the size of the vessel. We have loaded that ship since, and she was all right. We loaded it a few months ago.
3246. Is there any other information about that ship? Not that I know of.
3247. Have you had any of your coal give rise to gases which have exploded under any circumstances? It is not a gas coal at all; it is a steam coal.
3248. But it might have given rise to explosive gases all the same? We have never had any trouble in the mine at all.
3249. Do you load your coal into box waggons or into hoppers? Into hopper waggons.
3250. Have you any box waggons at your colliery? Not one; they are all hoppers.
3251. What is the reason for your preference for hopper waggons? I think they go under the screens better. 3252.

- B. Chadwick. 3252. How many waggons do you own? 164.  
 3253. What is the value of them? These waggons are ten years old—most of them.  
 18 Nov., 1896. 3254. Would it be a very serious drawback to you to go back partially to the box-waggons? It would be a very expensive matter, no doubt.  
 3255. If the waggons are ten years old you will have to replace them before long? We repair them when they get old; we put in new sides and bearings.  
 3256. But there will come a time when you will require new waggons? In fact, they become new waggons without your noticing it, especially the wooden ones; they are easily repaired.  
 3257. All your hoppers are not of iron? I think there are only about sixty of iron; the others have wooden sides.  
 3258. Are they made in the Colony or imported? The iron ones are made in Manchester, and some here.  
 3259. And the wooden ones? They are made here.  
 3260. Is there very much difference in the price of the two kinds of waggons? Not a great amount; the wheels and axles are all imported.  
 3261. The boxes can go down the hatches of a ship better than the hoppers? No doubt, and there would not be such a big fall of the coal.  
 3262. The advantage of using the hoppers, as compared with the boxes, is not so great as to make it imperative to use hoppers? No.  
 3263. It would only make a small difference in the expense? If you were building waggons now, the difference between the cost of the boxes and the hoppers, I do not think, would be very great.  
 3264. The carrying capacity is not quite so much in the case of the box-waggons? I do not think so.  
 3265. *Mr. Pittman.*] What are about the dimensions of them? They hold 7 tons 15 cwt. to 8 tons.  
 3266. You cannot tell me the dimensions in feet? No.  
 3267. *President.*] It has been suggested, in regard to the trimming, that some sort of Government inspection might be adopted at Newcastle;—would that effect you, as an owner, in any way? It would increase the cost of the coal, and competition is so keen that 1d. means the loss of an order, especially in the East.  
 3268. One penny a ton does? We have two vessels on the way on our own account. The biggest limit was 8s. a ton. If we had offered 8s. 3d. it would have been refused. Every penny is of great moment.  
 3269. Do you see to the insurance? When on our own account we do.  
 3270. You are paying now about 5 per cent.? The last shipments we made we had insured by the consignees in Hongkong, but we have never paid 5 per cent.  
 3271. Have you paid 4 per cent.? I daresay we may have paid 4 per cent.  
 3272. I suppose the average price of a ton of coal when it arrives at its destination may be estimated at £1? No.  
 3273. How much is it worth when it gets to Hongkong? It costs us 5s. 9d. f.o.b., and the freight is 8s.; that is 13s. 9d., and 6d. will cover exchange and everything else.  
 3274. That is 14s. 3d.? Yes.  
 3275. The value of a ton of coal at Hongkong? Yes.  
 3276. It must be cheaper to send to Hongkong than to San Francisco? Yes; because Hongkong is a free port, and there is a duty of 40 cents. at San Francisco. You cannot get an 8s. ship to San Francisco; it is about 10s. freight.  
 3277. You pay, in a case where you effect the insurance, about 4 per cent.? About that; we only insure the coal.  
 3278. Somebody insures the freight? That is a matter for the shipowner.  
 3279. It is added to the price of the coal, and it is a matter of indifference to us whether you pay for it or the buyers;—so that there would be about 7d. a ton for insurance? Yes.  
 3280. Supposing the insurance was dropped to 40s. per cent., that would mean a saving in insurance of half 7d.? Yes.  
 3281. About 3½d., say? Yes.  
 3282. Supposing the cost of the loading was increased 1d. a ton, there would be a profit on the total transaction of about 2½d.? Yes; there would be a profit there.  
 3283. As the trade is in such a condition that every penny makes a difference, that saving would be a great advantage to you? If you could guarantee that the insurance rates would go down. There would be a certain extra cost, but a doubt about the insurance.  
 3284. Several insurance representatives say they are anxious for the business if it proves good? There are many who will not take a coal ship at all.  
 3285. Many of them have undertaken to reduce the insurance from about 5 per cent. to about 50s., in the event of our recommendations being adopted;—in that case, who would be hurt, supposing it cost an extra penny? We would gain; nobody would be hurt.  
 3286. Supposing it were done, have you any other objection to inspection? No; but none of us like too many Government men about the place; they always interfere one way or another.  
 3287. Those are exactly our sentiments; at the same time we have had a great deal of evidence to show the importance of having some kind of inspection, and we want to hear what the colliery-owners have to say about it? There is no particular objection because these men are very troublesome at times.  
 3288. Have you anything you wish to lay before us? Simply this, that it was an extraordinary thing that the two largest ships we ever loaded were the only ones that heated. We have loaded ships of all sizes, and they never were on fire, with those two exceptions.

[Witness withdrew.]

Mr. J. S. Hutchinson sworn and examined:—

- J. S. Hutchinson. 3289. *President.*] What is your name? James Steel Hutchinson.  
 3290. What is your business? I am Secretary to the Hetton Coal Company.  
 18 Nov., 1896. 3291. Your work in connection with that company is in Sydney? Yes.  
 3292. Not at the mine? No.  
 3293. Who is your mine manager? Alexander Mathieson. Our shipping manager is Thomas Brown.  
 3294. Do you do a large over-sea trade? Just lately we have done a fair quantity—this last twelve months about 20,000 tons. 3295.

3295. Have you had any trouble with your coal heating in any way? Not that I am aware of—not that we have been made acquainted with. J. S. Hutchinson.
3296. Have any ships loaded with your coal been lost from any cause? One returned to Sydney after being three days out—the “Tamerlane;” and the “Patrician” was a total wreck going over to New Zealand. 18 Nov., 1896.
3297. What happened to the “Tamerlane”? It was owing to rough weather.
3298. Did the cargo shift? I believe it did.
3299. Do you know whether she had shifting-boards? I do not know if she had; I would not be certain on that point.
3300. And the “Patrician”? She had no shifting-boards, as far as I know.
3301. Have you had any heating of the coal at your mine, or any gob fires? Not that I know of.
3302. Is your practice of getting coal the same as it has been in past years, or has there been any change? It is just the same.
3303. We should like to hear whether there is any objection from your point of view to a system of inspection of the trimming of coal? As far as we are concerned we have no objection. All we do is to put the coal on board, and the ship pays for the trimming.
3304. So that from your point of view, there is no objection to trimming? No.
3305. Where is your trade chiefly to? Intercolonial ports; and we have sent a good quantity to Valparaiso and San Francisco.
3306. What do you reckon to be the value of a ton of coal after it gets to San Francisco, including freight and insurance? Freights vary sometimes, it might be, 15s. a ton, and sometimes 11s. We ship it at Newcastle at a price. We get the orders, and the ships are chartered in England.
3307. What is the average price of coal in Newcastle for over-sea purposes? 7s.
3308. So that about £1 a ton would be a fair average value for it at San Francisco? Yes; I believe that would be about the value of it.
3309. Do you ever pay insurance yourself? On intercolonial cargoes.
3310. What rates do you pay to intercolonial ports? I cannot say from memory, but I fancy about 20s. per cent. to New Zealand. It depends upon the port in New Zealand it goes to.
3311. You never insure to San Francisco yourselves? No; the charterers effect their own insurances, so far as our colliery is concerned.
3312. Have you your own loading appliances, or do you load from the cranes? We load from the cranes.
3313. You are aware the coal gets very much broken up by this mode of shipment adopted at Newcastle? Yes.
3314. We would like to hear from you whether, in the event of the coal not being so much broken, you would get a better price for it? I do not know. You see, we sell it as screened coal, and we charge the one price for it—7s.
3315. You send a certain amount of coal to Melbourne? Yes.
3316. Do you sell it to coal merchants there? We sell it principally to Cowlshaw Brothers here, and they arrange to take it over.
3317. I suppose they have a yard there? No; they supply Howard Smith and Company, Huddart Parker and Company, and the Adelaide Company.
3318. They do not sell coal to private consumers at all? I do not think so.
3319. We have evidence to the effect that a number of the large purchasers of coal sell a certain proportion for domestic purposes, which coal has to be screened;—the original purchaser pays some 7s. a ton for it all round, and perhaps only realises 3s. or 4s. on a portion of it; so that the coal would be more valuable if it were less broken up, and the influence of competition would be to enable them to pay you better prices, would it not? I do not know whether we would get a better price. I admit that they would reap a benefit if it were not broken up.
3320. How the benefit would be distributed is merely a matter of time? There would be a benefit, I admit that.
3321. What kind of waggon have you? Steel hopper waggons.
3322. Have you any box-waggons? No.
3323. Have you any objection to the use of box-waggons? We have no objection, but we think the steel ones would last longer.
3324. They cost somewhat more? Yes.
3325. You think it is rather more economical on the whole to use steel-waggons than box waggons? I am not competent to say that, but from my knowledge I would think it was.
3326. As the secretary, you would know the business reasons why the steel waggons were purchased? It is principally left to the colliery manager. What he advises, the Board of Directors consider, and they generally act upon what he says, if they, in their own minds, think he is right.
3327. Have you ever had box-waggons? No.
3328. So that you have no idea as to what is the expense of shipping by box-waggons as compared with the hopper? No.
3329. Have you anything you would like to lay before us? No, unless it is with regard to the appointment of an inspector to see that the coal is properly trimmed. I do not think that would do any harm to the port.
3330. You are in favour of it? Yes.
3331. Is that a personal feeling, or do you speak for the owners? It is my own feeling.
3332. Do you know any reason why it would injure the owners? I do not think it would. I think it would benefit them.
3333. Would you be prepared to pay a share of the expense? That is another matter altogether.
3334. *Mr. Pittman.* You do not think one inspector would be enough for the port of Newcastle? You see a number of vessels are loading there at the same time. I think if the waggons were lowered down almost to the floor of the ship there would be much less coal broken, and much less dust than there is when the coal is dropped down 30 feet.
3335. It would cost something more to do that? I do not think it would. The cranes are there, and are hauled up to the level of the deck; but I do not know whether they could lower them down to the bottom of the hold.

[Witness withdrew.]

Mr.

Mr. W. A. Firth sworn and examined:—

- W. A. Firth. 3336. *President.*] What is your name? William Arthur Firth.  
 18 Nov., 1896. 3337. What is your business? I am the Manager of the Southern Coal-owners' Agency—that is, the Associated Collieries of the Southern District.  
 3338. What is the nature of your duties? I am the commercial salesman for the whole of the collieries.  
 3339. Have you had any trouble through any of the coal heating from any of your collieries;—has the cargo of any ship been reported to you as having heated? No.  
 3340. Most of your business is done with intercolonial ports? Most of the trade in the south is for steamers' bunkers. We, however, export to China, Shanghai, Singapore, and America, but nothing like what we used to do. When I was Secretary to the Mount Kembla Company (in the old days) we used to have an export trade of 60,000 to 70,000 tons a year in sailing ships alone. We never had any experience of coal-heating at all.  
 3341. What has caused the trade to fall off? Strikes; that is my opinion about it.  
 3342. Your loading facilities are not good for sailing ships? We never load sailing ships down south. We have to bring the coal to Sydney by colliers and load them here.  
 3343. That is an expensive business? It is the thing that is killing us at the low prices. We have to maintain these steam colliers.  
 3344. Have you had any trouble down south through the ships being improperly trimmed at the jetties? We have never had any trouble at all in regard to the trimming.  
 3345. Do you load many large ships as compared with Newcastle? In loading from the jetties direct lately we have sent away about 20,000 tons to Bombay in big steamers.  
 3346. How many tons do these steamers take? The "Sonueberg" took over 4,000 tons, the "Echuca" 2,800, the "Gulf of Anecd" over 3,000. The "Port Phillip" has been there twice for 2,600 each time, and the "Port Adelaide" over 3,000.  
 3347. There has never been any accident from insufficient trimming? Never in the slightest.  
 3348. There has been no case of a vessel shifting her cargo? Not reported to us.  
 3349. Are there master trimmers who contract for the work? I fancy it is done on the co-operative principle, but I could not say for certain. One man arranges it, but I think they all go shares in the business.  
 3350. There are no boss trimmers? I do not think so. One man tenders for the work, but, as far as I know, they are all on equal shares. I have never gone into the matter.  
 3351. What price do they get for trimming, as a rule? I have had to pay as much as 4½d. a ton.  
 3352. For steamers? Yes.  
 3353. Is more paid for steamers than for sailing ships? I should say less, but that is the price we have paid down there. For the last cargo we sent away we paid that price. It goes from 3½d. to 4½d.  
 3354. Are you aware that at Newcastle they trim for 2l. sometimes? Port Kembla is an out-of-the-way place. The men have to come from Wollongong and the surrounding district, and have to come round the beach about 4 miles. I suppose we could get it done cheaper if we were in close connection with the town.  
 3355. The coal must be very much broken up by dropping the great height from the spouts into the hold of the ship? We load by means of shoots, and the big coal flies away in the wings of the collier as it is shipped, leaving the smaller coal in the centre of the hatch. I do not think we could get a much better way of loading than we have at the present time.  
 3356. Could you get a better price for the coal if less broken? The coal trade is very funny at the present time, it appearing to me to be a matter of price not quality.  
 3357. You send some coal to Melbourne, for instance? A lot of Mount Kembla coal goes to Melbourne.  
 3358. Is it used exclusively for ships, or for domestic purposes, or is it too dirty for domestic purposes? There is a great mistake in thinking southern coal not suitable for house purposes. I use it in my own house, and people that I have given it to, when the domestic servants get used to the coal, prefer it to Newcastle coal. It is a cleaner coal than Newcastle coal for household purposes, if they know how to work it.  
 3359. It is not much used for domestic purposes? It is not; 90 per cent., I suppose, of the whole of the coal is used for steam purposes.  
 3360. Some is used for domestic purposes? Perhaps about 10 per cent. We send a lot of coal to the retail yards on the railway, and it must be used for household purposes.  
 3361. But only to about the extent of 10 per cent.? I do not think it is more—if it is that.  
 3362. I suppose the domestic consumer will have his coal fairly whole? Yes.  
 3363. So that the coal-merchants have to screen it before they sell it? I suppose they have to. A lot of customers simply take a truck at a time as it comes away from the mine. Pretty well all the coal that goes to Melbourne is used for the railway or for bunkering steamers.

[Witness withdrew.]

Mr. T. Kerr sworn and examined:—

- T. Kerr. 3364. *President.*] What is your name? Thomas Kerr.  
 18 Nov., 1896. 3365. And what is your business? Secretary to the Metropolitan Coal Company at the present time.  
 3366. You ship your coal to Sydney chiefly, do you not? We do.  
 3367. And what is it used for when it gets to Sydney? I have nothing to do with the selling part of the business; that has been transferred to the southern agency; my work is simply the secretarial work.  
 3368. You do not know who buys it? No; the Southern Agency pay us a certain price for our coal, and they attend to the selling themselves. All I have to do is to see to the matter of the charge between the mine and the agency.  
 3369. *Mr. Pittman.*] Is that Mr. Firth's company? Yes. Most of the southern collieries are amalgamated.  
 3370. *President.*] You have no experience of the management of the mine? None whatever.  
 3371. Or shipping experience? Not at all.  
 3372. You represent the proprietors to some extent? I am in the employ of Messrs. McArthur & Co. We act as a sort of managing agents. We represent the London office in Sydney. 3973.

3373. Is there anyone in Messrs. McArthur & Company's who more directly represents the owners than you do? The manager at the mine would be the man to give information in regard to the coal. It is only within the last two or three weeks that I have taken over the work. T. Kerr.  
18 Nov., 1896.

[Witness withdrew.]

FRIDAY, 20 NOVEMBER, 1896.

[The Commission met at 2:30 p.m. at the Custom House, Newcastle.]

Present:—

PROFESSOR RICHARD THRELFALL, M.A., PRESIDENT;  
And EDWARD FISHER PITTMAN, Esq., A.R.S.M.

Mr. J. Brown, sworn and examined:—

3374. *President.*] What is your name? John Brown. Mr. J. Brown.  
20 Nov., 1896.  
3375. And what is your business? Merchant.  
3376. Are you a colliery proprietor? Yes.  
3377. Of what colliery? Brown's Duckenfield Colliery.  
3378. Have you any other colliery? No.  
3379. I understand you wish to give us some evidence. Mr. Brown? I do not know that I want to give you any evidence in particular. I may say I have read a good deal of the evidence that has been given before this Commission, and many statements have been made, and I certainly should have been disappointed if I had not been called.  
3380. Do you insure your coal yourself? No.  
3381. Do you do a considerable over-sea business? Yes.  
3382. Where does your coal go to? To all parts of the world.  
3383. You never do any insurance yourself? We insure at home, but also in the colony.  
3384. When you sell coal, do you always sell it f.o.b. at Newcastle? We sell it c. f. and i.  
3385. That is when you insure? Yes.  
3386. You insure wherever you can get the best terms? Yes.  
3387. What rates are you paying now? It varies. I think we pay the lowest of any colliery in the colony at the present time.  
3388. Do you send coal to San Francisco? Yes.  
3389. What rates do you pay then? I hardly think that is a fair question to ask me, as I do not see what it has to do with the losses of coal cargoes.  
3390. You must leave us to decide that, I think;—do you object to answer that question? I shall decline to answer the question, as it is a matter that concerns our business.  
3391. I do not think it is any use our asking you anything else;—if you do not care to answer our questions it is no use asking you about things we do not want to know? I think that is an unfair question to ask me, because it is a matter of business. I do not think it is a matter affecting this Commission.  
3392. I think you must permit us to judge of that;—if you object to answer, there the matter ends, and we have nothing more to ask you? I always understood if a person came to give evidence he had a right to object to give answers to questions.  
3393. And you have objected. As you will not answer our question it is no use our proceeding further.

[Witness withdrew.]

Mr. J. Reed sworn and examined:—

3394. What is your name? John Reed. Mr. J. Reed.  
20 Nov., 1896.  
3395. And your business? Screen overscer of the Wallsend Colliery.  
3396. You have a considerable quantity of coal stored in a hopper? Yes; we have at different periods.  
3397. You have two hoppers? Yes.  
3398. How much do the hoppers hold when full? 3,000 tons—the large one.  
3399. What kind of coal do you store in the hopper? What we call small coal.  
3400. That is coal that has passed through the screens? Yes.  
3401. And that coal is always sold to gas companies, or for similar purposes? Yes.  
3402. Does the coal ever heat in that hopper? Yes.  
3403. Has it ever got dangerously hot? Not to my knowledge; not what we would call dangerously hot.  
3404. Nowhere near firing? I do not know exactly how many degrees it would have to run up to to catch fire.  
3405. Did it ever get so hot that you could not bear your hand on an iron bar that had been put down? You could catch hold of it, but not for any considerable time. It was what you would call very hot.  
3406. Not so that it actually frizzled your skin? No.  
3407. Have you noticed any connection between the heating of the coal and the state of the weather? I have noticed that after rain, and then several hot days, it had a tendency to become warmer.  
3408. Had it a tendency to become warmer after rain, even if the days were not hot? I think so, if it stayed long enough.  
3409. How long after rain do you consider would be requisite before the moisture would take effect? I think you would notice the difference in a week, in the whole body of it.  
3410. It is important to know whether wet alone will cause the coal to heat, or whether wet and hot weather are required;—have you noticed that rain by itself has a tendency to cause coal to get hot? Speaking from experience, I think with that quantity of coal standing—small coal—you could see the effect of heat in the winter-time after rain.  
3411. The effect of rain in producing heat? Yes.  
3412. If you had hot weather at the same time as rain you would naturally expect the effect to be greater? I think it would get hot quicker in the summer-time.  
3413. You have yourself, from your experience, formed an opinion that wet does tend to heat coal? Yes.

- Mr. J. Reed. 3414. You have a very strong opinion to that effect? Yes; in fact, nearly all the lads reared about the colliery seem to have the same opinion—those that have had anything to do with small coal.
- 20 Nov., 1896. 3415. How deep is the coal in the hopper when the hopper is full? The deepest coal would be about 30 feet.
3416. What is the depth of the shallowest part? Eleven to 12 feet.
3417. Does the coal get hot in the shallow end as well as in the deep end? Not nearly so hot in proportion.
3418. Whereabouts does the heating generally occur? In the deepest part, a reasonable distance away from the end. I have noticed that a few feet from the planking all round does not get hot. I should think that would be the effect of the air, and the same from the floor. You cannot get any hot coal until you get a little way in the bulk of it, when it comes through, or if you try it with an iron bar, it is not hot at the bottom.
3419. What is the shallowest coal that has ever got hot? The shallowest coal that I ever noticed was the very day you were there.
3420. Where we were standing? Yes; that was nearly on the surface.
3421. What do you consider the shallowest heap that would be likely to heat? I have never given any consideration to that point—I have not taken any notice.
3422. You have noticed coal 12 feet thick warm, but not hot? Not to say hot in comparison with the high portion further back in the hopper.
3423. I suppose where it is 20 feet thick it becomes fairly hot? Yes; a certain distance up from the floor.
3424. With regard to the hot and wet coal we felt the day we were at the colliery, do you think that coal was hot before it was put into the hopper? No.
3425. It was cool coal? Yes.
3426. It came straight from the mine? Yes. I would take it that was the result of heat from below for that to be hot there so near the surface.
3427. So that the coal that was wettest, and was also the hottest, might have been simply wet from the steam having been distilled up from below? Yes.
3428. It had come from the coal below and been condensed on the surface? Yes; it is quite possible.

[Witness withdrew.]

Mr. W. B. Sharp sworn and examined:—

- Mr. 3429. *President.*] What is your name? William Bethell Sharp.
- W. B. Sharp. 3430. And what is your business? General merchant and shipping agent.
- 20 Nov., 1896. 3431. Have you anything to do with collieries? I am shipping manager for the Pacific Coal Company.
3432. Are you connected with any other collieries? No.
3433. Do you insure the cargoes of coal from the Pacific Colliery? No; that is all done in Sydney. I have just been appointed shipping manager—this week.
3434. You represented some company before? Yes, Dalgety & Company, Limited. I started their business here.
3435. You have been accustomed to shipping cargoes? Yes; for the last twelve or fifteen years.
3436. Where does the coal mostly go to? San Francisco, Manila, the west coast of America, Colombo, &c.
3437. What kind of insurance rates used you to pay for ships going to San Francisco? Thirty-five shillings to 40s. per cent.
3438. What rates have you to pay now? I believe they are as high as £5 or £7 per cent. In fact, I saw a policy the other day on a ship to Honolulu. They had to pay £7 to the London underwriters, and the same risk was taken by continental companies at 40s. The most extraordinary thing is that if a certain coal was shipped there was a reduction of 20 per cent.
3439. Which coal was that? Duckenfield.
3440. They undertook to insure Duckenfield coal at lower rates? They undertook to make a reduction of 20 per cent. on Duckenfield coal.
3441. Insurance is a very considerable item on the cost of cargoes? Yes; it is a ridiculous charge. There is no more risk now than there ever was.
3442. The underwriters think there is a risk? The underwriters are a good deal like other people—like a flock of sheep. It will go down to its level before long.
3443. You think that if nothing is done rates will come down? I think so; but I have been very strongly of opinion all the time we ought to have some supervision of the trimming.
3444. I suppose the average value of a cargo of coal to San Francisco is over £1, including all charges? Landed there it would be about 20s. or 21s.
3445. Five per cent. insurance on that would be about 1s.? You do not insure the whole risk. You do not insure the freight.
3446. Somebody must? Yes; it is insured on the round. The owner would insure his ship for the twelve months at so much per cent., and she could trade where she liked; and he would insure the freight likewise.
3447. Would he not have to say where he was going to sail? He probably would have to give an indication.
3448. Where would that insurance probably be effected? In London.
3449. I understand the London underwriters are looking very shyly at coal risks? They are at the present time.
3450. And if they knew the ship was going to take this coal the owner probably would have to pay a proportionately higher rate? It is quite probable he would have to.
3451. Perhaps we may say about 1s. a ton would be the cost of insurance, taking everything into consideration, on a cargo of coal? I do not think it would be a fair thing to take the freight in.
3452. What would you think a fair thing? The value of the coal—7s.
3453. It would be 5 per cent. on 7s.—about 4d. as the cost of insurance? Yes.
3454. So that in any case 4d. goes for the insurance of coal? Yes.
3455. Many witnesses have been of opinion that some form of supervision is desirable in the matter of trimming;—have you any opinion on that point? I think there ought to be Government supervision of trimming here.

Mr.  
W. B. Sharp.  
20 Nov., 1896.

3456. Why should Government money be spent on supervising the trimming;—why should not some part of the trade bear it? The Government get enough out of it; they get royalties on most of the coal; they get other advantages; they get dues for shipping and loading the coal.
3457. But they spend money on the harbour? That is a reproductive work; it pays them for all they spend on it handsomely.
3458. Supposing it did not pay them, would you recommend that they should still pay for the inspection? Certainly; it would be better than forest-thinning, or sand shifting.
3459. I do not ask your opinion as to the Government policy, but as to whether it is desirable that the Government should pay for the inspection? I think it is desirable.
3460. I presume you would not consider it fair that the coal-owners, or the shippers, or the purchasers, should be asked to contribute? I think the Government get quite enough out of them. They not only get charges for shipping and loading the coal, but they get the cost of traction through the Railway Commissioners.
3461. Do you consider the Railway Commissioners work at a profit? Certainly.
3462. Have you any means of estimating that? Take their last quarter's report (during the strike), and you will see the excuse given for the falling-off was on account of the Newcastle trade.
3463. You think a comparison might be made in that respect by comparing the last quarter's with the previous quarter's report? Yes.
3464. That is, you could make an estimate of the profit derived by the Railway Commissioners from the coal trade by comparing the last report with others? Yes; you could do so.
3465. *Mr. Pittman.*] Have you any idea what the profit is that the Commissioners make? I should estimate it at about 4d. a ton.
3466. They make a clear profit of 4d. on every ton shipped? Yes.
3467. *President.*] What do they charge? From 6d. up to 1s. 4d., which, I think, is the highest they charge. It is a mileage scale.
3468. *Mr. Pittman.*] Have you any direct means of arriving at that, or is it merely an opinion you have formed? It has been worked out; it can be calculated from the railway returns.
3469. *President.*] Have you calculated it? No.
3470. Do you know anybody who has? Yes.
3471. How do you arrive at 4d.;—is that an opinion, or the result of calculation? It is the result of seeing what the Railway Commissioners charge for engines.
3472. It is the result of calculation? Yes; I think *Mr. Keightley*, of the Newcastle Coal Company, has made a calculation.
3473. That is *Mr. Keightley's* estimate? Yes. It is easy enough calculated. An engine takes so many trucks, and there is a regulation charge for that engine; what they charge over and above that for traction of the coal is profit.
3474. The traction must be taken into consideration? Make a fair allowance for that.
3475. *Mr. Pittman.*] And interest and depreciation? That would not be very much.
3476. On what? While the train was running.
3477. *President.*] There was a large expenditure at the Dyke, on which interest has to be paid? They got all those works for nothing; the Railway Commissioners never paid for them.
3478. Somebody paid for them? The Harbours and Rivers Department.
3479. They are handed over to the Commissioners to work on business lines? Yes.
3480. The fact is, the country has spent so much money, and the Commissioners are entrusted with the works in the public interest? That land is valuable land, and it could be sold for ten times more than what it cost to be made, and the Railway Commissioners have got the land as a gift.
3481. The Railway Commissioners hold that land as public property for a certain purpose? I fancy they have never paid any interest at all on it.
3482. I am surprised, *Mr. Sharp*, that people should have the audacity to suggest that because the Railway Commissioners were not charged for the capital cost of those works, therefore the works should not be expected to pay interest? The Railway Commissioners are making a very good interest. You can take the export of coal at 2,000,000 tons and reckon what the traction is; it is only a matter of calculation.
3483. *Mr. Pittman.*] That is the gross profit, not the net profit? You have got the other particulars in the Blue Book—what it costs for working, and all that—and you will find it comes out as near as possible at 4d.
3484. *President.*] I quite understand that if the Government can be got to pay for the inspection everybody would be only too willing to allow them to do so? The Government pay for inspection for overloading of ships, why not for loading. I think the Government should supervise the trimming; it would be much more satisfactory to everybody, especially for saving lives at sea, and to see that the product was sent away in proper order. There is no doubt about it, in my opinion, that there is a good deal of laxity in the trimming, on account of the cheap rates that are paid. They do not put the men on until they have run up hundreds of tons of coal, and then there are large spaces very often left under the stringers.
3485. *Mr. Pittman.*] What do you think a fair rate for trimming? About 3d. It all depends upon the ship. Some ships have 'tween decks laid, and you could not get a ship like that done without putting in 4½d. or 5d. to make a proper job of it. With the modern ships that are all open you can put 900 or 1,000 tons of coal in without stopping—without putting a man on.
3486. Would you have inspection combined with licensing of stevedores? Yes.
3487. That would reduce competition? No; there would be about twelve or fourteen trimmers. In any case the inspector could regulate it so that every man had a fair share of the work.
3488. You do not think it is the duty of the Government to see that each man gets a fair share of the work? I think it is the duty of the Government to try to make everybody as comfortable possible.
3489. You would not advocate the Government paying for inspection to see that each man got a fair share of the work? I think the Government should inspect simply for the benefit of the whole of the sailing population visiting here; for the good of the port and the product of the country. If the trimmers were licensed I suppose they would pay something for the license. They would have to pass certain examinations.

- Mr. W. B. Sharp. 3490. *President.*] Is there anything else you would like to lay before us? No. I think most of the ships have been lost by bad trimming not by spontaneous combustion. They are very careless in sending a vessel away from here.  
20 Nov., 1896. 3491. That is a mere impression? Yes; it is impossible to say why the ships are missing.  
[Witness withdrew.]

Captain T. Williams sworn and examined:—

- Captain T. Williams. 3492. *President.*] What is your name? Williams.  
3493. And your christian name? Thomas.  
3494. You are the master of the "Cambrian Chieftain"? Yes; on the present voyage.  
3495. Were you the master of that ship in 1894? No, sir.  
3496. What ship were you master of? The "Cambrian Queen."  
3497. Have you had a case of shifting of cargo? The "Cambrian Chieftain" shifted her cargo last voyage; I was not master then.  
3498. Were you on board? No.  
3499. Have you ever been in charge of a vessel on which the cargo shifted? Yes.  
3500. What ship was that? The "Cambrian Queen" shifted a cargo taken from here.  
3501. A coal cargo? Coal and coke.  
3502. Where did she shift the cargo? Off New Zealand.  
3503. Had you shifting-boards up? Yes.  
3504. It shifted in spite of the boards? Not very severely.  
3505. Did it shift sufficiently for you to put into port? No.  
3506. Where were you going to? Mollendo, on the coast of Peru.  
3507. You were able to get through all right? Yes.  
3508. Was the cargo badly trimmed? It was not exactly badly trimmed. I think it could have been better done.  
3509. Did you superintend the trimming yourself? Yes; as much as I could.  
3510. Were you down below when it was done? Several times; not always.  
3511. Had you any of your officers down below? Yes; the mate.  
3512. What sort of ship was it? 1,200 tons.  
3513. An iron or steel ship? Iron.  
3514. Had she open tween decks? Partly; mostly covered.  
3515. Where did you have shifting-boards? Some 4 feet above the keelson, right up to the bottom of the deck.  
3516. All the way fore and aft? From abaft the foremast to the mizenmast.  
3517. What part of the cargo was it that shifted? It is hard to say.  
3518. Did you retrim it? We trimmed the coke and coal. The cargo generally shifts bodily, and then you have to retrim where you can.  
3519. In what direction did it shift? It shifted to starboard.  
3520. Was it during a gale of wind? In a very heavy storm; but afterwards the weather moderated, and we retrimmed the cargo.  
3521. Was it over to starboard the whole length of the ship, or only at one part of it? It all more or less shifted; it was higher up on one side than the other.  
3522. It was higher up on the starboard side both forward and aft? There was no coal in the fore hatch. She was full from abaft the foremast to the fore part of the mizenmast, and it sloped down each end. In a case like that you do not look as a rule to see where it shifted, but you try to trim it back again as soon as possible.  
3523. Have you had any experience of coal-heating on board ship? Never.  
3524. And that was your only experience of coal-shifting? Yes.  
3525. It was during bad weather? Yes, very exceptional bad weather.  
3526. In your opinion, which is the most dangerous circumstance causing the coal to shift—is it the pitching of the ship or the rolling? It is the heavy lurching; but the shifting can be avoided to a great extent by better trimming of the coal, and using shifting-boards.  
3527. You believe in shifting-boards? Yes; but all vessels have not got them.  
3528. If you had not had shifting-boards you would have been in a worse plight? We should have been on our beam ends possibly.  
3529. You think shifting-boards do constitute a good cure? Not always, sir; sometimes your shifting-boards give way.

[Witness withdrew.]

FRIDAY, 11 DECEMBER, 1896.

[The Commission met at 2:30 p.m., at the Chief Secretary's Office, Sydney.]

Present:—

PROFESSOR RICHARD THRELFALL, M.A., PRESIDENT;

And EDWARD FISHER PITTMAN, Esq., A.R.S.M.

Mr. H. McLachlan, Secretary for Railways, sworn, and examined:—

[Mr. McLachlan handed in a statement (*Appendix B*), at the same time making several explanatory remarks in regard thereto.]

- Mr. H. McLachlan. 3530. *President.*] Do you know whether it is a fact or not that some of the cranes at Newcastle are so short in the jib that the hoppers cannot be lowered into the holds of the ships? Not of my own knowledge.  
11 Dec., 1896. 3531. Have you heard that it is so? I think there are one or two that may be short; but Mr. Thow or Mr. Firth could give you that information. Mr. Russell, I think, said he could lower the hoppers if the hatches of the vessels would admit of it. 3532.

3532. Mr. Russell is no longer the contractor for the cranes? He is until the end of the year, when the crane employees are likely to have the work.

3533. *Mr. Pittman.*] Does that mean the stvedores or the trimmers? No; what are called the crane-boys.

3534. Not the trimmers? I think they are associated; it is called the Crane Employees' Association.

3535. *President (referring to statement handed in)*] Do you, as a matter of fact, provide twenty-two engines? No, we do not; but still they are available. The engines are used for other business; but if you were working that traffic and no other you would have to have that maximum number of engines. If the coal trade only requires six engines on any day, use could be made of the engines for other business. Very few engines are used purely for any particular business.

3536. *Mr. Pittman.*] You have not ever employed twenty-two? Nineteen is the maximum; but a certain proportion must be allowed for engines laid up for repairs.

3537. *President.*] You have reckoned the expenses of twenty-two? Yes, so far as the capital is concerned. In the loco. charges are included the wages of engine-drivers, guards, men in charge, cleaners, and stores.

3538. For the twenty-two engines, or for the number of engines actually employed? They are the actual daily out-of-pocket expenses in working the coal traffic.

3539. Does it include interest on the cost of twenty-two engines? That is included.

3540. The whole of the interest? Yes.

3541. That seems to be rather loading the amount if the twenty-two engines are not always employed? You would have to have that number if you were working the business. Supposing you took half of that—eleven, say, at £3,000—£33,000,—it would only amount to £1,200 or £1,300 a year, which is not a big item.

3542. With regard to the proportionate cost of the main line, does that mean the proportionate cost of a single line? It means the cost of equal to a single line.

3543. You added the line for the coal business? Yes.

3544. I understand you have the two lines? There is a double line in the coal district.

3545. And you have charged interest on the cost of one of those two lines? Yes.

3546. Have you charged any interest on the cost of the other line? No.

3547. Do these items, put down as interest, include depreciation? No, simply interest; the statement does not provide for renewals or depreciation.

3548. What interest is charged—that at which the money was raised? No, it is taken at 4 per cent.; probably some of the earlier money would have cost more than that.

3549. You averaged it at 4 per cent.? Yes.

3550. I may take it from you that the Railway Commissioners are not in a position to make any reduction in the rates charged for the haulage and shipment of coal? They think not; they think the charges are reasonable, considering the services rendered.

3551. The question of rough treatment has been mentioned by several witnesses;—what sort of state is your permanent way in there? In an excellent state.

3552. The rough treatment is not then the fault of the road? I think they complain that the engine-drivers shake the trucks unduly, and that Russell really handled them roughly. The matter has been looked into more than once. The trucks themselves in many cases are weak and defective. The road is excellent, and we are assured that proper care is taken in driving. There are men to watch it, and they take every care.

3553. Is there any objection, from the point of view of the Commissioners, to tarpaulins being put over the coal, supposing it were found requisite to keep the coal dry? The cost of the tarpaulins would be an item, and then there would be the matter of delay and labour. I am afraid it would be rather an expensive item to attempt to cover the trucks. It has never been looked into, so far as I am aware.

3554. So that you can only give us your impression on that point? Yes; nowhere is coal covered with tarpaulins.

3555. This is rather an exceptional port;—the combined heat and wet are circumstances which do not occur in England? It is a point that has not been looked at.

3556. The colliery owners would have to provide the tarpaulins? Yes; that would be part of the equipment of the trucks. There would be a good deal of labour in it too—roping and covering up the trucks.

3557. The tarpaulins would be small, and not like those for covering wool? You would have to have them carefully fixed to give a certain pitch.

3558. *Mr. Pittman.*] The loads would be all about the same height—it will not be like a mixed-goods train? The Victorian people used to have a ridge on their trucks; but I do not think it was altogether satisfactory—that is for loading produce. They had a girder or small ridge running a certain distance above the trucks.

3559. *President.*] It would make no difference to you whether the collieries have hopper-waggons or box-waggons? I would not like to say. I have not been practically engaged in loading and unloading; it is largely a matter of the unloading. So far as the hauling is concerned it would not make much difference.

[Witness withdrew.]

Mr. C. W. Darley sworn, and examined:—

3560. *President.*] What is your name? Cecil West Darley.

3561. And what is your office? Engineer-in-Chief for Public Works.

3562. You were associated, I believe, with the Harbours and Rivers Department at one time? I was the Engineer-in-Chief of the Harbours and Rivers before that office was abolished.

3563. Did you not erect at Newcastle the cranes for the loading of coal? Yes; I was sixteen years in Newcastle in charge of the erection of all but the last four cranes.

3564. The last four you did not erect? No.

3565. What is the average lifting power of the cranes, Mr. Darley? There are two cranes that will lift 25 tons; but they also have the 9-ton ram. There are six of the 9 and 15; and four of the 9-ton, without the compound ram.

3566.

Mr. H.  
McLachlan.  
11 Dec., 1896.

Mr.  
C. W. Darley.  
11 Dec., 1896.

Mr.  
C. W. Darley.  
11 Dec., 1896.

3566. We understand the length of the jib of the cranes is not the same in each case? They all vary, and some of the cranes are further back from the face of the wharf than others.

3567. Would it be very difficult to lengthen the jibs of the cranes? No.

3568. Some of the cranes are said not to allow of the hoppers being lowered down to the bottom of the holds of the ships? There are five of the cranes which will reach the centre of any ship going to the port. Those known as the No. 6 and No. 11—the two 25-tons, and the four 9-ton power.

3569. But the six 9 and 15 tons? They will not.

3570. Can you give us any idea what it would cost to alter those six cranes so that they would be able to lower the hoppers down the holds? It would have to be done with care, because they would be no longer 15-ton cranes, with the expanded jib; but seeing that the loading is all done with the 9-ton lift it would be quite safe for ordinary working to extend the jibs.

3571. How much do the hoppers hold—about 10 tons? The whole box and all very rarely exceed 9 tons. There are a few hoppers now belonging to the Railway Commissioners which, I believe, carry 10 tons, but they are not often unloaded in Newcastle. I have never known the 9-ton cranes to refuse any hopper in Newcastle. There would be no risk in extending the jib; the foundations would be strong enough with the increased reach for 9 tons.

3572. It would not be a very expensive matter? I do not think it would. It would only need about 7 feet on end of each jib.

3573. Then really the only cost would be that piece of blacksmithing? £50 a crane ought to do it.

3574. It would not take very long to alter them? No; there are a large number of ships going to the port so constructed that the hoppers will not go down the hatches.

3575. Those ships that have the hatches large enough will reap the benefit? You have to take into consideration how it is going to increase the cost; it will very nearly double the cost of shipping the coal.

3576. The loading is only about one penny and a sixteenth, or one penny and an eighth? That would be very nearly doubled, for this reason, if you double the distance you move the waggons, you double the quantity of water, and thus double the cost of pumping, because it would be moved through far more than double the space at present necessary.

3577. The incidental expense is a very large item, and that would not be doubled? There is the extra time in lowering down and hoisting up.

3578. The contractor has been for some time in the habit of lowering the waggons down for anyone who wished it without extra charge, and several witnesses have told us they do not think it possible the extra expense would come to more than  $\frac{1}{2}$ d. a ton. However, it would not be necessary to lower the whole of the coal down, but only until the heap is built up? You cannot wind up so quickly; you must steady coming up in case the waggon catches in the hatches.

3579. The time is not spent now in the crane going up and down, but in getting the waggons along the sidings, and very often in waiting for the trimmers to clear the coal away, so that there would really be practically no delay? It would only be in the first portion of the coal; once you have a cone of coal in the way of the hatch the necessity would cease.

3580. Have you taken any interest in the subject matter of the inquiry of this Commission, as to the prevention of spontaneous combustion of coal cargoes? No, I have not.

3581. You have not formed any idea as to what would be the best way of loading coal so as to minimise the danger of heating? I have not. I may say I have had a good deal to do with coal loading in South Wales, at Swansea. I was engaged there for some two years in connection with the railway works. They have Armstrong's hydraulic appliances there, and they ship a great deal of patent coal, compressed blocks, which used to be made there, and they all had to be lowered down to the bottom of the ships very carefully. The hydraulic arrangements there are quite different. They have very large gantries, and the waggons come underneath at a high level, and are picked up and dropped forward. They have high sheerlegs which pick up the waggons—all square boxes. As soon as the waggons are picked up the sheerlegs go forward and plumb the hold, and the boxes go right down, and the load is landed on the bottom.

3582. Do you know what is the object inducing all the collieries to use hoppers in place of boxes? Because they could not make the boxes the size of the hoppers. In the old days the cranes were smaller, and it took two lifts to discharge the waggons. The boxes I speak of at Swansea are much larger, because they are on the broad gauge. They are nearly as large as our hoppers. They are straight-side boxes, and are easy to put down the hold of a ship. They could not tip in the patent coal, which is shipped to the West Indies for the Naval station. The seam coal is brittle, and they were careful not to break it. It was with the object of preventing the breakage of the coal, not with any idea of gas.

3583. *Mr. Pittman.*] They have superseded those loading arrangements at Cardiff by the Barry Docks; they have the hydraulic lift, and they load the first portion of the coal with small boxes? Yes; there are one or two of those lifts, but they are not generally adopted. They are adopted in Cardiff, but not many of them.

3584. *President.*] Did any cases of heating of coal cargoes of Cardiff coal occur while you were there? I do not recollect any. My experience of Newcastle is that I cannot call to mind any case of explosion or heating being reported before about ten years ago. I do not recollect any cases being reported. It is only, comparatively, of late years that we have heard of this.

3585. Have you any opinion as to whether the wetting of coal is a circumstance likely to assist the spontaneous heating of coal;—have you any facts? I have no facts. I should think all the cranes that require altering could be altered for £300 or £400. There are three 15-ton steam cranes at the lower end of the Dyke; they are the old cranes formerly on the Newcastle wharf.

3586. I suppose they are only used when the hydraulic cranes are fully employed? Yes; some of the smaller ships are put under them.

3587. They are used entirely for the smaller vessels? Yes.

WEDNESDAY, 23 DECEMBER, 1896.

[The Commission met at the Chief Secretary's Office, Sydney, at 2:30 p.m.]

Present:—

PROFESSOR RICHARD THERELFALL, M.A., PRESIDENT;

And EDWARD FISHER PITTMAN, Esq., A.R.S.M.

Mr. W. Thow sworn and examined:—

3588. *President.*] What is your name? William Thow.

3589. And what is your office? Chief Mechanical Engineer for Railways.

3590. We understand you have recently paid a visit to Newcastle in connection with an inquiry into the means of loading coal on board ship;—I suppose you will agree with us that the present system leads to very considerable breakage of the coal? Yes, through falling down small hatches; but it does not necessarily do so through the middle hatch if it is big enough to take the hopper waggon bodies, and most of them are.

3591. We believe, however, that some of the cranes have jibs too short to enable the waggons to be lowered down the hatches;—is that the case? I think most of them will, through large hatches, let the waggons down to the bottom of the boat, or to within a few feet of it.

3592. You did not pay special attention to the length of jib of the cranes? No; but I made inquiry about it, and I understood there was no difficulty through the centre hatch in big vessels, and that the cranes would drop the body of the hopper nearly to the bottom of the boat if there was length enough of chain to do it.

3593. We have a report from Mr. Darley which says that there are only five cranes which have jibs longer than 19 feet 9 inches, and that we are told is the length required? I think, perhaps, he may be speaking without recent information. We lengthened two of the jibs quite recently, and there is no difficulty in lengthening some of the others; but, I think, at least seven or eight of the jibs have been lengthened. I think, but I am not very clear, that it was Nos. 9 and 10 that we lengthened quite recently.

3594. *Mr. Pittman.*] Mr. Darley knew that some had been lengthened? Some we lengthened some years ago, and we lengthened two about six months ago.3595. *President.*] Is there any difficulty in lengthening them? I do not think there is very much.

3596. What would it cost to lengthen a jib—would £50 cover it? I should think £50 a jib, but I am rather inclined to think it is the chain that is the difficulty. On some of the cranes there is not sufficient length of chain to allow the hoppers to go right down to the bottom. Where the large vessels are loaded I believe there is no difficulty about it.

3597. On some of the cranes the chains are long enough? Yes.

3598. And by arranging matters the large vessels could be brought under those cranes? That is what I understood they do.

3599. *President.*] Is there any difficulty in lengthening the chain? There might be; the cranes will only take up a certain amount of chain. The stroke of the ram, for instance, has to be met.

3600. Would it mean lengthening the stroke of the ram to lengthen the chain? I am afraid it would, in some cases.

3601. That, I presume, would be a serious matter? Yes.

3602. You have no idea what it would cost? I am afraid it would mean a new crane.

3603. Did you come to any conclusion yourself as to the best means of diminishing the breakage of the coal under the hatchway? The only way I saw was to load the forward and after hatches by smaller boxes—boxes that would go through the hatches and deposit a cone.

3604. Would that be feasible with the present crane arrangements? I think so, as far as the cranes are concerned; but it might be a difficulty with the colliery arrangements.

3605. The system you propose is that the collieries should send out their coal in box waggons? Yes; in boxes small enough to go through the hatches. Probably the boxes would not hold more than 4½ tons each, because they would be limited for height by the position of the screens at the collieries.

3606. Of course, you are aware there is very great objection to that on the part of the collieries? I should think there would be. It would mean a great deal of additional work to them.

3607. And a great deal of additional expense in rolling stock? Yes, they would have to provide that; and then it would also mean extra work in sorting out those waggons and getting them to the ship before any other waggons were sent down. It would impose a difficulty upon the working of the trade.

3608. Is there any alternative you can see? I do not think so.

3609. Is it, for instance, possible to erect some high level tips, from the spouts of which the coal might be dropped into small boxes, as is done at Cardiff? It might be; but that would mean a very heavy expense to re-arrange the yard.

3610. It is possible to re-arrange it? I do not think that it would be impossible.

3611. You cannot give any idea of the probable cost? No.

3612. Would it be tens of thousands? It would be a very heavy matter to re-arrange the yard.

3613. Would it be a matter of £100,000? It would mean going right back towards Hamilton some distance to get sufficient grade to do that.

3614. It would not, I suppose, be a matter of £100,000? It would depend entirely upon the application of that principle. If it were to be applied to all the present loading places where the cranes are, I am afraid it would run into a very large sum. It is very difficult indeed to say how it would work out. It might be applied to one or two cranes, but that would scarcely meet the difficulty.

3615. Have you given any attention to the loading of coal by means of distributors placed through the hatchways? I saw a suggested appliance at Newcastle, but I do not think they have sufficient slope with it to be of any service.

3616. It would prevent the formation of one great heap of "smalls" under the hatchway? It might do that. It did not look to me when I saw it to be a practical thing.

3617. That was your opinion—that it is not a practical thing? I do not think it is a practical thing. It means a great loss of time. One has to be careful, in adopting any plan for this purpose, to avoid lengthening the time of loading of the vessels; it is desirable rather to shorten than to lengthen the time.

3618.

Mr.  
W. Thow.  
23 Dec., 1896.

Mr.  
W. Thow.  
23 Dec., 1896.

3618. Almost whatever means are recommended means the expenditure of money, and it is really a choice of evils;—have you formed any idea yourself as to what is the best method, setting aside your position as Chief Mechanical Engineer for Railways? The only means that I can fancy, which would be a natural one, is to take steps to form a cone of coal underneath the hatchway so as to drop the other coal upon it. Of course, in the large vessels, under the larger cranes, there is no difficulty in doing that in the centre hatchway, and once that is formed I cannot see that anything more is required.

3619. We are all agreed on that point; but how are we going to arrange to form that cone under the smaller hatchways? The only way would be to drop smaller boxes through the smaller hatchways.

3620. We have practically elicited from the colliery owners that that is impracticable, and you have yourself said it would dislocate the whole trade? I am afraid it would.

3621. Do you see any chance of making some loading appliance to meet the case? I have not given much thought to that, because I have regarded it as a matter that would not be used by either ship owners or the coal people. It means a lot of money to put such an appliance into a boat and to take it out again; it has to be built up in fact.

3622. I take it, you are in very much the same position as the Commission, viz., we see many ways in which the thing might be done, but at an enormous sacrifice, and we are unable to decide which is the best;—is that your position too? That is exactly the view I take. I suppose the question is not in doubt as to the advisability, on firing grounds, for having some means of depositing the coal without breakage.

3623. I think there is no question about that? In England, of course, they have means for depositing it as far as possible without breakage, but that is for a different reason; it is simply not to destroy the commercial value of the coal. It is not on account, I think, of cargoes firing that that is done.

3624. I daresay it is on both grounds? I have only seen it urged on account of the disadvantage of breaking the coal.

3625. *Mr. Pittman.*] The English Commissioners' Report showed the coal people that a cause of spontaneous combustion was the smashing of the coal;—that was twenty-one years ago; and no doubt they have had that in view when building new shipping arrangements? Yes.

3626. *President.*] Is there anything you would like to lay before us? No; I have no practical suggestion to make.

[Witness withdrew.]

Mr. T. R. Firth sworn and examined:—

Mr.  
T. R. Firth.  
23 Dec., 1896.

3627. *President.*] What is your name? Thomas Rhodes Firth.

3628. And what office do you hold? Engineer-in-Chief for Existing Lines.

3629. I understand you visited Newcastle recently with a view to see if anything could be done to improve the manner of loading ships with coal? Yes.

3630. How long were you there? I was with Mr. Thow, and we were on one vessel one hour and a half watching the loading.

3631. You were only a day in Newcastle altogether? Yes.

3632. I presume you saw the difficulty of preventing the breaking up of the coal when put on board a ship? Yes.

3633. Did you come to any conclusion as to the best way to remedy that? The only really practical way I can see would be by enlarging the hatchways; and yet that is almost impossible, as the vessels arriving are of so many different sizes.

3634. We have ascertained beyond question, I think, that that is impracticable; setting that aside, have you any alternative method to suggest? There is the alternative means of bringing the coal in small boxes, or something of that kind, on trucks.

3635. That would be a matter affecting the colliery owners? Exactly.

3636. The colliery owners would have to provide the boxes? Yes.

3637. We have reason to believe that many of the colliery owners are not in a financial position to do that? Very probably. Again, it would cause considerable delay as well in loading the vessels.

3638. So that there is an objection beyond that of the cost? Yes.

3639. In fact, it would involve each colliery, when obtaining an order, sending out so many boxes of coal and so many hoppers of coal, which would undoubtedly be very inconvenient? Yes; they would then have to marshal them in the yards just as wanted, and the waggons would have to be shunted out of the road to make room for the boxes.

3640. That would give rise to considerable trouble in managing the yard? Yes.

3641. And would lead to a considerable increase in expense? Yes, and in time.

3642. In this matter the expense depends on the time taken, does it not? When I say expense and time, I mean it would be more expense in loading the coal in that form and likewise would take a longer time to do so.

3643. That method, therefore, may be set aside;—is there any other system you can think of? No satisfactory system.

3644. Did you contemplate the possibility of erecting a high-level system of tips from which the coal could be passed down by spouts into small boxes continuously run up and down by means of a crane? I know such a system could be adopted, but I did not think of it in regard to Newcastle, because it would involve an enormous outlay.

3645. Why would it involve such a large outlay? It would have to be the whole length of the dyke, and there would have to be considerable width to lay the tracks to get up there.

3646. These works would only be used to run up—to use the technical phrase—the smaller hatches; and perhaps in a ship carrying 3,000 tons of coal, 800 tons would be the most carried in this manner;—are you taking that into consideration? To provide for that by means of staging would block up the whole of the wharves to such an extent that you might as well use it for the whole of the loading. I do not see how you could put up the staging. The roads are so close and the sidings so numerous that you could scarcely erect a staging unless it were a complete one. It would be of very little use to run up a staging for the purpose of loading 600, 700, or 800 tons of coal; you might as well make it for all.

3647. As soon as the hatch was run up they would simply shoot the coal on top? Just so; instead of turning the trucks round with the crane, run the whole down the shoot.

Mr.  
T. R. Firth.  
23 Dec., 1896.

3648. Can you give us any idea as to what such a reconstruction of the loading appliances would cost? No; I could not. It would run into a great many thousands.

3649. Do you suppose it would run into £50,000? I think it would.

3650. Into £100,000? Perhaps not; but the thing at present is so vague. It is a question of putting the staging the full width of the wharf. Perhaps, after some consideration, my ideas might be considerably modified. I have not really studied that matter.

3651. Could an estimate be obtained from your Department as to what a reconstruction of the kind would cost? I think so; we could get out an estimate. I was going to mention that Mr. Thow and I were told that one of the companies used shoots, and these shoots are not satisfactory. They break up the coal very considerably.

3652. They have the shoots only, without the travelling boxes; the coal simply runs out and falls into the hold much as from the waggons; we are speaking now of a system which does not exist at Newcastle, but which does exist at Cardiff for instance, and I dare say at other places, and it is of importance to know what the cost of erecting such a loading system would be? We could get out an estimate. I really do not see that something might not be done to fill the boxes and tip them from the wharf.

3653. That is what we want to do; we wish to have some arrangement whereby not necessarily more than a small fraction of the whole cargo of coal could be lowered by small boxes; in the main hatches of large ships the hoppers would pass down were the cranes suitable, therefore the percentage of coal required to be lowered by means of these boxes is really very small? There is the question whether the boxes would go down. The stays come right across the hatches fore and aft, and that is one reason why the trucks cannot be lowered exactly over these hatches.

3654. It is not owing to the fact of the jibs not being long enough? No; that is not the reason.

3655. It is so with some of the cranes? Perhaps with some of the cranes. In the ship we were on, the "Talus," there was a stay coming from the mast right over the hatchway. In such a case I do not know whether it would be possible to get the boxes down.

3656. It has been shown that many of the cranes require altering, because the jibs are not long enough to lower the hoppers into the holds? The jibs could be lengthened.

3657. The jib could be lengthened, and the chain; but how about the ram? I think you could lengthen the chain without altering the ram.

3658. That depends on whether the ram works its full stroke; if it works its full stroke it is impossible, though you could put in another sheave and reduce its lifting power? Yes.

3659. That might be done in some instances, but not in others; with the 9-ton cranes there is not much margin? No.

3660. Can you give us any idea what it would cost to get the information together which we want? I should say, perhaps, £100; that would be the outside. It seems to me it would be an awkward job to get the best scheme. No doubt a scheme could be got out in a short time; but I am supposing we could get out a good scheme.

3661. It would be no use unless it were a good scheme? It would not do to make a scheme and be dissatisfied with it.

3662. It would not cost more than £100? I certainly would not spend more. I put that as the outside limit. It would be more likely from £30 to £50.

3663. Is there anything you would like to lay before the Commission? No, I do not think there is. I really felt in a difficulty when I saw the matter, and I cannot satisfy myself as to what is the best way to get over it.

3664. It is a very difficult matter, both from an engineering and an executive point of view, I may say? It is very difficult. I came away very dissatisfied and have been dissatisfied ever since.

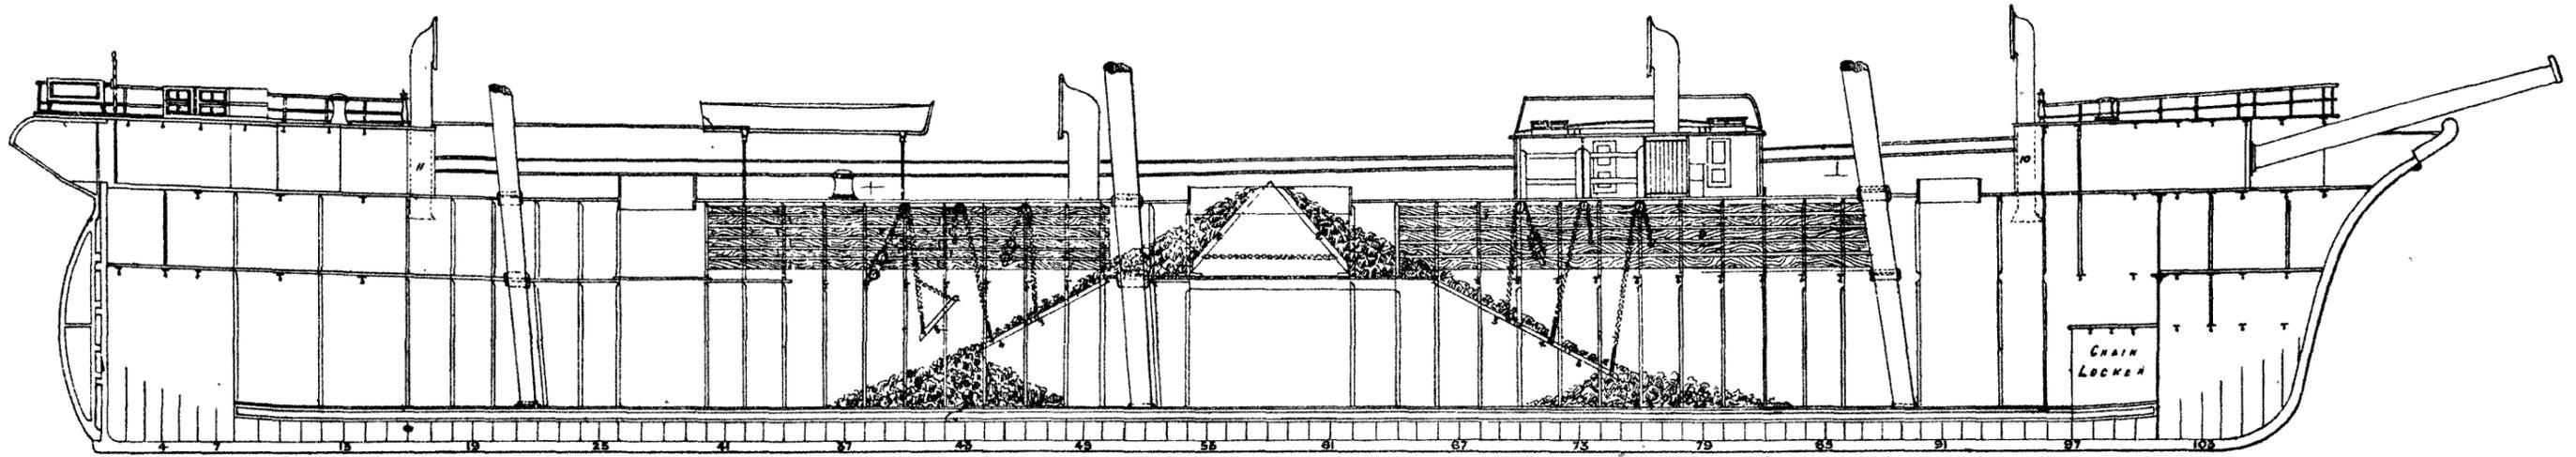

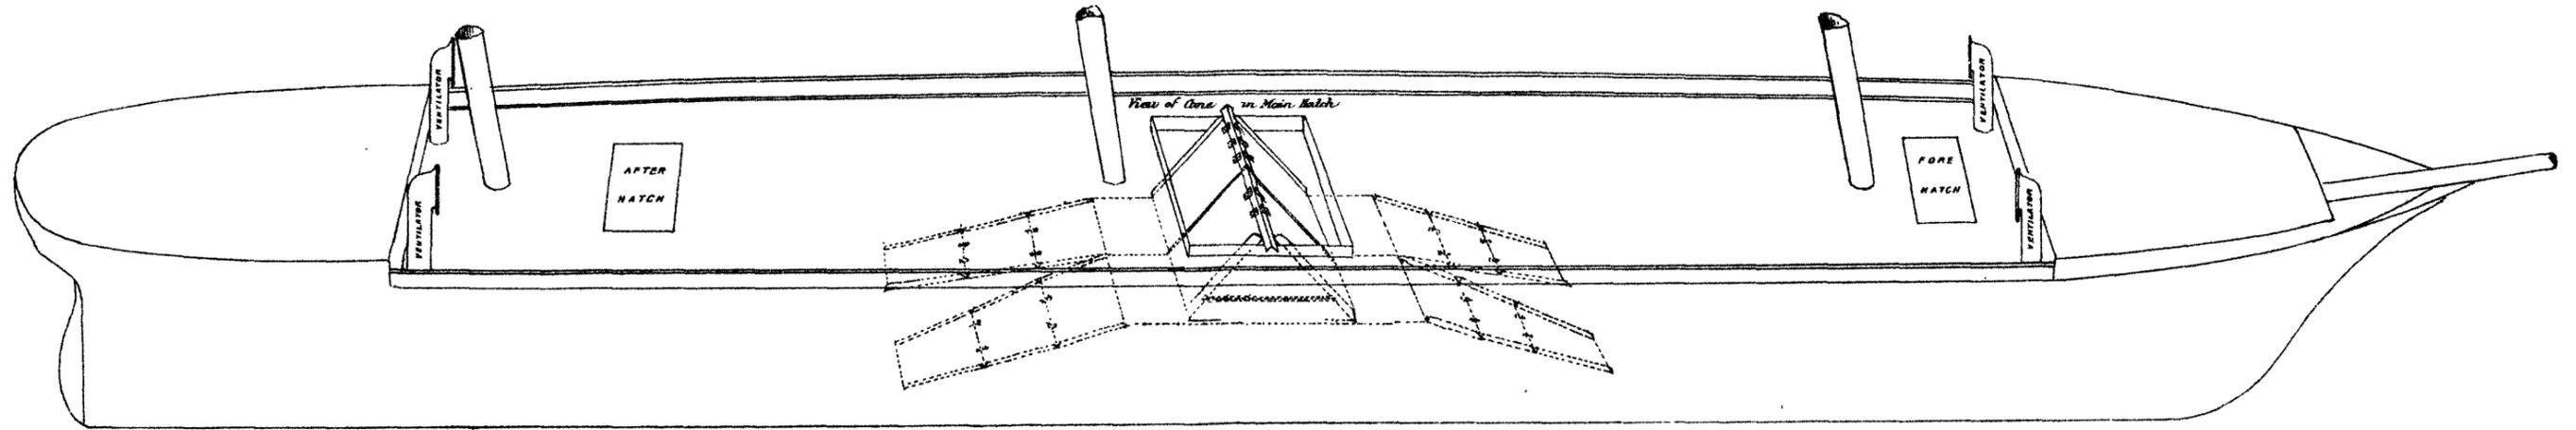

3665. Are you dissatisfied with the present system? I can see there is a fault in that. It is very clear the coal is smashed up in the loading; there is not the slightest doubt about that; and under the present arrangements that cannot be avoided.

[Witness withdrew.]

[One plan.]

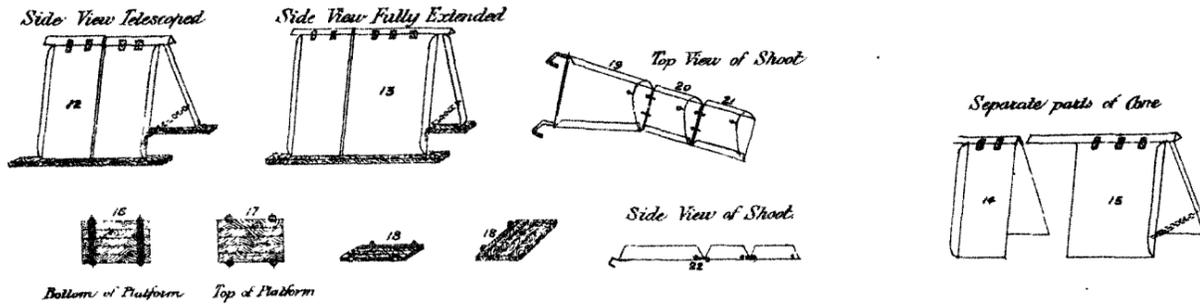

# DECK VIEW.

## SPENCER'S PATENT.

SPENCER'S IMPROVED SYSTEM of LOADING COAL CARGOES at Cranes and Tips, preventing Breakage of Coals while Loading, and shifting of Cargo at Sea: also preventing Fire from Spontaneous Combustion.

316 PAISLEY ROAD, GLASGOW.

FARRISON, PRINTER, GLASGOW.

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE, SYDNEY, NEW SOUTH WALES.

1897.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

LICENSING LAWS.

(PETITION FROM CERTAIN RESIDENTS IN THE DISTRICT OF PETERSHAM IN FAVOUR OF PRESENT RESTRICTIONS UNDER.)

*Received by the Legislative Assembly, 6 May, 1897.*

To the Honorable Sir Joseph Palmer Abbott, Speaker, and the Members of the Legislative Assembly of New South Wales, in Parliament assembled.

WE, the undersigned Residents of the District of Petersham, humbly desire to bring before your notice:—

- (1) That, according to our knowledge and experience, intemperance is a great and growing evil.
- (2) That increased facilities for obtaining alcoholic beverages tend to increase drunkenness.
- (3) That the true observance of the Sabbath, which forbids unnecessary trading on that day, is essential to national prosperity and greatness.

Therefore your Petitioners wish to place before the Members of the Legislative Assembly their desire in reference to the following clauses, and pray that the law may be so altered:—

- (1) Hours of closing.—That the present hours be not extended.
- (2) Sunday closing.—That no traffic other than that already provided for be allowed on Sundays.
- (3) Duty on Spirits.—That the present duty be not reduced.
- (4) Refreshment to Travellers.—That the restrictions now in force be retained.

And your Petitioners, as in duty bound, will ever pray.

*[Here follow 155 signatures.]*

1897.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

LICENSING LAWS.

(PETITION FROM CERTAIN RESIDENTS OF NEW SOUTH WALES, MEMBERS OF THE WOMEN'S CHRISTIAN TEMPERANCE UNION, AGAINST ANY ALTERATION OF EXISTING.)

*Received by the Legislative Assembly, 1 June, 1897.*

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales, in  
Parliament assembled.

The humble Petition of the undersigned Residents of New South Wales over the age of twenty-one,—  
SHOWETH :—

That your Petitioners are of opinion that the present measure of Sunday Closing has been very beneficial in the reduction of the number of arrests for intemperance, and should be made more effective by the inclusion of the provisions recommended by the New South Wales Drink Commission of 1886-1887; and humbly pray your Honorable House not to consent to any alteration of the law to provide for the opening of public-houses at certain hours on the Sunday, believing that such provision would tend to increase the intemperance at present altogether too prevalent in our Colony.

And your Petitioners, as in duty bound, will ever pray.

**LIQUOR TRAFFIC.**

(PETITION FROM CERTAIN INHABITANTS OF PENRITH, IN FAVOUR OF FULL LOCAL OPTION WITHOUT COMPENSATION.)

---

*Received by the Legislative Assembly, 29 July, 1897.*

---

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned Inhabitants of Penrith, New South Wales, humbly sheweth,—

That in view of the manifold evils through intoxicating drink, which not only include drunkenness, but much poverty, immorality, lunacy, and crime, your Petitioners humbly pray for the early passing of a Bill that will concede to the electors themselves, in every electorate, full local option without compensation.

And your Petitioners, as in duty bound, will ever pray.

(PETITION FROM THE REV. F. B. BOYCE, CHAIRMAN OF A PUBLIC MEETING HELD IN THE CENTENARY HALL, SYDNEY, IN FAVOUR OF.)

---

*Received by the Legislative Assembly, 19 August, 1897.*

---

To the Honorable the Legislative Assembly of New South Wales in Parliament assembled.

The Petition of the undersigned,—

HUMBLY SHOWETH:—

That the Petitioner was the Chairman, on the 12th August, 1897, at a public meeting held in the Centenary Hall, Sydney, at which the following resolution was unanimously carried:—

“That this public meeting of citizens approves of the Local Option Bill which the Honorable Joseph Cook, M.L.A., has tabled in the Legislative Assembly, and respectfully prays that your Honorable House will be pleased to pass the same into law as speedily as possible.

“And that the Chairman sign this Petition on and in behalf of citizens' meeting.”

The Petitioner therefore humbly prays that your Honorable House will be pleased to receive this Petition.

And your Petitioner, as in duty bound, will ever pray.

F. B. BOYCE,  
Chairman.

LOCAL OPTION.

(RESULT OF VOTE TAKEN IN METROPOLITAN SUBURBAN MUNICIPALITIES IN FEBRUARY, 1897.)

*Printed under No. 8 Report from Printing Committee, 17 June, 1897.*

The Acting District Inspector to The Superintendent of Police.

Sir,

Central Police Office, Sydney, 21 May, 1897.

I do myself the honor to forward herewith a Comparative Return showing the result of the Local Option Vote taken in the Suburban Municipalities within the Metropolitan District during the aldermanic elections in February last.

When the vote was taken in February, 1894, there were on the municipal lists 62,009 voters; this year there were 67,676—showing an increase during the last three years of 5,667. Only 9,595 voted under Division "A," and 9,115 under Division "B," which result shows about 14 per cent., being a decrease of about 7 per cent. There are thirty-one municipalities which are divided into 108 wards, and six municipalities undivided. Out of 114 elections, the Local Option Vote was carried—19 in the affirmative and 95 in the negative in Division "A," and in Division "B" it was carried in 32 in the affirmative and 82 in the negative. There are at present 429 hotels in the City of Sydney, 13 in places not yet incorporated, and 348 in the suburbs, showing an increase of 2 in the suburbs since the vote of 1894.

I have, &c.,

H. J. HUGHES, Sub-Inspector,  
Acting District Inspector, Metropolitan District.

Forwarded to the Inspector-General of Police.—G. READ, Supt., 22/5/97. Forwarded to the Under Secretary, Department of Justice.—EDM. FOSBERY, I.-G.P., 22/5/97. Submitted. A copy of this report, with the Return, might (as usual) be laid on the Table of the Legislative Assembly.—G.M. Approved.—A.J.G., 29/5/97.

COMPARATIVE Return of Result of Local Option Vote in the Metropolitan Suburban Municipalities, taken in February, 1897.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

**ABORIGINES.**

(REPORT OF BOARD FOR 1896.)

*Printed under No. 2 Report from Printing Committee, 6 May, 1897.*

The Aborigines Protection Board to The Principal Under Secretary.

Board for Protection of Aborigines, 105, Phillip-street,  
Sydney, 31 March, 1897.

Sir,

In accordance with the established practice, we have the honor to submit, for the Chief Secretary's information, the following Report respecting the work undertaken by us during the year 1896, together with information as to the number, location, and present condition of the aborigines throughout the Colony, and the means adopted by us for their relief, so far as the funds placed at our disposal would admit.

We regret to have to record the death, on the 20th August last, of Mr. Albert Maxwell Hutchinson, who, during the nine years he held a seat on the Board, took a deep interest in furthering every object which had in view the improvement of the condition of the aborigines.

The statistics of the aboriginal population of the Colony (*see Appendix A*), compiled from information collected by the Police on the 15th October last, show a total of 3,503 full-bloods and 3,481 half-castes—6,984 in all.

These figures exhibit, as compared with the previous year, a decrease of 157 full-bloods, but an increase of 95 half-castes—a net decrease of 62.

The deaths amongst the full-bloods exceeded the births by 61, the numbers being 140 and 79 respectively. Though the deaths were only 1 less than in 1895, there were 31 less births. The natural increase amongst the half-castes was 92, births (153) showing a decrease of 5, and deaths (61) an increase of 7, as compared with 1895. These figures would, however, account for an increase of 31 in the total population, instead of a decrease of 62 as shown. The difference can only be accounted for by the difficulty of making a correct census in the remote districts, owing to the wandering habits of the aborigines, and by the border tribes crossing into South Australia and Queensland.

