NOTE.—In consequence of the steady decrease in the prison population the average cost per head has somewhat increased notwithstanding the large saving (£15,700) in salaries. It is questionable whether the Department should be debited for the maintenance of lunatics, paupers, and Sheriffs' prisoners. The cost to the Prisons Department last year of such persons was £4,918 9s. 8d., an expense which appears to improperly swell the prisons' expenditure.

RETURN showing Cost of Maintenance of Established Gaols, Number of Prisoners to each Officer, &c., &c., during years 1895, 1896, 1897, 1898, and 1899. Police Gaols omitted.

APPENDIX V.

RETURNS concerning Staff.

1. New South Wales Penal Department. Number of Officers of various ranks.
2. Staff Board, showing the distribution of the principal officers on the 31st December, 1899, and the gaols where stationed.
3. Staff Board, showing the number of Warders, Overseers, Female Warders, Acting Gaolers, and Acting Matrons employed at the different gaols in the Colony on 31st December, 1899.
4. Particulars as to Retirements, Resignations, &c.

No. 1.

New South Wales Penal Department.—Number of Officers of various Ranks.

Ministerial Head : The Honorable the Minister of Justice.

Permanent Head (Official) : The Comptroller-General of Prisons.

The Deputy Comptroller and Inspector.

Regular Officers—8 Governors.

7 Deputy Governors.

1 Director of Labour.

21 Clerks.

1 Storekeeper (Principal).

2 Clerks and Schoolmasters.

3 Schoolmasters and Storekeepers.

1 Librarian and Schoolmaster.

15 Gaolers (6 Acting).

2 Superintendents, Female Division.

14 Matrons (6 Acting).

35 Acting Gaolers (Police).

35 Acting Matrons (Police).

5 Dispensers.

5 Chief Warders.

22 Senior Warders.

278 Warders.

23 Female Warders

15 Overseers.

13 Foremen.

3 Carters and Messengers.

2 Messengers.

1 Storeman.

1 Crane-driver.

1 Stableman.

2 Quarry Foremen.

1 Officer-cleaner.

Visiting Officers—53 Visiting Justices.

27 Visiting Surgeons.

55 Visiting Chaplains.

4 Honorary Chaplains.

16 Assistant Chaplains.

Total number of Officers—675

No. 2

No. 4.

PRISONS.

(RETURN SHOWING NUMBER OF PRISONERS SENTENCED BY VISITING JUSTICES TO FLOGGINGS FOR BREACHES OF PRISON DISCIPLINE DURING THE YEAR 1899.)

Printed under No. 1 Report from Printing Committee, 21 June, 1900.

[Laid upon the Table in accordance with promise made in answer to Question 24, Votes No. 5, Thursday, 21 June, 1900.]

RETURN of Flogging inflicted on Prisoners for Breaches of Prison Discipline during the year 1899, under Sentences of Visiting Justices.

Gaol.	Name of Prisoner.	Offence.	Punishment awarded.	Remarks.
Darlinghurst ...	Henry Albury, <i>alias</i> Henry Anderson, <i>alias</i> Frederick Thomas, <i>alias</i> Nelson.	Refusing to work; violently assaulting foreman, also a warder, who went to the foreman's assistance.	To receive 15 lashes.	The assaults on the officers were quite unprovoked, and, in case of the warder, necessitated an absence from duty of six days.
Bathurst	Bartholomew Conolly, <i>alias</i> P. Connolly, <i>alias</i> Dower.	(1) Assault the Deputy-Governor by throwing contents of night-tub in his face. (2) Creating a disturbance in the Gaol. (3) Using filthy and obscene language.	To receive 12 lashes.	This is an old criminal, with exceedingly depraved habits.
„	Thomas Dixon, <i>alias</i> Thomas Moore.	(1) Assault a warder by striking and kicking him. (2) Assault a warder by kicking him in the stomach.	„ ...	Inflicted with tawse, not with cat.
Berrima	Charlie Ah Yum	Eleven charges, consisting of obscene language, and yelling, and shouting indecent language.	„ ...	He had kept up a constant disorder for days, and his conduct was likely to create a general disorder.
„	Charles Graham, <i>alias</i> Chas. Cameron Macfarlane, <i>alias</i> Chas. Harrison, <i>alias</i> John Chas. Wilson, <i>alias</i> Chas. Balenall.	Four charges, consisting of violent assault on the Deputy-Governor, and gross disorderly conduct.	To receive 20 lashes (13 remitted).	The assault on the Deputy-Governor was a very cowardly one, and necessitated the absence of that officer from duty for four weeks. This man called upon me, and said he was very sorry in having assaulted the old man, and that he deserved the punishment.

FREDK. W. NEITENSTEIN,

PRISONS.

(REPORT RESPECTING THE FLOGGING OF PRISONER No. 302 IN GOULBURN GAOL.)

Printed under No. 1 Report from Printing Committee, 26 June, 1900.

.[Laid upon the Table in accordance with promise made in answer to Question 34, Votes No. 5, Thursday, 21 June, 1900.]

Department of Prisons,
Comptroller-General's Office, Sydney.

Minute Paper.

Subject: Parliamentary Question respecting Flogging of Prisoner No. 302 in Goulburn Gaol.

THE prisoner assaulted a warder under circumstances of much brutality. He suddenly sprang upon the officer (who was quite taken by surprise), felled him to the ground, and banged his head repeatedly upon the floor. He expressed his intention of murdering the warder, and would probably have done so if assistance had not speedily been forthcoming.

Two prisoners, who ran to the warder's assistance, have since been rewarded for their meritorious conduct.

FREDK. W. NEITENSTEIN,
Comptroller-General.

The Under Secretary of Justice,
B.C., 20/6/00.

GAOL AT EAST MAITLAND.

(EXTRACT FROM REPORT OF COMPTROLLER-GENERAL OF PRISONS, AND REPORT OF DEPUTY COMPTROLLER, RESPECTING CERTAIN STATEMENTS MADE BY MR. GILLIES, M.P., IN LEGISLATIVE ASSEMBLY ON 18TH JULY, 1900, *RE*).

Printed under No. 8 Report from Printing Committee, 9 August, 1900.

The Comptroller-General of Prisons to The Under Secretary of Justice.

MINUTE PAPER.

Maitland Gaol.—Statements made in Parliament by Mr. Gillies, M.P.

Department of Prisons, Comptroller-General's Office, Sydney.

1. It is represented that Warders Huer and Scott have been reduced in rank and removed from Maitland Gaol without just reason and without investigation. Warder Scott has not been reduced or transferred, but it may be found necessary to transfer him in the interests of discipline.

Warder Huer was guilty of a gross breach of discipline, calculated to weaken the authority of the officers in their control of the prisoners. He was reduced in rank and transferred. He had every opportunity to answer the charge, which was reduced to writing and handed to him for report. The matter was then placed before the Visiting Justice—the Police Magistrate of the district—who, in view of the grave nature of the offence, referred the case to me for decision. After careful consideration, I determined to afford the warder another chance of retrieving his character by transferring him to another gaol at reduced rank. He was allowed railway passes for himself and family at the Department's expense. All the papers have been submitted for the Minister's information.

2. Mr. McCauley did not accuse one of the warders, in the presence of five others, with having written anonymous letters, &c. What actually occurred will be gathered from Mr. McCauley's report attached. At Maitland there is much idle talk respecting the political influence possessed by certain warders, and this has unfortunately encouraged a negligent performance of duty, with the result that punishment has had to be inflicted. This, however, is not the fault of the Prison administration. The Inspector of Prisons, on his recent visit, addressed the warders collectively on the subject, as much in their own interests as in the general interests of discipline, and a distinct breach of the Regulations was committed by whoever communicated to persons not connected with the prison, information purporting to have reference to what took place inside on the occasion in question. * * * * *

FREDK. W. NEITENSTEIN,
Comptroller-General.

The Under Secretary of Justice, B.C., 24/7/00.

Memorandum to The Comptroller-General of Prisons.

Department of Prisons, N.S.W.,

Comptroller-General's Office, Sydney, 21 July, 1900.

FOLLOWING the practice usually adopted by me at the termination of an inspection of a gaol, I addressed the men on parade at Maitland Gaol on the 6th instant, and informed them that I noticed a marked improvement in the manner in which they performed their duties, but one matter I desired specially to apprise them of was that I had received an anonymous letter, evidently emanating from one of the staff. I told them that no good was done by such communications, and instead of its conducing to their interests, it would have quite a contrary effect, as they well knew such action was at variance with the rules of the Department. The Governor subsequently informed me that, in the case of a recent transfer, a warder had approached a Member of Parliament on the subject. On my next visit, on the 16th

instant, I informed the staff that it was improper for them to consult Members of Parliament in reference to decisions in their cases; that, while every attention was given the recommendations of Members of Parliament in favour of applicants for employment, no interference by them was allowed in reference to the discipline of the establishment. I did not, as mentioned in *Hansard*, accuse any officer of writing the anonymous letter. I addressed the staff collectively, and did not mention any names.

I conveyed your message to Chief Warder Scott, stating that it was contemplated transferring him to Forbes, as officer in charge of the gaol, as he did not appear equal to the duties at Maitland. He appeared upset, said he could do duty with any man in the Service, and that he would not go to Forbes. If he was not fit for duty at Maitland, then he ought to be retired. He further notified me that he had plenty of influence. On hearing this, I stopped him from making any further remarks, by saying I would convey his wishes to the Comptroller-General. On the following morning the Governor waited upon me when leaving in the train, and said that the chief warder informed him that, if he were removed and a senior and chief appointed in his place at Maitland, he would have good cause of complaint and of appeal.

The chief warder is anything but an efficient officer, and I have had to speak frequently to him of the manner in which he performs his duties.

SAMUEL McCAULEY,
Deputy Comptroller.

THE ANNUAL REPORT

OF

THE POSTMASTER-GENERAL

FOR THE YEAR

1899.

Printed under No. 8 Report from Printing Committee, 9 August, 1900.

SYDNEY: WILLIAM APPLIGATE GULLICK, GOVERNMENT PRINTER.

1900.

[2s. 3d.]

The following are the items of expenditure paid from Votes under the control of other Ministers which have not been taken into consideration in the above financial analysis:—

	1898.	1899.
Stores and stationery	£4,162 8 1	£4,724 10 0
Repairs and alterations to buildings	2,868 0 9	2,375 15 3
Furniture (including carriage)... ..	78 12 5	39 10 1
Printing, bookbinding, <i>Gazette</i> advertisements, <i>Gazettes</i> , &c..	7,064 6 5	7,200 12 2
Printing postage stamps	4,655 17 4	3,917 16 4
Do postal notes	578 19 5	463 5 10
Municipal and other rates	2,544 10 10	2,551 10 8
Postage	960 0 0*	1,020 0 0*
Advertising in newspapers	283 4 3	385 7 0
Fuel and light	1,923 12 7	1,379 12 8
Total	£25,119 12 1	£24,058 0 0

* Estimated.

The interest on the cost of construction of Electric Telegraph and Telephone Lines and Tunnels is estimated at £36,819, and the interest on the cost of buildings owned by the Government, and used as Post and Telegraph Offices in various parts of the Colony, is estimated at £32,064.

Interest has previously been calculated at 4 per cent. ; but in view of the rates at which loans have been secured during recent years, the computation of interest for the year 1899 has been made on a $3\frac{1}{2}$ per cent. basis.

Adding the expenditure on account of the services of the Postmaster-General from the Votes of other Departments, and the interest on the cost of buildings and construction of telegraph lines, the expenditure properly chargeable to the Department under my control for the year 1899 was £970,061 19s. 3d., or £9,259 2s. 11d. in excess of the revenue for the same period.

As explained in the report of my predecessor, for 1898, the Post Office performs a number of services for the public and for other Government Departments, for which no monetary credit is taken in the foregoing statement. These services include the conveyance by post of petitions to the Governor, the Executive Council, and Members of either House of Parliament; newspapers under seven days old; returns under the "Land and Income Tax Assessment Act of 1895," and letters and packets for the purpose of carrying out the provisions of the "Census and Industrial Returns Act," all of which are by law exempt from postage; also all mail matter on Her Majesty's Service, the postage properly chargeable on which is thought to be not fully covered by the annual vote of £32,000 for this purpose; the supply of shipping and weather intelligence by telegraph; the performance by Postmasters and other officers in various districts of the Colony of the duties of Electoral Registrar, Deputy Electoral Registrar, Registrar of births, deaths, and marriages, Meteorological Observer, &c.; and the maintenance of the electric light at Parliament House, Circular Quay, Cowper's Wharf, and the Jenolan Caves.

It is impossible to accurately appraise the value of these services, but it will be understood from the nature of them that they entail a considerable amount of expenditure on the Department, probably not less in the aggregate than £50,000 per annum, in addition to the £32,000 annually voted for Postage of Public Departments.

INLAND SERVICE.

The new postal routes opened during the year 1899, as shown in the annexed return, and including alterations in existing routes, amounted to 1,344 miles, viz. :—

Postal Line.	No. of times per week.	Postal Line.	No. of times per week.
<i>In the Western Country.</i>		<i>In the Southern Country.</i>

Whitton and 12-mile Gate	2	4			

The communication existing on the following lines was decreased :—

Postal Line.	No. of times per week.	
	From—	To—
<i>Southern Roads.</i>		
Between Granville and Guildford.....	12	6
Yalgogrin North and Ungarie.....	2	1
Yass-Queanbeyan Mail Line and Majura	3	1
<i>Northern Roads.</i>		
Between Bingara and Warialda	6	3
Deepwater and Torington	6	3

The extent of postal route traversed in the Colony up to the 31st December, 1899, was 35,740 miles, as compared with 34,961 miles traversed in 1898—

	1898.	1899.
On horseback	10,103 miles	10,235 miles.
By coach	21,214 „	21,832 „
By railway	2,752 „	2,781 „
By tramway	68 „	68 „
By steamer	824 „	824 „

The extension of mail route by railway during 1899 was as follows :—

Tamworth to Manilla	29 miles.
----------------------------	-----------

The number of miles travelled in the year 1899 was 11,638,500, being an increase of 635,000 on the mileage of the previous year.

The number of Post Offices established was 54, viz. :—Abercrombie, Armatree, Ashley, Barooga, Beaconsfield, Beaumont, Belmore, Boonoo Boonoo, Bora Creek, Brookong, Brookvale, Brucedale, Castlereagh-street, Central Raleigh, Colinroobie, Federal, Fernleigh, Glenfield, Glenreagh, Half-way Creek, Hallsville, Ingebyra, John's River, Kempton, Kenmore, Leichhardt Hill, Majura, Meroo Meadow, Milbrulong, Military Road, Naranghi, Pine Hills, Queen Victoria Markets, Roslyn, Sally's Flat, Sodwalls, Summervale, Suntop, Tarrawanna, Tempe Park, Tingiringi, Tomooroma, Triangle Flat, Upper Horton, Unkya Creek, Walmer, Ward's River, Weetangerra, Willaroo, Wirrialpa, Womboota, Woolabra, Yarrowitch, and Yerranderie.

Post Offices were re-established at Cuttabri, Garangula, and Moor Creek.

The number of Post Offices discontinued was 9, viz. :—Blackman's Point, Cuttabri, Mount Kimo, Mungunyah, One Tree, Park-street, Purnamoota, Springbrook, and Yarrabundie.

It was found desirable to change the designations of the following Post Offices, viz. :—Boggy Camp to Copeton, Box Ridge to Turondale, East Carlingford to Epping, Lower Botany to Botany, Mewburn to Rugby, Roslyn to Roseleigh, Tomooroma to Adjungbilly, and Warne to Euchareena.

Appendix A.

In the Appendix will be found a list of the 1,626 Post Offices in the Colony on the 31st December, 1899. In addition to these, there are 3 Travelling Post Offices, which run between Sydney and the northern border of the Colony at Jennings, between Sydney and Albury on the southern border, and between Sydney and Dubbo in the West.

Two hundred and four changes of Postmasters occurred during the year.

Receiving Offices were established at the following places :—Acacia, Alagala, Barranganyatti, Bellmount Forest, Blakebrook, Bland, Bokhara Hotel, Bonville, Bora Creek, Bowman's Creek, Brooklet, Buttai, Caddigat, Carlachy Tank, Carroll Gap, Coochoonah, Cooakanalla, Corang, Cottee, Crowther, Currawarna, East Guyong, Farrendale, Fernleigh, Forest Hill, Gregra Railway Station, Innesvale, Klori, Ladysmith, Leech's Gully, Mairjimmy, Mangain, Merowie, Micketymulga, Minore Siding, Mooculta Siding, Mosquito Creek, Mountain View, Mount Eurow, Mount Fairy, Mount Gwynne, Navarino, Nethercote, North Menangle, Norwood, Oallen, Pinkerton, Ranter's Creek, Rosehill, Roseville, Saumarez, Sharpe's Creek, Stanhope, Tallwood, Terranora, Terry-hie-hie, Tootal, Trungley, The Bunker, Walker's Hill, Warrambucca, Watterson's, Webb's, Yarrangobilly Caves, and Yerranderie.

Receiving

Receiving Offices were re-established at Blair Hill, Bob's Range, Keerrong, Rockmore, Ward's River, Yarrangobilly, and Yeo Yeo.

The names of the following Receiving Offices were changed, viz. :—Boney's Rocks to Burdett, Gunnary Creek to Gunnary, Lower Hickey's to Willawarrin, Margules to Tomooroma, Panpong to Paupong, and Trungley to Trungley Hall.

The Receiving Offices at the following places were converted into Post Offices, viz. :—Armatree, Ashley, Barooga, Boonoo Boonoo, Bora Creek, Brookvale, Brucedale, Central Raleigh, Colinroobie, Federal, Fernleigh, Garangula, Glenfield, Halfway Creek, Hallsville, Ingebyra, John's River, Kempton, Majura, Milbrulong, Naranghi, Roslyn, Sally's Flat, Summervale, Suntop, Tingiringi, Tomooroma, Triangle Flat, Unkya Creek, Upper Horton, Walmer, Ward's River, Weetangerra, Willaroo, Womboota, Woolabra, Yarrowitch, and Yerranderie.

The Receiving Offices at the following places were discontinued, viz. :—Barrieton, Chanticleer, Claremont, French Park, Gilmandyke, Gorton's Yard, Gwynne, Hiawatha, Hughstonia, Keerrong, Kingsvale, Mandemar, Meringlo, Mosquito Creek, Murrulebale, New Cryan, Rockmore, Rocky Plain, Scott's Gully, Tallawudjah, Teridgerie, Trickett, Turce Vale, Warrambucca, Westove, Woodenbong, Williams Crossing, and Yarrangobilly.

In the Appendix will be found a list of the Receiving Offices in existence at Appendix B. the close of the year—526 in number.

Appendix A contains a return of the Government Buildings for the trans- Appendix A. action of the Postal, Money Order, Savings Bank, and Telegraph business, and particulars of the premises rented or otherwise provided for the purpose. Government Buildings at the following places were completed and occupied during the year 1899, viz. :—Araluen, Barrington, Bodalla, Clifton, Drake, Manilla, Newcastle West, Peak Hill, Taree, and Whitton.

Sites for Post and Telegraph Offices were secured at Aberdeen, Bowraville, Broken Hill Railway Station, Ford's Bridge, Gloucester, Hungerford, Merewether, Mossgiel, Mundooran, Murwillumbah, Nelligen, and Pyrmont.

During the year 1899, 1 pillar letter-receiver was removed to a different site, and 5 were withdrawn; 49 small iron letter-receivers were placed, 5 removed to different sites, and 9 withdrawn; 1 pillar newspaper-receiver was withdrawn.

On the 31st December the number of letter-receivers erected in the Colony (both large and small) was 1,363, and the number of newspaper-receivers, 27.

The number of licenses for the sale of postage stamps issued in 1899 to persons other than postmasters or receiving-office-keepers was 110, the number transferred, 49, and the number cancelled, 15.

On the 31st December, 1899, the number of locked private letter-boxes let at the General Post Office was 1,307. In addition to these, 73 were allotted to Public Departments. The system is now in operation at the following offices, viz. :—Adelong, Albury, Armidale, Ashfield, Ballina, Balmain, Balranald, Bathurst, Bega, Berrigan, Bingara, Bombala, Bourke, Bowral, Braidwood, Broken Hill, Burwood, Casino, Cobar, Condobolin, Cooma, Coonamble, Cootamundra, Coraki, Corowa, Cowra, Deniliquin, Dubbo, East Maitland, Emmaville, Forbes, George-street North, Glen Innes, Goulburn, Grafton, Granville, Grenfell, Gulgong, Gunnedah, Hay, Haymarket, Hillgrove, Hillston, Inverell, Jerilderie, Junee, Katoomba, Kempsey, Kiama, King-street, Lismore, Maclean, Manilla, Manly, Marrickville, Moree, Moruya, Moss Vale, Mount Victoria, Mudgee, Murwillumbah, Muswellbrook, Narrabri, Narrandera, Newcastle, Newcastle West, Newtown, North Sydney, Nymagee, Orange, Pambula, Parkes, Parramatta, Peak Hill, Petersham, Queanbeyan, Queen Victoria Markets, Quirindi, Rozelle, Scone, Silverton, Singleton, Tamworth, Taree, Temora, Tenterfield, Uralla, Urana, Wagga Wagga, Walgett, Warialda, Warren, Wentworth, West Maitland, West Wyalong, Wilcannia, Wollongong, and Young.

Five private posting-boxes have been constructed on private premises for the use and at the expense of the occupants, under the system introduced in August, 1886. The fee charged for the clearance of these boxes varies from £3 to £5 per annum, according to the number of clearances effected daily.

The number of persons employed in connection with the Postal and Electric Telegraph Department for the year 1899 was as follows :—1 Postmaster-General, 1 Deputy Postmaster-General, 1 Secretary, 1 Chief Electrician and Engineer-in-Chief of Telegraphs, 1 Chief Accountant and Controller, Money Order Office and Government Savings Bank.

Ministerial

Ministerial Division.—1 inland mail clerk, 1 appointment clerk, 1 inspector for irregularity and missing and dead letter branch, 1 correspondence clerk, 1 record clerk, 41 clerks, 1 medical officer, 1 chief messenger, 7 indoor messengers, 2 detectives, 3 constables.

Money Order and Government Savings Bank Division.—1 accountant, 1 examiner, 1 teller, 79 clerks, 8 indoor messengers.

Account and Cash Division.—1 accountant, 1 distributor of stamps, 1 cashier, 20 clerks, 3 indoor messengers.

Mail Division.—1 chief inspector and superintendent, 1 assistant superintendent and senior inspector, 7 inspectors, 52 clerks, 1 officer in charge of parcel post, 1 clerk in charge of stores, 1 shipping clerk, 1 assistant shipping clerk, 1 clerk and translator, 1 relieving officer, 1 Chinese interpreter, 17 mail guards, 1 overseer of sorters, 126 sorters, 12 stampers, 1 outdoor inquiry officer, 1 overseer of letter-carriers, 76 letter-carriers, 17 junior letter-carriers, 60 mail-boys, 17 assistants, parcel post branch, 4 storemen, 2 custodians of mails, 1 custodian of mail-bags, 2 bag turners, 1 bag-maker, 1 letter-carriers' timekeeper, 1 mechanic, 1 carpenter, 1 caretaker, 1 assistant caretaker, 1 officekeeper, 1 tower attendant, 6 cleaners, 15 female servants, 1 manager of stables, 1 farrier, 1 assistant farrier, 3 grooms in charge, 5 grooms, 1 foreman of mail-cart drivers, 13 mail-cart drivers, 3 lift attendants.

Telegraph Division.—1 station manager, 2 assistant station managers, 2 supervisors (operating branch), 1 check clerk, 1 electrician, 1 assistant electrician, 3 testing officers, 2 junior testing officers, 1 receiving clerk, 35 clerks, 23 booking clerks, 178 operators, 8 junior operators, 1 supernumerary operator, 14 supernumerary assistants, 4 messengers' overseers, 11 monitors (despatch branch), 181 messengers, 1 mechanic, 5 fitters, 3 cadets (electrician's branch), 1 inspector of lines (city and suburbs), 1 assistant line repairer, 1 assistant (construction branch), 9 batterymen, 1 jointer, 1 bicycle mechanic.

Telephone Branch.—1 manager, 1 clerk, 1 mechanic, 31 fitters, 1 exchange foreman, 1 line foreman, 7 monitors, 1 matron, 110 switch attendants (43 male and 67 female), 2 junior assistants, 1 cleaner and messenger, 1 messenger.

Electric Light Branch.—1 chief engineer, 4 engineers, 12 assistant engineers.

Branch, Suburban, and Country Offices.—1,626 postmasters (422 official, 1,204 non-official), 7 telegraph station masters, 109 postal assistants, 64 junior postal assistants, 41 supernumerary assistants, 65 temporary postal assistants, 228 operators, 54 junior operators, 103 supernumerary operators, 7 postal and telegraph assistants, 19 non-official station masters and telephone operators, 17 mail-guards, 2 assistant guards, 170 letter-carriers, 207 junior letter-carriers, 46 mail-boys, 379 telegraph messengers, 107 switch attendants, 2 telephone fitters, 4 battery-men, 47 line-repairers, 4 construction overseers, 4 carpenters, 18 gangers, 56 temporary line-repairers, 28 labourers, 1 mason, 526 receiving office keepers.

Total, Head Office	1,310
„ Branch, Suburban, and Country Offices ...	3,941
„ Number of Mail Contractors	858
„ „ Porters	102
Total number of persons employed	6,211

These may be subdivided into—

Persons whose whole time is occupied in the service;	{	Principal officers	37
		Clerks	261
		Post and telegraph masters	429
		Assistants at Post Offices	261
		Operators	572
		Subordinate officials	1,913
and			3,473
Persons whose time is only partially employed in the service.	{	Sub or non-official postmasters, telephone operators, and receiving office keepers	1,749
		Assistants to non-official postmasters and other subordinate officials	29
		Mail contractors and mail porters	960
			2,738
Total			6,211

The

The removals from the Service numbered fourteen. Of these, one, a postal assistant, was sentenced to seven years' penal servitude for forgery in connection with attempted money order frauds; another postal assistant and a junior letter-carrier were each sentenced to twelve months' imprisonment for stealing letters, while for a similar offence a junior operator received a sentence of three years' imprisonment with hard labour. A letter-carrier was convicted on a charge of wilfully detaining a letter and fined £10, and a junior letter-carrier, for destroying letters, was sentenced to twelve months' imprisonment. The remainder were dismissed for the following offences, namely:—A post and telegraph master for irregularities in his accounts; a clerk, an operator, and a junior letter-carrier for absence without leave; a supernumerary operator for absconding after being charged with embezzlement; a letter-carrier for the loss of a letter containing £1; and a telegraph messenger and a switch attendant for other misconduct.

The appointments of four probationary officials were annulled, namely:—A switch attendant on account of physical unfitness; another switch attendant for absence without leave; and two telegraph messengers for unsatisfactory conduct.

Twenty-one deaths occurred, namely:—W. B. Scott, clerk; H. J. Leaney, booking clerk; P. Claye, telegraph master, West Maitland; J. P. Olson, post and telegraph master, Ashfield; C. H. Kellett, post and telegraph master, Penrith; J. Ramsay, post and telegraph master, Scone; Mrs. E. J. O. Stuckey, post and telegraph mistress, Surry Hills; B. L. Edwards, post and telegraph master, Cundletown; Mrs. M. A. Bush, post and telegraph mistress, Gresford; J. B. Coleman, operator, head office; C. T. McAuley, operator, Yass; J. Hay, operator, Wentworth; H. Williams, operator, Temora; A. Duffy, sorter; A. L. Ferguson and J. P. Strom, junior letter-carriers; A. E. Canning and W. H. Riley, mail-boys; F. R. Goodwin, assistant in bag-room; and T. C. Carr and F. Noden, telegraph messengers.

Sixty resignations took place.

Fourteen officers were transferred to positions in other Government Departments.

Ten officers retired from the Service, namely:—J. A. Dick, post and telegraph master, Windsor, and C. Smith, post and telegraph master, Gundagai, who were allowed pensions under the Civil Service Act, 1884; R. S. Cannon, clerk, T. A. McNeely, junior operator, Richmond, R. G. M. Gill and C. M. Schey, sorters, who were allowed gratuities under the Public Service Act of 1895; G. Boseley, postal assistant, Hay, and H. Hymann, post and telegraph master, Enngonia, who retired without gratuity, but were granted a refund of their contributions to the Superannuation Fund; and E. J. Duff and H. C. E. Travers, telegraph messengers, who were retired under the provisions of Public Service Regulation No. 206.

The Hon. Varney Parkes, M.P., who succeeded the Hon. Joseph Cook, M.P., in the administration of the Department on the translation of the latter to the Department of Mines and Agriculture, on the 27th August, 1898, retired with the Government of which he was a member on the 13th September, 1899, and I was appointed to the office of Postmaster-General in the present Administration on the 14th idem.

The Postal Inspectors in 1899 travelled a distance of 54,157 miles, and inspected the postal routes appertaining thereto, visiting 540 offices, 87 of which were visited more than once during the year.

In January, a system of compensation, not exceeding £2 in any case, for the loss of registered articles, other than parcels, was introduced. Before compensation can be claimed it must appear that the loss did not arise wholly, or in part, through the fault of the sender, and that it actually occurred whilst the article was in the post. In lieu of granting compensation, the missing article may be replaced by the Department, which, in either case, reserves the right to return the article or dispose of it as may be thought fit, should it be subsequently recovered. No compensation is allowed in respect of any article which may not be lawfully sent by post, and in the case of registered articles containing money, bank or postal notes, or valuable securities, &c., the special precautions provided in the regulations must be observed before any claim for compensation for loss can be entertained.

The regulation relative to notices of premiums due was amended in February, so as to allow of addresses, in addition to names, dates, and amounts, being inserted in such notices transmitted inland, and to New Zealand, South Australia, Tasmania, Victoria, and Western Australia.

In

In February, obliterated stamps and spent letters (*i.e.*, those which clearly have served their original purpose, and are at least two months old) were admitted to transmission by post, within the Colony, and to the other Australasian Colonies, at Commercial Paper rates, *viz.*, 1d. for every 2 oz. (up to 4 lb.), and subject to the usual Packet Regulations.

In March the Regulations were amended so as to allow of the transmission to Western Australia of Bankers' packets, containing bank notes, at the rate of 1d. per 2 oz., up to 4 lb.

The Regulation under which specimens, &c., are allowed to pass through the post "O.H.M.S." to the Department of Mines and Agriculture, and certain branches of other Government Departments, provided they are endorsed in the prescribed manner, was amended in March, so as to include specimens addressed to the Australian Museum.

From the 16th March, promissory notes, signed or unsigned, circulars, and other printed matter, enclosed with accounts, were transmitted by post within the Colony, and to Queensland, South Australia, Tasmania, Victoria, and Western Australia, at packet rate of postage, namely, 1d. per 2 oz. (up to 16 oz.), and from the 5th April New Zealand was included in the arrangement.

From the 5th April, proxy forms, or notices, in which may be inserted such particulars as date, signature, name of proxy, date of meeting, name of shareholder or member, and number of votes (but nothing which does not form part of the document as a legal instrument), were transmitted to New Zealand, at packet rate of postage, namely, 1d. per 2 oz.

In June, the rule relative to the prepayment in cash of postage on large quantities of mail matter, posted at the same time, the amount of postage on which is not less than £1, was extended to mail matter for Fiji.

In July, Bank or other pass-books, properly open to allow of inspection, to and from private individuals, were admitted to transmission by post within the Colony, to Victoria, Queensland, South Australia, Tasmania, and New Zealand, and in August to Fiji, at the rate of 1d. per 2 oz.

In May it was found needful to amend the Newspaper Regulations so as to prevent publications consisting merely of a repetition of literary matter contained in a previous number, obviously for the purpose of circulating advertisements, passing through the post as newspapers.

In October, consequent on the receipt of a communication from the Melbourne Post Office, stating that under the Victorian Postal law, newspapers printed or published in New South Wales and posted in Victoria would, in future, be subject to "Magazine" rate of postage, the same rate of postage was charged on newspapers printed and published in Victoria and posted in New South Wales, for delivery within the Colony.