The total number of full-bloods is now but 22 more than that of the half-castes.

A total sum of £17,311 17s. 10d. was expended by the Government on behalf of the aborigines during the year (*see Appendix C*.) This includes an expenditure of £12,961 13s. 11d. by the Board, £860 3s. 7d. by the Chief Medical Officer, £1,028 17s. 6d. by the Minister of Public Instruction, £2,394 5s. 10d. by the Controller-General of Stores, and £66 17s. by the Chief Secretary.

The Board continue to adhere to the rule laid down by them when first appointed for the distribution of the funds placed at their disposal, by restricting, as far as possible, the issue of supplies of food and clothing to those who, from age, sickness, or other infirmity, are unable to support themselves or their children, and to those attending school whose parents are unable to provide them with food and suitable clothing.

In all cases brought under notice, the actual condition and circumstances of the aborigines are fully ascertained, the cases of individual aborigines being investigated and dealt with the same as those of numbers congregating in camps. The young and able-bodied are made to support themselves and their families if work is at all procurable. The police render every assistance, and have succeeded in securing employment for a large number.

A statement in detail is given of the expenditure by the Board (*see Appendix D*). A sum of £9,581 3s. 9d. was expended during the year in the purchase of supplies of food, clothing, medical comforts, boats and gear, fishing tackle, fencing wire, farming implements, seed, material for the erection

67—A

and

[705 copies—Approximate Cost of Printing (labour and material), £16 19s. 3d.]

and improvement of dwellings, &c.; £616 5s. 11d. for the fares of aborigines travelling on the railway lines; and £2,764 4s. 3d. in liquidating claims incurred specially in connection with the Cumeroogunga (Murray), Warangesda (Murrumbidgee), and Brewarrina (Barwon) Aboriginal Stations.

On the last day of the year, 2,134 aborigines were being supported by the Board. Of this number 1,062 were children, and of the remainder 1 was over the age of 100 years, 2 were over 90, 10 over 80, 81 over 70, 278 over 60, 213 over 50, and 487 between the ages of 20 and 50. Of the total, 573 were classed as too old and feeble to earn a living for themselves, 11 blind, 36 sick or recently sick, and 34 crippled; 113 (54 men, 26 women, and 33 children) were being temporarily assisted whilst fencing and preparing Government reserves for cultivation, 204 were women with young children to support and whose husbands were seeking work, and 101 were men and women out of employment and for whom no work was at the time procurable. Of the children, some were young orphans, others were those of sick or destitute aborigines, whilst a large number were receiving rations as an inducement to attend school.

In addition to the above, 244 aborigines were being supported on the Cumeroogunga, Warangesda, and Brewarrina Aboriginal Stations.

During the year seven additional reserves, as under, aggregating an area of 794 acres, have been set apart for the use of aborigines:—

Sackville Reach (Hawkesbury River)	...	...	...	...	150 acres.
"                  "	...	...	...	...	30 "
Runnymede (Casino District)	...	...	...	...	100 "
Bushfield (Bundarra District)	...	...	...	...	280 "
Uralla ... ..	...	...	...	...	100 "
Willanthry (Hillston District)	...	...	...	...	100 "
Minnamurra River (Kiama District)	...	...	...	...	34 "

A small reserve at Singleton, upon which a comfortable dwelling was erected by the Board for an aboriginal widow and her children, has been increased in extent from 1 to 3½ acres.

The reserves of 164 acres at Wilberforce and 230 acres at Singleton, which are no longer required, have been revoked. The area of the reserve at Iluka has also been reduced from 100 to 58 acres.

Every inducement is held out by the Board to the aborigines to occupy and cultivate the land. They are supplied with seed, farming implements, building material, fencing-wire, &c., when the Board are satisfied that good use will be made of the same, and rations are issued to them whilst they are engaged in clearing, fencing, hut-building, &c., and until their crops have been harvested. The following extracts, from reports received are given as a few instances of the progress made by the aborigines:—

"The four reserves in the Gladstone district are now all securely fenced, cleared, and under cultivation. The aborigines now reap good crops, and are in a fair way of living.

"At Nymboida, good three-roomed dwellings have been erected. A portion of the land has been fenced, cleared, and placed under cultivation; the remainder has been ringbarked with a view to putting a larger area under crop next season.

"The aborigines at Walcha Road placed 20 acres under wheat, oats, and potatoes last season. They have also greatly improved their reserve by fencing, ringbarking, &c.

"One of the reserves in the Kempsey district has been enclosed with a good two-railed fence, and subdivided into three paddocks. Twelve acres are under maize.

"On the reserve at Sherwood, about 25 acres have been cleared of scrub and heavy timber. The aborigines are about to enclose the land with a substantial fence.

"On the reserve at Euroka Creek good progress continues to be made. One aboriginal has, in addition to a comfortable dwelling, erected a good straddle barn with bark roof. He keeps a lot of poultry, has 9 acres under maize, potatoes, and vegetables, and has enclosed 25 acres with a good dog-leg and superior pole fence. Another has erected a log pig-stye, stockyard, and calf-pen, has a number of fruit-trees growing, and 8 acres fenced and under maize and potatoes. Another has erected a skillion slab hut with bark roof, and has 7 acres fenced and under maize.

"The aborigines at Currowan grow maize and potatoes on their reserve, and keep a cow and fowls.

"The reserve at Minnamurra was only set apart towards the end of the year. The aborigines have already erected three dwellings, have cleared and burnt off a portion of the land, and have dug up and planted garden plots.

"The aborigines at Bushfield have erected dwellings for themselves, have fenced in vegetable gardens, and intend cultivating other portions of the land."

On the 31st December last there were 110 reserves for aborigines in different parts of the Colony, with a total area of 25,388 acres.

Thirty-four boats in all are now in use by the aborigines at Lawrence, Wardell, Macksville, Gladstone, Kempsey, Taree, Forster, Port Stephens, La Perouse, Sackville Reach, Illawarra Lake, Minnamurra River, Greenwell Point, Ulladulla, Jervis Bay, Wallaga Lake, Moruya, and Twofold Bay. They are used for fishing purposes, conveying stores to and from their island reserves, and ferrying their children to school. Fairly good care is taken of them.

Satisfactory progress continues to be made at the schools established specially for the instruction of aboriginal children at Barrington, Brewarrina, Brungle, Cumeroogunga, Forster, Grafton, Mulyan (Cowra), Rollands Plains, Warangesda, and Wauchope. The teachers are appointed by the Department of Public Instruction, and periodical visits are paid to the schools by Inspectors from that Department.

The number of children now receiving instruction throughout the Colony is 690—364 at Public Schools and the schools mentioned above, and 26 privately—a total increase of 58 on the previous year. The Board continue to offer every inducement for the attendance of these children at school, and are pleased with the result, both as regards the increase in the number of scholars and the progress made by them.

The Board note with regret that a large proportion of the deaths has arisen from the effects of intemperance, and much difficulty is experienced in preventing illadvised persons from supplying the aborigines with intoxicants. The police have been successful during the year in obtaining convictions against a number of persons in the Metropolitan District for breaches of the law in this direction, and also in the following country districts:—Broadwater, South Grafton, Moruya, Berry, Mungindi, Walgett, Hillston, Menindie, Balranald, Wilcannia, Tumut, and Corowa. It is difficult to obtain convictions in these cases, as the aborigines themselves will but rarely divulge the source from which they obtain the liquor.

The amount of the donations to the Aborigines Protection Association during the twelve months reached a total of £95 11s. 3d. only, the lowest received during any period since the formation of that body.

On the 9th July last the Board represented to the Chief Secretary that it was most desirable that some amendment should be made in the regulation by which the management of the aboriginal stations at Cumeroogunga, Warangesda, and Brewarrina was placed under the control of the Association.

It was then pointed out that the duties connected with the management were practically under the oversight of Local Committees, constituted for the purpose by the Board; that the gentlemen composing such Local Committees had repeatedly represented that their action was impeded rather than assisted by the Association, and had expressed their intention from time to time of relinquishing their offices unless they were relieved from any interference except by the Government Board.

The fact of the Association having almost ceased to collect funds from the public to further its objects, and the expenditure for the maintenance of the stations having therefore to be borne by the Government, was also alluded to, and it was strongly urged that the whole business arrangements and management should be vested in the Board, assisted by Local Committees, the Association being, however, rendered every assistance practicable in their endeavours to ameliorate the condition of the aborigines by religious teaching, similar encouragement and facilities being afforded the local clergy.

On the 15th January last the Council of the Association informed the Chief Secretary that they declined to be held responsible for future secular control of the three stations, and the Board now await the Minister's decision in the matter.

Requisitions for provisions and other necessaries are in the meantime being attended to by the Board.

Appended hereto will be found reports furnished by the Local Boards in connection with the Brewarrina, Brungle, Cumeroogunga, Grafton, and Warangesda Aboriginal Stations, as to the progress made at those settlements during the year, and the present condition of the inmates.

To the Local Boards and the police generally we are indebted for much valuable assistance in our efforts to improve the condition of the aborigines, and we take this opportunity of placing on record our appreciation of such services.

We have, &c.,

EDMUND FOSBERY, Chairman.

## APPENDIX I.

## REPORTS OF LOCAL BOARDS.

Sir,

In compliance with your request, we now beg to submit the following Report of the proceedings that have taken place at Cumerooogunga Aboriginal Station for the past year.

Improvements made during the year consist of 14 chains of six-wire fencing erected, also 10 chains of six-wire fencing re-erected; 500 acres cleared of suckers, and dead timber burnt off; a two-roomed weatherboard cottage erected, and another in course of building; a log hut built for aged men; a 3,000 gallon tank erected on stand for main water supply; 160 acres ploughed, 150 acres put under wheat, 2½ acres under potatoes, also a small patch planted with pumpkins.

The

The farm-blocks' men ploughed an aggregate of 70 acres, which they put under wheat. John Atkinson ploughed and sowed 27 acres with wheat—about 4 acres were destroyed by rabbits; 17 acres were cut for hay, giving a total yield of about 4 tons; 6 acres were stripped, giving a total yield of 72 bushels. He returned 12 bags of wheat to Station, that quantity having been supplied him for seed. He has cut most of his hay into chaff, and has sold over 1 ton. Robert Cooper ploughed and sowed 9 acres with wheat, which he cut for hay, getting a return of about  $3\frac{1}{2}$  tons. E. Joachim ploughed and sowed 10 acres with wheat; cut 3 acres for hay, getting about 1 ton return; stripped the other 7 acres for about 38 bushels of wheat. F. and H. Walter ploughed and sowed 8 acres with wheat; cut 7 acres for hay, getting about  $2\frac{1}{2}$  tons hay; and stripped 1 acre for 9 bushels, which they returned to Station. Bagot Morgan ploughed and sowed 8 acres with wheat, which he cut for hay, getting about a ton, which he sold for £3 10s. George Allen ploughed and sowed 9 acres; rabbits destroyed about 2 acres; crops cut for hay, about  $1\frac{1}{2}$  ton.

The Station's returns show as follows:—110 acres cut for hay; yield, about 45 tons—30 tons in a stack and 10 tons under the shed, 5 tons having been used during the harvesting. About 25 acres have been stripped, the yield being 120 bushels of wheat. There are 14 acres more to strip, but it is not quite ready.

The average attendance for the year at the school is as follows:—Boys, 34.7; girls, 34.3; total, 69. The general efficiency of this school compared with last year shows the results are higher. The following is an extract of the observations from the School Inspector's report:—"The pupils are bright and cheerful in demeanour, are healthy and well cared for in appearance. The government is genial and firm, the order is good, and the teaching has been earnest and successful."

The general condition of the school is very satisfactory.

The health of the people on the Station has been good. The conduct of the residents has been good with the exception of a few, and the Local Board have instructed the Manager to take severe measures to eradicate the evil unless they very materially reform. The management of the Station is satisfactory.

The population averages about 170 persons. There have been twelve births (all half-castes), three marriages (all half-castes), and two deaths (one child half-caste, and one adult full-blood).

We have, &c.,

A. E. KINSEY, Chairman.

C. L. BLAIR, Hon. Secretary.

The Secretary, Aborigines Protection Board.

Sir,

Local Board, Darlington Point, 16 February, 1897.

We have the honor to report that during the past year the Local Board held eleven meetings, at each of which there was much to occupy their attention. Disputes had to be settled, differences adjusted, misconduct rebuked, and advice given upon many matters.

We regret that the moral tone of the Station has been far from satisfactory. While the majority of the residents have conducted themselves circumspectly, a large minority have not done so, some having been guilty of gross misconduct.

We also regret that more useful work has not been done. When the number of strong able-bodied men who are to be seen about the Station is taken into consideration, the amount of work done is insignificant. Less useful work was done during the past year than during previous years.

A large spacious dormitory for girls was erected. The work was faithfully performed by a carpenter sent from Sydney. Authority was given for the erection of three new cottages and a hut for single men. Part of the necessary material was supplied and the work of erection commenced by some of the men, under the supervision of the Manager. Some minor improvements were effected by the erection of sapling fences at the Manager's residence, and at some of the cottages. The land (about 50 acres) that was cleared and grubbed in 1895, was enclosed with a substantial six-wire fence. The contract was let to some of the men, and was carried out in a thoroughly satisfactory manner. A few acres of this land was fallowed, but on account of the hardness of the ground, due to the long continued dry weather, fallowing had to be discontinued.

Only a very small area was put under cultivation, and in consequence of the severity of the drought the return was extremely poor.

The stock are in poor condition, owing to the scarcity of feed.

Towards the close of the year the Dormitory Matron, and the girls under her charge, moved into the new dormitory, where they are enjoying a measure of comfort and happiness which they did not experience in the old building.

The village has invariably presented a clean and orderly appearance.

The tidiness of the dormitory girls, and also of the women and children outside, reflects the greatest credit upon Mrs. Pridham and Mrs. Smith.

The school has made remarkable progress. The enrolment has largely increased.

The health of the residents has been fairly good.

During the year there were five deaths and five marriages.

We have, &c.,

H. KOOK, Chairman.

C. R. F. NOBBS, Hon. Secretary.

The Secretary, Aborigines Protection Board.

Sir,

Local Board, Grafton, 31 January, 1897.

We have the honor to report that satisfactory progress has been made at the Home for Aborigines in this district. Frequent visits have been made by the members of the Board, and we have been pleased to note the general contentment amongst the inmates, and the desire by the Manager and Matron to increase the usefulness of the Home.

You will note under the headings given below that considerable land has been put under cultivation, roads and bridges repaired, buildings erected, &c.

On the farm about 13 acres are now under crop, which have entailed a large amount of clearing, grubbing, and burning off. The crops have turned out fairly well, but dry weather is now retarding their growth. In buildings, a store and workshop have been erected, a cottage for the school teacher, and a large new school room, 27 x 16, is in course of erection.

A very fair cash return has been taken from the land, as will be seen in the Manager's report, but when additional land is under cultivation a large amount of current expenses will be saved. The potato crop has assisted in this direction, and a great quantity has been consumed by the aborigines.

Stock.—The grass has been good on the Home, and the stock in first-class condition, and during the coming winter months it will not be necessary to purchase much beef.

The health of the inmates of the Home has been satisfactory. Their conduct has been fairly good; but, of course, in dealing with aborigines we must not expect as much as from white people.

In conclusion, we regret that Mr. Frank Norrie's residence now in Sydney prevents us from having the benefits of his knowledge and experience.

The Board are pleased indeed to report matters are proceeding satisfactorily.

We have, &c.,

THOMAS PARKER, Chairman.

JAS. C. WILCOX.

The Secretary, Aborigines Protection Board, Sydney.

#### Manager's Report on the Home for Aborigines, Clarence River, for the year 1896.

On the 31st December the ordinary population was considerably reduced through people and children going away for school and Xmas holidays. The numbers of aborigines who ordinarily live at the Home, and receive rations there, are:—Full-bloods—15 men, 13 women, 7 boys, 15 girls; total, 50; half-castes—3 men, 4 women, 5 boys, 1 girl; total, 13; grand total, 63.

The daily average population for the year was 53.

The number of aboriginal children ordinarily attending the Home school—10 boys, 13 girls; total, 23.

Permanent improvements effected during the year.

Farm.—Eight acres new forest land cleared, partly stumped, ploughed, and planted with maize; 5 acres roughly worked last year, properly cultivated and planted; a great number of stumps and roots burnt and grubbed out; roads and bridges repaired after floods.

Buildings.

**Buildings.**—Store and workshop (one building) erected, 27 feet long, 14 feet wide, 8 feet wall, roofed with iron, wall partly boards, partly good ironbark slabs, split by Home men. Cottage, for school teacher, two rooms, board floor, and papered walls, with canvas ceiling, with skillion and verandah; total, floor, 23 feet x 20 feet. New school-room, 27 feet long x 16 feet wide, 10 feet wall, half-hipped Swiss roof, to be covered with iron, with verandah full length, 7 feet wide. (This is not erected, but all parts of it are cut and finished, and a few days work will see it ready for use.) One hundred and fifty slabs and 3,000 shingles were split in the bush, and brought to the Home for use in building; 65 sheets of bark were also stripped; an underground tank to catch roof water was commenced.

**Cultivation.**—The maize crop planted 1895, and gathered this year yielded from very poorly on bad land to good on richer ground. The poor land was left out of cultivation this year, and work concentrated on the best land. The cash return from 1895-6 crop was over £35, £21 being paid in cash to the Local Board, and the balance expended by the Manager, by permission of the Local Board, for a spring-van and harness, seed potatoes, and small items. There are now planted about 18 acres maize, 1½ acre potatoes, ½ acre tomatoes, 1½ acre onions, ½ acre lucerne, and 3 acres are under preparation for winter potatoes. The early maize is bearing a heavy crop. The potatoes yielded very well, but from the glut in the market will only just pay for the seed in cash, though there are several tons over for the people to eat, and for next planting. The onions are making a very profitable crop. The tomatoes were cut back by the frost, and will give no profit, though the Home people have greatly benefited by them, as a skin disease which troubled them has disappeared since they had free run of the tomatoes. The yield from late corn depends entirely on the weather, which threatens to be very dry. The people have been well supplied with vegetables this year. They have eaten several tons of sweet and ordinary potatoes, and have had plenty of cabbage, beans, pumpkins, melons, and tomatoes.

**Stock.**—The Home horses are in good condition, but one draught mare is lame and unfit for any more heavy work. The cattle are doing very well. The expense for beef was greatly reduced this year by killing Home cattle, and in a few weeks it will be cool enough to commence killing again.

**Health of Aborigines.**—The general health has been good.

**Deaths.**—One old man, a full-blood, about 65 years of age, died from inflammation of the lungs.

**Births.**—Nil.

**Conduct.**—There was absolutely no serious quarrelling or fighting of any kind, nor was there any person at the Home at any time really intoxicated. The aborigines now make a habit of settling their disputes away from the Home, and sleeping off the effects of liquor before they come in if they have too much. The vice of gambling, so prevalent among aborigines, is strong among these people, and occasionally gives trouble. Still, under persuasion, the men continue to spend most of their wages usefully, and all the people are well clothed and more comfortable under the care of the Board than they could be anywhere else.

**General.**—The cash value of permanent improvements effected, crop to hand, &c., is nearly, if not quite, £200, and the farm is replanted with crops for next season in addition to this sum; and, as the Home has undoubtedly made progress, I am emboldened to hope that the work for the year may meet with the approval of the Board.

The Chairman, Local Board, Grafton.

F. C. CURREY,  
Manager.

Sir,

Local Board, Brewarrina, 13 March, 1897.

The work performed during the year for the improvement of the Station has consisted principally of the erection of about 3 miles and 77 chains new five-wire division fencing and the removal of about 30 chains old fence to a more suitable position. The Station is now subdivided into three paddocks on the Cato Creek and five paddocks on the Barwon River, also a cultivation paddock of 12 acres, which has been sown with wheat for the last four years, and in only one year was a crop taken off it. The Board, therefore, are doubtful if it is advisable to continue cultivating this.

A new verandah has been lately erected all round the schoolroom, and the room has been ceiled. This has greatly improved the place, and the work has been carried out satisfactorily. It was only intended to erect this verandah on three sides, but, for the protection of the building, the Board thought it advisable and necessary to put it all round.

**Suckering ringbarked country on the station.**—There are about 3,000 acres now ringbarked, which will improve the carrying capacity of the country. All the improvements are in good state of repair, and are well looked after. The Board consider the Station now fully improved for all present requirements.

There were 42 aborigines slept on the station during the last nights of the year, and the monthly average was 48.9. There were 20 children enrolled on the school roll at end of year, and the monthly average was 19.6. The children passed a creditable examination.

There are eleven boys and five girls bound out at satisfactory wages, some of them just ending their third year, and, in most cases, giving satisfaction to their employers. Numbers of applications are continually being made for children.

There were six deaths during the year, nearly all from old age. The general health and conduct of the people are good.

The stock at end of year consisted of 42 cattle including calves, 20 horses, and 723 sheep including lambs. All these are in good condition.

The net proceeds of wool for 1896 from 619 sheep was £91 12s. 1d.

Sheepskins realised £19 15s. 3d., and extra wool £2 2s. Five hundred sheep were killed for rations during the year, being an average per month of 41.8.

The Manager and his wife have taken a great interest in everything connected with the Station during the year. The whole place is kept thoroughly clean, and the aborigines are well satisfied. The children have also greatly improved under their care. Considering the very satisfactory way in which the place has been managed, my Board would suggest that a small increase might be given the Manager if funds would allow of it.

The Secretary, Aborigines Protection Board.

H. LORAINÉ CATHIE,  
Chairman.

Gentlemen,

Aborigines' Station, Brungle, 1 February, 1897.

Subjoined I have the honour to present the Annual Report of this Station for the year 1896.

**School.**—This has been in operation every school-day throughout the year, except during the time when the alterations were being effected. The average attendance for the whole year was:—Boys, 9.9; girls, 9.9; total, 19.8. The normal attendance is about 22, but a period of sickness amongst the children reduced the average. The District Inspector's report on the year's work is very satisfactory.

**Health.**—The general health of the camp during the year has been only moderate, and one special case of cardiac disease has rendered a heavy expense for doctor's attendance necessary.

**Births.**—Full-blood—Male, 2. Half castes—Male, 2; female, 2. Total, 6.

**Deaths.**—Full-blood—Male, 3; female, 2. Half-castes—Male, 3. Total, 8.

**Cultivation.**—A new paddock, containing about 15 acres, has been grubbed and cleared ready for the plough; but it will be impossible to turn up any ground, either new or old, with the plough now on the Station, it being completely worn out. I very much regret to say that this year's operations in wheat-growing have resulted very unfavourably. There was every prospect of a good crop, and, to avoid risk of stacking, I arranged to strip the wheat. I found, however, that the stripper was leaving nearly half the grain, and I, therefore, stopped it, and procured a reaper and binder to complete the work. During January, and before I could get a thrashing machine, very heavy rain fell, and, in common with all others, the wheat in stack was seriously damaged. The whole had to be pulled to pieces and spread out to dry and restacked, in which process a large amount of grain was lost. The crop was actually better than last year, but, in consequence of these circumstances, only thirty-one bags were obtained.

**Conduct.**—The general moral tone of the camp is, I think, steadily, though slowly, improving. There has been only one minor disturbance in the camp during the year, and less trouble is experienced in the neighbouring towns with regard to men drinking. One white man was detected bringing liquor to the camp, and brought before the Bench and heavily fined.

I have, &c.,

J. G. USSHER,  
Superintendent.

Approved by Local Board.—A. M'GRUER, Acting Chairman.

[2d.]

1897.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

## INSPECTOR-GENERAL OF THE INSANE.

(REPORT FOR YEAR 1896.)

Presented to Parliament, pursuant to Act 42 Vic. No. 7, sec. 73.

*Printed under No. 5 Report from Printing Committee, 27 May, 1897.*

### The Inspector-General of the Insane to The Chief Secretary.

Sir, Lunacy Department, Inspector-General's Office, Gladesville, 15 May, 1897.

I do myself the honor, in accordance with the 73rd section of the Lunacy Act of 1878, to submit for your information a report on the state and condition of the Hospitals and other Institutions for the Insane for the year ending 31st December, 1896.

I have, &c.,

F. NORTON MANNING,  
Inspector-General.

On the 31st December, 1896, the number of insane persons under official cognisance was 3,845, and their distribution was as follows:—

Institution.	Number on Register.			Number on Leave.		
	Male.	Female.	Total.	Male.	Female.	Total.
Hospital for the Insane, Gladesville .....	522	346	868	1	22	23
Do Parramatta (Free) .....	685	383	1,068	7	7	14

<b>Total.....</b>	<b>2,356</b>	<b>1,489</b>	<b>3,845</b>	<b>19</b>	<b>40</b>	<b>59</b>

The number at the close of 1895 was 3,720, so that the increase during the year 1896 was 125 made up of 67 males and 58 females.

114—A

[525 copies—Approximate Cost of Printing (labour and material), £21 5s. 6d.]

This.

This increase was slightly less than that for the preceding year, but over the average for the last twenty years, 1877 to 1896 inclusive, which was 105.

During the twenty years, 1872 to 1891 inclusive, the proportion of insane to population, though varying slightly from year to year, remained practically stationary, but the five years, 1892 to 1896 inclusive, have added 711, or an average of 142 annually, to the number of insane persons under care.

The proportion of insane to population, which at the end of 1891 was 1 in 371, or 2.69 per thousand, was at the close of 1896, 1 in 337, or 2.96 per thousand.

The cause of this increase is to be found, as I have pointed out in prior reports, in the general commercial depression of the Colony, which has brought to many altered circumstances, trouble, and stress, which have served to break down in mind those who are neurotic and unstable, and least able to fight the battle of life under adverse conditions.

Of the total number of insane persons on the register at the close of the year, 3,782 were in the Hospitals and Licensed Houses in this Colony, 59 were absent on leave under the provisions of the Lunacy Act, and 4 were in Hospitals for the Insane in South Australia under the provisions of the Lunacy Convention Act of 1894.

The returns from the Hospitals and Licensed Houses show that there was an increase of 20 at Gladesville, 15 at Parramatta, 41 at Callan Park, 35 at Rydalmere, 8 at Kenmore, 6 at the Hospital for Criminals at Parramatta, and 1 at the Licensed House at Ryde, whilst there was a decrease of 1 at the Hospital at Newcastle, and 3 at the Licensed House at Cook's River. The number under care in South Australia and in the Licensed Houses for single patients at Picton remained unaltered.

The wards at Gladesville, Callan Park, and Parramatta were at the close of the year in a dangerously overcrowded condition, and a more than usually anxious charge to the Medical Superintendents, the excessive number of patients interfering seriously with the management, tending to quarrels and accidents, and militating against the physical health and the mental restoration of the inmates. The new wards at Kenmore, which should have been ready for occupation by the end of December, were then not nearly finished, and, though some of the buildings have since been taken over and occupied, it seems probable that it will be the end of June next, or six months beyond contract time, before all the wards are completed and so fitted and furnished that patients can be placed in them.

The arrangement, sanctioned by Act of Parliament and carried out under convention with the Colony of South Australia, by which patients from the district of Broken Hill in this Colony have been taken charge of by the authorities of South Australia, and maintained in the Hospitals for the Insane of that Colony, has been carried out during the year without any difficulties.

At the close of 1895, 4 such patients were in the South Australian Hospitals. During the year 1896, 7 were received, making a total of 11 under care. Of these, 5 were discharged recovered, 2 died, and 4 remained on December 31, 1896.

The following tables show the admissions, discharges, and deaths, the proportion of recoveries, the rate of mortality, the causes of insanity in those admitted, those who recovered and those who died, the causes of death, the length of residence in those who recovered and those who died, and also the ages, condition as to marriage, religious profession, nationality, and previous occupation of those admitted and of all under care, as well as the form of mental disorder in those admitted, those who recovered, and those who died during the year:—

TABLE 1.

SHOWING the Admissions, Readmissions, Discharges, and Deaths in the Hospitals and Licensed Houses for the Insane during the year 1896.

				Male.	Female.	Total.

#### Admissions.

The number of patients admitted during the year was 740—450 males and 290 females—a larger number than was admitted in any previous year. Up to 1893 the number received in any one year did not reach 700. In 1894 it was 712; in 1895, 715; and in 1896, as above stated, 740. Of the total number, 629 were admitted for the first time, whilst 111 had been at some former time inmates of one or other of the Hospitals for the Insane in this Colony. The proportion of re-admissions to original admissions is not larger than usual, and many of the patients were absent for very long periods; but the tendency to relapse in mental disease is well illustrated by the fact that in the case of nearly one-seventh of the whole number of admissions the patients had been previously under treatment.

The ratio of admissions to the general population of the Colony, or what is known as the ratio of "occurring insanity," was 1 in 1,753. This ratio was higher than in any year since 1882. The number of admissions from places beyond the Colony, reported under the provisions of section 4 of the Lunacy Act Further Amendment Act, was 4 only. In all these cases steps were taken by the Master in Lunacy to recover the charges for the maintenance of these patients from the persons liable by statute. The statutory provisions for this purpose, strictly enforced as they have been, have practically put a stop to the deportation of insane persons to this Colony, which had gone on unchecked for many years, and entailed a heavy expenditure for maintenance.

Attention has been directed in former reports to the very careless and unsatisfactory manner in which the medical certificates and other legal papers on which patients are sent to hospital are prepared; but this appears to have had but little effect. In no less than 174 cases, or something like one-fourth of the total number of admissions, the papers have been irregular, and it has been necessary to call for their amendment under the provisions of section 9 of the Lunacy Act Further Amendment Act. In some cases the medical certificates were vague, inconclusive, or incomplete in form; in others the order issued by the magistrates was irregular or defective. In not a few cases every legal document in the case showed evidence of want of care in its preparation and required amendment, and in occasional instances, the cases not being urgent or immediately dangerous, the patients were refused admission.

The provisions of the Lunacy Statute are simple. The requirements are duly set forth on the Schedule, and it ought not to be difficult for medical practitioners, Police Magistrates, and Clerks of Petty Sessions to realise that these papers are important legal documents, and that it is imperative that they should be correct in form in even minor particulars, and contain evidences of insanity at once exact and conclusive. Though the Lunacy Act gives power to amend defective papers within twenty-eight days of the admission of the patient, it was surely never intended that this provision was to cover repeated sins of omission and commission and the general neglect of all concerned in dealing with the commitment of the insane.

It

It is only right to add that on request being made the necessary amendments were made in all but four cases, in which, the patients being undoubtedly insane, fresh proceedings were taken; and that in no case during the year was any patient sent to hospital who was not insane and a fit subject for hospital treatment.

#### Transfers.

The number of patients transferred from one hospital to another, under the provisions of section 80 of the Lunacy Act, was 135. The greater number of these transfers was made from Callan Park and Gladesville to Rydalmere, chronic cases being sent to the latter institution, so as to relieve as far as possible the congested condition of the wards at the two main hospitals where acute cases are received. A few idiot and imbecile patients, sent in error to Callan Park and Gladesville, were sent on to Newcastle, the hospital specially set apart for this class of cases. Some twenty-four cases from the southern districts of the Colony were sent from Gladesville and Parramatta so that they might be nearer their relatives and friends, and a number of patients were transferred from one hospital to another at their own request or on the recommendation of the medical officers, with the hope that the change might be beneficial to their general or mental health.

The following return gives the particulars of the transfers for the year:—

RETURN showing Transfers for year 1896.

#### Discharges.

The number of patients discharged during the year was 377, and of these 332 were reported as recovered and 45 as relieved. The recoveries give a percentage of 44.86, and the cases relieved a percentage of 6.08 on the admissions, so that over 50 per cent. so far recovered under care and treatment as to be able to again take their places in the world. This recovery rate is somewhat above the average for the last ten years, and as it includes the returns from the Hospital for the Insane at Newcastle, where only idiot and imbecile patients are admitted, must be considered satisfactory.

The recovery rate varied at the different institutions, being 53.30 at Gladesville, 43.92 at Callan Park, 38.16 at Parramatta Free, 10.00 at Parramatta Criminal, and 42.85 at Cook's River. There were no recoveries at Newcastle.

#### Deaths.

The deaths numbered 231, and the percentage on the daily average number resident was 6.22, being somewhat below the average for the last ten years. The percentage at the different hospitals was as follows:—Gladesville 4.01, Parramatta Free 7.30, Parramatta Criminal 1.85, Callan Park 8.25, Rydalmere 5.19, Kenmore 1.30, Newcastle 7.71, and the percentage at the Licensed House, Cook's River, was 8.10.

In Table 4 the causes of death are set forth in detail, and from this it will be seen that in 110 cases, or nearly one-half of the total mortality, death was due to cerebral disease, in no less than 55 cases to thoracic affections, and in 20 cases to affections of the abdominal organs. In 34 cases the cause of death was reported as general debility and old age, in 3 as cancer, 3 as accident, and in 2 as suicide.

In reviewing this table, the high death-rate from general paralysis of the insane and from pulmonary consumption are perhaps the most striking features. That 50 patients—by far the highest number heretofore registered—should in one year have died from general paralysis of the insane, a disease which thirty years ago was almost unknown in this Colony, calls for some comment. This disease, always progressive, and ultimately fatal, would appear to be a product of modern civilisation. First described in 1839 as a distinct affection, it remained a rare disease for some years, and was practically unknown forty years ago, except to a few alien physicians. Even thirty years ago, though well known in England, it was seldom seen in institutions for the insane in Scotland and Ireland, and more rarely still in American institutions. Now it is common enough in all these places, and is very decidedly increasing in all, so-called, civilised communities. It is distinctly an urban disease. More than two-thirds of all the cases admitted to the hospitals for the insane in this Colony are to be found at Callan Park, where patients from the Metropolitan district are received, and the areas within which it originates are for the most part those pervaded by telephones and other kindred contrivances. Its causation may be expressed in the words hurry, high pressure, and excess.

There has always been a subtle connection between pulmonary consumption and insanity, and the percentage of deaths from consumption in the asylums of Great Britain has always been a high one, and very much in excess of that in this Colony. The percentage, however, is now increasing here, and was greater during the last than in any preceding year. The establishment of up-country hospitals for the insane will permit of patients threatened with pulmonary phthisis being sent away for a change to drier and more suitable climates; but it will probably be advisable, now that the pathology of this affection is better known, to make arrangements for the special isolation in separate buildings within the hospital grounds of all cases of this disease in its most infective form.

Total

*Total number under Care, &c.*

The total number of patients under care during the year was 4,591. The average daily number resident was 3,710, and the number on the registers at its close was 3,841, of whom 2,353 were males and 1,488 females. These numbers are exclusive of those patients belonging to this Colony who are under care in the Hospital for the Insane in South Australia.

*Leave of Absence.*

By the provisions of section 82 of the Lunacy Act, leave of absence can be granted to patients in institutions for the insane, and under those provisions 59 patients were absent on leave at the end of 1895. During 1896 leave was granted in 121 cases, making, with those already absent, 180 on leave. Of this number, 71 were discharged recovered at or before the time when their leave expired, 49 were returned to hospital, 1 died, and 59 were still on leave at the close of the year. The death was due to accident in an epileptic patient, the friends to whose care and at whose request the patient was allowed to leave the hospital not apparently having exercised the supervision which was necessary.

The system of granting leave of absence has been specially useful as a preliminary to discharge; but it also enables more or less chronic cases to spend short periods with their relatives and friends, and thus adds materially to their contentment and happiness.

The following return gives particulars as to leave of absence during the year:—

## RETURN showing particulars as to Leave of Absence during the year 1896.

*Accidents.*

In a large population made up of patients, some of whom are excited and aggressive, others demented and careless, not a few epileptic and impulsive, and all more or less irresponsible for their actions, accidents, even with careful classification and efficient supervision, are almost unavoidable, especially in wards much overcrowded.

The number of accidents during the last year has been fewer than usual, but included two cases which resulted fatally. One of these occurred at Callan Park and one at Gladesville. In addition to these, there were two cases of suicide, both of which were due to hanging, and both of which occurred at Parramatta. In all these cases, as well as in a case of death, inquests were held by the Coroner of the district.

The other accidents included 2 dislocations of the shoulder through falling in fits, 2 fractures of the thigh, 4 fractures of the collar-bone, 3 fractures of the leg, 3 fractures of the arm, and 1 fracture of the bones of the hands. All of these were at once reported by the Medical Superintendents, and were made the subjects of such inquiries as appeared necessary. The majority of these accidents occurred in epileptic patients, a few were due to quarrels, and others occurred in the course of ordinary work in the wards or on the hospital gardens or farms.

*Increase in the number of "Alien" Patients.*

In Table 9 notice is called to the nationality of the patients under care, and it may be advisable to take notice of the increasing number of those who, for want of a better name, may be called "aliens."

In 1896 there were 87 natives of China under care, and 243 patients classified under the general heading of "other countries." On analysing the figures under this latter heading, it appears that a considerable number belong to coloured races, and on 31st December, 1896, there were 106 patients under care, classified as follows:—Chinese, 73; East Indians, Cingalese, &c., 14; Syrians and Levantines, 2; South Sea Islanders, 2; other coloured races (not including Australian aborigines), 14.

It has become the rule in civilised communities to treat, maintain, and care for the sick and insane, whatever the nationality to which they may belong, in the countries where they may fall ill, and this reciprocal action is greatly to the advantage of the sufferers. This has always been the course pursued with regard to those falling insane in this Colony, and should no doubt be continued in the case of natives of all countries in which there is reciprocity in this respect, or where the persons falling sick have come to New South Wales as *bonâ fide* colonists, intending to make their home in the Colony. It is open to question, however, if natives of China and other countries with which there is no reciprocal action whatever, and who come here for the most part as visitors, should be permanently cared for in the hospitals for the insane in this Colony. In the acuter stages of their malady they must be taken care of and treated for the safety of themselves and others; but there appears to be no reason why, when their condition has become chronic and generally incurable, they should not be deported to the countries to which they belong. Their maintenance involves a very considerable expense to the Colony, they are a foreign and often offensive element in the hospitals, and it would be cheaper to deport them with all necessary care for their protection and welfare during the journey.

The Government of Western Australia has recently taken some action in this direction, and in the Annual Medical Report of the civil hospitals and lunatic asylums at the Straits Settlements for the year 1895 is the following passage:—"Measures were taken to reduce the number of lunatic patients by discharging and sending home some of the chronic cases which were considered harmless, in fair bodily health, and not in need of medical treatment; and it was found possible in this way to send back 57 Chinese patients to China and 4 Tamils to Madras."

#### *Changes in the Staff.*

The changes among the officers of the Department have been as follows:—Dr. Robert U. Russell, the Senior Medical Officer of the Hospital at Parramatta was promoted, after six years' service in this Department, to the charge of the Coast Hospital in the Department of the Medical Adviser to the Government; and consequent on this, Dr. Gavin Morton, the Junior Medical Officer at Gladesville, became Senior Medical Officer at Parramatta, and Mr. Hogg, M.B. and C.M., of the University of Edinburgh, succeeded Dr. Morton at Gladesville.

Miss Cooke, the Matron of the Hospital for the Insane at Parramatta, resigned her appointment after three years' service, and was succeeded by Miss Quinn, the Matron of the Hospital at Newcastle. Miss Newton, who had for a considerable period been Senior Nurse of the General Hospital at Newcastle, was appointed Matron to the Hospital for the Insane at Newcastle in succession to Miss Quinn.

Among the members of the general staff the changes were much more numerous than during any former year. No less than 68 attendants, nurses, and servants vacated their positions; a considerable number of these leaving the Service owing to their dissatisfaction with the rate of salary allotted to them under the original grading of the Public Service Board. This wholesale loss of members of the staff, selected for their special qualification and trained for their special duties, caused very considerable embarrassment to the Medical Superintendents in charge—embarrassment which was not lessened by the paucity of suitable applicants for the vacant positions.

#### *Need for Additional Accommodation.*

At the close of the year there was accommodation in the hospitals for 3,409 patients, whilst the number of inmates was 3,798, or 389 more than the buildings would properly accommodate. The condition was one of dangerous overcrowding, and the Department of Public Works was moved to urge the contractors for the additional buildings in progress at Rydalmere and Kenmore to complete and hand over these as soon as possible. Early in 1896 wards to accommodate 34 patients at Rydalmere and 215 at Kenmore—a total of 249—were ready for occupation, and steps were taken for the transfer of patients to these from the overcrowded wards of the other hospitals; but even with this addition to the ward space there were still 140 patients more than could be properly housed. The necessity for proceeding with the erection of additional wards at Kenmore is apparent, and it is hoped that no unnecessary delay will occur in carrying out this work. By the end of 1897 the surplus number of 140 will have been increased by at least another 100, and the state of matters at the end of the current year will be but little better than that at the end of 1896.

#### *Receipts and Expenditure.*

The receipts of the Department from all sources amounted to £13,913 5s. 10d., and was made up as follows:—Collected by the Master in Lunacy towards the maintenance of patients in hospitals, £13,103 2s. 3d.; paid by the Imperial Treasury for the maintenance of convict patients, £177 19s. 3d.; received from sale of fat and old stores, £590 9s. 1d.; and from rent of land, £41 15s. 3d. The receipts were somewhat less under every heading than during 1895, and fell short of the total amount received during that year by £814 1s. The details are shown in the following return:—

TABLE showing Total Receipts on account of Institutions for the Insane during the year 1896.

Licensed House for the Insane, Cook's River.....	.....	.....	.....	.....	.....
Reception House for the Insane, Darlinghurst .....	14 14 1	.....	.....	.....	14 14 1
Inspector-General's Office .....	.....	.....	.....	41 15 3	41 15 3
Total .....	£ 13,103 2 3	177 19 3	590 9 1	41 15 3	13,913 5 10

The total expenditure amounted to £103,928 5s. 3d., and was made up as follows:—Maintenance of patients in Hospitals for the Insane, £99,900 10s. 11d.; maintenance of patients in the Reception House at Darlinghurst, £1,457 1s.; maintenance of patients in South Australian Hospitals, £204 0s. 3d.; and general expenses—including cost of Inspector-General's Office, payments to official visitors, maintenance of steam-launch, &c.—£2,366 13s. 1d. With the exception of the payment to the South Australian Government, the expenses were lower than during 1895 in every item, although the average daily number of patients under care was 136 more than during that year.

The average weekly cost per patient was 10s. 5½d., without deducting collections, and 9s. 0½d. when these were deducted. The cost at Kenmore, though considerably less than during last year, is still higher than that at other hospitals, owing to the small number of inmates and the many initial expenses incidental to a new institution.

The following returns show—(1st) the average weekly cost of the hospitals for the last ten years, 1887 to 1896 inclusive; (2nd) the weekly cost at each hospital from 1870 to 1896 inclusive; and (3rd) the particulars of expenditure at the hospitals during the year 1896.

The following return shows the number of Insane Patients under care on 31st December of each year, the number of Admissions for each year, and the Total Expenditure in the Lunacy Department for each of the ten years from 1887 to 1896 inclusive :—

Year.	No. of Patients on 31st December.	Admissions.	Total Expenditure.
1887	2,821	532	£ 89,213
1888	2,898	588	89,895
1889	2,974	550	100,302
1890	3,102	611	96,138
1891	3,134	596	100,112
1892	3,312	666	102,519
1893	3,425	688	101,077
1894	3,537	712	99,425
1895	3,720	715	104,846
1896	3,845	740	103,928

The number of patients in Hospitals for the Insane has in ten years increased by 1,020, whilst the number annually admitted has risen from 532 to 740. During the same period the cost, which has varied somewhat from year to year with varying seasons and the cost of provisions and other necessaries, has increased by £14,715. In other words, whilst the number of patients resident has increased in ten years by 36 per cent., and the admissions—an expensive class of cases—by 39 per cent., the expenditure has, under a judicious system of economy, only increased by 16½ per cent.

The maintenance rate in the Hospitals for the Insane in this Colony is now so low that it cannot well be reduced without impairing the health, comfort, and well-being of the patients—without, in fact, sacrificing efficiency to economy, jeopardising the recovery of the inmates by an unwise parsimony, and running the risk of making into chronic cases and permanent inmates those who under wise and liberal expenditure would recover, and be no longer a burden upon the State.

*Reception House for the Insane, Darlinghurst.*

The statistics of this institution are not included with those for the Hospitals and Licensed Houses, as the patients are for the most part only admitted for temporary care and treatment on their way to the hospitals, or whilst awaiting the signature of the certificates and orders necessary for their admission to these institutions.

The number of patients remaining on December 31, 1895, was 6, and the number admitted during the year 587, making a total of 593 under care and treatment. This number, which was somewhat less than that for several previous years, was made up of two classes—those under certificates of insanity (365 in number), and those under remand under section 1 of the Lunacy Act Amendment Act, of whom there were 228. Taking these classes separately; of the 365 under certificate, 10 were discharged recovered, 352 were sent to hospitals for the insane, 1 died, and 2 remained at the close of the year; whilst of the 228 under remand, 110 were discharged recovered, 113 were sent to the Police Court, certified as insane, and returned to the Reception House, 1 died, and 4 remained at the end of the year. It will be seen that

110 of the number were first admitted in one, and subsequently in the other class. The Superintendent of the Reception House reports that 5 cases under certificate, and 10 cases under remand, were admitted twice during the year 1896, and that no less than 85 of the patients admitted during the year had in some one of the thirty years during which the institution has been in existence previously been inmates. The large majority of these recurrent cases were suffering from the temporary insanity due to drink. The institution has done good and useful work. The total number of patients discharged as recovered was 120, and the deaths were 3 only. Considering that a very large proportion of the cases was in an acute stage of the malady, the death-rate is a very small one, and the fact that no case of serious accident or suicide has occurred is creditable to the management.

The following table gives the detailed statistics of the Reception House for the year 1896:—

RETURN showing the Admissions, Discharges, Deaths, &c., of Patients in the Reception House for the Insane during the Year 1896.

	Remaining on 31st December, 1895.			Admitted during 1896.			Total Number of Patients under care.			Patients Discharged, Transferred, Died, &c.												Remaining on 31st December, 1896.

*The Observation Wards at H.M. Gaols, Darlinghurst and Parramatta.*

These wards are "set apart for the detention of any prisoner who may be supposed to be insane, or who, from mental imbecility, may be supposed to be unfit for penal discipline, in order that he may be there placed under observation until it be certified that he is of sound mind, or is insane and a fit subject for detention in an hospital for the criminal insane." Unfortunately, owing to the very overcrowded condition of the existing hospital for the criminal insane and the impossibility of transferring more patients of the criminal class thereto without serious danger, prisoners have, during the last three or four years, been still detained in the Observation Ward after a conclusion as to their insanity has been arrived at.

In addition to the original purpose for which the wards were established, they have been used for a number of other cases in which the question of mental capacity has been raised, including cases awaiting trial at the Supreme Court or Quarter Sessions, and under minor sentence or remand from the Police Court.

The accumulation of cases of various kinds has served in a measure to defeat the special objects contemplated in setting apart these wards and given malingeringers object lessons which might serve to assist in defeating the scrutiny of the medical officers and warders in charge.

The statistics of these wards are as follows:—There were at the ward at Darlinghurst on December 31, 1895, 9 inmates, and 49 were received during the year, making 58 under care. Of these, 36 were discharged of sound mind, 4 were sent to hospitals for the insane, 1 was sent to Police Court and discharged, 2 were transferred to the Observation Ward at Parramatta, and 15 remained at the close of the year.

In addition to these inmates, for whom the ward was specially set apart, 156 other prisoners were for short periods inmates, the majority of these being cases suffering from temporary mental symptoms due to alcohol whilst serving sentences of a few days, or whilst under remand.

At the ward at Parramatta there were on December 31, 1895, 10 inmates, and 43 were received during the year, making 53 under observation. Of these, 34 were discharged as of sound mind, 3 were sent to hospitals for the insane, 1 was discharged at Police Court, 1 died, and 14 remained at the close of the year. Into this ward, also, a number of similar cases to those received at Darlinghurst were admitted, the total number of these being 35.

The Lunacy Act provides that these wards should be visited by the Inspector-General of the Insane, and special visits of inspection were paid to the ward at Darlinghurst on January 14, April 15, July 8, and November 4, and to the ward at Parramatta on January 16, April 30, August 13, and October 19. The wards have also been visited at other times to see individual prisoners or at the request of the visiting medical officers. At the visits of inspection care has been taken to see and speak to every prisoner and to inquire into the circumstances of his case as well as to make a careful examination into the general management of the ward.

I have been satisfied with the care exercised in the general treatment and observation of the inmates, but I have had reason to criticise the methods adopted in individual cases, and I have called special attention to the necessity for providing day-rooms, provided with fires, for the accommodation of the inmates in the winter weather.

The Comptroller-General of Prisons has courteously furnished the following returns, showing the general statistics of the two wards for the year 1896:—

RETURN showing the number of Persons received into the Observation Ward, H.M. Gaol, Darlinghurst, during the year 1896, the places whence received, and their disposal.

The President of the State Children's Relief Board to The  
Chief Secretary.

Charitable Institutions of New South Wales,  
State Children's Relief Board,  
Richmond-terrace, Sydney, 5 April, 1896.

Sir,

In accordance with the provisions of Act 44 Vic. No. 24, I have the honor to submit for the information of the Honorable the Chief Secretary my Report upon the operations of the State Children's Relief Board for the official year which closed on the 5th April.

It is sixteen years since Parliament passed the measure by means of which the boarding-out system was legally established in New South Wales, in substitution of the method of dealing with State children previously existing (unpopularly known as the barrack system), which was both cumbersome and expensive, and under which all family principles of training the young were systematically ignored. The history of the movement has been one of uninterrupted progress, although at the outset the Board entrusted with its administration had to encounter many difficulties arising mainly from want of knowledge among those who had for many years managed and generously supported the larger institutions in which the poor children of this Colony were clothed, fed, and educated, and who naturally looked with suspicion upon the efforts of the few philanthropic ladies and gentlemen in New South Wales who were endeavouring to effect the reforms already adopted in two of the younger colonies, at a cost which was small when compared with the lasting good results that had been obtained.

It is now unnecessary, of course, to say anything in laudation of the boarding-out system, which is at present the national policy of dealing with the dependent children of this country. It has long ago passed beyond its tentative stages, and the physical, moral, and material advantages that have resulted to the thousands of children who have been rescued from poverty and evil association and provided with the advantages of wholesome family life in clean healthy homes, and useful trades and occupations, are "household words," and speak more forcibly than could any commendation from me, but when compared with the old-time "barrack system," last years computations will show that taking no heed whatever of any other consideration but the untenable one of pounds, shillings, and pence, the boarding-out system is to be credited with an absolute saving of over £170,000 during that period. These results have only been obtained by careful administration, constant watchfulness, and sustained enthusiasm on the part of the Board and its trusted officials.

The following table shows the rate at which the number of children under the care of the Board has increased annually since the initiation of the boarding-out system :—

Under control on	Supported by Government.			Adopted without payment.			Apprenticed.			Total under control.		
	Boys.	Girls.	Total.	Boys.	Girls.	Total.	Boys.	Girls.	Total.	Boys.	Girls.	Total.

5 " 1896.....	1,356	1,085	2,441*	50	76	126†	548	341	889‡	1,954	1,502	3,456

\* This total includes 6 children in Hospital, 150 in Cottage Homes, 30 in Depot, 13 under 2½ years paid for at 7s. per week, 37 paid for at 6s., 13 infants paid for at 8s. per week, and 3 infants paid for at 10s. per week.

† This total includes 125 children who are classed as "Boarders without subsidy," that is, placed with guardians who, as in the case of adopted children, do not receive payment for maintenance.

‡ This total includes 27 absconders, whose names still appear on the books, and 15 children classed as unofficial.

There has been a substantial falling off in the number of young children, whom it was found necessary, after careful investigation, to place under the control of the Board, and the figures may be accepted as a wholesome sign of improvement amongst the poorer classes of the community. At the end of the twelve months which closed on the 5th of April, 1896, there were 282 more children under control than in 1895, when the numbers were 365 in excess of the previous year, showing a proportionate falling off of 83 as compared with the operations of 1895. In 1895 there were 2,094 children supported by the Government, while apart from the adoption and apprenticing divisions, there are now 2,441 maintained in the various registered homes scattered throughout the Colony—an increase of 347 in the division in which payment is made to State guardians, whose homes are only approved by the Board after careful inspection and report by officers of the Department. When the official year closed in 1895 there were 3,174 children under control; there are now 3,456, comprising 1,954 boys and 1,502 girls, all of whom are either supported by the State, adopted without payment, apprenticed to useful trades and occupations, or detained in one or other of the cottage homes at Pennant Hills and Mittagong for observation and medical attendance. Taken altogether these results are satisfactory.

During the official year with which I am now dealing there were 1,954 boys and 1,502 girls under control, or a total of 3,456 children altogether, showing an increase of 282 over and above those dealt with in the year 1895, when the numbers were 1,822 and 1,352 respectively, or a total of 3,174—an excess of 365 over the previous twelve months. The falling off in the number of children admitted to State control does not necessarily mean that the number of applications for the admission of children was less either now or at any other time. There are always numbers of such applications that are not entertained, and official investigation has from time to time frustrated many cases where efforts were made by unworthy parents and others to place their offspring under official control, the real object of course being to release themselves from their responsibilities and shift their burdens to the shoulders of the Government. Such instances are not unknown to the Department, but the numbers have been growing smaller from year to year as the system of inspection and supervision improves, and the certainty of detection is more widely understood.

Speaking

Speaking in a general way of the children who are now under the control of the Board, it is gratifying to be able to say that their circumstances are not only very much improved all round, but their general condition is most satisfactory. In a few exceptional cases little difficulties and annoyances have been experienced, but they have been fairly dealt with and adjusted, and beyond the ordinary commonplace accidents, mishaps, and shortcomings of life there has been very little to complain of, either as against the children or the great body of guardians throughout the country. There were 506 boys and 423 girls, or a total of 929 children boarded out during the year, as against 601 boys and 452 girls, or a total of 1,053 children, so dealt with in 1895, showing a decrease in the paying section of 124, which means a substantial saving under this head. In 1895 there were 353 more children paid for under this head than in 1894, and alone involved an increased expenditure of something like £5,000. A saving of about £1,700 was effected in the boarding-out section of 1896. Of the 4,103 children dealt with during the year now under review, 288 were discharged upon the parents or relatives satisfying the Board that they were in a position to properly provide for them; 199 were released because the children having attained the age of 17 years (124 boys and 75 girls), they became entitled to their release under the Act; 30 were removed by death, 1 child was drowned at the Rookwood Asylum; 1 boy was transferred to the "Sobraon," 4 were removed to the Deaf, Dumb, and Blind Institution; there were 33 at the Boys Home at Dundas; 14 at the Benevolent Asylum, Sydney; 4 at the Newington Asylum; 5 at the Imbecile Asylum, Newcastle; 43 at the Shaftesbury Reformatory; 10 at the Carpenterian Reformatory; 3 at St. Vincent de Paul's; 1 at the Macquarie-street Asylum; 1 at the Convent at Manly; 1 at the Callan Park Asylum, and 9 absconded. These are accounted for in this way—374 boys and 273 girls, or a total of 647, which leaves a balance of 3,456 now under control. Of the 2,441 children who were paid for by the Government, 6 are in hospital, 152 are in the cottage homes at Parramatta and Mittagong, 10 are at the depôt at Paddington; 8 delicate infants are paid for at the rate of 10s. a week, 13 at 8s. a week, 13 at 7s. a week, and 37 at 6s. a week; whilst the whole of the remainder, who are counted in the paying division, are provided for at the rate of 5s. a week.

In the matter of expenditure, the closest economy consistent with the importance of the service has been observed, but the yearly increasing demands upon the resources of the Board have certainly not lessened the appeals that have had to be made to the Treasury to enable it to meet its engagements, and it may therefore be said that the high-water of expenditure has been reached this year. Deposits amounting to £42,026 10s. 3d. were received from the Treasury during 1895-6, to which must be added a sum of £214 10s. 9d., carried forward to the credit of the Board from the previous year's transactions, making a total of £42,241 1s. placed at the disposal of the Board during the year. After making provision for the payment of accounts due up to the closing of the books, the gross expenditure for 1895-6 was £42,200 14s. 11d., which left a credit balance of £40 6s. 1d. to be carried forward to 1896-7. The total cost of the boarding-out children was £31,780 8s. 5d. The daily average number of children placed out as boarders during the year was 2,170, an increase of 188, and the gross average cost per head was £14 12s. 10d. The gross receipts from those parents who contributed something towards the maintenance of their offspring amounted to £969 19s. 4d., and after deducting this amount from the gross expenditure, it will be seen that the actual capitation cost was £14 3s. 11d. A more detailed account of the expenditure for the year is given in the appendices.

## LIST OF GUARDIANS' OCCUPATIONS.

The following is the classification of the guardians' occupations:—  
 Accountants, 4; agents, 9; auctioneers, 2; attendants, 12; bakers, 6; bootmakers, 16; bricklayers, 5; brickmakers, 6; butchers, 8; builders, 7; brassfinisher, 1; boilermaker, 1; broom-makers, 2; blacksmiths, 11; bank managers, 4; clergymen, 12; carters, 6; coach-proprietor, 1; clerks, 24; cooks, 4; cabinet-makers, 2; carver, 1; carpenters, 37; contractors, 12; commercial travellers, 7; conveyancers, 2; coach-builders, 2; civil servants, 22; confectioners, 3; carrier, 1; chemists, 3; cordial makers, 4; collectors, 3; caretakers, 9; compositor, 1; cooper, 1; cabmen, 2; dairy farmers, 43; domestics, 327; dress-makers, 21; dealers, 3; doctors, 5; draper, 1; drovers, 3; draftsmen, 2; engine-drivers, 4; electrician, 1; engine-smiths, 2; engineers, 8; farmers, 865; fruiterers, 6; fishermen, 4; ferryman, 1; gardeners, 22; graziers, 28; gunsmith, 1; gatekeepers, 2; grocers, 9; grooms, 2; hairdresser, 1; independent, 42; instrument-maker, 1; inspectors, 2; ironworkers, 2; journalists, 2; labourers, 28; lamplighter, 1; laundresses, 8; letter carriers, 4; librarian, 1; miners, 36; merchants, 4; milkmen, 2; moulder, 1; machinist, 1; mariners, 5; messengers, 3; mine manager, 1; maintenance men, 2; nurses, 14; news agents, 2; orchardists, 76; organist, 1; plumbers, 11; painters, 9; plasterers, 5; printers, 4; poultry farmers, 2; photographer, 1; postmasters, 4; piano-tuner, 1; quarrymen, 4; railway employees, 29; school teachers, 19; shopkeepers, 24; shipwrights, 3; solicitors, 6; soapmaker, 1; smelter, 1; sailmaker, 1; surveyor, 1; stonemasons, 8; stationers, 2; storekeepers, 24; sawyer, 1; selectors, 12; stokers, 2; saddlers, 6; stevedore, 1; tailors, 7; upholsterer, 1; undertaker, 1; vigneron, 2; vanman, 1; warehousemen, 3; warders, 5.

The utmost precautions are taken not only to ensure the selection of the most suitable guardians under whom the children may ultimately acquire such trades and occupations as will enable them to earn their own livelihood in after life when they have been removed from supervision, but to confine the operations to the healthier districts of the Colony where climatic influences might be expected to assist in strengthening the weak and build up strong and robust constitutions amongst these helpless little dependents of the State. A thorough system of inspection is maintained—the homes of new applicants are visited, and careful inquiries made into antecedents, circumstances, and surroundings; and, subsequently, when appointed guardians the children are visited periodically, unannounced, at the schools as well as at the homes, not only by the official inspectors but by ladies residing in the various districts who take a creditable interest in the children, and generously give their gratuitous services to the work. Frequent changes are made in the guardians for a great variety of reasons, the most important of which is the always paramount interest of the children, but no very serious grounds of complaint exist against the guardians in any of the districts. There was a decrease of 118 in the number of children placed out with farmers, the total number for 1896 being 865, and the number of girls placed in domestic service was 327, whilst in all the other useful trades and callings satisfactory selections have been made. The number of foster parents has increased during the year from 1,925 to 2,055 that is to say that there are now 130 more guardians than there were in 1895. Taking all the trades and occupations into account, it will be seen that there are now 3,254 children being trained in the almost certain prospect of their being able when they arrive at years of manhood and womanhood to be able to provide satisfactorily for themselves.

## LIST OF DISTRICTS IN WHICH CHILDREN ARE PLACED.

Children are placed out in the undermentioned districts in the numbers stated:—Ashfield, 15; Arncliffe, 2; Annandale, 17; Auburn, 29; Albury, 7; Albion Park, 1; Adamstown, 7; Armidale, 16; Balmain,

Balmain, 132; Berrima, 12; Botany, 14; Blackheath, 1; Burwood, 27; Boggabri, 1; Bexley, 13; Balmoral, 3; Bowral, 20; Bowning, 1; Braidwood, 15; Bulli, 50; Berry, 30; Bungendore, 7; Binalong, 2; Brogo, 2; Bathurst, 27; Brewongle, 3; Blacktown, 2; Branxton, 39; Croydon, 14; Camperdown, 17; Canterbury, 1; Campbelltown, 4; Castle Hill, 4; Cowra, 2; Crookwell, 20; Canley Vale, 14; Camden, 30; Cootamundra, 11; Cambewarra, 14; Cargo, 4; Cooma, 3; Cessnock, 4; Coolac, 3; Cudal, 1; Clarencetown, 7; Dapto, 12; Dungog, 9; Douglas Park, 1; Dural, 7; Dubbo, 6; Eden, 2; Forbes, 8; Glebe, 22; Gladesville, 15; Goulburn, 315; Grabben Gullen, 18; Granville, 79; Guildford, 12; Gunning, 14; Glenbrook, 1; Gerrington, 10; Girilambone, 1; Glen Innes, 3; Gosford, 6; Greta, 2; Gulgong, 4; Hunter's Hill, 15; Hurstville, 27; Hexham, 2; Helensburg, 2; Hinton, 3; Hartley, 1; Hawkesbury, 101; Islington, 1; Junee, 2; Jamberoo, 10; Kogarah, 18; Kellyville, 3; Kangaloon, 11; Kiama, 23; Kangaroo Valley, 30; Leichhardt, 86; Liverpool, 19; Lambton, 16; Lismore, 5; Lawson, 1; Manly, 10; Maitland East, 23; Maitland West, 87; Marrickville, 76; Macdonaldtown, 26; Mummel, 14; Menangle, 1; Minmi, 8; Mittagong, 110; Moss Vale, 8; Marulan, 11; Murrumburrah, 7; Milton, 29; Moruya, 5; Mulgrave, 7; Mudgee, 5; Molong, 6; Miller's Forest, 17; Morpeth, 4; Muswellbrook, 6; Manning River, 4; Macleay River, 2; Nevertire, 1; Newbridge, 1; Newtown, 70; Nowra, 21; Newcastle, 81; Nelson's Plains, 6; North Sydney, 63; Oberon, 1; Orange, 4; Ourimbah, 3; Pymont, 12; Paddington, 38; Parramatta, 187; Petersham, 27; Parkesbourne, 5; Patterson, 24; Picton, 37; Pitt Town, 26; Penrith, 14; Parkes, 5; Prospect, 7; Queanbeyan, 7; Quirindi, 1; Rockdale, 14; Rookwood, 36; Redfern, 43; Rydalmere, 2; Ryde, 12; Randwick, 9; Riverstone, 27; Richmond, 12; Rooty Hill, 2; Raymond Terrace, 11; Raglan, 1; Summer Hill, 8; Sydney, 8; Singleton, 14; Surry Hills, 36; Shellharbour, 4; St. Mary's, 11; St. Alban's, 6; Sassafras, 2; Stockton, 1; Scone, 3; Taralga, 4; Tarago, 6; Tumut, 1; Thirlmere, 17; Tilba Tilba, 1; Tamworth, 4; Tirranna, 5; Waverley, 21; Woolloomooloo, 13; Woollahra, 24; Waterloo, 41; Wheeo, 19; Windellama, 3; Watson's Bay, 4; Wagga Wagga, 2; Wollongong, 27; Windsor, 41; Wallerawang, 1; Wentworth, 3; Waratah, 8; Wilberforce, 22; Wellington, 4; Wallsend, 12; Wickham, 2; Woodville, 4; William Town, 3; Wombat, 1; Wilcannia, 1; Wollombi, 5; Wyce, 1; Yass, 8; Young, 2; out of Colony, 4. Total, 3,254.

A very large number of new applications were received from persons in almost every district in the Colony who desired to be appointed State guardians, and the most careful examination has been made by the Inspectors into the circumstances of each applicant, in order that none but the most suitable homes should be selected.

There were 1,520 new applications received during the year, and of the total 1,124 were from the various Protestant denominations, and 396 from Roman Catholics. The 1,124 Protestant applications sought to obtain 1,807 "boarders," 250 apprentices, and 13 children for adoption, making up a total of 2,070, while the 396 Roman Catholic applications sought to obtain 585 "boarders," 78 apprentices, and 6 children for adoption. Of the new applications received in 1896, 1,256 were reported upon by the inspectors, who approved of 858 and refused 398 on a variety of grounds that were considered sufficient by the members of the S.C.R. Board. The balance of these applications has not yet been reported upon.

There were twelve sittings of the Board during the year, at which the members attended as follows:—The Hon. Sir Arthur Renwick, Kt., M.D., M.L.C., President, 12; Mrs. Garran, 10; The Hon. L. F. Heydon, 10; Lady Windeyer, 10; Mrs. Goodlet, 10; Lady Manning, 7; Mrs. McMillan, 6; The Hon. W. J. Trickett, M.L.C.,

M.L.C., 6; Mrs. Slattery, 5. Mrs. McMillan was absent in Europe during a portion of the year, and Lady Manning was granted leave of absence since January, 1896.

The following is the usual list of lady visitors, under whose supervision the homes are placed in various parts of the Colony, and whose voluntary services are so valuable a factor in the working of the system:—Armidale, Mrs. Alingham, Mrs. S. A. Kearney, Mrs. J. J. Bliss; Albury, Mrs. Edmondson; Ashfield, Mrs. Wilson; Bowral, Mrs. Bagot, Mrs. D'Arcy Irvine; Bega, Mrs. Evershed; Balmain, Mrs. W. McKenzie, Mrs. Pole, Mrs. J. Dixon; Branxton, Mrs. J. A. Tulloch, Mrs. Bereini, Mrs. E. Smith; Bundanoon, Mrs. Osborn; Bathurst, Mrs. Marriott, Miss Newman, Mrs. Deighton; Berrima, Mrs. G. Shephard, Mrs. Wilshire; Bethungra, Mrs. M. Sawyer; Baulkham Hills, Mrs. Wm. Best; Berry, Mrs. E. Morris, Mrs. English; Boolong, Miss Grant; Burrowa, Mrs. C. Robinson, Mrs. J. H. Boucher; Barraba, Mrs. Kidd; Bulli, Mrs. J. B. Nicholson; Braidwood, Mrs. O'Brien; Cootamundra, Mrs. E. Barnes, Mrs. W. H. Mathews, Mrs. E. G. Webster; Camden, Mrs. Chas. Furner; Cassilis, Mrs. Traill; Cooma, Mrs. King; Carlingford, Mrs. H. Cox; Cowra, Mrs. Johnson; Cambewarra, Mrs. Brennan; Collector, Mrs. Best; Cessnock, Mrs. M'Donald; Campbelltown, Mrs. J. Kidd, Mrs. J. Loney; Crookwell, Miss Olivia Smith; Croydon, Mrs. Wilson; Cobargo, Mrs. Tarlinton; Cobbity, Mrs. G. H. Allnutt; Deniliquin, Mrs. H. M'Cullough, Mrs. A. H. Noyes, Mrs. Holt; Dungog, Mrs. M. Day, Mrs. Waller; Dalton, Mrs. H. T. Beresford; Dubbo, Mrs. Phillips; Forbes, Mrs. Raymond, Goulburn, Mrs. Ross, Mrs. Oliver, Mrs. Greig, Mrs. Arthur Chisholm, Mrs. Spencer, Mrs. De Lauret, Mrs. Hancock-Burkitt, Mrs. M'Killop, Mrs. E. Gillespie, Mrs. Jessop, Mrs. Craig, Mrs. L. Barber, Mrs. E. Zouch; Glebe, Mrs. Munro, Mrs. Graham; Gladesville, Mrs. Lumsdaine; Guildford, Mrs. Gurney; Granville, Mrs. E. B. Docker; Gunning, Mrs. Saxby; Gresford, Mrs. Logan; Gerringong, Mrs. Heighway; Gosford, Mrs. Powell; Mrs. J. King Brown; Gordon, Mrs. Richardson; Hay, Mrs. Johnson, Mrs. Lavender; Junee, Mrs. Studds; Kogarah, Mrs. M. Grosvenor; Kempsey, Mrs. Minnet; Katoomba, Miss E. Gittins; Liverpool, Mrs. Tillet; Leichhardt, Mrs. J. Dougherty; Maclean, Mrs. M'Innes; Moss Vale, Mrs. Gale; Maitland, Mrs. J. Prentice, Mrs. M. Smith, Miss Annie Wolfe, Mrs. W. G. Lipscombe, Miss Alice Hyndes; Menangle, Mrs. Onslow; Morpeth, Mrs. Thomas; Murrumburrah, Mrs. G. Barnes, Mrs. C. Cutcliffe; Mittagong, Miss Burke, Mrs. Beaumont; Mudgee, Mrs. E. J. Willis, Mrs. M. Crossing; Marulan, Mrs. M. E. Shaw; Moruya, Mrs. Archibald; Milton, Miss Kendall; Marrickville, Mrs. W. W. Clarke; Molong, Mrs. Aldis, Mrs. Dr. Browne, Mrs. Panton; Muswellbrook, Miss Luke, Mrs. W. S. Wilson; Minmi, Mrs. Froome; Newcastle, Mrs. Weatherill, Mrs. J. Harris, Mrs. Ireland, Mrs. M'Donnell, Mrs. Cuthbertson, Mrs. Davidson, Mrs. Arnott, senr., Mrs. Froome; Nowra, Mrs. Morton; North Sydney, Mrs. T. O'Sullivan; Newtown, Mrs. R. Scott, Mrs. Clegg, Mrs. J. E. Lee, Mrs. Goldsmith, Mrs. Hobbs; Orange, Mrs. Jas. Dalton; Parramatta, Mrs. W. J. Gunther, Mrs. H. Taylor, Mrs. C. E. Lamb; Penrith, Mrs. Lethbridge, Mrs. Ewans, Mrs. Woodriffe; Picton, Mrs. Gibson, Mrs. Sheppard, Mrs. W. B. Antill; Prospect, Mrs. Remington; Qucanbeyan, Mrs. G. Campbell, Mrs. P. G. Smith, Mrs. Willans, Mrs. Emery; Redfern, Mrs. Boyce; Raymond Terrace, Mrs. J. Richardson; Ryde, Mrs. Collingridge; Richmond, Mrs. Onus, Miss Onus; Rooty Hill, Mrs. Mackay; Rouse Hill, Mrs. M. Pearce; Randwick, Mrs. Hellicar; Sutton Forest, Mrs. A. G. Stoddart; Stroud, Mrs. Rushforth; Stockton, Mrs. S. W. Smith; Summer Hill, Mrs. W. E. Shaw, Mrs. Holland; St. Peters, Mrs. E. D. Madgwick; Stanmore, Mrs. W. W. Clarke; The Burrier, Mrs. Thompson; Tamworth, Mrs. Middleton, Mrs. Wiseman; Tumut, Mrs. A. M. Brown; Tenterfield, Mrs. Armstrong; Tarago, Miss May Roberts; Windsor, Mrs. J. B. Johnson, Mrs. Hall, Mrs. W. Deane,

Deane, Miss Hall, Mrs. J. C. Fitzpatrick, Mrs. Holland; Wollongong, Mrs. Elder; Woollahra, Mrs. Newton, Mrs. Gerber; Wallsend, Mrs. Neilson; Waverley, Mrs. W. H. Simpson, Mrs. Best, Miss Walker; Wallerawang, Mrs. Abbott; Wagga Wagga, Mrs. G. Coleman; Windeyer, Mrs. Mallon; Wiseman's Ferry, Miss Laughton, Miss Wilson; Woodville, Mrs. Graham, Mrs. Thomas; Wybong Creek, Mrs. Cox; Wentworth, Mrs. A. H. Davies, Mrs. Wilkinson; Windellama, Mrs. Calthorpe; Yarrunga, Mrs. Throsby; Young, Mrs. Dr. Heeley, Mrs. M. Byrne; Yass, Mrs. Sheehy, Mrs. H. Faunce.

The inspection of the Homes under the control of the Board—both by the voluntary lady visitors and the official inspectors—numbered 8,614, which was 458 in excess of the previous year. The voluntary visitors made 2,008 inspections, whilst the official inspections numbered 6,606. Subjoined are the details of the visits—Honorary lady visitors 1889, 1,356; 1890, 1,292; 1891, 1,225; 1892, 1,383; 1893, 1,638; 1894, 1,666; 1895, 1,305; 1896, 2,008; or an increase of 703 on the previous year. Official visits by inspectors during year ending 5th April, 1893, 5,969; 1894, 6,323; 1895, 6,851; 1896, 6,606. The average number of children under supervision for the year ending 5th April, 1896, was 3,114. The total number of visits of inspection was 8,614, or an average of  $2\frac{3}{4}$  visits to each child as against  $2\frac{2}{3}$  in the previous year.

The Board has as usual endeavoured to reduce the number of children in every house without separating families. The statistics of 1896 show:—

1,271	homes with 1 child.			
470	" "	2 children, including 265 with children of one family.		
225	" "	3 " "	94	" "
81	" "	4 " "	29	" "
6	" "	5 " "	4	" "
1	home	6 " of one family.		
1	" "	8 " "		

2,055 homes, containing 3,254 children (exclusive of 27 absconders, 6 in hospitals, 159 in cottage homes, and 10 in depôt); total, 3,456.

In consequence of the adoption of the principle of keeping families of children in the same home, as far as possible, there are thus 394 such families with separate guardians; and exclusive of homes of this character there are—

1,271	homes with 1 child.		
205	" "	2 children each.	
131	" "	3 " "	
52	" "	4 " "	
2	" "	5 " "	

1,661 homes, containing 2,292 children (a little over  $1\frac{1}{2}$  average, or 1.38); last year the average was 1.41, or slightly in excess of this year.

#### NURSING CHILDREN.

The number of children of this class under control during the year was less than for any similar period since 1893, when the capitation cost averaged as high as £25, owing in a great measure to the difficulty of securing the services of a superior class of creditable matronly persons in the initiatory stages of the experiment. It was difficult at the outset to obtain clean wholesome women in healthy localities willing to suckle these sick and delicate infants, but after a time the increased payments induced a good class of women to undertake the duties, and there is now no question as to the wisdom of the experiment. Practical experience has not only proved its wisdom, but to its early adoption and the care that was taken in the selection of the wet-nurses may now be attributed the lives of hundreds of delicate infants now grown strong and lusty who would otherwise have been sacrificed inevitably in the closer confinement and partial care of ordinary asylum nurses. The payments now vary from 6s. to 10s. per week for very young and very delicate children, while the ordinary children

children of the State who are boarded out are paid for at the rate of 5s. per week. At the termination of the past year there were 71 such delicate children under control as against 96 in 1895, whilst the daily average throughout the year was 95, and the total cost of their maintenance £2,112, or an average capitation cost of £22.

#### ADOPTED CHILDREN.

Good results continue to attend the practice of encouraging the adoption of young children by well-to-do persons who desired to bring them up without remuneration as members of the family. A very large number of children, who would otherwise have become a charge upon the public revenue for many years, have been dealt with in this way, and there is hardly an instance in which the permanent welfare of the children was not assured. In all these cases the supervision of the Board is continued until the children reach the age of 17 years, when the visits of the Inspectors cease as a matter of course, but it has been ascertained that although the names of the children have been removed from the registers they still continue with the foster-parents as if they were really their own, and are, without exception, happy and well provided for. When the year closed there were 101 such children under supervision, as against 124 in 1895, the diminution being accounted for by the number of children who were written off the books upon reaching the age of 17 years. Their religious classification was as follows:—Protestants, 38 boys and 54 girls; Roman Catholics, 4 boys and 5 girls; total, 42 boys and 59 girls. Taking the lowest possible estimate of the cost that would have been incurred had these children not been dealt with in the manner described, it will be seen that a saving of £1,495 was effected during the year, or a total of £8,660 for the five years ending on the 5th April, 1896. It is needless to say that the greatest care is always taken in the selection of these foster-parents, and thorough inspection is made of their homes and circumstances before the children are placed under their control; and in order to prevent the guardians from obtaining cheap servants under this section, only very young children are placed out for adoption.

#### APPRENTICED CHILDREN.

It is satisfactory to be able to say that out of the whole number of 3,456 children now under the control of the Board, there are no less than 847 learning useful trades and occupations, and practically earning their own livelihood. It has been the practice heretofore to apprentice State children to selected trades when they reached the age of 12 years, but it was found that owing to the youth of the children the apprenticeship was for a considerable time only an apprenticeship in name, and after consideration it was decided to invite Parliament to extend the powers of the Board in this and other important directions. As these powers have now been obtained, more satisfactory results may be looked for in connection with the class of children who are dealt with in this way in future. There were 847 children under indentures when the books closed for 1896. The girls in this class numbered 327, all of whom are at domestic service, and the boys 520, all of whom are learning to become blacksmiths, boot-makers, butchers, builders, carpenters, chemists, coach-builders, dairymen, dealers, drapers, farmers, gardeners, grooms, grocers, orchardists, plumbers, saddlers, and tailors. The number of apprentices discharged during the year was 126 boys and 52 girls, or a total of 178 as against 172 during 1895 and 148 during 1894. The total cost of management of the apprentices division was £2,195, a decrease of £75, and brought the average cost to £2 10s. per head, the same as the previous year, when the expenditure under this head was £2,270. When it is considered that there were such a large number of apprentices under control, the low cost of administration will be perceived and appreciated.

CHILDREN

## CHILDREN CLASSED AS UNOFFICIAL.

The children who are brought under the operation of the Act for self-protection continue to increase from year to year, and with very good results. In these cases children who are too old to be placed under control in the ordinary way surrender themselves to the Board chiefly with the object of being provided with occupations that will enable them to earn their own livelihood. Last year there were 12 children of this class under supervision—now the number has increased to 15. They are all doing well. The expense to the Board is small, being merely the small proportion of the cost of inspection, and since the initiation of the scheme some 50 children have been dealt with in this way, and they may literally be regarded as having been rescued from the streets.

## THE CENTRAL HOME.

During the year some 1,332 children passed through the Central Home at Paddington, as against 1,703 in 1895, a substantial saving of time and money having been effected in a large number of instances by dealing with the children in some of the more suitable districts without first forwarding them to the Dépôt. The daily average of admissions was 17, and the average cost of maintenance £9 15s. 1d. The total cost of maintenance of children at the Central Home was £165 16s. 11d. The home is a mere receiving house, whence children are boarded out, and they seldom remain in it more than a few days.

## COTTAGE HOMES FOR INVALID CHILDREN.

The principle of providing cottage homes in healthy localities for invalid and delicate young children has been extended and improved, and the most gratifying results have been obtained during the year that has just closed. Both at Pennant Hills and at Mittagong large numbers of weakly children have been restored to health and strength under the kind matronly care of specially selected women, and it is not an exaggeration to say that the whole of the children sent to these homes during the year were most materially benefited by the pure fresh air, good food, and clean wholesome surroundings. There were 159 in the Homes on the 5th April, 1896, namely, 38 boys and 121 girls, as against 146 at the end of the previous year.

The following is the usual table of particulars :—

	Boys.	Girls.	Total.
Total number of children admitted to Cottage Homes to 5th April, 1896	561	702	1,263
Total number of children discharged from Cottage Homes to 5th April, 1896	523	581	1,104

The total expenditure upon the Homes was £3,707, or £3,280 15s. 3d. for maintenance, management, medical expenses, salaries, &c., and £426 14s. 4d., the value of clothing furnished to the inmates from the Central Store at Paddington, and the proportionate cost of inspection. The capitation cost was £21 16s. 2d., or a reduction of 3s. 10d. per head upon the operations of 1895.

#### CONCLUDING REMARKS.

I regret that I have not been able to submit the Report with my usual punctuality. In consequence of the new arrangements made in connection with the officials who carry out the practical details of the Department, various changes have resulted which have occasioned this delay. I do not, however, propose to refer to these matters in the present Report, as they will properly fall within the scope of next year's Report; and I now allude to this subject merely to explain the unusual delay which has taken place in submitting this Report.

In conclusion, I have much pleasure in conveying the thanks of the members of the Board to Mr. Critchett Walker, C.M.G., the Principal Under Secretary, and to Mr. Fosbery, the Inspector-General of Police, for the valuable assistance rendered to the Department during the year.

I have, &c.,

ARTHUR RENWICK,

President.

## APPENDIX J.

Mrs. M. A. Alhutt, Cobbity :—

I have no hesitation in saying, from my personal observation of the State children in this district, that I can hardly conceive of anything better for the mental and bodily health of the children who are thrown upon the care of the State. In every case that has come under my notice the children have improved in every way by the natural life they lead, with the fresh air and the general care and kindness of their foster parents. The girls especially receive a home training which should fit them for becoming useful members of society.

Mrs. Mary S. Antill, Pieter :—

The boarding-out system is a very good one. I have taken an interest in the State children in this district for some years and they appear very healthy and happy and are taught many useful things on the farms, and there are very few complaints from either guardians or children.

Mrs. A. M. Bagot, Bowral :—

In the homes about Bowral where I visit, the boarding-out system works very well. The homes, with one or two exceptions, here are most comfortable and the foster parents very proud and fond of the little ones.

Mrs. L. M. Beresford, Dalton :—

I consider the institution an excellent one.

Mrs. F. Bliss, Armidale :—

I think it an excellent system—a great improvement on the old way of keeping the children in asylums. All the children boarded-out in this district are happy and contented, and their guardians are careful of and kind to them.

Mrs. F. B. Boyce, Redfern :—

The children under my supervision appear in every respect to be perfectly happy and well looked after. I do not know one case where I would wish the conditions of foster mother and child altered.

Mrs. Brennan, Cambewarra :—

The boarding-out system is working well in my district. I have five boys and one girl under my supervision, and I do not hear one complaint from either the children or guardians. The children all look happy and well cared for.

Mrs. M. J. Byrne, Young :—

As far as my experience goes I think the system of boarding-out children is an admirable one, especially when children are placed in good country homes.

Mrs. A. Cuthbertson, Newcastle :—

I am every day more convinced of the great benefit the children derive from this excellent institution. Having acted as lady visitor for the past eight years, I have had every opportunity of seeing how the children fare, and with very few exceptions they all appeared very happy and well cared for, and the foster parents all that could be desired.

Mrs. Roderick Davidson, Newcastle :—

In my one year's experience as lady visitor in the Newcastle district the boarding-out system is a great success. Great care is taken in the selection of homes for the children. The frequent visits of the inspectors and lady visitors can only have a good effect. Those under my supervision appear happy and well cared for. My visits to the homes and schools are always unexpected, and in all instances things have been satisfactory. The children and guardians become attached to one another, and I do not think their parents could do better for them. I believe the system is an admirable one, and a great blessing to the poor children who benefit by it.

Mrs. M. M. Dalton, Orange :—

The system is a great boon to many poor children who would otherwise become waifs. I have visited some homes in my capacity as a Benevolent Society visitor, where it would be well for the poor children there if they could be removed from such homes, and either boarded-out or apprenticed to someone who would teach them to become virtuous and useful members of society.

Mrs. G. Deighton, Bathurst :—

I cannot speak too highly of the system. During my office as lady visitor in Bathurst, and in cases I have come in contact with in other towns, the children are well treated, and generally between the foster parent and child there grows a wonderful affection.

Mrs. J. Dougherty, Leichhardt :—

These children are very well cared for and better looked after than the majority of the children that are cared for by their own parents—I mean the working classes—as I have a very good chance to judge of both, being always amongst them.

Mrs. W. N. M. Edmondson, Albury :—

I am quite sure that it is very much better for the children to be in families than institutions. After they have lived in institutions I think they are very unfit to live in families with children.

Mrs. Marion Ewan, Penrith :—

The boarding-out system in this district is a complete success. The State children here are perfectly happy and well cared for.

Mrs. M. A. Froome, Plattsburg :—

I have not the slightest hesitation in saying that I believe the system of boarding-out the children with suitable people to be far preferable than to herd them together in large numbers in asylums. The home life of the former system must operate for good on the average run of children.

Mrs. J. E. Gibson, Pieter :—

The boarding-out system cannot be improved upon. The children have had good homes and been well cared for, especially in this district.

Miss J. Kendall, Milton :—

The boarding-out system in this district has worked very well on the whole. In a few cases, where the children have run away from their homes, it seems to have been more from a love of wandering or from the whim of the moment than for any other reason. There have been very few cases of ill-treatment by guardians. The children are taught how to work and earn their living, and they are healthy and strong.

Mrs. Emily Logan, Gresford :—

The boarding-out system is satisfactory. The children are happy and fond of the children with whom they are placed.

Mrs. Bertha Marriott, Bathurst :—

I am very pleased to express my opinion of the boarding-out system in Bathurst and the vicinity where I have the privilege and responsibility of observing its working. I am convinced it is a thorough success. All the children here are in comfortable homes, and are well cared for and as kindly treated as they could be if they were with their own parents.

Mrs. Maria O'Brien, Braidwood :—

My experience for the past few years I find the boarding-out system most beneficial for the children's welfare. They are carefully looked after by their guardians, have clean comfortable homes, and all look well and happy. Those who attend school, the teachers speak very highly of them being well conducted and truthful. I think it is a great blessing for those poor children to have such an institution, where they are so carefully trained and looked after.

Mrs. S. Oliver, Goulburn :—

I am very favourable to the boarding-out system for children needing State protection, with the frequent supervision of those whose duty it is to take the oversight. I can find no fault at present with the homes I visit. The children seem happy and well cared for, and their dress and appearance at school compare favourably with their schoolmates.

Mrs. D. Osborn, Bundanoon :—

Having more children boarding out in my district than formerly, have better opportunity of judging of the system, which answers admirably. The children seem as happy and as comfortable as if they were with their own parents, and are treated just the same as the children of the family.

Mrs. M. Pole, Bahmain :—

It gives me great pleasure to express my continued satisfaction with the working of the boarding-out system. Some of the cases here lately have been very trying, and involved a great amount of patient self-denial and watchful care on the part of the foster-parents, especially the mothers, which has been cheerfully given. Though little or no immediate results are seen, I trust it will bear fruit in after life and reward their anxious care.

Mrs. M. Remington, Prospect :—

For the last five years I have taken an interest in watching the success of your system, and have come to the conclusion that it cannot be improved on; it leads to the amelioration of the unhappy conditions which children of the class cared for are necessarily placed under. Under it they imbibe domestic affections of a healthier moral class than that from which many of them are reclaimed. They receive a fair education and their physical wants receive due attention. The children under my observation are healthy and happy.

Mrs. Julia Richardson, Gordon :—

So far, my experience in this district would lead me to the conclusion that boarding out is a success, but, at the same time, the children under my supervision have been fortunate in having exceptionally good homes. I am not in favour of the children being taught at home when it is at all possible to send them to a public school, as such teaching is generally of an erratic and uncertain character.

Miss. Olivia Smith, Crookwell :—

The boarding-out system appears to me to answer admirably in this district. All the children are well clothed and fed, and attend school regularly.

Rev. Canon Taylor, Newtown :—

I regard the boarding-out system as infinitely superior to that which it has superseded. The children are commonly brought up as members of the family in which they are placed, so that the training of family life—with its joys and sorrows—its little difficulties and perplexities, is obtained by the children. Such training seems to me invaluable. It is well calculated to develop the varied powers of the children, and gradually to prepare them for the independent stand which they must take in after life.

Mrs. M. Willans, Queanbeyan :—

I think very highly of the boarding-out system, and, from my own experience, can testify to the love and affection shown on both sides.

Mrs. Agnes Wilson, Ashfield :—

In the districts of Ashfield and Croydon the children have all, with one or two exceptions, comfortable and happy homes. The children are really and truly cared for, return the affection that seems given to them, look well and happy, and are being brought up useful members of society. In the large institutions it is simply impossible to get very near to any child, and one corrupt child infects scores, whereas, in the private homes, when the guardians are respectable and well-living people, the children are duly looked after both morally and physically.

Mrs. E. J. Willis, Mudgee :—

I can candidly state that the boys seemed very contented with their homes and their work, and those in charge spoke encouragingly of them. I think they have a better chance of doing for themselves to greater advantage by being apprenticed to steady, hardworking families. They also have home life which cannot possibly be known in an institute.

#### LETTERS FROM SCHOOL TEACHERS.

Teacher, Superior Public School, Bathurst :—

The boarding-out system simply strengthens my previously expressed opinions upon it, viz. that, from a school point of view, the State children are in every sense upon an equality with the other pupils. They are neat and clean in dress, present a well-nourished physical appearance, and are, as a rule, beyond the average in regularity of attendance. Case of neglect in any of these particulars is soon remedied, owing to the excellent supervision given by the Departmental officers. Many children under their parental control are not so fortunate and blessed.

Teacher, Public School, Brauxton :—

In cases where children show a due appreciation of their surroundings, they appear to be happy, comfortable, and well cared for.

Teacher, Public School, Coolac :—

I have much pleasure in testifying to the very favourable results of the boarding-out system. All the State children who have been enrolled in the school under my charge were fairly regular in their attendance, clean and tidy in dress, and in most cases equal to, and in some instances, surpassed in attainments the other children. The boarding-out system is proving every day that it is one of sound common sense.

Teacher, Public School, Campbelltown :—

The State children attending this school are well behaved, punctual and regular in their attendance. They are comfortably clothed, and apparently well kept, and compare very favourably with the other children under my charge. As far as my observation goes, the boarding-out system works very satisfactorily in this portion of the district.

Teacher

Teacher, Public School, Cootamundra :—

From an experience extending over many years I have no hesitation in saying the boarding-out system is a splendid one. The children are, as a rule, well cared for, and much happier than they would be in their own homes. I have always found the inspecting officers thoroughly in earnest and most painstaking in ascertaining the actual state, moral and physical, of those children under their charge. The day that alters present circumstances in such a manner as to deprive these unfortunates of isolated country homes, where they get fresh air and plain wholesome food, and thorough inspection, will be a sad one.

Teacher, Superior Public School, Granville :—

The State children attending this school compare very favourably with the other pupils, and their attendance is more regular. Their progress is fairly good.

Teacher, Public School, Gunning :—

I have a very high opinion of the boarding-out system, and consider it a great blessing to those brought under its operation. The children attending this school have good homes; they attend regularly, and appear well fed; their clothes are always clean, and they seem quite happy; in fact, in these hard times they are better off than many of the children living with their own parents.

Teacher, Public School, Gerringong :—

The children placed in this district are well cared for, nourished, and clothed.

Teacher, Public School, Jamberoo :—

The boarding-out system is all that could be expected. The children are neatly dressed, well-behaved, and attend school punctually and regularly. They possess an intelligence somewhat above the average child, which is partly accounted for by the parental manner in which they are treated by their guardians.

Teacher, Public School, Mittagong :—

The State Children attending this school compare very favourably with the other children in regularity, cleanliness, and intelligence.

Teacher, Superior Public School, Picton :—

The boarding-out system works well as far as my experience goes. The children are almost all very carefully kept, and seem contented and well treated. Their conduct is satisfactory, and is in almost every case up to the usual standard of behaviour. The State children now in attendance here give me no special reason for complaint.

Teacher, Public School, Parkes :—

On the whole, the boarding-out system is a good one. In several instances I have noticed a strong attachment grow between the State child and its guardians; and, in the majority of cases, the children have been neatly clothed and apparently well cared for.

Teacher, Public School, Parramatta North :—

Re the boarding-out system, the children attending my school appear to be well cared for, and your system is no doubt a great blessing to them.

1897.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

---

# STATE CHILDREN RELIEF BOARD.

## REPORT

OF THE

PRESIDENT, THE HON. SIR ARTHUR RENWICK, K.B., M.L.C.,  
&c., &c., &c.,

FOR THE

YEAR ENDING 5 APRIL, 1897.

---

---

*Printed under No. 25 Report from Printing Committee, 8 December, 1897.*

---

---

SYDNEY: WILLIAM APPLGATE GULLICK, GOVERNMENT PRINTER.

---

The President of the State Children Relief Board to The  
Chief Secretary.

Charitable Institutions of New South Wales,  
State Children Relief Board,  
Richmond-terrace, Sydney, 5 April, 1897.

Sir,

In accordance with the provisions of Act 44 Vic. No. 24, I have the honor to submit for the information of the Honorable the Chief Secretary my Report upon the operations of the State Children Relief Board for the official year which closed on the 5th April.

Seventeen years have now elapsed since the State Children Relief Act was assented to, and the change made in the treatment of dependent children of the State has resulted in the most satisfactory exemplification of the beneficial effect of the boarding-out system, both on the ground of the development of the family system among the children and that of economy to the State.

When the Act referred to was under consideration by the Legislature, it experienced considerable opposition, and the supposed dangers and defects surrounding the system sought to be established were pointed out. Many of those who were interested in the various institutions for the housing of the dependent children of the State regarded the scheme with distrust, and, in some cases, even with suspicion. Having occupied the position of President from the initiation of the system, I have watched with great interest the gradual relaxation of the suspicious attitude of the opponents of the proposed boarding-out Act, and have gladly observed the growth of a more sympathetic feeling, and the uninterrupted and satisfactory progress of the movement from year to year, until it has come to be the national policy of dealing with the dependent children of this country.

The defects which surrounded the initiation of the system unquestionably led to the submission to Parliament of the Act for boarding-out children as a tentative measure; and, as a consequence, a number of powers and provisions, which practical experience in the working of the Act suggested from time to time, demanded further legislation. With the approval of the State Children's Relief Board, I therefore introduced to Parliament the measure now known as the State Children Relief Act of 1896 (which is construed as one with the State Children Relief Act of 1831). The principal provisions of the Amended Act are as follow:—

Age for apprenticeship.

1. The age at which children are retained under the provisions of the Principal Act shall be extended to fourteen years at the discretion of the Board.

## Regulations.

2. It shall be lawful for the Governor to frame regulations from time to time—
- (i) exempting any boarded-out child from apprenticeship and extending the time for a period not exceeding three years during which such child may be maintained;
  - (ii) prescribing the terms and conditions of indentures of apprenticeship of boarded-out children, with power to transfer such apprentices or to cancel their indentures in case of ill-treatment of the children, or for other sufficient cause;
  - (iii) authorising the Board to deduct from payments due to apprentices in the event of misconduct;
  - (iv) defining the mode of procedure for the recovery of wages due to apprentices;
  - (v) and generally for the purpose of enabling the Board to carry out the objects of the Principal Act and of this Act in regard to apprenticed children.

## Extension of period of supervision.

3. The Board shall have power to visit and inspect all children for two years after their official period of boarding out or apprenticeship shall have terminated.

## Penalty for withdrawing, harbouring, &amp;c., apprentices.

4. If any person shall directly or indirectly withdraw from, or counsel, or induce any apprentice to abscond from the person to whom such apprentice is indentured before the expiration of his term of apprenticeship, or knowing any apprentice to have so withdrawn or to have so absconded shall harbour or conceal such apprentice or prevent him from returning to the person to whom he was apprenticed or to the place of his original detention (as the case may be) such person shall be liable for any such offence to a penalty not exceeding twenty pounds, or to be imprisoned with or without hard labour for any term not exceeding two months.

## Power of arrest of absconding apprentices, &amp;c.

5. It shall be lawful for any Justice of the Peace to issue a warrant for the arrest of any apprentice or boarded-out or adopted child who may have absconded or been illegally removed by parents or other persons from the control of the legal guardian under the provisions of this or the Principal Act.

## Money and other property of State children to be controlled by Board.

6. All moneys and other property to which children boarded out, adopted, or apprenticed shall be entitled shall be placed to a separate fund, and shall be under the control of the Board for the benefit and maintenance of such children.

## Payment for outfits by parents on restoration of their children.

7. At the discretion of the Board, parents, on the restoration of their children, may be compelled to pay the value of their outfits.

## Power to compel payment for neglect of care of outfits by guardians.

8. It shall be lawful for the Board to deduct from the payments due to the guardians such amounts as may be deemed equivalent to the loss occasioned by their neglect to keep outfits up to regulation standard.

## Parents to have no further control of children after adoption.

9. Whenever a child is surrendered by his parents for adoption such parents shall have no further control over such child, except by the consent of the Board.

## Deserving widows and deserted wives may have their children boarded out to them.

10. It shall be lawful for the Board if it shall think fit to board out to deserving widow and deserted wives their own children under the provisions of the Principal Act, but in the latter class of cases only by an unanimous vote of a meeting of the Board and with the approval of the Colonial Secretary.

## Children placed in cottage homes.

11. It shall be lawful for the Board to place invalid or sick children under its control in cottage homes in approved localities, and to make the necessary regulations for their management.

## Prosecution of defaulting parents.

12. The Board shall in the name of its boarding-out officer have power to institute legal proceedings against all parents for moneys expended in the maintenance of their children when satisfied that they are in a position to pay for such maintenance.

## The like in the case of illegitimate children.

13. The Board may in the name of the boarding-out officer institute legal proceedings against the parents of illegitimate children for the recovery of maintenance money; the father and the mother to be liable jointly or severally.

## REVISION OF REGULATIONS.

Consequent upon the passing of these new provisions, it has been found necessary to revise the whole of the Regulations, with a view to their conformity with the altered conditions of the system, and to the additional provisions now having the force of law. These Regulations have been submitted to the Crown Law Officers for approval, and will be published at an early date.

## ANNUAL INCREASE IN NUMBER OF STATE CHILDREN SINCE INITIATION OF BOARDING-OUT SYSTEM.

The following table shows the rate at which the number of children under the care of the Board has increased annually since the initiation of the boarding-out system :—

Under control on	Supported by Government.			Adopted without payment.			Apprenticed.			Total under control.		
	Boys.	Girls.	Total.	Boys.	Girls.	Total.	Boys.	Girls.	Total.	Boys.	Girls.	Total.

5 „ 1897....	1,506	1,145	2,651*	55	71	126†	524	370	894‡	2,085	1,586	3,671

\* This total includes 9 children in Hospital, 153 in Cottage Homes, 17 in Depôt, 24 under 2½ years paid for at 7s. per week, 39 paid for at 6s., 18 infants paid for at 8s. per week, and 12 infants paid for at 10s. per week.

† This total includes 24 children who are classed as "Boarders without subsidy," that is, placed with guardians who, as in the case of adopted children, do not receive payment for maintenance.

‡ This total includes 20 absconders, whose names still appear on the books, and 14 children classed as unofficial.

These figures speak for themselves. From them it will be seen that a still further relative decrease has taken place in the number of young children placed under the care of the Board throughout the year. This is in some measure due to the section 10 clause of State Children Relief Act, which came into operation in October last, and of which mention will be made later on. There is now a total of 3,671 children under control, as against 3,456 in 1896, showing an increase of 215 children, whilst the last year's lists gave 292 more than the previous year, there thus being a decrease of 67 in comparison with last year's figures. These children are all supported by the State, adopted without payment, apprenticed to useful trades or occupations, or placed for treatment in the cottage homes established by the Department.

It

It has been found necessary in some cases to make changes in the guardianship of the children in order to ensure their welfare. In a few instances the guardians themselves have relinquished their charges on account of bad behaviour. These latter have, however, shown signs of improvement on being transferred to other homes. Taking them as a whole, the relations between guardian and child are most harmonious, and there can be no doubt as to the reality of the affection existing between them.

Four hundred and twenty-three boys and 362 girls (or a total of 785 children) were placed out during the year as against 506 boys and 423 girls (or a total of 929 children) in 1896, a relative decrease in the paying section of 144, which, of course, means a proportionate saving in expenditure.

A large number of applications for discharge from State control were dealt with during the year, and out of the 4,241 children under supervision, the Board approved of 294 being handed over to parents or other relatives, who proved that they were in a position to satisfactorily provide for the children; 91 boys and 61 girls (or a total of 152) were discharged upon their attaining the age of 17 years; 32 deaths were recorded; 1 boy was transferred to the "Sobraon"; 4 were removed to the Deaf and Dumb and Blind Institution; there were 8 at the Benevolent Asylum, Sydney; 24 at the Boys' Home, Newington Asylum; 2 at the Imbecile Asylum, Newcastle; 13 at Shaftesbury Reformatory; 2 at Carpenterian Reformatory; 2 at Home for Boys, Westmead; 3 to Female Refuge; 1 to St. Joseph's Providence; 1 to Tempe Refuge; 5 to friends; 3 to guardians; 2 to St. Martha's Home; 5 to Industrial School for Girls, Parramatta; and 16 absconded. As there were 3,456 children under control on 5th April, 1896, and as 785 were admitted and 570 discharged during the year, the total number under the control of the Board on 5th April, 1897, was 3,671.

Of the 2,651 children paid for by the Government, 9 are in hospital; 153 are in the Cottage Homes at Mittagong and Parramatta; 17 are at the Dépôt at Paddington; 12 delicate children are paid for at the rate of 10s. per week; 18 at 8s. per week; 24 at 7s. per week; and 39 at 6s. per week; the remainder, who are all included in the paying division, are provided for at the rate of 5s. per week.

It has been found necessary during the past year to exercise the most rigid economy over the expenditure, in consequence of the manner in which the resources of the Board have been taxed. In addition to the sum of £40 6s. 1d., which was carried forward to the credit of the Board from the previous year's transactions, deposits and accounts, amounting to £51,124 7s. 1d., were received from the Treasury during 1896-7, making a total of £51,164 13s. 2d. placed at the disposal of the Board during the year. After deducting the amount due for accounts owing at the closing of the books, the gross expenditure for 1896-7 was £48,166 5s. 4d., there then being a credit balance of £2,998 7s. 10d. to be carried forward to 1897-8.

The total cost of the maintenance of boarding-out children was £36,157 1s. 5d. The daily average number of children placed out as boarders during the year was 2,494, and the average cost per head was £14 9s. 11d. The contributions of those parents who were able to help to maintain their children amounted to £839 0s. 2d., and after this sum had been deducted from the gross expenditure, the actual capitation cost was £14 3s. 2d. A full account of the annual expenditure will be found in the Appendices.

The foregoing table shows the class of people who now seek to have children placed with them. When selecting homes, the greatest care is taken by the inspecting staff to reject those applicants who are not in sufficiently comfortable circumstances to warrant their providing for the children in a proper manner. Preference is naturally given to those living in healthy localities; and, upon a reference to the return shown upon page 6, it will be seen that a large number of children are placed out in the perfect climates of the South Coast, New England, and the Southern and Blue Mountain ranges. That the children must of necessity improve in bodily health under such climatic influences is a foregone conclusion, and as the homes in these districts are all of an excellent class, there need be no fear as to the future well-being of the inmates. Many of the guardians become so much attached to their charges, that upon the latter reaching the age of 12 years, they are retained as apprentices until they pass from under State control. In very many instances they then further elect to remain with their late guardians, being by that time looked upon quite as members of the family.

There are now as guardians 830 farmers, as against 865 in 1896, a slight decrease of 35 having taken place during the year. A larger number of children have, however, been placed out amongst mechanics and artizans, &c. The number of guardians for the official year amounts to 2,115, an increase of 60 over the previous year, when a total of 2,055 was shown in the statistics. There are now, therefore,

no less than 3,472 children boarded out with a class of people the greater number of whom are in a position to equip those entrusted to their care to fight the battle of life, and become valuable members of the community.

## APPLICATIONS FOR STATE CHILDREN.

It has been found a very difficult matter throughout the year to cope with the numerous applications which continue to increase in number. As the success of the boarding-out scheme depends in a very large measure upon the selection of the homes in the first instance, the greatest care has to be exercised by the Inspectors in making their decisions either for or against those who desire to become State guardians. For a variety of reasons, but principally on the grounds of insufficient means or accommodation and unsuitable localities, no less than 301 applications were refused by the Board on the recommendation of the Inspectors, who also approved of 769 homes, making a total of 1,070 reported upon during the year. There still remains a balance of 440 not yet dealt with. Of the 1,510 applications received, 1,079 were from the various Protestant denominations, and 431 from Roman Catholics. The 1,079 applications from the Protestants were for 1,152 boarders, 221 apprentices, and 16 children for adoption, whilst the 431 Roman Catholics applied for 657 boarders, 86 apprentices, and 7 children for adoption.

## BOARD MEETINGS.

There were eighteen (18) sittings of the Board during the year, viz., 12 general, 3 special, and 3 adjourned, at which the members attended as follows:—The Hon. Sir Arthur Renwick, Kt., M.L.C., President, 18; Mrs. Garran, 18; Mrs. Goodlet, 17; Mr. McMillan, 14; Lady Windeyer, 13; the Hon. L. F. Heydon, 9; Mrs. Slattery, 6; the Hon. W. J. Trickett, 5; and Lady Renwick, 2. Lady Manning was on leave of absence visiting Europe during the whole of the time. Lady Windeyer resigned her position on the 22nd February, 1897, and Lady Renwick was appointed on the 26th February in her place. The Hon. W. J. Trickett was seriously ill during several months, and was consequently unable to attend.

## LADY VISITORS.

As is now well known, the State homes in various parts of the Colony are placed under the supervision of lady visitors, whose voluntary services on behalf of the children cannot be too highly appreciated. The usual list is appended hereto, viz.:—Armidale, Mrs. Allingham, Mrs. J. J. Bliss; Albury, Mrs. E. Edmondson; Ashfield, Mrs. Wilson; Bowral, Mrs. J. C. Bagot, Mrs. D'Arcy Irvine; Bega, Mrs. Evershed; Balmain, Miss C. B. R. Dixon, Mrs. W. McKenzie, Mrs. G. Boulton, Mrs. Venables, Mrs. Pole; Branxton, Mrs. J. A. Tulloch, Mrs. Bercini, Mrs. E. Smith; Bundanoon, Mrs. Osborn; Bathurst, Mrs. Marriott, Miss Newman; Berrima, Mrs. G. Shephard, Mrs. Wilshire; Bethungra, Mrs. M. Sawyer; Baulkham Hills, Mrs. W. M. Best; Berry, Mrs. E. Morris, Mrs. English; Boolong, Miss Grant; Burrowa, Mrs. C. Robinson, Mrs. J. H. Boucher; Barraba, Mrs. Kidd; Braidwood, Mrs. O'Brien, Mrs. Bayley; Cootamundra, Mrs. E. Barnes, Mrs. W. H. Mathews, Mrs. E. G. Webster; Cobbitty, Mrs. G. H. Allnut; Camden, Mrs. C. Furner; Cassilis, Mrs. Maria Traill; Crookwell, Miss Olivia Smith; Cooma, Mrs. King; Carlingford, Mrs. H. Cox; Cambewarra, Mrs. Brennan; Cobargo, Mrs. E. Tarlinton; Collector, Mrs. R. Beit; Cessnock, Mrs. M'Donald; Campbelltown, Mrs. J. Kidd, Mrs. J. Loney; Croydon, Mrs. Wilson; Deniliquin, Mrs. H. M'Cullough, Mrs. A. H. Noyes, Mrs. Holt; Dungog, Mrs. M. Day, Mrs. Waller; Dalton, Mrs. H. T. Beresford; Dubbo, Mrs. F. Phillips; Forbes, Mrs. Reymond; Goulburn, Mrs. Ross, Mrs. Oliver, Mrs. Arthur Chisholm, Mrs. Spencer, Mrs. Handcock-Burkitt, Mrs. William Chisholm, Mrs. De Lauret, Mrs. M'Killop, Mrs. E. Gillespie, Mrs. Jessop, Mrs. Craig, Mrs. L. Barber, Mrs. E. Zouch, Mrs. T. M'Killop, Mrs.

Mrs. Emery; Gosford, Mrs. W. F. Powell, Mrs. J. K. Brown; Glebe, Mrs. Munro, Mrs. Graham; Gladesville, Mrs. Lumsdaine; Guildford, Mrs. Gurney; Granville, Mrs. E. B. Docker; Gordon, Mrs. Richardson; Gunning, Mrs. Saxby; Gerringong, Mrs. Heighway; Hay, Mrs. Johnson, Mrs. Lavender; Junee, Mrs. Studds; Kogarah, Mrs. M. Grosvenor; Kempsey, Mrs. Minnet; Kurrajong, Mrs. M. Gray; Katoomba, Miss E. Gittins; Liverpool, Mrs. Tillet; Leichhardt, Mrs. J. J. Dougherty; Lambton, Mrs. Arnott, senr.; Maclean, Mrs. M'Innes; Moss Vale, Mrs. Gale; Maitland, Mrs. J. D. Prentice, Mrs. M. Smith, Miss Annie Wolfe, Mrs. W. G. Lipscombe; Menangle, Mrs. Onslow; Morpeth, Mrs. F. H. Thomas; Murrumburrah, Mrs. G. Barnes, Mrs. Cutcliffe; Mittagong, Miss Burke, Mrs. Beaumont; Mudgee, Mrs. E. J. Willis, Mrs. M. Crossing; Moruya, Mrs. Archibald; Milton, Miss Kendall; Marrickville, Mrs. W. W. Clarke; Marulan, Mrs. M. E. Shaw; Molong, Mrs. Alldis, Mrs. Browne, Mrs. Panton; Minmi, Mrs. M. A. Froome; Merewether, Mrs. Berkeley; Muswellbrook, Miss Luke, Mrs. W. S. Wilson; Newcastle, Mrs. J. Harris, Mrs. Ireland, Mrs. M'Donnell, Mrs. Cuthbertson; Nowra, Mrs. Morton; North Sydney, Mrs. T. O'Sullivan; Newtown, Miss Eve, Mrs. R. Scott, Mrs. J. G. Clegg, Mrs. J. E. Lee, Mrs. Goldsmith, Mrs. Painter, Mrs. Howe; Orange, Mrs. James Dalton; Parramatta, Mrs. Inglis, Mrs. Gunther, Miss Taylor, Miss Duncan; Penrith, Mrs. F. E. Lethbridge, Mrs. Ewans, Mrs. F. Woodriffe; Picton, Mrs. Gibson, Mrs. W. R. Antill, Mrs. Sheppard; Prospect, Mrs. Remington; Qucanbeyan, Mrs. G. P. Smith, Mrs. G. Campbell, Mrs. Willans; Quirindi, Mrs. Mary Patrick; Redfern, Mrs. Boyce; Raymond Terrace, Mrs. J. Richardson; Ryde, Mrs. Collingridge; Richmond, Mrs. Onus, Miss Onus; Rooty Hill, Mrs. Mackay; Rouse Hill, Mrs. M. Pearce; Randwick, Mrs. Hellicar; Sutton Forest, Mrs. A. G. Stoddart; Stroud, Mrs. Rushforth; Stockton, Mrs. S. W. Smith; Summer Hill, Mrs. W. E. Shaw, Mrs. Holland; St. Peters, Mrs. E. D. Madgwick; Stanmore, Mrs. W. Clarke; The Burrier, Mrs. Thompson; Tamworth, Mrs. Middleton, Mrs. Wiseman; Tumut, Mrs. A. M. Brown; Tenterfield, Mrs. Armstrong; Windsor, Mrs. J. B. Johnston, Mrs. Holland, Mrs. Hall, Miss Hall, Mrs. W. Dean, Mrs. Fitzpatrick; Wollongong, Mrs. Elder; Woollahra, Mrs. Newton, Mrs. Gerber; Wallsend, Mrs. Neilson; Waverley, Mrs. Best, Mrs. W. H. Simpson, Miss Walker; Wentworth, Mrs. A. H. Davies, Mrs. T. Wilkinson; Wallerawang, Mrs. Abbott; Wagga Wagga, Mrs. G. Coleman; Windeyer, Mrs. Mallon; Windellama, Mrs. Calthorpe; Wiseman's Ferry, Miss A. Wilson, Miss Laughton; Woodville, Mrs. Graham, Mrs. O. C. Thomas; Wybong Creek, Mrs. Cox; Yarrunga, Mrs. Throsby; Young, Mrs. Byrne, Mrs. Heeley; Yass, Mrs. B. Sheedy, Mrs. H. Faunce.

#### CHANGES IN THE OFFICIAL STAFF.

In consequence of the investigations of the Public Service Board, certain changes were effected during the year in the official staff and in the arrangement of the offices of the Department.

Almost from the very initiation of the boarding-out system Mrs. S. Maxted has acted as matron of the Department. At first, this lady gave her services without remuneration, and subsequently was appointed as a salaried officer of the institution. In accordance with the provisions of the Public Service Act, the Public Service Board deemed it their duty to retire Mrs. Maxted from this position, much to the regret of every member of the State Children's Relief Board, and despite the fact that urgent representations were made by them, as a body, respecting the valuable nature of the services rendered to the Department by Mrs. Maxted.

Mr.

Mr. A. W. Green, the Secretary to the Board, was—by the same authority—appointed Chief Superintendent of Government Asylums. I have pleasure in stating my appreciation of the services rendered by this officer while occupying the former position.

The arrangement made in connection with the amalgamation of all the various offices connected with the Public Charities Department, and their centralisation at Richmond-terrace, Domain, in view of better management and greater economy, met with the approval of the State Children Relief Board. It is, however, matter for regret that the arrangements in connection with the Shaftesbury Institution (now under dual control) have not yet been placed on a footing satisfactory to the State Children Relief Board, or in the best interests of the community at large.

#### INSPECTION OF HOMES.

The total number of visits paid by the lady visitors and official inspectors amounted to 8,612, practically the same as that of the preceding year.

The lady visitors made 1,465 inspections, whilst those paid by the officials numbered 7,147. The details of the visits are as follows—Honorary visitors—1890, 1,292; 1891, 1,225; 1892, 1,383; 1893, 1,638; 1894, 1,666; 1895, 1,305; 1896, 2,008; 1897, 1,465. Official inspections—1894, 6,323; 1895, 6,851; 1896, 6,606; 1897, 7,147. The average number of children under supervision for the year ending 5th April, 1897, was 3,226, as against 3,144 of last year.

The total number of visits of inspection was 8,612, or an average of  $2\frac{7}{10}$  to each child, as against  $2\frac{3}{4}$  in the previous year.

The principle of maintaining, as far as possible, the feelings of family affection, by not separating brothers and sisters, has been adhered to, with the results as shown hereunder:—

1,254 homes with 1 child.					
501	„	„	2 children, including 272 with children of one family.		
250	„	„	3 „ „ 115 „ „		
91	„	„	4 „ „ 34 „ „		
14	„	„	5 „ „ 7 „ „		
3	„	„	6 „ of the same family.		
2	„	„	7 „ „		

2,115 homes, containing 3,472 children (exclusive of 20 absconders, 9 in hospitals, 153 in cottage homes, and 17 in depôt).

It will be seen, therefore, that there are 433 homes with children of one family.

Exclusive of homes containing children of one family, there are:—

1,254 homes with 1 child.			
229	„	„	2 children.
135	„	„	3 „
57	„	„	4 „
7	„	„	5 „

1,682 homes, containing 2,380 children, or an average of 1.41 (last year the average was 1.38).

#### NURSING CHILDREN.

This very important branch of the work still continues to make satisfactory progress. The superior class of women who are now not only willing, but anxious to nurse the motherless infants of the State, gives practical evidence of the wisdom of the scheme. Delicate and puny from their birth as these unfortunates too frequently are, they need every care and attention which it is possible to bestow upon them,

them, in order to save lives which may in the future become of service to the community. The weekly payments for these children vary from 6s. to 10s., according to circumstances; and it speaks volumes in favour of the characters of the nursing mothers, that upon the cessation of the special payments they do not relinquish their charges, invariably retaining them at the ordinary boarding-out rate of 5s. per week. There can be no reasonable doubt that some hundreds of little ones owe their constitutions, if not their lives, to this admirable system of dealing with these sickly infants, of whom there are now 93 under control, as against 71 in 1896. During the past year a daily average of 96 was maintained at a capitation cost of £22—the total cost of their maintenance being £2,090.

#### ADOPTED CHILDREN.

The number of children adopted by reputable citizens during the year remains practically unchanged, there being now 40 boys and 48 girls in the Protestant, and 8 girls and 6 boys in the Roman Catholic, division, making a total of 102 in all, as against 101 of the previous year. In addition to the important saving thus effected (viz., an annual sum of £1,500), the children themselves are in better circumstances than would have been possible had they remained burdens upon the State. As only very young children are selected for adoption, these little orphans grow up without missing the mothers' care and love, so essential to their well-being. Their foster-parents, almost without exception, not only rear the children as their own, but assiduously guard against any chance of their discovering their true parentage. Great care is exercised by the Inspectors, in making their periodical visits, not to undeceive the children in this respect.

#### APPRENTICED CHILDREN.

One of the great advantages of the boarding-out system is that as the children advance in years they are given a means of livelihood by being apprenticed to various trades and callings. Until the extension of the powers of the Board granted by Parliament last year, it was the custom to apprentice children at the age of 12. Their extreme youth and the necessity for their attendance at school were a great drawback to obtaining satisfactory positions for them. The discretionary powers obtained by the Board have, however, enabled them to make more suitable arrangements to the mutual advantage of child and guardian. There are at the present time 860 children under indenture, of whom the girls number 363, all being at domestic service—whilst there are 497 boys engaged in useful occupations and apprenticed to blacksmiths, bootmakers, butchers, builders, carpenters, chemists, coachbuilders, dairymen, dealers, drapers, farmers, gardeners, grooms, grocers, orchardists, plumbers, saddlers, and tailors, &c.

There were discharged during the year 109 boys and 53 girls, a total of 162; whilst during 1896 there were 178 discharges, 172 during 1895, and 148 during 1894.

In this division the total cost of management, estimated at an average of £2 10s. per head, was £2,150.

#### CHILDREN CLASSED AS UNOFFICIAL.

There are now under the care of the Board 14 children (8 boys and 6 girls), who, for various reasons, are classed as above. The majority of these are over 12 years of age, and are all doing well. They are visited at stated periods by the officials of the Department, though this is the only expense incurred. Great benefit has resulted from the supervision, in this way, of these waifs and strays, of whom, in all, some 64 have thus been brought under the influence of the Board.

## THE CENTRAL HOME, PADDINGTON.

A large saving has again been effected in the working of the Paddington Depôt by arranging, where practicable, for the transfer of the children direct from one home to another in the same district without the expense of first transmitting them to the home. That a considerable amount of both time and money has been thus economised, is evidenced by the fact that, whilst the daily average of admissions was 19, the cost of maintenance averaged £9 2s. 9d., as against £9 15s. 1d. last year, the total annual cost for maintenance being £173 12s. 10d.

Except in very rare cases the children do not remain long in this home, which is merely for the convenience of admitting and drafting out to the various homes in which it is deemed advisable to place the children.

## COTTAGE HOMES AT MITTAGONG AND PARRAMATTA.

Too much cannot be said in favour of these valuable adjuncts to the boarding-out system. Whilst it is a comparatively easy matter to place out the ordinary children under the care of the State, there must of necessity be among so many a certain number who, by reason of their physical or mental infirmities, are debarred from being provided for in the usual way. The Board solved this serious difficulty by establishing, both at Mittagong and Parramatta, cottage homes, where this particular section of children might be specially treated. Under careful and judicious management, with pure air and wholesome surroundings, combined with sound moral training, many hitherto looked upon as incurable have sufficiently recovered to permit of their transfer to the boarding-out division, whilst others, hopeless invalids for life, have found their lot largely alleviated by the constant care and thought bestowed upon them.

There were 153 children in the homes on the 5th April, 1897, viz., 40 boys and 113 girls, as against 159 at the end of the previous year.

The following is the usual table of particulars :—

	Boys.	Girls.	Total.
Total number of children admitted to Cottage Homes to 5th April, 1897	597	808	1,400
Total number of children discharged from Cottage Homes to 5th April, 1897	557	690	1,247
Number in Homes on 5th April, 1897	40	113	153

The total annual expenditure upon the homes was £3,957 8s. 2d., being £3,557 8s. 2d. for maintenance, management, medical expenses, rents, salaries, &c., and £400 for clothing furnished to the inmates from the depôt. This expenditure includes the proportionate cost of inspection, the capitation cost being £22 14s. 10d.

#### CHILDREN BOARDED TO THEIR OWN MOTHERS UNDER SECTION X OF THE STATE CHILDREN RELIEF ACT OF 1896.

I now proceed to deal with the working of Section 10 of the State Children Relief Act, which became law in 1896.

The urgent necessity of administering relief to the large number of women left with their young families in a state of destitution, either through the death or desertion of their husbands, claimed for some years the attention of the Board. In view of the necessities of the case, I submitted for the consideration of the Board the provisions contained in the Amended Act, and after mature deliberation and approval, I introduced the Bill dealing with the subject in the Legislative Council, and the Act was passed on 10th September, 1896.

The provisions of this Act gave to the State Children Relief Board power to board-out to deserving widows and deserted wives their own children, in accordance with the original Act of 1881, in all cases in which it was considered that the interests of the children would be best met by the adoption of such a course.

That some such a measure was sorely needed was evidenced by the numerous applications which, immediately upon the Act being brought into operation, were received by the Board. Many of these were from mothers who, in their sorest need, had endured great privations to retain their children, and who now eagerly sought the assistance. The remuneration granted in such instances is at a lower rate than is allowed to ordinary guardians, as, in view of the circumstances of the mother, the regulations as to accommodation and outfit are not as stringent as is usually insisted upon by the Board. This small monetary allowance also, whilst it secures to a certain extent the comfort and well-being of the children of these deserving widows and deserted wives, precludes the possibility of the mothers and elder members of the family relaxing their efforts to supplement the relief from the State.

It

It is unavoidable that, in spite of the thoroughness of the investigation, there should be some cases in which the Inspectors are at first deceived; but the strict supervision exercised ensures the early detection of anything approaching fraud, when the relief is immediately cancelled.

To ensure the best results from the scheme, the greatest care is necessary in making the preliminary inquiries, and the *modus operandi* is as follows:—Upon an applicant seeking relief, a form is given, which must be filled in by herself, and signed by a clergyman and one other approved person. Every detail which may lead to a knowledge of her circumstances must be stated—such as the reason of her destitution; the ages, occupations, and earnings of any of her family; the addresses of all relatives, and whether they are in a position to assist her; what amount of rent is paid; and any other particulars which may bear upon the case. The form is then placed in the hands of an Inspector, with whom rests the responsibility of verifying or disproving the applicant's statements. Should he consider the case one worthy of relief, the recommendation is made accordingly; and, if approved of by the Board at its subsequent meeting, an allowance per child, varying from 1s. 3d. to 5s. per week according to circumstances, is granted.

In order that the several members of the State Children Relief Board may have time to consider the various cases coming under notice, a summary of each is made, and forwarded one week before the date of meeting, which takes place on the last Monday in each month. The ordinary meetings of the Board are held once a month, but since the passing of the Amended Act additional special meetings have been held to deal with this class of cases; and supplementary summaries are made of all cases so as to ensure an early response to the application. The adoption of this course entails a considerable amount of work which cannot well be avoided, as otherwise applicants for relief would, in many instances, be compelled to wait two months, the allowances being payable at the expiration of a month from the date of approval.

During the period ending 5th April, 1897, the State Children Relief Board dealt with 479 cases, with the following results:—

Allowances granted.	Refused.	Postponed.
378	50	51

There are now in receipt of relief the under-mentioned mothers:—

Widows.	Deserted Wives.				Total.
	Deserted Wives.	Husbands Insane.	Husbands in Gaol.	Husbands in Govt. Asylums.	
293	62	14	5	4	378

It was also deemed advisable to increase the rate per week per child in 13 cases, and to reduce the rate in 3 instances.

In all, 1,244 children were admitted to control, 14 of whom have since been discharged from the books. The ages of the children are as under:—

Under 1 year.	1 to 2.	2 to 3.	3 to 4.	4 to 5.	5 to 6.	6 to 7.	7 to 8.	8 to 9.	9 to 10.	10 to 11.	11 to 12.	Over 12.

#### CONCLUSION.

From the facts and statistics supplied in this Report, it will be perceived that the Department has become one of large and increasing usefulness; that its varied responsibilities are of great importance to the State, and that the duties of the Board—always of a responsible, and not infrequently of an onerous nature—have been considerably added to.

I desire to tender my thanks to the members of the Board for their hearty support, their regular attendance, and the unflinching interest they have taken in all the departments of the work. To the lady visitors who, at very great trouble, have inspected and supervised the boarded-out children in their homes, the country owes a debt of gratitude. The various members of the official staff have, on the whole, given satisfaction in the performance of their duties.

And in conclusion, I have much pleasure in conveying the thanks of the members of the Board to Mr. Critchett Walker, C.M.G., the Principal Under Secretary, and to Mr. Edmund Fosbery, the Inspector-General of Police, for the valuable assistance rendered to the Department during the year.

I have, &c.,

ARTHUR RENWICK,

President.

## APPENDIX J.

Mrs. T. O'Sullivan, North Sydney :—

I have much pleasure in endorsing my former letter, in favour of the boarding-out system. The Department seems to have used great discretion in the selection of the homes in my district, and the children, in nearly every instance, seem well cared for, and quite happy and fond of their foster-parents.

Mrs. F. B. Boyce, Redfern :—

I have continually under my notice a large number of the children boarded-out to strangers, and am perfectly satisfied regarding them.

Mrs. Brennan, Cambewarra :—

I have much pleasure in stating the system works well in my district. Most of the boys are on farms, and have good comfortable homes. The boys look well, and always tell me when I visit them that they have no complaints to make.

Mrs. A. M. Brown, Tumut :—

I have visited the homes of State children in Tumut for years, and found it a pleasure, knowing how comfortable they were, and how well the children were looked after. The children are all happy and contented.

Mrs. J. J. Bliss, Armidale :—

There is, in my opinion, little difference between the State children under my observation and those who are under the care of their own parents. Those State children under my supervision in this district are all well cared for, and look quite happy and contented.

Mrs. E. J. Bailey, Hunter's Hill :—

After many years' experience of the system, I have great pleasure in testifying to its efficiency. I have almost invariably found the children well cared for and kindly treated, and have been pleased to see the affection existing between them and their guardians.

Mrs. M. Brown, Gosford :—

Respecting the system of neglected children, I am quite of opinion that it is a good one, notwithstanding some difficulties arising from the characteristics of the children themselves.

E. A. Bayley, Braidwood :—

I can only say that I have found the boarding-out system most satisfactory in all the cases that have come under my supervision. The relations existing between the children and their guardians compare most favourably with those who are under the care of their own parents.

Mrs. J. G. Clegg, Newtown :—

All the children under my supervision are exceedingly well cared for, healthy and happy, both their spiritual and temporal wants being studiously attended to. I have very great pleasure in testifying, as far as my experience extends, to the great success of this beneficent plan of succouring children, and enabling them to become in after years worthy citizens.

Mrs. E. Colthorpe, Windellama :—

The system is very good, as far as my district is concerned, as the children are all in good hands, even better than a great number of the children who have their own parents to care for them.

Mrs. J. Dalton, Orange :—

I have much pleasure in saying that, as far as my experience goes, I find that the boarding out system is very satisfactory.

Mrs. D'Arcy Irvine, Bowral :—

There is great cause for thankfulness that the State provides for these poor children in placing them in happy, comfortable homes.

Mrs. W. M. N. Edmondson, Albury :—

I think, from my experience, that there can be no comparison between putting the children into families, under proper supervision, and herding them in institutions to the detriment of their minds and bodies.

Mrs. M. Ewan, Penrith :—

I have pleasure in saying that the State children under my supervision have the best of homes, and are well treated in every respect. I think the boarding-out system, as far as this district is concerned, an unqualified success.

Miss

Miss E. Eve, Newtown :—

The children under my supervision seem happy, and I believe their guardians do the best they can for them, as I always find them clean and well cared for.

Mrs. H. Goldsmith, Newtown :—

Re the boarding-out system and its results, I am of opinion that the dependent children of the State will compare most favourably in every respect with children of the same class who are not under State supervision, and hundreds who would otherwise be ruined are growing up into respectable men and women. The relations existing between the children and their guardians appear respectful, happy, and free.

Mrs. Gibson, Picton :—

I have great pleasure in expressing my opinion in regard to the well-being of the State children. In the homes which I visit several are better cared for than they would be in the home of their own parents, both as to their personal comfort and outward appearance.

Mrs. and Miss Hall, "Lavalette," Windsor :—

We can only repeat what we have formerly said, that the majority are well cared for, and compare favourably with children whose parents are in a similar position to their guardians.

Mrs. M. Arnott, Newcastle :—

I think the system a splendid one, and it seems to me that the majority of children are quite as happy as those who live with their own parents.

Mrs. E. J. Willis, Mudgee :—

I may say that in Mudgee district those children whom I visited I found healthy, well clothed, and with kindly feelings towards their guardians.

Mrs. T. H. Wilkinson, Wentworth :—

I am pleased to state that, so far as the children under my supervision are concerned, the system of boarding them out has proved very successful. They are well and kindly cared for, are healthy and happy looking, both guardians and children being mutually attached.

Miss Millie Wilson, Wiseman's Ferry :—

All the children who come under my supervision are well kept and very kindly treated, better in some cases than the guardians' own children. I am much pleased with the boarding-out system.

Mrs. D. Willans, Queanbeyan :—

I am pleased to say how very highly I think of the boarding-out system. It is quite a pleasure to see the love that exists between guardians and children.

Miss M. A. C. Walker and Mrs. W. H. Simpson, Warerley :—

We have much pleasure in stating that in our experience the boarding-out system works remarkably well. The affection existing between children and guardians will bear comparison with that between those with their own parents.

Mrs. E. G. Webster, Cootamundra :—

I beg to state that, with very few exceptions, I find the children much better cared for than they would have been in their own homes. As regards the relation existing between guardian and ward, it is more of a paternal nature than otherwise.

Miss Alice Taylor, Parramatta :—

It affords me much pleasure to be able to say that the homes that come under my notice are in every way well managed, and the children appear very contented and happy.

Rev. J. Shaw, Paterson.

Mrs. Shaw and I have watched the growth of the system, with which we have been connected since its inception, and consider that its results have been most successful. There are now in this district those occupying respectable positions and esteemed by their neighbours who were once boarded-out children.

Mrs. B. Sheehy, Yass :—

In all cases that I have visited the children bear testimony to the success of the boarding-out system. They are all well cared for, neatly clothed, have comfortable and suitable accommodation, and seem to be contented and happy. The relations existing between the children and their guardians are of a very cordial nature.

Mrs. R. Scott, Newtown :—

I have much pleasure in stating from my experience that the boarded out system for State children works splendidly. All the children under my supervision have good homes and are well cared for, and, as a rule, a very good feeling prevails between guardians and children; indeed, the latter often compare favourably with those under the care of their own parents.

Miss Olivia Smith, Crookwell :—

Respecting the operation of the boarding-out system in force in this district, I beg to state, briefly, that it seems to me to answer admirably. The children appear to be as well provided for by their guardians as they would be if living under parental care, and are receiving a good education in their several stations of life.

Mrs. Pole, Balmain :—

I have much pleasure in again testifying to the beneficial effects of the boarding-out system in Balmain. The children compare very favourably with those who reside with their own parents.

Mrs. J. Richardson, Raymond Terrace :—

I think the boarding-out system excellent. The children are comfortable and well cared for, and a good feeling exists between children and guardians. The children compare most favourably with those who are under the care of their own parents.

Mrs. G. Onus, Richmond :—

The State children who are in this district appear to be very comfortable and contented in their several homes, in fact as well looked after, if not more so than if they were with their own people.

Maria O'Brien, Braidwood :—

The State children whom I have visited lately look well and happy. There have been no complaints whatever either from the children or their guardians. They are in good health, and kindly treated by their foster-parents.

Mrs. D. Osborn, Bundanoon :—

I have had a few of your children under my supervision the last year or two, and on each of my visits found them well clad, happy, and comfortable. I am still of the opinion that the boarding-out system is far preferable to the barrack one.

Mrs.

Mrs. J. T. Marriott, Bathurst :—

I believe the boarding-out system is a thoroughly humane and sound one, and I am often astonished at the amount of self-denial and attachment shown by the guardians for their charges. The children, I am sure, could not be more tenderly loved and cared for if they were their own.

Miss C. M. Loughton, Wisoman's Ferry :—

I can honestly tell you that the children that come under my supervision are as well cared for by their guardians as their own children, and I believe are better off than ever they were.

Mrs. J. Kidd, Campbelltown :—

I think the boarding-out system works well, as under it the children are well cared for.

Mrs. E. C. Irving, Hunter's Hill :—

I have only a favourable report to give with regard to the system of boarding out the State children; for, when kindly treated, it gives them the advantage of a home life, which is very essential in the bringing up of children.

Mrs. L. Heighway, Gerringong :—

I am pleased to be able to say that the State children placed in homes in and around Gerringong are well cared for, enjoy good health, and, while learning to help on farms, are not kept from school. They appear to be happy and contented.

Mrs. Heiley, Young :—

I have much pleasure in saying that I think the boarding-out system a very good one, and the five children under my supervision are very happy in their homes.

Public School, Leichhardt West :—

Judging from an experience of sixteen years, during ten of which 117 State children have attended the various schools under my charge, I have no hesitation in stating that the State Children Relief Board does excellent work in training the "waifs and strays" to become useful and honourable citizens.

Public School, Murrumburrnh :—

I have much pleasure in testifying to the success of the boarding-out system of State children, as far as evinced by my own observation; and I believe that, morally and socially, it is far preferable to the aggregation of such children in homes or asylums.

Public School, Mummel :—

From my experience the boarding-out system is an admirable one affording to the children of the State good homes, where in the majority of cases they are treated in the same consideration as members of the family circle. The State children under my own supervision are quite the equal of the other children in the school.

Public School, Muswellbrook :—

My experience of State school children is that, as a rule, they compare favourably with other children.

Public School, Mittagong :—

The State children enrolled in this school are regular in attendance, clean and tidy in dress, and compare favourably with the others in their general appearance.

Superior Public School, Petersham :—

In reply to your circular of 10th instant, I have the honor to report that from my experience of State children in this school, the system of boarding-out is excellent in every way.

Superior Public (Girls') School, Penrith :—

One child boarded out by the State Children Relief Department attends this school. She appears healthy and happy; is always cleanly and very comfortably clothed.

Public School, Nowra Hill :—

I beg to certify that the boarding-out State children who attended this school were well clothed and cared. They were punctual, intelligent, and obedient.

Superior Public School, Picton :—

My experience of the boarding-out system extends over about three years. During that time I have had to do with about thirty State children, and I am opinion that the results of the system are on the whole satisfactory.

Superior Public School, Parramatta North :—

In reply to your circular, *re* the working of the boarding-out system, I beg to state that the children come to school very regularly, and are tidily dressed.

Public School, Pitt Town :—

I consider the boarding-out system, as far as the children attending this school are concerned, to be a decided benefit to the children. The children are well cared for as far as I can ascertain, and seem to be quite contented with their lot.

Public School, Robertson :—

From personal observation, extending over a period of ten years, I am of opinion that the boarding-out system in this Colony is an admirable one, and the results extremely satisfactory. The State children I have known have, without exception, compared favourably with the other children brought under my supervision. They have been well fed, well clad, and well cared for.

Public School, Rouse Hill :—

I have had under my observation for a period of about twenty-two months a number of State children as pupils in attendance at my school. The result of my experience is that I find they compare very favourably with the other children in appearance and conduct, and seem contented and well cared for.

Public School, Shaw's Creek :—

I consider the boarding-out system an excellent one, and all the children I have had under my supervision have been well cared for—in most cases more so than the majority of children living with their parents.

Public School, St. Peters :—

From personal observation and from inquiries made amongst the other teachers here I am of opinion that the boarding-out system has proved very satisfactory. The children compare very favourably with the other pupils of the school.

Public School, Thirlmere :—

The State children attending this school are, apparently, as well cared for as are the majority of children of the poorer class.

Public School, North St. Leonards :—

My experience of the boarding-out system is that it is a wise and beneficent scheme for orphan children, and is fulfilling its object for them—the care and comforts of a well-ordered home. The State children attending this school are punctual and regular in their attendance, neat and tidy in appearance, and in all respects compare favourably with the other children attending the school.

Public

**Public School, Woonona :—**

For the past seven or eight years many State children have attended this school. I find them well attended, cheerful, and happy, and know from personal knowledge that their homes are as comfortable as respectable parents could provide for them. In all respects they compare favourably with other children, and in no way are they ever caused to feel any reflection upon their position.

**Public School, Woollahra :—**

The State children in this school appear to be well cared for, and compare favourably with other children.

**Public School, Wilberforce :—**

I have much pleasure in testifying to the good results of the boarding-out system in this place. The children under my notice compare very favourably with the other children of the place, and are clean and respectful.

**Superior Public School, Waterloo :—**

The children attending this school under the name of "State children," seem well cared for in every respect. They compare favourably with the other children of the school.

**Public School, Wattamolla :—**

I have been in different parts of the Colony, and from my own observations I have found the results of the boarding-out system very satisfactory.

**Public School, Ulladulla :—**

As far as the State children under my charge are concerned, the boarding-out system has shown very satisfactory results. The guardians appear to treat them as their own children, and, being regular attenders at school, their progress and general conduct is quite equal to that of other children.

**Public School, Terrara :—**

Only two State children have attended the schools under my charge, and they compared favorably with others under my supervision.

**Public School, Tirranna :—**

As far as it has come under my notice the boarding-out system in this district bears encouraging results. The State children enrolled at this school compare quite favourably with any attending in dress, cleanliness, manners, and looks, and they certainly attend with more punctuality and regularity, as the records show.

**Public School, South Strathfield :—**

There are now six State children attending this school. They are very regular in their attendance, are making satisfactory progress, are well clothed, and compare favourably with the other children under my supervision.

**Superior Public School, Lismore :—**

From personal observations, I am able to speak highly of the boarding-out system. The two little girls who are boarded out in Lismore come to school regularly; they are always clean, tidy, and well clothed, and appear to be comfortable and happy in their respective homes.

**Public School, Lower Mittagong :—**

Judging from what I have seen in Mittagong, I have not the slightest hesitation in saying that the boarding-out system is an unqualified success.

**Public School, Liverpool :—**

I have the honor to inform you that the State children attending this school appear to be well cared for, and are clean and tidy in dress. At school they are well behaved, and make fair progress in their studies. Judging from what I see of their conduct, I consider that they compare favourably with the other pupils of this school.

**Public School, Kelso :—**

I have the honor to inform you, that the State children attending this school compare favourably with the other pupils in this school; they are always tidy and clean, and from appearances they are well cared for.

**Public School, Kingsdale :—**

I have the honor to inform you that one State child attends this school, and that he is well-conducted and intelligent; further, that he always appears well cared for and happy.

**Superior Public School, Kogarah :—**

I have the honor to report that, almost without exception, the State children who come under my notice, appear to be well cared for; they are tidy and fairly regular in attendance at school. I think I may safely state that they compare favourably with other children of the school.

**Public School, Kialla :—**

During my eight years charge of this school I have had the opportunity of observing nine cases of children under the boarding-out system of your Board. With the exception of two, all these have been favourable to the system. In the exceptional cases, the boys were accustomed to city life and frequently evidenced their longing to return, and though kindly treated were always discontented with their lot, and on one or two occasions ran from home. Both these boys are out of this locality now. My opinion is that the "Sobriou" would have been a better home for them in the first instance. The other cases compared in every respect very favourably with the children under my supervision.

**Public School, Ingleburn :—**

There are at present about a dozen State children in regular attendance at this school. They all appear happy, well fed, and comfortably clothed.

**Public School, Glenhaven :—**

All the State children who are attending the school under my charge, are well cared for and appear perfectly contented, and compare very favourably indeed with the other children under my supervision.

**Public School, Granville North :—**

As far as I am able to judge, the boarding-out system from every point of view is thoroughly successful. The children attending this school are all decently clad and healthy looking, and have every appearance of being properly treated and well cared for. In these respects, and in their general conduct, they compare favourably with other pupils of the school.

**Public School, Guildford :—**

With reference to the results of the boarding-out system, I have the honor to report—1. My experience with the system dates back some eleven years; 2. I have at present four state children attending this school; 3. the children have always appeared contented and well nourished, and are kept exceptionally clean and tidy, and attend school regularly; and 4. they compare very favourably with the other scholars.

**Superior Public School, Goulburn South :—**

In reply to yours respecting the results of the boarding-out system, I beg to state that I consider the system the most humane that could possibly have been adopted. I have carefully watched its administration in this city, as I take an interest in the children, and from my personal observations, I feel

feel satisfied that the little ones, in the great majority of cases, are in comfortable homes. I can find no fault with those that attend my school. They are punctual and regular in attendance, bodies and clothing clean, all apparently well nourished and happy, and in every respect compare very favourably with my other pupils.

Public School Gunning :—

There are at present seven State children at this school; they all attend with very fair regularity and punctuality (indeed, three of them seldom miss a day); they are well and cleanly clothed, and appear well fed and happy. They all seem to have a genuine affection for their guardians, and, I am happy to say, the affection is mutual. They all compare very favourably indeed with the other children, there being nothing either in appearance or conduct to distinguish them. Taking the cases that have come under my notice as a guide, I have come to the conclusion that the boarding-out system is a very great blessing to these poor children.

Public School, Granville :—

With reference to the condition of the children boarded out by your Department, I can only repeat what I have stated on previous occasions: That the "State" children under my charge are well fed and clothed, and that any person, not acquainted with their history, would pick them out from among the pupils as children of fairly well-to-do parents.

Public School, Gordon :—

So far as my knowledge of the boarding-out system goes, I have much pleasure in stating that it is productive of much good. The children under my supervision last year were well clothed and nurtured, and seemed quite satisfied with their guardians.

Public School, Forrester :—

The State children under my charge are progressing satisfactorily and compare favourably with the other children attending my school.

Public School, Eastwood :—

The boarded-out children in the school under my charge are always neatly and decently dressed and clean. They appear well nourished, contented, happy, and compare very favourably with the other children in the school.

Public School, Fairy Meadow :—

I consider that the present boarding-out system is working very satisfactorily, and is of immense advantage to the children, who seem far happier and healthier than they could possibly be when crowded together without proper supervision. The children under my charge are well cared for, and will compare favourably with the others under my supervision.

Public School, Ebenezer :—

In answer to your letter of the 8th inst., I desire to state that in most cases the boarding-out system has been a benefit to the children sent out. In a great many instances they find good homes. There have been times when the children have turned out badly, and have been a source of danger to other children. I have seen very little of it in my own school. I have had no trouble with the five now attending.

Public School, Wellombi :—

With regard to your inquiries *re* the boarding-out system, I beg to state that as far as my experience goes the children, in most cases, compare very favourably with the other children under my supervision.

Public School, Taralga :—

I beg to state that my experience of the system is the greater conviction of the benefits bestowed upon many of the youthful population of our Colony. Being provided with comfortable homes and a proper training in various branches, fits them with the means of carrying out these callings, and of conducting themselves advantageously, with credit to those in whose hands they have been placed, and with a usefulness to society; whereas, had they not been taken up by the State, and cared for, they may have become inmates of some of our prisons, thereby bringing disgrace and anxiety upon all connected with them.

Public School, Bowan :—

The boarding-out system works well in this district, and the children are kept clean, and appear to be well cared for. They attend school very regularly.

Public School, Shellharbour :—

*Re* the boarding-out system, those cases that have come under my notice have firmly impressed me with its infinite superiority over the "Barracks system" of housing the children without any profitable occupation, and with ample chance to communicate evil habits one to another. The children who attended my school at different times were, without exception, tidy and clean, and quite as well conducted as other children under the control of their own parents. It is a natural system, and gives boys in many instances the benefit of a good home.

Public School, Yass :—

I have much pleasure in stating that from my experience of the State children attending my school, I consider the results of the system to be eminently satisfactory. In nearly every case the large number of these children attended with marked regularity, and in this respect they compare most favourably with the other pupils. As a rule they are decently clad and cleanly in habits, and in general demeanour and intelligence are not inferior to the other pupils of the school.

Public School, Rookwood :—

As in former years, it may still be said that the condition of the State Relief children in this district compares favourably with any of the rest, and is superior to several. One guardian does not like her charge to be called by any but the family name. Another is parting with her ward for the child's benefit, both being grieved at the separation.

Public School, Erskineville :—

The conduct of the State children attending this school is in all cases good; their dress is usually neat and tidy, and with regard to attendance at school, all are very regular, giving no cause for complaint.

Public School, Dural :—

I beg to inform you that I have had very little experience of the boarding-out system, as I have only had three State children enrolled during the last few weeks, but so far I can say that they compare very favourably with the other children under my charge.

Public School, Coolac :—

In reply to your letter of the 8th April, 1897, I have the honor to state that, so far as I have observed the working of the boarding-out system in this Colony, the results have been strongly in favour of the system. The children attending the school under my charge have been clean and tidy in their dress, and compare favourably with the other children of the school.

Public School, Corrimall :—

In reply to your request with reference to the boarding-out system, I beg to state that there are six children attending school, and they seem to be well cared for; their attendance is very good, and they compare favourably with the other children. The system seems to work well at this place.

Public

**Public School, Cranebrook :—**

In this neighbourhood, at least, the boarding-out system seems to work admirably. The children attend school regularly, are neatly dressed; seem well nourished, and, in general appearance and demeanour, compare favourably with the other pupils attending this school.

**Superior Public School, Cootamundra :—**

Although I have not had any State children under my supervision for some time, yet I am able from past experience to say that I am satisfied that your Institution is rescuing children from beggary and immorality, and giving them an idea of home and comfort.

**Public School, Croydon :—**

The State children attending this school are well cared for and compare favourably with the other children.

**Public School, Campbelltown :—**

In reply to your communication of the 8th instant, *re* State children in this district. I know of only one. He attends this school regularly, and is always neatly and comfortably dressed, and has the appearance of being well kept and well nourished by his guardian.

**Public School, Bexley :—**

In reply to your circular letter of April 8th, I beg to state that the boarded-out children who have come under my notice since my arrival in Sydney appear to be well cared for and treated as well as the members of the family in which they live.