From the 21st January Buckdoon, Kilgin, Riley's Hill, South Woodburn, Swan Bay, and Woodburn were added to the list of places in the Ballina and Lismore districts between which letters may be transmitted at the "town" rate of postage, namely, 1d. per $\frac{1}{2}$ oz. Cronulla Beach was included in the Metropolitan district from 1st August, and Fassifern in the Newcastle district from 15th September.

The rate of postage on letters transmitted to and from Post and Receiving Offices within 13 miles of Braidwood was reduced to 1d. per $\frac{1}{2}$ oz. from the 20th February.

In view of the loss sustained by the Department, as well as the anomalies in connection with the system under which letters are transmitted at the "town" rate of postage to and from places within certain prescribed districts, it was decided that no application for the extension of the system to any fresh district should be entertained after the end of February.

FOREIGN SERVICE.

As intimated in the Report of my predecessor for 1898, the contract with Mr. James Huddart, for the mail service between Sydney and Vancouver, expired on the 24th May, 1899, and an agreement, published as an Appendix to such Report, was concluded with Burns, Philp, & Co. (Limited), the terms and conditions of which are similar to those of the previous contract (with certain modifications introduced during its currency), except that the route is *via* Brisbane instead of *via* Wellington. The subsidy payable is £10,000 per annum, and the duration of the contract four years.

years. The contract provides that the steamers may call "at Fiji, at the option of the Company," but, at the request of the Company, permission was given for another Pacific port of call (to be approved by the Department) to be substituted for Fiji. The steamers ceased to call at Fiji after August, 1899, and have since then proceeded direct to and from Brisbane and Honolulu.

Particulars of the Mail Services performed *via* Suez, San Francisco, and Vancouver during the year 1899 :—

Estimated postages collected in the Colony	1,375	0	0			
				2,638	10	0
Estimated net cost to the Colony				£7,465	8	2
The estimated net cost for 1898 was				£7,345	9	9

PARCEL POST.

In connection with the Inland and Intercolonial Parcel Post system, which was established in 1893, the Railway Department was paid at the rate of £3,200 per annum, representing one-third of the gross postages on Inland parcels, carried by rail, and one-third of this Department's share of the postages on parcels to and from the other Colonies, carried by rail, for the six months ended the 31st March, 1894. From that date the payment was increased to £3,500 per annum, at which amount it remained until the 1st July last, when, in response to the application of the Railway Commissioners for additional subsidy, it was further increased to £5,000 per annum.

During the year revised rates of postage were introduced in connection with the exchange of parcels between New South Wales and various British Colonies and foreign countries.

In March a system of insurance of postal parcels against loss or damage whilst in transit through the post was introduced, the maximum amount of such insurance being £50.

The following are the rates levied for this service, in addition to the ordinary postage:—

- On parcels posted in New South Wales, for delivery therein:—4d. to secure compensation up to £10, with an additional 2d. for each successive £10 up to £50.
- On parcels posted in New South Wales for South Australia, Victoria, or New Zealand:—5d. to secure compensation up to £10, with an additional 2½d. for each successive £10, up to £50.
- On parcels to the United Kingdom:—6d. to secure compensation up to £10, with an additional 3d. for each successive £10, up to £50.

From the 1st April, parcels for Tasmania were insured against absolute loss only, on the terms and conditions of the general regulations relative to the insurance of parcels.

The Colonies concerned have concluded an agreement governing the exchange of insured parcels, the text of which will be found in the Appendix.

In December the system was extended to the following countries, *via* the United Kingdom, the insurance fee varying from 7d. to 2s. 9d. per parcel according to value:—

Algeria, Antigua, Ascension, Austria, Azores, Bahamas, Barbados, Belgium, Bermuda, Beyrout, British East Africa, British Guiana, Cameroons, Chili, Constantinople, Cyprus, Danish West Indies (St. Croix, St. John, and St. Thomas), Denmark, Dominica, Falkland Islands, France (not including Corsica), Gambia, Germany, Grenada, Holland, Italy, Lagos (Africa), Luxemburg, Madeira, Mombasa, Montenegro, Montserrat, Nevis, Newfoundland, Niger Coast, Norway, Portugal, Roumania, Russia, St. Helena, St. Kitt's, St. Lucia, St. Vincent (West Indies), Servia, Sierra Leone, Smyrna, Switzerland, Tobago, Tortola, Trinidad, Tunis, and Zanzibar.

Appendix C.

The

The Inland and Intercolonial Parcel Post was established on 1st October, 1893, and during the three months ended 31st December, 1893, 38,025 Inland parcels, weighing 115,066 lb. were posted, upon which postage amounting to £2,038 was paid; 3,830 Intercolonial parcels, weighing 10,086 lb., with a declared value of £4,766 were also posted, the postage amounting to £309. The following table shows the growth of the Parcel Post for the six years ended 31st December, 1899 :—

* The number of articles, other than newspapers, exempt from postage being comparatively small, a separate account has not been kept of them, and they are included with articles subject to postage.

† Estimated population on 31st December, 1899, 1,356,650.

NOTE.—The numbers of ordinary letters, packets, and newspapers, are calculated on the basis of returns furnished by Postmasters during two months of the year, and must therefore be accepted as approximate only. For all other items, the actual numbers dealt with during the year are given.

DEAD LETTER BRANCH.

The following return shows the number of Letters, Post Cards, and Packets dealt with either by the return to writers, discovery of persons addressed, or otherwise, during the year 1899 :—

	Letters.	Post Cards.	Packets.
INLAND.			
Returned to senders.....	198,860	2,294	274,650
Destroyed, in accordance with section 32 of 31 Vic. No. 4.....	38,280	1,142	18,750
INTERCOLONIAL.			
Originally addressed to other colonies :—			
Returned to senders, or otherwise disposed of.....	17,888	260	9,648
Destroyed, in accordance with section 32 of 31 Vic. No. 4.....	3,579	75	2,765
Returned to other colonies as unclaimed.....	18,775	565	10,493
FOREIGN.			
Originally addressed to other countries :—			
Returned to senders, or otherwise disposed of.....	5,955	190	710
Destroyed, in accordance with section 32 of 31 Vic. No. 4.....	1,191	35	51
Returned to other countries as unclaimed.....	63,685	433	2,554
Total number dealt with.....	348,223	4,984	319,621

The above return includes 2,427 registered letters posted originally within the Colony. A considerable number of these letters had the names and addresses of the senders embossed on the envelopes, and were returned accordingly. The others were opened to obtain the required information. They were found to contain, besides correspondence and valuable articles of jewellery, such as watches, rings, &c., the sum of £2,210 6s. 5½d. in coin, notes (bank and postal), cheques, money orders, and stamps. In 1,560 unregistered letters were found enclosures representing £5,968 10s. 6½d.

447 registered letters, originating in places beyond the Colony, were returned unopened, as follows :—197 to the other Australasian colonies, 104 to the United Kingdom, and 146 to other countries.

Besides those otherwise disposed of, packets, to the number of 822, containing merchandise, jewellery, &c., having been refused by addressees on account of surcharges, or posted out of course, or having become detached from their covers in transit, were received and detained pending inquiry on the part of the senders or of the addressees. The major portion were subsequently delivered. Articles of this description are kept for a prescribed period, at the expiration of which, if unclaimed, their contents are disposed of by public auction, in conformity with the Postage Act, the proceeds being paid into the Consolidated Revenue.

1,236 letters were posted unaddressed, a considerable portion of which were either returned to the writers or forwarded to the persons for whom they were found to be intended. The remainder afforded no adequate indication as to the whereabouts of the senders. As an illustration of the negligence shown by some people, even in matters of importance, it may be mentioned that 38 letters covering valuable enclosures to the amount of £131 13s. 10d. were consigned to the post without address.

On an average, 52 letters and packets, with insufficient directions, were passed on to the Dead Letter Office daily for treatment. The addresses of a large number were corrected, and the articles forwarded to their respective destinations. The others were returned to the senders or were otherwise disposed of, as required by law.

About

About 60,000 letters were refused by addressees, owing to surcharges. The largeness of the total is explained by the fact that the bulk of this correspondence—to be precise, 55,237 letters—was directed to the originator of a chain-letter.

1,725 Chinese letters, imperfectly addressed, were despatched to their intended destinations through the assistance of the Chinese interpreter, by whose instrumentality 1,249 letters were returned as unclaimed to the writers.

A sum of £488 2s. 4d., contained in letters, which had remained unclaimed for the prescribed period, was paid, in accordance with law, to the credit of the Consolidated Revenue.

It is estimated that fully £00,000 unclaimed newspapers were disposed of during the year.

As an instance of want of care in seeing that letters, even when containing valuable enclosures, are properly sealed before posting, may be mentioned the fact that a cheque on a leading banking company of Sydney, for £1,009 18s. 6d., was discovered loose amongst correspondence posted on the evening of the 4th April, 1900, inquiry in regard to which showed that the cheque had formed portion of the contents of a letter (from a prominent City firm) which had inadvertently been posted, unsealed, the cheque having evidently dropped from the envelope in the process of sorting.

DELIVERY BY LETTER-CARRIERS.

The number of letters, &c., delivered by the Letter-carriers attached to the head office during the years 1898 and 1899 was as follows:—

	1898.	1899.
Unregistered letters	10,360,173	11,311,857
Registered letters	96,591	99,373
Books, &c.	246,457	266,355
Newspapers	1,496,144	1,621,558

REGISTRATION BRANCH.

The number of Registered Letters which passed through the General Post Office in 1899 was 830,576, against 821,930 in 1898, the increase in number being 8,646.

MAILS RECEIVED AND DESPATCHED.

The following return shows the number of Mails received at and despatched from the General Post Office during the years 1898 and 1899.

Year.	Received.		Despatched.		Total number of Mails which passed through the office.
	Inland.	Foreign.	Inland.	Foreign.	
1898	249,513	10,535	213,104	12,744	485,896
1899	255,630	10,917	218,636	13,052	498,235
Increase	6,117	382	5,532	308	12,339

RECORD BRANCH.

The number of written communications received from the public during 1899, intimating changes of address, or requesting letters, &c., to be forwarded, was about 25,850, against about 25,000 in 1898.

The number of communications addressed to the Department relating to the extension and improvement of the service, to irregularities connected with the performance of mail contracts, and to the transmission of letters, telegrams, &c., and recorded in the year 1899, was 54,690, against 51,713, in 1898.

POSTAGE STAMPS, STAMPED ENVELOPES, &c.

The following return shows the number, description, and value of Postage Stamps, &c., issued at the General Post Office during the years 1898 and 1899 :—

Number		Description	Value.		Increase in issue for 1899.		Decrease in issue for 1899.

In accordance with the resolution of the Postal Congress held at Washington, expressing the desirability of adopting uniformity in colour throughout all Postal Union Administrations, with regard to such stamps as are mostly in use in the international service, the colours of the half-penny and twopence-halfpenny postage stamps were changed from grey and royal purple to green and dark-blue, respectively, from the 1st January.

In consequence of the alteration of the colour of the halfpenny postage stamp from grey to green, the colour of the sixpenny stamp was, from the 17th January, altered from viridine green to deep orange.

In July regulations were introduced providing for the issue of envelopes impressed with the 1d. or 2d. stamp, for use by Members of the Legislative Assembly when corresponding on public business. The issue is limited to a total value of £1 5s. per month for each Member. The envelopes are endorsed, "On Public Service Only," and bear the printed inscription, "This envelope can only be lawfully used by Members of Parliament, and only on the Public Business. The Public are cautioned against using it under any circumstances."

The 2d. envelope is available for the transmission by post within the Colony of a letter not exceeding 2 oz. in weight, or as a wrapper for Parliamentary papers, printed matter, or returns up to 8 oz., provided the ends be left open, as required under the regulations.

INLAND MAIL CONVEYANCE.

In the year 1899 the average cost per mile of the Inland Mail Conveyance was about 3½d., against 3¾d., the price per mile paid during the previous year.

The number of contracts in existence on the 31st December, 1899, for the conveyance of inland mails was 1,007, and the number of mail services in respect of which no formal contracts were executed, 299.

MONEY

MONEY ORDERS.

Money Order Offices were established during the year 1899 at the following places, viz.:—Airly, Attunga, Bangalow, Beaconsfield, Bobadah, Castlereagh-street, Cockle Creek, Epping, Fifield, George's Plains, McPhail, Military Road, Mullaley, Ourimbah, Queen Victoria Markets, Tempe Park, and Wahroonga.

The offices at Gunbar, Park-street, and Reefton were abolished, and the name of the office at Lower Botany was changed to Botany, and Warne to Euchareena.

The number of Money Order Offices in the Colony on 31st December, 1899, was 662.

The number of money orders issued was 421,085 (exclusive of 5,499 certificates of transfer amounting to £31,541 used by Postmasters in connection with transmitting fees for private letter-boxes, &c., &c.), and the value £1,436,927, against 407,161 of the value of £1,371,727, the difference showing an increase of 13,924 in the number, and £65,200 in the amount, as compared with 1898.

The number of money orders paid (exclusive of 5,499 certificates of transfer amounting to £31,541) was 418,855, and the value £1,466,602 against 410,772 of the value of £1,432,373 in 1898, being an increase of 8,083 in the number and £34,229 in the amount.

The amount of revenue received as commission on money orders issued was £15,874 13s. 7d., being £764 8s. 7d. more than the amount collected in 1898.

A comparative return showing the various countries where the money orders issued in New South Wales were made payable, and also the money order issues of other countries payable in New South Wales, will be found in the Appendix.

Appendix D.
Appendix A.

In the information contained in Appendix A will be found a detailed statement of the business transacted and revenue collected at each office in the Colony.

From the 1st March the hours during which Money Order and Government 'Savings' Bank business may be transacted were altered to the following:—

Chief Office, 9 30 a.m. to 3 30 p.m., Mondays to Fridays; Saturdays, 9 30 a.m. to 12 noon.

City Branch Offices, and Suburban, and Country Offices, 9 a.m. to 5 p.m.

Chief Office and all Offices at which there is a branch of the Government Savings Bank, 7 to 9 p.m. (on Saturdays only), for the receipt of deposits.

Appendix E.

A convention concerning the exchange of money orders with the colony of Natal, the text of which will be found in the Appendix, was concluded and brought into operation on the 1st October, 1899.

POSTAL NOTES.

During the year 1899, 1,251,747 postal notes, of the value of £456,779 6s. 6d. were supplied to Postmasters for sale to the public. Of these, 1,184,652 were issued and paid in New South Wales, having a value (with stamps affixed) of £424,645 4s. 7d.; 62,063 notes, value £25,011 7s. 4d., of other colonies were also paid; making a grand total of 1,246,715, of the value of £449,656 11s. 11d., paid in New South Wales.

The number of notes issued in this Colony and paid in other Colonies was 66,650, of the value of £25,302 19s. 5d. (including postage stamps to the value of £251 9s. 5d. affixed thereto).

The amount of revenue collected as poundage was £10,966 1s. 11d., an increase of £867 0s. 5d. as compared with 1898.

The following table contains particulars of the postal notes paid in New South Wales during the year 1899:—

Issuing Colony.	Denomination of Notes.														Total Number.	Value of Stamps affixed.	Total value of Notes, including Stamps.

Total	39 79	150 1

Telegraph Offices were opened at Castlereagh-street and Queen Victoria Markets, and at Cumnock and Quambone, in lieu of the Telephone Offices previously existing at those places.

The Offices at Morangarell and Mulgoa were converted into Telephone Offices, and the Offices at Park-street and Bundanoon Railway Station were closed.

The name of the Telegraph Office at Lower Botany was changed to Botany.

The local rate of 6d. for the first ten words, and 1d. for each additional word, has been charged from the dates specified for messages transmitted between the undermentioned offices :—

- Between Katoomba and Leura, from 15th February.
- Between West Maitland and Bishop's Bridge, from 7th April.
- Between West Maitland and Earley, from 24th May.
- Between Bourke and Pera Bore, from 17th July.
- Between Sutherland and all offices in Metropolitan district, from 21st August.
- Between Fassifern and all offices in Newcastle district, from 15th September.
- Between Wagga Wagga and Uranquinty, from 20th November.
- Between Railway Station and Post-office, Manilla, from 21st December.

In order to meet the convenience of merchants and other members of the business public, arrangements were made in March, whereby a sum of money, not less than £15, could be deposited with the Department to meet the cost of cablegrams transmitted after their offices or places of business are closed.

From the 1st April, the annual charge for the registration of code addresses for telegrams was increased from 10s. to 10s. 6d., in accordance with the resolution of the Hobart Conference, 1898.

The regulation relative to the charge for multiple telegrams was amended in May, so as to provide that copies of a telegram other than "Press," addressed to several persons in the same town, should be charged at the rate of 6d. per copy, if transmitted from any place within New South Wales for delivery therein.

The rates for cablegrams to various places beyond Australasia were revised in accordance with alterations from time to time notified in the transit rates charged by other Administrations.

In connection with the reduction in the rate for ordinary telegrams transmitted between Victoria and Queensland to 2s. for the first ten words, the New South Wales share of the tariff was reduced from 1s. to 8d. for the first ten words from the 1st January, 1899, and from the 1st March, 1899, the three colonies named agreed to share in equal proportions the reduced rates chargeable from that date on Press telegrams passing between Victoria and Queensland.

CABLE COMMUNICATION VIA THE CAPE OF GOOD HOPE.

The proposal of the Eastern Extension Australasia and China Telegraph Company, Limited, to lay an alternative line of cable between England and Australia, *via* the Cape of Good Hope, was referred to in the report of my predecessor for the year 1898, but, as therein shown, no definite conclusion was arrived at in the matter, which remained in abeyance until the 24th July, 1899, when the Company's Acting Manager in Australasia, forwarded copy of a letter which he had addressed to the Postmaster-General of Victoria, submitting an amended proposal, the details of which are given in the following memorandum, which was handed to the Deputy Postmaster-General by the Acting Manager of the Company, on the 31st August, 1899:—

The Company will entirely waive renewal of subsidy and guarantee against competition, and, in addition to providing a cable from the Cape all the way to Glenelg, *via* Perth, will at once reduce tariff to 4s. for the whole of Australia and Tasmania, and make further reductions on a sliding scale as traffic increases.

In return for the above the Company would only require the same privilege in Perth, Adelaide, Melbourne, and Sydney as they have hitherto enjoyed in Great Britain, of directly distributing and collecting their international telegrams to and from the public.

When the tariff is reduced to 4s. the Government rate will be made 3s., and the Press 1s. 6d. per word.

The rate to South Africa will be about 2s. per word.

The details of the sliding scale are as follows: The amount now guaranteed by the Australian Governments is £227,000, which, with £123,000 for the estimated yearly expenses of the new Cape line, forms a minimum of £350,000, or £15,000 less than the present actual receipts of the Associated Companies.

If the receipts for the three years 1898, 1899, and 1900 average £350,000, the 4s. tariff would be reduced in 1901 to 3s. 6d. If they are maintained at £350,000 for the years 1899, 1900, and 1901, the tariff would be reduced to 3s. in 1902. If the average receipts are again maintained for the three years, 1900, 1901, and 1902, the tariff would be reduced in 1903 to half-a-crown per word. The receipts must average £350,000 for three consecutive years before the next reduction of 6d. per word is made.

If the Company's proposal is agreed to, the new cable will be completed within a period of two years.

The Cape-Great Britain section is now being manufactured.

The reduction in tariff on a sliding scale between England and the Cape came into force at the end of August, and can be extended to Australia as soon as the Company's proposal is accepted.

This proposal formed the subject of negotiations by telegraph and otherwise, between my predecessor, the late Postmaster-General of Victoria, the Company's representative, and myself, and as a result, the Agent-General for New South Wales was telegraphed to by the Premier on the 23rd October, 1899, as follows:—

Wish you consult Mr. Chamberlain *re* proposals of Eastern Extension Company as bearing on prospects Pacific Cable. Our contract with Company expires thirty-first instant. We desire accept their proposals if Imperial Government see no objection, having in view prospects of Pacific Cable. Company entirely waive renewal subsidy, £32,400, and guarantee against competition and, in addition to providing cable all way to Glenelg *via* Perth, agree at once reduce tariff to 4s. (present rate 4s. 9d.), Government rate 3s., Press rate 1s. 6. per word, and make further reductions on sliding scale as traffic increases. Sliding scale as follows:—"The amount now guaranteed by Australian Governments is £227,000, which, with £123,000 for the estimated yearly expenses of the new Cape line, forms a minimum of £350,000, or £15,000 less than present actual receipts of Associated Companies. If receipts for years 1898, 1899, and 1900 average £350,000, the 4s. tariff would be reduced in 1901 to 3s. 6d. If they are maintained at £350,000 for the years 1899, 1900, and 1901, tariff would be reduced to 3s. in 1902. If average receipts maintained 1900, 1901, and 1902, tariff would be reduced in 1903 to half-a-crown word. Receipts must average £350,000 for three consecutive years before the next reduction of 6d. per word is made."

In return Company require same privilege in Perth, Adelaide, Melbourne, and Sydney as now enjoy Great Britain of directly delivering and collecting their international telegrams to and from public. Privilege mentioned as enjoyed in Great Britain is that Companies pay British Post Office £5 yearly per mile for each wire, and work both ends by their own operators, collecting and delivering traffic direct with the public. All telegrams to places other than those where the Companies have offices are dealt with by Post Office, who are paid their ordinary inland tariff. If the Company's terms are accepted the whole line might be in working order within two years.

Company further agrees that whilst they enjoy this privilege not to increase tariff as it stands in 1902 or 1903, which ever year is the lower—this agreement obtained order prevent increase rates should it happen that from any cause Pacific Cable be delayed. Cable reply.

A

A reply was received by cable on the 8th November, 1899, in the following terms :—

Mr. Chamberlain sees no objection to acceptance Extension Company's proposals contained in your telegram, 25th [? 23rd] ultimo. He points out, however, it is not expressly stated that Company is not in any case to increase its rates, and phrase at end telegram appears imply power reserved increased rate up to 1903 if revenue falls below amount fixed. Mr. Chamberlain would suggest you stipulate that once reduction made it must stand, though traffic falls off. He also thinks you should insist on South Africa to Australia Cable being made all British. No mention is made as to rates between South Africa and Australia, and, although this point does not directly concern Imperial Government or Mr. Chamberlain, of opinion you would do well to stipulate for fair maximum rate least, if not for sliding scale, as in other case. Finally, Mr. Chamberlain of opinion that arrangement should be made by which points where new cable landed would be settled in consultation with military authorities, with view ensuring they shall be landed where shore ends can be protected by fixed defences.

After enquiries in regard to Mr. Chamberlain's suggestion, the Acting Manager of the Company, having been empowered to deal with the points raised, on the 9th January, 1900, submitted for consideration a draft agreement for carrying out the project. The matter was discussed at a conference of Premiers, held in Sydney, on the 27th January, 1900, when, after full consideration, the following motion was proposed :—

“That the proposals of the Eastern Extension Telegraph Company for a Cape-Australian cable be accepted, with the following qualifications :—

- (a) The suggestion of Mr. Chamberlain to be agreed to.
- (b) The right to open local offices to be exercised only on the laying of the Pacific cable.
- (c) No exemption from Customs duties to apply except to telegraph instruments, cables, and chemicals.
- (d) Sites in Perth, Fremantle, Adelaide, and Glenelg to be subject to satisfactory arrangements approved by the Governments of Western Australia and South Australia.
- (e) The Roebuck Bay cable not to be closed. The Postmasters-General to arrange details subject to these provisions.”

A majority of Premiers were in favour of the above motion, but the Premiers of Victoria and Queensland having expressed a desire to obtain further information, it was unanimously agreed to postpone the final decision for a few days, and that the Premiers of Victoria and Queensland should communicate with the President, who would thereupon record and notify to the Secretary of State the decision arrived at.

Further negotiations ensued, but, so far as this Colony is concerned, a final decision has not yet been reached. The Colonies of South Australia, Western Australia, and Tasmania have, however, concluded an agreement with the Company.

PACIFIC CABLE.

In my predecessor's Report for the year 1898 a brief account was given of the position of affairs regarding the Pacific cable negotiations up to the 30th June, 1899. The following is an outline of subsequent proceedings in this matter, extending into the year 1900, viz. : On the 7th July, 1899, the Agent-General cabled :—

(1.) Pacific cable meeting Tuesday, Secretary of State for the Colonies, and Chancellor of the Exchequer, with High Commissioner for Canada, and Agents General for New South Wales, Victoria, New Zealand, and Queensland. Imperial Government now offer to co-operate fully with Colonies in raising capital for cable and in construction and management ; proposes this should be carried out by Board of Commissioners located in London, selected by contributing Governments as follows —

“The United Kingdom three members, Canada two, Australia and New Zealand together three ; England asks for this proportion as proposes virtually provide the capital, any annual deficiency for interest, and perhaps sinking fund being met in proportion already agreed upon. Imperial Government suggests preliminary steps should be taken by Provisional Board thus appointed to invite tenders, arrange scheme of management, settle rates and other preliminaries with a view to preparing for legislation. Imperial Government suggests that rates should be unanimously agreed to at outset, subsequent changes to be authorised by a fixed majority of Board. If you generally agree to scheme thus provisionally outlined desirable that Members of Board be notified promptly, and should be capable business men. This message to be communicated by you to three Colonies interested.”

(2.) Pacific cable message cable to-day previously seen by Secretary of State for the Colonies, and cabled by High Commissioner to Canada. It was agreed, at suggestion of Secretary of State, that should be left to Australia and New Zealand Governments to decide whether one of the three Australian delegates should be specially representative of New Zealand. Please inform other Governments interested.

•And on the 8th idem a further cable was received, as follows :—

Pacific cable. *Re* representatives on Provisional Board. Chamberlain's proposal was Australia two delegates, New Zealand one. I opposed this as unfair to Australia. At the suggestion of Agent General for New Zealand, agreed question should be left Governments concerned to settle. This nominal correction sent at request of Premier of New Zealand.

On the 11th July the Premier of Queensland telegraphed :

Referring to your telegram of yesterday, embodying two messages from your Agent General communicating results of Pacific Cable Conference, I am strongly of opinion that each contributing Colony should have a separate representative on the proposed Board of Commissioners, making four for Australia and New Zealand, and that representation of the other contributories should be proportionally increased.

And the Premier of New Zealand also telegraphed, under date 12th July, 1899 :—

Re Pacific cable.—New Zealand Government agrees to suggestion Imperial Government that Provisional Board should be appointed for the purpose of inviting tenders, arranging scheme of management, settling rates and preliminaries, that rates should be unanimously agreed to at outset, and that subsequent changes be authorised by fixed majority of Permanent Board. It would be a graceful act on part of Australian Colonies, and would be much appreciated, if they would agree to one of the three representatives on the Board specially representing New Zealand.

A further telegram was sent by the Premier of New Zealand on the 27th July, 1899, stating that that Colony had decided that their share of cost of Pacific cable should be fixed at one-ninth.

After correspondence between the Premiers of this Colony, Victoria, Queensland, and New Zealand, and the Secretary of State for the Colonies, it was agreed that three representatives should be appointed to the Pacific Cable Committee—one for New Zealand, and two to jointly represent New South Wales, Victoria and Queensland. Nominations were made by the latter three Colonies, and a ballot being taken the Agents-General for New South Wales and Victoria (Sir Julian Salomons and Sir Andrew Clarke) were appointed.

On the 16th October, 1899, a despatch was forwarded by His Excellency the Governor to the Secretary of State for the Colonies, informing him of the appointment of representatives.

Representations having been made by the Secretary of State for the Colonies, and the Premiers of Canada, New Zealand and Queensland, regarding the adverse effect on the Pacific cable project which would result from the acceptance of the Eastern Extension Company's Cape cable proposals, I advised that a reply be sent to each of the Governments mentioned, in the following terms :—

“Eastern Extension Proposals.—Seems some misapprehension. We are ready and anxious to carry out our undertaking *re* Pacific cable. Admitted all sides, this cannot be completed for three years—probably more. Meantime Eastern Extension offer immediate reduction of rates to four shillings, or about sixteen per cent., and by sliding scale coming three years to two shillings and sixpence as business increases. Also lay cable Cape to Adelaide, and then reduce present excessive Cape rates from seven shillings and threepence to two shillings and sixpence word. No concession asked for or given until Pacific cable completed. They then want direct offices so as to compete on equal terms, and in meantime any reduction whatever to remain until Pacific cable laid. Our present agreement terminates 30th April, and if no fresh one made Company can, instead of reducing rates, increase them up to eight shillings a word.

Cablegrams were despatched in accordance with this suggestion on the 6th March, 1900.

On the 5th March, 1900, the Premier of Canada cabled that he had ascertained from the best manufacturers that the Pacific cable could be made and laid within eighteen months. He also asked the Australian Colonies to postpone the consideration of the Eastern Extension Company's proposals until the Pacific cable was in operation.

The Pacific Cable Committee's Report has recently been received, but as papers on this subject have been laid before Parliament, it is unnecessary to make further comment upon the matter herein.

The

The following return shows the extent of line and wire in use, and the number of offices in existence on the 31st December, 1899; also the number and value of telegrams which passed over the lines during the year, as compared with 1898:—

„ „ Departmental system	186
	<u>9,618</u>

The length of lines opened during the year was 308 miles and 34 chains, and additional wires erected 2,457 miles and 43 chains, the cost of construction, including expenditure on tunnels, being £55,554 10s. 1d.

Public Telephone Offices were opened during the year at Attunga, Cal Lal, Charlestown, Morangarell and Mulgoa (in lieu of the Telegraph Offices previously existing at those places), and at Allynbrook, Barrengarry, Beaconsfield, Belford, Bellinger Heads Pilot Station, Bishop's Bridge, Bogan Gate, Bookham, Boppy Mountain, Brookvale, Brownsville, Burrumbuttock, Cobbadah, Eltham, Galston, Humula, Islington, Leichhardt Hill, Lower Botany, McPhail, Manilla Railway Station, Nelson's Plains, Nerrigundah, Newrybar, Portland, Riley's Hill, Rous, Tempe Park, Upper Pyramul, Wallabadah, Whealbah, and Yantabulla.

The Telephone Offices at Cumnock and Quambone were converted into Telegraph Offices.

The names of the Telephone Offices at Cornelia, East Carlingford, and Warne were changed to Lower Portland, Epping, and Euchareena, respectively.

Amendments have been made in the Telephone Regulations, giving power to the Department to make telephone connections with existing exchanges in lieu of establishing new exchanges, and fixing the charges in connection therewith; exempting a subscriber from payment of the cost of alterations to line when he wishes his telephone removed, in cases where the annual rental is increased; limiting the time during which telephone conversations may take place between subscribers to city, suburban, and country exchanges, and exempting the owners of private telephone lines from payment of the fee of £3 3s. per annum for accommodation and free delivery of messages within a mile of the office of connection in cases where no local delivery is practicable.

Following the establishment of telephone communication between Sydney and Newcastle, a distance of 102 miles, on the 3rd January, 1898, a similar connection was made on the 13th March, 1899, between Sydney and Katoomba (66 miles), and on the 5th June, 1899, between Sydney and Bathurst (145 miles), the charges for ordinary conversations being fixed at 2s. and 3s. 6d. respectively, for the first three minutes, and 1s. for each additional three minutes or fraction thereof, and for press messages, half the above rates.

An exchange was also established at Katoomba in September, open from 9 a.m. to 8 p.m. daily (Sundays excepted), these hours being extended to a continuous day and night service from the 4th December.

From the 7th July, the rate for telephone messages to and from Sydney and Newcastle was reduced to 3s. for each conversation of three minutes or portion thereof, and 1s. for each additional three minutes or portion thereof. (Press messages, between 8 p.m. and 8 a.m., half the above rates.)

The

The receipts from the long-distance Telephone services for the year 1899 were as follows :—

	£	s.	d.
Sydney-Newcastle	1,143	9	10
Sydney-Katoomba (from 13th March)	85	1	6
Sydney-Bathurst (from 5th June)... ..	105	2	9

A branch Exchange was established at Liverpool on the 14th August, to be kept open from 9 a.m. to 8 p.m. daily (Sundays excepted), the charges for connection, including communication with the Central and Suburban Exchanges, being the same as in the case of other branch Exchanges.

On the 21st September a Bureau was opened at Liverpool, the charge for local connections being fixed at 6d. for each three minutes, and for connections with Sydney or suburbs, 1s. for the first three minutes, and 6d. for each additional three minutes.