**Public School, Cullinga :—**

During 1896 I had only one child under the boarding-out system on the rolls of this school. This child is on all occasions very clean and neat, and has the appearance of being well fed and cared for, and compares favourably with other children attending school.

**Public School, Brookfield :—**

I beg to state I have at present only two State children under my charge. Both are under the same guardianship and present every appearance of being well fed. They attend school in good clothes regularly and punctually. These children are treated by their guardians as their own.

**Public School, Albury :—**

My experience, so far as it goes, proves that the boarding-out system works very satisfactorily. Amongst the limited number who attend my school, the children are apparently well cared for, and compare favourably with others.

**Public School, Annan Grove :—**

In reply to your memo. dated 10th inst., I beg to acquaint you that, as far as I know, the boarding-out system is advantageous to the children concerned. With regard to the children under my charge, I must say that they are well cared for, and compare favourably with the other pupils of my school.

**Public School, Adamstown :—**

I beg to state, in reply to your memorandum, that the State children in attendance at this school are as well dressed and as well behaved as other pupils, and in other respects compare favourably with them.

**Public School, Arncliffe :—**

Three State children have attended this school recently. They all appear to be fairly treated, well clothed and fed, and, in fact, to be on a footing with the bulk of the pupils of the school in all important respects.

**Superior Public School, Annandale :—**

I have to state that the children boarded out by your Department in this locality have every appearance of being well looked after. They seem to be well fed, well clothed, and happy. There is nothing to distinguish them from the bulk of the children attending school.

**Public School, Baulkham Hills :—**

I have the honor to state that I have observed that the boarding-out system appears to work well, and the children compare very favourably with others attending this school, both with regard to cleanliness and general appearance of clothing. At present there is but one attending, who is a well-behaved, modest, little girl.

1897.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

CARPENTERIAN REFORMATORY.  
(CORRESPONDENCE RESPECTING.)

*Printed under No. 11 Report from Printing Committee, 15 July, 1897.*

[Laid upon the Table of the House in response to a Question asked by Mr. Lyne, on the 16th June, 1897.]

Question.

MR. LYNE asked THE MINISTER OF PUBLIC INSTRUCTION,—

- (1.) Is it a fact that the late Superintendent of the Carpenterian Reformatory reported that the Reformatory was overcrowded, and suggested that more room should be given at Brush Farm or elsewhere?
- (2.) Was this course approved; or, if not, was the recommendation ignored?
- (3.) As a consequence, did the Superintendent tender his resignation?
- (4.) Did the Minister, or any other person connected with the Department of Public Instruction, order the discharge of twenty-eight of the lads referred to, and had these twenty-eight the worse record?
- (5.) Was an instruction afterwards given, and by whom, on which these lads were rearrested and placed on the "Sobraon"?
- (6.) By what authority was this action taken?
- (7.) Will he lay upon the Table all instructions and papers connected with the matter and the resignation of the Superintendent?

ANSWER.

MR. GARRARD answered,—

- (1.) Yes.
- (2.) These premises are leased for ten years, at a rental of £500 per annum; the lease has yet seven years to run. To make the place suitable for the requirements of the Colony would need an expenditure on this private property of about £10,000, and the additional cost of resumption, if resumed. The Government, under these circumstances, has not yet decided what action to take.
- (3.) Captain Murray resigned because the Government did not sanction the increased expenditure that he desired on this leasehold property.
- (4.) Eleven boys were discharged on the recommendation of the late Superintendent, and twenty-eight others, which it was desired to send on board the "Sobraon," were also discharged, as it was found that, legally, the action contemplated could not be carried out. The records were, as in the case of most Reformatory boys, not good.
- (5.) No.
- (6.) Answered by No. 5.
- (7.) Yes.

## CARPENTERIAN

RETURN asked for by Mr. Creed,

Name of Boy.	Age.	Date of Commital.	Place of Commital.	Offence charged with and committed on.	Time in Institution.	Conduct in Institution.

## Minute Paper for the Executive Council.

No. 42.

Department of Public Instruction, Sydney, 22 March, 1897.

Carpenterian Reformatory, Brush Farm, Eastwood.—Discharge of Boys.

I RECOMMEND, for the approval of His Excellency the Governor-in-Council, that the boys whose names are mentioned hereafter be discharged from the Carpenterian Reformatory, Brush Farm, Eastwood, under the provisions of section 4, Act 30 Victoria No. 4:—

Samuel Hodge,	Douglas Cook,	Leslie Owens,
John Higgins,	William B. Cassidy,	George Parker,
William White,	Sydney Davies,	Sydney Rootsey,
Samuel J. West,	Alfred George,	Bernard Redmond,
Henry M. Taylor,	Charles W. H. Hyland,	Alfred Smith,
James Brislin,	Edward Harper,	George T. Stacey,
Charles Dixon,	Victoria E. Lilley,	Robert Shaw,
Charles Cox,	William F. Meehan,	Henry Stewart,
Thomas McDonald,	James Middleton,	George Thomas,
William E. Lane,	Joseph Manders, or	James Thompson,
Percy James Dean,	McNally,	Henry Thompson, or
John Butler,	Edward J. Maher,	Arthur H. Wilson,
George Cooling,	Thomas McGuire,	George Harold Wilie.
Thomas Cooper,	William O'Brien,	

J. H. YOUNG.

The Executive Council approve of the discharge of the boys referred to from the said Reformatory.—  
ALEX. C. BUDGE, Clerk of the Council. Min. 97/13, 23/3/97. Confirmed, 30/3/97. Approved.—  
HAMPDEN, 23/3/97.

May be discharged at once or to-day.—

Samuel Hodge,	James Brislin,	William Lane,
John Higgins,	Charles Dixon,	Percy James Dean.
William White,	Charles Cox,	
Samuel West,	Thomas McDonald,	
Henry Taylor,		11 in all.

List of boys who require special treatment, which cannot be given at Brush Farm at the present time owing to the want of proper accommodation:—

Butler,	Lilley,	Smith, A.
Cooling,	Meehan,	Stacey,
Cooper,	Middleton,	Shaw,
Cook,	Manders,	Stewart, H.
Cassidy,	Maher,	Thomas, G.
Davis,	McGuire,	Thompson,
Evans,	O'Brien,	Wilson,
George,	Owens,	Willie.
Hyland,	Parker,	
Harper,	Rootsey,	30 in all.
Lessells,	Redmond,	

J. S. MURRAY.

## Memorandum to The Superintendent, Carpenterian Reformatory, Brush Farm, Eastwood.

Discharge of Boys.

The necessary Executive authority having been obtained, the following boys should be discharged forthwith:—

Samuel Hodge,	Douglas Cook,	Leslie Owens,
John Higgins,	William B. Cassidy,	George Parker,
William White,	Sydney Davies,	Sydney Rootsey,
Samuel J. West,	Alfred George,	Bernard Redmond,
Henry M. Taylor,	C. W. H. Hyland,	Alfred Smith,
James Brislin,	Edward Harper,	George T. Stacey,
Charles Dixon,	Victor E. Lilley,	Robert Shaw,
Charles Cox,	William F. Meehan,	Henry Stewart,
Thomas McDonald,	James Middleton,	George Thomas,
William E. Lane,	Joseph Manders, or	James Thompson,
Percy James Dean,	McNally,	Henry Thompson, or
John Butler,	Edward J. Maher,	A. H. Wilson,
George Cooling,	Thomas McGuire,	George H. Wilie.
Thomas Cooper,	William O'Brien,	

The boys are simply to be discharged, and no other action is to be taken.

Department of Public Instruction, Sydney, 31st March, 1897.

J. C. MAYNARD,  
Under Secretary.

The

The Superintendent, Carpenterian Reformatory, to The Under Secretary of Public Instruction.

Brush Farm, Eastwood, 26 January, 1897.

In my letter of the 12th instant,\* I had the honor to report that all the sleeping accommodation at the Reformatory was full. Since that date five boys have been sent here.

I would now respectfully point out that the limit of safety has been passed; and that the pressure has obliged me to put boys to sleep in a cottage from which they can easily abscond.

Since the 31st December, 1896, four boys have absconded: all have been recovered with much trouble and anxiety.

At present there are five boys confined in the cells for safety. Every care is exercised with regard to their health—but four of these boys are dangerous if released—and, before proceeding to put in force Section 12 of the Reformatory Schools Act, I would ask for an instruction in this matter.

In my Report of 1st September, 1896, I stated that the number of boys at Brush Farm this year would probably be 120, and pointed out the necessity for a new dormitory, as the accommodation was then full.

J. S. MURRAY,  
Superintendent.

J. S. MURRAY,  
Superintendent.

26th January, 1897.

Submitted.—J.C.M., 29/1/97. Seen by Minister.—J.C.M., 10/2/97.

The Superintendent, Carpenterian Reformatory, to The Under Secretary of Public Instruction.

Brush Farm, Eastwood, 24 February, 1897.

I have the honor to lay before the Minister the following statement:—

I have not been allowed to make the arrangements necessary for the development of the Reformatory, in the direction of safe accommodation for the boys; nor have I been permitted to build workshops for teaching trades—without which the Reformatory must fall short of its purpose—although these wants have been made known for many months past.

On account of this, the safety of the institution is, at the present time, dependent entirely on my own personal effort to keep the boys together; and the impossibility of properly training, educating, and keeping safe 112 criminal boys—with means which are wholly inadequate—is so painfully apparent that no course now remains open but to offer my resignation.

On account of the crowding, and the want of a penal division here, I have been obliged to adopt a course of severity which is repugnant to myself and contrary to my plan and principle for reclaiming the boys.

There are 32 boys without safe sleeping room; and the small improvised workshops carry 14, instead of 50 or 60.

The rate of admissions for the last six months is 112 per annum.

I would place on record the undoubted fact that the success of the Reformatory scheme is proved. For the boys requiring this asylum—and who cannot be sent on board the "Sobraon" under the Act—are being sent in rapidly from all parts of the Colony. But there is no room here.

The Matron's resignation necessarily goes with mine.

I would suggest that the officer appointed to succeed me should reside with us for a few days to become acquainted with the present management.

J. S. MURRAY.

The Public Service Board,—I have seen Captain and Mrs. Murray and explained to them that nothing can be done in the direction he wishes till a new Act has been passed. I think he will recall this resignation, or at any rate not ask to be relieved till after next June.—J.C.M., 11/3/97.

The Superintendent, Carpenterian Reformatory, to The Under Secretary of Public Instruction.

Dear Mr. Maynard,

Brush Farm, 12 March, 1897.

Perhaps you would kindly give us a date for our departure as soon as Mr. Garrard returns.

The sooner it can be arranged the more convenient it will be for our own plans, as our goods and chattels are scattered about, and must be collected.

I could arrange a plan for carrying on, if you would wish to have my help.

Believe me, &c.,

J. S. MURRAY.

Submitted that Captain Murray's resignation be accepted to take effect from 30th instant.—J.C.M., 2/4/97. Approved.—J.G., 2/4/97. Informed.—W.J.D., 2/4/97. Treasury informed.—G.M., 14/4/97. The Public Service Board.—J.C.M., 14/4/97.

\* No such letter received by Department of Public Instruction, which only took over the Carpenterian Reformatory in December, 1896.

The Superintendent, Carpenterian Reformatory, to The Under Secretary of Public Instruction.

1 April, 1897.

I HAVE the honor to make application for four weeks' leave of absence from this date.  
I have not been on leave for three years.

I am, &c.,  
J. S. MURRAY.

Approved for Minister. Mr. Stayner of the "Sobraon" to act temporarily.—J.C.M., 2/4/97.  
Captain Murray and Mr. Stayner written to.—W.J.D., 2/4/97.

The Under Secretary of Public Instruction to The Superintendent, Carpenterian Reformatory.

Sir, Department of Public Instruction, Sydney, 2 April, 1897.

Referring to your letter of the 12th instant, I am directed to acquaint you that the Minister of Public Instruction has accepted your resignation as Officer-in-charge of the Carpenterian Reformatory at Brush Farm, to take effect from 30th instant. The Minister has also granted you one month's leave of absence from the 1st instant, and has appointed Mr. F. W. Stayner, of the N.S.S. "Sobraon," to take temporary charge of the institution. He has been instructed to proceed to Brush Farm early to-morrow morning.

It is understood that you will remain at the Reformatory for a few days, so as to initiate Mr. Stayner into the working of the institution.

I have, &c.,  
J. C. MAYNARD,  
Under Secretary.

Captain J. S. Murray, Carpenterian Reformatory, to The Minister of Public Instruction.

Sir, Eastwood, 1 May, 1897.

After working for nearly two years at this Reformatory, it will be counted but reasonable, I trust, that I should be permitted to give an account of myself and my work, and of the reasons which have compelled me to resign my appointment as Superintendent.

Appointed by the present Government, I took charge on 1st September, 1895, at a salary of £360 per annum, with usual allowances. There were then but few boys—8 in all—and Brush Farm was immediately put in order for the work.

My report for the first year speaks for itself.

There were 70 boys on the roll on 1st September, 1896. At this time I began to feel neglect on the part of those under whose charge we had been placed, and the strain put upon us by increasing numbers, with no leave to expand, became very severe. Remonstrances were made by me personally to the Public Service Board, and the Shaftesbury Institution was suggested, and virtually promised, as a penal division for our relief—as permission to expand at Brush Farm was refused.

Transferred to the Department of Public Instruction early in December, 1896. Distinct orders were received not to expend more on this Reformatory. The work, however, progressed, and excellent cases for the Reformatory coming in rapidly—57 for the half-year ending 1st March. I called attention to the serious position in which I was being placed with the responsibility of keeping safe some thirty or forty boys, for whom there was not sufficient room (the whole number at this time being 118), and receiving no instructions for my guidance, I was compelled to offer my resignation on 24th February, 1897.

The order to release twenty-eight of the worst characters in the Reformatory on 1st April, 1897, came upon me as a shock; and being quite unable to carry such an order out my resignation had to be accepted. I have reason to regret that more confidence had not been placed in me, for it would have been quite easy to relieve the pressure temporarily—if there were no other way—by handing in thirty names of boys who were worthy of having their periods reduced, and such a simple and reasonable course would have had a powerful effect for good.

About the treatment which Mrs. Murray and I have received personally—which is quite a secondary matter when speaking of Reformatory work—I have to complain of having been asked to take this most important work in hand when there was no clear intention of supporting me in the endeavour, and after a very considerable amount of success has been accomplished of forcing me to resign. My salary in the meantime being reduced to £10 per month (less than the carpenter's pay on the "Sobraon"). We have suffered much personally, but it is the breaking up of our twenty months' work, so suddenly, which causes intense pain.

It can safely be affirmed that the Reformatory itself has been a success, and in no small degree, and the work remains on record, for out of 133 boys entered on the books only one can be called a failure.

I am, &c.,  
J. S. MURRAY.

Seen.—J.G., 6/5/97. Ackd.—W.E.B., 10/5/97.

The Under Secretary of Public Instruction to Captain J. S. Murray.

Sir, Department of Public Instruction, Sydney, 10 May, 1897.

I am directed by the Minister of Public Instruction to acknowledge the receipt of your letter of the 1st instant, stating your reasons for resigning the position of Superintendent of the Carpenterian Reformatory.

I have, &c.,  
J. C. MAYNARD,  
Under Secretary.

The

The Under Secretary of Public Instruction to The Superintendent, Carpenterian Reformatory.

Sir, Department of Public Instruction, Sydney, 13 March, 1897.

At the instance of the Public Service Board, I beg to introduce Captain Neitenstein, the Comptroller of Prisons.

Will you kindly afford him every facility in the inquiry which he has been appointed to make.

I have, &c.,

J. GIBSON

(For Under Secretary).

Minute Paper.

*Subject*:—Carpenterian Reformatory.—Report respecting letters from the Superintendent (Captain Murray), also general condition of the Institution.

Department of Prisons, Sydney, 16 March, 1897.

In compliance with the instructions of the Public Service Board, I visited the Carpenterian Reformatory yesterday for the purpose of inquiring into the various points contained in the attached letters from the Superintendent (Captain Murray), and also of ascertaining the general condition of the institution. I arrived at 9 a.m., and left shortly before 8.30 p.m., after seeing the boys turned in for the night in their various dormitories.

The reformatory is situated amidst pleasant surroundings, and the position is one of great beauty. The principal administrative buildings are nearly 400 feet above sea-level, and the locality is among the healthiest in the Colony. Few institutions of the kind have such wholesome and cheerful natural surroundings.

Not much more can be said in its favour. The buildings are altogether unsuitable. They were never intended for the purpose to which they are being applied; and their structural defects are of so grave a character as to render supervision and security out of the question. From time to time feeble attempts have been made to increase the accommodation and to alter the arrangements, but these alterations and additions have not materially been improvements, and they have simply added to the holes and corners so impossible to supervise. The heterogeneous collection of old buildings and new additions, many of them of a flimsy nature, are scattered about in different directions—in some cases a quarter of a mile apart—and these serious disadvantages in themselves increase the difficulties of the management. The administrative buildings, with the dormitories, school-rooms, recreation-halls, and other necessary portions of a successful institution, should be so constructed, and should be so concentrated, as to be readily capable of access and supervision. But to thoroughly put the Brush Farm establishment in this condition would mean a radical alteration, involving the expenditure of much money. The place is now held upon a ten years' lease, of which three years have expired. The annual rental is £500, and the contract provides that the orchard shall be kept in good order, and that all trees which become useless shall be replaced with others by the lessee. Provision is made for the purchase by the Government during the currency of the lease at the then value of the property. The principal thing, therefore, to be determined is whether the estate is to become the property of the Government. Until this is settled, it would be an unbusiness-like transaction to expend a large sum in alterations in connection with a lease having only seven years to run. This is the main difficulty, and it controls the situation. I, therefore, at once draw attention to it before proceeding to lay before you the results of my inquiry into matters of detail. It might, further, be pointed out that the place is not suited for agricultural work, and the ground can only be utilised as an orchard, and, in a limited direction, for vegetable gardening and some dairy work. These occupations would be healthy, and afford useful training, but they would not be pecuniarily profitable, and any ideas that they would render the institution self-supporting must be abandoned. I am aware that sanguine expectations on this head were indulged in at the inception of this establishment, and that it was officially stated: "It may be taken for granted that the monetary returns from the sale of fruit, vegetables, and general produce will prove a large source of revenue, and the inmates' labour can be so utilised as to reduce the actual cost to the State under this heading to a comparative trifle." Unfortunately, these expectations have not been realised, a return, prepared for me by the Superintendent, showing that the operations on the orchard account, to the 31st December last, had resulted in a debit balance of £82 ls. 3d. on the total transactions since the lease was entered upon. The revenue is principally made up of the estimated value of the jam made by the boys and consumed on the premises, and supplied to other institutions. And, by taking into consideration the estimated value of the jam in stock, the debit is converted into a credit balance of £12 2s. 1d., as at the 31st December last. Taking the most favourable aspect of these transactions, it must be apparent that the probable income, from a practical £ s. d. point of view, need not be seriously taken into consideration.

I arrived at the institution at 9 a.m., entirely without notice, and my observations are founded strictly on an ordinary day's routine. The Superintendent was with me all day, and he afforded me every information. It may not be out of place here to record my impressions of that officer. Captain Murray has a most trying situation, and he accomplishes much good under serious disabilities. He has the sailor's readiness of resource, combined with a refined and benevolent disposition, and I was particularly struck with the strong good feeling that plainly existed between him and the boys. He is constantly with them from "turn out" in the morning at 6 until they are all stowed away in bed at a quarter past 8 or so at night. His efforts are ably seconded by his wife, the Matron, and it is only the personal power of these two people, and the grateful regard which the inmates have for them, which prevent more boys from absconding. The whole place is bounded by public roads, from which they are mostly separated only by low two-rail fences. There is little to prevent a general exodus, if the boys felt so inclined, and that more do not abscond is a testimony to the qualities of the two principal officers. It is to be regretted that Captain Murray has tendered his resignation, which, necessarily, carries his wife's with it. He has a great deal of present trouble to encounter. Of late, the various benches have been committing to his care youths of bad character in unusually large numbers, and the weak resources of the institution are severely strained. There are amongst the new-comers boys of a sullen and bad disposition, and the sudden influx of these determined fellows, and others, has not only overcrowded the institution, but has led to an increase of misconduct, necessitating the infliction of punishment which Captain Murray feels  
repugnant

repugnant to his principles and theories. He plainly fears the occurrence of a riot or mutiny, with which he may be unable to properly deal, with his present imperfect appliances. Abscondings or attempts to abscond are not infrequent, and the overcrowding which takes place in the dormitories at night is carried into the miserable apologies for workshops in the day, so that the occupation of these boys cannot be provided for as it should be.

I have carefully gone into this matter, and have inspected the whole of the boys, some of whom certainly would delight in a combined outbreak. I consider, nevertheless, that the danger of an émeute is not imminent, but the present circumstances may very probably lead to such taking place. The overcrowding of the dormitories at night is, however, the most serious thing, and no delay should arise in relieving Brush Farm of at least thirty-four of its inmates, so as to bring the numbers down to manageable proportions. They could be discharged by the Governor-in-Council, and then apprehended under the Industrial Schools Act, and placed on the "Sobraon," where there are already hundreds of youths of similar antecedents and characters, and where there are proper means for humanely but fittingly dealing with them. This might be an evasion of the law, but it would not be without precedent. It would be certainly better to strain legal procedure than to await the occurrence of a grave scandal. As an alternative, the few girls now at Shaftesbury might be housed elsewhere in a place to be proclaimed a Girls' Reformatory. Shaftesbury could then be designated a Male Reformatory, and the boys transferred there. But something must be done at once, and legal intricacies should not be allowed to bar the way to affording relief to an urgent and harassing situation. These boys removed, the immediate tension would be less acute, and there would be breathing time to consider the future.

It is almost impossible to deal satisfactorily with the existing jumble of buildings without entailing considerable outlay. A comprehensive rearrangement, or even complete reconstruction offers the real solution of the difficulty, but this need not be gone into at the present juncture. The Government must first decide the question of ownership. But to meet the requirements of the immediate future some modest expenditure is absolutely necessary in some at least, if not in all, the following directions: Firstly, new workshops are needed for the tailoring, bootmaking, and joinery classes. A long shed, 65 feet by 20 feet, divided into three compartments for each trade, should not be expensive. Secondly, a messroom should be constructed for the attendants who now use the boys' library room. Thirdly, a long dormitory should take the place of a fragile and dangerous portion of the existing sleeping apartments. This dormitory should be well lighted both by night and by day, and should have modern methods available for ensuring supervision. Fourthly, a rearrangement, involving little outlay, should be carried out in connection with the hospital accommodation. Fifthly, the present defective water supply should be supplemented by arrangement with the Water and Sewerage Board; and sixthly, some attention should be paid to the quarters occupied by the officials. Besides the foregoing, are two most important matters, which require carrying out at once. The improvement of the sanitary arrangements, and the establishment of a special quarter where new-comers might serve a probationary detention until they become amenable to discipline, and which might also be held *in terrorem* over would-be offenders. Further, a rearrangement of the staff is strongly urged.

The necessity for the foregoing, as it presented itself to me, will perhaps be gathered from the following account of my visit to the establishment. The staff is composed of two divisions. In the first division is a superintendent, a matron, a clerk, 3 attendants, 1 orchardist, 1 schoolmaster, 1 farm overseer, and 1 joiner (a new appointment, commencing next week). This gives 10 officers, besides whom there is a second division, comprising a number of old men and women drawn from the different asylums, who work with, instruct, and, in cases, supervise the boys in various ways. These people are virtually in the positions of subordinate officers, and provided the greatest possible care is exercised in their selection, moral harm may not arise by reason of the seeming incongruity of their appearance in such a place. They board and lodge on the premises, and receive small rates of daily pay, ranging from 3d. to 1s., and in special cases to a little more. The shoemaker instructor, for example, gets £2 monthly. This arrangement provides for a large number of supernumerary officers at small rates of pay, and at the present time 18 are so employed. I do not view with favour this plan, especially as some of these persons are entrusted with duties involving serious responsibilities, but the Superintendent assures me that no harm has arisen to the establishment up to the present. On visiting the school, 48 boys were found to be present under the charge of Mr. Chopin (classification 2B). The schoolmaster informed me that 98 out of 114—the total number of inmates on the books—were on the school roll, and that these were divided into two parts, who attended alternately mornings and afternoons. They are graded into three classes, according to qualifications, and the first class is divided into an upper and a lower division. So far as possible, the ordinary curriculum of the Public School system is carried out, but I much regretted to find that singing was not taught. It would also appear that singing is not in vogue to any extent in any part of the institution, and that a drum and fife band has fallen into disuse. I strongly recommend the cultivation of music and singing in the reformatory, and a rearrangement of the staff should include the engagement of an officer competent to teach wind instruments in addition to performing general duties. A lesson on dictation was proceeding, and the results showed 70 misspellings amongst 18 boys. The order was good. The dress was not uniform, and about half had no boots. The teacher gave a good account of the boys' conduct. He appeared to be a capable man, and he does not reside on the premises. A resident teacher would be preferable, who could help to supervise the boys in their hours of recreation. Such a person might act as *locum tenens* for the Superintendent on occasions. At present there is no recognised second in command. A rearrangement of the staff should provide for this.

The various workshops were inspected, and I was impressed by their general unsuitability, excepting in the case of the carpenter's shop. The indoor trades, besides carpentry, are bootmaking, tailoring, and tinsmithing, and nearly all the needs of the establishment in the named directions are supplied. The three last-named trades are taught in hovels under the direction of some of the ex-asylum inmates, and very fair specimens of work are turned out. Some of the lads show considerable proficiency, and they generally exhibited interest in their work. Probably boots for the Industrial School for Girls, and also for the Girls' Reformatory, could be made here at a profit. The tailors cannot cope with the requirements of the Farm, and the clothes supply is falling behind in consequence. As a matter of fact, some of the boys are not clothed properly, and this matter needs attention. A fair supply should be purchased and issued to the Superintendent, so as to give him a fair start. Thereafter he would, no doubt, be able to provide for future wants by the boys' labour. Good order was maintained.

In connection with the orchard, the fruit is principally made into jam, and this industry is the principal productive occupation. The jam factory is small, but well up to requirements, and various jams, marmalades, preserves, &c., are prepared of first-rate quality and appearance. The Officer-in-charge, who is also the Orchardist (Shirdin), shows much interest in his work, and carefully teaches the lads told off to him.

At my request, a parade of all available boys was held on the recreation ground. Effort was made to turn out the parade dressed properly, but the clothes difficulty could not be surmounted, and the garments were a mixed collection. Numbers of the boys were without flannel shirts as there was none in stock. Some wore smart hats set off by a red band, and others simple white linen Glengarry-shaped caps. I suggest that cabbage-tree hats might be made and worn by the boys. They would cost almost nothing, and would look much better than the ugly shapeless white caps. Drill was confined to "attention," "standing at ease," and marching two deep—all done badly. I suggest that a more systematic drill practice be introduced. In going round the ranks the boys appeared to be generally healthy, although here and there appeared traces of past skin and eye disease. Captain Murray told me that he was much troubled by boys being received with ringworm and sore eyes.

The recreation ground is a fine spacious place, well turfed, but its gymnastic appliances could be materially improved at little cost. There are only two horizontal bars composed of gas barrels fixed on wooden posts.

The isolation hospital is situated a long distance away from the main buildings—probably a quarter of a mile off. There were six cases of bad eyes and four cases of ringworm. Dr. Violette visits twice weekly. This hospital forms part of a ramshackle collection of tumble-down shanties, which also provide sleeping quarters for a number of the aged persons engaged from the asylum.

Across the main road a piece of ground is leased from Mr. King for some four years. It comprises 24 acres, and is principally used for the dairy work and for the horses. Several boys were engaged at milking and attending to the cows under the supervision of an old woman. At night time thirty boys march from the Reformatory, over a quarter of a mile away, and sleep in an improvised dormitory, which offers no protection against escape. Three of the officers also live in close proximity. It must add to the general insecurity to have the staff of officers so split up at night and so divided from each other. The main buildings are left in a very unprotected condition (as I shall show later on) through this separation.

I inspected the kitchens, dining hall, and sculleries, which were all in fair condition. Captain Murray tells me he has no trouble with the food contractors. The provisions, including vegetables grown on the lands, were of first-class quality, and were abundant. There can be no doubt about the lads being well fed. Plenty of fruit, fresh vegetables, bread and jam, and good quality meat with occasional puddings and custards, with tea, eggs and smoked fish, make up a varied and healthy dietary scale. The kitchen arrangements are under the care of some old women, and the dining hall is controlled by one of the old men employed. The mess utensils were in good order.

The sanitary arrangements need immediate attention. There are in the main establishment four closets and one urinal, besides two closets and one urinal elsewhere. They are of a primitive condition, and somewhat offensive. There are three plunge baths, and the boys use them once weekly. This is altogether insufficient in a climate like this, and when the boys are engaged on dirty work, but water cannot be spared. The fact is, the water supply is dependent on rain caught on the roofs and stored in tanks. This is not enough to meet the wants of some 150 people, boys and adults, besides providing for animals, laundry purposes, cooking, cleaning, etc. Water has, therefore, to be purchased at much inconvenience, and at a cost of seven shillings and sixpence per thousand gallons. Most certainly arrangements should be made with the Water and Sewerage Board for a constant and ample supply of water. Should fire occur amongst the scattered, badly-constructed dwellings, the consequences would be disastrous. There is no fire engine, no fire extinguishers—only a few buckets of water available for emergencies. I cannot too strongly insist upon the great urgency of installing a satisfactory water supply.

I inspected the dormitories on two occasions, when the rooms were untenanted and after the inmates had retired to rest. The bedding was ample and fairly clean. Spring mattresses were used, and I saw no trace of vermin. The beds are close together, but this cannot be avoided. Classification has been carried out to some extent, but the night arrangements are perhaps the most unsatisfactory features of the entire establishment. At 8.30 p.m. all boys are in bed, with one exception, who remains up until 11 as a sort of watchman assistant. On one landing there were a number of lads in the main dormitory. At right angles to this, connected with strong doors with padlocks and bolts, were smaller dormitories. In one was five or six boys, in another only two. These doors were locked and bolted. In several other dormitories somewhat similar sleeping arrangements obtained. In some cases the apartments were lighted by a kerosene lamp fastened to a hoop in the middle of the ceiling. In others, kerosene lamps were fixed to the wall. Windows, when not barred, were screwed up so as only to open a certain distance. In every case the outer doors are locked, and the boys are left to their own devices for the night, excepting in one dormitory, where an old man attendant sleeps in the same room. Supervision of the whole of the sleeping places is handed over to the night watchman, Samuel Fisher, who is paid 1s. per diem and rations, &c. He is an aged person, who is responsible all through the night.

I am told that immorality is entirely absent from the institution, and that only one case has ever occurred. I suggest, however, that, if the present dormitories have to be retained, better arrangements are needed for the night watch. I need not point out in what direction: it must be sufficiently obvious. Mechanical checks in the form of detector clocks should also be placed about the premises. The whole sleeping quarters are now badly off in protection from fire. Flimsy buildings, kerosene lamps, locks and bolts, mischievous boys, imperfect supervision, and insufficient water supply form a combination which may some day lead to a terrible disaster.

Two boys were undergoing cellular treatment for absconding, or attempting to abscond. A properly constructed penal division is an urgent want. Boys should not be sent to gaol for misconduct in the Reformatory. At present one of the two boys referred to has just served four weeks in Parramatta Gaol for absconding from Brush Farm. He is now back in the institution. Much better for all concerned if he could have been dealt with at Brush Farm. I think all institutions of a reformatory kind should be able to deal in a punitive way with offences, other than by calling in the aid of the prison authorities. The present enclosed playground might easily be converted into the probationary division at little cost; the unenclosed playground, with a shelter-shed, would be ample for out-door recreation.

After work the boys assembled in the playing fields, and thoroughly enjoyed playing in various games. After tea short prayers were read. Then from 6:45 to 8 the boys divided into four groups. One lot played and otherwise amused themselves about the front of the Superintendent's quarters; another lot amused themselves, under the supervision of Mrs. Murray, with draughts, dominoes, and so forth; a third quietly read in the library, which contains a fair collection of books and a large assortment of papers, such as the *Graphic*, *Sydney Mail*, *London News*, &c.; while a fourth party, twenty-eight in number, assembled in the Superintendent's quarters, where Captain Murray, after comfortably seating them in chairs around him, read a book to them. I saw with great gratification this part of the daily routine. One intelligent young lad told me the same thing went on every night. He said that they all liked the Captain and his wife, and that the boys who gave them trouble ought to be ashamed of themselves. There can be no doubt about Captain Murray's special fitness for dealing with boys. He likes them and they like him. Few people would get so much good out of the material he has to work upon as he does. At present he is somewhat unstrung by the constant strain, but the remedial measures herein proposed would largely smooth away existing difficulties.

The other officers appeared quiet well-disposed men. Their hours are somewhat long, and their pay (£5 monthly clear of deductions) is somewhat low. The Superintendent gave them all good characters, with one exception, the farm overseer (Tuck), who is stated to be averse to doing anything outside his special duties. In rearranging the staff every officer should be engaged on the distinct understanding that he assists in the general supervision of the boys outside his special duties.

I have not thought it necessary to enter into the principles underlying the methods pursued at Brush Farm. There is no mark system, and there are no rules specially in operation. Nowhere did I see a code of regulations exhibited for the guidance of officers or boys. The Superintendent explained that, as the institution is of comparatively recent establishment, it has been deemed expedient to allow of some further experience being gained before framing permanent rules. I think though it would be advisable to draw out a workable code of rules and regulations, and to have them approved by the Governor-in-Council, as laid down in section 3 of the Act. Complications may possibly arise in the future, and the absence of authorised and clearly laid down rules may prove a great source of inconvenience.

FREDK. W. NEITENSTEIN,  
Comptroller-General of Prisons.

The Under Secretary of Public Instruction, &c.

#### Appendix A.

##### ROUTINE of daily duties at Brush Farm, with the Rules now in force.

Boys are turned out at 5:30 a.m. in summer, and 6:30 a.m. in winter.  
The boys muster from the several dormitories, and wash themselves thoroughly, under the eye of attendants.  
Stable and cow boys, washhouse, messroom, and kitchen boys go to their work at once. About 6:45 (in summer) a party of about twenty-five boys go to work in the orchard for an hour (weather permitting), gather fruit, &c., and the boys making jam begin their work for the day. (N.B.—Jam is made all through the year.)  
General cleaning up of garden and grounds, yards, closets, &c., is done at this time.  
7:50—Bugle sounds "Fall-in," and all boys are mustered, inspected, and go to breakfast at 8 a.m.  
Between 7 and 8 a.m. all sick boys are attended to by Mrs. Murray.  
Superintendent examines the whole establishment about 6 a.m. daily.  
After breakfast—Boys are sent to their various occupations, trades, jam-making, orchard work, &c., for the day.  
Boys for school (thirty) at 9 a.m.  
At noon, bell rings for "Knock-off."  
Boys muster, wash, and go into dinner at half-past 12.  
1 to 1:30, boys play and amuse themselves. 1:30, afternoon school begins. Boys who have been in school in the morning go to work in the afternoon, and *vice versa*. Some boys who are very backward, and whose time in the Reformatory is short, are at school all day. Bell rings for "Knock-off" at 4:30 p.m. Bugle sounds for muster and tea at 5 p.m. At 5:30 boys are taken to the playing-field.  
6:45 (in summer) boys muster for prayers.  
At 7 p.m. the whole number is divided into four squads. One party in the library for reading; another in messroom playing games, in charge of Matron; about twenty in reading-room, with Superintendent; remainder with attendant on duty in exercise yard.  
At 8 p.m. bugle sounds "Last Post," and all to bed.

##### Dormitories.

No. 1. Senior boys in open room, with an inner room in their charge.  
No. 2. Over workshops; senior boy in charge.  
No. 3. Over messroom; in charge of a trustworthy man.  
No. 4. At the Home; one of the attendants sleeps there—with a respectable woman in charge during the day (½ mile from headquarters).  
No. 5. Hospital; in Superintendent's house.  
At 8:30 reports are made, and night watchman takes duty until the morning, visiting all parts from time to time during the night.  
Clothes are changed twice a week, and more frequently when necessary.  
On Saturday, boys are bathed, have hair cut, &c.  
Music lessons and drilling.  
Play all the afternoon. Twelve boys are sent to Newington to swim.  
On Sunday, after usual cleaning up, all boys put on clean clothes—uniform.  
Breakfast is slightly different on Sunday—smoked fish or eggs for breakfast.  
At 8:45, parade for inspection by Superintendent.  
At 9 a.m., Protestant boys have Sunday School in Library by Superintendent, and elder boys take junior classes. Catholic boys have catechism at same time. At 11 a.m. service is held for Roman Catholics by Father Power, excepting on second Sunday of the month, when all boys are marched down to chapel at Erimington.  
Protestant boys are taken for a walk on Sunday forenoon; Catholics at 2 p.m., if convenient, in charge of an attendant.  
There is Church Service for Protestants every Sunday afternoon at 2:30, by Rev. H. Britten, Incumbent of Ryde Parish Church, on alternate Sundays, and Superintendent at other times.  
Boys walk about in playing-field after tea, and write letters.  
Visitors are allowed on Sunday afternoon.  
Reading in the evening as usual.

\* Quarters, clothes, rations, fuel, and light.

Submitted.—Mr. Garrard contemplates introducing a Bill to abolish the distinction between Reformatories and Industrial Schools. If this passes, defects in the administration of the Carpenterian and Shaftesbury Reformatories can easily be put right, but in the meantime it is necessary to reduce the attendance at the Carpenterian Reformatory at once. As pointed out by Captain Neitenstein, the accommodation even for about 70 inmates is very unsuitable, but for the present number, 113, it is most insecure. He recommends (page 5 of Report) that about 23 of the most troublesome be transferred to the "Sobraon," and that 11 of the good-conduct boys be discharged. In the mode of transfer suggested there may be a slight infringement of the spirit of the "Reformatory Schools Act," but transfers have been made before in this manner, and at present there appears to be no other way of reducing the number at the Reformatory.—J.C.M., 17/3/97.

Captain Neitenstein's proposal may be carried out.—J.H.Y., 19/3/97.

1897.

## LEGISLATIVE ASSEMBLY.

## NEW SOUTH WALES.

## COAST HOSPITAL, LITTLE BAY.

(REPORT FOR 1895.)

*Printed under No. 25 Report from Printing Committee, 8 December, 1897.*

The Chief Medical Officer of the Government to The Principal Under Secretary.

Sir,

Sydney, 25th November, 1897.

I have the honour to submit, for the information of the Chief Secretary, the Annual Report on the working of the Coast Hospital at Little Bay for the year 1895, with appendices containing the usual returns.

The following general statement shows the number of patients under treatment during the year, with results:—

Remaining in hospital on 31st December, 1894	...	...	...	...	...	164
Admitted during the year	...	...	...	...	...	2,451
Total	...	...	...	...	...	2,615
Discharged well or convalescent...	...	...	...	...	...	1,824
"    relieved	...	...	...	...	...	482
"    unrelieved	...	...	...	...	...	52
Died	...	...	...	...	...	82
Total	...	...	...	...	...	2,440
Remaining in hospital on 31st December, 1895	...	...	...	...	...	175
Average number resident daily throughout the year	...	...	...	...	...	176.3
Mean residence of each patient in days...	...	...	...	...	...	24.6
Rate of mortality over all cases...	...	...	...	...	...	3.7

The number of patients admitted during 1895 shows an increase of 393 over the previous year. The average daily number resident throughout the year was 176.3, as against 176.4 for the year 1894, and the residence in hospital of each patient was shortened from 27.6 days in 1894 to 24.6 in 1895. The average rate of mortality was 3.7—slightly lower than that in 1894.

RETURN No. 1.—Showing the channels through which the Patients admitted during the year reached the Hospital.

	Hospital Admission Depot.	Medical Adviser's Office.	Medical Superintendent.	Total
Number of patients.....	1,999	363	89	2,451

From the following returns relating to typhoid fever, it will be seen that 96 cases were admitted, being 47 less than in 1894, and that the mortality from this disease was 6.25 per cent. as against 8.3 per cent. in the preceding year.

RETURN No. 2.—Showing the number of cases of Typhoid Fever, distributed under sex and age, and the death at each age, which were admitted during 1895.

(Average stay in Hospital, 33.2 days; mortality, per cent., 6.2.)

	0-5.		5-10.		10-15.		15-20.		20-30.		30-40.		40-50.		50-60.		60-70.		Total.

Return No. 4 deals with infectious cases admitted during the year, showing the form of disease, and the localities from which the cases were received. 60 cases of scarlet fever were admitted, with no fatal cases, as against 118 cases and 9 deaths in 1894. Only 1 case of measles was admitted, as against 7 in the previous year. There were 45 cases of diphtheria with 1 death, and 5 cases of erysipelas, none proving fatal.

RETURN No. 4.—Showing localities, whence and how many cases of Infectious Fevers, &c., were admitted in 1895.

1897.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## MUDGEE HOSPITAL.

(REPORT OF THE ROYAL COMMISSION APPOINTED TO INQUIRE INTO CHARGES PREFERRED AGAINST THE MEDICAL ATTENDANT AND MATRON OF, IN CONNECTION WITH THE TREATMENT OF MARY BEATTIE, NOW DECEASED.)

Presented to Parliament by Command.

Printed under No. 18 Report from Printing Committee, 7 October, 1897.

## REPORT.

To His Excellency Henry Robert, Viscount Hampden, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies.

MAY IT PLEASE YOUR EXCELLENCY:—

In accordance with Your Excellency's commands, conveyed to me by letters patent, dated the 3rd day of September, 1897, I have made a diligent and full inquiry into all charges that have been preferred against Dr. Harvey Nickoll, Medical Attendant, and Miss Ethel McEwen, Matron of the Mudgee Hospital, in the Colony of New South Wales, in connection with the treatment in, and the discharge from, such institution of one Mary Beattie (since deceased).

The inquiry, open to the public, was commenced at the Court-house, Mudgee, on Tuesday, the 21st day of September instant, and concluded on Thursday, the 23rd instant.

Mr. Gannon, barrister-at-law, appeared on behalf of Miss McEwen. Mr. Thompson, of Bathurst, and Mr. Mccares, of Mudgee, solicitors of the Supreme Court, represented the relatives of the deceased and Dr. Nickoll respectively.

Representatives of the Press were permitted to record the proceedings.

Thirty witnesses, as hereinafter detailed, were examined, viz. :—

William Trafford	...	...	Pipeclay	...	...	Labourer.
William Beattie	...	...	do	...	...	Miner.
Ada Sparrow...	...	...	Mudgee	...	...	Domestic servant.
Esther Kurtz	...	...	Pipeclay	...	...	Widow.
Ethel McEwen	...	...	Mudgee	...	...	Matron, Mudgee Hospital.
Harvey Nickoll	...	...	do	...	...	Duly-qualified medical practitioner.
Robert Beith...	...	...	do	...	do	do
Charles Edward Lester	...	...	do	...	do	do
Sarah Jane Salsbury	...	...	do	...	...	Nurse and midwife.
Thos. Robt. Curnew Campbell	...	...	do	...	...	Archdeacon of the Anglican Church.
Frederick John Bird	...	...	do	...	...	Storekeeper.
George Stewart	...	...	do	...	...	Member of the Hospital Committee.
Rose Lyons	...	...	do	...	...	Assistant at Hospital, June last.
Joseph Milton Cox	...	...	do	...	...	Secretary of the Hospital.
Kate Anderson	...	...	do	...	...	Nurse at the Hospital.
Flora Day	...	...	do	...	...	Married woman.
John Rice	...	...	Abbotsford	...	...	Miner.

Thomas Sheridan ... ..	Mudgee ... ..	Maintenance man.
Henry Edw. Alex. Wells ... ..	do ... ..	Agent.
Sarah Rowell ... ..	do ... ..	Member of the Salvation Army.
Charles D. Meares ... ..	do ... ..	Solicitor.
James Harvey ... ..	do ... ..	Sergeant of Police.
Fred. Wm. Dolman ... ..	do ... ..	Constable of Police.
John Cotter ... ..	do ... ..	Gaoler.
Walter Sherry ... ..	do ... ..	Member of the Hospital Committee.
Richard Squibb ... ..	do ... ..	Wardsman of the Hospital.
Edwin Richards ... ..	do ... ..	Editor of the <i>Mudgee Guardian</i> .
William Joseph Cohen ... ..	do ... ..	Proprietor of a boot factory.
Mary Ann Daly ... ..	do ... ..	Married woman.
George Hazeltine ... ..	do ... ..	Blacksmith.

The following is the outline of the subject:—On the 18th June last, one Mary Beattie, married woman, aged about 36 years, was admitted to the Mudgee Hospital, suffering from diarrhœa, where she remained until the 1st July, when her stepfather, William Trafford, called for and drove her (Mary Beattie) in a spring-cart to the residence of her husband at Pipeclay, a distance of about 5 miles from Mudgee. Mary Beattie suffering considerably on the road home, gradually became worse, and died the same evening about 9 o'clock p.m.

A Coroner's inquest was held on the 3rd July, and the Jury found "That the said Mary Beattie, at Pipeclay, near Mudgee, in the said Colony, on the 1st day of July, 1897, died from collapse due to hemorrhage attending premature labour, which was brought about by getting into and journeying in a spring-cart a distance of about 6 miles upon the same day, and which journey was undertaken a short time after recovery from an attack of diarrhœa." *Rider*:—"We suggest that it would be to the interests of all concerned for patients, especially in the condition of the deceased, to be thoroughly examined immediately prior to their discharge from the Hospital."

In view of the evidence given by witnesses William Trafford and William Beattie, supplemented by representations made to the Government by certain residents of Mudgee, it was deemed expedient to hold an inquiry; hence the Royal Commission.

#### TREATMENT IN HOSPITAL.

Allegations in connection with the treatment in the Hospital are confined to statements said by Trafford and Beattie to have been made to them by deceased.

William Trafford, in his evidence, states that when he saw the deceased at the Hospital on the 26th June, she said: "If I got out of bed I could not stand. I have the same pains as when I came in. I have told the doctor; but he doesn't take any notice of what I say."

When Trafford, Beattie, and the deceased were going home to Pipeclay, on the 1st July, the deceased is alleged to have stated, "I am bad, and worse than when I went into the Hospital. They have turned me out of the hospital to die. If you (Beattie) don't get some work very soon my children will starve. I have to leave all my poor children behind. The doctor never sounded or examined me when in the Hospital. The matron called me dirty names. The matron made me get out of bed to go to a closet covered with zinc, and when I sat on it it made me shiver. The matron treated me badly. I asked for a hot bath, and she told me I would have to go home and get one; that anything was good enough for me. The doctor ordered me medicine, but I did not get it at the proper times. I could not get a drink at all, except from one of the patients, Ada Sparrow. I said to the matron, 'I want to go to the closet,' and she complained that I was a regular nuisance; I had to go on my hands and knees to it. The matron pulled the clothes off me while I was in bed. I was at the hospital a day and a half before I saw the doctor."

Ethel McEwen, the matron, deposes as to deceased coming to the Hospital in a very weak state on the 18th June; that Dr. Nickoll saw her about two hours after admission and next day examined her with a stethoscope, and ordered her a different medicine to that which she had been taking; that the deceased never complained of pains in her back; that her temperature was taken several times, and was always normal.

Neglect and inattention are denied absolutely, as also are the allegations of ill-treatment said to have been made by deceased.

Dr.

Dr. Harvey Nickoll states that he knew all about the deceased from the Benevolent Society, Mudgec, and had prescribed for her prior to her admission to the Hospital on the 18th June; that he examined her very carefully on the 18th, also on the 19th June, finding no temperature, and subsequently found, on examination, that she had a slight mitral murmur; that he saw the deceased daily, except on the 27th June, and visited the Hospital after she had left, on 1st July; that deceased suffered from ordinary and not inflammatory or acute diarrhoea, and was prescribed for accordingly; that the diarrhoea was cured, and she had to be treated for constipation; that deceased never complained of her treatment, except as to being refused hot tea, which he objected to; and that on the 28th June deceased appeared fit to leave the hospital.

Ada Sparrow, a patient in ward with deceased for nine days, never heard her complain of her treatment in Hospital, although they conversed together daily. She says that the Matron and nurse were always kind to deceased, who had no cause for complaint, as she got what she wanted. Witness spoke in grateful terms of her own stay at the Hospital, praising the staff generally.

Sarah Jane Salsbury, nurse and midwife, states that she had a prescription from Dr. Nickoll for deceased on the morning of the 18th June; that she visited the Hospital on the 22nd June, but that deceased made no complaint as to her treatment except being refused hot tea.

Rose Lyons, assistant at the Hospital, states deceased had no necessity to get out of bed when suffering from diarrhoea, as pans were at the bedside. Deceased was suffering from constipation after diarrhoea was cured. When she commenced to get up she always dressed herself without assistance, and used to sit about the verandah, and appeared to improve daily. At no time did the deceased ever complain to me of her treatment in the Hospital, and I saw more of her than anyone else. Patients never had occasion to go out to the closets in the yard instead of being attended to in the wards. The diarrhoea lasted for three or four days, after which she suffered from constipation. She never complained to me of diarrhoea after the first three or four days.

Flora Day, a patient in the Hospital till the 22nd June, states:—Deceased was treated by Dr. Nickoll about two hours after her admission. Never saw her get out of bed to go to the closet; there was no necessity to do so. Deceased used to get out of bed against the Matron's orders; heard the Matron scold her for doing so. The officials treated me and the others in the same manner, and were very kind.

Sarah Rowell, a member of the Salvation Army, "saw deceased four times at the Hospital; our conversations were about herself and her health. She never complained of her treatment or pains."

#### DISCHARGE FROM HOSPITAL.

William Trafford states:—About 1 p.m., on 1st July, I went to Hospital in pursuance of letter from the Matron (*Exhibit "A"*); the deceased came down stairs and walked towards the cart; I ran towards her, as she seemed ready to drop. I put my hands round deceased and put her foot on the step of the cart when helping her to get into it. The Matron and nurse were present, but would not give me any assistance. I placed her on the seat of the cart, and she said, "Father, I believe I am dying." Before getting into the cart I stooped down to tie deceased's bootlaces, and something like blood and slime fell on my hand. I saw another drop fall on my hand. Ada Sparrow was on the balcony and a nurse on the verandah, and I believe I saw the Matron in the corridor. Deceased seemed to be tottering as she came out of the Hospital along the corridor to the steps. I looked and thought I saw the Matron and the nurse. I believe I saw the Matron. I cried out to the Matron, "You and the doctor ought to be ashamed of yourselves for turning a woman out of the Hospital in her state." I say I believe I saw the Matron jeering. (At the Coroner's inquest Trafford stated "the Matron stood at the door jeering.")

Later in his examination the witness says: "I did not complain when the Matron brought her from upstairs. Deceased did not say anything to my knowledge about being unfit to leave the Hospital, nor did I say anything about her unfitness to leave in the presence of the Matron. I was not aware that there was anything the matter with the deceased in regard to labour. I cannot say I saw the Matron when I was lifting deceased into the cart. The Matron was not at the door jeering. I don't think the Matron was close enough to hear deceased say, 'Father, I am not fit to leave the Hospital.'" Trafford

Trafford left the Hospital in the cart with deceased, and almost immediately William Beattie (husband of deceased) joined them. They subsequently went to Mr. Bird, Mr. Stewart, and the Venerable Archdeacon Campbell, members of the Hospital Committee, who saw deceased and interviewed Trafford, who does not appear to have made a direct application to them for the readmission of deceased to the Hospital. Trafford did not mention to these gentlemen one word about blood falling on his hand at the Hospital, because "he did not think it important," and the appearance of deceased did not in their opinion necessitate her receiving immediate medical treatment.

Trafford appeared to have a very bitter animus against Dr. Nickoll, and that seemed to control his conduct. Two of the Committee suggested that deceased be conveyed to the Gaol Hospital by Trafford as she was destitute.

Ada Sparrow remembers the Matron coming to the deceased on 1st July, and saying, "Your father is ready to take you away." Deceased appeared unwilling to go, but left the ward with the Matron. Witness then went on to the balcony where she could see the cart and the steps, but could not see anyone or what occurred on the verandah below.

Witness continues: "Deceased, on the steps, said to her father, "I am not able to go"; she seemed in a very weak state; I could not say if Trafford helped the deceased into the cart or not; she appeared to get up quite easy. If Trafford had stooped to tie the laces of deceased's boots I must have seen him, but I did not." Again: "I adhere to the statement that I made before, about the woman getting into the cart without difficulty, being correct; the cart was only within a few yards of me, and I could see all that took place; I never saw Trafford assist her at all; she took hold of the iron railing of the cart with her right hand and helped herself up."

Ethel McEwen, Matron, states:—"I wrote letter (*Exhibit "A"*) to Trafford by direction of Dr. Nickoll. Deceased appeared reluctant to leave the Hospital on account of her coming confinement. I walked downstairs with deceased, but did not put my hand on her as she did not require assistance. I left deceased at the table in the corridor or hall, and did not see Trafford, whom I avoided, and never spoke one word to, because he had previously been rude to me. I went into the sitting-room off hall, and spoke to Nurse Anderson. I did not see deceased get into the cart. I did not see Trafford with deceased leave the Hospital, nor did I hear anything said by them. Deceased never said that she was unable to leave the Hospital that I heard. I told her to be sure and see Mrs. Salsbury before she left town, as I knew Mrs. Salsbury was engaged for her confinement. She was absolutely fit to leave the Hospital."

Dr. Harvey Nickoll states:—"I instructed the Matron to notify the intended discharge of the deceased from Hospital, considering her fit to leave. I knew of arrangements for the confinement of deceased in August, and had promised the Secretary of the Benevolent Society to attend deceased and gave the order with that knowledge. Cases of pregnancy are not admitted at the Hospital except when accompanied by other ailments, when there is sometimes no alternative but to admit them. I knew deceased was pregnant, but I did not know about the arrangements made for her being taken away by Trafford. Getting into the cart and travelling might have accelerated the confinement. If the Committee had sent deceased back to the Hospital she would have been readmitted. I was present when Dr. Lester performed the *post-mortem* examination. In my opinion, death was caused by the separation of the placenta from the uterus. I think there is no connection between the diarrhoea and the labour."

Dr. Robert Beith states:—"I was present at the *post-mortem* examination, and consider that Mrs. Beattie died from shock of premature confinement. The journey in the cart caused the premature confinement, owing to the acceleration of labour. I could not say if deceased had entirely recovered from diarrhoea at the *post-mortem*. I consider that hemorrhage was brought about by miscarriage; shock appeared to be the greatest cause of death."

Dr. Charles Edward Lester states:—"I made a *post-mortem* examination on deceased on 3rd July last. I attribute the cause of death to collapse from hemorrhage and shock."

Sarah Jane Salsbury states:—"I told Trafford on the 18th and 22nd June to bring deceased to my house when she came out of the Hospital, as I had made arrangements for her confinement; and I also told the deceased to be sure and come  
to

to me, as I had made arrangements through the Benevolent Society for her confinement, and she replied 'Very well.' (Corroborated by Minute Book of Society, *Exhibit H*). After the death of Mrs. Beattie, Trafford complained to me about the Hospital, and I said, 'Why did you not bring the deceased to me?' Trafford replied, 'I think I must have been mad; I did not know what I was doing.'"

Kate Anderson, nurse, states:—"I saw deceased leave the Hospital on the 1st July. She put one foot on the step of the cart and caught hold of the railing of the cart to help herself up. Trafford could not have assisted deceased into the cart without my seeing him, and I did not. I did not notice Trafford do up deceased's boots. I did not see deceased in the Hospital, as I was in the isolated ward."

Flora Day, patient in the Hospital, states:—"I heard witness Salsbury tell deceased to come to her place when she (deceased) came out of the Hospital."

John Rice, patient in the Hospital, states:—"I saw deceased get into the cart. Trafford did not assist her, except by putting his hand behind her. Deceased looked bad and walked slowly. Trafford did not stoop down to do up boots of deceased. He could not have done so without my seeing him; neither did I see Trafford wipe anything off his hand."

John Cotter, Gaoler, Mudgee, produces a record of criminal convictions of one John Rogers and other *aliases* who is identical with William Trafford.

Richard Squibb, wardsman, states:—"I saw deceased leave the Hospital. She was walking unassisted and easily. Trafford did not help her into the cart. I did not see Trafford bend down as if to do up deceased's boots. I was present on purpose to see if I might be of any assistance."

A great portion of the evidence is hearsay and irrelevant. I deemed it advisable, however, to have recorded any statement that might assist me in coming to a determination in the matter.

Trafford, a most unsatisfactory witness, by reason of his contradictory statements, fencing replies to questions, and demeanour generally, proved himself unworthy of credence in essentials, and I treat his evidence accordingly.

The deceased, eight months pregnant, was, in my opinion, according to the evidence, fit to be discharged from the Hospital, after being cured of diarrhoea, the complaint for which she was admitted and treated.

Leaving the Hospital at 1 o'clock p.m., in a spring-cart, Trafford and Beattie take the unfortunate woman 6 miles on a bush road, portion of it not cleared, to her home at Pipeclay, arriving at 5 o'clock p.m., or later, and at 9 o'clock p.m. death ensues from collapse, due to hemorrhage attending premature labour. (This house, which is only a hovel in the true sense of the word, I personally inspected, travelling over the road referred to in the evidence.)

Had Trafford gone as directed to the residence of Mrs. Salsbury, in Mudgee, with deceased, or had he sought medical advice, as common sense would suggest to most persons, and as Mr. Bird did suggest, it is probable that Mrs. Beattie might not have died. Attributing the symptoms to her late sickness, ignorant of the commencement of labour, and, doubtless, actuated by vindictive feelings towards Dr. Nickoll, the Hospital Medical Officer, he said, "I will take her home at the doctor's risk," and did so, with the fatal result.

The suggestion of the Venerable Archdeacon Campbell and Mr. Stewart, members of the Hospital Committee, to take the unfortunate woman to the gaol was, I feel sure, made with the best intentions, and with the one object of assisting a destitute woman; but a moment's consideration must convince all persons that gaols are for prisoners only, under remand or convicted, and cannot be utilised as benevolent asylums.

I am of opinion that the deceased, when a patient in the Hospital, received necessary attention and care from Dr. Nickoll, the Matron, and other members of the staff, and that the charges are accordingly not substantiated.

The members of the Committee and others examined express every confidence in Dr. Nickoll, as also in the Matron, Miss McEwen, who holds credentials from many of the leading medical practitioners in Sydney.

Given under my hand and seal at Sydney, in the Colony of New South Wales, this 13th day of September, 1897.

MILTON S. LOVE,  
Police Magistrate,  
Commissioner.

Court-house, Mudgee, 21 September, 1897.

*Before Milton Sydney Love, Police Magistrate, Commissioner.*

INQUIRY into charges made against Dr. Harvey Nickoll and Ethel McEwen, Matron of the Mudgee Hospital, in connection with the treatment in and discharge from such Institution of one Mary Beattie (since deceased).

Mr. Gannon (barrister-at-law) for Miss McEwen.

Mr. Thompson (solicitor) for the relatives of the deceased.

Mr. Meares (solicitor) for Dr. Nickoll.

Tuesday, 21 September, 1897.—Court sat 11 o'clock a.m.

This deponent, *William Trafford*, on his oath, saith as follows:—I am a labourer, and reside at Pipeclay, near Mudgee.

*Mr. Thompson*: Marie Beattie was my stepdaughter, and prior to her death was living at Buckaroo, near Mudgee; she was taken to the hospital on the 18th of June; I took her to the hospital from Mrs. Salsbury's place; I got an order from Mr. Willis for admission to the hospital; I saw Miss McEwen at the hospital; I assisted her upstairs as she was in a very weak condition, and the matron would not help her [*statement withdrawn*]; I explained that she was suffering from diarrhoea and violent pains in the back, and I told the doctor that; before we brought her to the hospital she complained of pains as though she were about to be confined; I went to see her on the 26th June; I saw the matron, and said I had come to see Mrs. Beattie; she said she was ready to go out of the hospital, and that I could take her away as soon as I liked; I went upstairs and saw Mrs. Beattie, who was lying in a bed near the fire; she was in a very weak condition; I told her the matron had said she was ready to leave the hospital, and she answered that if she got out of bed she could not stand; she said "I have the same pains as when I came in"; I said, "Why don't you tell the doctor about the pains?" she said, "I have, but he doesn't take any notice of what I say"; I said, "I don't consider you are fit to leave the hospital, and I won't take you out"; I went downstairs and asked the matron if she really meant Mrs. Beattie to leave the hospital; she said, "Yes; she may be a little weak; but if you take her home, she will soon be strong"; I said, "Woman is in a very weak state, and I don't think she is fit to leave the hospital," and I said, "I won't take her out"; she said, "Then she will be put out"; no one was present but myself; I said, "I will report you to the Committee"; she said, "You can report me," and walked away; I then left; on the following Monday I took her two sons in to see their mother; the ages of the boys are 10 and 12, I think; as Neal came away from the hospital the matron came running down from the hospital; I went down to see Mr. Sherry after leaving the hospital; he is one of the Committee; I reported the matter to him; I said, "The matron wants me to take Mrs. Beattie out of the hospital"; I said, "I feel sure she is not fit to leave it"; I said, "I wish you would go up and see her, and ask her how she is"; Pipeclay is 5 miles from Mudgee; Mrs. Beattie came down, and walked towards the cart; I ran towards her, as she seemed ready to drop; she said, "I am not in a fit state to leave the hospital"; Ada Sparrow was on the balcony above where I and deceased were.

Exhibit A.

*Commissioner*: The matron was in the corridor about 8 or 10 yards away; I stood down to tie deceased's boots, and as I stooped down I felt something fall on my hand; it turned out to be like blood and slime; I put her foot on the step of the cart, and assisted her up as I could; I then saw another drop which fell on my hand; the matron and nurse were present, but would not give me any assistance; I placed her on the seat in the cart; she said, "Father, I believe I am dying"; I said, "Don't talk like that, mother will be home to-morrow, and she will look after you"; when I saw she was so bad, I said, "I have made a mistake in taking you out of the hospital, but I will take you up to the Committee and get you readmitted"; I left the hospital about 1 p.m.; I met the husband near the railway; he said, "You look very bad, my dear," to his wife; she said, "I am bad, and worse than when I went into the hospital"; she said to her husband, "They have turned me out of the hospital to die; if you don't get some work very soon my children will starve"; she said, "I shall have to leave all my poor children behind"; I heard her say to her husband, "The doctor never examined me when in the hospital"; I heard her say that the matron called her dirty names; "the matron made me get out of bed and go to a closet covered with zinc, and when I sat on it, it made me shiver"; I said to her husband, "We will go down and see if we cannot get her back into the hospital"; I said, "This letter I have got tells me to take her home from the hospital"; I said, "The doctor knows that I shall have to take her 5 miles on the road"; I went to see Mr. Bird, one of the Committee; I explained to him the state of the deceased; he said, "I cannot interfere"; I said, "Come out and have a look at her"; he was reluctant, but came out to the cart; I said, "Ask that woman how she feels"; I said, "This is one of the Committee; tell him how you feel"; her husband was present; she said to Mr. Bird, "I am very bad indeed, and am much worse than when I went into the hospital"; he said, "She looks bad"; "Well," I said, "if you can't interfere, I will see Archdeacon Campbell"; I drove round to his place; I said to the Archdeacon, "This woman is very bad, and I have seen one of the Committee"; I said, "She was turned out of the hospital; I have a letter, and it tells me to take her home"; I said, "This woman is not fit to go home"; I said to him, "Dr. Nickoll is a very careless man"; he said, "How do you know?" I said, "Through his wilful neglect he blinded my son"; he went away, and came back with Mr. Stewart, another member of the Committee; they went away, and consulted together; they returned, and one of them said, "We recommend you to give deceased over to the care of Mrs. Citter, the matron of the prison"; I said, "What is the hospital for?" he said, "She is destitute"; I said, "Because she is destitute you want to put her in prison"; I said, "While I have a shelter she shall never go to prison, and if you cannot interfere I will do as the doctor told me to do—I will take her home at the doctor's risk, as his letter tells me I must take her home, or he will send her out and make me pay expenses"; I drove to Mack's store; the Archdeacon gave me an order to get a few things for the children, and when I came out of the store I saw a woman standing near the cart; she was speaking to deceased; she was Mrs. Joseph Kurtz; I spoke to her, and heard deceased speak to her; I heard her say, "I must go home, as they have turned me out of the hospital"; I heard her say, "The doctor never examined or sounded me when in the hospital"; after that I started for home, and as I turned Church-street the deceased fainted; this was about 3 o'clock; she said, "Oh, father, give me a drink"; I went into the "Imperial Hotel," and got some brandy and water; I gave her some, and she threw the rest away; I took her husband in the cart and went home, and he had to hold her in his arms all the way; we arrived at Buckaroo at about 5; we travelled slowly and carefully; I was driving; we kept on the right road,

Exhibit A.

road, and it was a good one; she complained all the way of the pains, and I heard her say to her husband, "I feel as if I were bleeding to death"; when we got home we carried her from the cart into the hut; I said, "I hope you will be better to-morrow, and mother will take care of you"; I then went to my own place, about a mile away; about 9 in the night the boys came down and said, "Mother is dying"; and I went there and found that she was dead; she died about 9; I then reported the matter to the police; she was in bed when I went up at 9 o'clock; deceased was about 35; before she went to the hospital she had the pains spoken of, and then the diarrhœa came on.

*Mr. Gannon*: I am in my 75th year; I object to answer question *re* my past life; on the 18th I took Mrs. Beattie to the hospital in a cart; she was suffering with diarrhœa; Mrs. Salsbury said she would keep her for a week, to see how she got on; I know she had two months to go before she would be confined; I took her to Mrs. Salsbury because Mrs. Stacy had instructed her to come out to look after deceased in case she was confined; I don't know anything about Mrs. Salsbury; I remember when the foundation stone of the hospital was laid; it was on the 22nd June; I saw Mrs. Salsbury, and she said she had seen deceased; I knew on the night of the 18th June that Mrs. Salsbury was to confine deceased; I don't know when the arrangement was made that Mrs. Salsbury was to confine deceased; I was angry at the time, having to take the woman home; I felt that she had been badly treated; I never said that I wouldn't take her home because I had nothing to eat in the house; I drove home by the Buckarro-road; I know two or three Kurtzs living near me; I don't know if there is a married woman living at Mrs. Kurtz's; I don't know if there are any married people about the place; how do I know if the deceased was bleeding when I was taking her home in the cart? I didn't pass the house of any woman as I was going home that I know of; and I didn't look for any woman to help her, as the doctor said she was all right; I don't remember saying that the matron was insolent to me; she was always respectful to me, and I to her; she was indignant when I said I wouldn't take the woman out of the hospital; I said at the inquest that I took hold of the deceased's foot in assisting her into the cart; the horse in the cart was a quiet one; I put my hands round deceased in helping her into the cart; I believe it was the right hand on which the blood fell as I assisted her up; I don't think there was any blood on the other hand; I could not tell you what clothes I had on at the time; I wiped the blood off my hands, but could not tell on what I wiped them; I did not tell the Archdeacon or any other gentleman that any blood had fallen from the woman on to my hands; I did not think it important. [*Depositions taken at the Coroner's Court handed to the witness, who is asked if he could swear to his handwriting—that is, his signature. Witness believes signature to be his.*] I remember giving evidence in the Coroner's Court; at the hospital I saw a woman on the balcony and a nurse on the verandah, and believe I saw the matron in the corridor, but I don't know what she was doing there. [*Court adjourned till 2 o'clock. Examination continued.*] I said the woman seemed to be tottering as she came out of the hospital along the corridor towards the steps; this was the first time I took hold of her; I assisted deceased towards the cart, but won't swear that I did not leave hold of her till she got to the cart; I took time in assisting her, as she was in a weak state; I could not say whether she could stand without my aid or not, but before she got into the cart I bent down to do up the laces of her boots, which were blucher boots; she did not ask me to do up her boots; I don't know whether I put my hands in front of her legs or behind; I don't know how far I put my hands up her clothes; the blood fell on my hands as I was doing up her boots; I might have wiped my hands on her dress; I don't know what coloured stockings she had on; I don't know whether she had stockings on or not; I told you she had stockings on; I withdraw my other statement: I now say she had stockings on; when I had my hand on her boot a drop of blood fell on my hand, and I wiped my hands on the woman's dress, and when I got into the cart I drove away; I was not interested in her being in the hospital for her confinement; I said she was going to Mrs. Salsbury's for her confinement; I never thought of her confinement when the blood fell on my hand; I would have taken her to Mrs. Salsbury's if I had thought her confinement was approaching; I looked into the hospital when she was in the cart, and I thought I saw a nurse and the matron; I believe I saw her; I said to the matron, "You and the doctor ought to be ashamed of yourselves for turning a woman out of the hospital in her state"; I was in the cart at the time; I cried this out aloud while in front of the hospital; I don't know who heard me, but shouted it out loud enough for anybody to hear it; I say I believed the matron was jeering; it appeared that her face was jeering; I can't explain her face, but it seemed to be indignant; I should rather think I did know what indignant was; I didn't hear her say anything. [*Explanation of indignation and sneering.*] It was just after 1 o'clock that I left the hospital, and I got home before dark; don't remember if it was dusk or starlight; I could not say exactly what hour it was I got home; if I had started from the hospital as I should have done, I should have been home by 3 o'clock, but I am not sure what time it was that I did get back; I don't remember if her husband suggested that she should go to Mrs. Salsbury's; Mrs. Beattie said before she went to the hospital her confinement would take place in August; she did not tell me what she was suffering, only that she had pains; she (matron) said that they would bundle her out if I didn't come for her; she said that the matron made her go to the closet on her hands and knees, and that on one occasion the matron tore the bed-clothes off her; I heard her tell her husband something similar to this; I forgot the names she told me the matron called her; but I believe they were dirty names; I couldn't say whether I have any note of the names the matron called her; the Commissioner may read the notes; I don't remember if I told the gentlemen of the Committee if she had diarrhœa, nor did I mention that she was bleeding; I don't know the date of the letter I wrote to the hospital; the notes I have are in my handwriting, but I will not let you see them; I have them in my pocket; they were written at my own place; I don't know who was at the place at the time; I don't remember anyone coming to my place about this case; I am not aware that I went to anyone's place about it, but will not swear; I don't remember speaking to anyone about the case at my house; I decline to answer the question whether I instructed Mr. Thompson to appear for me in this case; I couldn't say if I knew that Mrs. Salsbury was a midwife, and that it was in that capacity that Mrs. Beattie was going to her house; I know that Mrs. Beattie was going there for her confinement; I knew that Mrs. Salsbury was engaged to attend on Mrs. Beattie in her confinement; I remember that provisions were taken out in the cart, and were brought back to Mrs. Salsbury's place; Mrs. Salsbury said to me that I would have to take the deceased to the hospital before she had been at her house long, and I said to her, "You are soon tired of her; you said you would keep her for a week"; she made use of an awful expression; she said she was "— from head to foot"; it shocked me frightfully; it made me dislike to take her back, but that wasn't the cause; I took deceased to hospital, with Mrs. Salsbury, and we both went upstairs with the matron; I don't remember Mrs. Salsbury saying, "Be sure

Exhibit "A."

to

to bring her back to my place when she comes out of the hospital"; she said, "Bring her back when the time comes"; I knew Dr. Nickoll pretty well, but I did not go to the doctor about deceased saying that he would not go and see her; from the day she went to the hospital I never went to Dr. Nickoll about the ill-treatment she complained of; I knew there were other doctors in the town besides Dr. Nickoll; I believe there are Drs. Beith and Lester; I know where they live; they live not far from Mr. Marks'; I never thought of going to see them; she was then under a doctor; I went to nobody I had no occasion to; there are three or four roads to my place; the road I went by was not rough at the time; there is a fence on both sides for some distance; I should have been going a mile farther if I had taken the main Maitland Road; Mrs. Smith is across the creek, and she is about half a mile from us; there is Mrs. Andrew Kurtz also near; it never occurred to me to go to either of these women; deceased's husband was there, and I had nothing more to do with it; when I left her she was seated on a box, when on the road (down) I didn't examine her when we got home with regard to the bleeding; she had nothing to eat or drink before I left; "You're a mean dog [*in answer to question whether he was in gaol the last thirty years*]; I won't answer the question."

*Mr. Thompson*: I have no interest in the inquiry at all; I am a very poor man, and have no means; the matron never said anything to me about deceased going to Mrs. Salsbury's, and never heard the deceased say anything about it either; Mrs. Salsbury was very eager to get remuneration; the road I went by was the one usually used, but couldn't say whether others went by it.

*Commissioner*: I did not complain when the matron brought her from upstairs; she did not say anything to my knowledge about being unfit to leave the hospital in the presence of the matron, nor did I say anything about her unfitness to leave; I did not ask the Archdeacon or the others to allow her to re-enter the hospital; I was not aware that there was anything the matter with Mrs. Beattie in regard to labour; I (my memory is defective a little) I can't say I saw the matron when I was lifting Mrs. Beattie into the cart; the matron was not at the door when she was jeering; I have heard the deposition read as to the matron standing at the door jeering on the 1st July; I don't think the matron was close enough to hear when deceased said, "Father, I am not fit to leave the hospital"; I can't give any reason for not complaining; I did complain to Mr. Sherry; I am not a subscriber to the Mudgee Hospital; I did not make any demand for her readmission; when Mrs. Beattie said in the corridor, "I am dying," I don't think the matron was near enough to hear it.