Tunnels.

During the year progress was made with the extension of the main subway from the Redfern Railway Station to Glebe Point, a distance of 3,733 feet being constructed, and the branch from George-street West to Newtown was completed for a length of 1,800 feet. The Kent-street tunnel was carried along Liverpool and George Streets to the junction of George and Engine Streets, and the extensions southerly *via* Engine and Harris Streets to the George-street West tunnel, and northerly to McArthur-street, Ultimo, were also commenced. About 1,000 feet of the tunnel from Clarence-street, *via* Erskine-street, to Sussex-street was completed. The tunnel from the Exchange to Macquarie-street, with branches to the new Treasury buildings and the Public Works Office, was commenced and completed. The total length of tunnels constructed during the year was about 10,144 feet.

Electric Light and Power.

Extensive alterations and improvements have been made by the Government Architect's Branch in the engine and boiler room accommodation at the General Post Office, and the new steam plant—mentioned in last year's report—has been erected and brought into use.

This plant provides ample current for the lighting of the whole building, and sufficient boiler power is available for further extensions of engines and dynamos for pneumatic tube and electric elevator services.

The new Telephone Exchange has been lighted by seventy-five incandescent lamps and six 5-ampere enclosed arc lamps.

Three new arc lamps have been erected at the eastern side of Woolloomooloo Bay to accommodate one of the new sheds built thereon, and six additional lamps are being erected.

In July the hydraulic lift connected with the mail branch was removed and replaced by a Sprague Electric Elevator, having a capacity of raising 1 ton at a speed of 150 feet per minute.

The continued increase in the business of the Postal and Electric Telegraph Department, manifested in this report, is a gratifying indication of the increased prosperity of the Colony.

I have the honor to be,

Your Lordship's most obedient Servant,

W. P. CRICK,

Postmaster-General.

Postal and Electric Telegraph Department,
General Post Office, Sydney, 28 July, 1900.

APPENDIX A.

RETURN showing names of Post and Telegraph Offices, number of Letters posted, Telegrams transmitted, Postal Notes paid, Money Orders issued and paid, Savings Bank Deposits and Withdrawals, Revenue received from each Office, Salaries and Allowances paid, and arrangements regarding premises during the year 1899.

APPENDIX C.

AGREEMENT concerning the exchange of Insured Postal Parcels, concluded between the British Colonies of New South Wales, Victoria, South Australia, Tasmania, and New Zealand.

WHEREAS it is deemed desirable to establish an exchange of Insured Postal Parcels between the British Colonies of New South Wales, Victoria, South Australia, Tasmania, and New Zealand, the undersigned, being duly authorised in that behalf, have agreed, in the name of their respective Governments, to the following articles:—

Article 1.

There shall be a regular exchange of Insured Postal Parcels between the abovenamed Colonies, by means of the services available for the exchange of other classes of mail matter.

Article 2.

Each Colony shall notify to the other Colonies, parties to this agreement, the Post Offices under its control which are authorised to exchange Insured Postal Parcels.

Article 3.

The maximum amount for which a parcel may be insured shall be £50.

Article 4.

The fee payable for insurance against loss or damage, in addition to ordinary postage, on each parcel to be insured and intended for transmission from one of the Colonies named to another such Colony, shall be as follows:—

To secure compensation—	s.	d.
Not exceeding £10	0	5
Exceeding £10, but not exceeding £20	0	7½
" £20 " " £30	0	10
" £30 " " £40	1	0½
" £40 " " £50	1	3

Article 5.

The fee for insurance must be prepaid by means of postage stamps, which the sender must affix to the parcel with the stamps in prepayment of postage.

Article 6.

On each insured parcel the Colony of origin shall account to the Colony of destination, and to each intermediary Colony through which the parcel is forwarded, at the rate of one penny (1d.) for the first £10, or portion thereof, of insured value, and one half-penny (½d.) for each additional £10, or portion thereof, of insured value.

Article 7.

A certificate of insurance, on a form similar to form "A" annexed hereto, must always be obtained by the sender of an insured parcel. The necessary particulars must, as far as practicable, be inserted in the form of certificate by the sender of the parcel or his representative. No charge will be made for the issue of such certificate.

Article 8.

No parcel may be insured for a sum in excess of the real value of the contents. An invoice or description of contents and of the value of each article contained in the parcel must be enclosed therein.

Over-insurance is a bar to compensation.

Article 9.

Parcels containing any of the following articles are excluded from insurance, viz.:—Liquids, or semi-liquids; perishable articles, such as eggs, butter, fruit, flowers, confectionery, &c.; fragile articles, such as glassware, &c.

Under no circumstances will compensation be given for the loss of or damage to a parcel containing any of the above-mentioned articles.

Article 10.

Every parcel intended to be insured must be carefully and substantially packed, with due regard to the nature of the contents and the length of the journey, and must be secured in such a manner as to prevent tampering without leaving obvious traces of violation.

Article 11.

Article 11.

Parcels containing watches, jewellery, or any article of gold or silver, must be enclosed in strong boxes or cases, which must be securely fastened in wrappers of linen, canvas, strong paper, or other substantial material.

Article 12.

If a parcel tendered for insurance does not, in the opinion of the officer to whom it is tendered, fulfil the foregoing conditions as to packing and fastening, it is his duty to refuse to insure it; but the onus of properly packing and fastening the parcel lies upon the sender; and the Postal Administrations of the respective Colonies assume no liability for loss or damage arising from defects of packing or fastening which may not be observed at the time of posting.

Article 13.

When an insured parcel is re-directed from one of the contracting Colonies to another such Colony, a fresh insurance fee becomes payable for each such transmission; if this fee be not prepaid, it will be collected before delivery of the parcel.

Article 14.

Compensation for an insured parcel lost or damaged in the post will not exceed the amount of the actual loss or damage; but no compensation will be paid for a parcel containing any prohibited article, or which has been delivered without external trace of injury, and has been accepted without remark by the addressee, or when loss or damage arises from flood, tempest, shipwreck, earthquake, war, or other causes beyond control.

Article 15.

No application for compensation will be entertained unless made within three (3) months from date of posting of the parcel. Such application may be made to the Postal Administration of either Colony of origin or delivery, but the certificate of insurance must be produced when required. The Colony in which the loss or damage is sustained is responsible for the amount of compensation payable. Where it is impossible to determine in which Colony a parcel has been lost or sustained damage, the amount payable for compensation shall be borne in equal proportions by the Colonies of despatch, intermediary (if any), and destination.

Article 16.

No legal liability to give compensation in respect of any parcel for which an insurance fee has been paid attaches to the Postal Administrations of the respective contracting Colonies, and the final decision upon all questions of compensation rests with the Postal Administration of the Colony in which the loss or damage has taken place.

Article 17.

Any insurance effected contrary to the foregoing articles is invalid.

Article 18.

Where not repugnant to the foregoing articles, the general regulations of the respective contracting Colonies relating to uninsured parcels apply also to insured parcels. In the case of parcels exchanged with Tasmania, compensation, where payable, will be allowed only in case of absolute loss of parcels.

Article 19.

The various contracting Colonies have the power to draw up, by mutual consent, any measures of detail and order which may be deemed necessary for the carrying out of this agreement.

Article 20.

Any British Colony of Australasia which is not a party to this agreement is admitted to adhere to it upon demand. This adhesion must be notified in proper form to the Government of each contracting Colony. Such adhesion implies, as a matter of course, accession to all the provisions of the present agreement.

Article 21.

This agreement shall be deemed to have come into operation on the 1st day of April, 1899, and shall remain in force for an indefinite period; but each contracting Colony has the right to withdraw therefrom by means of a notice given one year in advance by its Government to the Government of each of the other contracting Colonies.

APPENDIX E.

CONVENTION between the Colonies of Natal and New South Wales concerning the Exchange of Money Orders.

THE Post Office Department of Natal and the Post Office Department of the Colony of New South Wales being desirous of establishing a system of exchange of Money Orders between the two countries, the undersigned, duly authorised for the purpose, have agreed upon the following Articles :—

Article 1.

There shall be a regular exchange of Money Orders between the two countries.

The maximum amount for which a Money Order may be drawn in either country upon the other shall be £10 sterling.

No Money Order shall contain a fractional part of a penny.

The amount of each Order, whether issued in the Colony of Natal, or the Colony of New South Wales, must be expressed in sterling.

Article 2.

The amounts deposited by the remitters and paid to the payees of Money Orders shall be in gold coin or any other legal money of the same current value.

Article 3.

Each Money Order shall be delivered to the remitter thereof, to be forwarded by him at his own expense to the payee.

Article 4.

The Natal Post Office Department shall have power to fix the rates of commission on all Money Orders issued within its jurisdiction, and the Post Office Department of New South Wales shall have the same power in regard to all Money Orders issued in the Colony of New South Wales. Each office shall communicate to the other its tariff of charges or rates of commission which shall be established under the Convention, and these rates shall in all cases be payable in advance by the remitter, and shall not be repayable. It is understood, moreover, that each office is authorised to suspend, temporarily, the exchange of Money Orders, in case the course of exchange or any other circumstances should give rise to abuses or cause detriment to the Postal revenue.

Article 5.

Each country shall keep the commission charge on all Money Orders issued within its jurisdiction, but shall pay to the other country one-half of 1 per cent. on the amount of such Orders.

Article 6.

Orders shall be drawn only on the authorised Money Order Offices of the respective countries, and each Postal Administration shall furnish to the other a list of such offices, and shall, from time to time, notify any addition to or change in such list.

Article 7.

Every Money Order and Advice must contain the name of the office at which it is intended that payment shall be made, and no Order shall be issued unless the applicant furnishes the forename and surname of the person to whom the amount is to be paid, and his own forename, surname, and address, or the name of the firm or company who are the remitters or payees.

Article 8.

The service of the Money Order system between the two countries shall be performed by the agency of offices of exchange.

On the part of the Colony of New South Wales the office of exchange shall be Sydney, and on the part of the Colony of Natal the office shall be Pietermaritzburg. Lists of Money Orders issued shall be despatched from each office of exchange, accompanied by the Advices, each bearing an impression of the dated stamp of the office from which the list is despatched. The lists shall be numbered consecutively throughout the year, and ending with the last number included in the transactions of the year. Lists shall be despatched only when there are Advices to be forwarded.

Article 9.

Money Orders issued either in New South Wales or Natal in the month of December, the relative Advices of which have failed to reach the respective offices of exchange until the month of January, shall be entered in supplementary lists of the year in which the Orders were issued.

Article 10.

The Advices, on their arrival at the office of exchange in the country of payment, shall be compared with the entries in the list, and afterwards stamped and despatched to the office of payment.

Article 11.

Each office of exchange shall promptly communicate to the other the correction of any simple error which it may discover in the verification of the lists.

When the lists shall show irregularities which the receiving office shall not be able to rectify, that office shall apply for an explanation to the despatching office, and such explanation shall be afforded without delay.

Article 12.

The Orders drawn by each country on the other shall be subject, as regards payment, to the regulations which govern the payment of Inland Orders of the country on which they were drawn. The paid Orders shall remain in the possession of the country of payment.

Article 13.

At the close of each quarter, or as soon after as practicable, an account shall be prepared at the Post Office at Pietermaritzburg, showing, in detail, the totals of the lists containing the particulars of Orders issued in either country during the quarter, and the totals of repaid and void Orders.

Should the balance of the account be in favour of New South Wales, the amount due shall be forwarded to Sydney by bank draft, or order drawn on the Agent-General for Natal in London. On the other hand, should the balance be in favour of Natal, the amount shall be forwarded to Natal by bank draft, or order drawn on the Agent-General for New South Wales in London.

It is further provided that as soon as one of the two Administrations shall ascertain that it owes the other a balance exceeding One Hundred Pounds (£100) sterling, the indebted Administration shall cause the approximate amount of such balance to be paid to the other Administration.

Article 14.

Duplicate Orders shall be issued, and transfer of payment made only by the Postal administration of the country on which the original Orders were drawn, and in conformity with the regulations established in that country.

Article 15.

Repayment of Orders to remitters shall not be made until an authorisation of such repayment shall first have been obtained by the country of issue from the country where such orders are payable, and the amounts of the repaid Orders shall be duly credited to the former country in the quarterly account (Article 13). It is the province of such Postal Administration to determine the manner in which repayment to the remitter is to be made.

Article 16.

Article 16.

Orders which shall not have been paid within twelve months from the month of issue shall become void, and the sums received shall accrue to, and be at the disposal of the country of origin. The Pietermaritzburg Office shall therefore enter to the credit of New South Wales in the quarterly account all Money Orders entered in the lists received from New South Wales which remain unpaid at the end of the period specified (Article 13). On the other hand, the Post Office Department of New South Wales shall, at the close of each month, transmit to the Pietermaritzburg Office for entry in the quarterly account a detailed statement of all Orders included in the lists despatched from the latter Office, which under this Article become void.

Article 17.

The two Postal Administrations may, by mutual agreement, make modifications, if found expedient, in matters of detail connected with the execution of this Convention, in order to provide for greater security against fraud, or for the better working of the system.

Article 18.

This Convention shall take effect on the first day of October, 1899, and shall continue in force until twelve months after either of the contracting parties shall have notified to the other its intention to terminate it.

Done in duplicate, and signed in Natal, on the twenty-eighth day of August, in the year of our Lord, 1899, and in New South Wales, on the sixth day of November, in the year of our Lord, 1899.

FREDK. M. DARLEY,
Lieutenant-Governor of New South Wales.
WALTER HELY HUTCHINSON,
Governor of Natal.

APPENDIX F.

PROPOSAL OF THE EASTERN TELEGRAPH COMPANY FOR ADDITIONAL
TELEGRAPH COMMUNICATION BETWEEN GREAT BRITAIN AND
THE AUSTRALASIAN COLONIES, VIA THE CAPE OF GOOD HOPE.

(CORRESPONDENCE, &c., RESPECTING.)

No. 1.

Eastern Telegraph Company to The Chancellor of the Exchequer, London.*
(First Proposal.)

The Eastern Telegraph Company, Winchester House, Old Broad-street, London, E.C.

Sir,

March 22nd, 1897.

With a view to meeting the demand, which is believed to exist, for additional telegraphic communication between Great Britain and the Australasian Colonies, quite independent of the Mediterranean route, I have the honor to place before you, for the consideration of Her Majesty's Government, the following proposal, namely:—

That in return for certain privileges enumerated below, the Eastern and South African, and Eastern Extension Telegraph Companies are prepared forthwith to provide an alternative line of cables between England, the Cape, and Australia, touching only at Gibraltar, Sierra Leone, Ascension, St. Helena, Durban, Mauritius, Rodrigues, and Cocos *en route*, as shown in the accompanying chart marked No. 1.†

It will be observed that this system of cables would bring into telegraphic communication the important British Possessions of Ascension and St. Helena in the Atlantic and Rodrigues and Cocos in the Indian Ocean, all of which islands are at present entirely without means of communication with the outer world.

It would also afford two additional routes to Mauritius, a second communication with Seychelles, and two additional routes to South Africa, besides strengthening telegraphic communication with India.

As this is a very comprehensive and costly scheme, involving an expenditure of over 14,000 nautical miles of cable, costing at least £2,000,000, the companies consider that the Governments interested may reasonably be asked to grant to them the following privileges, namely:—

1. An annual subsidy from the Imperial Government of £25,000, payable for twenty years, for connecting St. Helena, Ascension, Rodrigues, and Cocos. This, I may point out, is less than the amount paid at the present time for connecting Mauritius and Seychelles, where a substantial amount of traffic was anticipated; and is also less than the subsidy recently granted by the French Government to the French Atlantic Cable Company, for providing cable communication between France and North America.

2. An extension by the Australasian Governments, for a period of at least ten years, of the subsidy of £32,400 per annum payable to the Eastern Extension Company. This

* Forwarded by the Agent-General, London, under cover of a letter dated 19th August, 1897.

† Note.—The chart referred to was not received from the Agent-General.

This subsidy was granted for duplicating the Australian-Singapore cable, and, in the ordinary course, would cease in 1899.

3. An undertaking by the Governments concerned that, for a fixed period, they will not subsidise any opposition line connecting any of the places served at present by the associated companies. On their side the companies to undertake to increase their cables whenever necessary to meet public requirements.

This principle was, to some extent, formally recognised by the Imperial Government with the approval of the Australasian Colonies, when the Eastern Extension Company's Singapore-Labuan-Hongkong cable was laid in 1894.

4. In order that the whole of the working between Australasia and Great Britain may be under the control of one administration, the companies would ask the Governments of Cape Colony and Natal to place at their disposal, free of cost, two wires between Cape Town and Durban, which could be operated by the employees of the companies.

5. An improved landline service (underground throughout if practicable) to be given to the Companies between London and Porthcurnow, for the transmission of their 'through' traffic.

At present the communication is dependent on aerial lines, which are liable to interruption whenever exceptionally severe weather prevails along the Channel.

In formulating the above proposal we have endeavoured to make the route to the Cape and Australia as direct as possible so as to avoid unnecessary retransmission of the 'through' traffic; but should a direct connection with Ceylon be particularly desired, the companies would be prepared to provide it by laying a separate cable from Seychelles to Point de Galle, touching at Diego Garcia, as shown by the accompanying chart marked No. 2.*

This separate connection would involve the laying of an additional 2,386 nautical miles of cable; but as it would consist of comparatively short sections, and not be required for the 'through' traffic, it could be laid as a 'strategic' line with a small core, and consequently would not cost more than about £250,000. The amount of subsidy required for this separate connection would be £32,000 for twenty years in addition to the £25,000 and £32,400 asked for for carrying out the original scheme. On the other hand, an additional direct connection with India would be secured, and another British coaling-station (Diego Garcia) brought into telegraphic communication.

As the companies' proposal is obviously more beneficial to British interests as a whole than the Pacific cable project, I venture to hope that it will meet with favourable consideration, and lead to the conclusion of a satisfactory arrangement between the companies and Her Majesty's Government.

I have, &c.,

J. DENISON PENDER,
Managing Director.

No. 2.

Postmaster-General to Premier, New South Wales.

MINUTE.

WITH reference to the letter of the Agent-General herewith, dated 19th August last, concerning certain proposals of the Eastern Telegraph Company relating to the establishment of additional telegraphic communication between Great Britain and Australia by a line *via* the Cape of Good Hope touching only at British possessions, I would point out that the interests of the eastern and western portions of Australia are not in all respects identical, and it would therefore be advisable to ask the Secretary of State for the Colonies to sanction the representation of Australia by two gentlemen, instead of one as proposed. As it is probable that the Honorable Thomas Playford would be nominated by the western colonies, it would, I think, be expedient to nominate Sir Daniel Cooper to represent New South Wales and the eastern colonies.

It would, perhaps, be better to appoint Messrs. Cooper and Playford to be the representatives of Australia at the Commission, on the distinct understanding that they shall in no way bind the colonies to any proposal that may be submitted.

If the Honorable the Premier approves of this suggestion, he will, perhaps, instruct that the Government of each colony concerned be asked (by wire) for its concurrence.

JOSEPH COOK,
11th November, 1897.

No. 3.

Premier, New South Wales, to Premiers of Victoria, South Australia, Western Australia, Queensland, and Tasmania (sent 18th November, 1897), and to Premier, New Zealand (sent 19th November, 1897).

TELEGRAM.

COMMITTEE on proposals *re* additional telegraphic communication between Great Britain and Australia. Suggest that Secretary of State for the Colonies be asked to sanction representation of Australia by two gentlemen instead of one, as interests of eastern and western portions of Australia are not in all respects identical; also that Mr. Playford and Sir Daniel Cooper be appointed Australian representatives, with instructions that they shall in no way bind colonies to any proposal that may be submitted. Do you concur? Am telegraphing also to Premiers of * * * * *

No. 4.

* NOTE.—The chart referred to was not received from the Agent-General.

3

No. 4.

Premier, Tasmania, to Premier, New South Wales.

(Received 18 November, 1897.)

TELEGRAM.

I CONCUR your suggestion *re* representation of Australasia, and that representatives do not bind Colonies.

No. 5.

Premier, New Zealand, to Premier, New South Wales.

(Received 22 November, 1897.)

TELEGRAM.

AFTER careful consideration, Government have decided take no action direction suggested by Committee on proposals *re* additional telegraphic communication between Great Britain and Australia. Look upon scheme as being counter to Pacific cable movement. Prefer to await Canada's decision *re* Pacific cable.

No. 6.

Premier, Victoria, to Premier, New South Wales.

(Received 22 November, 1897.)

TELEGRAM.

Re Committee on proposals for additional telegraphic communication between Great Britain and Australia. This Government concurs in having two representatives from Australia. We think it necessary to suggest the names of Agent-General for New South Wales and Agent-General for South Australia, but that this Colony is not to be bound by any report of Committee. Presume you will inform Imperial authorities of result of your inquiries from other Colonies.

No. 7.

Premier, Queensland, to Premier, New South Wales.

(Received 25 November, 1897.)

TELEGRAM.

Re your telegram of 18th instant, this Government consider that Australia should have two or even three representatives on Telegraphic Communication Committee, and having regard to the importance to Queensland of the Pacific route, they are furthermore strongly of opinion that one of the gentlemen appointed should be selected with special regard to the interests of this Colony. * * * * *

No. 8.

Premier, South Australia, to Premier, New South Wales.

(Received 7 December, 1897.)

TELEGRAM.

REPLYING to your telegram of 18th November, *re* additional telegraphic communication between Great Britain and Australia, we concur in your proposal that Australia should have two representatives on Committee, and that Agents-General for South Australia and New South Wales should be appointed, with instructions suggested by you. Will you please inform Imperial authorities accordingly.

No. 9.

Premier, New South Wales, to Agent-General, New South Wales.

(Sent 3 January, 1898)

TELEGRAM.

COMMITTEE on proposals *re* additional telegraphic communication between Great Britain and Australia. Victoria, South Australia, Tasmania, Western Australia, and this Colony think that Australia should have two representatives on Committee. In anticipation of Secretary of State for Colonies concurring, Colonies named have agreed to appoint you and Mr. Playford, Agent-General for South Australia, to represent them, with instructions to in no way bind them to any proposals that may be submitted. New Zealand prefers to take no action. Queensland desires third representative in own interest, but Colonies named dissent.

(The Right Honorable the Premiers of Victoria, Queensland, Tasmania, Western Australia, and South Australia were informed (5/1/98) of the despatch of the above cablegram)

No. 10.

Manager in Australasia for the Eastern Extension Australasia and China Telegraph Company, Limited, to Premier, New South Wales.

Sir,

February 24th, 1898.

As you are aware, the Eastern and Associated Cable Companies have submitted proposals for laying an 'All-British' cable to Australia, *via* Cape Colony, and that a Committee representing the Imperial Government, India, Cape Colony, and the several Australian Governments, has been appointed to consider this and other cable projects.

The basis of the extension of this cable from the Cape to Perth, is upon the renewal of the present duplicate cable subsidy of £32,400 per annum for a period of *ten years*.

In view, however, of the widespread dissatisfaction and feeling of insecurity with the present long Australian land-lines, and the numerous complaints that have been lodged, both in London and the colonies, of the serious delays in transmission of messages, and the frequent interruptions which, it is stated, have caused great inconvenience and loss to the telegraphing public, I have the honor to inform you that my directors have instructed me to intimate to the several Australian Governments that, the Eastern Extension Telegraph Company, with the view of making more complete the proposed all-British cable service between England and Australia, is prepared—at its own expense—to extend the proposed Cape cable to Albany, and thence lay, work, and maintain a cable to Glenelg (Adelaide), or thereabouts, provided the Australian Governments will continue the existing subsidy of £32,400 per annum for twenty years. This would increase the length of the Cape cable by nearly 1,500 knots, involving the Company in an additional outlay of, at least, £200,000, which they are prepared to incur for the purpose of establishing a quick and reliable cable service between the mother country and the Australian colonies.

I may state that the object of selecting Glenelg (or thereabouts) for the landing point is that Adelaide may continue to be the junction or distributing point for the international traffic; and I have no doubt a satisfactory arrangement could be arrived at for the transmission of intercolonial telegrams between Adelaide and Albany, whenever the land-lines are interrupted.

I have, &c.,

W. WARREN,

Manager in Australasia.

No. 11.

Manager Eastern Extension Company to Premier, New South Wales.

Sir,

The Eastern Extension Australasia and China Telegraph Company, Limited,
Melbourne, 2 March, 1898.

As there appears to be an impression that my Company—in submitting an offer to provide an 'All-British Cable Service' between England and Australasia, *via* the Cape—is asking for a preferential right against competition, I have the honor to state for your information that this is quite an erroneous one, as all they wish, or ask for, is to have the first refusal to supply further cables when necessary to meet public requirements in the regions already served by them with cable communication, and which I may state was agreed to by the British and Australasian Governments prior to the laying of the Singapore-Hongkong cable in 1894.

I have, &c.,

W. WARREN,

Manager in Australasia.

No. 12.

Acting Manager Eastern Extension Company to Postmaster-General, New South Wales.

Sir,

The Eastern Extension, Australasia, and China Telegraph Company (Limited),
Melbourne, 24 July, 1899.

I have the honor to send for your information copy of a letter to the Honorable the Postmaster-General of Victoria, submitting a proposal by my Company for an all-British cable to Australia *via* the Cape, together with a reduction of the tariff to 4s., and a further reduction on a sliding scale as tariff increases.

I have, &c.,

J. EUSTON SQUIER,

Acting Manager in Australasia.

[Enclosure.]

The Eastern Extension, Australasia, and China Telegraph Company (Limited), to The Honorable
Postmaster-General of Victoria.

Sir,

Melbourne, 24 July, 1899.

Referring to the proposal made to your Government by this Company in my interview with you on the 14th instant, I have the honor to confirm the same with additional particulars supplied by my head office:—

“As public opinion in Victoria apparently favours an alternative cable *via* the Cape rather than the Pacific, and, according to the Chancellor of the Exchequer's admission, the Company's Cape proposal was also preferred by the Imperial Government, but fell through because Australia refused to assist it, we
are

are willing to meet the difficulty by making the following liberal concessions, namely, we will entirely waive the renewal of the subsidy and guarantee against competition, and, in addition to providing a cable all the way to Glenelg, *via* Perth, will agree to at once reduce the tariff to 4s., and make further reductions on a sliding scale as traffic increases. In return for the above the Company would only require the same privilege in Perth, Adelaide, and Melbourne as they have hitherto enjoyed in Great Britain, of directly delivering and collecting their international telegrams to and from the public."

The privilege mentioned as enjoyed in Great Britain is, that the companies pay the British Post Office five pounds (£5) yearly per mile for each wire, and work both ends by their own operators, collecting and delivering traffic direct with the public. All telegrams to places other than those where the companies have offices are dealt with by the Post Office, who are paid their ordinary inland tariff.

I might mention that a rate based upon that stated above would bring in a revenue to your Government quite as much as that now derived from the international traffic, and the salaries of operators would be saved.

The first half of the all-British Cape-Australian cable, namely, between Great Britain and Cape Colony, is now being manufactured; and, if the Company's terms are accepted, the whole line might be in working order within two years.

I have, &c.,

J. EUSTON SQUIER,
Acting-Manager in Australasia.

No. 13.

Postmaster-General, New South Wales, to Postmaster-General, Victoria.

(Sent 25 July, 1899.)

TELEGRAM.

TASMANIA, South Australia, and Western Australia cannot be represented at the proposed Ministerial Conference, and nothing is stated about the proposal to invite Queensland and New Zealand, as mentioned in my telegram to them. I am surprised that the Eastern Extension Company's proposals have not been communicated to this Government; but if they are as stated in the *Argus* of the 17th instant, it would seem that a conference is not really necessary, as, according to the *Argus*, there is to be no subsidy, no guarantee, and a reduction of rates to 4s.; the only concession asked being the right to collect and distribute the Company's international messages direct. On this question I can hardly express an opinion without further information, but cannot see how this will work, as the Company must use our wires between West and South Australia and the other parts of Australia.

VARNEY PARKES.

No. 14.

Postmaster-General, Victoria, to Postmaster-General, New South Wales.

(Received 27 July, 1899.)

TELEGRAM.

SUBJECT of Pacific Cable and Eastern Extension Company's agreement so important and so mixed up that it is absolutely necessary to discuss matter fully and in private, otherwise, between newspaper paragraphs and unofficial communications from Eastern Extension Company, we will not know where we are. Premier has sent several questions on to me during the last few days. I have replied in each case that matters must first be discussed by Colonies interested. If you can get Queensland and New Zealand for 10th August, or either of them, we could talk matters over. In any case, I had better run over and see you, as matters really depend on action of our Colonies.

J. GAVAN DUFFY.

No. 15.

Postmaster-General, New South Wales, to Postmaster-General, Victoria.

(Sent 27 July, 1899.)

TELEGRAM.

Will be glad to see you and talk matters over, but am of opinion that Eastern Extension Company's proposals must stand over until their stipulation *re* direct receipt and delivery of international messages is made clearer by them, and then analysed and considered by each Administration concerned. The Pacific Cable question has now reached a definite stage, the Imperial Government having, as the result of our pressure, agreed to share on the terms we have so often suggested, and I think we should at the earliest moment possible reply to Agent-General's message, copy of which was sent to your Premier on 10th instant, proposing appointment of Board.* Queensland and New Zealand have agreed, and latter reminded us, on 21st instant, that promptness in nominating delegates is desirable, and we are only awaiting reply from you.

VARNEY PARKES.

No. 16.

* See Section II, No. 4.

No. 16.

Eastern Extension Company to Postmaster-General, New South Wales.

(Acknowledged 15 August, 1899.)

Sir,

Melbourne, 8 August, 1899.

Referring to my communication, dated the 24th ultimo, I have now the honor to submit for your information the details of the sliding scale of reductions proposed by my Company in connection with the Cape Cable.

The tariffs mentioned are to be uniform throughout Australia and Tasmania, the respective Governments still retaining their local transit and terminal rates.

Minimum Annual Revenue required by Associated Companies.

Present revenue guaranteed by the Australian Governments	£227,000
Plus estimated yearly expenses of the new Cape line	123,000
				£350,000

The present receipts from the Australian traffic (taking the average of last three years) amounts to £365,000, or £15,000 more than the minimum required.

If the minimum revenue is maintained the Company offer a uniform halfcrown tariff, on the following sliding scale:—

If the tariff is reduced to 4s. the Company will take the average receipts of the three years, 1898, 1899, and 1900, and if the minimum of £350,000 is reached the rate in 1901 will be reduced to 3s. 6d.

If the average receipts of £350,000 are maintained in 1901 at the reduced rates the tariff will be reduced in 1902 to 3s.

If the average receipts again maintained in 1902 the tariff will be reduced to 2s. 6d.

Should the average receipts not keep up to £350,000 any one of the above reductions would be postponed until the receipts averaged the standard figure of £350,000 for three consecutive years.

The rate to South Africa will be reduced to 2s. per word, or thereabouts.

I have, &c.,

J. EUSTON SQUIER,

Acting Manager in Australasia.

No. 17.

Eastern Extension Company's Second Proposal.

(Handed by Acting Manager, Eastern Extension Company, to Deputy Postmaster-General, Sydney, 31 August, 1899.)

THE Company will entirely waive renewal of subsidy and guarantee against competition, and, in addition to providing a cable from the Cape all the way to Glenelg, *via* Perth, will at once reduce tariff to 4s. for the whole of Australia and Tasmania, and make further reductions on a sliding scale as traffic increases.

In return for the above the Company would only require the same privilege in Perth, Adelaide, Melbourne, and Sydney as they have hitherto enjoyed in Great Britain, of directly distributing and collecting their international telegrams to and from the public.

When the tariff is reduced to 4s. the Government rate will be made 3s., and the Press 1s. 6d. per word.

The rate to South Africa will be about 2s. per word.

The details of the sliding scale are as follows: The amount now guaranteed by the Australian Governments is £227,000, which with £123,000 for the estimated yearly expenses of the new Cape line, forms a minimum of £350,000, or £15,000 less than the present actual receipts of the Associated Companies.