Taken and sworn at Mudgee, this 21st day of }  
September, 1897, before me,—

WILLIAM TRAFFORD.

M. S. LOVE, P.M., Commissioner.

This deponent, *William Beattie*, on his oath, saith as follows:—I am a miner, and reside at Pipeclay.

*Mr. Thompson*: Deceased, Mary Beattie, was my wife, about 35 or 36, and native of Sydney; I did not know that she was taken to the hospital; the first time I knew she had been in the hospital was when I met her with Wm. Trafford in the cart; I said, "You look bad," and she said, "Yes, and worse than when I went into the hospital," and that she was turned out to die; she said the matron treated her badly; that she asked for a hot bath, and the matron told her she would have to go home and get one; the matron said that anything was good enough for her; she said that the doctor ordered her medicine, but that she did not get it at the proper time; she said the doctor had never examined her while she was in the hospital; she said she couldn't get a drink at all, except from one of patients, by name Ada Sparrow; she said to the matron she wished to go to the water-closet, and that she (the matron) had complained that she (deceased) was a regular nuisance, and that she had to go on her hands and knees there; he saw Mr. Bird, but he said the doctor would deal with it, as he had nothing to do with it; I then went to Archdeacon Campbell's place; on the way home my wife complained that she was bleeding to death; she did not say what was the matter with her; I did not see any blood; I did not know what was the matter with her; I arrived at Pipeclay about sundown; Trafford drove the cart, and went by the best road; when we got to the hut we took her from the cart and placed her on a box; great care was used; I remained with my wife all the time, and Trafford went to take the horse out; I did not notice that my wife was getting worse when we took her out of the cart; I never went for any assistance; there were women about three-quarters of a mile away; she died about 9; after sitting on the box my wife said she could not sit up any longer, so I put her on the bed, from which she did not rise till her death; I thought the matter was diarrhoea.

*Mr. Gannon*: As soon as I met my wife at the railway station she complained of her treatment; I did not hear Trafford speak to Mr. Bird about this alleged cruelty in the hospital; she told us of her treatment on the way home; I was there when they called on Archdeacon Campbell; I received provisions from him; I knew she was in the family-way before I went away; I did not know when her confinement was expected; I don't know anything about Mrs. Salsbury; I did not know whether any arrangements had been made for the confinement of my wife; I did not know what was the matter with her when she was bleeding in the cart; Trafford said there was no good seeing another doctor when she had just come from a doctor; we never went to a doctor, nor did we go to Mrs. Salsbury's place; the road by which we went was not a rough one; there are others, but one is as near to women as the other; Trafford did not go for any female assistance; she was about the same when we got home as when she left the hospital; Trafford was helping my wife when I was away; I had nothing to support her with myself; I have seen nobody about this case, and nobody has been near my place nor anywhere else about it; I am not a native of this country; I am a native of Scotland; I heard her say, "My God, I am dying, and am turned out of the hospital"; I didn't believe it, though if I had I probably should have had her seen to in town.

*Mr. Meares*: I saw Mrs. Salsbury about a week after the death of my wife; I did not hear her say to Trafford, "What could you have been so foolish for as to take her home, and not bring her here as arranged," nor did she ask me any questions at all; the first time I saw the blood was when she was in bed.

*Commissioner*: I did not hear Mr. Bird recommend Mr. Trafford to go back to the doctor of the hospital.

Taken and sworn at Mudgee, this 21st day of }  
September, 1897, before me,—

WILLIAM BEATTIE.

M. S. LOVE, P.M., Commissioner.

This

This deponent, *Ada Sparrow*, on her oath, saith as follows:—I am a domestic servant, and reside at Mudgee.

*Mr. Thompson*: I was a patient in the hospital, and while there remember seeing Mrs. Beattie there; she was a week there before me; she complained of pains in her back, and was suffering from diarrhoea; she did not tell me that she was suffering from anything else; she said, "I can't get any milk" to me on one occasion; I remember Trafford coming to the hospital, and I heard her say to her father that she was not able to go; I was only present; she was just getting strong enough to walk about then; on the day she left the matron came up and said, "Your father is waiting to take you away"; she did not appear to go willingly; the matron took her by the arm, and they went downstairs; I then went on the balcony, and saw Trafford's cart below; deceased, while standing on the steps, said to her father, "I am not able to go"; I heard her say this distinctly; she seemed in a very weak state when going towards her father; I do not know where the matron was when deceased met her father; I could not say whether Trafford helped deceased into the cart or not; she appeared to get up quite easily; deceased had proper attention at the hospital; I never heard her make any complaints to her father or anyone else that she had not been properly treated; I saw the doctor visit deceased, but never saw him examine her.

*Mr. Gannon*: When I went to hospital I heard that deceased was getting better; I was in the same room with deceased, and know that doctor's instruction were carried out; Miss McEwen and nurse were always kind to deceased, and treated her as they did me; she had no cause for complaint; she always got what she wanted; she got warm milk when she wanted it; there is no truth that the matron called her bad names; when deceased left hospital she had recovered from diarrhoea, but complained from pains in the back; I remember her being ordered an opening medicine, as she was suffering from constipation; the doctor and matron seemed to take an interest in the welfare of the patients in the hospital one and all; I never saw the clothes pulled off her while I was there, and she never complained to me of the same, nor of having to go on her hands and knees to the closet; I never heard the matron tell Mr. Trafford that the deceased would have to be bundled out, as the hospital was no place for her; she never complained to me that the doctor or matron had been unkind to her; I never knew that the matron refused to give her a drink; I remember the matron saying one day that her father was waiting for her in a kindly way; at the time of the departure of the deceased if Trafford had bent down to do up the boots of deceased I must have seen him, but I did not; I have seen deceased in hospital on verandah moving an easy chair about without assistance; I heard deceased singing "Jesu, lover of my soul," on one occasion; I never saw anyone on the verandah at the time of the departure of deceased; I could not see the wardman or the nurse, but I could not have seen them if they had been standing near the door at the time; at 11 o'clock on the morning of her departure a cup of cocoa was taken up to her by Miss Lyons; she also had some beef-tea on the same morning; she seemed very much better then than when I first saw her; deceased used to dress herself, and I was always present; she had the usual clothes of a female; she had every kindness from the doctor, matron, and the nurse.

*Mr. Thompson*: I did not hear her say in the presence of the matron that she was unable to go, but she said so to me; I have never spoken to anyone of the case since the inquest; I have seen Mrs. Salsbury twice since then.

*Mr. Gannon*: I adhere to the statement I made to-day about the woman getting into the cart without difficulty being correct.

*Commissioner*: I saw deceased daily in the hospital; I never heard her say that she did not get proper attention from the matron; I spoke to her daily, but at no time did she make any complaint either of the doctor or the matron; the cart in which the deceased left was only within a few yards of me, and I could see everything that took place; I never saw Trafford assist her at all; she took hold of the iron-railing of the cart with her right hand and helped herself up; Dr. Nickoll used to come round and inspect the patients at 12 and 1; deceased appeared to me to get into the cart without the assistance of Trafford; I was in the hospital for nine days, but never once heard a complaint against the doctor, matron, or the nurse.

*Mr. Thompson*: I never heard the matron say, "We don't want the woman here, she only wants to be confined here"; she said to me she may want to have her confinement here, and that nothing like that was permitted there.

Sworn at Mudgee, this 21st day of September, }  
in the year 1897, before me,— }

ADA SPARROW.

M. S. LOVE, P.M., Commissioner.

[Tuesday, 21st September, 1897, 6 p.m., Court adjourned to 8 o'clock p.m.]

21st September, Tuesday, 8 o'clock—Court sat.

This deponent, *Mrs. Esther Kurtz*, on her oath, saith as follows:—

*Mr. Thompson*: I am a widow, and reside at Pipeclay; my place is about 2 miles from Mrs. Beattie's; I remember seeing deceased in Mudgee, at Marks' place, about the time of her death; she was in a cart by herself at the time I spoke to her; she seemed sick, but not sick enough to die; I asked if she were better, that she was going home, but she said she was worse; she said she was turned out of the hospital; I asked if she had anyone to look after her, and she said only a girl of 13; she said, "The doctor has never sounded me since I have been in the hospital"; this is all I know with regard to the matter.

*Mr. Gannon*: I am not a friend of deceased; I don't know what she was like before she went into the hospital; I know her stepfather; deceased complained of no other pains except those in her back; I know the road out to her place, and that it is a bad one, but I don't think it was rough enough to cause her any injury; I heard that labour pains had come on on Saturday night.

*Mr. Meares*: Nobody else was in the cart when I saw her but she, sitting cramped up.

*Mr. Thompson*: I could see by her state that she was pregnant.

Taken and sworn at Mudgee, this 21st day }  
of September, before me,— }

ESTHER KURTZ.

M. S. LOVE, P.M., Commissioner.

This deponent, *Ethel McEwen*, on her oath, saith as follows:—I am matron of the Mudgee Hospital, and reside at Mudgee; I have been a nurse for five years, and received my training at Prince Alfred's Hospital, Sydney, and received a certificate of competency about January twelve months ago; I was appointed to the Mudgee Hospital on the 6th October, last year, and should say I have had about 100 cases under my care since that time; the medical staff was composed of Dr. Nickoll, whose custom it was to attend almost daily; in any emergency he would attend at once; before the 18th I never saw Trafford or deceased; about 3 in the afternoon of the 18th she was brought to the hospital by Trafford; I took charge of her, and gave her a bed in the women's ward; at the time she was suffering from diarrhoea; she was in a very weak state when she came, and had to be lifted out of the cart and helped upstairs; Dr. Nickoll attended about two hours after her admission; I attended to her till the doctor arrived; she was bathed and put to bed; I treated this case as my experience dictated; I gave her no medicine before the doctor arrived; she was properly treated by the whole staff; Dr. Nickoll came on the second day, and examined her with a stethoscope, and ordered her a new medicine; it is a lie that the doctor never came till the next day, as also it is a lie that he never examined; the doctor said that deceased must remain in bed; she remained there, and everything was given to her that was required, and the doctor's orders rigidly carried out; deceased was in bed for eight days, according to doctor's orders; I had to forbid deceased on some occasions to keep in bed, but she said she thought it would do her good to get up; she never made any complaint to me, and during the eight days the doctor saw her every day, and his orders were carried out; after eight days the doctor said deceased might get up on the couch by the fire; at this time she was recovering from the attack of diarrhoea; it was about four days after admission that the symptoms seemed to disappear; when the doctor, on the day that she got up, he said she would be able to go in a week; on the 26th I saw Trafford, and at that time she was completely recovered from the diarrhoea; Trafford came about 2 in the afternoon; he saw me at the door, and asked me how Mrs. Beattie was; I said she was better, and would be able to go out in a week; Trafford went up to see her, and when he came down he said that deceased wasn't fit to go out in a week, and that she (the matron) ought to be ashamed of herself to allow her to go out when there was not a crust of bread in the house; it is not my duty to allow persons to remain in the hospital when the doctor says they are cured; it is not the duty of the hospital to act as a benevolent society; on the 28th there was no symptom in deceased's state to warrant her remaining at the hospital; cases of pregnancy are not allowed to be received at the hospital; I knew that Mrs. Salsbury had been engaged for the confinement of the deceased; on the day she left, in my opinion, she was absolutely fit to go out; I knew that the confinement of deceased would be in about a month or six weeks; deceased in her convalescence used to move about without assistance, and was supplied with everything that she required and that was allowed by the hospital; when Trafford came I was coming from the kitchen through the hall; as matron of the hospital, I did everything in my power to attend to her, but when she had recovered from the diarrhoea it was my duty to see that she was removed to some other place for her confinement; when I went upstairs I said to Mrs. Beattie—I told her that her father was waiting for her; she then made reference to her confinement, and on that account she seemed to be reluctant to leave the hospital; up to the time I went up to her on Thursday she never complained of pains in her back, and I am not aware that any such pains existed, and suppose that if there had been such she would have mentioned them; before she left I asked her if she would have any more beef tea, and she appeared to wish to avoid seeing Trafford for she went away into the lavatory; I did not put my hand on her when going away; she required no assistance; I walked downstairs with her and left her at the hall table, and did not see Trafford at the time, and up to that time she had made no complaint to me *re* her treatment, except in the case of the hot tea, which would have been highly injurious to her in her state of health; I avoided seeing Trafford because I did not wish him to be rude to me again as he had been before; at this time Ada Sparrow was upstairs having her dinner; I walked into the sitting-room when leaving Mrs. Beattie, and never spoke one word to Trafford; I spoke to Nurse Anderson in the sitting-room; Wardsman Squibb was in the hall at the time; I did not see deceased getting into the cart, and there is no particle of truth in the statement that I was jeering at them; there is no truth that I ever pulled bedclothes off deceased, or that I said that she would have to be bundled out of the hospital, nor is there any truth in the statement that I compelled her to go on her hands and knees to the closet; I never at any time did anything insulting either to Trafford or Mrs. Beattie; there is not a fragment of foundation for any of the charges; in my career I have never had any charge of neglect preferred against me; I gave special orders that she should have warm milk, nor did I deny her anything at any time that was allowed by the hospital; Trafford did not pass the steps to help the deceased, as far as I know; had I known that the woman was bleeding, on my own responsibility I would have readmitted her to the hospital; the facts I swore at the inquest are correct, and I repeat the same now; I never heard anything about the woman bleeding from anyone; severe diarrhoea may conduce to miscarriage; I deny the charges of cruelty or inattention, and I carried out the orders of the doctor, who at all times behaved as a gentleman should do.

*Mr. Thompson*: I knew she was in a far advanced state of pregnancy; it was no part of my duty to inquire into that; there was no necessity for the doctor to make any further examination than he did; she never complained to me of any pains in her back; when Trafford came to take her away she never said anything about being unable to go out, but only made reference to her confinement; Ada Sparrow was not present at the time; the statement made by Ada Sparrow saying that I said deceased only wished to stay at the hospital for her confinement is not true; had Mrs. Beattie said she was not fit to leave the hospital, I should not have allowed her to go, but I told her to be sure to go and see Mrs. Salsbury before she went out of town; in urgent cases patients are admitted to the hospital without the doctor's order; this has been the practice with me; I should have to follow the doctor's instructions in all cases, even against my own judgment; I only said in my letter that she was to go out in the coach and not to go to Mrs. Salsbury because I understood that she was to be confined there; I knew if Mrs. Beattie was to go to Mrs. Salsbury's place she was to get £1 a week, but if she (Mrs. Salsbury) went out to Mrs. Beattie's she was to get 10s.; and I understood that her confinement was to take place in about six weeks; Dr. Nickoll saw deceased on the 30th June.

*Commissioner*: Mr. Sherry and Mr. Tuckerman were the Visiting Committee at the time; I can't say how many times they were there in June; as a rule, they go through the female wards; I don't remember if they went through the ward in which deceased was; there is no register of complaints; I did not see deceased and Trafford departing from the hospital, nor did I hear anything that was said by them; Mrs. Beattie never said that she was unfit to leave the hospital; deceased was a destitute patient, and was admitted on the recommendation of Mr. Willis, who is a Member. *Mr.*

*Mr. Gannon* : I have heard her complain of shortness of breath, and the doctor examined her at once; it makes no difference to me if patients pay or not; there were no symptoms of shortness of breath when she left.

Sworn at Mudgee, this 21st day of September, }  
in the year 1897, before me,—

ETHEL McEWEN.

M. S. LOVE, P.M., Commissioner.

[Tuesday, 21st September, 10 o'clock p.m., Court adjourned till 9:30 a.m., 22nd September.]

Wednesday, 22nd September—Court sat 9:30 a.m.

This deponent, *Dr. Harvey Nickoll*, on his oath, saith as follows.—I am a duly qualified medical practitioner, and reside at Mudgee, and am Government medical officer for the Mudgee Hospital, which position I have held for over eight years.

*Mr. Meares* : Mrs. Salsbury called on me on the 18th, and said she had been out to see Mrs. Beattie, and found that she was suffering from diarrhœa, and not from labour pains; I had been asked previously by the Benevolent Society to attend to the woman in her confinement, so I knew all about her case before she came to the hospital; on the 18th I gave Mrs. Salsbury some medicine for deceased, as I told her I could not see her that morning, as I had a case to attend to in the hospital; I then gave an order for her admission to the hospital, where I treated her for diarrhœa; on the 19th I was very careful to examine deceased, as I thought she had a temperature, but upon examination I found that she had none; I examined her in every way that I thought her case required; on the 20th I prescribed for her medicine to be taken every three hours; after that I saw her every day, except the 27th, till the day before her discharge; deceased was in bed for seven days; after the diarrhœa was cured she suffered from constipation, for which she was treated; I don't remember the day on which I said deceased was fit to leave the hospital, but I remember instructing the matron to write to Trafford; I always discharge patients, and the matron receives her instructions from me; I saw deceased frequently when convalescent, and never heard her complain of anything except having warm tea, which I told her at the time was quite unsuitable for her in her state; I was up in the ward every day and Ada Sparrow was there; deceased had every opportunity to complain, but did not do so.

Exhibit C.

Prescription,  
19th—D.  
20th—E.

*Mr. Gannon* : I have been in the hospital over eight years; I have been in the Sheffield Infirmary and the Royal Infirmary, Edinburgh, after which I came out here, and practised in Victoria; and with the exception of four years my experience has been in hospitals; I was at the hospital when Miss McEwen was appointed at the hospital as matron on account of her special requirements; I know she is an excellent matron, and has always treated the patients in the hospital with unflinching kindness, even as far as buying clothes for them with her own money; I have known her to work for eighteen hours at a spell voluntarily; I have known her to keep a child with ophthalmia in her own room in order that it might receive special care; cases of pregnancy are not allowed at the hospital, but when accompanied by other ailments there is sometimes no alternative but to admit them; twice a week visitors are allowed to come and see the hospital, and relatives may come in at any time; if the deceased had been bleeding at the time she left the hospital I would not have dreamt of allowing her to go; I never knew there was anything the matter with her except her pregnancy when she left the hospital; I never heard that the matron had been unkind to deceased; it is quite false that I did not examine her while in the hospital; after two or three days when deceased was in the hospital, I examined her heart, and found that she had a slight mitral murmur.

*Mr. Thompson* : On the first day I was very careful to examine deceased; deceased was suffering from flatulency, as women do when they are in an advanced state of pregnancy; death of deceased was caused by separation of the placenta from the uterus; it was my impression that the confinement of deceased would take place in August; I knew that arrangements had been made for her lying-in, and was asked by the Secretary of the Benevolent Society to attend the woman during her confinement; I did not know that deceased was destitute; deceased, while in the hospital, never suffered from inflammatory diarrhœa, nor was it calculated to bring on premature labour; I think there is no connection between the diarrhœa and the labour; my opinion is that the labour pains started after the deceased left the hospital; before that time there was no pain complained of suggesting her approaching confinement; I knew that deceased was on the list of the Benevolent Society, and that she was supplied with provisions; I never discharge a patient from the hospital except I know that he has somewhere to go, and making due inquiries; I knew that arrangements had been made for the confinement of deceased, and gave an order for her discharge with that knowledge; Mrs. Salsbury had stated that arrangements had been made for her to lie-in at her house; I consider that deceased at the time she was discharged was quite in a fit state to go out; cases of pregnancy have been occasionally brought to the hospital, but it has only been when the patient has been suffering from another illness; urgent cases are admitted without an order of admission; I think it is a matter for the Committee themselves if they say they have no power to order the readmission of patients without reference to me.

*Mr. Gannon* : I cannot account for the separation of the placenta, nor do I think that it is possible to tell the cause of it; it is abnormal that the placenta should be separated before expulsion of the fetus; travelling in a cart undoubtedly would have been detrimental to her case; I think if she had been attended at her confinement she would have been alive now.

*Commissioner* : I saw deceased every day except the 27th; I saw her the day before she was discharged; on the 28th I saw her, and she appeared quite fit to leave the hospital; I saw nothing in her condition to make me alter the order for her discharge; I was at the hospital on the 1st July, but heard no reference made to her discharge; I know nothing about the arrangements that had been made for her being taken away; I think that getting into the cart, or travelling in the same, might have accelerated deceased's confinement; premature labour is often caused by lifting heavy weights, or other similar actions—walking downstairs, &c.; patients who are destitute are not prevented from entering the hospital; the admission of destitute sick is in accordance with Crown regulations; Trafford never made any complaint to me; if the Committee had sent deceased back to hospital she certainly would have been readmitted; Committee go round the wards at various times, and the patients have every opportunity to make complaints.

*Mr. Gannon* : I knew deceased came in a cart to town on the 18th instant pregnant and with diarrhœa, and thought when she was cured of diarrhœa she might easily return as she came; the road by which deceased went home was a bad one, and not fit for a sick person to travel over.

*Commissioner* :

Exhibit F.

*Commissioner* : I am aware of rule 6, which states that certain diseases are not to be admitted—among others, infectious diseases; copy of circular, dated 1st December, 1891, from the Board of Health to the Hospital Committee is with the Hospital Committee, amongst other things notifying that infectious diseases must be admitted; there is an isolated house, built for the reception of infectious diseased, in accordance with the Board of Health's circular; and cases of this kind have been admitted.

*Mr. Meares* : I do not know that a sub-committee was appointed to consider the reconstruction of new rules, in accordance with the said circular.

*Mr. Thompson* : I have made a record of visits, in accord with rule 7, but I have not made a record of examination on patients; on the 1st of July I was not at the hospital till late in the afternoon, after the deceased had left, nor did I see her that day.

Sworn at Mudgee, this 22nd day of September, }  
in the year 1897, before me,—

HARVEY NICKOLL.

M. S. LOVE, P.M., Commissioner.

This deponent, *Dr. Robert Beith*, on his oath, saith as follows:—

*Commissioner* : I am a duly qualified medical practitioner, and reside at Mudgee; I was present at the *post-mortem* examination of Mary Beattie, on the 3rd July; I consider that she died from the shock of the premature confinement; I heard the evidence taken in the Coroner's Court; I knew nothing of deceased prior to *post-mortem*.

*Mr. Gannon* : I have been sometimes to the hospital professionally, and I consider that it is carried on properly, and it appeared to me that the matron was well qualified for her duty.

*Mr. Thompson* : I only go to the hospital for consultations, and I have no right to see the patients; I was at the *post-mortem* which was held to discover the cause of death, which was put down to shock with hemorrhage owing to premature confinement; we considered that the journey in the cart had caused the premature confinement owing to the acceleration of labour; I don't see why deceased should not have been discharged from the hospital after recovering from diarrhoea, even though she were pregnant; I could not say if the deceased had entirely recovered from diarrhoea at the *post-mortem*; I think it is a general rule to examine patients before they leave the hospital.

*Mr. Gannon* : Prescriptions given by Dr. Nickoll are, I consider, quite correct for the case; I think that it would not have been dangerous for the deceased after having been cured of diarrhoea to return on the 1st of July.

*Commissioner* : I consider it possible for the labour to have been brought on by Mrs. Beattie getting up into the cart.

*Mr. Meares* : I would not have thought it necessary to have a vagina examination before deceased left the hospital if she had been cured of the diarrhoea for seven or eight days.

*Mr. Thompson* : If the pains complained of had disappeared for some days there would have been no necessity to make any further examination.

Sworn at Mudgee, this 22nd day of September, }  
in the year 1897, before me,—

ROBERT BEITH.

M. S. LOVE, P.M., Commissioner.

This deponent, *Dr. Charles Edward Lester*, on his oath, saith as follows:—I am a duly qualified medical practitioner, and reside at Mudgee; on the 3rd July I made a *post-mortem* on deceased; the result of it was this: the woman appeared to be about 40, no external marks of violence, and the usual *post-mortem* rigidity was present; there was a large clot of blood protruding from the vagina; the skin of the abdomen showed that the deceased had borne children, and she was at present within a few weeks of her confinement; I opened the chest; there was a small amount of fluid in the right pleural cavity, otherwise the lungs were healthy; there was a small clot of blood on the right side of the heart; the left was empty; I opened the abdominal cavity, and found recent signs of diarrhoea; the mouth of the womb was fully dilated; all the fluid had escaped; all the other organs examined were practically healthy; I attribute the cause of death to collapse from hemorrhage and shock.

*Mr. Thompson* : I found there were no fæces in the bowels of the deceased; the serous membrane and subserous tissue was thickened, and showed injected zones of blood-vessels; there was a small amount of mucous about the sæcum and the rectum; it would be possible for a person to say whether diarrhoea had continued up to time of death from the *post-mortem*; the signs I saw at the *post-mortem* showed that diarrhoea might have occurred within two or three days previous; the signs were of acute diarrhoea; diarrhoea would have been very depressing to the vital powers of the patient in a state of pregnancy, and it would predispose to premature labour, and might have caused the labour of deceased without her getting into a cart as she did; it is an anxious time for a person pregnant, and with diarrhoea, and it would make the doctor very careful about discharging the patient; diarrhoea and labour-pains would not have caused death if deceased had had proper medical attention; I cannot say from the *post-mortem* if the woman was in a fit state to be discharged from the hospital, but I consider that death could have been averted if she had been taken to a lying-in hospital, or a medical man attending her.

*Mr. Gannon* : Her life could have been saved if a medical man had been sent for; I think that the prescription of Dr. Nickoll was correct for a simple form of diarrhoea; I saw that the symptoms at the *post-mortem* were consistent with the enema and castor oil; I never meet with Dr. Nickoll for consultation now.

*Mr. Meares* : I did examine the small intestine externally; in inflammatory diarrhoea I should expect a patient to have a temperature, and if the matron and doctor said there was no temperature I should believe that the diarrhoea was not acute, and that Dr. Nickoll's prescription was correct for a simple form; I think that if deceased had recovered from diarrhoea for seven or eight days, and had, on the other hand, been treated for constipation she would have been fit to leave the hospital; if there was no diarrhoea, and no temperature and constipation, I think that the woman would be able to leave the hospital; I have seen similar cases of diarrhoea; it is possible to diagnose a case of diarrhoea from the examination of the rectum that I made, but it is not possible to say how long the diarrhoea may have ceased; there may not have been diarrhoea for a week before death.

Sworn at Mudgee, this 22nd day of September, }  
in the year 1897, before me,—

CHAS. E. LESTER.

M. S. LOVE, P.M., Commissioner.

This

This deponent, *Miss Ethel McEwen*, recalled on her oath, saith as follows:—I know Mrs. Beattie's temperature was taken in the hospital, but I don't remember how many times; at all times it was normal; in the faces of deceased there was no signs of mucous or blood at any time; I asked the girl assisting me to report if there was, but she never did so.

*Mr. Thompson*: I do not know if a register is kept by the Board of Health for persons qualified to act as nurses, and as far as I know my name is not registered with the Board of Health; my certificate was obtained from the Prince Alfred Hospital.

Sworn at Mudgee, this 22nd day of September, }  
in the year 1897, before me,— }

ETHEL McEWEN.

M. S. LOVE, P.M., Commissioner.

[1 p.m., 22nd September, Court adjourned till 2.15.]

Wednesday, 22nd September—Court sat 2.15.

This deponent, *Mrs. Sarah Jane Salisbury*, on her oath, saith as follows:—I am a nurse and midwife, and reside at Mudgee, and have acted in that capacity for twenty-five years; I know Mrs. Stacey; I saw her on the 17th June, and she asked me to go out and see Mrs. Beattie; I said I would go out, but would not be able to stop with the woman; I went out; Mrs. Beattie was suffering from diarrhoea, so I brought her into town in a cart, Trafford driving; she stopped at my place for the night; in the morning of the 18th I saw doctor, and he gave me a prescription for deceased, and later on in the day I took her to the hospital with Trafford; when deceased came out of the hospital I told Trafford he could bring deceased back to my house, and that I would look after her; I saw Trafford on the 22nd June, and he said he had not seen deceased since she had been in the hospital, and I then said to him not to forget to bring her to my place when she came out of the hospital, as I had made other arrangements; I also saw deceased in the hospital, and I told her to be sure to come to me when she left the hospital; I told her that I had made all the necessary arrangements for her confinement through the Benevolent Society; she said, "Very well"; deceased seemed much better on that day; I was at the hospital for two hours, and the only complaint of hers was that she would like some hot tea, but no other complaint was made; I saw her in bed, and that the proper arrangements were made for her for the diarrhoea, and that there was no necessity for her to get out of bed; I did not see her after that in the hospital; on the Thursday I went up to see her; I arrived at about 2.30, and saw the matron, and asked for Mrs. Beattie, and she said, "Oh, Mrs. Beattie has gone; hasn't she gone to your place?" I said, "No, not when I left"; the matron seemed surprised; she said, "Surely she's gone there; I told her to be sure to go there"; I said "It is funny; I told Trafford to do so"; I then returned home, but Mrs. Beattie was not there; I went round some of the streets to see if I could see Trafford or deceased, but could not see them; Trafford brought the provisions, which he obtained at Marks' through the Benevolent Society, to my house; Trafford came and made a complaint to me of the treatment of deceased, and I said to him, "Why did you not bring her to me?" he said, "I think I must have been mad"; I said to him that I had noticed in his evidence that he had said Mrs. Beattie had to crawl on her hands and knees to the closet, and that he had noticed a drop of blood fall on his hand when he was helping deceased into the cart; I said, "Did you know then that you should have brought the woman to my place then—you said you understood all about a woman in that condition?" he said he did not know what he was doing; Beattie said, when he heard this, "Good God, if I had known this I would have brought her to your place"; Beattie said he did not notice any pains when she was going out in the cart; and he said that the first time he had noticed blood was about half an hour before she died; he said she used the chamber, and that he had remarked to her that there was a lot of blood there, and she said, "I must be going to be ill"; I said, "It is funny you did not get a woman for her"; he said he did not know what to do; I said, "There was a woman with her the night before she had gone to the hospital—why could you not get that woman again?"

*Mr. Gannon*: It is not true that I made use of filthy language to deceased, and that that was the reason for Trafford not taking her back to my place when she left the hospital; it appeared to me that she was treated very well at the hospital.

*Mr. Thompson*: I did not know the matron had written to Trafford till after the account of the death appeared in the paper; I know that the matron told Trafford to bring deceased to my place.

*Commissioner*: The arrangement with the Benevolent Society for deceased's confinement was, that I was to be paid £1 to attend her for a fortnight, and that Dr. Nickoll would attend to her if it were necessary, and that she was to be taken to my house; notwithstanding that her confinement was not to take place till August, I was to make arrangements for her to stay in Mudgee till her time was approaching.

*Mr. Thompson*: Deceased was suffering from acute diarrhoea when she came to my place in the first, and that was why I sent her to the hospital, and I thought that this might bring on premature confinement.

*Commissioner*: I saw deceased twice at hospital, and she never complained to me of her treatment.

Sworn at Mudgee, this 22nd day of September, }  
in the year 1897, before me,— }

S. J. SALSBURY.

M. S. LOVE, P.M., Commissioner.

This deponent, the *Venerable Archdeacon Thomas Robert Curnew Campbell*, on his oath, saith as follows:—

*Mr. Gannon*: I am the Archdeacon of the Anglican Church, and reside at Mudgee; I am one of the Committee of the hospital, and have been so for three and a half years, and have taken an interest in the proceedings of the hospital since here; from my own observation, the present matron is an admirable one; she was selected from a number of candidates on account of her good credentials; she has always treated the patients kindly, and I have never heard any complaint against her; patients can always complain to the Committee, but never have; I have never heard to the contrary that Dr. Nickoll had performed his duty in an efficient way; I heard that deceased had suffered from diarrhoea in the hospital; I saw deceased and Trafford on the 1st July, and he asked me if I did not think deceased looked ill in the cart; I said I did so; Trafford never mentioned that he had blood on his hand from deceased; I supplied provisions to deceased; Trafford said to me that deceased's expected illness was looked for in the course of

a few weeks; I knew from that that she was in an advanced state of pregnancy; I supplied her with what I could, and she was taken home; I have still every confidence in the doctor and the matron, in spite of the allegations of Trafford.

*Mr. Thompson*: I heard that deceased was suffering from diarrhœa at the hospital; when I saw her she looked very ill, and I recommended Trafford to take her to the gaol infirmary, where she would be taken care of by Mrs. Cotter, who was a very kind woman; I did not know that I had power to send her back to the hospital as a simple committeeman, and I told Trafford this.

*Commissioner*: Trafford never asked to have deceased readmitted to the hospital; I thought the gaol infirmary would be a resting-place for deceased, and neither she or Trafford made any objection, except that he said that deceased's mother might object; Trafford appeared to have a very bitter animus against Dr. Nickoll, and that seemed to me to control his conduct; it did not strike me that they would have no right to receive deceased at the gaol infirmary (my legal knowledge is not very great); from deceased's appearance she did not seem to require immediate medical assistance; I did not suggest that deceased should return to hospital; if I had thought she required immediate assistance I should have had her sent back on my own responsibility; deceased never made any complaint to me; if I saw a case of this kind I should at once write an order for admission to the hospital, and send patient there; I think Trafford wrote a long letter to the Committee after death of deceased, but don't remember if any action was taken on it.

*Mr. Gannon*: Had I thought deceased required immediate medical treatment I should have ordered her back to the hospital myself.

*Mr. Thompson*: Trafford never urged that deceased should be taken back to hospital; I did not see how I could send back deceased to hospital, when she had just been discharged on medical authority; I thought that, if Trafford would not do as I suggested, the best thing that could be done was to take her to her own home.

Sworn at Mudgee, this 22nd day of September, }  
in the year 1897, before me,—

T. R. CURNEW CAMPBELL.

M. S. LOVE, P.M., Commissioner.

This deponent, *Frederick John Bird*, on his oath, saith as follows:—I am a storekeeper and reside at Mudgee, and am a member of the Hospital Committee; I saw Trafford on the 1st July; he asked me if I were on the Committee, he asked me to come and see the woman he had outside to see if she were in a fit state to leave the hospital; I said, "It is no use me going to see her, what does the doctor say?" he said the doctor says she is fit to leave; after a little I looked at her, and he asked if she were in pain; she said she was in great pain about the chest; he said, "Does she look fit to leave the hospital?" I said, "She does look bad"; but she always looked unhealthy, and did not look any worse than before; I have seen deceased twice before she went to the hospital; on the 1st, when I saw deceased, she complained of the pains mentioned; Trafford never asked me as a committeeman to send her back to the hospital, but I said it was no good for me to send her back when the doctor had discharged her.

*Mr. Gannon*: I advised Trafford to take deceased to see a doctor.

*Mr. Thompson*: When deceased was sitting in the cart she was sitting up quite straight.

*Commissioner*: When I told Trafford to take deceased back to the doctor, I meant Dr. Nickoll; he answered, "If I go to the doctor there will be a row"; I said, "Shouldn't there be a row if there was anything wrong"; I said, "You are the man to make the row if there is anything wrong with the woman."

Sworn at Mudgee, this 22nd day of September, }  
in the year 1897, before me,—

FRED. J. BIRD.

M. S. LOVE, P.M. Commissioner.

This deponent, *George Stewart*, on his oath, saith as follows:—

*Commissioner*: I am a member of the Committee of the Mudgee Hospital, and reside at Mudgee; on the 1st July, I saw deceased and Trafford in a cart in the street in Mudgee; Trafford spoke to me and abused Dr. Nickoll, and asked me if I thought she was fit to leave the hospital, to which I made no reply; deceased looked ill and in a destitute condition, but she did not look ill enough to require immediate attention; Trafford did not say anything about her readmission to the hospital to me as far as I recollect; Trafford said deceased was not fit to go home as he had practically nothing in the house for her; I suggested that I recommend the matter to the police, and let her go to the gaol, which was the only place that occurred to me; I knew of no arrangement that had been made with the Benevolent Society, and nothing was said about it, nor was there anything said about blood on Trafford's hand.

*Mr. Thompson*: Deceased looked very ill when I saw her, but I never formed an impression as to her returning to the hospital; I thought that the letter I read dealt with the matter.

*Mr. Gannon*: I suggested the gaol infirmary at the time because I never thought of the Benevolent Society.

*Mr. Meares*: She did not appear to require immediate attendance.

*Commissioner*: Trafford said that he would take deceased home at doctor's risk.

*Mr. Gannon*: Trafford seemed very bitter against Dr. Nickoll.

*Mr. Thompson*: Trafford seemed to have other causes of complaint against the doctor besides the discharge of deceased.

*Commissioner*: I would not suggest at the present any patient be taken to the gaol—I would recommend the Benevolent Society.

Sworn at Mudgee, this 22nd day of September, }  
in the year 1897, before me,—

G. STEWART.

M. S. LOVE, P.M., Commissioner.

The letter from  
the matron of  
the Hospital.  
A.

This

This deponent, *Rose Lyons*, on her oath, saith as follows:—

*Mr. Meares*: I was an assistant at the Mudgee Hospital in June last, and reside at Mudgee; I was at hospital when deceased came to hospital, where I assisted generally under the direction of Miss McEwen; deceased was in bed for three or four days with diarrhoea, and bed-pans and other necessaries were supplied her, so that there was no necessity for her to get out of bed; the diarrhoea lasted about three or four days; after that she did not suffer from diarrhoea, but did so from constipation, for which she was treated; she never complained to me after the first three or four days of diarrhoea; after she commenced to get up she always dressed herself and had no assistance; in the day-time she used to sit about on the verandah and elsewhere, and appeared to improve daily; on the morning she left I took deceased her breakfast, but I don't know if she had anything after that till she left; at no time did deceased ever complain to me of her treatment in the hospital, and I saw more of her than anyone else.

*Mr. Thompson*: I did not give evidence at the inquest; I was not called; deceased complained to me on the morning she had the injection that the oil had not worked, and I told the matron.

*Mr. Gannon*: I acted under the instructions of the matron, and deceased was always treated kindly.

*Commissioner*: I saw the deceased on the morning of her departure, and she seemed quite well; I saw her several times that morning, but she never made any complaint; patients never had occasion to get out to the closets in the yard instead of being attended to in the wards.

Sworn at Mudgee, this 22nd day of September, }  
in the year 1897, before me,— }

R. LYONS.

M. S. LOVE, P.M., Commissioner.

This deponent, *Joseph Milton Cox*, on his oath, saith as follows:—I am Secretary of the Mudgee Hospital, and reside at Mudgee.

*Commissioner*: I received a letter of complaint from Trafford on the 6th July, but no action was taken on it at the time; a special meeting of the Committee was arranged for the 13th July, which was held; on the meeting of the 6th I was ordered to apply for copies of the depositions taken at the inquest for the meeting of the 13th [*Action by resolution was taken for inquiry*]; the doctor was not present at the meeting, and no report was made either by him or the matron. I remember the circular from the Board of Health, 1st December, 1891; since the receipt of that circular a house has been built for the reception of infectious diseases, and the old by-law of the hospital stating that infectious diseases would not be admitted has not been amended.

Exhibit G.

*Mr. Gannon*: I have had long experience in connection with the hospital, and have always found that the doctor and the matron have performed their duty faithfully, and no complaint has ever reached me against them; the depositions of the inquest were not obtained before the letter was sent to the Chief Under Secretary; communications were made with the Justice Department and the Board of Health and the Principal Under Secretary asking for investigation into the charges against the hospital; in my communications I never sent any cuttings from the local papers; the Committee have always been anxious to have the whole matter sifted to the bottom; as a result of my letters to the Board of Health I received a communication notifying the appointment of a Commission of Inquiry.

Letters produced.

*Mr. Thompson*: Committee have taken some steps to amend the rule in accordance with model rules of the Board of Health.

Exhibit G. Letter of Trafford to hospital.

Sworn at Mudgee, this 22nd day of September, }  
in the year 1897, before me,— }

JOSEPH M. COX.

M. S. LOVE, P.M., Commissioner.

This deponent, *Kate Anderson*, on her oath, saith as follows:—I am a nurse at the Mudgee Hospital, and reside at Mudgee; I remember Mrs. Beattie in the hospital, but was never in attendance on her; I saw her as she left the hospital on the 1st July; I saw Trafford with her; as deceased walked down the stairs of hospital I heard Trafford abusing the matron; I also heard him ask deceased if she were in bed, and she said no; when she got to the cart she put one foot on the step, and took hold of the railing to help herself up; when Miss McEwen left the door she came into the sitting-room.

*Mr. Meares*: After deceased had got into the cart Trafford got in at the other side; I never saw Trafford assist deceased into cart, and he could not have done so without my seeing him; deceased appeared to have no difficulty in walking; I did not notice Trafford do up deceased's boots.

*Mr. Gannon*: Trafford was behind deceased when she got into the cart, and the matron was in the sitting-room, and it is an absolute lie that she was jeering at him.

*Mr. Thompson*: The first time I saw deceased was when she came downstairs to go away; I heard Trafford ask her if she was in bed when the matron went up to bring her down; after deceased came to the door she did not sit down at all; I never heard Trafford tell the matron deceased was not able to leave the hospital; I did not look as the deceased was actually getting into the cart; the last time I saw Trafford was when he was on the third step of the hospital, and deceased had her foot on the iron step of the cart; after that I did not see them, and could not say whether Trafford helped deceased into the cart; I did not see deceased in hospital at all; I was in the isolated ward; I heard Sergeant Harving ask me if I had anything to do with the deceased while she was in the hospital.

*Commissioner*: I was about 3 yards from Trafford and deceased when she got into the cart; Trafford appeared to be excited and angry; he said he would take deceased to Dr. Lester and see if she were fit to leave the hospital; he said, "I will make it hot for you" (speaking to the matron); he said Miss McEwen was not fit to look after pigs, let alone Christians; I think the matron could have heard this, as the sitting-room window was open; Trafford could not see the matron, but the words he used I think were addressed to her; I did not hear deceased say, "Father, I am not in a fit state to leave the hospital"; I have never heard any complaint of the treatment of deceased while in the hospital.

*Mr. Thompson*: I did not see Ada Sparrow, but was closer to deceased than she could have been.

Sworn at Mudgee, this 22nd day of September, }  
in the year 1897, before me,— }

K. ANDERSON.

M. S. LOVE, P.M., Commissioner.

This

This deponent, *Flora Day*, on her oath, saith as follows:—I am a married woman and reside at Mudgee; I was in the hospital at the time deceased was there, but not when she left, as I went on the 22nd of June.

*Mr. Meares*: I was at the hospital when deceased was first admitted; she was treated by the doctor the afternoon she was admitted, about a couple of hours after her arrival; the doctor attended to deceased every day; she never at any time made any complaint to me of her treatment; she never had to get out of bed to go to the closet—proper arrangements were made that she should not have to do so; deceased used to get out of bed against the matron's orders, and I have heard the matron scolding her for it, and she promised not to get out any more; I saw Mrs. Salsbury coming to see her on the first Sunday she came into the hospital and on the following Tuesday, and I heard Mrs. Salsbury tell her to go to her place when she came out of the hospital; I was at the hospital for a month, but never heard any complaints made; I was well treated, and the matron and nurse were very kind to me and treated the others in the same manner, as did also the doctor.

*Mr. Thompson*: I never saw the doctor examine deceased; I did not take notice of anything that took place between the matron and deceased or the doctor and the deceased, but I heard what Mrs. Salsbury said to her; deceased and Mrs. Salsbury were conversing for about ten minutes; I heard Mrs. Salsbury say, "Come to my place," and the deceased say, "Very well"; I have not seen Mrs. Salsbury since, except to-day and yesterday.

*Mr. Gannon*: I did not see doctor examine deceased, because examinations are made privately, the bed being surrounded by a screen.

Sworn at Mudgee, this 22nd day of September, }  
in the year 1897, before me,—

FLORA DAY.

M. S. LOVE, P.M., Commissioner.

This deponent, *John Rice*, on his oath, saith as follows:—I am a miner and reside at Abbotsford; I was at the hospital when deceased left; I was on the verandah; I was about 15 feet away and had a full view of everything; I saw Mrs. Beattie get up into the cart; Trafford was near the cart, but did not assist her except by putting his hand behind her as she got up into the cart; I did not see the matron; I heard Trafford saying, "You ought to be ashamed of yourself," looking towards the door, and said, "You're all a lot of pigs," and "You're not fit to look after pigs," and when he was going away he said, "I will show you up, all of you, in the papers"; had Mrs. Beattie said anything I could have heard it; deceased looked bad at the time; she walked slowly; when she got into cart she stood up till Trafford got in and told her to sit down; I never saw Trafford stoop down to do deceased's boots up; he could not have done it without my seeing him.

*Mr. Thompson*: After deceased had got into cart he, Trafford, stood near horse; I have never been interrogated about the evidence I have to give in this matter; I never heard Trafford say anything to deceased; I was close to them at the time; I saw Nurse Anderson at the same time, but she seemed farther away from them than I was; deceased seemed very weak when she got into cart; I never saw Trafford appear to wipe off anything from his hand after deceased had got into cart; I must have seen this if it had been the case; the patients at the hospital while I was there were always treated kindly by the matron and the doctor, as far as I know.

Sworn at Mudgee, this 22nd day of September, }  
in the year 1897, before me,—

JOHN RICE.

M. S. LOVE, P.M., Commissioner.

This deponent, *Thomas Sheridan*, on his oath, saith as follows:—

*Mr. Thompson*: I am a maintenance man, and reside at Mudgee, and am employed on the Cassilis road; I know the road leading to Trafford's house which was taken by the cart driven by Trafford. The cart was going very slowly when I saw deceased, and Trafford and Beattie, who seemed to be supporting deceased at the time; the track by which they went was a bushtrack, and is what I should call a very fair one, and the pace at which the cart was travelling was about as slow as possibly could be.

*Mr. Meares*: I had been on the road at the time for some period making repairs; I had never been as far as Trafford's place along the road, but have been within a mile or so; I do not know the exact time at which I was there; I am not prepared to say the exact track the deceased took.

*Mr. Gannon*: I don't know for what reason I was brought here to give evidence; I don't remember speaking to Mr. Richards with reference to this matter; I was here yesterday at the Court; I don't remember the time at which I saw deceased and the others driving out; I don't remember what coloured horse was in the cart; I don't know where Beattie lives; the track near Beattie's house I do not know; I occasionally contribute to the *Mudgee Guardian*, but I have never discussed the matter with that paper.

*Mr. Thompson*: I also write for the *Western Post*; I have no interest in this case whatever.

Sworn at Mudgee, this 22nd day of September, }  
in the year 1897, before me,—

THOMAS SHERIDAN.

M. S. LOVE, P.M., Commissioner.

This deponent, *Henry Edward Alexander Wells*, on his oath, saith as follows:—I am an agent, and reside at Mudgee; I know Trafford's place and the track well; it was a good track at the time deceased was going out to Trafford's house; the road is a chain wide where it is fenced.

Sworn at Mudgee, this 22nd day of September, }  
in the year 1897, before me,—

H. E. A. WELLS.

M. S. LOVE, P.M., Commissioner.

This deponent, *Sarah Rowell*, on her oath, saith as follows:—I am a member of the Salvation Army, and reside at Mudgee. I visited the Mudgee Hospital, in June, when Mrs. Beattie was there; I saw her for two Sundays; I saw her about four days before she left hospital; the second time I saw her I spoke to her, but she never complained to me of her treatment in the hospital.

Mr.

*Mr. Thompson* : On the second time I saw deceased I sang and prayed with her, but never spoke about hospital matters; but our conversation was about herself and her health, and she never made any complaint, or said that she was suffering from any pains.

*Mr. Gannon* : Deceased was in a peaceful frame of mind when I saw her last; I never at any time said to the matron that I thought deceased was too ill to leave the hospital.

Sworn at Mudgee, this 22nd day of September, } SARAH ROWELL.  
in the year 1897, before me,— }

M. S. LOVE, P.M., Commissioner.

This deponent, *Charles D. Meares*, on his oath, saith as follows:—I am a solicitor, and reside at Mudgee; the minutes produced are the records of the Benevolent Society of Mudgee, in the handwriting of Mrs. Stacey, and are proceedings of meetings held on the 29th June and 13th July. Exhibit

Sworn at Mudgee, this 22nd day of September, } CHAS. D. MEARES.  
in the year 1897, before me,— }

M. S. LOVE, P.M., Commissioner.

This deponent, *James Harvey*, on his oath, saith as follows:—

*Mr. Thompson* : I am a sergeant of police, and reside at Mudgee; I remember going to hospital on the 3rd July; I saw the matron and spoke to her *re* death of deceased; I asked her if there were any convalescent patients in the ward in which Mrs. Beattie had been; she said there had been one, Ada Sparrow; I asked her what nurses had been in attendance on Mrs. Beattie; she said, "I attended to her"; I said, "What about Miss Anderson, was she in the ward?" she replied, "No; she was tending to the contagious ward"; I then saw Miss Anderson, matron not being present; I asked her if she had been attending Mrs. Beattie; she said no; I asked her if she saw Mrs. Beattie leaving the hospital; she said, "No, I was at the contagious ward, I did not see anything of them"; I told the matron I wanted these persons to attend the inquest.

*Mr. Gannon* : That was all the conversation I had; I was with Constable Dolman at the time.

Sworn at Mudgee, this 22nd day of September, } JAS. HARVEY.  
in the year 1897, before me,— }

M. S. LOVE, P.M., Commissioner.

This deponent, *Frederick William Dolman*, on his oath, saith as follows:—I am a constable of police, and reside at Mudgee; I went with Constable Harvey to the hospital on the 2nd July, and heard what Harvey said to matron; he said to matron, "Who was attending deceased?" she said "I was"; the sergeant then said, "What about Miss Anderson?" she said, "She knows nothing about it, she was at the contagious wards"; the sergeant then went to see Miss Anderson; I did not go with him.

Sworn at Mudgee, this 22nd day of September, } F. W. DOLMAN.  
in the year 1897, before me,— }

M. S. LOVE, P.M., Commissioner.

[22nd September, 1897, 6.15, Court adjourned till 10 on 23rd instant.]

Thursday, 23rd September, 10 o'clock.

This deponent, *John Cotter*, on his oath, saith as follows:—

*Mr. Gannon* : I am a gaoler, and reside at Mudgee; I have been there for nearly seven years; I remember seeing William Trafford in the gaol under the name of John Rogers and other aliases; the last sentence he had was fourteen years' penal servitude, for receiving stolen property, and has received various sentences in other Colonies. Exhibit I.

*Mr. Thompson* : As far as I know, there has been nothing against William Trafford since his discharge from the gaol in 1892; he has been living about Mudgee since that time.

*Mr. Gannon* : Had it not been for the commutation of the sentence by the Governor, he would have been in gaol till last year.

Sworn at Mudgee, this 23rd day of September, } JOHN COTTER.  
in the year 1897, before me,— }

M. S. LOVE, P.M., Commissioner.

*Mr. Gannon* : *Ethel McEwen* recalled: I produce my nurse's certificate from the Prince Alfred Hospital, and credentials from medical men; and the hospital had these papers before them when I was appointed.

*Mr. Thompson* : Deceased was getting solid food from the time of her recovery from diarrhoea till her discharge.

Sworn at Mudgee, this 23rd day of September, } ETHEL McEWEN.  
in the year 1897, before me,— }

M. S. LOVE, P.M., Commissioner.

This deponent, *Walter Sherry*, on his oath, saith as follows:—I am a member of the hospital Committee, and reside at Mudgee.

*Commissioner* : I was one of the visiting Committee in June last; I visited the hospital on the 16th, 20th, 22nd, 27th, and 28th June; I was not in the female ward in that month; I did not see deceased there at all; I did not hear anything *re* her treatment in the hospital; any patient could complain if they so desired; when I go to the hospital I tell the patients who I am, and ask if they have any complaints to make; I constantly visit the hospital; I have never heard any complaint against the doctor or matron, and we could not have a better matron than we have; I know nothing of this case.

*Mr. Gannon* : On my visits I have always heard the patients speak well of their treatment in the hospital, and have never had any complaints.

*Mr. Thompson* : About the 26th I saw Trafford, and he asked me to go to the hospital, and see if deceased was fit to leave ; I went up on the following day, but did not see deceased ; I saw matron, and she gave a satisfactory reply ; I have every confidence in the matron.

Sworn at Mudgee, this 23rd day of September, }  
in the year 1897, before me,—

WALTER SHERRY.

M. S. LOVE, P. M., Commissioner.

This deponent, *Richard Squibb*, on his oath, saith as follows :—I am a wardsman of the Mudgee Hospital, and reside at Mudgee, and have been so for about eight months.

*Mr. Meares* : I saw deceased as she was leaving hospital ; she was walking unassisted, and seemed quite well ; I was going to the kitchen at the time ; when I returned deceased was at the door ; Miss McEwen was in the sitting-room ; Trafford took deceased down to the cart, where she put her hands on the iron railings of the cart to get up, when I heard Trafford say to her, "Be quick, quick, so that we may get away from this murdering shop" ; after deceased had got into cart Trafford went round horse's head and got in at the other side, and before driving away sang out, "You are not fit to look after pigs, let alone Christians ;" deceased appeared to me to be able to walk easily by herself ; Trafford did not help her to get into the cart ; I did not see Trafford bend down to do up deceased's shoes, and if he had done so I must have seen him do it ; I was just inside the front door at the time ; I did not hear Trafford say anything to deceased, except as he met her at the doorway, when he said, "Were you in bed ;" twice she replied, "No."

*Mr. Thompson* : I don't remember any other patients leaving at the time of deceased's departure ; I remember deceased's departure, because the matron told me that Trafford had abused her on one occasion, and I went on purpose to see deceased go, to see if I might be of any assistance ; I thought it possible she might require assistance ; it is my duty to see the male patients leave the hospital, but I have nothing to do with the females ; I am certain that Trafford did not do anything to deceased's boots ; deceased did not sit down on the steps ; I did not see Ada Sparrow at the time ; deceased did not say to Trafford, "Oh, father, I am not able to leave," to my knowledge ; I did not give evidence at the inquest ; Last Monday week was the first time that I spoke of what I had seen at the deceased's departure from the hospital.

*Mr. Meares* : I saw Mr. Rowell two weeks after the inquest, and I told him that what had been said was all a lot of lies by Trafford ; I saw deceased enter hospital, and assisted her out of the cart.

*Mr. Thompson* : I understood that deceased was suffering from pregnancy when she left the hospital.

Sworn at Mudgee, this 23rd day of September, }  
in the year 1897, before me,—

R. W. SQUIBB.

M. S. LOVE, P.M., Commissioner.

*Mr. Gannon* : On the 17th June, I went out to deceased's house with Trafford, and then I had to leave the cart about 100 yards from the house, and I and Mrs. Trafford had to assist Mrs. Beattie to the cart down a deep creek and up a good rise, and we assisted her into the cart when bedding had been prepared for her ; the place we left was what you would call a humpy, there was nothing in it except six children who had no one to look after them ; I asked Trafford why he did not take deceased to his home, he said that his wife was away ; all the road from there to Mudgee was very bad at the time ; there had been rain about the beginning of June, but the roads were dry at the time.

*Mr. Thompson* : I heard Trafford say that there was another road by Abernethy's to this place ; I have been out on that road, and I know it is impossible to drive to deceased's house by that way ; I never said it was not a wonder they wanted to get rid of Mrs. Beattie on account of her dirty condition ; the reason of the deceased's dirty condition was from the fact that she was suffering from diarrhoea ; when I first saw her she said she had been suffering for a week ; she appeared then in a very bad way ; I don't think there was anything for her at her house, and she was in an exceedingly low state when I saw her.

Sworn at Mudgee, this 23rd day of September, }  
before me, in the year 1897.—

S. J. SALSBURY.

M. S. LOVE, P.M., Commissioner.

[One o'clock—Court adjourned till 2 o'clock.]

[Two o'clock—Court sat.]

This deponent, *Edwin Richards*, on his oath, saith as follows :—I am editor of the *Mudgee Guardian*, and reside at Mudgee.

*Mr. Gannon* : I have been in the employment of the paper for about eight years ; I have only control over the literary department ; the paper belongs to Charles Knight ; I produced extracts of the paper referring to the hospital case to the Principal Under Secretary in the presence of Mr. Jones, M.P. ; I knew that the hospital had requested that the Board of Health do make an inquiry ; the reason I went to Sydney was to see the authorities about the case ; I did not think that the Board of Health was the proper body to investigate this matter, and that was why I saw the authorities ; when I saw the Principal Under Secretary, I asked him if he had received any papers from the Mudgee Hospital, and he said he had not ; I gave him the articles in my paper to read ; I did nothing else beside that in Sydney to influence the case ; Mr. Thompson was retained by the *Mudgee Guardian* in the case ; I did not go out of my way to obtain evidence ; I have no direct evidence to give on this case ; I saw deceased in cart in Market-street on the day she left hospital, and she looked very poorly ; I saw the man with her giving her a drink ; deceased had brown jacket on, closely buttoned at the time ; she was sitting in a slanting position ; I asked Sheridan, the maintenance man, that if he saw Trafford on the road to send him to me ; there was a communication brought to me about the inquiry, but I had it suppressed owing to the steps taken by the Hospital Committee ; I wrote all the leading articles in this matter. [Article in *Mudgee Guardian* of 16th July, Exhibit "H," and article of 30th, Exhibit "I."] I have no animus against Dr. Nickoll ; I did not

not think it was necessary for to come and give evidence in this matter, though I saw the state of the woman when she was in Market-street; I have no antipathy against the matron; I rather encouraged the Committee in appointing her by my articles in the paper, and I have the highest respect for all the staff of the hospital.

Article 17th  
September,  
Mudgee  
Guardian,  
Exhibit L.

*Mr. Cannon*: Mr. George Hazeltine said to me that certain impressions had been made on his mind since the inquest, and that he considered the inquest was too hurried.

*Mr. Thompson*: I have no personal feeling against Dr. Nickoll; I have always advocated the appointment of three doctors to the medical staff; I had a conversation with one of the doctors who had been at the *post-mortem* examination; it was Dr. Beith.

*Mr. Cannon*: There is no mention in the articles produced *re* the appointment of three doctors instead of one; I did not see the Board of Health when I was in Sydney about the case.

*Mr. Thompson*: I believe Mr. Cassel wrote to Mr. Jones, asking him to urge on this inquiry.

Sworn at Mudgee, this 23rd day of September, }  
in the year 1897, before me,—

EDWIN RICHARDS.

M. S. LOVE, P.M., Commissioner.

*Dr. Beith* recalled:—

*Mr. Thompson*: I consider hæmorrhage was brought about by miscarriage; I was present at the *post-mortem*, and think hæmorrhage was caused by the separation of the placenta; but I do not know if there was any separation before death; I could not tell from the surface if there was any hæmorrhage; shock appeared to me to be the greatest cause of death; I think Dr. Lester said that the separation of the placenta took place after death; I did not see the large intestine opened; I did not see any clots of blood; so far as I saw, the bowels were empty; I saw a small amount of liquid fæces; I don't know that the bowels being empty was evidence of there being diarrhœa up to the time of death; the bowel was not opened past the sigmoid flexia bend in my presence; I never said to Mr. Richards that he had to thank his brother medical men that he (Dr. Nickoll) was not in a serious position over this matter; I never said that the woman was not fit to leave the hospital; judging from the *post-mortem*, I said that the authorities, under the circumstances, should have been very careful in discharging deceased.

*Mr. Meares*: In my opinion the *post-mortem* was not an exhaustive one; the appearance of the rectum might be put down to other causes than diarrhœa; I heard the evidence of Dr. Lester yesterday, and I consider that the thickening of the lining membrane of the rectum spoken of by him was of trivial consequence.

Sworn at Mudgee, this 23rd day of September, }  
in the year 1897, before me,—

ROBERT BEITH.

M. S. LOVE, P.M., Commissioner.

*Dr. Lester* recalled:—

*Mr. Thompson*: The time deceased suffered from diarrhœa would seriously weaken the system; and after an attack of that kind considerable time would have to be allowed for her to get well again; I would not expect to find the bowels empty if deceased had recovered from diarrhœa; the diarrhœa suffered by deceased might have recurred though it had once been checked; at *post-mortem* we saw no indications of very great hæmorrhage; the hæmorrhage appeared to come from the lower pole of the uterus; when I made the incision into the womb I cut part of the placenta, and either Dr. Beith or Nickoll said that that was where the hæmorrhage came from; I stripped the placenta off, and there were no signs of hæmorrhage there; jolting in the cart and premature labour would cause shock.

*Mr. Meares*: It is perfectly consistent with all I saw that diarrhœa may have ceased for seven or nine days; but possibly there may have been some between the time she left the hospital and her death.

Signed and sworn, at Mudgee, this 23rd day of September, }  
in the year 1897, before me,—

CHAS. E. LESTER.

M. S. LOVE, P.M., Commissioner.

This deponent, *William Joseph Cohen*, on his oath, saith as follows:—

*Mr. Thompson*: I am a proprietor of a boot factory, and reside at Mudgee; I know Dr. Beith; I remember him speaking to me of the inquiry; he said deceased was not cured of diarrhœa when she left the hospital, and was not fit to leave.

*Mr. Cannon*: Mr. Cohen, of the *Mudgee Guardian*, is my uncle; it was about the Sunday week after the inquiry that Dr. Beith spoke to me.

Sworn at Mudgee, this 23rd day of September, }  
in the year 1897, before me,—

WILLIAM J. COHEN.

M. S. LOVE, P.M., Commissioner.

*Mr. Richards* recalled:—Dr. Beith said these words, and I repeated them to two gentlemen in town, "Nickoll can thank the kindness of his brother medical men for the turn the case took," and I said, "Yes"; I made no other remark; he said, "Did you miss anything from my evidence?" I said, "Yes, a good deal"; he said, "Did you see I was not asked whether the woman was cured of diarrhœa or not?" I said, "Yes."

Sworn at Mudgee, this 23rd day of September, }  
in the year 1897, before me,—

EDWIN RICHARDS.

M. S. LOVE, P.M., Commissioner.

This deponent, *Mrs. Mary Ann Daly*, on her oath, saith as follows:—

*Mr. Thompson*: I am a married woman, and reside at Mudgee; I am a member of the Benevolent Society; I heard that arrangements had been made for Mrs. Beattie to go to Mrs. Salisbury's place for her confinement; the arrangements were £1 for ten days, and we were to pay for the provisions.

*Mr.*

*Mr. Meares* : The arrangements were left for Mrs. Stacey, the Secretary, to make ; matters were left entirely in the discretion of the Secretary.

*Mr. Thompson* : I was deputed to inquire as to whether the Beatties were proper persons to receive assistance ; in the meantime the woman died.

Sworn at Mudgee, this 23rd day of September, } M. DALY.  
in the year 1897, before me,— }  
M. S. LOVE, P.M., Commissioner.

This deponent, *George Hazeltine*, on his oath, saith as follows :—

*Mr. Meares* : I am a blacksmith, and reside at Mudgee ; I was one of the jury on the inquest of deceased ; I heard Mr. Richards giving his evidence in Court this morning ; I heard him say that if I had known as much before the inquest as I know after I should have come to a different decision on the matter ; the statement is quite untrue.

*Mr. Thompson* : I never spoke to Mr. Richards on the subject ; I have not been to Sydney since the inquest specially to consult a doctor.

Sworn at Mudgee, this 23rd day of September, } GEO. HAZELTINE.  
in the year 1897, before me,— }  
M. S. LOVE, P.M., Commissioner.

*Dr. Nickoll* :—

*Mr. Meares* : In the first prescription given to deceased there was chalk, but in the two subsequent ones there was none ; I examined the rectum at the *post-mortem* ; in my opinion the congested condition of the rectum was due to advanced pregnancy ; the condition of the rectum was not consistent with a severe attack of inflammatory diarrhœa ; the medicines given to deceased were not for inflammatory diarrhœa ; I should not have believed the evidence of Cohen if I had not heard it on oath ; I consider that the *post-mortem* was not a complete one ; the whole of the intestines should have been examined carefully, and not superficially ; I treated Trafford's son for his eyes ; his son was struck in the eye with a piece of wood ; I pointed out to them the danger of the injured eye remaining in, and that it would have to be removed, and they would not listen to it.

*Mr. Thompson* : I never said that I was satisfied with the inquest ; deceased appeared to have no trace of recent diarrhœa ; it is possible that there might have been an evacuation of the rectum through the pains of labour.

Sworn at Mudgee, this 23rd day of September, } HARVEY NICKOLL.  
in the year 1897, before me,— }  
M. S. LOVE, P.M., Commissioner.

[Inquiry closed 5 o'clock, Thursday, 23rd September, 1897.]

## EXHIBITS—MUDGEE HOSPITAL INQUIRY.

### Exhibit A.

To William Trafford, Mudgee Hospital, Monday, 28 June, 1897.  
I have been instructed by Dr. Nickoll to inform you that Mrs. Beattie is ready to leave the hospital now, and if you do not come for her she will be sent out on the coach at your expense.

E. McEWEN,  
Matron.

### Exhibit B.

REPORT of the Mudgee District Hospital for the year ending 31st December, 1895, with subscribers' names, life members, rules and regulations ; report of the Committee, Treasurer's statement, and Medical Officer's return of sick treated for the year, &c., &c.

THE UNDERMENTIONED ARE THE OFFICE-BEARERS FOR THE CURRENT YEAR.

Trustees :—Hon. C. H. Cox, D. Cassin, Esq., and C. D. Meares, Esq.

Committee :—1, Ven. Arch. Campbell ; 2, Rev. Dean O'Donovan ; 3, Rev. C. W. Willis ; 4, D. Cassin ; 5, W. Little ; 6, Edward Clarke ; 7, W. F. Kellett ; 8, R. M. Hunter ; 9, E. Deane ; 10, J. C. Gunnell ; 11, J. Loneragan ; 12, C. D. Meares ; 13, W. Sherry ; 14, W. Shaw ; 15, W. L. B. Brown ; 16, F. J. Bird ; 17, C. H. Tuckerman ; 18, Osborne E. Norris ; 19, James Parker ; 20, H. S. Thomas ; 21, P. Barnett ; 22, J. T. Hartigan ; 23, Alex. Low ; 24, G. A. Blumer.

Secretary :—Mr. J. M. Cox.

Hon. Treasurer :—Mr. F. J. Bird.

Medical Officer :—Dr. Harvey Nickoll.

Auditors :—Messrs. T. J. Lovejoy and D. R. Macdonald.

Nurse Superintendent :—Miss Johnson.

Life Members :—Hon. L. H. Bayly ; W. R. Blackman, Esq. ; H. C. White, Esq. ; W. Kite, Esq. (Bathurst) ; W. Smith, Esq. (Caerleon) ; R. J. Black, Esq. ; Matthew Morton, Esq. ; J. L. Brown, Esq. (Caigan) ; John Miller, jun. ; V. J. Dowling, Esq. ; R. Rouse, Esq. ; E. A. Nardin, Esq. ; W. Kellett, Esq. ; S. H. Barnes, Esq. ; A. H. Cox, Esq. ; Geo. Fishburn, Esq. ; Hon. G. H. Cox ; Mrs. G. H. F. Cox ; Mrs. A. H. Cox ; H. Crossing, Esq. ; Sir J. G. L. Innes ; Jas. Atkinson, Esq. ; J. D. Cox, Esq. ; W. Wilton, Esq. ; Evan Richards, Esq. ; Mrs. Evan Richards.

### REPORT OF THE COMMITTEE OF THE MUDGEE HOSPITAL FOR THE YEAR 1895.

Your Committee have great pleasure in reporting that the affairs of the institution continue in a highly satisfactory condition. The staff have creditably discharged their duties, and the great number of patients admitted during the twelve months has fully taxed their energy. Since we presented our last report several improvements have been effected on the premises, thereby adding comfort to the patients and value to the property. The main building has been covered with galvanized iron at a cost of £83 5s. 5d. Your Committee, like all governing bodies, have felt the acute depression, whereby their finances have suffered, still they are grateful withal for the present position of their funds. From the Hon. Treasurer's balance-sheet it will be found that the credit balance in Bank is £31 14s. 4d. less than at the commencement of last year. Your Committee desire to place on record their high appreciation of the services of those ladies and gentlemen who gave assistance on Hospital Sunday, at the annual ball, and with subscription lists, and would earnestly solicit a continuation of the same in the interests of the hospital. During the year your Committee have been called together 13 meetings as follows :—D. Cassin, 12 ; W. Sherry, 12 ; Archdeacon Campbell, 11 ; W. L. B. Brown, 11 ; W. Little, 9 ; W. F. Kellett, 9 ; R. M. Hunter, 9 ; G. D. Young, 9 ; E. Deane, 8 ; O. E. Norris, 8 ; C. H. Tuckerman, 8 ; Rev. J. Woodhouse, 7 ; Rev. Dean O'Donovan, 7 ; E. Clarke, 7 ; Jas. Loneragan, 6 ; Rev. C. W. Willis, 4 ; J. C. Gunnell, 4 ; F. J. Bird, 4 ; J. H. Parker, 3 ; P. J. Rheinberger, 3 ; F. Carpenter, 1 ; John Lee, 1 ; C. D. Meares, 1.

MEDICAL

MEDICAL OFFICER'S REPORT.

During the last twelve months there have been 175 admissions into the hospital; 85 were cured, 46 relieved, 5 unrelieved, and 25 died, 13 remaining in hospital. The number of admissions still very high. The death rate this year far exceeds that of other years, and is to be accounted for by the fact that there was an exceptional influx of very aged men, nearly all of whom were admitted in a hopeless condition. The isolation ward has been of great service, and has so far answered its purpose well.

BALANCE-SHEET FOR THE YEAR 1895.

Table with columns for Dr. (Debit) and Cr. (Credit) in pounds, shillings, and pence. Includes items like To Balance, Subscriptions, Donations, Commercial Travellers cricket match, Hospital Sunday, A.O. Foresters, Mudgee Town Band, W.C.T.U., Charles Courts, Mrs. Parker, Ange Leroux, Miss Johnson, H. C. White, Treasurer, Cooyal Sports, Hargraves Hospital box, Lodge Edinburgh, Unclaimed pound fees, Patients' fees, Burial fees, Trustees, Mudgee Hospital, Government subsidy, Outstanding cheque, etc.

FRED. J. BIRD, Hon. Treasurer. 20th January, 1896.

Examined and found correct,— D. R. MACDONALD, THOS. J. LOVEJOY, Auditors.

SUBSCRIPTION LIST.

Table listing subscribers and their contributions in pounds, shillings, and pence. Includes names like Very Rev. Dean O'Donovan, D. Cassin, E. Clarke, John Lee, C. D. Meares, R. M. Hunter, John Muller, R. Jones, M.P., John Pye, William Little, Alex. Lowe, P. J. Rheinberger, J. M. Cox, J. Bennett, W. Thomas, Mrs. Brown (Bowen-fells), Cricket match, Commercial Travellers v. Stores, H. C. White, Judge Murray, Proceeds Hospital Sunday, Lawrence Palmer, A. O. Forresters, Proceeds Hospital Ball, Mudgee Town Band, W.C.T. Union, Trustees Mudgee Hospital, Charles Courts, Mrs. Parker, A. Leroux, A Friend, Dr. Dufflot, Hunter White, Proceeds Cooyal Sports, Hon. G. H. Cox, Unclaimed Pound Fees, Jas. D. Cox, W. Everingham, M. R. Lowe, John Taylor, James Jennings, Frederick Leeder, John Phillips, Lodge Edinburgh, Jonathan Bones, Mrs. F. S. Cox, George Cadell, Mrs. J. Albert, Miss Walsh, Miss Flanagan, J. Lov, J. Tulk, Mrs. Holden, Mrs. Rowell, R. Rope, A. E. Wetherell, D. Donovan, E. Sheppard, Western Post (W. Shaw), H. Baurig, R. Cunliffe, A. Blackett, A. Campbell, B. Ward, J. RULES AND REGULATIONS.

- I. That an annual meeting of the subscribers to the Mudgee Hospital be held in the month of January in each year for the purpose of electing the Committee of twenty-four, and transact business connected with the same, and that one fortnight's notice of the time and place of meeting be published in the Mudgee newspapers.
- II. That the Committee shall meet on the first Tuesday in every month—five to form a quorum.
- III. That during the interval between the meetings of the general Committee, the affairs of the hospital shall be under the provisional management of a visiting Committee, consisting of not less than two members, who shall each hold office for two months consecutively, one member retiring each month, and he shall not be eligible for re-election for three months.
- IV. That a donation of £10, in one sum, shall constitute the donor a life member, who shall be entitled to exercise the privileges of an annual subscriber.
- V. That subscribers shall be entitled to vote at all general meetings of the hospital, and to recommend patients for admission as hereafter provided.
- VI. That any five subscribers be empowered to demand that a special meeting of the subscribers be called to transact any business connected with the institution.
- VII. That the Medical Officer be required to attend the hospital daily, or oftener, if necessary, and to make a record of each visit.
- VIII. That the Medical Officer be required to keep a book, entering the names of all persons received into the hospital, together with the age, occupation, religion, and ailment of every such patient, also the date of his discharge, or whether cured or otherwise. A special entry shall be made of all operations performed, with particulars of the same. The book so kept to be open at all times for the inspection of any member of the Committee. Furthermore, the Medical Officer shall cause a card to be placed at the head of each patient's bed, stating age, occupation, and religion.
- IX. That no account or salary be paid by the Treasurer until passed by the visiting Committee, and confirmed by the General Committee.
- X. That the funds of the hospital be deposited in the Bank of New South Wales, Mudgee; cheques to be signed by the Treasurer, Secretary, and one of the clergymen.
- XI. That the Committee prepare a report of its proceedings, and submit it for adoption at each general meeting, and that a copy of such report, together with all the rules and regulations connected with the institution, and the subscriptions for the past year, be forwarded to each subscriber.
- XII. In the foregoing rules "a subscriber" shall be held to be one who has paid for the current year a subscription of £1.
- XIII. That annual subscribers to the Mudgee Hospital be permitted to attend the Hospital Committee Meeting.