If the receipts for the three years, 1898, 1899 and 1900 average £350,000, the 4s. tariff would be reduced in 1901 to 3s. 6d. If they are maintained at £350,000 for the years, 1899, 1900 and 1901, the tariff would be reduced to 3s. in 1902. If the average receipts are again maintained for the three years, 1900, 1901, and 1902, the tariff would be reduced in 1903 to half-a-crown per word. The receipts must average £350,000 for three consecutive years before the next reduction of 6d. per word is made.

If the Company's proposal is agreed to, the new cable will be completed within a period of two years.

The Cape-Great Britain section is now being manufactured.

The reduction in tariff on a sliding scale between England the Cape came into force at the end of August, and can be extended to Australia as soon as the Company's proposal is accepted.

Memorandum.

In return for the Cape Cable, and reducing the rate to 4s. at once, with further reductions down to 2s. 6d., as per sliding scale, the only concession asked for is that the Company be given the same privilege in Perth, Adelaide, Melbourne, and Sydney as they have hitherto enjoyed in Great Britain, of directly distributing and collecting their international telegrams to and from the public. This would virtually bring the cable end into the centre of the cities named, and the cable system into direct touch with the commercial community.

The

The Cape Cable is preferred by the Imperial Government to the Pacific Cable as "offering greater advantages from a purely strategic point of view." (Mr. Chamberlain's letter to the chairman of the Eastern Telegraph Company, dated 10th July, 1899.)

The Government of Western Australia have accepted the proposal and conceded the right to open a station in Perth.

The British Government grant this privilege to British or Foreign Cable Companies whenever requested as a matter of course.

The arrangement in the United Kingdom is as follows:—The companies pay the British Post Office £5 yearly per mile for each wire, and work both ends by their own operators, collecting and delivering direct to and from the public. All telegrams to places other than those where the Companies have offices, are dealt with by the Post Office, who are then paid their ordinary inland tariff.

The Cable Companies exercise the same right at the Cape and Natal, where similar conditions prevail to those in Australia, and the privilege is enjoyed by the Direct United States and Commercial Cable Companies in Canada.

By arrangements with the British and French Governments the Eastern Company leases a line between London and Marseilles, which is worked by the Company's operators.

In connection with the Cape scheme, the Natal and Cape Governments will place two wires at the disposal of the Cable Companies, and Cape stations are already established both in Cape Town and Durban.

The privilege has also been conceded to the Cable Companies by the Governments of Gibraltar, Malta, Egypt, the Straits Settlements, Hong Kong, China, Portugal, Phillipine Islands, Netherlands, India, &c., &c.

The Eastern Company own eight stations in London, and others in Manchester, Liverpool, and Glasgow.

The Great Northern Telegraph Company of Copenhagen has offices in England, and competes for continental traffic with British Government-owned cables.

The Anglo-American Cable Company has six stations in London, and others in Liverpool, Manchester, Glasgow, Bristol, Newcastle, Bradford, Dundee, Leith, Havre (France), New York (U.S.), Montreal (Canada).

Other companies could be named having the same facilities.

In granting this right to the Eastern Extension Company the interests and revenue of the Government Telegraph Department would not be made to suffer in any way; but in owning and controlling the whole line from Great Britain to Adelaide, the Company are naturally desirous of extending the control to the short land sections from Adelaide to the Melbourne and Sydney termini, and it is hoped that the system will be extended to Brisbane, Wellington, and Hobart.

It would materially expedite the cable traffic to have a line and system wholly devoted to it, and where it would not have to take turn with the large intercolonial traffic. It would also be a convenience to the public that they should be in direct communication with the agency that carries their messages from one end of the world to the other, instead of through the intermediary of the local Telegraph Departments, whose jurisdictions end with the boundaries of the respective Colonies.

The international telegraph traffic is almost wholly in code, is of a special nature, and is worked under complicated and extensive rules and regulations. These rules provide that all points raised must be submitted in turn to each Administration interested; therefore, when claims are made by the public for refunds, or questions of error or mutilations arise—which are of daily occurrence—they are subject to long delays, during which time they are being dealt with by the several Administrations.

Many instances of serious inconvenience to public business could be cited; but a most important one is that the international difficult code traffic is worked side by side, and under the same system as the plain language intercolonial business. No record is kept, and no errors can be traced, while for their own work the Companies have adopted recording instruments, have established Clearing Houses, where messages transmitted between their stations may be compared, times noted, and the work of each operator and his speed and accuracy carefully examined.

The Eastern Extension Company are only anxious to exercise their trained control over the traffic from end to end of their cable system.

Acting Manager in Australasia.

No. 18.

From the Postmasters-General of New South Wales and Victoria to The Acting Manager, Eastern Extension Company.

(Handed to Mr. Squier, 5 October, 1899.)

5 October, 1899.

INQUIRE of Mr. Squier if his Company would be prepared to vary its present proposal by an immediate reduction to 3s. 6d.

Further, if the Government accept such proposal, will his Company enter into an agreement that its rate shall not be less than the Pacific Cable.

This must be treated as confidential.

J.G.D.
W.P.C.

No. 19.

No. 19.

The Acting Manager, Eastern Extension Company, to The Postmaster-General,
New South Wales.

(Received 8 October, 1899.)

8 October, 1899.

CONFIDENTIAL. The Company's reply is as follows:—"Your confidential service of fifth received and carefully considered. In making proposal now before Colonies, Company have made utmost concession possible, and regret they cannot vary offer as suggested by Ministers. Regarding second point, as it officially announced that Pacific Cable is to be worked on commercial basis in active competition with existing lines, Company must retain absolutely free hand over rates, so that if necessary they can reduce them to lowest possible limit."

J.E.S.

No. 20.

Postmaster-General, New South Wales, to Postmaster-General, Victoria.

(Sent 19 October, 1899.)

TELEGRAM.

CONFIDENTIAL. Have been in further communication with Squier, and I think matter should be closed on terms as now altered. In view of Chamberlain's statement that Pacific Cable would be worked on commercial principles, altered terms are not open to improvement, and all parties will know the basis of competition. I asked Squier to cable his Company as follows:—"If the Government concede privilege asked, will you undertake, while you enjoy such privilege, not to increase tariff as it stands in 1902 or 1903, whichever year is the lower," and he received reply as follows:—"You can inform Mr. Crick Company quite ready give undertaking suggested. You can also assure him his fears are groundless, seeing that Mr. Chamberlain has practically recognised justice of our claim for separate offices, by officially informing us that he has communicated with Governments on subject."

I cannot see how we can improve on this, and there is the danger of the Company withdrawing its offer, unless an answer is given, which in the state of public opinion might give reasonable ground for adverse comment. I, therefore, after very full consideration, think I should accept on behalf of this Colony. Do you concur?

No. 21.

Postmaster-General, Victoria, to Postmaster-General, New South Wales.

(Received 20 October, 1899.)

TELEGRAM.

CONFIDENTIAL. I am still of opinion that any agreement with the Eastern Extension Company should be made by all the Colonies interested in Pacific Cable acting together, and not by the Company making terms with each Colony separately without the knowledge of the others. By acting together, better terms can be obtained, and the Pacific scheme safeguarded. There are a number of questions that will require settling—for instance, the right of the State to purchase the cable, the terms of the concession, the forbidding of secret commission. I think that all these points could be best discussed in London with the Company's Directors, with a full knowledge of the terms and conditions under which similar concessions are allowed elsewhere. I do not understand how the concessions in telegram from Company quoted by you can be of any benefit unless Pacific Cable abandoned. *Company must come down to Pacific Cable rates* as soon as Pacific Cable constructed. We have no communication from Mr. Chamberlain such as is mentioned in Company's wire. Do you know to what it refers? Of the four Australasian Colonies interested, New Zealand has expressed opinion strongly against concession. Queensland has not given any opinion. You seem to favour the concession. I am against it on terms proposed, as Company has not met us in any way, even in regard to "cutting rates," about which you were anxious. I have just received from Mr. Larke a very strong expression of opinion, pointing out the danger of the concession. I think, having regard to these circumstances, and the fact that no meeting can be obtained of the Colonies interested, that referring whole question to Australian delegates, Pacific Cable scheme, is best plan. New Zealand agrees to this. I have not heard from Queensland. On Tuesday I am to meet commercial representative in conference, and will be able to wire you further then. I shall, of course, take no public step without informing you, and expect same from you.

JOHN GAVAN DUFFY.

No. 23.

Premier, New South Wales, to Agent-General, London.

(Sent 23 October, 1899.)

TELEGRAM.

WISH you consult Mr. Chamberlain *re* proposals of Eastern Extension Company as bearing on prospects Pacific Cable. Our contract with Company expires thirty-first instant. We desire accept their proposals if Imperial Government see no objection, having in view prospects of Pacific Cable. Company entirely waive renewal subsidy, £32,400, and guarantee against competition and, in addition to providing cable all way to Glenelg *via* Perth, agree at once reduce tariff to 4s. (present rate 4s. 9d.), Government rate 3s., Press rate 1s. 6d. per word, and make further reductions on sliding scale as traffic increases. Sliding scale as follows:—"The amount now guaranteed by Australian Governments is £227,000, which, with £123,000 for the estimated yearly expenses of the new Cape line, forms a minimum of £350,000, or £15,000 less than present actual receipts of Associated Companies. If receipts for years 1898, 1899, and 1900 average £350,000, the 4s. tariff would be reduced in 1901 to 3s. 6d. If they are maintained at £350,000 for the years 1899, 1900, and 1901, tariff would be reduced to 3s. in 1902. If average receipts maintained 1900, 1901, and 1902, tariff would be reduced in 1903 to half-a-crown word. Receipts must average £350,000 for three consecutive years before the next reduction of 6d. per word is made."

In return Company require same privilege in Perth, Adelaide, Melbourne, and Sydney as now enjoy Great Britain of directly delivering and collecting their international telegrams to and from public. Privilege mentioned as enjoyed in Great Britain is that Companies pay British Post Office £5 yearly per mile for each wire, and work both ends by their own operators, collecting and delivering traffic direct with the public. All telegrams to places other than those where the Companies have offices are dealt with by Post Office, who are paid their ordinary inland tariff. If the Company's terms are accepted the whole line might be in working order within two years.

Company further agrees that whilst they enjoy this privilege not to increase tariff as it stands in 1902 or 1903, which ever year is the lower—this agreement obtained order prevent increase rates should it happen that from any cause Pacific Cable be delayed. Cable reply.

REFERRING to your telegram of 25th ultimo, *re* Eastern Extension Company's proposal, am communicating with Mr. Chamberlain, and hope to report result in a few days.

No. 25.

Agent-General to Premier, New South Wales.

(Received 8 November, 1899.)

TELEGRAM.

London, 4 November, 1899.

IN continuation telegram second, Mr. Chamberlain sees no objection to acceptance Extension Company's proposals contained in your telegram, 25th ultimo. He points out, however, it is not expressly stated that Company is not in any case to increase its rates, and phrase at end telegram appears imply power reserved increase rate up to 1903 if revenue falls below amount fixed. Mr. Chamberlain would suggest you stipulate that once reduction made it must stand, though traffic falls off. He also thinks you should insist on South Africa to Australia Cable being made all British. No mention is made as to rates between South Africa and Australia, and, although this point does not directly concern Imperial Government or Mr. Chamberlain, of opinion you would do well to stipulate for fair maximum rate least, if not for sliding scale, as in other case. Finally, Mr. Chamberlain of opinion that arrangement should be made by which points where new cable landed would be settled in consultation with military authorities, with view ensuring they shall be landed where shore ends can be protected by fixed defences.

No. 26.

Postmaster-General, New South Wales, to Acting Manager, Eastern Extension Company, Melbourne.

(Sent 8 November, 1899.)

TELEGRAM.

READING Agent-General's cable, 4th November, will you inquire from your Company if they agree, namely—(1) That a reduction having once been made it must stand in any event; (2) Will your South Africa-Australia line be all British, and will you confer with military authorities with view ensuring ends will be where can be protected by fixed defences; (3) What rates do you propose on this line?

When you have a reply to this I shall be glad to see you * * *

No. 29.

Acting Manager, Eastern Extension Company, Melbourne, to Postmaster-General,
New South Wales.

The Eastern Extension Australasia and China Telegraph Company, Limited.

Sir,

Melbourne, 9 January, 1900.

I have the honor to refer you to my Company's proposal to lay a Cape cable.

I now beg leave to submit for your perusal and consideration the Draft Agreement for carrying out this new project together with tables of tariffs. Generally speaking, it has been prepared on the lines adopted for the Cape-Great Britain agreement, of which a print was forwarded a few months ago by the Agent-General for the Cape to each of the Australasian Governments.

You will observe that the proposed Draft Agreement includes the Government of Tasmania as a contracting party, and, on the assumption that that Government will concur, we have included Hobart in connection with the collection and delivery privilege, although we do not propose for the present to exercise the right in that capital.

Queensland and New Zealand are left out of the agreement because we do not see any immediate prospect of their joining in the arrangement, but they will not receive the benefit of the reduced rates for Government telegrams, nor the uniform terminal arrangement until they come in. If they decide to join later on, the Company will, in that case, require the right—whether it is exercised or not—of collecting and delivering their messages in Brisbane and Wellington.

The suggested date for starting the reduction of tariff is the 1st May of this year as it is necessary to first terminate the existing arrangement, for which purpose the Company have to give at least two months' formal notice in accordance with the Guarantee Agreement. Moreover, it is anticipated that with every desire to expedite the matter as much as possible, it will take a few months before all the necessary formalities can be arranged.

In Article 5, the Company propose inserting the figure "1" so as to make it possible to further reduce the tariff to 3s. 6d. on the 1st January, 1901, if the average income of the three preceding years has reached or exceeded the standard figure, but this date will, of course, depend upon the prompt completion of the Agreement. Should it be unduly delayed, it might postpone the contemplated reduction until the 1st January, 1902.

It will be observed that the standard figure of £350,000 has been reduced to £330,000. This is because it has been decided to exclude the local international traffic, such as the Australian-Indian, Australian-China, &c.

Provision has been made in Article 8 for the condition suggested by Mr. Chamberlain that if the tariff is once reduced under the sliding-scale arrangement, it shall not be raised.

The Company have also, in Article 13, provided for the stipulation made by the Western Australian Government that the Glenelg-Perth section shall not be used for Intercolonial traffic under ordinary circumstances.

Article 18 fixes the Company's proportion of the rate between Australia and South Africa at 2s. per word. The Australian terminal added to the Natal and Cape terminals would make the total charge 2s. 8d., but the Australian Governments will, no doubt, be prepared to make a reduction in their terminals for this class of traffic, and thus make the total rate 2s. 3d. or 2s. 4d. per word.

The

The tables of tariffs explain themselves and, as will be seen, show the apportionment of the rate for each reduction, and provide for transmission by all possible routes; also for a uniform terminal rate in all the *contracting* Colonies. Should the contracting Colonies be unable to arrange amongst themselves for a uniform terminal rate, it may be necessary to adopt schedule 3, which is based upon the assumption that the Company will take upon themselves the uniform terminal obligations, and pay to the contracting Colonies their terminal charges.

When the Draft Agreement is approved by the contracting Colonies, it would greatly facilitate the completion of the necessary formalities before the 4s. rate can be brought into force, if the Agents General were to be instructed by cable to sign the document on behalf of their respective Colonies.

I have, &c.,

J. EUSTON SQUIER,
Acting Manager in Australasia.

AN AGREEMENT dated the _____ day of _____ 1899, and made between the Government of the Colony of New South Wales by _____ for and on behalf of the said Government, of the first part, the Government of the Colony of Victoria by _____ for and on behalf of the said Government, of the second part, the Government of the Colony of South Australia by _____ for and on behalf of the said Government, of the third part, the Government of the Colony of Western Australia by _____ for and on behalf of the said Government, of the fourth part, the Government of the Colony of Tasmania by _____ for and on behalf of the said Government, of the fifth part, and the Eastern Extension Australasia and China Telegraph Company, Limited (hereinafter called "the Extension Company"), of the sixth part.

Whereas the Colonies, parties hereto of the first five parts are hereinafter referred to as "the Contracting Colonies."

And whereas the telegraphic traffic between the contracting Colonies, New Zealand, Queensland and New Caledonia on the one side, and Europe, and when transiting Europe all other countries beyond Europe, on the other side, to be transmitted in the terms of this Agreement (hereinafter called "the Australasian traffic") is carried by the cables and telegraphic lines of the Extension Company in connection with lines belonging to the Indo-European Telegraph Department of Her Majesty's Indian Government, the Eastern Telegraph Company, Limited (hereinafter called the "Eastern Company"), and the Indo-European Telegraph Company, Limited (hereinafter called "the Cis-Indian Administrations,") and the lines and cables connected therewith.