Rules for the Admission of Patients.

1. That every subscriber shall be entitled to two "patient's tickets," admitting patients into the hospital, for every £1 annually subscribed. That the clergy of the different denominations, as well as subscribers, have the privilege of giving orders for admission to the hospital, countersigned by the Medical Officer.

II. That every person applying for admission to the hospital as a patient shall procure from a subscriber or clergyman a "patient's ticket," which shall be signed by such subscriber or clergyman, and countersigned by the Medical Officer. In the case of a person who is in destitute circumstances and unable to pay, he shall be admitted as a non-paying patient, in which case the ticket must be further signed by a member of the Committee.

III. Every "patient's ticket" shall have printed on the back thereof an agreement to pay an amount per week to be fixed by the visiting Committee, but in no case to exceed 3s. per day during his stay in the hospital; such tickets to be received by the matron and handed over to the custody of the Secretary.

IV. In cases of patients requiring private wards, applications should be made to the matron, and in such cases the visiting Committee shall fix the amount to be paid.

V. That the Medical Officer's sanction be required in all cases for admission, except those arising from accident, which shall be admitted immediately. Any other cases of emergency shall be taken into the reception room until seen by the Medical Officer.

VI. The following cases not be admitted, viz., incurable cases; chronic cases, such as inveterate ulcers of the legs, &c.; pregnant women; lunacy; infectious diseases, such as small-pox, itch, &c.; confirmed consumptives.

Ward Regulations.

- I. No smoking will be allowed in the wards.
- II. Patients will not be allowed to receive anything from their friends except by permission of the Nurse Superintendent.
- III. Patients absenting themselves without leave will not be allowed to return.
- IV. No gratuity of any kind is to be given by the patients or their friends to any officers or servants of the Institution.
- V. Persons having complaints are to communicate them to the Medical Officer, the Visiting Committee, or one of the clergymen.
- VI. Convalescent patients will be expected to assist, as far as they are able, in the work of the Institution.
- VII. Strict obedience to the directions of the Medical Officer and Nurse Superintendent from all patients will be insisted upon.

Patient's Ticket.

ADMIT THE BEARER

into the Mudgee Hospital as a paying patient, subject to the Rules and Regulations of the Institution.

Subscriber (or Clergyman).  
Medical Officer.

N.B.—In the case of a non-paying patient this ticket must be further signed by a member of the Committee.

Date 189 . Member of Committee.

(To be printed on the back of the ticket.)

I hereby agree, in consideration of my receiving treatment at the Mudgee Hospital, to pay to the Treasurer of the Mudgee Hospital, on demand, a sum of money, to be fixed by the Visiting Committee, at a rate not exceeding 3s. per day.

Date 189 . Patient.

Memo.—Amount fixed to be paid by the above patient is fixed at per day. } Visiting Committee.

AN ACT TO FURTHER AMEND THE LAW RELATING TO THE MANAGEMENT OF HOSPITALS. [ASSENTED TO 31st OCTOBER, 1894.]

BE it enacted by the Queen's Most Excellent Majesty, by and with the advice and consent of the Legislative Council and Legislative Assembly of New South Wales, in Parliament assembled, and by the authority of the same, as follows:—

1. The Act fifty-fourth Victoria number twenty-eight is hereby repealed, and the Act eleventh Victoria number fifty-nine, hereinafter termed the Principal Act, is amended as follows:—

2. At any annual or special general meeting for the election of trustees of any public hospital within the meaning and under the operation of the Principal Act, and at the annual meeting for the election of the committee and auditors of any such hospital any contributor qualified to vote shall be eligible for election as trustee or as member of the committee, and any person, whether so qualified or not, shall be eligible for the position of auditor, but no person shall be elected to any of the abovementioned unless proposed and seconded by two contributors qualified as aforesaid, and unless nominated in writing at such meeting, the sanction of the person nominated having first been obtained, and such meeting shall be advertised in the nearest local paper at least a week before the day on which such meeting is to be held.

3. In the event of the number of persons nominated being greater than the number to be elected either for a committee, trustees, or auditors, the election shall be adjourned, and the hospital secretary shall, by advertisement in the nearest local paper, call a meeting for the purpose of such election for a day being not less than seven days nor more than fourteen days after the adjournment aforesaid, and shall forthwith transmit by post or otherwise to every contributor entitled to vote, a voting-paper initialled by the secretary containing the names of all the persons duly nominated, which voting-papers, with the names of those persons struck out whom the persons voting do not desire to vote for shall be enclosed in an envelope endorsed "voting paper," which envelope shall be enclosed in another envelope bearing the voter's signature inside, and returned to the secretary not later than the day before that to which the meeting is called for the purpose of the election, and all such envelopes endorsed "voting paper" as aforesaid shall be handed by the secretary to the scrutineers appointed at such meeting, who after counting the votes shall present a signed return to the adjourned meeting, showing how many votes were recorded for each person nominated, and the chairman of such meeting shall declare those persons elected who have received the majority of votes.

4. No person shall be qualified to vote at any annual meeting of contributors to any such hospital for the election of trustees or any committee of the said hospital, or on any question brought before such meeting aforesaid, unless he has paid to the hospital a contribution of £1 sterling at the least at any time between the commencing of business at such meeting and the commencing of business at the preceding annual meeting, or has contributed and paid £10 in one sum to the said hospital; and no person shall be qualified to vote at any special general meeting of contributors to any such hospital for the election of trustees or any question brought before such meeting unless he has paid to the hospital a contribution of £1 sterling at the least at any time during the twelve months preceding the day for which the meeting is called, or has contributed and paid £10 in one sum to the said hospital.

5. After the passing of this Act, notwithstanding anything contained in the Principal Act or any amendment of the same, the treasurer shall be appointed annually.

6. The committee of any hospital as aforesaid shall appoint—

- (i) The treasurer, secretary, medical officer, warden, matron, and any other officer or servant they deem necessary for the efficient working of such institution, anything in the Principal Act to the contrary notwithstanding.
- (ii) And make rules for the conduct of business at meetings of the said committee and generally for the management and control of any hospital for which such committee has been elected.

7. When any member of the committee of any hospital as aforesaid dies or resigns or becomes non compos mentis, or refuses or becomes otherwise unable to act as a member of such committee, the committee may declare that such person has ceased to be a member of such committee, and may in like manner appoint a qualified person in his place; and the person so appointed shall have the same rights, powers, and authorities as the person had in whose place he has been so appointed.

8. Whenever by proclamation under section 11 of the Principal Act, the provisions of the said Act shall be extended to any hospital, then :—

The auditors and committee of such hospital, at the date of such proclamation, shall hold their respective offices, and shall to all intents and purposes be vested with the same rights, powers, and authorities in law, as if they had been duly elected under the provisions of the said Act and any Act amending the same.

(ii) At the first annual meeting of contributors to any such hospital after the date of such proclamation as aforesaid, every person who has, at any time within twelve months prior to the commencing of business at such meeting, paid to the hospital a contribution of £1 sterling at the least, or has contributed and paid £10 in one sum to the said hospital, shall be qualified to vote for the election of trustees or any committee of the said hospital, or on any question brought before such meeting.

Sir, Board of Health Offices, 127, Macquarie-street, Sydney, 1 December, 1897.  
As it has recently been found that a number of the country hospitals, which receive a subsidy of £ for £ from the Government, do not clearly understand the conditions upon which such subsidy is granted, I have the honor, by direction of the Colonial Secretary, to inform you :—

1. That the Government subsidy of £ for £ is given on the condition that the hospital admits all accidents and urgent cases brought to its doors.
2. That all destitute cases recommended by the Police Magistrate or other approved officer (among whom must be considered the Government Medical Officer and the chief local officer of police) must be admitted without delay ; and
3. That cases of fever, erysipelas, and other infectious diseases must be admitted, as well as ordinary cases, and suitable provision made for their accommodation and treatment.

Should the hospital authorities refuse or neglect to admit any suitable patient who has been properly recommended, the necessary arrangements will be made for the treatment of such elsewhere, and the expense thereof deducted from the next annual subsidy.

I have, &c.,

F. NORTON MANNING,

Medical Adviser to the Government.

The Honorary Secretary, Hospital Committee.

**[Exhibit G.]**

Pipeclay, 5 July, 1897.

STATEMENT of William Trafford to the committee of the Mudgee Hospital, asking for a further inquiry into the case of the late Mrs. Beattie, who was turned out of the Mudgee Hospital in a dying state last Thursday afternoon, and who died the same night :—

"I beg to state that, being a witness, I was not allowed to ask questions, nor address or speak to any of the jury, and that left Dr. Nickoll and the matron to have it all their own way. You will see by the evidence of Dr. Nickoll and the matron they say Mrs. Beattie was cured of diarrhoea. Dr. Lester, in his evidence, said that in *post-mortem* examination he saw traces of diarrhoea, and if he is asked he must acknowledge that Mrs. Beattie was not cured of diarrhoea. I know all about the arrangements in regard to Mrs. Salsbury. The matron never said a word to Mrs. Beattie or to me about going to Mrs. Salsbury. The matron told Mrs. Beattie that her father had come to take her home. Before I put her foot on the step of the cart I saw blood. I stooped to do something to her boots and stockings, and the blood trickled on to my hand. I did not know at the time where it came from ; I thought it was a relapse of diarrhoea. The letter sent to me by the matron, by order of Dr. Nickoll, said I must take her home. They knew it was 5 miles to Buckaroo, and if I did not take her they would send her home by the coach at my expense. The matron said Mrs. Beattie did not complain about going out of the hospital. The woman patient said she heard Mrs. Beattie tell the matron before she left the room she was not fit to leave the hospital. She also states that she was looking over the balcony, down to the steps, and heard Mrs. Beattie say to me, 'Father, I am not in a fit state to leave the hospital.' I have no hesitation in saying that turning Mrs. Beattie out of the hospital in that state caused her death. Before I left Mudgee I spoke to three of the committee ; they all said she looked very bad. I told them I would take her home at the risk of the doctor and matron. She told me after I had got her in the cart that she felt that she was dying, and she was sure she would never reach home. I am sure it will never be safe for anyone to go into the Mudgee Hospital after what has taken place, for everyone is crying out about Dr. Nickoll. Everyone I speak to says they will never give another shilling to the hospital while Dr. Nickoll is at the head of it. Everyone I speak to says there should be a second doctor, and that is my way of thinking, and that would put a check on him. I have told Dr. Nickoll more than I shall tell you, for I know him, and if the committee will give me a hearing, I have a lot of complaints against Dr. Nickoll. I do hope and trust the committee will make a searching inquiry, for it is one of the most cruel cases ever came before the public, for a poor creature to be sent to an untimely grave, and to leave behind all those poor children. It appears to me that Dr. Nickoll has often been questioned, and always escapes ; but I hope it will not be the case this time, for it is well known that he is very careless. There is a great number of people say that Dr. Nickoll is not a fit man for the position he holds, and I am of the same opinion ; and I do hope and trust the committee will wipe him out and put some other doctor in his place, for I am sure we have better men than ever he was. This letter can be made use of in any way the committee think proper.

I am, &c.,

WILLIAM TRAFFORD.

I know there is no time on Tuesday night to give it proper consideration. I will ask the committee to call a special meeting and allow me to address the committee myself. I have a complaint to make against the doctor for blinding William Brewer; and I am sure I can prove to the committee that he caused Mrs. Beattie's death. I will call the attention of the committee to Mr. Bird, to the Rev. Archdeacon Campbell, also Mr. Steward and Mr. Sherry. They can tell you about the state of Mrs. Beattie. I told them I would take her home at the doctor's risk; but I was sure that Mrs. Beattie was in a dying state when I took her from the hospital.

WILLIAM TRAFFORD,  
Care of H. Barton,  
Pipeclay Creek, near Mudgee.

### Exhibit H.

[Extract from minutes of proceedings at meeting of Mudgee Benevolent Society, June 29th, 1897.]

THE case of Mrs. Beattie was discussed, and Mrs. Daly said she would make inquiry about her from people who lived in the neighbourhood. The secretary mentioned that Mrs. Salsbury would keep her in her house and attend her for ten days for £1, or go to her house and attend her at the time for 10s., food to be supplied by Society. The Secretary was instructed, after receiving further information, to use her own discretion in the matter as to which course to follow. The secretary mentioned that, hearing of Mrs. Beattie being ill, she, after consultation with treasurer and Mrs. Willis, got Mrs. Salsbury to go out and see her. Mrs. Salsbury brought her in, and next day Mrs. Beattie was admitted to hospital.

A. CADELL.

### Exhibit I.

[Copy of List of Convictions.]

PARTICULARS of conviction and history of John Rodgers, *alias* Roberts, *alias* Jones, *alias* Caroline, transferred from the gaol at Parramatta to Mudgee gaol, under authority of transmission warrant, dated 1st September, 1890:—

Name of prisoner—John Rodgers, *alias* Roberts, *alias* Jones, *alias* Caroline. Convicted—Parramatta Quarter Sessions, 9th October, 1886. Offence—Having stolen property in his possession. Sentence—Fourteen years penal servitude. Judge—Dowling. Recommendation or remarks—This prisoner was charged on five other charges, but no sentence was passed in either case. Previous convictions:—Forbes Quarter Sessions, 26th August, 1875; burglary; twenty-one months hard labour. \*Penrith Police Court, 18th June, 1886; stealing, two charges; two months hard labour on each charge, cumulative. General conduct in Mudgee gaol—Good. Personal description of prisoner:—Name, John Rodgers, &c; born in Liverpool, England, 1823; arrived in Colony per ship "Great Britain" in the year 1852; religion, Church of England; trade or occupation previous to conviction, labourer; height, 5 feet 5½ inches; colour of hair, brown to grey; eyes, brown; education, read and write.

Anthony Wrench, *alias* Trafford, *alias* Roberts, *alias* Caroline.

Per ship "Architect," 1853, free; born about 1830; native of Lancashire; 5 feet 6 inches high; sallow complexion, light brown hair, hazel eyes, large nose, sharp chin, two moles left shoulder-blade.

Tried at Pleasant Creek, 13th May, 1858, vagrancy; two years. Tried at Bullarah, 21st June, 1858 (same year), burglary; sentence, four years (sentences cumulative). Received ticket-of-leave 7th May, 1861, for the district of Melbourne. (*Vict. P.G.*, 1861, page 199.)

Arrested by the detective and general police, January, 1862, at Back Creek, Carisbrook, for stealing fowls; escaped from the lock-up whilst in custody on this charge. When arrested, the boots and coat stolen from the tent of Edward Webster, Back Creek, were found in his possession, but he was not charged, as the owner was absent in New Zealand. (*Vict. P.G.*, 1862, pages 3 and 8. *Vict. P.G.*, 1861, page 452.)

Ticket-of-leave was transferred about 1st October, 1861, to Avoca district, to report at Redbank. (*Vict. P.G.*, 1862, page 18.)

Reported illegally at large. Arrested by the Burnt Creek police, under the name of John Caroline. Remanded to Pentridge, with a recommendation that his ticket-of-leave be cancelled for three months. (*Vict. P.G.*, 1862, page 16. *Vict. P.G.*, 1862, pages 71, 89.)

Received ticket-of-leave again in May, 1862, for the district of Melbourne. (*Vict. P.G.*, 1862, page 190.)

Reported illegally at large, July, 1862. (*Vict. P.G.*, 1862, page 267.)

Arrested by the detective police, Sydney, 4th February, 1865, for burglary on the premises of Messrs. Dawson and Stewart, Brisbane, January, 1865. Escaped from the Central Police Lock-up, Sydney, 5th February, 1865. (*Vide N.S.W. P.G.*, 1865, pages 207 and 47.)

Arrested by the Queensland Police in May, 1865, and sentenced to ten years' penal servitude for burglary. Discharged, under remission, to freedom, 28th October, 1872. (*Vide Queensland P.G.*, 1872, page 90.)

### Exhibit J.

[The Mudgee Guardian, July 16, 1897.]

THE LATE HOSPITAL STIR—TO BE FURTHER INVESTIGATED.

It is indeed gratifying to find so many in the community commending us for the determined front we have assumed in demanding further and more searching inquiry into the circumstances surrounding the death of the unfortunate woman, Mrs. Beattie. Telegrams and letters encouraging us to go on have been received from as far out as Coonamble. We are glad to receive such expressions, because the position we have assumed is to us singularly critical and trying. We realise that the burden of fastening the responsibility of that poor woman's death on the proper shoulders involves a most serious task. It is gratifying also to be able to tell well-wishers that the Hospital Committee has decided, as we suggested last week, not to constitute itself the tribunal for further investigation. At the meeting on Tuesday evening a resolution was carried with a view to having the matter sifted by the Board of Health. We are delicate about passing an opinion one way or the other on that point; still we cannot help thinking there need be no necessity to go altogether from home. If the authorities are to be consulted, we would suggest that no more competent conductor of an inquiry could be had than our Sub-inspector of police, with the Police Magistrate presiding, to take statements. A suggestion of this kind would be more likely to receive attention from the Department of Justice. Then let the hospital authorities judge as to how far the institution is affected. Both sides, we are sure, would be satisfied with such an inquiry, as the public would be also. Going for members of the Board of Health will involve expense, unnecessarily. The Sub-inspector of Police is already in possession of the facts so far as the Coroner's inquiry went, and the police would be the most likely people to ferret out the deficiencies—the missing links—which we assert emphatically were wanting to have brought about a condemnatory verdict. Even if the Board of Health is asked to assume the responsibility, and we doubt if they will undertake it, there must be certain conditions, especially that the parties, if there be parties, shall have the right to employ a solicitor. In any case this must be demanded. There will be plenty of scope for cross-examination. This granted, we have no fear of the result. Any other mock inquiry will not satisfy the brief we have undertaken on behalf of these orphan children and on behalf of an indignant public. We have had too much experience of inquiries conducted by the layman. Very recently we saw something like a farce under cover of the Public Service Board, when there was no counsel to shape and to curtail evidence. Indeed we have had the privilege of facing an examination before the Board of Health in Sydney, and were not impressed with the method of that august body's procedure. Certainly we would place the experience of our Police Magistrate with our Sub-inspector of Police far before the very formal, cold procedure of the Board referred to. We are sure the hospital authorities would have no objection to substituting the names of our two highest and most responsible local Civil Servants, whose procedure would be

\* Prisoner was serving these sentences when convicted at Parramatta Quarter Sessions.

in accordance with the practice of a Court of Justice. This is all we ask; but we shall press the point to have the right to fee a solicitor to uphold our contention. We are not levelling a general charge against the hospital. There may be overwhelming evidence of general goodness. But in this case the points we want cleared up are: How long before the discharge of Mrs. Beattie was she seen by the medical officer? And most important of all: Was Mrs. Beattie in a fit state to leave the hospital at the time she was discharged?

This is the serious feature of the whole business, to our mind—not what the old man, Trafford, said to the matron, or what the matron said to Trafford. As for what might have transpired between the sick woman and the nurse, we are not going to take sides. The woman is silent for ever, and nothing short of a resurrection will clear up this point. The old man, Trafford, is dubbed from the outset a hoary-headed old fabricator; still it is possible he has been repeating no more than his stepdaughter told him when no one else was present to hear.—which is quite a reasonable conclusion that a patient in the hospital will tell a visiting relative, one's stepfather, all his or her grievances, real and imaginary. In connection with our case we do not for one moment intend blending Trafford's statements with the two questions set up above. We do not say for one moment that Trafford is a vile old perjurer, as some put it, because he is corroborated by the girl Ada Sparrow in one particular, and where he might have been supported or contradicted by the members of the Committee whom he saw, we have not yet had opportunity of hearing the gentlemen examined. Of course, in the event of a new inquiry, these gentlemen must be heard; and we would impress on them at this stage that they have to bear testimony for or against the dead, and now, whilst everything is fresh to their mind, to make note of every word Trafford said to them, and what they said to him, and as to the state of the woman when they saw her. This is the time for each of the gentlemen referred to to use pencil and paper. In a month's time memory might fail them. Of course, these gentlemen are not to blame. They could not know that the woman was likely to die. No doubt any one of them would have heeded the appeal of Trafford; but the patient was out of the hospital, and she was discharged by the doctor's order, and according to the rules of the institution there is but one doctor, and for the time being he must be the one controlling cockbird of the roost. Why, some ask, is the *Guardian* so much concerned that it takes this stubborn stand? Simply because we are aiming for future reform in hospital matters, and because that unfortunate creature died a death of torture, and that that death might have been averted. We are not hankering after popularity, but are prompted by that feeling which makes us picture some other mother, some other wife, someone's daughter in poverty, amongst strangers, thrust out of an institution to die within a few hours; and Mrs. Beattie was thrust out—no one can say to the contrary. She had to go, when, it is said, she was not fit to go. True, she was only a pauper; but she was a mother. She had little children at home in the bark humpy—little children that she probably loved as dearly as any mother who reads this loved her offspring. What more natural than that the unfortunate creature, six weeks before her expected confinement, would prefer to go home to the bark humpy to see those little children from whom she had been separated for three weeks—aye, chose to go to her children, to go out in a spring-cart, in the agony of what was her travail, perhaps bent on seeing her little ones. Because if she was fit to leave the hospital she was fit to be at home, even though the put-up cry of "Why didn't she go to Mrs. Salsbury" is the weakly, miserable wail of those who would not care if the woman did die like a dog, so long as somebody we are not now able to name is not made to bear the burden of woman-slaughter. Supposing, for argument sake, that there had been no Mrs. Salsbury's to be a kind of reception-house, according to the hospital authorities the woman was cured of her complaint, and she had to go. If she was not taken away she would be sent away. This view is not *Guardian* fiction either. We might say a great deal, but will not, and merely say this much now to justify ourselves in the position we have taken. If the woman had suicided after she left the hospital the case would be bad enough; but she died by inches—actually bled to death; died sooner than had she opened a main artery. And men stand up to hush up the horror. Some of them look askance at us because we, too, will not hush the thing. "Leave it where the Coroner's jury left it," says one who ought to know better. No, no; though the victim was an obscure creature of God, she had a soul as big, probably, as the soul of any ministering angel on earth, male or female. As we said last week, the Coroner's jury stopped short, and now we want more. We must hear new testimony; we must have former witnesses over again, and cross-examined. Then, and not till then, will the proper verdict be wrung out; then, too, will our detractors now join with the thousands of others throughout the north-west district in the praises of our humble, yet earnest, effort to expose a wrong done to a fellow-being gone from all earthly aid. Let the hospital committeeman who wants to "hush it up" picture his own wife, the mother of his sons and daughters, dying under such circumstances, and probably he would not be as calm as was the husband of the deceased woman in the most trying time—whilst the *post-mortem* examination was being carried out. Let anyone ask Constable Dolman, who was present. The constable had almost to drive off the big, weeping husband, who was with difficulty restrained from bursting in upon the scene. "They're cutting up my poor wife," said the frantic man. Hush it up, they say! Not if we know it—not until the inquiry we must have is an accomplished fact, and things not yet recorded are recorded. If we fail, then at all events we shall at least have the consolation of knowing that we have manfully and fearlessly done our duty to the community, and towards that poor, destitute, obscure woman.

#### HOSPITAL COMMITTEE MEETING.

THE Ven. Archdeacon Campbell was voted to the chair at the special meeting of the Hospital Committee on Tuesday evening, and there were also present the Revs. R. H. Rickard and C. W. Willis, and Messrs. E. H. Deane, J. C. Gunnell, W. Sherry, D. Cassin, O. E. Norris, C. H. Tuckerman, W. C. Carter, Geo. Stewart, F. J. Bird, W. A. Marsh, Geo. Cadell, H. S. Thomas, W. F. Kellett, W. Little, W. Shaw, and W. Bishop.

The first business taken was the letter from Dr. Lester with reference to a patient named Horne, which had been referred to Dr. Nickoll for a reply. Dr. Lester's letter was read as follows:—

"To Mudgee Hospital Committee.

Gentlemen,

Mudgee, 30 June, 1897.

On the 14th June I was consulted by a patient of mine named Horne. An operation was necessary, and as he could not afford a private operation he said he would have to go to the hospital. I explained to him that the case would be taken out of my hands, but I would write to Dr. Nickoll and ask him to let me know when he intended to operate, as Horne wished me to be with him and administer the chloroform. Dr. Nickoll has not yet replied to my letter, although he told my groom that "he would answer my letter in the morning."

I wish to know, in the event of any patients of mine wishing hospital treatment, can I (or otherwise) attend them? I attach a copy of my letter written to Dr. Nickoll.

I am, &c.,

CHAS. E. LESTER.

[COPY.]

To Dr. Nickoll.

Dear Sir,

A patient of mine, named Horne, from Havelah, intends going into the hospital. He wishes me to give chloroform. Acting on the advice of one of the visiting committee I am writing to you. Will you please let me know when you intend to operate.

Yours, &c.,

CHAS. E. LESTER.

Dr. Nickoll's letter was as follows:—

"Gentlemen,

Mudgee, 13 July, 1897.

"I beg to acknowledge the receipt of your letter dated July 7, enclosing a letter from Dr. Lester, and asking me for an explanation.

"On June 14th I received a message to see a man named Horne staying at Mr. W. Campbell's house. On seeing him I found that an operation would be necessary, and when I told him so he said that he had no means, and would like to be taken into the hospital. I told him to get a ticket, and that he would be admitted.

"The following day Dr. Lester's groom met me in Mortimer-street and gave me the enclosed letter. I read it at the time and said that I would reply to it the next day, as I was then going some distance out of town. Up to this time I was unaware that Dr. Lester had seen the case. I saw Horne shortly after this, and in the presence of Mr. W. Campbell I told him that I had received a letter from Dr. Lester, and asked him if it was a fact that he wished Dr. Lester to give him chloroform. He replied that he did not wish it. I then asked him whether he had expressed any desire at all for Dr. Lester either to give him chloroform or be present at the operation. He replied that he had not done so, but that Dr. Lester had suggested it to him.

"As

"As these facts put such a very different complexion on Dr. Lester's letter, I thought it would save more unpleasantness by leaving it unanswered.

"I return Dr. Lester's letter, also the one sent to me, and a statutory declaration made by Horne."

Accompanying this was a statutory declaration from the man Horne:—

"I, William Horne, of Bara Creek, miner, do hereby declare and solemnly affirm that—

"1. I am at present a patient in the Mudgee Hospital.

"2. On Monday, June 14 last, I came to Mudgee and went to see Dr. Lester. He told me an operation would be necessary, and what his charge would be for same, and I was to think over it before deciding what I would do. On thinking it over I decided to go into the hospital, and I went to Dr. Nickoll to come and see me at Mr. W. Campbell's. On Monday afternoon (before Dr. Nickoll came) Dr. Lester came to Mr. Campbell's, and I then told him that I had decided to consult Dr. Nickoll, and that I had sent for him to come and see me, and that I meant to go into the hospital for treatment. Dr. Lester then asked me if I would ask Dr. Nickoll to let him (Dr. Lester) administer the chloroform to me, and I said I would.

"3. That same evening Dr. Nickoll came to see me at Mr. Campbell's. I did not tell Dr. Nickoll that I had previously been to Dr. Lester. I did not mention Dr. Lester's name to him at all, nor speak to him about the chloroform. Dr. Nickoll examined me, and it was arranged I should go into the hospital and be operated on.

"4. On the next day Dr. Nickoll came to me at Campbell's as to a letter he had received from Dr. Lester. He asked me whether I had expressed any wish for Dr. Lester to administer chloroform to me. I told him I had not, but that Dr. Lester had asked me if I would ask Dr. Nickoll that he (Dr. Lester) might administer chloroform to me, and that I said I would ask. Dr. Nickoll then said that Dr. Beith was in the habit of administering chloroform at the hospital, and I then said I did not care which doctor administered it. A day or two after this Mr. Sherry spoke to me on the same subject, and I told him the same as I had told Dr. Nickoll.

"5. I did not at the time I first consulted Dr. Nickoll, nor at any time afterwards, express any desire for Dr. Lester to give me chloroform, as I did not consider myself a patient of Dr. Lester's, and I did not care who administered the chloroform to me."

The declaration was signed by Horne, before Mr. William Bishop, J.P.

Mr. Cassin said he did not see that they could do anything beyond intimating to Dr. Lester the contents of the declaration. He proposed, "That a letter be written Dr. Lester, stating that a declaration had been made contradicting his statements."

Mr. C. H. Tuckerman seconded.

Mr. O. E. Norris thought they were not going far enough. With reference to this particular matter the motion would answer the case; but Dr. Lester asked if any patient admitted desired him to give chloroform whether he would be permitted to administer it. There ought to be a direct answer of yes or no to this question.

Mr. Cassin thought that in view of the correspondence read, it would be very unwise to force Dr. Lester into the hospital. If they trusted their medical officer they should allow him to elect with whom he would practice.

Mr. Norris said Dr. Lester might write again unless they gave him a direct answer. The Committee should say that Dr. Nickoll was authorised to select his own medical assistant.

The Chairman thought it was usual among professional men to do this.

Mr. Cassin moved, "That under the circumstances the Committee did not think it desirable to interfere with Dr. Nickoll's desire in this matter." It would be unwise to force his hand.

The Rev. R. H. Rickard said it would be better to deal with the first motion, and then deal with the second part of the matter. He moved as an amendment, "That a copy of the declaration be sent to Dr. Lester."

Mr. E. Clarke seconded.

Amendment carried.

The Rev. R. H. Rickard submitted the following motion:—"That if any patient in the Mudgee Hospital desire the attention of any medical man other than the medical officer of the institution, he shall be allowed to call him in, but this committee will not be answerable for any financial responsibility for such attention, and such medical man shall not interfere in any way with other patients." In moving this he said: Everyone knows that if a man has a doctor who understands him he prefers that man to deal with him; and every medical man will admit that he can better deal with a case known to him than with a new case. Another point was that it would be a great gain to the hospital if this motion was carried, for patients of other doctors might wish to occupy the private wards. A patient of Dr. Beith's had told him some time ago that had he been able to have his own medical man he would have become an inmate of a private ward for seven or eight weeks; and, no doubt, there were other similar cases. This would be a gain to the hospital. Since they could, by adopting this, grant a convenience to the public, the public would justify them rather than condemn the committee.

Mr. W. C. Carter seconded the motion.

Mr. Caddell submitted that the motion should be ruled out of order. This matter should come before the general meeting of subscribers.

Mr. Cassin said that this was a matter Mr. Rickard did not understand. This matter had been submitted to the largest meeting of subscribers ever held in Mudgee, and was lost by two to one. The object then was to admit the three doctors to show the spirit of those introducing it, immediately it was lost they nominated Dr. Beith as medical officer, and this was defeated by five to one. He objected to divided responsibility. The medical officer must be responsible to the committee.

Mr. Clarke rose to a point of order, and asked for the Chairman's ruling.

The Chairman said he must rule it out of order.

Mr. Rickard asked for the reason for doing so.

The Chairman said he thought it was so important that the subscribers should have notice of it, and the committee should not be placed in a position of such responsibility.

Mr. Rickard said it was a matter of law, not an opinion. They had an amending Act since the meeting referred to, and that placed the whole responsibility on the committee, not the subscribers. This matter was not before the meeting spoken of.

Mr. Cassin said if this was carried every rule would have to be altered.

The Chairman said the rule said the committee should appoint a "medical officer."

Mr. Norris said there was an Act which stated that where necessary the singular should be read to mean the plural number.

Mr. Rickard:—

The Chairman: I must rule the motion out of order.

Mr. Rickard: With all due respect, Mr. Chairman, I submit—

Mr. Cassin: I think the chair should be supported. He objected to Mr. Rickard's contradicting the Chairman.

Mr. Rickard (in protest): We are getting an opinion, not a ruling.

Mr. Norris said Dr. Lester was due the courtesy of a reply, as he asked a plain question.

Mr. Caddell moved, "That Dr. Lester be written to, stating that the committee could not interfere with the medical officer's arrangements."

Mr. Cassin seconded. Carried.

#### • PATIENT BENSON'S CASE.

The following letter was read from Dr. Nickoll relative to the patient Benson:—"This case was not admitted on account of his paralysis, but to try and modify, if not cure, a terrible lesion of large area, and extending down to the bones of his pelvis. His condition requires constant attention, and if he be removed from the hospital it should be to an institution for incurables. I have on more than one occasion discussed this case with members of the committee."

The Chairman said the question arose whether they should not take action to send Benson to Sydney, but he should have some say in it himself.

Mr. Clarke said that perhaps his friends would pay for his keep in the hospital rather than have him sent away. He moved that the secretary inquire.

Mr. Norris seconded. Carried.

#### THE CASE OF MRS. BEATTIE.

The secretary read the letters written and received with reference to the depositions of the recent inquest, and stated that so far the copy asked for had not reached him. Mr.

Mr. Cassin said that before going further he would like to submit a resolution that he thought would meet the case. It was:—"That having regard to the charges made against the doctor and matron of the Mudgee Hospital with reference to the death of Mrs. Beattie, and with a view of an impartial inquiry into the matter, freed from any suspicion of local feeling or prejudice, the secretary of the hospital communicate with the Chief Under Secretary, with a request from the committee of the Mudgee Hospital that the Chief Under Secretary will be pleased to direct the Board of Health to inquire fully into and report upon the subject matter of the said charges at an early date." It was exceedingly desirable that an impartial and qualified officer should be sent here to conduct an inquiry. The present state of public feeling was very injurious to the best interests of the hospital. If the committee would pass this resolution he was sure the trustees would do what they could to help in the matter.

The Chairman thought the officer should be sent at an early date. He was convinced they could do nothing without the depositions, as the newspaper reports did not agree in one instance. There was something in the *Guardian* that was not in the other paper as evidence of Miss McEwen. They all had the interests of the institution at heart, and came there to do the best for the hospital, not as partisans. They wanted to clear the matter up. He suggested that the Committee do not consider the letters of Mrs. Salisbury and Trafford.

Mr. Clarke seconded the motion. A great deal of feeling existed in the district, and as the matter was one out of the ordinary run of Committee work, and no matter what decision they came to, insinuations would be cast which he did not think should be cast on men who came there to assist in the management of the hospital, an inquiry by the Committee might be the means of causing unpleasantness among them. The best thing would be to get a person to investigate, who was in no way interested.

Mr. Little, who had come prepared with a resolution, read it for the information of the meeting, and was proceeding to speak, when

Rev. Mr. Willis rose to a point of order. Were they going to decide in the matter, or relegate it to someone else?

The Chairman ruled Mr. Little out of order. He would like Mr. Little, however, to bring his proposed new rule before the Committee later on, as it was a very admirable one.

Mr. Carter asked whether if the inquiry were held, the evidence would be published, as well as the report by the officer investigating. The evidence should be published as well as the result, as it would tend to do away with the ill-feeling now existing.

The resolution submitted by Mr. Cassin was carried.

It was resolved that letters, &c., in the case be withheld from the Press.

An anonymous letter was opened but cast aside.

It was resolved that as soon as word was received of the appointment of an official to conduct the inquiry that the Committee be called together to arrange for meeting him.

The meeting then adjourned.

#### Exhibit K.

[*The Mudgee Guardian*, 30 July, 1897.]

#### THE HOSPITAL CASE.—AN INQUIRY TO BE HELD.

At last we are in a position to definitely indicate that our representations to the Government in connection with the hospital case are likely to be adopted, as the following information by telegraph from the Press Association will show:—

"Sydney, Thursday.  
"The Member for Mudgee saw the Chief Secretary, Mr. Brunker, with Dr. Ashburton Thompson, re the death of the woman Mrs. Beattie. The depositions taken at the coroner's inquest only reached the Board of Health last evening. A decision will be arrived at to-day as to proposed further inquiry. Dr. Thompson thinks with Mr. Brunker that the inquiry should be held by a police magistrate, assisted by himself as Chief Medical Officer of the Government, and such inquiry is likely to take place next week. Mr. Jones has urged prompt action. The authorities here look on it as a very serious case, and think an inquiry, stripped of all local considerations should be held."

It will thus be seen we have not been shirking our duty in this very painful affair. We have impeached the hospital administration, whether rightly or wrongly will be seen when the proposed inquiry is over. It is to be hoped the proceedings will be as free and open as it is possible to have them. We ask no more than the commonest case is granted in a Court of Justice. Every latitude must be given for the free and fullest examination of every person sworn. Thus far have we carried out our duty in this wretched affair. With a police magistrate presiding and the Chief Government Medical Officer of the Colony hearing the medical testimony, no more competent tribunal could be chosen to elicit and sift the intricacies that we hope to see unravelled, and set at rest for ever. It would be still better with our Sub-inspector of Police to assist. As we said in a previous article, we cannot bring that poor woman back to life, but we can prevent similar occurrences in future. No other poor forlorn "nobody" will be liable to similar fate; and those who enter the hospital will know that in the *Guardian* they have a watchman who will see that the institution is run for humanity's sake; who will see that the life of the poor stranger within our gates is as valuable as that of our own flesh and blood. Having said this much, let us now leave it for a scrutinising, anxious public to be the judges, when they have heard all.

#### Exhibit L.

[*The Mudgee Guardian*, 17 September, 1897.]

#### THE HOSPITAL MATTER.

SOME people are still to be found in our midst who say we have done the hospital harm by obtaining from the Government the appointment of the Commissioner to sit at the Court-house to further investigate the case of the unfortunate woman, Mrs. Beattie—*dead!* Only this week a Committee-man of the hospital, in his puerile impotency, told us so much. To us it is at least gratifying that our task has so far succeeded, and if all Mudgee raved at us, instead of a paltry handful doing so, we would still stand up and assert that the Coroner's inquiry stopped short, that there was other evidence which should have been forthcoming. We have never yet directly impeached anyone. We simply said there were grounds for further inquiry; we said also "that we could still build up a very strong case from fragments not on the depositions taken at the Coroner's inquiry," and next week we intend having these fragments adduced. We have not been idle all the time, and have succeeded in finding a deal of corroborative evidence to justify us in the stand we have taken. We are going to have the doctors under cross-examination. They are to be asked questions that were unasked by the Coroner, the police, or the jury. Archdeacon Campbell, Mr. Bird, and Mr. Stewart are to be asked to come forward and say what they saw. Knowing all this, "we ought to be silent;" this creature of the Committee comes forward, and tells us we "are doing the hospital an injury." It is the soulless, cringing apologist for a daylight wrong who has been doing the hospital injury. Our object is for the benefit of the poor, forlorn nobody—if they like to be looked at in that way—who has no place to die, if his or her time has come. Then, let them die in the institution, once they are there. But don't hunt them out—don't despise them because they have been unkeapt and poverty-stricken and friendless. And those who know anything of the *pauper* inmate (we must use the word *pauper*, because the hospital adopts it) know that the majority are poor and friendless. Mary Beattie was one of them. And as we have said previously, the living picture of that poor creature, almost crouching in the cart in front of the public-house door, where she was given stimulants to sustain her, haunts us still. Her piercing glance of agony, as we rode past, still fixes upon us as though from her grave, and which glance of agony wrung from us since the day of the inquest our determination to sift and sift the case to the bottom. So far we have scored all along the line—we checked the influence that seemed to have made the Board of Health tell the Colonial Secretary there was no case for further inquiry. A little later on we will get this Board's report, and show what kind of creatures are associated with that august body. But even there the influence did not stop. Bless you, they wanted further inquiry to be conducted by a medical man; yes, indeed, even that was resorted to, but people will talk, and we heard what was going on, and again we put the brake on. We want a fair and square inquiry, a full inquiry, and this will be the result of next week's proceedings, we believe. Mr. Love, who will conduct the case, is a Police Magistrate of experience, and just as he has disposed of big Police Court cases he will treat this hospital matter, only with greater latitude, and whatever the report of the Commissioner, free from professional or personal sympathies with anyone concerned, we will be satisfied. Then our duty in the unpleasant matter can end—our part as citizens of the community will be discharged—and as journalists who have always been to the front when gross wrong required exposure, we will have done all in our power, regardless of personal expense and frowns and misrepresentation, concerning which we shall say nothing at present.

Exhibit

## Exhibit A 1.

Sir, Office of the Chief Medical Officer, Sydney, 22 July, 1897.  
I am directed by the Chief Medical Officer to ask that you will have the goodness to let me have on loan the depositions taken at the inquest held on the body of Mary Beattie, at Mudgee, in the early part of the present month.

I have &amp;c.,

C. A. SIMMS,

Secretary.

The Under Secretary for Justice, Sydney.

The depositions above referred to are forwarded herewith as requested.—G.M., B.C., 24/7/97. The Chief Medical Officer.

Re Inquest, body of Mrs. Beattie, near Mudgee.

Sir,

Mudgee Hospital, Mudgee, 8 July, 1897.

At a meeting of the Committee of the abovenamed institution held on the 6th instant, a resolution was passed directing me to apply for a copy of depositions taken at the inquest above referred to. Application has been made to the Coroner, Mr. W. J. E. Wotton, who states that all the inquest papers have been sent to your Department. I therefore beg to apply for a copy thereof. The Committee of Mudgee Hospital purpose making a searching inquiry into the death of this woman, and to aid them in so doing a copy of the inquest papers is asked. A special meeting of the Committee is called for Tuesday next, 13th instant, at 7.30 p.m.; will you therefore be good enough to let me have the copy on or before that date.

I am, &amp;c.,

JOSEPH M. COX,

Secretary.

The Department of Justice, Sydney.

Submitted. As the depositions are required by the Committee of the hospital with a view to further inquiry, they might perhaps be supplied free of cost.—G.M., 9/7/97. Appd.—A.J.G., 9/7/97. Sec. Mudgee Hospital, 24/7/97. Put by, 24/7/97.

## MINUTE.

Subject:—Mary Beattie—Inquest re death of.

Department of Justice, Sydney, 9 July, 1897.

Submitted. A copy of the verdict and rider of the jury at inquest touching the death of one Mary Beattie might be forwarded to the hospital authorities at Mudgee.

G.M.

New South Wales, }  
to wit.

" Re Mary Beattie."

INQUIRY held at the dwelling-house of William Trafford, at Pipeclay, in the district of Mudgee, in the Colony of New South Wales, this 3rd day of July, 1897, before me, William J. E. Wotton, one of the Coroners of our Sovereign Lady the Queen for the Colony aforesaid, on view of the body of Mary Beattie, then and near there lying dead.

Upon the oaths of George Douglas Young, William Albert Marsh, Frederick William Smith, Henry Strickland Thomas, William James McDiarmid, John Loneragan, Eugene William Daly, Thomas Robert Randall, John Olly Mulley, George Hazeltine, William Frederick Kellett, George William Kenniwell, good and lawful men of the Colony aforesaid; who, having been sworn and charged to inquire (on the part of our said Lady the Queen) when, where, how, and by what means the said Mary Beattie came to her death, do, upon their oaths, say that:—We find that the said Mary Beattie, at Pipeclay, near Mudgee, in the said Colony, on the 1st day of July, 1897, died from collapse due to hæmorrhage attending premature labour, which was brought about by getting into and journeying in a spring cart a distance of about 6 miles upon the same day, and which journey was undertaken a short time after recovering from an attack of diarrhœa.

Rider:—"We suggest that it would be to the interests of all concerned for patients, especially in the condition of the deceased, to be thoroughly examined immediately prior to their discharge from the hospital."

In witness whereof, as well, the said Coroner as the Jurors aforesaid, have to this inquisition set their hands and seals, this day and year aforesaid.

WILLIAM J. E. WOTTON, Coroner,

Jurors.

NEW SOUTH WALES, }

" Re Mary Beattie."

INFORMATION and depositions of witnesses, taken on oath, before me, William J. E. Wotton, one of the coroners of our Sovereign Lady the Queen, for the Colony of New South Wales, this 3rd day of July, 1897, at the dwelling-house of William Trafford, at Pipeclay, in the said Colony, on view of the body of Mary Beattie, then and there lying dead.

Witnesses having been sworn:—

Frederick William Dolman sworn, states: I am police constable stationed at Mudgee; from information I received I reported the death of Mary Beattie to the Coroner yesterday morning, and from his instructions I proceeded to the Mudgee Hospital; I saw Dr. Nickoll first, and afterwards saw the matron; I asked her when Mary Beattie was discharged from the hospital; she said, "She left the hospital on the 1st instant at 1 p.m., where she had been for a fortnight"; I afterwards went to Pipeclay, about 5 miles from Mudgee, to the residence of William Beattie, the husband of the deceased, and there saw the body of Mary Beattie; I knew her personally; I examined the body, and found no external marks of violence on it; William Beattie, the husband, stated that she arrived home from Mudgee on the 1st instant, about 4 o'clock p.m., and that he accompanied her and William Trafford, her father, from Mudgee, and that she died about 9 o'clock p.m.; they came from Mudgee in a spring-cart.

Examined by Jury: I asked the matron whether she was willing to leave the hospital, and she said "yes."

Sworn and made at Pipeclay, on this 3rd day of }  
July, 1897, before me,—

F. W. DOLMAN.

WILLIAM J. E. WOTTON, P.M., Coroner.

William Trafford, sworn, states: I am a labourer, and reside at Pipeclay; I have seen the dead body of Mary Beattie; she was the wife of William Beattie, and my stepdaughter; I took the deceased to the Mudgee Hospital, on the 18th June last, she was suffering from diarrhœa; I saw her again on the 1st instant; I went to the hospital for her in consequence of receiving the letter "marked H." purporting to be signed by E. McEwen, matron; when I arrived I saw the matron, and told her that on account of receiving her note I had come for Mrs. Beattie; I waited awhile, and Mrs. Beattie came walking downstairs without help; I went towards her as she seemed as if she was going to drop; she was very weak and quite exhausted; I had a lot of bother to get her into the cart; when she put her foot on the step I noticed something came down on to my hand, and saw it was a drop of blood; when I got in the cart she said, "Oh, father, I am dying, and you will not get me home"; she said, "Dr. Nickoll and the matron have killed me"; I said, "Do not talk like that—my wife will

will be home in a few days and she will get you all right"; I, noticing she was very ill, took her to Mr. Bird, the store-keeper, being one of the hospital committee; when I was leaving the hospital the matron stood at the door, jeering; I said, "You ought to be ashamed of yourself turning a woman out of the hospital in this state"; she said something about "bundling the woman out," but I could not catch the whole of it; the matron did not hear the deceased say she was dying; I did not say to the matron before I got her in the cart that she was not in a fit state to leave the hospital; eight days after I had taken deceased to the hospital I went to see her; before I went upstairs the matron said, "You will have to take that woman out of this as she is cured of what she came in for"; I went and saw the deceased and asked her how she was; she said, "Oh, father, I am very bad, pains all over my back and sides, and something wrong with my chest"; I said, "Why do you not tell the doctor about it"; she said, "I have told the doctor, but he takes no notice of what I say, he has never sounded me or examined me in any way"; she said, "He comes in but very seldom and just walks away whistling"; when I came downstairs I saw the matron; I said, "Do you really think that woman would be fit to come out on Monday or Tuesday, she seems so weak and cannot stand, she cannot go on Monday or Tuesday, and I will not take her out"; she said to the effect that if I did not take her out she would be bundled out, and then walked away; I did not hear any conversation between deceased and the matron when she was leaving; after leaving the hospital I took her first to Mr. Bird, as stated, and then to Archdeacon Campbell; they said they could not interfere with the doctor, but as she was destitute they said, "I had better hand her over to the police, and she could be put into the gaol"; I said I "could not think of her going into prison"; Mr. Stewart was with the Archdeacon; these two advised me to hand her over to the police; I said, "Look at the woman? what do you think of her?" the Archdeacon and Mrs. Stewart said, "She looks very bad"; I said, "I will take her home at the doctor's risk"; the Archdeacon gave us some assistance in the shape of food, and I started for home; I picked deceased's husband up in the town, and the three of us came out together in the cart; nothing happened to the deceased on the road other than that she was complaining of great pain, and she was passing blood; I took the cart at a slow pace; there was no extra jolting; I went very carefully; when I left her at her husband's place, about three-quarters of a mile from here, I shook hands with her, and bid her good-night, and came home; I did not see the deceased alive after that; I heard of her death about 9 p.m. of the 1st instant; two of her sons came and said she was dying or was dead; I went up to the place at once and found that she was dead; the family were present, and her husband was closing her eyes; I went in the same night to Mudgee, and reported the matter to the police; deceased told me she could not get a drink from the matron, but that the woman that was in the ward with her used to give her drinks; she said the matron pulled the clothes off her while she was in bed, and made her go on her hands and knees to the "stool," and used to call her bad names, and say the sooner she was out of this the better; she says she asked the matron for a drop of warm milk; she said in answer, "You will get no warm milk here—cold milk is good enough for you"; she says she told the matron she thought a warm bath would do her good; she says that the matron said, "You will get no warm bath here; go home and get a warm bath"; the pains she complained of in the cart were similar to the ones she complained of in the hospital; I do not remember her saying anything about labour pains; the deceased was in bed at the time she was complaining of pains; when I saw her in the hospital deceased said she had these pains constantly.

*Examined by Jury:* When I took her to Mr. Bird he said, "I cannot interfere"; I said, "You are one of the Committee, and why cannot you interfere"; Mrs. Beattie was in a proper state of mind, so far as I could judge, when she made these statements; there was no one about to help me to lift her in the cart; the matron cleared out at once; I did not ask for any assistance, as there was no one to ask.

Sworn and made at Pipeclay, on this 3rd day }  
of July, 1897, before me,—

WILLIAM TRAFFORD.

WILLIAM J. E. WORTON, P.M., Coroner.

*William Beattie*, sworn, states: I am a miner, living at Pipeclay; the dead body in my house is that of my late wife, Mary Beattie; she was born in Sydney, and was 35 or 36 years of age; her maiden name was Brewer; I married her in 1881, and she leaves six children; I have been away from home the last time for six weeks; I did not see her during that time; I returned to Mudgee on 30th June, and ascertained my wife was in the hospital, and I went in to the hospital on the 1st instant, to see how she was getting on, and saw her in Mudgee in a spring-cart with her step-father; I said she looked very bad, and she said, "I am bad and worse than when I went into the hospital"; I asked her how she got on in the hospital; she said she was there a day and a half before she saw the doctor, and that he never examined or sounded her, merely gave her medicine; she said she asked for warm milk and could not get it, nor warm tea, and that the matron said she was not there to be dictated to by her patients, and that she would have to take what she could get; there was another woman she said in the hospital who was sick, and that if she had not given her drinks, she would have died; she said that when she wanted the chamber or the closet, the matron made her go on her hands and knees to it; she said, "I am turned out of the hospital, and I am dying, and I do not know what you will do with the youngsters, they will be starving for the want of food"; she said she had had diarrhoea, and was suffering from it, and was only able to get up for one day; that she was in the hospital, and that was Sunday; she said she had pains in the stomach and in the sides and back; I accompanied her and Trafford in the cart home; I had to support her, she was so helpless; when I got to the slip-pannel about 30 yards from my house, she could not walk, and I had to carry her to the house and sit her down on a box; she wanted some warm tea which I gave her; and she said she could not sit up any longer, so I put her in the bed; that was about three quarters of an hour after I came home; she had another drink of tea, and wanted the chamber; she passed blood and she could not get up; I had to lift her and put her back into the bed; she was in pain all the time; she often asked for drink; the last time she was on the chamber she did not get up; I was baking some cakes for the children, and I did not hear her breathing; I went to her and saw she was leaning forward; I said to the boys "Your mother is dying, go and tell Trafford," and I knew she was then dead; she died quietly without a struggle; she told me a few minutes before she died, about five minutes, that all the pains had left her; my family and myself are perfectly destitute; I have been sick for nearly twelve months past; and if it was not for what the Archdeacon gave us we should be starving; and I am not in a position to provide for the burial of my wife; I have not a shilling in the world; the ages of the children range from 4 years to 14 years.

*Examined by Jury:* I think I met my wife with Trafford in the cart about 3 o'clock; I think she died about 9 p.m.; I did not notice any blood coming from her in the cart.

Sworn and made on the 3rd day of July, 1897, {  
before me.—

WILLIAM BEATTIE.

WILLIAM J. E. WORTON, P.M., Coroner.

*Harvey Nicholl*, sworn, states:—I am a legally qualified medical practitioner, residing at Mudgee, and medical attendant to the hospital; I have seen the dead body of Mary Beattie; she was a patient at the hospital from the 18th June last up to the 1st July, when she was discharged from the hospital; when she was admitted she was suffering from diarrhoea; she was brought in by a woman who was engaged to attend her during her confinement, which, upon inquiry, I found was not due until August; the diarrhoea left her in four days, or about that time; it might be five, and she remained in bed until the seventh day from her admission; it was on the afternoon of the eighth day that she was allowed to get up, and lie on a couch near the fire; after that time she got up every morning by herself, and spent the day generally in the verandah; the last day I saw her was last Wednesday; she had just finished her mid-day meal, and was walking about the verandah; she made two complaints to me about her treatment; one was that she was not allowed to have tea, and she was not allowed meat for her tea; that was according to my own instructions, given to the matron personally; I think she had tea about the seventh or eighth day, as much as she liked, but she was not given meat; in addition to the diarrhoea, she had a mitral murmur at the heart, and it was very slight and scarcely perceptible; she was eight months advanced in her pregnancy, and the occasional pains she suffered from in her abdomen and across the loins, I certainly considered was due to her condition; she was treated as to medicine and diet the same as others suffering from similar complaints; deceased complained to me about the pains, and stated they were occasional, not constant; I examined the murmur at the heart by examination; I examined her on more than one occasion; I should think it most probable the first time on the day she came in, that, in the usual practice, I saw her in the afternoon; she came about 3 o'clock, or a little later; I ordered her discharge a few days before she went out; I should think about the 28th June; I considered her at that time, and at the time she did leave, in a fit state to leave the institution, more especially as I had promised the Benevolent Association to look after her during her confinement; the letter produced was written on my authority; neither the matron or the deceased intimated to me that the deceased was not in a fit state to be discharged; after the deceased had

had been told of her discharge she had plenty of opportunities of telling me that she was not in a fit state to leave, but she did not do so; I have not examined the body since death; I cannot give any idea as to the cause of death; when I first heard of it, I thought it was premature confinement.

Sworn and made at Pipeclay, on this 3rd day }  
of July, 1897, before me, — }  
WILLIAM J. E. WOTTON, P.M., Coroner.

HARVEY NICKOLL.

*Ethel McEwen*, sworn, states:—I am the matron of the Mudgee Hospital; I have seen the dead body of Mary Beattie, and that is the same Mary Beattie who was a patient under my care in the hospital; she was admitted on the 18th June; she was suffering from diarrhoea; she was seen by Dr. Nickoll in about two and a half hours after admission; he then provided her with medicines; he told me she had to be kept in bed, certain medicines and diet to be given, and these instructions were carried out by me; she remained in bed until the eighth day, when she was allowed up to lie on the couch in front of the fire; she complained of pains coming on spasmodically when she first got up; she complained for the first two days after she got up of occasional pains; she did not complain the day she was discharged; I think it was the 29th June she last complained of the pains; I told Trafford on the 26th June, that she would be ready to go out the beginning of the week; Trafford said he would not take her out, but would go and see the doctor; I said, "Do so"; he said he would not take her out, because there was not a crust of bread to eat out there; Trafford did not say she was ill, but began abusing me, so I went away and left him; I did not at any time refuse to supply her with drink; excepting tea which the doctor prohibited; I gave milk instead, she had warm milk; I did not pull the clothes off her and compel her to go to the chamber on her hands and knees; I often complained to her about her getting up when she was told not to; the latter part of the time she was in the hospital, she seemed well; she was able to get up and walk on the verandah; she was weak; she was better and able to carry the lounge from one balcony to the other to avoid the sun; I did not treat her differently from what I treated other female patients; I did not tell her at any time that "she would have to leave the hospital and that that was no place for her"; the deceased walked down stairs by herself, and I took her to the door and left her at the time Trafford came to take her away; that I did not want to give him another opportunity of abusing me; as far as I could judge deceased was in good health when she left the hospital; I know the state she was in (pregnancy); she did not tell me she was not sufficiently well to go, and did not make any objection to leaving.

Sworn and made at Pipeclay on this 3rd day }  
of July, 1897, before me, — }  
WILLIAM J. E. WOTTON, P.M., Coroner.

ETHEL McEWEN.

*Ada Sparrow*, sworn, states:—I am a domestic servant and reside at Mudgee; I have seen the dead body of Mary Beattie to-day; she was in the hospital the same time that I was there; we were both in the same ward; I was there the day she was discharged; she said she had a pain in her back; she did not care to eat anything; she got all she wanted; but all she would take was water; she said the day she was leaving that she was "not in a fit state to go, and had told her father so"; I cannot say whether anybody else heard her say this but me; I never saw the bed-clothes pulled off her, and made go to the chamber on her hands and knees; I never heard the matron say that she would have to be "bundled out of that;" or that the hospital was not a fit place for her; I never heard the matron refuse her anything; anything she asked for she got; she never made any complaint to me about being badly treated; I had opportunities of speaking to her constantly, and she made no complaint; Dr. Nickoll visited her in his ordinary rounds as well as the other patients; she did not say the doctor was not treating her properly, nor of being neglected by him; I have given the deceased water; the matron never refused to give her anything; I did not see any examination; she was in the hospital before I went in; I cannot say what happened before.

*Examined by Jury*: When deceased said she was not in a fit state to leave, she did not say why she was not fit; I cannot say whether she was fit to leave, but she used to walk about the room right enough; I saw deceased leaving the hospital; there was a cart at the door waiting for her; her father was there and helped her up; I was on the balcony; I did not hear what deceased said in the cart; I heard her say when on the door-step that she was not able to go, and she said that up in the ward also in the presence of the matron; the matron said her father was waiting for her down stairs, and that the doctor said she could go; the matron caught hold of her arm, I cannot say whether she led her down stairs as I was not there; she dressed herself every morning without help while I was there; she was not willing to go away from the hospital; I do not think she was able to get into the cart without assistance; I was nine days in the hospital and discharged yesterday; deceased was discharged at 1 o'clock; I have seen the deceased dragging a lounge along the balcony to avoid the sun; it was a cane one; I did not hear the matron reprimand her for getting out of bed; deceased got into the cart quite easily without the slightest pain with Trafford's assistance; deceased had just finished some beef-tea that the matron had given her when her father came for her; all the conversation between the matron and deceased I did not hear.

Sworn and made at Pipeclay, on this }  
3rd July, 1897, before me, — }  
WILLIAM J. E. WOTTON, P.M., Coroner.

ADA SPARROW.

*Harvey Nickoll* further states:—I was present at a *post-mortem* examination of the deceased; in my opinion the cause of death was due to hæmorrhage during labour; death took place before the labour was completed, and the rest of the observations I have made during the *post-mortem* bear out the evidence I have given formerly; I think the removal in a spring-cart would accelerate labour under any conditions, but I think the hæmorrhage took place when in the act of getting into the cart.

*Examined by Jury*: I last saw the deceased on Wednesday, the 30th June; all traces of diarrhoea had been cured, and had been so for days; there was no signs of hæmorrhage during her stay in the hospital; it is likely the hæmorrhage would not have happened if she had remained in the hospital, as medical attendance would have been forthcoming; the act of getting into a spring-cart could bring on labour with a woman in her condition, or at any period of pregnancy.

Sworn and made at Pipeclay, on this 3rd day }  
of July, 1897, before me, — }  
WILLIAM J. E. WOTTON, P.M., Coroner.

HARVEY NICKOLL.

*Robert Beith*, sworn, states:—I am a legally qualified medical practitioner residing at Mudgee; I was present this morning when Dr. Lester performed a *post-mortem* examination on the body of Mary Beattie; she died in labour from shock with hæmorrhage; getting up into a spring-cart, and travelling from Mudgee to where she lies, might cause the labour altogether; being discharged from the hospital after an attack of diarrhoea, and labour supervening, might be dangerous to life, if taking a journey in a spring-cart; it might not have happened if she had remained in the hospital; the fact of her leaving would not have caused it, but getting up into the cart and going a journey no doubt would cause it.

Sworn and made at Pipeclay, on this 3rd day }  
of July, 1897, before me, — }  
WILLIAM J. E. WOTTON, P.M., Coroner.

ROBERT BEITH.

*Charles E. Lester*, sworn, states:—I am a legally qualified medical practitioner, residing in Mudgee; I made a *post-mortem* examination of the body of the deceased, Mary Beattie; I consider the deceased about 40 years of age; no external marks of violence; there was a large clot of blood protruding from the vagina; the skin of the abdomen showed the deceased had been delivered of children, and she was at present within about six weeks of her confinement; I opened the chest; there was about half a pint of fluid in the right pleural cavity, otherwise her lungs were healthy; there was a small clot of blood in the right side of the heart, the left side was empty; I opened the abdominal cavity, and opened the lower part of the bowel, and found recent signs of diarrhoea; I opened the womb, and found the mouth of the womb open, nearly all the fluid had escaped, and there was signs of recent bleeding; all the other organs examined were practically healthy; I attribute the cause of death to collapse from hæmorrhage; I heard Trafford say that when assisting deceased into the spring-cart

spring-cart something dropped on to his hand which he found to be blood; if at the time a medical man had been called he would have had no difficulty in diagnosing her condition, or if he had mentioned it to the matron, she would have understood it, and have obtained medical assistance, and death would probably have been averted; a woman might travel in a spring-cart in the condition of the deceased with no fatal results; deceased getting into a spring-cart in the condition she was in, and going a journey, might bring on labour.

Sworn and made at Pipeclay, on the }  
3rd July, 1897, before me,—

CHAS. ED. LESTER.

WILLIAM J. E. WOTTON, P.M., Coroner.

*Recalled* :—An examination two days before a premature confinement would probably show signs; I would not consider a journey advisable for a person just after suffering from diarrhoea, as convalescence is often unduly retarded; diarrhoea predisposes a person in condition of deceased to premature labour.

WILLIAM J. E. WOTTON, P.M., Coroner.

CHAS. ED. LESTER.

*Ethel McEwen*, recalled, states :—I made the deceased aware that, just as she was leaving the hospital, that all arrangements had been made for attendance upon her in her confinement, and that she had better see Mrs. Salsbury before she left town, that the Benevolent Society had made all arrangements; I heard that Dr. Nickoll was to attend her.

*Examined by Jury* : Deceased did not say when leaving that she was not in a fit state to leave; it was then I told her about the arrangements for her confinement; deceased came downstairs by herself.

WILLIAM J. E. WOTTON, P.M., Coroner.

ETHEL McEWEN.

No. 707.—New South Wales.—District of Mudgee.—3rd July, 1897.

Inquisition on view of the body of Mary Beattie.

*Finding* :—We find that the said Mary Beattie, at Pipeclay, near Mudgee, in the said Colony, on 1st July, 1897, died from collapse due to hæmorrhage attending premature labour, which was brought about by getting into and journeying in a spring-cart a distance of about 6 miles upon the same day, and which journey was undertaken a short time after recovery from an attack of diarrhoea.

*Rider* :—We suggest that it would be to the interests of all concerned for patients, especially in the condition of the deceased, to be thoroughly examined immediately prior to their discharge from the hospital.

WILLIAM J. E. WOTTON, P.M.

## MUDGEES SHOW-GROUND BILL.

---

 REPORT.
 

---

THE SELECT COMMITTEE of the Legislative Assembly, for whose consideration and report was referred on 3rd August, 1897, the "*Mudgee Show-ground Bill*," beg to report to your Honorable House:—

That they have examined the witness named in the margin (whose The Hon. G. H. Cox, M.L.C. evidence will be found appended hereto); and the Preamble having been satisfactorily proved to your Committee, they proceeded to consider the Bill, in which it was not deemed necessary to make any amendment.

Your Committee now beg to lay before your Honorable House the Bill without amendment.

ROBERT JONES,  
Chairman.

*No. 1 Committee Room,  
Legislative Assembly,  
18th August, 1897.*

---

PROCEEDINGS OF THE COMMITTEE.

---

WEDNESDAY, 18 AUGUST, 1897.

MEMBERS PRESENT:--

Mr. Carroll,		Mr. Edden,
Mr. Hurley,		Mr. Robert Jones,
Mr. Simeon Phillips.		

Mr. Robert Jones called to the Chair.

Entry from the Votes and Proceedings appointing the Committee read by the Clerk.

Printed copies of the Bill *referred*, together with original Petition to introduce same, before the Committee.

The Hon. George Henry Cox, M.L.C. (*a Trustee of the Mudgee Agricultural Society's Show-ground*) called in, sworn, and examined.

Room cleared.

Preamble considered.

Question, "That this Preamble stand part of the Bill," *put* and *passed*.

Clauses 1 to 6 read and *agreed* to.

Title read and *agreed* to.

Chairman to report the Bill without amendment to the House.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

MUDGEE SHOW-GROUND BILL.

WEDNESDAY, 18 AUGUST, 1897

Present:—

MR. HURLEY,  
MR. EDDEN,

MR. CARROLL,

MR. ROBERT JONES,  
MR. SIMEON PHILLIPS.

ROBERT JONES, Esq., IN THE CHAIR.

The Hon George Henry Cox, called in, sworn, and examined.

1. *Chairman.*] You are one of the Trustees of the Mudgee Agricultural Society's Show-ground? Yes.
2. Will you state to the Committee the object of this Bill? It appears that some years ago the Government made a grant of land to the Society, and it was supplemented by a further grant, making together something like 21 acres. The Society had some small amount of subsidy given them by the Government, but it was quite inadequate for the purposes for which it was required—fencing, erecting buildings, clearing, and other works. The consequence was, that a number of gentlemen had to unite together to obtain a sum of money to carry out the necessary improvements. They agreed to become personally responsible to the Bank to the extent of some £600. As far as my recollection serves me, the overdraft amounts to something like £650 or £660. Those gentlemen are very anxious to get rid of their liability, and have requested the Member for the district, Mr. Jones, to bring in a Bill enabling them to mortgage the land over which, at present, they have no control, to reimburse themselves for the liability under which they are now labouring to the Bank. It is also considered desirable to make further improvements; but considering that there is a debt of more than £600 on the land and buildings, they do not see their way to expend money unless they have some security.
3. *Mr. Edden.*] The Preamble of the Bills says this:—"To authorise the Trustees of certain lands dedicated for the use of the Mudgee Agricultural Society to mortgage and sell the said lands for the purpose of enabling the said Trustees to pay off the present liabilities incurred in effecting improvements on the said lands; and to effect further improvements thereon; and to purchase other lands in the town of Mudgee";—that seems to me a sort of contradiction? That is transcribed from two or three other Bills of the same kind which have been passed by Parliament; it was thought desirable to adopt the same words.
4. *Mr. Phillips.*] It is a power which they may or may not exercise? Yes. It is clear that if the Trustees have power to mortgage they must have power to sell, because in the event of the money being claimed, and the parties not being able to get it, they must raise it by the sale of the property; therefore it is necessary to have power of sale—not that they intend to sell.
5. What they want is power to mortgage? Yes; and power to raise further money for various contemplated improvements.
6. *Mr. Hurley.*] Do you think they can clear off this liability and raise a further sum? It is 21 acres of land, in the town of Mudgee, and therefore of considerable value. I was stating that it is necessary, in order to carry out the objects of the Society, to make further improvements. One necessary improvement is the erection of a grandstand. A number of people go to the show-ground on the days on which

Hon. George  
Henry Cox.  
18 Aug., 1897.

Hon. George  
Henry Cox.  
18 Aug., 1897.

which the Show is held, but there is not a place where they can sit down to rest; and some people do not go to the Show because they cannot put up with the inconvenience of having to stand all the day. The erection of a grandstand will involve the expenditure of some hundreds of pounds, which there is no means of raising unless they can give security on the land. There are also other things to be done. It is considered desirable to further utilise the land by opening a track for bicycles. It is considered that a fair amount may be obtained from bicycle clubs if a proper course is prepared for them. It is the intention of the Committee to use the ground for various other purposes, as well as for the Agricultural Shows. The Bill has been introduced to enable the Trustees to make further improvements, and to make the ground as valuable and useful as possible for the benefit of the inhabitants of Mudgee. These are the reasons which commend to my mind this application to Parliament to pass this Bill.

7. *Chairman.*] There is no reserve available in Mudgee at the present time where sports, such as cricket, football, or cycling, could be held? No.

8. They are held at present on private land? Yes. I may mention that there is a small park of 10 acres in the town, but that is all laid out in walks and plantations, and is not available for sports.

9. The Robertson Park is not suitable? No.

10. *Mr. Hurley.*] Is there any land in the township of Mudgee which the Trustees think of substituting for this land? No.

11. Then that will contradict the words of the Preamble, which says: "and to purchase other lands in the town of Mudgee, or in the vicinity of the said town, for the use and general purposes of the Society"? The only reason for those words being in the Preamble is that this is an exact copy of similar Bills which have been passed by Parliament. It is thought desirable, having once formed a precedent, to follow that precedent without variation.

12. *Chairman.*] If the present liability was paid off, is it your opinion that for other purposes it would be easy to raise further money amongst the present Committee? I think so. I think it is unfair to ask the present bondsmen to become further liable than they are already. Some of them are individually liable for this large amount, and it is unfair to ask them to increase it.

13. *Mr. Carroll.*] Has the money been owing long? Yes, some years.

14. Has the interest been paid up yearly? Yes.

15. Otherwise the institution is solvent? Well, sometimes when the Society have a Show they make a few pounds; on other occasions they only just make both ends meet.

16. What is the amount of the subscription? Ten shillings a member.

17. I suppose you have several hundred members? No; only about 160.

18. Are the townspeople all satisfied with regard to this Bill? Yes.

19. They are all satisfied that it is to be a general benefit? Yes.

20. *Chairman.*] You know that this Bill was placed in my hands to bring forward in Parliament with the consent of the present Committee? Yes.

21. *Mr. Edden.*] Clause 1 gives the Secretary for Lands power, from time to time, to give his consent to the raising of money on mortgage on the said lands? Yes; it is considered desirable, because you might have Trustees who might take the bit in their mouths, so to speak, and do what would be undesirable; therefore the Secretary for Lands should have this right, because this is Crown property, although it is vested in Trustees to exercise some little control.

22. *Mr. Phillips.*] There have been similar Bills passed for other Societies? Yes; and this is word for word the same as the other Bills.

23. *Chairman.*] This Bill is brought in with a view to place those men who are the guarantors at the present time on the same footing as the rest of the Committee? Yes; to relieve the guarantors of the burden which they have taken upon themselves, and which we think unfairly rests upon them. It has been on them for some years, and we think that we could get the money at a much cheaper rate elsewhere than from the Banks.

24. And the Committee think it would be unfair to further increase their indebtedness as long as those gentlemen are guarantors for this amount? Yes; we want to spend at least £400 in putting up a grandstand, but we cannot do it with this heavy burden on these few individuals.

25. As far as you know, the present guarantors are not complaining, nor is the Bank? No; the only complaint was by a gentleman who is not a guarantor, but who has spoken very warmly of the way in which the guarantors have been allowed to remain with this heavy liability upon their shoulders for so many years.

## MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON

## NYNGAN TOWN HALL (MORTGAGE) BILL.

THURSDAY, 18 NOVEMBER, 1897.

Present:—

MR. EDDEN,  
MR. ROBERT JONES,MR. HAYNES,  
MR. KELLY,

T. WADDELL, ESQ., IN THE CHAIR.

Frederick Wm. Walker, solicitor, sworn and examined:—

1. *Chairman.*] You are a solicitor of the Supreme Court of New South Wales? Yes.
2. You are acting for Mr. Burns, of Nyngan, who is the solicitor for the Nyngan Municipal Council? Yes.
3. You have a knowledge of the provisions of this Bill, and of the reasons which have induced the Municipal Council to ask Parliament to pass it? Yes.
4. Have the necessary notices been published in the newspapers in conformity with the Standing Order of the House relating to private Bills? Yes.
5. Some months ago the Municipal Council at Nyngan decided to build a Town Hall? Yes.
6. They then applied to a company in Sydney to lend them the money to do so? I believe so.
7. According to the reading of the Act by laymen, they had reason to believe that they had full power to mortgage the general rates, as well as the land and the building? I was informed by Mr. Burns that they considered that they had that power.
8. From all you know in connection with this matter, do you think that there were reasonable grounds for laymen to take that view of the Act? Yes.
9. After deciding to build a Town Hall, they applied to a company in Sydney to lend them the money on the security of a second mortgage over the general rates—that is, after the mortgage given in connection with the water supply—and also a mortgage over the land and the building? I believe they applied to someone, but I do not know who it was.
10. A company in Sydney, you understand, were willing to lend the Council money to build the Town Hall? If they could be satisfied as to the security.
11. Thinking that everything was right, the Council let a contract for the work, and the contractor proceeded with the building? I believe that is correct.
12. About the same time the Council made an application to the Principal Under Secretary for the necessary warrant giving them the power to mortgage the general rates? Yes.
13. They got a warrant to mortgage the land and the building? Yes.
14. They did not get a warrant to mortgage the general rates? No.
15. But they applied to the Principal Under Secretary for a warrant for that purpose? I believe they did.
16. And the Principal Under Secretary, thinking that there might be a doubt as to whether the law gave power to grant a warrant in this special case, submitted the point to the Crown Solicitor? It was referred to the Crown Solicitor for his advice to see whether it could be done.
17. What opinion did he give? I think his advice was against it. They then took counsel's advice themselves. It was considered that it is not a permanent improvement within the meaning of the Act.
18. Owing to this warrant not being obtainable the company referred to would not lend the money? I believe so.
19. In the meantime the contractor went on with the work? Yes.

F. W.  
Walker.  
18 Nov., 1897.

20.

- F. W. Walker.  
18 Nov., 1897.
20. And the building is nearly completed? It is nearly finished, and they want the money to pay the contractor.
21. Unless this Bill is passed, there is no way for the Council to pay the contractor? None whatever; they can borrow the money if the Bill is passed.
22. There is a mortgage over the general rates in connection with the water supply? There is a mortgage over the general rates.
23. Are you aware whether they are building any offices in connection with the Town Hall which will be a source of revenue? I am informed that they are.
24. *Mr. Edden.*] What is the revenue of the municipality? I cannot say.
25. *Mr. Kelly.*] Do you know the amount of the contract? I think it is about £1,300. They ask for leave to borrow £1,500 in case the contract exceeds £1,300.
26. *Mr. Edden.*] Have any public meetings been held at Nyngan to urge that this should be done, or to point out some necessity for it? I do not know of any public meetings being held, but I know that the advertisement announcing the intention to borrow certain moneys has been appearing in the Nyngan papers for some months past, so that the people must be aware of it up there.
27. I suppose that advertisement was published in accordance with the section of the Municipalities Act when they thought they had the authority to borrow the money? Yes.
28. Are the aldermen all favourable to this being done? I cannot tell you.

TUESDAY, 23 NOVEMBER, 1897.

Present:—

MR. HOGUE,

MR. EDDEN,

MR. KELLY.

T. WADDELL, ESQ., IN THE CHAIR.

F. W. Walker, Esq., representing B. E. Burns, Esq., of Nyngan, appeared as Solicitor for the Bill.

Joseph Knight called in, sworn, and examined:—

- J. Knight.  
23 Nov., 1897.
29. *Chairman.*] Are you Mayor of Nyngan? Yes.
30. When did your Council first decide to build a new Town Hall? In 1894.
31. Under what Act did you think you had power to borrow money to erect the building? The Municipal Loans Act of 1888.
32. After deciding to build the hall, and reading that Act, did you and the other members of the Council think you had full power to borrow money to build a hall? Yes.
33. Did you then apply for the necessary warrant from the Principal Under Secretary? Yes.
34. Did you then make any arrangements with any company in Sydney to lend you the money? Yes the Citizens' Life Assurance Company.
35. Did you let a contract for the building before you actually got the money in hand? Yes, thinking the money would be available at any time.
36. Why did the company refuse to lend you the money after having promised it? Because they said we had to get the warrants under the 190th section of the Municipalities Act, in order to mortgage the general rates.
37. Up to this point, did you think that you were quite sure to get the money, and had you actually commenced the building before you knew you would not be able to get the money? Yes.
38. When the company stated that they would have to get a mortgage over the general rates as well as over the land and building, did you then apply to the Principal Under Secretary for a warrant to mortgage the general rates? Yes.
39. Did he grant the warrant? No; he referred us to the Crown Solicitor.
40. Had he doubts as to whether the law gave power? Yes.
41. What was the Crown Solicitor's opinion? He was also doubtful, and he advised us to get counsel's opinion.
42. Did he think that the law did not give the power, but, at the same time, that it was one of those doubtful points that should be submitted to eminent counsel? Yes.
43. Did you obtain the advice of counsel as to whether the Government had power to grant a warrant or not? Yes; we got Sir Julian Salomons' opinion. [*See Appendix.*] He said that he did not think the Town Hall was a permanent improvement under the Act.
44. And consequently that the Government would not have power to issue a warrant? Yes.
45. Did he give any opinion as to the law being difficult to understand or being rather indefinitely worded? He said the law might be defective.
46. Did the Crown Solicitor wish the point to be referred to Sir Julian Salomons so as to be absolutely sure? Yes.
47. Have you let the contract for the building, and is the work now far advanced? It will be completed in about four weeks.
48. When you let the contract were you and the other members of the Council fully satisfied from the wording of the Act that you had the power to give the necessary mortgages in order to get the money from us? Yes; we felt so satisfied that we applied to the company for the money.
49. If you had any doubts at all about being able to get the money, would you have let the contract? No.
50. Have you now been placed in a very awkward position? Yes.
51. When you found you would soon have to pay the first instalment on the contract, did you apply to the company for the money? Yes.
52. What answer did the company's solicitor give you? He found that the warrant did not give power to grant a second mortgage over the rates.
53. Did the Company then refuse to lend you the money unless you got a warrant giving that power? Yes.
54. Was it after that refusal that you applied to the Principal Under Secretary for a warrant to give a mortgage over the general rates and it was then found that it could not be legally granted? Yes.

55. Unless you get a Bill through the House immediately giving you the necessary powers, will the Council be in a very serious position financially? Unless we get something done, I do not know what we shall do. We have no means of paying a contractor; we have paid him all we possibly could out of the general rates already. J. Knight.  
23 Nov., 1897.
56. How much? £395.
57. Would this mortgage be a second mortgage? Yes; the general rates have been mortgaged for the waterworks.
58. Would the company have been agreeable to take a second mortgage? Yes.
59. What amount of interest have you to pay for the money borrowed for the waterworks? The waterworks cost £9,000 and the interest amounts to £325 8s. 9d. per annum.
60. What would be about the cost of the waterworks per annum for management? £246. That includes all costs.
61. What would the interest and working expenses of the waterworks come to in a year? £571 8s. 9d.
62. What is the total return from the waterworks per annum? From the rate of 12d. in the £, £323 1s. 6d. We get from the Railway Commissioners £300; that gives a total revenue of £623 1s. 6d.
63. Then you derive a profit from the waterworks? Yes; they are self-supporting. There is nothing to pay from the general rates on their account.
64. For some years past has your financial position been good? Yes, it is really good. At present we have a debit in the bank of £185 18s. 4d., but we are really in credit to the amount of £285 11s. 9d., because we have paid away nearly £471 10s. for the Town Hall.
65. Have you any other loans except the waterworks loan? No.
66. Have you carried out the work of forming the streets without borrowing any money at all? When we first started we borrowed £400. That was seven years ago. We have paid that off.
67. So that practically you have carried out all the works in connection with the streets without borrowing anything? Yes.
68. Then your financial position is really a good one? Yes.
69. What is about the annual revenue from the general rates? In 1891-92 the revenue was £280 17s. 6d.; in 1892-93, £319 5s. 6d.; 1893-94, £314 4s. 7d.; 1894-95, £405 0s. 11d.; 1895-96, £401 5s. 9d.; 1896-97, £338 7s. 5d.; 1897-98, £322 19s. The outstanding rates at the present time are £251 4s. 6d.
70. Are you likely to get most of the outstanding rates? Yes, pretty well all of it.
71. So that the rates have been increasing during the last few years? Yes.
72. Is the town likely to improve? Yes.
73. Consequently there is every probability of the rates increasing as the time goes on? Yes.
74. With reference to the Town Hall itself, have you to rent a building now to meet in? Yes; we have no Council Chambers.
75. So that by erecting a Town Hall you will save rent? Yes.
76. *Mr. Edden.*] What amount of rent do you pay at present? We pay £13 a year for a mere shell which is not at all suitable.
77. *Chairman.*] Do you expect to get any revenue from the Town Hall? I think it will more than pay the interest.
78. What will the interest amount to? £78 per annum.
79. Did the Government give you the land? Yes.
80. Will the only annual liability which you will have to meet in connection with the Town Hall be £78? Yes.
81. What do you think will be about the annual return from the Town Hall? I cannot state the exact amount, but I am certain it will pay the interest. There is no other hall in the place, and the offices which we will have to let will be worth £52 per year.
82. So that the Town Hall will be no additional cost to the rate-payers, as it will be self-supporting? Yes.
83. *Mr. Walker.*] With regard to the income to be derived from the Town Hall, have you allowed for repairs and insurance? It will more than cover all that. I believe the revenue will pay something towards a sinking fund.
84. *Chairman.*] Of what material are you building the Town Hall? Brick, with a galvanized-iron roof and ceiling.
85. Is it a substantial building that will last for some years? Yes.
86. *Mr. Edden.*] Do you expect the income from the Town Hall to pay the interest on the loan? Yes.
87. Have you allowed for insurance, cleaning, &c.? Yes.
88. How do you propose to raise the £1,500 that you intend to borrow? I think the hall will pay a good deal of the principal. There are a great many entertainments given in the town.
89. Do you look upon the hall as an absolute necessity for the town? Yes; there is no hall there at present. There is a hall at Mr. Barrett's, but it is used as a store at present.
90. Do you look upon this hall as, practically, a necessity for the benefit of the public? Yes.
91. Has there been unanimity amongst the aldermen on this question? Yes.
92. Has there been any protest from the people? No; and the proposal was well advertised. They all seemed willing.
93. *Chairman.*] Did you say you had a warrant under one Act to mortgage the land and building? Yes.
94. Was it the refusal of the Government to grant you a warrant under the Municipalities Act to mortgage the general rates as well that caused the difficulty in getting the money? Yes.
95. Is the company still willing to lend the money if you can get power to mortgage the general rates? Yes.

## APPENDIX.

[To Evidence of Mr. Joseph Knight.]

## QUESTIONS UPON CASE FOR OPINION OF SIR JULIAN SALOMONS.

1. Can the block of land promised by the Government be considered, under the circumstances stated, as land held or purchased?
2. Can the authorities already given by the Governor and Executive Council be amended so as to carry out the wishes of the municipality?
3. Can the existing authorities be cancelled as suggested in the third paragraph of the case?
4. If so, must not any new borrowing be under the 190th section with all its attendant formalities, and can the "promised land" be included in the security to be offered?
5. Is the erection of a Town Hall a permanent improvement within the meaning of the Municipalities Act?
6. Assuming that the Governor and Executive Council can cancel the existing warrants and that the powers to borrow upon the promised site and building have thereby gone, in what way could the land and building be made a security for any advance obtained? Can an application to borrow be successfully made, offering as security the existing rates and the site and building, when the deed of grant is obtained?

## (COPY) OPINION.

1. I am of opinion that the land promised by the Crown is not land "purchased" by the municipality, nor is it, in my opinion (until it is conveyed), land held by the municipality within the meaning of the Act, 52 Vic. No. 9. It is, however, I consider, land upon which the municipality is entitled to borrow money by virtue of the provisions of the said Act, for by section 1—which, read by the light of the preamble, authorises the borrowing of money on land to be used as the site for a Town Hall—a municipality is authorised to borrow money on such site, although the site itself may not have been at such time actually purchased.

2. As to the second question, I think not. The only authority given by the said Act is to borrow (for the purchase of a site and paying for the erection of a Town Hall) on the security of the site and the building. There is, therefore, no power to give security over the rates for this purpose, nor could such security be given except for the purposes and in the manner prescribed by section 190 of the Municipalities Act of 1867. (See answer to Question 5.)

3. I think the existing authorities can be cancelled—that is, if no money has been borrowed under them.

4. In order to be able to give security over the rates the borrowing must be under the provisions of the above section 190, and of course all the formalities required by the section must be complied with. I am, however, of opinion that the land promised by the Government could not be included in the security until it had been conveyed to the Council.

5. In my opinion the erection of a Town Hall is not a "permanent improvement" within the meaning of section 190 of the Municipalities Act. Section 117 seems to me to indicate what works are meant by the expression "permanent improvements," and they do not, I think, include the erection of a Town Hall. The fact that it was thought necessary to pass the Act, 52 Vic. No. 9, tends to show that the Legislature considered that borrowing money for the erection of such a building was not within the powers already existing under the 190th section.

6. The law may be defective, but I know of no way by which, as the law stands, the existing rates can be made a valid security for money borrowed for the purpose of building a Town Hall. In my opinion, in order to enable the Council to borrow money on the security of the rates (for the purpose in view), the authority of an Act of Parliament is necessary.

JULIAN E. SALOMONS.

## LITHGOW CO-OPERATIVE COAL COMPANY RAILWAY BILL.

---

**REPORT.**

---

THE SELECT COMMITTEE of the Legislative Assembly, for whose consideration and report was referred on the 27th October, 1897, the "*Lithgow Co-operative Coal Company Railway Bill*,"—beg to report to your Honorable House:—

That they have examined the witnesses named in the List\* (whose evidence will be found appended hereto), and the Preamble having been satisfactorily proved to your Committee, they proceeded to consider the several clauses and the Schedule to the Bill, in which it was deemed necessary to make certain amendments. \*See List, page 7.

Your Committee now beg to lay before your Honorable House the Bill as amended by them.

JAMES A. HOGUE,  
Chairman.

*No. 3 Committee Room,  
Legislative Assembly,  
2nd December, 1897.*

---

## PROCEEDINGS OF THE COMMITTEE.

---

TUESDAY, 16 NOVEMBER, 1897.

MEMBER PRESENT:—

Mr. Hogue.

In the absence of a Quorum, the meeting called for this day lapsed.

---

WEDNESDAY, 17 NOVEMBER, 1897.

MEMBERS PRESENT:—

Mr. Hogue,		Mr. Fegan,
Mr. Affleck,		Mr. Edden,
Mr. Gormly,		Mr. Griffith.

Mr. Hogue called to the Chair.

Entry from Votes and Proceedings, appointing the Committee, *read* by the Clerk.

Printed copies of the Bill referred, together with original Petition to introduce same, before the Committee.

Present:—William Arnott, Esq. (*Messrs. Arnott and Reynolds, Solicitors for the Bill*).

William Arnott sworn and examined.

John William Wilson (*one of the Promoters*) called in, sworn, and examined.

Witness withdrew.

John Haydon Cardew (*Licensed Surveyor, and A.M.Inst.C.E.*) called in, sworn, and examined.

Witness withdrew.

William Wiley (*one of the Promoters*) called in, sworn, and examined.

Witness withdrew.

[Adjourned till Wednesday next at 11 o'clock.]

---

WEDNESDAY, 24 NOVEMBER, 1897.

MEMBERS PRESENT:—

Mr. Hogue in the Chair.

Mr. Gormly,		Mr. Fegan,
Mr. Affleck,		Mr. Hawthorne.

John Sydney Cargill called in, sworn, and examined.

Witness withdrew.

Henry Deane (*Engineer-in-Chief for Railway Construction*) called in, sworn, and examined.

Witness withdrew.

Jasper Gaze Wiseman (*Council Clerk of the Borough of Lithgow*) called in, sworn, and examined.

Witness withdrew.

[Adjourned till Tuesday next at 11:30 o'clock.]

---

TUESDAY, 30 NOVEMBER, 1897.

MEMBERS PRESENT:—

Mr. Hogue in the Chair.

Mr. Fegan,		Mr. Affleck.
------------	--	--------------

Present:—William Arnott, Esq. (*Messrs. Arnott and Reynolds, Solicitors for the Bill*).

[Adjourned till Thursday next at 10 o'clock.]

---

THURSDAY, 2 DECEMBER, 1897.

MEMBERS PRESENT:—

Mr. Hogue in the Chair.

Mr. Affleck,		Mr. Mackay,
		Mr. Edden.

Present:—William Arnott, Esq. (*Messrs. Arnott and Reynolds, Solicitors for the Bill*).

William Arnott recalled and further examined.

Hugh McLachlan (*Secretary to the Railway Commissioners*) called in, sworn, and examined.

Witness withdrew.

Henry Deane recalled and further examined.

Witness withdrew.

John

John Haydon Cardew, recalled and further examined.

Witness *produced* plan showing the land proposed to be taken for a tramway.

Room cleared.

Preamble considered.

Question,—“That this Preamble stand part of the Bill,—put and passed.

Solicitor called in.

Clause 1 read, amended,\* and agreed to.

#### SCHEDULE OF AMENDMENTS.

Page 2, clause 1, line 21. After “aforesaid” *insert* “and to use so much of the said roads”

Page 2, clause 1. *Add* at end of clause “Provided also that the gauge of the said railway shall be the Gauge same as that of the Government railways.”

Page 2, clause 2. *Omit* clause, *insert* the following new clause to stand as clause 2 :—

2. The said railway and all necessary bridges and causeways in connection therewith shall be in all respects constructed and at all times maintained in a proper and workmanlike manner as directed, and to the satisfaction of the Engineer-in-Chief for Railway Construction; and the Company shall at all times make, do, and supply all such repairs, alterations, additional works, things, and materials as in the opinion of the said Engineer-in-Chief shall be necessary for the proper and safe working of the said railway. And if the Company shall fail to make, do, or supply any such repairs, alterations, additional works, things, and materials within a reasonable time after being by notice in writing under the hand of the said Engineer-in-Chief required to make, do, or supply the same, the Governor, with the advice of the Executive Council, may declare the said railway to be closed until such repairs, alterations, additional works, things, or materials shall have been made, done, or supplied as aforesaid; and if the Company cause or allow the said railway to be worked during such closure, the Company shall be liable to a penalty not exceeding £10 for each and every day the said railway is so worked.

Page 3, clause 3, lines 18 to 26. *Omit* “Provided that if the railway shall be damaged by parties who shall themselves use the railway for transit and supply locomotive power, the Company shall be entitled to compensation for such damage, to be recovered by action in the Supreme Court of New South Wales, the District Court, or the Court of Petty Sessions; and in estimating such damage the Company shall be entitled to compensation not only for the cost of repairing and restoring the railway, but also for the consequential damage (if any) sustained by reason of the suspension of transit or otherwise.”

Page 3, clause 4, line 27. *Omit* “And be it enacted that” *insert* “subject to the approval of the Governor and Executive Council.”

Page 3, clause 5, lines 51 and 52. *Omit* “For the purposes and subject to the provisions hereinafter contained.”

Page

Page 3, clause 5, line 54. Motive-power  
and rolling  
stock.  
Power to  
Railway Com-  
missioners to  
object to rolling  
stock.  
Penalty.

9. It shall be lawful for the company to use and employ steam or other motive-power, and carriages, waggons, and trucks to be drawn hereby on the said railway. Provided that it shall be lawful for the Railway Commissioners of New South Wales at all times to object to any rolling stock used or intended to be used on the said railway, and if the Company shall use any rolling stock after the same shall have been so objected to, the Company shall be liable to a penalty not exceeding £10 for each and every day the same shall be so used.

Page 7. Insert the following new clauses to stand as clauses 14 and 15 :—

Compensation  
for resumptions,  
&c.

14. Before proceeding with the construction of the said railway or any section thereof, the Company shall give notice of the lands (including Crown lands) proposed to be taken and used for the purposes of the said railway. Such notice shall be given to the owners of such lands and shall state,—

- (i) The particulars of the lands proposed to be so taken and used.
- (ii) That the Company are willing to treat as to the compensation to be made to such owners for such lands and the damage (if any) sustained or to be sustained by them by the exercise of the powers conferred by this Act.
- (iii) That such owners are required to forthwith deliver to the Company particulars of their respective estates or interests in such lands, and of the claims made by them in respect thereof, and such other particulars, and in such form as may be prescribed by such notice, together with an abstract of their title to such lands.

Service of notice  
on owners of  
lands

15. All notices required to be served by the Company upon the owners of such lands shall be served either personally upon such owners or left at their usual place of abode in New South Wales: Provided that if any such owners shall be absent from the colony, or cannot be found after reasonable inquiry, such notices shall be left with the occupier (if any) of such lands, or if there be no such occupier shall be affixed upon some conspicuous part of such lands, and a copy thereof published by and at the expense of the Company once a week for four consecutive weeks in the New South Wales *Government Gazette* and in a newspaper published at Lithgow, and shall also be posted and kept posted at the post office nearest to the lands to which such notices refer for a period of one month.

Page 10. Insert the following new clauses to stand as clauses 33, 34, 35, and 36.

Power of  
purchase of  
tramway by  
Government.

33. At any time, after two years from the commencement of this Act, the Governor, with the advice of the Executive Council, may, if he think fit, purchase such tramway upon giving to the Company six months notice in writing of his intention to do so. If the amount tendered for the purchase of the property be considered inadequate by the Company, the amounts shall be ascertained by assessment in terms of the Lands for Public Purposes Acquisition Act: Provided that the cost of resumption shall not exceed by ten per centum the original cost of construction: Provided further that on such resumption taking place, the lands on which the tramway has been constructed shall be held to have reverted to the Crown.

Running powers  
over tramway  
to Railway  
Commissioners.

34. The said Railway Commissioners shall have running powers over the said railway to enable them to obtain supplies of any coal, wood, stone, gravel, clay, or other material that may be required by the Railway Department for its own use. Provided that for such privilege the said Department shall pay the Company at the rate of one half-penny per ton per mile on such material, and that the weight of engines used by the Railway Commissioners, and their speed, be not greater than that used or approved of by the Company.

Power to assign.

35. It shall be lawful for the Company at any time, by any deed or instrument in writing, to assign and transfer all the rights, powers, privileges, benefits, and advantages conferred upon them by this Act to any person or persons or to any duly registered company, and upon any such transfer or assignment being signed or executed, the person or persons or duly registered company in whose favour such transfer or assignment is made shall then stand in the place of the Company, and shall have all the rights, powers, benefits, privileges, and advantages conferred upon the Company by this Act.

Hire to be paid  
as described by  
the said  
Company.

36. The hire and charges to be made under this Act by the Company shall be in such terms and amounts, and shall be paid to such persons upon or near to the tramway, or in such manner and under such regulations as the Company shall by notice appoint.

Page 11. Insert the following new clauses to stand as clauses 46, 47, 48, and 49 :—

Railway Com-  
missioners may  
appoint  
Inspectors.

46. The said Railway Commissioners may from time to time appoint any person to be inspector for the purpose of inspecting the said railway, and of making any inquiry with respect to the condition of the works thereof, or into the cause of any accident thereon, provided that no person so appointed shall exercise any powers of interference in the affairs of the Company. Every inspector under this Act shall, for the purpose of any inspection or inquiry which he is directed by the Railway Commissioners to make or conduct, have the following powers—that is to say :—

- (i) He may enter and inspect the said railway and all the stations, works, buildings, offices, stock, plant, and machinery belonging thereto or used in connection therewith.
- (ii) He may, by summons under his hand, require the attendance of any person who is engaged in the management, service, or employment of the said Company, and whom he thinks fit to call before him and examine for the said purpose, and may require answers or returns to such inquiries for the said purpose as he thinks fit to make.
- (iii) He may require and enforce the production of all books, papers, and documents of the Company which he considers important for the said purpose.

47. Whenever in or about the said railway, or any of the works or buildings connected therewith, or any building or place, whether open or enclosed, occupied by the Company for working such railway, any of the following accidents take place in the course of such working—that is to say,—

- (i) Any accident attended with loss of life or personal injury to any person whomsoever ;
- (ii) Any collision where one of the trains is a passenger train ;
- (iii) Any passenger train, or any part of a passenger train, accidentally leaving the rails ;
- (iv) Any accident of a kind not comprised in the foregoing descriptions, but which is of such kind as to have caused, or to be likely to cause, loss of life or personal injury, and which may be specified in that behalf by any order to be made from time to time by the said Railway Commissioners,

the Company shall send notice of such accident, and of the loss of life or personal injury (if any) occasioned thereby, to the Railway Commissioners. Such notice shall be in such form and shall contain such particulars as the said Railway Commissioners may from time to time direct, and shall be sent by the earliest practicable post after any such accident takes place.

48. The Railway Commissioners may from time to time by order direct that notice of any class of accidents shall be sent to them by telegraph, and may revoke any such order. While such order is in force notice of every accident of the class to which the order relates shall be sent to the Railway Commissioners by telegraph immediately after the accident takes place. Failure to comply with the provisions of this section shall render the Company liable for each such offence to a penalty not exceeding twenty pounds.

49. It shall at all times be lawful for the Crown to make any road through, over, under, or across the said railway, or the land used therewith, without paying or being liable to pay any compensation therefor to the Company, provided that in making any such road as little interference as possible with the said railway or the working thereof, shall be made.

Page 11, clause 45 50, line 50. *Omit* "three" *insert* "two"

Page 11, clause 45 50. *Add* at end of clause "If the railway hereby authorised shall cease to be worked as a railway by the Company for twelve calendar months, the land, site, and permanent way thereof shall, on proclamation by the Governor, with the advice of the Executive Council, vest in and become the absolute property of the Crown without making any allowance or compensation or paying any consideration in respect thereof to the Company."

Page 11, clause 46 51, line 54. After "Act" *insert* "the words 'the Company' shall mean and include the said William Hunter, John William Wilson, and William Wiley, their heirs, executors, administrators, and assigns, and"

Page 12, Schedule. *Omit* Schedule *insert* the following new Schedule :—

SCHEDULE.

All that piece or parcel of land, being parts of portions 41 and 5, parish of Marangaroo, and portions 45 and 53, parish of Lett, county of Cook, in the Colony of New South Wales: Commencing at the south-west corner of M.P. 1, parish of Marangaroo; and bounded thence by the south boundary of M.P. 1, bearing 88° 36' 1,140.5 links; thence by part of the western boundaries of portions 89 and 5, bearing 180° 1,027 links; thence by a line bearing 154° 19' 1,450 links; thence by a curve of 1,025 links radius for 486 links, its chord bearing 167° 53' 30"; thence by a line bearing 181° 30' 411 links; thence by a curve of 975 links radius for 341 links, its chord bearing 171° 28'; thence by a line bearing 161° 26' 648.8 links; thence by a line bearing 71° 26' 25 links; thence by a curve of 1,050 links radius for 175 links, its chord bearing 156° 39' 30"; thence by a line bearing 171° 0' 1,584 links; thence by a line bearing 261° 0' 25 links; thence by a curve of 2,025 links radius for 372 links, its chord bearing 155° 58' 30"; thence by a line bearing 181° 31' 1,676 links; thence by a curve of 775 links radius for 566 links, its chord bearing 150° 36' 30"; thence by a line bearing 139° 39' 30" 867 links; thence by a curve of 775 links radius for 656 links, its chord bearing 115° 24' 30"; thence by the railway fence bearing 245° 57' about 110 links; thence by a curve of 825 links radius for 585 links, its chord bearing 295° 24' 30"; thence by a line bearing 319° 39' 30" 867 links; thence by a curve of 825 links radius for 602 links, its chord bearing 330° 36' 30"; thence by a line bearing 1° 31' 1,676 links; thence by a curve of 1,975 links radius for 362 links, its chord bearing 335° 58' 30"; thence by a line bearing 261° 0' 25 links; thence by a line bearing 351° 1,584 links; thence by a curve of 950 links radius for 159 links, its chord bearing 336° 39' 30"; thence by a line bearing 71° 26' 25 links; thence by a line bearing 341° 26' 648.8 links; thence by a curve of 1,025 links radius for 359 links, its chord bearing 351° 28'; thence by a line bearing 1° 30' 411 links; thence by a curve of 975 links radius for 462 links, its chord bearing 347° 53' 30"; thence by a line bearing 334° 19' 1,346 links to western boundary of portion 5; thence by part of that boundary bearing 180° 215 links to a creek; and thence by that creek upwards, to point of commencement.

1897.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

LITHGOW CO-OPERATIVE COAL COMPANY  
RAILWAY BILL.

WEDNESDAY, 17 NOVEMBER, 1897.

Present:—

MR. GORMLY,  
MR. AFFLECK,  
MR. GRIFFITH,

MR. HOGUE,  
MR. FEGAN,  
MR. EDDEN.

J. A. HOGUE, ESQ., IN THE CHAIR.

William Arnott, Esq., of the firm of Arnott and Reynolds, solicitors, appeared for the promoters of the Bill.

William Arnott sworn and examined:—

1. *Chairman.*] I believe you are solicitor for the Bill? My firm are the solicitors for the promoters.
2. Have you advertised the Bill in conformity with the requirements of the law? Notice of the promoters' intention to apply for the Bill has been duly advertised, in conformity with the Standing Orders of the Legislative Assembly, in the *Sydney Daily Telegraph*, in the *Government Gazette*, and in a paper printed and circulated in the Lithgow district. That notice correctly and, I think, fully specifies the general purposes of the proposed Bill.
3. Have you petitioned Parliament for leave to bring in the Bill? Yes.
4. Have you any statement to make in connection with the Bill? The Bill as drafted by me and presented to the House is, I believe, on the same lines as other Bills for purposes similar to that for which this is intended. Possibly some few amendments may be deemed necessary; but, as it at present stands, it gives the usual powers to the promoters for making and using the proposed railway, and it also has provisions for safeguarding vested interests and preventing the promoters from taking more than surface rights, and provides for compensation to be paid to owners, and for disputes as to the value of the land being decided by arbitration; also the manner in which the arbitration is to be conducted and the arbitrators appointed, and it proposes to give the promoters power to make by-laws. That is a power which will hardly ever be used, because it is proposed that the Railway Commissioners shall work the line. It is not proposed to carry passengers on the line, but simply to use it as a means of conveying coal from the coal-mines to the Lithgow station.
5. Have you notified the Railway Commissioners of your intention? I sent a letter to the Secretary for Railways giving him notice that the Committee would sit yesterday, and enclosing a copy of the Bill and a tracing of the proposed connection of this line with the Great Western Railway, near Lithgow station. The meeting having lapsed yesterday, I wrote again, giving the Secretary notice that the Committee would sit this morning at 11 o'clock.
6. Have you submitted to the Secretary for Railways a schedule of the rates that you propose to charge? The rates are set out in the Bill itself; these are maximum rates; but, as I have said, the line is proposed to be worked by the Railway Commissioners.

W. Arnott.  
17 Nov., 1897.

- W. Arnott. 7. These rates are, I presume, subject to the approval of the Railway Commissioners? I do not think there is any provision in the Bill for that, but there is a provision that the promoters shall charge a rate not exceeding a certain amount, and the only people whom we are likely to do business with in that respect are the Railway Commissioners.
- 17 Nov., 1897. 8. Do you anticipate any passenger traffic? No passenger traffic at all. The line is simply to be for the conveyance of coal from the mine to the Lithgow station.
9. *Mr. Gormly.*] What is the distance? About 1 mile.
10. *Chairman.*] This is a co-operative company which is promoting this line? At present the promoters are only three individuals. I understand that they contemplate, when they get the thing going, turning it into a co-operative company.
11. *Mr. Affleck.*] Is it not a co-operative company at present? No; they are simply calling themselves the Lithgow Co-operative Company; that is just a trading name.
12. Have you any information as to the extent of the coal land which is to be developed? I understand that the land which the promoters are entitled to work comprises an area of between 680 and 690 acres, under the whole of which there are large coal deposits.
13. The Bill requires that the line shall be completed within three years? Yes; the 45th clause provides for that.
14. I presume that the plans will be submitted? Yes.
15. As far as you know, the law has been complied with in all respects, and care has been taken in drafting the Bill to conserve all public and private rights? Yes.
16. *Mr. Fegan.*] Do you not think that three years is a long time to allow for the making of a line of railway? I should not be prepared to say that it will take three years to make the line; it could be made in a few months.
17. If this is a *bonâ fide* company why do they want such a long period as three years? When I was instructed to draw the Bill I was not aware of the length of the line, and I simply took care to give them plenty of time.
18. In Bills which have been passed lately in regard to warrants of distress, certain exemptions have been allowed—such articles as workmen's tools, wearing apparel, beds, and bedding being exempt;—would you have any objection to that being provided for in this Bill? I do not think we have anything in the Bill referring to that. I assume that you mean warrants of distress issued by landlords upon tenants. That would apply, of course, assuming that the company erected houses that would be occupied by miners.
19. Refer to clause 35? That is a provision in which the company is authorised to take possession of the land for the purposes of the railway. If the owner refused to give possession, then by summary process they could invoke the aid of the sheriff.
20. *Chairman.*] Would anything in this Bill override the law in this respect? It does not touch the law of landlord and tenant in any way. We would have no objection to this Bill making working men's tools exempt, and also wearing apparel and bedding.
21. *Mr. Affleck.*] Under clause 3 a person wanting to carry goods over the line and providing their own trucks and engines would have to pay 2d. instead of 3d., is not that too small a reduction as compared with the amount to be paid by those who do not provide their own motive power, who have only to pay 3d.? The clause says not exceeding 2d., but it is not anticipated that there will be any traffic over the line except what is carried by the Railway Commissioners.
22. What will be the gauge of the line? Four feet 8½ inches.

---

John William Wilson sworn and examined :—

- J. W. Wilson. 23. *Chairman.*] What are you? Colliery manager.
- 17 Nov., 1897. 24. Are you the John William Wilson described in the preamble of the Bill as one of the promoters? Yes.
25. What is the extent of the coal land you propose to work? Between 600 and 700 acres.
26. What is the depth of the seam? The depth from the surface is about 100 feet.
27. What is its thickness? Five feet 8 inches of marketable coal. The seam altogether is 11 feet in thickness.
28. What output of coal do you expect from it? About 27,000 tons of large coal and 3,000 tons of small coal annually, bituminous coal.
29. How has the land been acquired? Under the 28th section of the Mining Act.
30. Have you any documents with you bearing upon the acquisition of the land? I produce the lease, with the plan attached, of the land which is to be worked.
31. Has the company yet been formed? There are three of us in the company.
32. And you propose to form it into a co-operative company to work the land? Yes.
33. Do you know of any objection to the construction of this railway line? I have not heard of any.
34. Have you any idea of what the cost of construction will be? I think it will cost about £3,500.
35. *Mr. Fegan.*] Why do you ask for such a length of time as three years within which to construct the railway? To get the company formed, and other preliminaries. We want to form it into a co-operative company.
36. Why do you ask for such a long period as three years? It should not take three years.
37. What do you think will be a reasonable time? I think the work should be carried out within two years.
38. The land is only 1 mile from Lithgow? Yes.
39. What distance is it from this land to the next colliery? The nearest one is the Hermitage Colliery, which is within half a mile. That is on the west side; on the east side is the Zigzag Colliery, that is within a mile, and the workings are within half a mile of this property.
40. What seam is it called? The Lithgow Valley seam.
41. Which has been worked by other companies? Yes.
42. So that the coal has been thoroughly proved? Yes.
43. You have a seam of 5 ft. 8 in. of good steam coal? Yes.
44. How many men will this mine employ? About thirty-five.
45. I suppose you have no idea yet as to what are the terms of the articles of association? No; I have no idea of that at present.
46. You have not got the capital at present? No.

47. You expect that under this Bill you will be able to raise sufficient capital to get the work done? Yes. J. W. Wilson.
48. Have you been a working miner yourself? I have been connected with mines all my life. 17 Nov., 1897.
49. Have you got a certificate under the Act recently passed? Yes.
50. Were you managing a colliery at that time? Yes; the Zigzag.
51. Working the same seam? Yes.
52. You would have no objection to a less time than three years being provided within which to make the line? No; two years would do.
53. You think it would not hamper the Company in any way? I should not think it would.
54. You have every reason to believe that if the Bill is passed you will get the necessary capital? Yes, I think so.
55. Have any other colliery proprietors objected to the passing of this Bill? Not to my knowledge.
56. *Mr. Affleck.*] Have those other two mines that you have mentioned got a railway connection? Yes; they have direct communication with the Great Western line.
57. Then you do not expect to get any traffic from them? No.
58. *Chairman.*] I presume that although you ask for three years in which to construct the line, you do not anticipate that it will take that length of time? No, I think two years will be quite sufficient; everything ought to be in good going order in that time.
59. There might be some delay in the formation of the Company, which would render a period of three years necessary? Yes; but I think that we can get the money straight away, as soon as the Bill is passed.
60. *Mr. Gormly.*] What would be the chief causes of delay of two years before you could open the railway;—would it be in connection with the construction of the railway or in the opening of shafts? It would be in connection with both; all the work could be carried on together.
61. You would require to sink shafts before you could utilise the railway? Yes.
62. Which would cause the greatest delay, the construction of the mine or the sinking of the shafts? I think it would all be carried out at the same time. It would not take long to sink a shaft—only about six months. It is only 100 feet, and very good sinking.
63. *Chairman.*] Do you propose to deal with the work of sinking the shaft and the construction of the railway both at the same time? Yes; as soon as the Bill is passed we can start with the shaft, and have it ready almost before the railway.
64. Could it all be constructed within twelve months? Yes.
65. *Mr. Arnott.*] You have had a great deal of experience in coal-mining? Yes; twenty-two years.
66. You know the whole of that district very well? Yes.
67. You are aware that the Bill proposes to give power to run the railway over certain roads? Yes.
68. Do you produce a plan of the district? Yes.
69. These roads that the line is to cross are not used, are they? Yes; they are used for day traffic.
70. There is a road from the Hermitage Colliery to M.P. 1, on the road between portions 41 and 5;—is that road used? That road is not used. We propose to cross that road between portions 41 and 5.
71. That part of the road is not used at all? No.
72. Are there any coal-shafts on the road? There is a little shaft, which Hunter and Wilson put down 40 feet.
73. Are there any shafts at the Farmers' Creek end of the road? There are no shafts, but there is a tunnel.
74. That in itself blocks the road, does it not? Yes.
75. This line is to cross the new road, is it not? Yes.
76. That is a road leading over to the Lithgow railway bridge, is it not? Yes.
77. Is that road used? Yes, it is.
78. Is there much traffic over it? A fair amount.
79. How often do you think your trucks will have to cross that road? Not more than twice a day.
80. The surrounding lands are all mining properties, are they not? Yes; they are used for mining and smelting.
81. Would the construction of this railway affect their operations at all? Not in the slightest degree.
82. Do you know what amount will be payable to the Crown in royalties if this mine is opened up? It would amount to £712 10s. per annum.
83. How much per ton? Sixpence a ton for shale and large coal and 3d. a ton for small coal.
84. That is set out in the lease? Yes.
85. It would also mean a considerable outlay for miners' wages? Yes, miners and other workmen.
86. The promoters do intend to open this coal mine, do they not? Yes.
87. Would it be any use for them to open this mine without having the railway? It would not be of any use.
88. The land would be absolutely useless without the railway? Yes.
89. Is it proposed to work this colliery with your own rolling-stock? No; the Railway Commissioners will work it.
90. So that the running on the line will be entirely under the control of the Railway Commissioners? Yes.
91. *Mr. Gormly.*] That is if the Railway Commissioners will undertake to run their rolling-stock on it? Yes.
92. There is no agreement between the proposed company and the Commissioners, or any promise? No; but the Commissioners work the colliery lines in that district. The trucks are brought to the mines and loaded, and the Commissioners take them away.
93. *Mr. Arnott.*] You asked for leave to run your own waggons to provide against such a contingency as the Railway Commissioners not supplying rolling-stock? Yes; but the Commissioners usually provide the rolling-stock in that district.

John Haydon Cardew sworn and examined:—

94. *Chairman.*] You are a licensed surveyor? Yes; and Associate Member of the Institute of Civil Engineers, London. 17 Nov., 1897.
95. You are aware of the object of the Bill before the Committee? Yes.
96. Have you surveyed the line of railway which it is proposed to construct? I have.

- J. H. Cardew. 97. *Mr. Arnott.*] You have had considerable experience in railway matters, have you not? Yes, I have.  
 98. I believe you are consulting engineer for the Zigzag Colliery? Yes.  
 17 Nov., 1897. 99. One of the largest collieries in the district? Yes.  
 100. You have also been engaged on many works for the Government? Yes. And I was employed quite recently by the Railway Commissioners in the McSharry arbitration case against the Railway Commissioners. I was also employed by the Railway Commissioners on the quadruplication of the Western Railway Line, and the proposed duplication to Goulburn.  
 101. You know the country over which this railway is proposed to pass? I do.  
 102. Have you carefully surveyed it? Yes.  
 103. Does the description in the schedule to the Bill correctly describe the land? It does.  
 104. I believe the plan produced was made from your survey? Yes.  
 105. That shows correctly the proposed route? It does.  
 106. Do you know as a matter of fact what roads this railway will cross over? Yes. First of all it crosses the new road to the bridge.  
 107. Is that road used much? Not a great deal.  
 108. The only other part where it crosses the road is near M.P. 1? Yes.  
 109. Is that road used? It is not used. It is not even marked out or made—it is an impracticable road. It goes over a mountain. That road is also blocked by the Hermitage Colliery, near Farmer's Creek.  
 110. What is the total length of the proposed line? About 1 mile.  
 111. Is it proposed to make the line on the same gauge as the Government railway? Yes.  
 112. What is the ruling grade? That question I have not really gone into yet; but I can say, approximately, that the steepest grade would be about 1 in 35. I think that that can be obtained with a little cutting.  
 113. That would be going up to the mine? Yes.  
 114. So that it will only be empties returning that will have to ascend that grade? Yes; the load will always be going down hill.  
 115. Do you know the nature of the surrounding country? Yes.  
 116. Is it used chiefly for mining purposes? It is used very little for anything but mining. It is very mountainous.  
 117. Would the construction of the railway interfere with the mining operations of the adjoining mines? Not in the slightest.  
 118. Could the coal-mines on M.P. 1 be worked on a commercial basis at all without the construction of a railway such as is proposed? No, they could not.  
 119. The land would be practically useless without the railway? It would be valueless without a railway to take the minerals away.  
 120. What do you estimate will be the cost of making the railway? About £3,500. I have not taken out a detailed estimate, but I think that that would about cover it.  
 121. How long do you estimate it would take, in ordinary working, to make the line? Three or four months.  
 122. Do you know how long it would take to put down the shaft upon M.P. 1? I have not gone into that question yet.  
 123. We have been told by a preceding witness that the coal lies at a depth of 100 feet;—can you form any idea how long it would take to sink a shaft? They will not sink a shaft, but drive in an adit. They will have to go 300 or 400 feet.  
 124. Is it not proposed that you shall be the consulting engineer for these mines? I cannot say. I am consulting engineer for the railway. I do not know whether they will engage me for the mine itself.  
 125. The line, as proposed, presents no engineering difficulties? None at all.  
 126. *Chairman.*] As far as you know, the construction of the line will not in any way interfere with the existing rights of private individuals or of the State? No; I cannot see that it will interfere with the rights of private individuals or with those of the State either.  
 127. *Mr. Gormly.*] Have you made an estimate of what the line could be constructed for with a grade of 1 in 50? No.  
 128. Would it be practicable? I have not made a detailed estimate of the cost at all.  
 129. Would it be possible, at a reasonable cost, to construct a line with a grade of 1 in 50? No; it would not be possible, owing to the nature of the country. You could not do it without zigzagging all over the country.  
 130. You are of opinion that it is not possible to make the line at a lower grade than 1 in 35? Not at a reasonable cost.  
 131. *Chairman.*] Are you responsible for the drawing up of the schedule of the Bill containing the description of the land? I wrote the description of the land.  
 132. Is it not usual to give the name of the county in the schedule? Yes.  
 133. You would have no objection to the schedule being amended to that extent? No; I believe the county was mentioned in my description.  
 134. *Mr. Fegan.*] You say that you are consulting engineer for the line? Yes.  
 135. Is it not strange that you are not able to give us something definite as to the grades;—you have produced a plan which shows grades of 1 in 30 and 1 in 32? Those are only pencil-marks.  
 136. Is not that to give the Committee an idea of the grades? No, not at all. They were put on for my information. I brought the plan with me as being all the information that I have at my disposal.  
 137. Do you not think that you ought to be able to give us definite information in regard to the grades? The line has not been finally staked out.  
 138. So that the Committee cannot go by this plan? As far as the land is concerned which will be required for the purposes of the line you can go absolutely by the plan, but not as to the grades. They have not been detailed yet. The position of our works at the pit bank will determine them to a great extent.  
 139. Is the plan produced in accordance with the schedule to the Bill? Exactly; but there is nothing about grades in the Bill.  
 140. Does not a great deal depend upon the grade? Yes.

141. Do you not think that the Committee ought to have more information about them? It is for the Committee to say. J. H. Cardew.

142. I am asking you? I do not think so. 17 Nov., 1897.

143. You are asking for three years to make the railway;—if you were going to make it with a better grade would it take longer? Yes; but it would not be practicable to make it 1 in 50.

144. Do you think that three years is too long a period? I do not know anything at all about the time mentioned in the Bill, I have not seen a copy of it.

145. *Mr. Affleck.*] You say that the grade will not be over 1 in 30? I think it quite possible to obtain a grade of 1 in 35.

146. *Mr. Gormly.*] Would you be prepared to state, for the information of your principals, that the line could be constructed with a grade of 1 in 35? Yes.

147. *Mr. Fegan.*] Will the proposed railway be within the Lithgow municipal area? I am not acquainted with the municipal boundaries of Lithgow; but I think it must be within the municipal area.

148. Have the municipal council raised any objection as to the right of way? I have not heard of any objection.

149. Would not the railway interfere with the traffic on their streets? It crosses the road approaching the bridge across the railway at Lithgow station; but it is a very common thing at Lithgow to see railway lines crossing the streets.

150. At what point do you connect with the Western Line? About 300 feet to the east of the Lithgow station.

151. *Mr. Edden.*] Do you know whether this company has got any private land there which, after the opening of this line, they will be able to cut up and sell in allotments to the men that work at the mines? I do not think they have.

152. *Chairman.*] As far as you know, the line is wanted solely for the purpose of developing the coal-mine? Yes, as far as I know.

153. *Mr. Gormly.*] Would it be convenient for the workmen to live at Lithgow? Yes; it would not be a mile away.

William Wiley sworn and examined.—

154. *Chairman.*] You are aware of the object of the Bill into which the Committee is inquiring? I am. W. Wiley.

155. Are you the William Wiley mentioned in the preamble of the Bill? I am. 17 Nov., 1897.

156. *Mr. Arnott.*] You are one of the promoters of the Bill? Yes.

157. And with the other two promoters you intend opening coal-mines on M.P. No. 1? I do.

158. And to do that will necessitate an expenditure of a considerable sum of money? It will.

159. And that money will be thrown away if a railway such as the one proposed is not constructed? We could not develop the colliery without the railway.

160. The land would be useless without the railway? Yes.

161. It would be impracticable to open coal-mines there without a railway to get the coal away? Yes.

162. In opening this colliery, and in constructing a railway such as is proposed, I suppose, that large sums of money will have to be expended? Yes; about £9,000 altogether in making the railway and opening the mine.

163. If these mines are opened it will mean a further outlay of money, will it not? There would be a large amount paid in wages.

164. All this money will go to people in the Colony, will it not? Yes.

165. Therefore it will benefit those people? Decidedly.

166. Do you or your co-promoters own any other land in the district? Not that I know of.

167. *Mr. Edden.*] You are not certain? I am pretty certain. I have never heard them speak of any.

168. *Mr. Arnott.*] You own none? I own none.

169. This mining lease was obtained some time ago, was it not? It was obtained this year. It is a mining permit.

170. Have you had some correspondence with the Mines Department in connection with mining under this piece of land? Yes; and more particularly with that adjoining it. An application was made under the 28th section for power to mine under the road approaching this land, as shown on the map; application was also made to the Lands Department for permission to occupy the surface of a portion of the road adjoining this land.

170½. What was the result of these applications? In both cases the Lands Department advised that it would be better, as we had to cross over private lands, to get a Bill passed. The Mines Department advised the same course.

171. Do you know the country over which the line travels? Yes.

172. Do you know what it is used for? It is a poor bit of country. There are a few cows on it. It is rented at £30 a year for 100 acres, with about 200 acres alongside of it.

173. Are mining operations being carried on under this land? No.

174. If mining operations were carried on, would the proposed railway affect them in any way? I think not.

175. *Chairman.*] The land is coal-bearing, is it not? It is very shallow. The coal outcrops at one corner, and at the extreme end it is not very deep.

176. You know that road near M.P. 1, where the line proposes to cross it? Yes.

177. Is that road used at all? No, not at all. It is not used from one end to the other in any portion. It is occupied with screens in one part.

178. *Mr. Fegan.*] What is your profession? General agent and land valuer.

179. You are one of the promoters of the company? Yes.

180. Do you not think that for an expenditure of £3,500 three years is too much time to ask for? I dare say it is. Probably two years would be ample.

181. You have no objection to its being made two years? No; but it takes a little time to put things in train.

182. *Mr. Edden.*] You want only two years to construct this line of railway? It takes some little time to put things into proper order. There is the arbitration business to be gone through in taking the land. Time must be allowed for that; you cannot rush these things.

183. You think two years would be sufficient? Yes.

- W. Wiley. 184. I suppose it is your intention to float a company? No, I think not.
185. You are not sure? I am not exactly sure as to the system, but we know we can carry out the work.
- 17 Nov. 1897. 186. You are not certain but what you will float a company? No.
187. *Chairman.*] You call it the Lithgow Co-operative Coal Company's Railway? Yes.
188. Whatever company is formed will be on the co-operative principle? That is the intention.
189. *Mr. Edden.*] It is the intention to form a company? Yes.
190. Suppose you fail? We shall have gone to a lot of expense for nothing.
191. You will not go on with it if you do not form a company? I do not say that; we may be able to finance it ourselves, and probably should.
192. You have definitely stated your intention to form a company;—how many shares will there be for the public to take up? It is impossible to say at present.
193. You say that the undertaking will entail an expenditure of about £9,000. Surely you ought to be able to tell us how many shares you will offer to the public. I suppose you have not yet decided how many promoters' shares there will be? No; a lot of expense will be incurred. We have to find out what the expenses would be.
194. The solicitor was asking you something about benefiting the community. In the preamble of the Bill it says, "And whereas the said coal-mines are likely to prove beneficial to the Colony"; how do you think they will prove beneficial even to the promoters or the shareholders seeing that coal is selling at 4s. 10d. per ton;—how do you expect to get a profit? It is 4s. 3d., because the colliery proprietors charge that. If they charged more they could get it.
195. I suppose you have no idea what wages the men make? If they are working full time they would make a reasonable wage. I do not say that it should not be better, but if they were working continuously the wages would be satisfactory.
196. They are not working continuously? I think the mines are nearly all overmanned.
197. Too many men, and consequently they do not work full time? No.
198. If you get your mine developed will it be the means of making the men work more time? There is an increase in the trade at Lithgow. There has been a large increase during the last few years. A large quantity of coal is used for smelting purposes. There are some big smelting works at Lithgow.
199. I want to know how this coal-mine is going to benefit the public, seeing that the coal-mines at Lithgow are not working full time;—will it not be the other way about? I do not think so. There is a big market for coke at Lithgow which has not been utilised at all.
200. Would you make all your coal into coke? I do not say all, but some of it. There is a fine opportunity there now which is being neglected.
201. Of course, you must have gone into the whole business? Of course, if I thought the thing would be a failure I would not have gone into it.
202. How much do you expect to sell the coal at per ton? That is very hard to say.
203. Suppose things remain as they are for the next four or five years, coal being 4s. 3d. per ton at Lithgow, do you think it is possible for you to open a mine, form a company, and benefit the public? I say that there is a trade there that should be supplied. Coke is wanted for the western mines.
204. I suppose you make the coke from small coal? Yes; but there is no reason why they should not make it from large coal.
205. But you would not pay the price for large coal and then crush it into small? There is no reason why you should not do it.
206. Do they do that elsewhere? Yes; in some parts of England.
207. Where in England? I could not tell the colliery, but they do it in certain cases, and there is no reason why they should not.
208. Considering what the prices are, do you think it is possible for you to form a company, to call upon the public to take up shares, and to ensure that it will be a success? I think there is every possibility of it.
209. You say there is a trade at Lithgow? Yes; that is one item.
210. Who would consume the coal at Lithgow? Nobody.
211. Where would it go to? To the western mines, which are opening up very freely at Cobar, Nymagee, and in that locality. The coke trade is increasing very fast, and coke is being sent to Broken Hill from Illawarra.
212. If it was not for the coke business you would not open this mine? There is a chance of a fair development in the coal trade. It has been increasing for the last two years.
213. In clause 3 of the Bill it says:—
- The railway shall when constructed be open to the public use upon payment of a toll to the company of a sum not exceeding three pence per ton per mile on freight for every transit.
- Do you not think that that is an exorbitant charge? It is the usual formula that has to be put into Bills of this kind. A clause could be put in if necessary stating that under no circumstances should more than a certain profit be obtained. The Government will use the line solely.
214. You say that you have no other land about this line? No.
215. And none of the other promoters have any? No.
216. You say definitely that it is not the intention of the company to cut up land into blocks for sale? Certainly not.
217. *Mr. Affleck.*] You say that you are perfectly agreeable that the three years within which the line is to be constructed shall be made two years? Yes.
218. *Chairman.*] In case of arbitration proceedings occurring that would make a delay, would it not? I think so. There might be many things that would delay matters, but two years ought to be sufficient time.
219. Touching the question of the opening of this mine being beneficial to the public;—do you consider that any development of mineral wealth is directly or indirectly beneficial to the public? It must be in one way or another.
220. Have you proved the quality of the coal on this land? It has been proved on either side of it. This coal is below the surface.
221. Lithgow coal is very good for coke making? Yes, very good indeed.
222. Is there not a great deal of coal from Lithgow being used on the railways? Yes.
223. Is the demand increasing? It has been increasing considerably during the last three years.

224. Do you think it is at all likely with the population increasing that things will remain as they are now at Lithgow? As a matter of fact, the establishment of smelting works has made things move along very fast in the western mines. Lithgow seems to be the spot at which they do their final refinement of the ores. W. Wiley.  
17 Nov., 1897.

225. In your opinion, is there likely to be any increase in the demand for coal from the western mines? I feel confident that there will be.

226. You think, at any rate, that there is a fair prospect of this venture proving successful? I do indeed.

WEDNESDAY, 24 NOVEMBER, 1897.

Present:—

MR. GORMLY,  
MR. AFFLECK,

MR. FEGAN,  
MR. HAWTHORNE.

J. A. HOGUE, Esq., IN THE CHAIR.

John Sydney Cargill sworn and examined:—

227. *Chairman.*] You are an officer in the Crown Solicitor's Department? Yes.

228. Have you been furnished with a copy of the Bill? Yes.

229. Have you seen the Crown Solicitor about it? I have spoken with him in reference to the matter, and I have read the Bill. J. S. Cargill.  
24 Nov., 1897.

230. Are there any provisions of the Bill to which you think exception can be taken;—any which in any way clash with the existing law? No; I see nothing that clashes with the existing law.

231. Is there any respect in which you think the Bill might be amended in any point affecting the public interest? There is one point. Under clause 45 it is provided that, unless the railway is completed and brought into use within three years, the rights and privileges of the Company shall cease. There does not appear to be any provision as to whether the railway, or such portion of it as may have been constructed, should be forfeited or not. Of course, it may not be considered necessary, inasmuch as the Company is, in the first instance, bound to purchase the land over which the railway is constructed. At the same time it might be desirable, in the interest of the community generally, that the Railway Commissioners should have some right with regard to the line or such portion of it as may be completed.

232. Is there any such provision in any other Act? Yes; it is in the Capertee Act, clause 49, which says that if the line shall be unworked for one year continuously it shall be competent for the Railway Commissioners to take possession of the same on paying compensation.

233. Is there anything whatever in reference to the public interest that the Bill touches in regard to which the Bill needs amendment? No; I do not see in it any unnecessary interference with public rights.

Henry Deane sworn and examined:—

234. *Chairman.*] You are Engineer-in-Chief, Railway Construction Branch? Yes.

235. Have you been furnished with a copy of the Bill? Yes, and I have gone through it carefully.

236. Have you any suggestions to make with regard to it, or any objections to it? I object to the form of the Bill very much. There are a great number of clauses that want alteration—in fact, the whole of the Bill almost, in my opinion, wants redrafting. It is a great pity that it was not drawn up in the form of one of the more recent private railway or tramway Bills. During the last six years, or even more, we have paid a great deal of attention to the wording of the provisions of private railway Bills, and a satisfactory result has been obtained without the infliction of any hardship on the promoters, and I think that if this Bill had been drawn up according to the form in which more recent Bills have been drawn up there would have been no objection to it. As it is at present there are a great many omissions; there is nothing in the Bill about gauge; there is nothing about inspection, nor the passing of plans for works; there is nothing about the width of the land required; there is nothing about the payment for or leasing of Crown lands. There is a provision for land to be acquired by the promoters without formal transfer or conveyance, which, as matters are at present viewed, is very objectionable. Then the land resumption clauses are not as complete as they should be, and there is no provision for resumption of the railway by the Government, as is usual in all these Bills. The Government may not want to take the line, but it is usual to have a provision of that kind; and, finally, I have been trying to make out the course of the line from the Schedule, and I find that the Schedule is not sufficiently descriptive. I sent one of my officers to see Mr. Wiley about the matter, but he was not able to catch him. The Committee will notice that in one or two places where curves are mentioned, it does not state which way they turn. The length and bearing of the previous straight is given, but it does not say whether the curve bears to the right or the left, so that it is impossible to mark the line on any plan from the description given in the Schedule. I should recommend that the Bill be almost entirely redrafted on the lines, say, of the Simpson's Railway Act, on which a great deal of attention was bestowed, or upon the lines of one or two of the later Bills, which would probably meet the same object.

237. It is rather to the form of the Bill than to the substance that you object? It is both to the substance and the form.

238. One objection that you take to the Bill is that there is no provision made about the gauge? Yes.

239. Will you state in detail the objections that you have to some particular clauses? The objections are so numerous that I find it rather difficult to enumerate them. I have mentioned some of the particular points which I find are not attended to in the Bill; but there are other points about which, if the Bill were put into proper form, one would have something—say, for instance, clause 12, about over-bridges and under-bridges. I am not at all clear that the provisions made in clause 12 are proper ones to make, for the reason that I have not been able to trace the line on any plan. Therefore, I do not know whether the roads are properly dealt with. It would be impossible, at a moment's notice, to say whether the provisions for the width and headways are sufficient. If it were not perhaps going further than I am asked to go I might suggest that it would really save the time of the Committee if the Bill had a thorough overhaul by the

H. Deane. the solicitor, and I should be very happy to give any assistance in the matter if the promoters' solicitor will come to me, but this Bill is so imperfect, according to modern ideas, that it is impossible to deal with it, and I think it can best be dealt with in the way I have indicated. Possibly the preamble is correct, and some of the clauses.

24 Nov., 1897.

240. *Mr. Affleck.*] What Act do you propose that they should take as a model? Simpson's Railway Act is one of those which has had the most attention bestowed upon it.

241. *Chairman.*] Would you be prepared to go through the Bill with the solicitor, and suggest the necessary amendments? Yes; I shall be very pleased to see him. The Capertee Tramway Act is more in accordance with what is required. This Bill is quite different from the Capertee Act; for instance, that Act gives authority to construct and inspect in clause 1; gauge, levels of lines, repairs, &c., clause 2. The only thing I have to add is that in addition to what has been provided in Simpson's Act, and I think in the Capertee Act, there should be provision to allow the Government to open roads across the line at any future time without claiming compensation for interference. Of course, the promoters will not object to anything of that sort.

Jasper Gaze Wiseman sworn and examined:—

J. G.  
Wiseman.

24 Nov., 1897.

242. *Chairman.*] What are you? I am Council Clerk to the borough of Lithgow.

243. Have you seen the Bill? I have not.

244. Are you aware of its general purport? I believe it is to provide for a siding from the Lithgow platform, on the north side, to portion M.P. 1.

245. Then you do know the general purport of the Bill? I do.

246. You know that it is a Bill for the construction of a line from the railway to the Co-operative Company's coal-mine? Yes.

247. Is there any objection to the line on the part of the Lithgow people? No.

248. *Mr. Gormly.*] Do you know whether the line has been surveyed? I am informed that it is, and I have seen the survey-pegs.

249. *Chairman.*] Has the matter been before the Municipal Council of Lithgow? No.

250. Has it been spoken of there? No.

251. Do you know what the opinion of the people of Lithgow is as to the propriety of constructing this line? I do not think there is any objection to it; the only people who could object are the proprietors of the land over which the line is to go.

252. I suppose that you would be in a position to hear the objections if there were any? I should be most likely to hear them.

253. *Mr. Gormly.*] Do you know whether there is any objection to the proposed mode of crossing any of the roads? No.

254. Can you tell the Committee what effect the line would have on existing roads? I do not think it would delay the traffic.

255. Do you know how it is proposed that the line shall cross the roads? By level crossings, I understand.

256. *Mr. Fegan.*] Do you not know? I do not know where the line will cross the roads exactly, but they gave me to understand that it was to be ordinary level crossings, the same as the others.

257. Who gave you to understand that? The proprietors.

258. Have you been in conversation with the proprietors about it? Yes.

259. But you have not seen the Bill? No.

260. *Mr. Gormly.*] Have you seen the plans of the proposed line? I saw one this morning.

261. You had not a plan before you when you had a conversation with the promoters as to where the line would cross the road? No; they showed me on the municipal map the line approximately.

262. *Chairman.*] Do you know the road marked on the plan which the line is proposed to cross? Yes.

263. Is there much traffic? Similar to what there is on all the other main roads of the borough. We have other lines crossing the roads in the borough in exactly the same way, and it has not been detrimental.

264. *Mr. Hawthorne.*] Would there be sufficient traffic to necessitate someone being kept at the crossing to warn people of the approach of trains? I suppose the traffic there would be the same as the traffic on any other line. About twice a day is the average number of trains, and it does not incommode the street traffic at all.

265. *Mr. Fegan.*] Do you know where the pit's mouth would be? Outside the boundary of the borough. The whole of the land is outside the municipal area, but the line is to pass through the municipality.

266. Some councils have way-leave;—have you any suggestion of that kind? We could only deal with the line. The way-leave could only affect the coal-mine where the screens and the output of coal came into the municipality. The coal is obtained outside the municipality. We could not rate the mine, but we could rate the coal which comes out of the mine. That is the point of dispute between municipalities and the owners of mines. We rate the screen, the area of land, and the buildings to which the coal is brought within the municipal boundaries. We assess this at an annual rental, based on the output of coal. When the coal itself comes from beyond the municipal area, we argue that the value of the screen is so much decreased owing to the extra cost of bringing the coal there, then the way-leave is charged.

267. The Municipal Council of Lithgow has a Bill before Parliament? Yes.

268. What would the effect of that Bill be if this Bill passes;—will that Bill operate on this? Not at all.

269. Would any provision of this Bill have any effect upon it? It could not.

270. You say that you never saw this Bill? No, I never saw it.

271. Are you here to give evidence on a Bill that you never saw? I do not know what evidence is required from me. I was simply asked to come here. I have here a letter asking me to come. The letter says: "Mr. Wiley, one of the promoters of the abovenamed Bill, requests me to write and ask you to be good enough to attend before the Select Committee on such Bill, at the Legislative Assembly Chambers, Macquarie-street, Sydney, on Wednesday next." That was signed by the solicitor for the Bill.

272. You are asked to give information with regard to a Bill that you never saw? Yes.

273. You do not know whether it will be in conformity with the Bill that you have before Parliament? It could not interfere with it; they are so diverse. The two Bills could not clash.

274. If the Bill gave power to the Company to take in three or four streets, do you think that the people of Lithgow would be against that? Certainly.
275. How do you know that there is not such a provision in the Bill? I cannot possibly know when I have not read the Bill. I am told that it is to give power to erect a tramway, a plan of which I have seen. As far as I know the people have no objection to it.
276. *Mr. Affleck.*] Suppose that when a tramway has to cross certain roads or streets in the municipality over which there will have to be level crossings, do you think the people will object to the tramway being constructed on that account? Not on the north side. If the tramway crossed one main street the people would object.
277. Does it cross any particular street where they would be likely to object? No.
278. *Chairman.*] Are there any other tramway lines running into Lithgow? There are five other tramway lines crossing the roads.
279. And no objection has ever been made to them? They were constructed before Lithgow became a municipality.
280. Are they in any way detrimental to the progress of Lithgow, or do they contribute to it? They contribute to the progress of Lithgow.
281. Would such a line as this contribute to the progress of Lithgow? I think so.
282. *Mr. Fegan.*] Are the colliers at Lithgow working full time? Pretty nearly full time. I seldom see idlers in the streets now, and that is the best test.

J. G.  
Wiseman.  
24 Nov., 1897.

THURSDAY, 2 DECEMBER, 1897.

Present:—

MR. HOGUE,		MR. MACKAY,
MR. AFFLECK,		MR. EDDEN.

J. A. HOGUE, ESQ., IN THE CHAIR.

William Arnott, Esq., of Messrs. Arnott and Reynolds, Solicitors, appeared for the promoters of the Bill.

William Arnott further examined:—

283. *Chairman.*] Since the Committee last met I understand that you, in conjunction with the Engineer-in-Chief of the Construction Branch, Public Works Department, have gone carefully through the Bill? I have.
284. And various alterations have been made in the Bill? Yes; at Mr. Deane's suggestion.
285. Those suggestions are now embodied in the Bill before the Committee? Yes.
286. What is the general tenor of the amendments? The general tenor of the amendments is to make the construction of the railway and the working of it after it is constructed subject to the approval and direction of the Railway Commissioners and their officers.
287. Are you aware whether they approve of the Bill as it now stands? I saw Mr. Deane on Monday morning, and he told me that he would approve of the Bill as amended. The Bill made it compulsory on the promoters, if they were allowed to make the railway, to make it in a certain way, the bridges to be of a certain height and width; but all that is done away with now by leaving it to the direction and approval of the Engineer-in-Chief for Railway Construction. Some provisions have been taken out of the Bill, and others have been put in.
288. *Mr. Affleck.*] It was understood that the clause which provided that the railway was to be made within three years was to be altered, three years being thought too long a time? I understood that that was an alteration which the Committee themselves proposed to make. We have no objection to it.
289. *Chairman.*] There is provision made amongst the amendments for the width of gauge? Yes; the gauge is to be the same as that of the Government railways.

W. Arnott.  
2 Dec., 1897.

Hugh McLachlan sworn and examined:—

290. *Chairman.*] You are Secretary to the Railway Commissioners? I am.
291. You are familiar with the objects of the Bill before the Committee? Yes.
292. You see the amendments that are suggested in the Bill before you? Yes. In going through the Bill there were a number of things which it seemed to me should be provided for. In the first place, the railway should be made to the satisfaction of some responsible officer, and the rolling stock should be subject to approval. I see that these things are provided for in the amendments now in the Bill.
293. Will now clause 9 be all that is required with regard to the rolling stock? Yes; it is not very likely to be required, but it is a good one to have in the Bill. I expect that the Company will not have any rolling stock of its own.
294. Have you seen the provision with regard to the gauge? Yes. There is a provision in lines 20 to 25, page 3, which is new to me. It seems quite unnecessary to put in a provision like that. It is not usual, because the Company has its remedy at law. If ever anything happens, it might be imagined that there was something more in it than an ordinary ground of action.
295. It does not give anything beyond the ordinary common law rights? It is unnecessary, and it would be wise to leave out the whole of that proviso. It is liable to lead to misunderstanding. I notice also in another clause there is power given to make a branch railway, and this branch railway could run anywhere—it might be possible for the Company to make a branch railway that would compete with the Government railway. I think it is wise to provide that even a branch railway should have the approval of the Governor-in-Council. Some of the old Acts provide that a branch railway shall not be made parallel to a Government railway, but if you put in the Bill that it shall only be made subject to the approval of the Governor-in-Council that will make it all right. The most important clauses to the Railway Commissioners are those in regard to the connections, and I think that clauses 38, 39, and 40 provide for all that is necessary. I see that power is provided for the Government to purchase. I have suggested once or twice that another provision should be put in Bills of this sort, that is, that if a line is not worked for a certain period it should revert to the

H.  
McLachlan,  
2 Dec., 1897.

H. McLachlan. Crown. The clause which I am referring to is in Simpson's Railway Act, and I think it is in the Capertee Tramway Bill. I would suggest that it be put in this way: That the line shall revert to the Crown if it is not worked for a period of twelve months. There is one weakness in regard to the appointment of inspectors. Power is given to the Railway Commissioners to appoint persons to inspect and examine rolling stock, buildings, and all sorts of things; but there is no penalty provided. We may find a line in a most defective condition, but there is no penalty to compel the Company to remedy it. There is no obligation on the Company to repair any defects when they are pointed out. If the Commissioners require certain things to be done, they cannot enforce it.

2 Dec., 1897.

296. In the second clause there is a penalty for neglecting to carry out repairs, &c., will that meet the case? I think that perhaps the provisions of new clause No. 2, which it is proposed to add, may be sufficient.

297. *Chairman.*] Is there anything else that you object to? No; as far as the policy of the line is concerned, the Commissioners see no objection to it. Our interests seem to be properly protected. The promoters have no powers on our line, and we have power to make whatever provision we find necessary with regard to junctions.

Henry Deane further examined:—

H. Deane. 298. *Chairman.*] I understand that since you last gave evidence you have gone through the Bill with the solicitor of the promoters and suggested certain amendments? Yes.

2 Dec., 1897. 299. Does the Bill now embody all your views with regard to this proposal? I think they fairly meet my recommendations.

300. Have you any further suggestions to make in regard to the Bill? I think it fairly meets the objections which I pointed out. I think it will be sufficient with regard to the schedule, if you give the bearings of the chords. The description now produced does that.

301. *Mr. Affleck.*] Would you substitute the description now produced for the schedule in the Bill? Yes; I think it may fairly be taken as meeting the case.

John Haydon Cardew further examined:—

J. H. Cardew. 302. *Chairman.*] Have you prepared a new schedule for the Bill? I have.

303. Is it the one now produced? Yes.

2 Dec., 1897. 304. There is a difference between that amended schedule and the one in the Bill? There is no difference, as far as the land is concerned, but there is an addition. I have quoted in the description the bearings of the chords. I believe that Mr. Deane made some objection to it. From a surveyor's point of view, they are not really required; but from an engineer's point of view they are.

305. Do you produce a plan for the information of the Committee? Yes; the description which I have just referred to is a description of the land edged red on the plan.

1897.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

**GOVERNMENT LABOUR BUREAU.**

The Superintendent, Government Labour Bureau, to The Minister for Labour and Industry.

Sir,

Sydney, 9 September, 1897.

I have the honor to submit the fifth annual report of the Government Labour Bureau for the year ending June 30th, 1897.

I am pleased to be able to report what may be considered a very marked improvement in the number and condition of the unemployed generally for the year as compared with the one preceding it.

In the following table will be noticed a considerable diminution in the numbers for the year:—

	Previous year.	Year ending 30 June, 1897.	Decrease.
Average daily registrations.....	36.65	21.43	15.22 per day.
Average weekly number of unemployed working on the different relief works about Sydney.....	1,570	106.2	1463.8 per week.

It may be mentioned in connection with the latter item that the winter of this year was not so severe as that experienced in the previous one. The decrease is, nevertheless, a most significant one.

From the number employed on relief works a fairly reliable estimate may be formed of the probable number of destitute unemployed in and around the metropolis. It should, however, be borne in mind that the numbers quoted for both years do not represent so many individuals, but the number of working orders issued to men for the specified periods, some receiving one, two, or three days a week, in accordance with the family scale regulating the working time. But there can be no mistaking the comparison, as showing the improvement in condition and number of unemployed for this as compared with the previous year.

The same improvement is observed in the country districts of the Colony. Last year the sum of nearly £2,000 was expended by the Government in £ for £ moieties to the different country municipalities, to assist their destitute local unemployed. This year no such special amounts were granted, nor were they asked for.

The reports from the agents of our country branches all indicate a distinct improvement generally throughout the Colony, especially when the large increase in the revenue of the Railways (*vide* the Commissioners' last report) is also considered.

When it is remembered that during the first four or five months of 1897 the whole Colony suffered from a severe drought, casting a gloom all over the country, and creating great loss of stock, crops, &c. ; causing stagnation in all avenues of labour and industry, and resulting in dearth of employment, the foregoing facts and figures unmistakably indicate a marked improvement in trade and commerce generally throughout the Colony, and in the number and condition of the unemployed, both in the city and country at the present time.

It is safe also to anticipate a continuance of this improvement. From all parts of the interior there is evidence of the beneficial effects of the late rains, which with increased cultivation justifies the confidence of many that the approaching season will prove the most prolific known for many years.

From latest reports agricultural, pastoral, and mining industries are reviving, and will absorb the bulk of all unemployed able and willing to work caused by the late drought.

### Relief Works.

No doubt the drought was the cause of creating and increasing the unemployed in the country, a large number of whom, induced by the reports that relief works were being started in Sydney to alleviate the distress of the destitute unemployed, flocked to the metropolis in the hope of securing a share; and which there is every reason to believe also had a similar effect in inducing many unemployed from adjoining colonies to come to Sydney with the same hope; thus swelling the ranks of our own local unemployed to a much larger degree than would otherwise have been the case.

It is a most singular fact that the majority of these men will remain here so long as they can possibly earn a bare existence, preferring to enjoy the excitement of city life rather than return to the country. This has been proved repeatedly by numbers of men refusing legitimate employment in the country, and preferring to wait their turn once in six or eight weeks on the relief works.

It is, therefore, questionable if these temporary means of assisting the destitute unemployed are of much genuine benefit to them, excepting perhaps in the cases of married men with large families, whose circumstances will hardly permit them to go to the country; others too old; and numbers of clerical and professional men unfitted for hard manual labour, such as is required in country pursuits.

### The Building Trade.

It is to be regretted that the building trade, which is generally a reliable index of the condition of the labour market, is still and has been for some time very much depressed.

If the erection of the City Markets be excepted, very few buildings of any note, either public or private, have been erected during the year which would give employment for any length of time. This inactivity has had the effect of a reduction in wages, and has caused many of our best mechanics to leave the Colony with a view of bettering their condition in Western Australia and South Africa, in which some have succeeded, while others have returned poorer but wiser men.

The cause of the depression in the building trade is due chiefly to its having been overdone during the period of the late memorable land boom, when speculation in land, and the erection of buildings in the city and suburbs, far exceeded the demand. To the bursting up of the land boom, and the numerous financial societies it brought into existence, together with a series of ill-advised industrial disputes, may be attributed the chief cause of the severe depression in all branches of labour and industry from which the Colony has suffered for years. It is not the want of capital that we are suffering from, but the want of confidence. There is plenty of money, but a lack of enterprise through the want of confidence.

There is, however, evidence that the country is on the "up grade" again; and if the industrial classes will only use their experience and common sense in their own interests, confidence between capital and labour may again be restored to their mutual advantage.

### Number of Unemployed.

The number of men apparently unemployed daily seen in and around this city is not a fair criterion of the actual state of the labour market generally.

In all large cities, and especially where the Parliament and Government sit, there can be seen at all times a number of men professing to belong to the unemployed. Amongst these, especially in winter when work is slack, are a number of genuine working men, who really desire work and anxious to secure it in the interests of their families. But there are also a number of those who seldom if ever work or desire it. How they live can only be imagined, yet they seem to fatten on idleness and mistaken charity. Their chief trade and calling seems to be in button-holing Members of Parliament and appealing to the Government for relief works about the city. And while they can get a few days on wages at these works, they frequently refuse legitimate employment in the country.

The attractions of Hyde Park and city life are too much to give up by this section of the unemployed. These are invariably the men who make the most noise and give the most trouble to the Labour Bureau; and who only degrade their genuine fellow working men.

So far as I am able to judge, there are not more than from 3,000 to 4,000 genuine unemployed in Sydney and the suburbs at the present time. It is a most difficult matter to form an accurate estimate of the probable number of genuine unemployed, as a great many of the men attending here receive occasional work now and then, and cannot for that reason be classified as strictly unemployed; and in the 3,000 to 4,000 mentioned a great proportion of this class is included.

The average daily attendance of unemployed at the Bureau is from 150 to 400, excepting when a selection takes place of men for relief works. On such occasions, the attendance is doubled at least. They come and go all day in the hope of getting something to do. The conduct of the unemployed about the Bureau is generally good, excepting when induced and led away to mischief by agitators who lack the courage to "face the music" themselves.

## Fossickers.

The recent drought interfered to a large extent with fossicking and gold-mining all over the Colony.

The industry is of little use unless there is an abundance of water; and owing to the dearth of same, fossickers, and in some cases mines, were compelled to discontinue work.

For the year, only 1,647 men from the city and country were sent to different parts of the Colony fossicking. The preceding year 5,209 men were sent; showing a decrease this year of 3,562.

As a recognised industry fossicking has been in operation for the last four years, during which time no less than 25,707 men have been assisted and sent all over the Colony. Several have done well, others fairly well, and others have made just sufficient to live.

A man recently called at the Bureau to refund the cost of his railway fare, and stated he and his mate joined a party who were working some ground in the Parkes district, which had been abandoned some twenty-five years ago. After sinking only 3 feet a very rich reef was struck, for which they had been offered £14,000 cash and 6,000 shares by a company that wished to buy them out.

Another man called a short time ago, also to refund the cost of his pass, and stated he left here on 23rd May last for Cooma, where he had succeeded very well at fossicking, and had come down to Sydney for a trip. Two old fossickers, who had made sufficient to take them over to Western Australia, recently sent a draft in payment of passes issued them by the Department. They stated they were doing well, and had not forgotten the assistance given them by the Bureau when they were hard up and needed it most.

A large number of men have combined fossicking with other work, have sent for their families, and settled down in the country. In this way over 700 families have been sent to join them.

It is worth noticing that the value of gold won in the Colony since the fossicking system was introduced by the Bureau has on the whole steadily increased, as the following totals will show:—

Year.	Oz.	Value.		
		£	s.	d.
1891	153,336	558,305	12	3
1892	156,870	569,177	17	4
1893	179,288	651,285	15	8
1894	324,787	1,156,717	7	7
1895	360,165	1,315,929	0	0
1895-6 (intermediate period)	111,024	402,590	0	0
1896-7	275,285	1,014,077	2	3

## Wages.

The rate of wages offered at the Bureau was about the same as last year. In some callings there has been a slight reduction.

The Bureau does not, as is generally known, interfere with the terms or conditions of employment. Its main object is to bring employers and workmen together, leaving it to the parties themselves to make their own arrangements.

In cases, however, where an employer offers what is considered a very low wage, we sometimes point out that he cannot expect to get a good man at his rate of wages; and frequently by these means an increase is secured for the man and better class of labour for the employer.

It may be of interest to quote a few of the applications for labour, and the wages offered by different employers, showing the liberal rates and class of work offered by some in contrast to the very small wages and the variety of qualifications (accomplishments in some cases) required by others:—

*J. W.* required a married couple. The man as boundary rider; the wife to cook and wash for overseer. Wages £65 per annum and found—a bonus of £10 if they gave satisfaction; rail and coach fares paid by employer. The couple engaged have since spoken of their employer in the highest terms of praise; whilst the employer wrote to express his satisfaction of their services.

*J. D.* wrote for a steady reliable engineer for station. Wages first month, £2 10s. per week and found; and afterwards £3 10s. per week and found. Employer and employee have both expressed mutual satisfaction.

*J. M.* wrote for two single men of good character, steady, and able to read and write; wages £61 per annum and found, with a rise of £7 per annum to good men.

*J. B.* wrote for baker, good tradesman, sober and steady; wages £2 per week and found.

*J. G.* wrote for gold miners; wages £2 10s. per week.

Several mechanics have been forwarded to employers at wages 9s. and 10s. per day of eight hours.

In contrast, however, the following instances may be quoted:—

*J. H.* from the country wrote as follows:—"I want a generally useful man for hotel-work, and teach the children for a few hours each day. Must be able to do garden work, milk, kill sheep; also teach music and the piano, and play same for singing and dancing. Wages 20s. per week and found." This gentleman failed to secure a man from the Bureau.

*X. Z.*, not far from Sydney, wanted a thoroughly reliable, steady, sober, single man to be generally useful and competent to drive his wife out; to wear livery. Wages 2s. per week and found.

*J. L.* writes for an elderly man as tutor for six children, must have good references, bear a good character, and be competent. Wages 6s. per week and found.

These few instances are chosen from many similar ones to illustrate the different opinions of some employers as to remuneration of services.

I regret to report that during the year several mechanics refused to accept places in the country from 6s. to 9s. per day. And others, many of them single men, refused work from 7s. 6d. to 20s. per week and found, but were always eager to receive a turn on any of the relief works about Sydney.

## Relief Works Classified.

*Centennial Park.*—This work (for rations) of levelling the building sites surrounding Centennial Park ceased in February, 1897. The total number of turns of from one to three days (according to the number in family) worked was 5,027. Of course, as already explained, this does not represent as many individuals. The total cost of rations for this work from the 1st July, 1896, to February, 1897, when it was discontinued, was £1,348 19s. 10d.

*Free Rations.*—The issue of free rations to the families of unemployed, who were in the country seeking employment, commenced in November, 1896. The total number of families were 369, with 1,504 children. The average number of families receiving free weekly rations was 10. The total cost to end of June, 1897, was £80 5s. 11d.

*Centennial Park.*—From the 16th January to 13th February, 1897, 106 old men erected 348½ rods of fencing. Each pair of fencers were allowed to put up a limited number of rods at 3s. per rod. The total cost came to £52 5s. 6d.

*Randwick Rifle Butts.*—From April to end of June, 177 old men were employed on piece-work, clearing on the Randwick Rifle Butts, the cost of which came to £153 8s. 9d.

*Kensington, &c.*—In June, 1,035 received five days' work at Kensington and Centennial Park, at 5s. per day, at a total cost of £1,293 15s.

*Church and School Lands.*—The clearing and road-making on the Church and School Lands was completed in February last; and from the 1st of July, 1896, to that time, 1,034 unemployed, chiefly old men, received fortnightly turns at piece-work; total cost, £3,716 17s. 7d. A great deal of good work has been done by the unemployed on this estate. No less than 9 miles of streets have been formed and made, and 737 acres of land have been cleared and partially fenced. Altogether £16,000 have been expended in improving the estate, with a view of letting it in blocks on long leases, from which, no doubt, a good return will be obtained; and at the same time it has been the means of finding employment for a very large number of destitute unemployed.

*Sewage Farm.*—During the year 2,920 of the unemployed received fortnightly turns as they came round on the Sewage Farm, Botany, at 6s. per day. A large amount of levelling and filling up has been done in preparing the land for the Western Suburbs Sewerage Scheme. The total cost of this work for the year was £12,913 9s. 11d., which has enabled a large number of the unemployed to find work.

*Shea's Creek, Cook's River, and Muddy Creek Reclamations.*—These works have been in progress for some years. During the year 2,442 men were employed in fortnightly turns at 7s. per day. The total expenditure for the year was £37,944 11s. 10d. This outlay also found employment for a large number of unemployed married men. Those selected for the above-mentioned relief works were limited to married men only, and the weekly and fortnightly turns referred to came round about every six or eight weeks.

The following table will give the numbers of men employed on the different relief works and the total cost incurred:—

		Average	Total Cost.
		Weekly	£ s. d.
		Number.	
Total number of men employed on the Centennial Park for rations from 1st July, 1896, to February, 1897 .....	5,027	152.3	1,348 19 10

## West Bogan Scrub-clearing.

This work being of a reproductive character cannot therefore be called a relief work, although it has been the means of finding employment for a large number of the unemployed.

The first batch of men was despatched to the work on 14th September, 1896, when five gangs of ten men each were sent to Nyngan. The total number of men sent to this work at different periods up to the end of June, 1897, was as follows:—

	Number of men.
From Sydney—61 gangs ... ..	610
Do to fill vacancies ... ..	258
Engaged by Mr. Taylor locally to fill vacancies ... ..	223
From country branches in gangs—

	1,302
Less number of men abandoned work, completed blocks, &c. ... ..	620
Number on the works, 30th June, 1897 ... ..	682

Much adverse criticism and unfavourable comments have appeared in the press from time to time, and the same has found expression on the public platform, *re* the Bogan Scrub works, and the small wages the men were earning, &c., which, however, has not been borne out by actual results, as will be seen by reference to the paysheets and statements of several of the men who have completed their blocks and returned to Sydney. According to the former, a number of the gangs have earned wages varying from 4s. 6d. to 9s. 6d. per day each man, whilst two or three of the gangs went as high as 14s. and 15s. per day each man. It is true that several of the gangs only made from 2s. 6d. to 3s. 9d. per day, and in some cases even less; but on inquiry the cause has invariably been traced to their own fault, the chief reasons being quarrelling among themselves, dissension, laziness, &c., and others have found the work unsuitable.

In a gang of ten men there may be six really good workers, while the other four might be the reverse. The good men would be compelled to do the work of the gang, and, as a natural consequence, dissatisfaction would creep in, disorganise the gang, and the result would be low wages.

Of course at the commencement of the clearing a large number of men willing and eager to work went to the Bogan with the best of intentions, but through inexperience in that class of work, physical inability, and the extreme heat in that part of the year, were unable to give either themselves or the work a fair trial. The result was low returns, which a great many, not taking into account the causes mentioned, seemed only too eager to attribute to the low prices offered. As a matter of fact, the prices on some blocks which at first gave a very low return have since proved sufficient to permit good men earning liberal wages.

Only recently, a man received a letter from a gang working on the Bogan, informing him of a vacancy, and instructing him to call at the Bureau and apply for same. Among other things the writer stated the following:—"I have had a look very near all through the block, and by what I have seen of it I think if you can bring a couple of good men such as I have mentioned, we can make good wages by all working well together. We are getting 3s. per acre, and with a full gang last month we made £1 10s. per man clear of everything."

It has been proved beyond doubt that all gangs that work together amicably and unitedly can earn good wages on the Bogan.

Many of the men who completed their blocks and returned have informed me that those who would work together could do well; and, perhaps, the best evidence of this is that almost every one of these are anxious to return to the Bogan.

The cost of living is not as high as is frequently stated and generally supposed. One man writing to the Bureau from the Bogan for men to fill vacancies in his gang went on to state that they were doing very well, and that their living cost 5s. 3d. per man per week; but added that the living was plain, yet good, and did not include "pickles, jam, cigarettes, or bottled beer."

Others have stated that plain living costs from 6s. to 10s. per man per week.

The men themselves formed their own gangs, and have always been told to select men who are suitable for the work, and who would agree and work unitedly together.

The heavy rush in the first instance to form gangs and get away was the cause no doubt of a number of men getting into gangs altogether unsuitable for and unable to do a fair share of the work. The character of the country in the density of the scrub, &c., of course effected the earnings of the block each month.

Taking the bad with the good, however, the average earnings of the men came to about 6s. per day. And taking an all round view of the work, good bushmen admit that the prices per acre and the wages earned are the best paid unskilled labour at present in the Colony.

Some

Some of the families in Sydney of the married men have been advanced provisions, the cost of which has been deducted from their earnings, till they are able to send their wives money.

Mr. H. C. Taylor, Officer-in-charge of the West Bogan Scrub Works, very kindly furnished me with a short review of the Bogan scrub clearing from its inception up to the end of June, which I append hereto:—

“In compliance with the request contained in your letter of the 21st instant, I am writing a somewhat hurried summary of the work done in ringing, cutting down, and grubbing the timber and scrub upon the large area of public land situated on what is commonly known as the West Bogan.

“So far as I am concerned the work actually commenced on the 28th August, 1895, when Mr. Forester Condell and myself left Sydney for Nyngan, to initiate the business by inspecting a few blocks situated on the holdings known as West Bogan No. 1, Budgery, and Hermidale.

“This work was soon completed, and on the 15th of the following month fifty men arrived at Nyngan, to start operations in accordance with the specifications. Since that time the business has been kept going, and remunerative and reproductive work has been found for upwards of 1,263 men, drawn from all conditions of life, but the majority of whom were strangers to work of this description, and some strangers to work of any description. The principal portion of the work is located on the southern side of the Nyngan-Cobar railway line, for about 40 miles, the area forming a triangle, the apex of which is about 20 miles from the base.

“In addition, however, the work has been conducted on more scattered areas along the Nyngan-Bourke railway, extending as far as Coolabah, a distance of 47 miles.

“The total area of the blocks that have been let under the terms of the West Bogan Agreement up to the 30th ultimo is 385,354 acres, and of this total 201,940 acres had, it is estimated, been dealt with up to that date. The actual cost of the work for the period in question may be set down at £20,000. To my thinking the State has started a useful, and what will eventually become a profitable, undertaking, and has afforded a large number of unfortunate and thriftless individuals an opportunity of keeping themselves above the reach of want, and of those referred to, many, owing to their weaknesses, will never be able to do more than this, nor, indeed, do they seek it. To the hard working and careful it has presented a means of acquiring money, whereby they have been enabled to drift into other avenues of employment, to which they are more suited. All reasonable effort has been made to assist those desiring work to obtain an equivalent for it. The State has come to the assistance of men in an absolutely penniless condition, and supplied them with the wherewithal to support themselves. Tents, tools, and all other implements necessary have been supplied on credit, the goods being purchased wholesale, and retailed at cost price. Under the “butty-gang” system, which is in force here, the men are in a great measure their own masters. In some instances the gangs which left Sydney have remained and completed the works undertaken, with apparently little internal dissension. In the majority of cases, however, there have been many changes. Men have found the work unsuitable and the conditions of life strange to them. Others have been unable to perform the work, and others, again, unwilling to do so. These have drifted back to the populous centres. The men who have stuck to the task have earned what must be regarded as good wages for bush work, when compared with that paid by private employers, and it may be safely asserted that the average wage would equal 6s. per day. In operating upon an area of, say, 5,000 acres of land some time must necessarily elapse before a gang of ten could complete its contract, and in fixing the price to be paid per acre for the work the earnings would of course be variable. It has come to pass that one month men would find it hard to pay the cost of living, whilst the next would find them in comparative affluence. This has caused many to abandon the work as unremunerative, with the result that they have gone back to absolute distress, and once more found it necessary to seek assistance from the Government Labour Bureau. In some cases I have found that the earnings of a gang for the first month has been as low as 2s. 6d. per day, but this is invariably due to the fact that the men are not in condition, and their hands are not equal to the task of wielding an axe, or a slasher, all day. This defect soon disappears, and then better wages are earned. The improvement in the condition of the men is soon apparent in more ways than one, but principally by the paysheets. I have quite lately seen instances of men returning to Sydney after six months work here, with accumulated savings, after having provided for their families in Sydney, amounting to £20, and it is not too much to say that it would have taken a much longer time for them to have been in such a position had they been in the locality of some city.

“So far as I am able to ascertain, at this late date, the total number of men sent from Sydney amounts to 762, but as there have in the past been so many changes from one gang to another, it is hard to keep any accurate record, and in fact I have not tried to do so knowing that the information would be available elsewhere. I have set down the total number of men that have been employed from time to time as 1,263, but the total is also swollen by the defections from one gang to another.

“At the expiration of the last half year the total number employed amounted to 586.

“In the conduct of any future works under the same system, it appears to me that better results would be obtained if the works were allotted in smaller areas, and by that means the number of men in a gang could be reduced. Some discretion should be exercised by the Government in the selection of the gangs, and as far as possible men of the same nationality or creed should be placed together, and married and single men should form separate gangs. When the gangs arrive here I find that the men in many instances are absolute strangers to each other, the only tie that binds them being their common poverty. After the first payment this bond soon disappears and trouble commences. Men who are not kindred spirits are sent to Coventry and forced to leave the gang, and in some cases are voted out. It is no good for a minority to battle against this condition of affairs, and the only way out of the difficulty has been to find them a place in some other gang. It is a fact, and one that admits of no contradiction, that the greatest trouble and difficulty these men have had to contend with is the comparative absence of unity. Co-operation in labour is not the success that the theory of it teaches us.

“One word in conclusion as regards those men. My experience has shown me a strong desire on their part to meet all their liabilities, and it can be stated that the losses sustained by the many tradespeople and dealers, with whom they are brought in contact, have been trivial. The same can be said as regards their obligations to the Crown, and the cheerfulness and readiness with which they defray the cost of railway fares, tents, tools, &c., calls for all praise.”

Refunds.

### Refunds.

The amount received as refunds of railway passes, &c., for the year was £2,864 19s. 3d., or £1,371 less than for the previous year. The total amount received as refunds since the refund system was adopted (a period of four years and ten months) is £14,618 8s. 4d. There is still a large sum owing, viz., over £50,259 Gs. Every opportunity is taken to collect arrears of payments, by the frequent issue of circulars, &c., and also through the country agencies.

### Registry Offices.

During the existence of the Bureau numbers of persons engaged through registry offices for employment in the country have applied to me for railway passes to enable them to reach their destination, and in all cases which I believe to be genuine I have granted such passes, at the same time taking an order on the employer in each case for a refund.

My experience, however, of these registry offices during the existence of the Bureau leads me to the conclusion that a great many abuses exist in connection with them which might, and should, be remedied.

In the interest of the unemployed themselves I would strongly recommend that these offices be licensed and placed under Government supervision. The principal reason that prompts me to bring this matter specially under notice is that I am satisfied that several of those professing to have obtained employment through registry offices have been victimised. After spending, perhaps, all they possessed in registry fees, they have found themselves stranded in a strange place, without employment, and without the means of existence whilst they looked for it. Only recently there were several such cases in Court, when in some instances substantial damages were awarded.

In the interests of all those seeking employment through these offices, I would strongly recommend that an Act be passed legalising all such offices, and placing them under the supervision of the Government, so that poor people may not be victimised.

I understand such a measure is at present engaging the attention of the Victorian Legislative Assembly, and were such an Act passed in this Colony it would result in benefit to the unemployed, and be a source of revenue to the State.

### Country Branches.

These branches (forty-two in number) have been for the most part in operation since March, 1896. They have been the means of furnishing the head office with the state of the labour market in the various districts of the Colony and the probable number of unemployed in the country. They have also generally assisted with any information required, as well as collected refunds for railway fares, &c.

The annual reports from the different agencies are hereto attached, giving the nature of the chief industries, rate of wages, &c., in each district, from which it will be seen that labour and industry has improved generally throughout the Colony, especially since the breaking up of the drought, and also that the numbers of the unemployed are diminishing.

The total number registered at the branches during the year was 1,253, and the total number assisted and sent to work was 534. The amount of refunds of fares collected by the agents for the year was £159 15s. 9d.

A return is also attached, showing in detail the numbers registered and sent to employment by the different branches for each month of the year ending 30th June, 1897.

### Summary.

The number of unemployed registered at the Bureau Head Office during the year was 6,427 (or 7,635 less than the previous year), of which 2,498 were married men with 4,608 children depending on them, and 3,929 were single men.

The total number assisted and sent to work for the year was 13,713, or a decrease of 6,858 to that of the previous year, and 7,291 more than the number registered; but this is owing to the fact that many registered in previous years were sent to different jobs during the year, in some cases to five or six.

The number of fossickers for the year was 1,647, or 5,446 less than the previous year, due to the drought referred to.

The number of arrivals from the other colonies (viz., 676) shows a decrease of 320 as compared with that of the previous year (viz., 996).

I may mention that no assistance is rendered to those coming from the other colonies until they have resided in the Colony six months.

The number of those registered at the Bureau who were arrested for drunkenness and other offences during the year, and whose tickets were taken from them and forwarded to this office by the police, was 210, as against 307 for the previous year—a decrease of 97.

The late secretary, Mr. P. E. Bloxham, severed his connection with the Bureau in February last, having been appointed Governor of H.M. Gaol, Goulburn. The office of secretary has been abolished, and Mr. C. E. Ramage, as chief clerk, was promoted to carry out the duties previously performed by Mr. Bloxham.

Having altered the beginning and ending of the annual report to that of the Government financial year, I have the honor to append an intermediate detailed report from 18th February to 30th June, 1896, which brings the figures up to date.

On behalf of the staff I have pleasure in stating that the various duties in connection with the Bureau were never better or more expeditiously carried out than at present.

JOSEPH CREER,  
Superintendent.

### COMPARATIVE STATEMENT.

Showing results for the years ending 17th February, 1893-4-5-6, and 30th June, 1897.

TABLE giving the number registered for each of the above years; number assisted and sent to work for the same periods; amounts refunded for railway passes and miners' rights; number of fossickers sent out from Sydney and Country (inclusive), together with increase or decrease under each head. NOTE.—This return does not include those men who were employed on the different Relief Works for rations only, and it will be noted there is a broken period accounted for owing to altering the date of our annual reports to suit the financial year, viz., 1st July to 30th June.

## The Labour Agent, Bega, to The Superintendent, Government Labour Bureau, Sydney.

Sir,

Department of Labour and Industry, Bega, 3 July, 1897.

I have the honor to report that during the past year five applicants for work have been registered at this branch, comprising 1 butcher, 1 farmer, 1 saddler, and 2 labourers, their respective ages being 50, 34, 55, 48, and 33 years. Their dependents numbered 6, 3, 7, nil, and 2. One came from Maitland, two live in Bega, one from Sydney, and one from Goulburn. They reported themselves as being out of employment from three to twelve months. Only one applicant had been previously assisted by the Bureau, and he obtained a miner's right from me for six months. So far I have not received a refund.

The average rate of wages paid during the year is given below —

Watchmakers, from £2 10s. to £3 per week.	Shop hands, 7s. per day.
Blacksmiths, 7s. per day.	Labourers, 6s. per day.
Carpenters, 7s. 6d. per day.	Labourers on dairy farms, from 12s. to 15s. per week, with rations.
Bricklayers, 8s. per day.	Road workmen, 5s. to 5s. 6d. per day.
Plasterers, 8s. per day.	Ploughmen, about 20s. per week, with rations.
Wheelwrights, 7s. per day.	
Storeman, 7s. to 10s. per week.	

One employer required a hand to milk, but as no one registered capable of this work, he was compelled to do the best he could himself.

Throughout the year the trades have been slack and buildings have not been of such a class that would require other than an ordinary carpenter to erect them, the material used being mostly wood.

Roadmaking has been fairly active. The different contractors, however, employ but few outsiders, as they keep their regular hands fairly well employed.

The ordinary labourers required on the farms work for a few days erecting fences, yards, cow-hails, &c., but after a few shillings have been earned, throw the job up and leave. This applies particularly to the class called "swagmen," as I am informed.

In conclusion, I may state that although this office is well known throughout the district as a labour agency, but few people avail themselves of it, as the returns will show.

I have, &amp;c.,

W. E. O'BRIEN,

Agent.

## The Labour Agent, Grafton, to The Superintendent, Government Labour Bureau, Sydney.

Sir,

Court House, Grafton, 8 July, 1897.

Referring to your telegram of yesterday's date, I have the honor to state that owing to the press of work lately, and at the present time being daily engaged in the Courts—Quarter Sessions and District Court—it is impossible for me to furnish the full report intended.

I may state that during the year only two applicants for employment have been registered. I enclose letters received from the largest employers of labour in the district, giving information respecting rates of wage, &c., and upon which I purposed basing my report, had an opportunity occurred.

The following are extracts from the letters referred to:—

"In the mining industry, the rates of wage are from 6s. 4d. to 8s. per day, according to the kind of work performed, and, so far as I can judge, there are not many about here who are willing to work that have not got it to do. I do not intend this as an inducement for men to come to the district, as I am convinced that the supply as at present is equal to the demand."

In

In the sugar growing industry, the manager of the Harwood Mill reports, "That they are likely to employ about 450 hands at the mill and cane-cutting, preference being given to the old hands. The minimum wage is 20s. and rations. No trouble, I think, will be experienced in getting the men required."

In the timber trade, an employer states that, "For the last two or three years the supply of labour has been far in excess of the demand, a large number of men being out of employment. I have numerous applications for work almost daily, some offering to work for almost any rate of wages, and if I were in want of 100 men at present, I believe I could get same at two days notice. The prevailing rates of wage are as follows, viz.:—Clerks, 4s. 2d. per day; firemen and engine-drivers, 6s. 8d. to 7s. per day; machinists and benchmen, 7s. per day; assistant benchmen, puntmen, yardmen, and labourers, 6s. per day."

Another employer states that, "The prospects of the timber trade are very fair, and should keep a goodly number of men employed for the next twelve months. The prevailing rates of wage are from 6s. to 9s. per day.

I have, &c.,  
A. GATES,

Agent.

The Labour Agent, Kempsey, to The Superintendent, Government Labour Bureau,  
Sydney.

Sir,

Department of Labour and Industry, Kempsey, 30 June, 1897.

In forwarding the Annual Report I have the honor to inform you that no miners' rights, passes, or other forms of assistance have issued from this Office, and no persons have been registered.

The local labour market is well supplied with labour, in fact the supply exceeds the demand.

The accompanying schedule sets forth the approximate current rate of wage.

I have, &c.,

H. NEWMAN,

Agent, Kempsey.

APPROXIMATE Current Rate of Wage.

The Labour Agent, Lismore, to The Superintendent, Government Labour Bureau,  
Sydney.

ANNUAL REPORT.

Sir,

Department of Labour and Industry, Lismore, 3 July, 1897.

In submitting my annual report for the year ended 30th June last, I have the honor to inform you that very little use is being made of this branch of the Labour Bureau, there being only three persons registered during the year, viz., 2 labourers and 1 bookkeeper. No applications have been made for assistance or railway passes, and but one application from an employer for carpenters in connection with the building of the new post-office at Byron Bay.

I have made inquiries from the Resident Engineer, the Council Clerk, and the police concerning the condition of the labour market, besides making numerous personal inquiries, and have ascertained that the supply of labour has been just about equal to the demand. At the present time there are a few men unemployed, most of the road contracts having been let in order that they would be completed and paid for by the 30th June; but as funds will be again available early in July, activity in roadwork will recommence. Besides this, the cane season is approaching. Some of the men are waiting for this, when many hands will be employed, though there is very considerable uneasiness felt in consequence of the influx, during the last few months, of hundreds of Hindoos. I believe there are considerably over 1,000 of these foreign people in the district now, and as they live upon so little, it is expected they will cut down the price of labour in the cane-cutting this year. Through the reduction of the duty on sugar, the millowners are this year to pay 1s. 8d. per ton less than last year, and have announced that, in consequence, the price for cutting and punting will be also reduced. Dairy-farming is being very largely taken up all over this district, many of the South Coast farmers coming over and settling down, and it is expected that this industry will entirely supersede cane-growing in the future, especially should the sugar duties be all removed. There are many inquiries about farms, but little business being done by way of selecting. In my position of Crown Land Agent, I can say that there is a deal of valuable agricultural land in the district yet to be taken up; but, because of there being no roads, it is not suitable for occupation. The Government have set apart a lot of country for homestead selections, but for the same reason there are no applicants. Most of the land on and close to the Richmond River has been selected, and for miles around there are certain evidences of progress, and a splendid future is in store for the district. At the present time, £1,100 worth of additions are being made to the court-house, a new post-office is just being commenced, to cost £3,340, a new residence for the Sub-Inspector of Police is to be erected, tenders to close this month. There are several new and important residences going up; new brick premises are being erected in the main street; the Bank of New South Wales have just moved into their new building, the cost of which was over £3,000; new creameries are going up throughout the district; all pointing to the fact that it is a progressive place. At the same time, I would quote the Council Clerk's remarks here, viz.: "In my opinion this is a very unsuitable district to send surplus labour to from the metropolis, for the reason that all contractors have their regular hands available and working on small farms."

The average number of men employed during the year, according to the Resident Engineer's opinion, from personal observation, in connection with roads and bridges, has been 155. The largest number were employed during April and May, when 228 and 245, respectively, were at work. The rate of wages paid by the department for unskilled labour has been 7s. per day, and good men have received the same rate from contractors under the department, though, in some cases, the wages paid are 20s. per week and provisions, or 5s. per day without. At certain times, when a large amount of contract work was out, such as during April and May, there was a scarcity of labour in the district, and contractors could not get a sufficient number of the right class of men. More particularly has this been the case

with

with stonebreakers; there have been a limited number of these in the district, so that they have been able to pick and choose their work, and, consequently, some contractors had to wait several weeks to get metal broken to a 2½-inch gauge, at 2s. 6d. per cubic yard, the men preferring to break 3-inch gauge, at 2s. per cubic yard, of which there was a large amount to be done in the district. The Council Clerk informs me that within the municipal district the supply of labour has been equal to the demand. The rate of wages paid has been 6s. to 7s. per day, metal breakers a trifle under 6s. per day. He says there were only about twenty really good labourers, and they chiefly strangers, applied for work during the year.

The Sergeant of Police says that the current rate of wages for men, principally employed in road-work, has been from 5s. to 7s. per day; farm labourers, 12s. to 15s. per week, with board and lodging.

The farmers themselves say that the greatest demand is for men who can milk and understand dairy work, that being the chief thing now; and, as stated in my last monthly report, the late rains have improved matters wonderfully, and the prospects of the coming season are cheering.

All tradesmen in the town say they are full handed. Mechanics seem to be fully occupied. Trusting the foregoing will be deemed satisfactory.

I have, &c.,  
**ANDREW T. COCHRANE,**  
 C.P.S., Labour Agent.

**The Labour Agent, Newcastle, to The Superintendent, Government Labour Bureau, Sydney.**

NEWCASTLE being the largest centre at which a Labour Agency is established, the work of the agency requires an explanation, beyond a mere statement of figures.

During the year the registration of unemployed persons has been limited. Names have been principally registered in connection with the Bogan work, and applications for passes to the country. The Bogan work, as far as Newcastle is concerned, has been the cause, not the consequence, of such registration, the persons forwarded to the Bogan being men who registered subsequent to the notification of such work, and who, probably, but for such notification, would not have registered at all.

The majority of other names in the Annual Return attached of unemployed are those of persons proceeding to the country to employment secured by their own efforts, a letter from their employer being, in the majority of cases, a condition precedent to the issue of a pass.

Schedule A annexed, will show the value of the passes issued, and the small amount of refunds paid through the local agency.

The object for which the agency has been founded, to bring the employers and the unemployed together, has not been fulfilled. The unemployed, apparently, do not register unless they want to get to another district, and the employers of labour never come near the Agency.

T. G. ADRIAN, C.P.S., Agent.

**SCHEDULE "A."**

**SCHEDULE "B."**

Rates of wages at Newcastle for year ending 30th June, 1897.

Class of Employment.	Rates of Wages.
Wharf Labourers ... ..	1/- per hour.
Carters ... ..	40/- per week.
Shop Assistants ... ..	35/- "
Clerks ... ..	35/- "
Miners... ..	2/11 per ton (hewing rate).
Carpenters ... ..	9/- per day.
Joiners ... ..	9/- "
Bricklayers ... ..	9/- to 11/- per day.
Plasterers ... ..	9/- to 11/- per day.
Bricklayer's Labourers ... ..	1/- per hour
Printers ... ..	8/- per day.
Plumbers ... ..	9/- to 11/- per day.
Stonemasons ... ..	10/- per day.

**SCHEDULE "C."**

Summary for year ending 30th June, 1897.

Number of persons registered as unemployed	215
Number of passes issued	140
Value of passes	£275 7 6
Refunds paid through Agency	£10 7 8

The Labour Agent, Nowra, to The Superintendent, Government Labour Bureau,  
Sydney.

Sir, Department of Labour and Industry, Nowra, 8 July, 1897.

I beg to report that, during the year ending 30th June last, fourteen men registered their names at this office for employment. These were chiefly comprised of men who passed through the town in search of work.

A few of the men applied to be sent to the Bogan Scrub work, but subsequently withdrew.

As far as I can gather, from information received by me, the number of unemployed in all the district would not reach eighty. Numbers of men do not get constant work, but they cannot be classed among the unemployed.

The numbers of men employed at farming and mining have greatly decreased owing to the severity of the drought; and at Yalwal, one of the principal mining places in the district, several men have left for New Zealand and the other colonies. At present, at Yalwal, I believe, over thirty men are out of employment.

During the year numerous men have found employment in connection with the erection of bridges and in connection with road contracts, but builders or carpenters find it very difficult to obtain any employment.

I might state that, owing to most of the farmers and their families doing the work on the farms, it is very difficult for labourers and others to find work in this district. The wages offered are, as a rule, very small.

The following is the average rate of wages:—

Carpenters and builders	...	...	...	...	...	...	8s. per diem.
General labourers	...	...	...	...	...	...	3s. 6d. per diem.
Farm labourers...	...	...	...	...	...	...	12s. per week.

I have, &c.,  
W. F. MARKS,  
Agent.

The Labour Agent, Wollongong, to The Superintendent, Government Labour  
Bureau, Sydney.

Wollongong, 7 July, 1897.

I, HARRY S. BINGLE, District Labour Agent, Wollongong, beg to report that for the year ending 30th June, 1897, there were fifteen railway passes granted to persons seeking employment, but in very few cases has any refund been received; in some cases the order upon the future employer has been returned, no such person being known in the district. To guard against fraud in this way, it would be safer if the agent wired to the address given before issuing any railway pass, and ascertain if such a person really did exist. There were also six passes granted to the families of applicants.

There is absolutely no demand for labour, nor is there likely to be.

No men have been engaged here for employment during the year, and there have been but very few registrations.

The ruling rate of wages (current) is as follows:—Carpenters, 6s. to 8s. per day; blacksmiths, 8s. per day; strikers, 6s. per day; coal-miners, £1 10s. to £2 per week; navvies, 6s. per day; labourers, 6s. per day; bricklayers, 8s. per day; farm labourers, 8s. to 12s. per week, and board; bushmen and fencers, about 30s. per week; butchers, 30s. per week; bakers, £2 10s. per week; barbers, 15s. per week; grooms, 10s. per week, and board; wharf labourers, 5s. per day; coal-trimmers, about 15s. to £1 per day; compositors, £1 to £1 15s. per week.

Those registered during the year were:—Miners, 8; labourers, 4; shearers, 1; gangers, 1; clerks, 1.

H. S. BINGLE,  
Labour Agent.

The Labour Agent, Bathurst, to The Superintendent, Government Labour Bureau,  
Sydney.

Sir, Court House, Bathurst, 7 July, 1897.

I have the honor to report, for the year ended 30 June last, in connection with the work of the local branch of the Labor Bureau, as follows:—The number registered during the year was sixty-eight, to which should be added thirty-six, being number of passes issued to shearers and others who did not register, but whose names it would now appear should have been shown in my register. I regret to state that I have not received any applications from the employers of labour in this district, for either skilled or unskilled workmen, nor has one employer requested me to submit to him the list of unemployed. I can, therefore, safely assume that when the employers require workmen they seem to be able to obtain them without seeking the assistance of this office. I desire to state, I have come to the conclusion, that the main object in connection with the establishment of the country branches, viz, procuring work for the unemployed, has, at any rate, so far as this branch is concerned, been a failure. The branch is useful for the purpose of issuing passes to those who have obtained employment elsewhere and also for despatching various gangs to works inaugurated by the Government. I attach hereto a list showing the rate of wages paid in this district, and might add that there is little or no demand for labour at present.

I have, &c.,  
W. G. B. SMITH,  
Labour Agent.

The Labour Agent, Bourke, to The Superintendent, Government Labour Bureau, Sydney.

Sir,

Bourke, 2 July, 1897.

During the year ending 30th June last, 154 persons have registered their names at this Branch, forty of whom were sent to the Bogan scrub-cutting works.

This Branch has not been used by employers of labour, and no engagements have been made directly through me, though I have afterwards heard that numbers registered soon got employment.

I attach Sergeant Miller's report as to the general condition of labour during last year, which, I think, will concur with my monthly reports.

The rates of wages have not materially altered during the past twelve months. Ordinary labour varies from 6s. to 8s. per day, and skilled, from 9s. to 12s. Shearers are paid 20s. per hundred. Shed labourers, 20s. to 25s. per week, with rations. Station-hands, from 20s. per week, with rations, according to their usefulness.

As the labour portion of the district is a moving one, it is impossible to work the Branch with satisfaction; men register and never present themselves again. As a rule, they cannot afford to wait in the town, and necessity compels them to seek work where they think they are most likely to find it, or where they can live most cheaply. If I had work for, say, twenty men to-day it would be some days before I could get suitable hands, and before that time my order might be countermanded.

If further particulars are required, I will try to furnish them.

I am, &c.,

GEORGE ATKIN,

Agent.

Bourke Police Station, 30 June, 1897.

SENIOR-CONSTABLE MILLER reports:—During the past year the labour market in the Bourke district has been well supplied. During the shearing season of last year the demand was quite up to the supply, and until near the end of the season there did not appear to be any surplus labour. During the off season, i.e., between shearing, there have been as usual a number of men travelling in search of employment, but not so many as in former years.

The current rate of wages for ordinary labour—including rouseabouts on stations—is about £1 per week, and board or rations. Of course there are, doubtless, men in the district obtaining a higher wage, and again, probably, others are working for less, but taken all round £1 may be considered the current weekly wage of an ordinary labourer. Men engaged as navvies, on such works as, say, the Bourke weir, get from 7s. to 8s. per day, out of which they have to provide themselves with board.

G. Atkin, Esq., C. P. S.,

Bourke.

I am, &c.,

J. G. MILLER,

Senior-Constable.

The Labour Agent, Broken Hill, to The Superintendent, Government Labour Bureau, Sydney.

Sir,

Broken Hill, 30 June, 1897.

I have the honor to submit my annual report of the transactions of this branch for the year ending 30th June, 1897, with particulars as required by your memorandum of the 19th of May, 1897.

Only three men were registered by me in this Bureau during the past twelve months; of these, two were general labourers and one a baker. After registering the names of these men, I never again heard from them; but I have no doubt that, if they were sober and hard-working, they obtained employment. No tickets have ever been returned to me.

As each of the large mines has a Labour Bureau of its own, the transactions of this branch do not in any way show the very large field of labour in this district; and I regret to say that from the very first the employers were not disposed to make use of this office in the direction of employing men.

Unskilled labourers here, as elsewhere, have the most difficulty in obtaining regular employment, although the mines and municipality absorb a very large number. I would not recommend that any men of this description be sent here.

The permanency of Broken Hill as a silver-field being now assured, buildings of a more substantial character than those at present existing are being erected. Carpenters and stonemasons are at present in demand; but these are obtainable from Adelaide, which city keeps our local labour market supplied with tradesmen. Good practical miners are always in demand, and high-class men of all trades find no difficulty in getting employment here.

I would point out, however, that, although the general rate of wage appears high, the cost of living here is very much higher than in the cities and other more favoured localities. House rent is a large item, especially with men with large families.

Broken Hill presents no attractions as a permanent place of residence for persons in any walk of life, and the population is a shifting one.

I attach hereto the schedule showing the rate of wages obtaining here in the several departments of industry.

I have, &c.,

JAMES WATT,

Labour Agent.

The Labour Agent, Coonamble, to The Superintendent, Government Labour Bureau, Sydney.

Sir,

Court-house, Coonamble, 16 July, 1897.

In accordance with the request contained in your memo. of the 19th May last, I have the honor to inform you that, during the year ended 30th June, 1897, the work done at this branch of the Government Labour Bureau, when summed up, amounted to almost nil.

About half a dozen applications were made at this office for work by general hands, but in no instance was the applicant successful in obtaining employment. Two names were added to my roll of persons seeking work.

The condition of the labour market in this district, since my last annual report, appears to me to be, generally speaking, unaltered; but I would add within the last couple of months a large number of unemployed persons may be seen daily loafing around the streets of Coonamble; a circumstance which would lead one to believe that the supply of labourers in this district is considerably in excess of the demand for same. This influx of unemployed may, however, be attributable to the fact that very shortly shearing will be in full swing in this district, and the majority of these persons may be waiting here until their particular "shed" commences work, when, no doubt, they will be able to obtain a "stand."

From inquiries, I have ascertained that the rate of wage current in this district is—as nearly as possible—as follows:—Carpenters and builders, 8s. to 10s. per day; coachbuilders, wheelwrights, and blacksmiths, from 1s. to 1s. 3d. per hour; saddlers, from £2 to £2 10s. per week; bakers, £2 per week; and labourers and station-hands at no fixed rate.

I have, &c.,

C. DILLON,

C.P.S. and Local Agent.

The Labour Agent, Cowra, to The Superintendent, Government Labour Bureau, Sydney.

Sir,

Cowra Branch, Government Labour Bureau, 21 July, 1897.

I have the honor to inform you that for the year ending 30th June, 1897, only one person registered his name at this office, a cook and baker by trade, who obtained a pass to Culcairn, where he was to obtain employment at Mr. A. M'Bain's Station, Kerndeen.

The schedule hereunder will show the rate of wage given in the various occupations common to this district:—

- Station-hands, from 15s. to 25s. per week.
- Cooks, from 10s. to 20s. per week.
- Wheelwrights, from 50s. to 55s. per week.
- Blacksmiths, from 50s. to £3 per week.
- Carpenters, from 50s. to £3 per week.
- Shearers, from 18s. to 20s. per 100.
- Rouseabouts, from 15s. to 20s. per week.
- Drapers, from £4 to 30s. per week.
- Grocers, from £3 10s. to 25s. per week.

These occupations are invariably filled by local people, and there seems to be little or no demand for outside labour, casual labourers being employed in road contracts, grubbing and clearing land, and farm labour, in nearly every case at contract rates agreed upon.

I have, &c.,

JAMES MILLER,

Agent.

The

The Labour Agent, Cobar, to The Superintendent, Government Labour Bureau,  
Sydney.

Sir,

Department of Labour and Industry, Cobar, 2 July, 1897.

I have the honor to report that during the past twelve months, the condition of the local labour market has been much improved by the great advance of the mining industry in this locality.

From careful inquiries made I estimate that the different mining companies alone give employment to about 700 men, whilst the current daily rate of wages for the above period has averaged as follows:—Miners, 8s. 4d.; engine-drivers, 9s. to 10s. 6d.; carpenters, 9s. to 10s. 6d.; and general labourers, 7s. to 7s. 6d.

As may be seen from my monthly returns, only one person has been registered on my books. Since the establishment of this branch I find that the unemployed are in the habit of camping near to the different mining companies' works, and prefer to make personal application for employment, as vacancies occur.

Altogether the past year has shown a decided improvement in the state of our labour market, whilst the mining industry, upon which this town is dependent, has so rapidly advanced, that Cobar field is, to-day, one of the most flourishing in New South Wales.

Trusting that this report contains all the information that you require,

I have, &c.,

O. B. C. BURKE,

Bureau Agent.

The Labour Agent, Dubbo, to The Superintendent, Government Labour Bureau,  
Sydney.

Sir,

Dubbo, 5 July, 1897.

I have the honor to report for the year ending 30th June, as follows:—

This district has suffered from a prolonged drought, which has recently broken up. During its continuance nearly all agricultural operations were stopped, and men were discharged in numbers. The advent of rain has caused the re-employment of ploughmen; there is, however, no demand outside, as the local supply is more than sufficient.

*Wages.*—The usual rate for farm hands (good) is £1 weekly, with rations. Inferior men receive less, down to nominal pay. Day labourers earn from 5s. to 6s. per diem.

*State of the Labour Market.*—This may be described as overstocked, and numbers of men are to be met with, travelling in search of employment.

*Contract Work.*—Scrub-cutting, ring-barking, timber-getting are mainly done by contract; the amount earned varies a good deal, according to the capability of the men.

*Town Industries.*—These comprise flour-milling, coach-building, saw-milling, brewing, &c. The hands employed as an average get 8s. per diem.

*Wool-washing and Boiling-down.*—These industries are intermittent; at present they are stopped. Wages on these are from 7s. to 8s. daily. I have issued, with approval of Head Office, passes for ten persons. As far as I know, two obtained work. £4 17s. have been received at this office as refunds for passes issued.

The majority of the men who registered did so to obtain work at scrub-cutting, but when instructions came to enrol gangs, the men had dispersed in order to seek work in the country. Since the inception of the Labour Bureau Branches in the country, only one employer has made an application to me for labour. I am of opinion that when these men register it is with the intention of obtaining work under Government, to which they appear to think their registration tickets will entitle them.

I may state that I have made all possible inquiries from employers in town as to the foregoing details. In regard to the pastoral and agricultural rates, I am largely indebted to information supplied me by Mr. W. Stuart, Agent for the Equitable Life Assurance Society, who is intimately acquainted with the state of the district, on account of his visits to all parts of it.

I have, &c.,

R. T. MACNEVIN,

Labour Agent, Dubbo.

The Labour Agent, Forbes, to The Superintendent Government Labour Bureau,  
Sydney.

Sir,

Forbes, 21 July, 1897.

I have the honor to report that during the twelve months ended 30th June ultimo, 7 men were registered for employment at this office, 6 being labourers and 1 a cook. No inquiries have been made by employers for workmen. The drought seriously interfered with the employment of workmen, miners more especially in this district. The usual rate of wages given is 15s. per week, and found. One railway pass has been issued. The receipts or refunds are nil.

There is at present more labour offering than is apparently required.

I have, &c.,

N. BLACK,

Local Agent.

The Labour Agent, Hillston, to The Superintendent Government Labour Bureau,  
Sydney.

Sir,

Hillston, 6 July, 1897.

I have honor to submit my annual report for the year ended 30th June ultimo.

This Branch was opened in the beginning of November last, and I regret to state that absolutely no advantage has been taken of it, either by employers or those in search of employment. This is, perhaps, owing to the long distance from railway communication, and the fact that the town occupies such an isolated position. The industries are few, principally pastoral and farming, and the class of employment offered is mostly of a labouring character, and then only during the shearing and harvesting seasons,

seasons, and the ruling wage would average about £1 per week, the employer providing the necessary rations, &c. There is no labour to be had in the district, other than for general labourers, and employers are able to engage men who are permanently settled in the community.

The unemployed, generally speaking, are seldom met with in this district since the Branch was opened.

I have not received a single application for employment of any kind, and no other business has been transacted at this Branch.

I have, &c.,

ROBERT HUGHES,

Labour Agent.

The Labour Agent, Lithgow, to The Superintendent Government Labour Bureau,  
Sydney.

Sir,

Lithgow, 3 July, 1897.

In accordance with the instructions contained in your letter 19th May last, I herewith beg to make an annual report of the work done at this Branch, as well as the industries in this district, and the current rate of wages.

There has been 37 persons names registered for employment, and 29 railway passes granted in order to go to and seek employment, out of which 12 fares have been refunded, representing the amount of £14 11s. 9d.

With reference to the industries, there are 7 collieries at work, which give employment to about 200 men. The Cobar Copper-smelting Company employ about 80 men. The ironworks about 150 men. Two breweries employ about 15 men. The Coverwell Tweed Factory about 10 men, besides a number of women and boys. The Lithgow Pottery Company, who employed between 30 and 40 men, have stopped work, and the managing director attributes the cause to the fiscal policy.

All the industries in this district at work appear to be in a flourishing condition, and the men employed are making fair wages, and with a prospect of continuing to do so.

The ironworks are working with two shifts of men night and day. The local unemployed I should not estimate at above 50. The most of the applicants for work are from men tramping through the town, and even these have considerably diminished of late.

The current rates of wages are—Coalminers, 1s. 8d. per ton hewing rate, their earnings averaging 7s. 6d. per day; copper-smelters earn from 7s. to 8s. 6d. per day; ironworkers, from 7s. to 9s. per day; labourers, from 6s. to 7s. 6d. per day; bricklayers, from 8s. to 9s. per day; carpenters, 7s. to 8s. per day; engine-drivers and engineers, from 8s. to 10s. per day; and farm hands, from 10s. to 20s. per week, and found.

I have, &c.,

E. M. COHEN,

Labour Agent.

The Labour Agent, Mudgee, to The Superintendent, Government Labour Bureau,  
Sydney.

Sir,

Court-house, Mudgee, 6 July, 1897.

I have the honor to state that my annual report for the year ending the 30th June last will be very unfavourable on account of the severe drought experienced in this district—stock dying and not a blade of grass to be seen, therefore no work for the unemployed. During that period no applications were received for registration by persons seeking employment.

The rate of wages were—miners, 8s.; labourers, 5s. to 7s.; mechanics and others, £1 to £3 10s. per week.

As we have had abundance of rain of late and farmers are now ploughing, have no doubt that things will improve in this district, especially mining, as they now have plenty of water for washing purposes and for prospecting.

I have, &c.,

F. S. OSBORNE,

Agent.

The Labour Agent, Molong, to The Superintendent, Government Labour Bureau,  
Sydney.

Department of Labour and Industry, Molong, 3 July, 1897.

I HAVE the honor to report that no applications, either by employers or persons seeking employment, have been made at this office during the year ending 30th of June, 1897.

The current rate of wages for class of labour usually required in this district, namely, station and farm hands, is from 10s. to 15s. per week with rations.

It is only at harvest time that extra labour is required in the farming business, which can be fully supplied locally. To my knowledge there are several useful and reliable men in this town who are not more than half the year employed, simply because graziers and farmers are compelled, owing to the depressed times, to employ as little labour as possible.

I have, &c.,

H. H. CHIPPENDALL,

Labour Agent.

The Acting Labour Agent, Nyngan, to The Superintendent, Government Labour  
Bureau.

Sir,

Department of Labour and Industry, Nyngan, 21 July, 1897.

I have the honor to submit herewith report for year ending 30th June, 1897.

In reading over the reports furnished by this office, and from what I could ascertain from the police, I find that there has been little or no demand for labour in this district. The average rate of wages has been from 6s. to 8s. per day, the class of labour mostly required being "station-hands" and general labourers. The only industry in this district is a boiling down and meat preserving works, and this has only been periodically working. The number of unemployed in the district has varied considerably monthly, but the *bonâ fide* unemployed here now are less than in previous months of the past year.

I have, &c.,

W. IRONSIDE PERRY,

Acting Labour Agent.

The

The Labour Agent, Orange, to The Superintendent, Government Labour Bureau,  
Sydney.

Sir,

Orange, 1 July, 1897.

I do myself the honor to submit my report for the year ended 30th June, 1897.

*Men Registered.*—Forty-three men were registered during the year; of these 23 were sent to the West Bogan.

*Railway Passes.*—Twenty-nine railway passes were issued under instructions from Head Office.

*Miners' Rights.*—One miner's right was issued from Sydney.

*Demand for Labour.*—There has been very little demand for labour. Only two applications were sent to me—one for a cook, and the other for a gardener. I sent men out to both places, but I was informed the parties could not come to terms. A few men were sent here from the Head Office. Two of these left after working for one day.

*Rate of Wages.*—Farm labourers (local and known to be good working men), from 15s. to 20s. per week with rations; miners, from 30s. to 45s. per week.

*Refunds.*—No refunds for railway passes or miners' rights have been made during the year.

I have, &c.,

H. P. LEARY,  
Local Agent.

The Labour Agent, Walgett, to The Superintendent, Government Labour Bureau,  
Sydney.

Sir,

Court-house, Walgett, 8 July, 1897.

I have the honor to forward you my annual report in connection with the Government Labour Bureau in this district. Since my term of office as Agent no applications have been made, and, on account of the multiplicity of my duties, I have been unable to ascertain the number of men out of work scattered round this vast district. Those who are, apparently, out of work are waiting for the shearing season. Others can obtain the ordinary rate of wages which is to be obtained in the western districts.

I have, &c.,

W. HURROCK,  
Government Labour Agent.

The Labour Agent, Wilcannia, to The Superintendent, Government Labour Bureau,  
Sydney.

Sir,

Wilcannia, 8 July, 1897.

I do myself the honor to report that since the Government Labour Bureau Agency has been established here there have been no applications registered either by employers or employee. In up-country districts applications are always made either to the storekeepers or local private agents.

The principal labour employed in this district is station-hands, and the current rate of wages is—

Married couples, £65 to £75 per annum.

Teamsters, 25s. per week.

Cooks, 20s. to 25s. per week.

Boundary-riders, 15s. to 20s. per week.

General hands, 15s. to 20s. per week.

Shearers, 20s. per 100 sheep.

Shed-hands and rouseabouts during shearing, 20s. to 25s. per week.

The demand, generally speaking, is far less than the supply.

Owing to the small shearing this year the number of hands employed during the next few months will be very much less than usual during shearing season.

I have, &c.,

WALTERUS BROWN,  
Labour Bureau Agent.

The Labour Agent, Armidale, to The Superintendent, Government Labour Bureau,  
Sydney.

Sir,

Armidale, 7 July, 1897.

I have the honor to report as follows for the past twelve months, *i.e.*, 1st July, 1896, to 30th June, 1897.

There have only been 4 registrations, *viz.*, 1 miner, 1 compositor, 1 groom, and 1 general hand. A few others applied for work in the district, but would not register, as they were only passing through. In a couple of instances labour was applied for. I posted up notice outside the office, and wrote to previous applicants on my books, but letters were returned unclaimed, applicants having left the district. No passes have been issued, as no applicants having any certain show of work applied. No refunds have been made to me during the time specified herein. There is no increased demand for labour since 1st July, 1896. Wages remain the same. Miners, about £2 per week; bootmakers the same; farm labourers, 10s. to 15s. per week and rations.

The principal industries are agricultural, mining, and bootmaking.

I have, &c.,

B. P. P. KEMP,  
Agent.

The Clerk of Petty Sessions, Glen Innes, to The Superintendent, Government  
Labour Bureau, Sydney.

Sir,

Glen Innes, 21 July, 1897.

Referring to your telegram of the 20th instant, I have the honor to inform you that, according to the local agent's records for the year ending 30th June last, no applications for employment or from persons requiring employees were received at this office during the period named. Having been in the district only since May last, I am not in a position to speak as to the state of the labour market during the last twelve months.

At

At the present time any surplus labour that might have been is absorbed in the chaff industry, which has been favoured by the protracted drought and high prices, and it may be said the district is devoid of unemployed. There are no industries or other avenues of employment in the district likely to afford an outlet for the surplus labour of other parts.

The average rate of wages for farm and other labourers is about 25s. to 30s. per week.

I have, &c.,

M. J. McMAHON, C.P.S.

The Labour Agent, Maitland, to The Superintendent, Government Labour Bureau,  
Sydney.

Annual Report.

Sir,

Court-house, Maitland, 7 July, 1897.

I have the honor to report for your information that there are still in my district a considerable number of persons unemployed, quite as many, and even more, than there were at the date of my report made in April of last year. The principal reason for the scarcity of employment has been that the district has suffered very much from the effects of drought in the first six months of the year 1897. However, as rain has within the past month fallen, and the farmers' crops are looking very well, I have no doubt that the surplus labour will be employed within the next few months, but there is not likely to be any demand for labour beyond that which is available locally during the ensuing year. The rate of wages during the year have been as follows:—Ordinary labourers, 5s. to 6s. per day; miners, 6s. to 8s. per day; mechanics (other than carpenters), 6s. to 8s. per day; carpenters, 7s. to 8s. per day; bricklayers, plasterers, and masons, 8s. to 9s. per day; farm labourers, 10s. to 12s. 6d. per week and keep.

The principal industries in the district are mining and farming, and these are well supplied with all the labour that they are likely to require during the ensuing year.

I have registered 350 persons since my branch of the Bureau was opened in March of last year, but much the larger proportion of those were tramps.

I have, &c.,

W. ROBERTSON, C.P.S.,  
Agent.

Senior-Sergeant Pountney, Moree, to The Superintendent, Government Labour  
Bureau, Sydney.

Police Station, Moree, 8 July, 1897.

SENIOR-SERGEANT POUNTNEY begs to report no work has been done by men from the Labour Bureau in this district. Moree is a pastoral district, and men from the Bureau are not required in the district.

Nearly all old and new selectors do all improvements on the selections themselves, and at shearing time employ a few shearers that visit the district from other parts.

Current rates of wages are:—

Shearers, 20s. per 100 sheep.  
Shed-hands, 6s. per day.  
Station-hands, 15s. per week.  
Burr cutters, 10s. per week.  
Clerks on stations, £25 and rations.  
Boys on stations, 5s. per week.  
Domestic servants, 10s. per week.  
Butcher and stable man, £40 per annum.  
Carpenters in town, 8s. per day.  
Bricklayers, 10s. per day.  
Grooms in town, 20s. per week.  
Farmer and wife, £40 per annum.  
Private clerks in town, £15 per annum.  
Butchers, 45s. per week.  
Paper editors, 40s. per week.

W. M. POUNTNEY,

Senior-Sergeant.

The Labour Agent, Muswellbrook, to The Superintendent, Government Labour  
Bureau, Sydney.

Sir,

Department of Labour and Industry, Muswellbrook, 3 July, 1897.

I have the honor to submit my report for the year ended 30th June, 1897.

During the year there were twenty-five registrations of unemployed made at my branch. Of these twenty were granted passes as approved by you, and five were refused.

Refunds of railway fares were made amounting to £4 2s. 2d., representing assistance rendered to three applicants.

The labour market in this district is on the whole quiet, and, but for travellers passing through, many of whom I know personally for a fact have no desire when work is offered them of performing it. No demand either one way or the other exists.

The current rate of wages for the period has been from £1 to £1 10s. per week all round.

I have, &c.,

O. A. S. FITZPATRICK, C.P.S.,  
Agent.

The

The Labour Agent, Narrabri, to The Superintendent, Government Labour Bureau,  
Sydney.

Annual Report for the year ending 30th June, 1897.

Narrabri, 19 July, 1897.

The following particulars show the work done at this branch during the period above mentioned.

Passes issued, three (3)

Refunds received, three (3) = £4 9s. 6d.

No registrations have been made except to those persons to whom assistance has been given.

The labour market for the year has been fully supplied locally—that is, for the classes of labour which the pursuits of the district generally require.

The district is chiefly pastoral, and the rate of wage to station hands is as follows:—

Boundary riders, 20s. per week with rations.  
General hands, 15s. to 20s. per week with rations.  
Scrub cutters, 12s. 6d. to 15s. per week with rations.

At the meat-preserving works the rate of wages is as follows:—

Slaughtermen,—

Carcasses for boiling-down, 10s. per 100.  
" preserving, 11s. 6d. "  
" chilling, 20s. "

Other general hands receive from 4d. to 10d. per hour, according to the nature of the work.

Carpenters, rough work, 5s. per day; others, from 7s. to 8s. per day; store hands or shop assistants, drapers assistants, from 70s. per week downwards; grocers assistants, from 50s. per week downwards.

WALTER SCOTT,  
Labour Agent.

The Labour Agent, Tamworth, to The Superintendent, Government Labour Bureau,  
Sydney.

Sir,

Tamworth, 3 July, 1897.

In compliance with instructions contained in your letter of the 19th May last, I have the honor to report that during the year ending 30th June ultimo, thirteen persons have been registered at this office.

No applications have been made by employers to obtain labourers. Twelve passes have been granted to nine men and one woman and her two children, at a cost of £12 5s. The sum of 16s. 3d. only has been refunded to this office.

There are many men—perhaps, say, 100—in this locality without work, and many have barely sufficient to maintain their families and keep them from starvation.

If the Municipal Council could see its way to construct a weir on the Peel River, it would be a vast improvement to the town and give employment to many, as also would a Government Experimental Farm. I am of opinion the latter would be a great inducement to landowners here to improve their methods of farming, fruit-growing, and drying, &c., and much more labour would be required.

The current rate of wages is for—Saddlers and harness-makers, 40s. to 60s. per week (mostly piece-work); grocers, 40s. to 60s.; drapers, 50s. to 70s.; butchers, 42s. to 50s. per week; bootmakers, 40s. to 60s. per week (mostly piece-work); painters and finishers, 40s. to 60s.; blacksmiths, 30s. to 50s. per week; and hairdressers, 42s. to 50s. per week; municipal labourers, 6s. per day.

I have, &c.,

L. W. BROUGHTON,  
Labour Agent.

The Labour Agent, Tenterfield, to The Superintendent, Government Labour Bureau,  
Sydney.

Sir,

Department of Labour and Industry, Tenterfield, 3 July, 1897.

I have the honor herewith to submit my annual report for the year ending 30th June, 1897,  
viz. :—

*Number of persons registered.*

One man only has registered his name during the past 12 months—a bootmaker by trade. He has received no assistance, nor has he obtained employment through this office.

*Works undertaken in district.*

The usual work under the supervision of the Superintendent of Roads has been carried out both by contract and day-labour. Such work has only been the means of absorbing those resident in and about the district together with the men in regular employment. Between £7,000 and £7,500 has been expended on roads and bridges during the past twelve months.

The Chilled Meat Works Company have been at work intermittently for the past twelve months, employing only a few hands.

The Boot Factory is also only working with half the number of men usually employed.

The

The rates of wages ruling in the district for all kinds of labour is as follows, viz. :—

Butchers, 25s. to 30s. per week.  
 Bakers, 25s. to 30s. per week.  
 Carpenters, 8s. per day.  
 Tinsmiths, 8s. per day.  
 Blacksmiths, 8s. per day.  
 Labourers (ordinary), 7s. per day.  
 „ (farm), 5s. per day to 15s. per week and rations.  
 Drapers, 40s. to 50s. per week.  
 Compositors, 40s. per week.  
 Bootmakers, 40s. per week.  
 Domestic servants, 7s. to 10s. per week and keep.  
 Grocers, 50s. per week.  
 Carters, 15s. per week and rations.  
 Stockmen, 20s. per week and rations.  
 Grooms, 15s. to 20s. per week and keep.  
 Saddlers, 40s. to 50s. per week.

I have, &c.,  
 F. BURNE,  
 Labour Agent.

The Labour Agent, Albury, to The Superintendent, Government Labour Bureau,  
 Sydney.

Sir,

Albury, 12 July, 1897.

I have the honor to submit the following report on the operations of this Branch for the year ended 30th June, 1897.

One registration was effected during the period stated, one pass issued, no refunds received, and no inquiries made by employers or unemployed.

The police report that there are no unemployed persons in the district that they know of, excepting a few "loafers" and swagsmen passing through on their way to or from employment.

The principal industries of the district are the wine-making, wool-growing, agriculture, and gold-mining. The three former absorb the most labour; the latter is not in a flourishing condition.

During the year the following rates of wages have been paid :—

Miners ... ..	50/- per week.
Agricultural and vine labourers ... ..	20/- per week and board.
Ordinary labourers ... ..	6/- per day.
Carpenters, bricklayers, plasterers, and painters ..	7/- to 9/- per day.
Coachbuilders ... ..	7/- to 8/- per day.
Blacksmiths and wheelwrights ... ..	50/- per week.

I have, &c.,  
 W. JAMIESON,  
 Local Agent.

The Labour Agent, Braidwood, to The Superintendent, Government Labour Bureau,  
 Sydney.

Sir,

Braidwood, 2 July, 1897.

I have the honor to submit my annual report on this Branch for the year ending 30th June last.

During the year only three names were registered at this Branch, which is accounted for by there being so few unemployed resident within this district.

Owing to the severe drought experienced during the year, which interfered materially with the agricultural and mining industries, the demand for labour was small. A fair number of men who were travelling from one district to another were content to work for their keep and a few shillings a week for temporary employment.

The following is a list of the average rates of wages ruling in this district, viz. :—Mechanics, 5s. to 10s. per day; miners, 30s. per week; stockmen and cooks, 20s. per week and keep; grooms, 15s.; shepherds, 5s.; and labourers, from 15s. to 20s. per week and keep.

A large number of men are employed in different parts of the district fossicking for gold; some make good wages and others only a living. Since the break up of the drought both farming and mining operations are being pushed ahead, but there are sufficient men in the district to cope with the demand for labour.

I have, &c.,  
 L. A. McDOUGALL,  
 Labour Agent.

The Labour Agent, Cooma, to The Superintendent, Government Labour Bureau,  
 Sydney.

Sir,

Department of Labour and Industry, Cooma, 3 July, 1897.

I have the honor to submit my report, as follows :—

Forty-four (44) persons have registered themselves at this office during the past twelve months, of whom twelve proceeded to the West Bogan to cut scrub.

The amounts paid direct to this office as refunds of railway fares totalled £27 3s. 11d.

*Labour market.*—At the present time there are very few unemployed in this district. One reason for this improvement, which may be only temporary, is that the winter here is too severe for men looking for work who have to camp out. I am informed that many men leave this district for Sydney and the warmer parts of the Colony as soon as the cold weather sets in here. Work in connection with the building trade and road making has been fairly brisk, which, no doubt, accounts for the absorption of a good many men; in fact there is some difficulty in obtaining suitable men for builders. Grazing

Grazing is the principal industry; agriculture and mining give employment to comparatively few men.

*Wages.*—I am informed that the rates range from about 4s. for unskilled to about 8s. for skilled labour per diem. Miners as a rule obtain about 6s.

The busiest time of the year on Monaro is from November to the end of February, when shearing and harvesting operations are carried on.

I have, &c.,  
EDWARD GOMM,  
Local Agent.

The Labour Agent, Cootamundra, to The Superintendent, Government Labour Bureau, Sydney.

27 July, 1897.

WITH regard to the working of this branch for the twelve months ending 30th June, 1897, I have the honor to report as follows:—Some 14 men applied for registration, and in 6 of these cases passes were applied for and granted to travel on the railway line to reach certain work. Twelve out of the 14 men mentioned above were general labourers, and 2 of the 14 shearers. The branch has not been largely used, as there has not been a great demand for labour, nor, on the whole, has there been employment sought. There have been occasional tramps in the town, who have not sought permanent work, but have been content with odd jobs and then moved on. I find that a great many of these tramps do not really wish to work, but as long as they can beg tucker are quite content. I need hardly say there are exceptions. There has been little demand for labour. For instance, there has been little or no building going on in this district; and as to general labour, such as harvesting, ploughing, &c., although occasional hands are wanted, yet the farmers and their families manage to do this kind of work themselves. I may mention that within the last week very important work has been started some 6 miles from here, viz., the deviation of the railway line at Frampton, and I understand some few hundreds of men will be employed for some three or four months; but the greater part of the labour required has been introduced from other parts of the Colony. However, I can speak more fully of this matter in my next monthly report. There are labourers seeking work there at the present time. The list given below will show the current rates of wages for various trades, &c., in this district:—

							£	s.	d.	
Labourers (with board)	...	...	...	...	...	...	0	15	0	per week.
Blacksmiths	...	...	...	...	...	...	2	10	0	"
" strikers	...	...	...	...	...	...	0	15	0	"
Coach-builders	...	...	...	...	...	...	2	10	0	"
Painters	...	...	...	...	...	...	..			Piecework.
Tailors	...	...	...	...	...	...	2	10	0	"
Drapers	...	...	...	...	...	...	2	10	0	per week.
" assistants	...	...	...	...	...	from	0	5	0	"
Shoemakers	...	...	...	...	...	...	2	5	0	"
Bricklayers	...	...	...	...	...	...	3	0	0	"
Plasterers	...	...	...	...	...	...	3	0	0	"
Carpenters	...	...	...	...	...	...	3	0	0	"
Grocers' assistants	...	...	...	...	...	...	2	10	0	"
Grooms (with board)	...	...	...	...	...	...	0	15	0	"
General labourers	...	...	...	...	...	...	0	6	0	per day.

I have, &c.,  
G. ADDISON,  
Labour Agent.

The Clerk of Petty Sessions, Goulburn, to The Superintendent, Government Labour Bureau, Sydney.

Sir,

Court-house, Goulburn, 7 July, 1897.

Nothing of any importance took place at the Goulburn Branch of the Government Labour Bureau during the year ended 30th June, 1897.

The usual registrations were made, and returns furnished to you monthly. From time to time men reported that they had no work, and were unable to obtain any.

Three gangs of ten men each were sent to the Bogan scrub clearing works, but no men were found private work, with the exception of a few.

Generally speaking, this district is in a most poverty-stricken condition, owing to a great extent to the protracted drought.

The rates of wage did not vary very much, the following being what was usually paid:—Miners, 30s. to 45s. per week; bootmakers, 30s. per week; carters, 30s. to 35s.; slaughtermen, 25s. to 27s.; labourers, 25s. to 30s.; and cooks, 20s. to 40s. per week; drovers, 15s. per week and keep; millers, 50s. to 65s.; wheelwrights, 40s. to 50s.; and shop assistants, 30s. to 70s. per week.

I have, &c.,  
W. D. STAFFORD,  
Clerk of Petty Sessions.

The Labour Agent, Hay, to The Superintendent, Government Labour Bureau, Sydney.

Sir,

Department of Labour and Industry, Hay, 10 July, 1897.

I have the honor to report that the operations at this branch for the past year have been of a very limited character. *The only registration was of a man who was granted a pass to another district.* No employers have applied to me for men. I have received £7 0s. 9d. on account of refunds for railway passes.

As far as I can ascertain there have not been any considerable number of men out of employment. An irrigation scheme near Hay has provided work for from thirty to forty men during the past three months, and, as it is not yet completed, will carry most of them on through the winter, which is usually a slack time. These men all appear to be residents of the town and district, and I may say that, except at shearing time, there is seldom any influx from other places.

Avenues of employment outside the town are confined to the pastoral and agricultural industries. There is no mining of any kind in the district. The general rates of wages are approximated as follows:—

	s.	d.	s.	d.
Bricklayers, per day ... ..			10	0
Carpenters " " " " " " " " " "			9	0
Wheelwrights " " " " " " " " " "	8	0	to	9 0
Blacksmiths " " " " " " " " " "	8	0	"	9 0
Horse drivers, per week (with rations) ... .	20	0	"	25 0
Station-hands " " " " " " " " " "	15	0	"	25 0
Labourers, per day ... ..	6	0	"	7 0

I have, &c.,

J. BURNETT,

Agent.

The Labour Agent, Junee, to The Superintendent, Government Labour Bureau, Sydney.

Sir, Department of Labour and Industry, Junee, 6 July, 1897.

In reply to your circular of the 19th May last, I have the honor to submit herewith my report of the business transacted at this office for the year ending 30th June, 1897.

During the half-year ending 31st December, 1896, I registered nine men, and for the remaining half-year four men were registered, but could not obtain employment for them. Three out of the last four were registered to go to work for a Mr. M'Nicholls, of Ganmain, on a clearing job, but their intended employer wrote me to say on account of the protracted drought he was knocking off work. I have never had a satisfactory reply from him since.

All the men, as far as I can ascertain, with the exception of the one last registered, have left the district, the bulk of them being ordinary tramps.

The principal industries are Cohoe and Walster's foundry, blacksmiths, wheelwrights, &c., and farming, also the railway locomotive sheds. The latter, the railway authorities declined to give any information about, stating they were all permanent hands there, with the exception of casual labourers, who were paid, when required coal-heaving, &c., at 6s. per day.