And whereas the present rates for the transmission of the Australasian traffic are governed by three agreements, the first dated the 31st day of March, 1891, and made between Her Majesty the Queen of the one part, and the Extension Company of the other part, the second dated the 13th day of December, 1892, and made between Her Majesty the Queen for account, and on the authority of the respective Governments of New South Wales, Victoria, South Australia, Western Australia, and Tasmania of the first part, Her Majesty the Queen on account, and by the Authority of the Government of New Zealand of the second part, and the Extension Company of the third part, and the third dated the 30th day of April, 1895, and made between Her Majesty the Queen, by the authority of the Governments of New South Wales, Victoria, South Australia, Western Australia, Tasmania, and New Zealand of the one part, and the Extension Company of the other part.

And whereas under clause 8 of the said Agreement of the 31st day of March, 1891, and clause 1 of the said Agreement of the 30th day of April, 1895, the present arrangement as to rates for the Australasian traffic may be determined by notice, such notice being not less than two calendar months' notice in writing expiring on the 30th day of April, 1900, or the 30th day of April in some subsequent year and given either by the Extension Company to the Agent-General of South Australia or by such Agent-General to the Extension Company in manner mentioned in the said clause.

And whereas the Extension Company in accordance with the said clause 8, has given a notice expiring on the 30th day of April, 1900, to determine the present arrangement as to rates for the Australasian traffic.

And whereas it is intended that the rates for the Australasian traffic shall after the said 30th day of April, 1900, be those hereinafter mentioned.

And whereas the present terminal stations in Australia of the Extension Company's submarine cables are situated at Port Darwin, in the Colony of South Australia, and Roebuck Bay, in the Colony of Western Australia.

And whereas it is intended that the Extension Company, in co-operation with the Eastern Company, shall lay a new cable between Durban in the Colony of Natal, South Africa, and Australia as hereinafter provided, hereinafter called the new cable.

Now this indenture witnesseth and it is hereby agreed and declared by and with the contracting Colonies and their successors and the Extension Company their successors and assigns as follows, that is to say:—

1. As from the 1st day of May, 1900, the rates for the transmission of the Australasian traffic by the existing lines and cables, and the apportionment of such rates shall be the rates and apportionment specified in the said First Schedule hereto, Table A. And from and after the opening for traffic of the new cable as hereinafter mentioned the rates for the transmission of such traffic if and when sent by the new cable and the apportionment of such rates shall be the rates and apportionment specified in the Second Schedule hereto, Table A.

2. In these presents and the Schedules hereto by "Government Telegrams" are meant political or administrative telegrams sent from or to Her Majesty, and by Her Majesty's Principal Secretary of State for the Colonies or any Government Department in the United Kingdom, or the respective Agents-General for any of the contracting Colonies on the one hand, and by the Governors, Ministers, or any officer in charge of any Government Department of any of the contracting Colonies on the other hand, on matters relating to the public business of the said Colonies or any of them.

3. By "Press Telegrams" are meant telegrams addressed to any newspapers, duly published in accordance with the respective laws relating to the publication of newspapers in force in the United Kingdom or the Colonies, or countries in which they are respectively published and intended in good

faith

faith for publication in full in such newspapers, and shall include only such as are intelligible and written in English or French in plain language without the use of cypher, code, groups of figures or letters, or words of concealed meaning.

4. The respective Governments of the contracting Colonies shall in respect of telegrams forming part of the Australasian traffic, be entitled to be paid out of the rates charged for transmitting the same, the terminal charges specified in the Schedule hereto.

5. If on the 1st day of January, 190 , or on the 1st day of January in any subsequent year, the net receipts of the Extension Company and the Cis-Indian Administrations from the Australasian traffic retained by them for their own use and benefit shall have averaged during the three previous consecutive calendar years a sum of £330,000 per annum or any sum in excess of that amount the rates for the transmission of the Australasian traffic to and from Europe *via* Singapore and Suez, or Teheran, or *via* the Cape Colony and St. Helena shall be reduced to three shillings and sixpence per word for ordinary telegrams, two shillings and sixpence per word for Government telegrams, and one shilling and fourpence per word for Press telegrams, which reduced rates and their apportionment are specified in the First and Second Schedules hereto, Tables B; and if at the expiration of any subsequent calendar year after such reduction has been made the said average net receipts of the three previous consecutive calendar years shall have amounted to or shall have exceeded the said sum of £330,000 the rates for such traffic by the said routes shall be reduced to three shillings per word for ordinary telegrams, two shillings per word for Government telegrams and one shilling per word for Press telegrams, which reduced rates and their apportionment are specified in the First and Second Schedules hereto, Tables C; and if at the expiration of any subsequent calendar year after such further reduction has been made the said average net receipts of the three previous consecutive calendar years shall have amounted to or exceeded the said sum of £330,000 the rates for such traffic by the said routes shall be reduced to two shillings and sixpence per word for ordinary telegrams, two shillings per word for Government telegrams and one shilling per word for Press telegrams, which reduced rates and their apportionment are specified in the First and Second Schedules hereto, Tables D; and such rates respectively shall be considered in the respective cases in this Clause defined to be the maximum rates for the time being for the purposes of this Agreement.

6. Nothing herein or in the said Schedule contained shall prevent the Extension Company from varying the apportionment of any rate provided the total rate is not increased.

7. If and whenever the said rates are reduced in pursuance of Clause 5, the terminal charges payable to the respective Governments of the contracting Colonies in respect of telegrams transmitted at such reduced rates shall be reduced according to the scale set forth in the Schedule hereto.

8. After any reduction in the rates for Australasian traffic and in the terminals shall have been made under Clauses 5 and 7 hereof, the said rates and terminals shall not again be raised above the rates in those Clauses mentioned.

9. Nothing in this Agreement contained shall prejudice the right of the Extension Company and the Cis-Indian Administrations to at any time reduce the rates for the Australasian traffic, including Government and Press telegrams and at pleasure to raise them, subject to the maximum limits in each case fixed by this Agreement.

10. In the event of the full rates for the Australasian traffic being at any time reduced by the Extension Company and the Cis-Indian Administrations, the charge per word for Government telegrams shall not exceed the full outpayments for the time being charged by Governments and Administrations and three-fourths of the rate retained by the Extension Company and the Cis-Indian Administrations for their own use and benefit.

11. The Extension Company shall within three months from the expiration of the year 190 and within a like period from the expiration of each subsequent calendar year send to the Government of each of the contracting Colonies an account showing the net receipts of the Extension Company and the Cis-Indian Administrations during such year retained by them for their own use and benefit out of the Australasian traffic, and such account shall when required by the contracting Colonies be verified by the production in London of the traffic accounts of the Extension Company kept in respect of the Australasian traffic and when so required by a Statutory Declaration made by the Manager, Secretary, Traffic Accountant or other duly authorised officer of the Extension Company, but nothing herein contained shall give the contracting Colonies any further or other rights to inspect any other accounts of the Extension Company or the Cis-Indian Administrations.

12. The Extension Company shall, with all convenient speed, procure to be manufactured and laid between Durban, in the Colony of Natal, and Australia a submarine telegraph cable (herein called "the New Cable") in the five sections following, that is to say:—(1) Durban to Mauritius; (2) Mauritius to Rodrigues; (3) Rodrigues to Cocos; (4) Cocos to Fremantle in Western Australia; and (5) Fremantle to Glenelg in South Australia. The Extension Company shall also lay, or procure to be laid, in connection with the new cable two subterranean land lines; one from Fremantle to Perth in Western Australia, and the other from Glenelg to Adelaide in South Australia. The Extension Company shall also establish and supply or procure to be established and supplied all stations, offices, and apparatus necessary for the proper working of the new cable and the said subterranean land lines.

13. The cable between Fremantle and Glenelg mentioned in Clause 12 hereof shall not, as long as the land lines between the Colonies of Western Australia and South Australia shall be in working order, be used to transmit between the two last-mentioned Colonies telegrams not forming part of the Australasian traffic.

14. The respective Governments of South Australia and Western Australia shall, without charge, give to or procure for the Extension Company: (1) suitable sites for stations and officers at Glenelg and Adelaide, and at Fremantle and Perth respectively, and (2) all such lands, landing rights, licenses and other rights and facilities as may be reasonably required by the Extension Company for the purpose of laying and working the new cable and the said subterranean land lines, or for the purpose of duplicating the new cable or the said land lines, or laying such further cables or land lines as may be required for the efficient maintenance of the telegraph service between Europe and Australasia.

15. The Governments of Victoria and South Australia shall provide and maintain in efficient working order at their own expense, for the transmission of the Australasian traffic, a special wire on the Government posts between Melbourne and Adelaide, and the Governments of South Australia and New South Wales shall provide and maintain in efficient working order at their own expense for such traffic, a special

special wire on the Government posts between Adelaide and Sydney. The said special wires shall be respectively connected with the offices of the Extension Company in the said three cities, and shall always be at the service of and be worked by the staff of the Extension Company.

16. The Extension Company shall at all times be entitled to collect direct from and to deliver direct to the public in the cities of Perth, Adelaide, Melbourne, Sydney and Hobart any telegrams forming part of the Australasian traffic.

17. The Australasian traffic shall be transmitted *via* the new cable or *via* Port Darwin as the exigencies of the traffic of the Extension Company may require; but traffic received *via* Port Darwin for transmission to places beyond Adelaide shall be handed to the Extension Company at Adelaide for such transmission.

18. Upon the opening of the new cable for traffic the net charges of the Extension Company and the Eastern Company after deduction of out-payments for telegrams between the contracting Colonies and Durban or Cape Town shall not exceed two shillings.

19. Each of the Governments of the respective contracting Colonies shall cause all cables, cable apparatus, telegraph instruments, machinery, furniture, stationery, and all goods of any kind of the Extension Company, or their assigns, which are used solely for the purpose of the business of the Extension Company, or their assigns, or for laying, repairing, or working any of their cables, land lines, or cable ships to be relieved from all custom duties and wharfage rates in its own respective Colony, and shall cause every vessel which shall be used by the Extension Company, or their assigns, for the purpose of laying, repairing, or duplicating any cable or any vessel belonging to or chartered by the Extension Company, or their assigns, in which any such cable, cable apparatus and telegraph instruments, machinery, furniture, stationery, and goods as aforesaid shall be carried, to be exempt from all port and light dues, whether upon entering any port or passing through any waters of any such Colony or otherwise howsoever, and shall also repay to the Extension Company such sums as will be sufficient to recoup the Extension Company any income tax and any rates or taxes, Parliamentary, Municipal, or otherwise, which the Extension Company shall be required to pay in such respective contracting colony. Provided always, however, and it is hereby mutually agreed and declared by and between the parties hereto that nothing in this present clause shall be deemed to waive, defeat, modify, or affect any privileges, exemptions, or rights belonging to the Extension Company, or their assigns, under certain Articles of Agreement, bearing date the 29th day of August, 1871, and made between the Governor of the Province of South Australia of the one part and the British Australasian Telegraph Company (Limited) of the other part, or under certain other Articles, bearing date the 14th day of March, 1889, and made between the Government of Tasmania of the one part and the Extension Company of the other part; but, on the contrary, this present clause shall be deemed to be collateral and additional to each of the last-mentioned Articles of Agreement.

20. Nothing in this Agreement contained shall prevent the Extension Company at any time after they shall have commenced working the new cable from closing their station at Roebuck Bay, and taking up the cable which lands at that place.

IN WITNESS WHEREOF

SCHEDULES I AND II, TABLES A, B, C, AND D.

NOTE.—It is not considered necessary to print these Schedules in full. They provide a maximum tariff per word as follows:—Ordinary, 4s.; Government, 3s.; Press, 1s. 4d. The proportions payable to Australia under Table A are 6d., 4d., and 3d. respectively, such amounts being uniform for all the contracting Colonies. The other Tables show the rates as reduced in accordance with the sliding scale, as follows:—

	Ordinary.	Government.	Press.	Australian.		Proportion.
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
Table B	3 6	2 6	1 4	0 6	0 4	0 3
„ C	3 0	2 0	1 0	0 5	0 3½	0 2½
„ D	2 6	2 0	1 0	0 4½	0 3½	0 2½

SCHEDULE III.

TARIFF PER WORD and Apportionment of Australasian Terminal Charges for Traffic exchanged between Australasia and Europe on and after 1st May, 1900, and to come into operation upon further reductions of Rates taking place under the provisions of Article V.

No. 30.

The Postmaster-General to The Premier, New South Wales.

MINUTE.

Re proposals of the Eastern Extension Telegraph Company (Limited).

In regard to the present position of this matter, I think it expedient, in view of the recent Ministerial changes in some of the Colonies, that the Victorian, Queensland, and New Zealand Governments should be communicated with to the following effect, namely:—

On the 23rd October, 1899, it was considered desirable by the Government of this Colony to ask its Agent-General, by cable, to take the following action:—

(See copy cablegram dated 23rd October, 1899, No. 23.)

In reply, the Agent-General despatched the following two messages:—

(See copy cablegrams received 4th and 8th November, 1899, Nos. 24 and 25.)

It was suggested by the late Postmaster-General of Victoria (Mr. Duffy) that the proposals of the Eastern Extension Company should be submitted to the Advisory Board in England, but this Government did not consent to the adoption of that course, as it was not considered to be any part of the Board's duty to deal with those proposals, and on being so advised, Mr. Duffy forwarded, through the Premier of Victoria, a memorandum, dated 24th November, of which the following is a copy:—

"I regret Mr. Lyne's action. The suggested reference is not to the Advisory Board on Pacific cable, but to the *three Australasian representatives*.

"The suggestion is made because—

- "1. The matter of agreement with the Eastern Extension Company is one that should be decided by Colonies interested after discussion.
- "2. It has been found impossible up to the present time to assemble representatives of these Colonies in Australia.
- "3. The Directors of the Eastern Extension Company are on the spot in London, and can be dealt with direct. The Agent here has no powers.
- "4. The Australasian members of the Pacific Cable Board are in the best position to ascertain the opinions of the Imperial and Canadian authorities, our partners in the Pacific scheme, as to the proposed concessions; and
- "5. To see that any concessions given to the Company will not unduly prejudice the Pacific cable scheme.

"I presume the Government of New South Wales will not act in the matter without giving us notice confidentially beforehand of what is proposed to be done.

"We are drifting into a most unfortunate position in this affair, owing to the fact that the question has never been properly discussed by the Colonies interested. The future of the Pacific cable scheme is involved, and if we are not careful we will play into the hands of the worst enemies of that scheme.

"If New South Wales Government will not agree to Australasian Members Pacific Board acting, will it call conference of Colonies interested to discuss question?"

It is understood that the Governments of South Australia and Western Australia have accepted the Company's proposals, and I am disposed to advise the Government of this Colony to do the same, on condition that it agrees to reduce the tariff at once as regards such Colonies as accept the proposals, and that the promised payment of £5 per mile per annum for use of our land lines be made concurrently with the reduction of tariff, or so soon as we can place a wire at its disposal.

We should thus secure an immediate reduction of rates, without subsidy or guarantee, whilst under the most favourable circumstances the Pacific cable could not be completed for at least three years.

It is desired to learn the views of the Governments of Victoria, Queensland, and New Zealand on the subject before a final decision with regard to it is arrived at here.

The Queensland and New Zealand Governments should be communicated with as partners in the proposed Pacific Cable scheme, and I would suggest that the latter be asked to reply by cable.

It might be added that the Agent-General for New South Wales, in a letter dated 10th November, 1899, addressed to you, makes the following statement:—

"The present enhanced value of all the materials needed for the manufacture of cables has made the obtaining of tenders for the Pacific Cable within the limits contemplated, for the present perhaps, impossible."

It seems to me that unless we come to terms with the Company we will be at the Company's mercy for at least the next three years.

W. P. CRICK,
11/1/1900.

No. 31.

Extract from Proceedings of Conference of Premiers held at Sydney, on Saturday, 27th January, 1900.

THE Conference assembled at 10:30 a.m. and entered upon the discussion of the proposals of the Eastern Extension Telegraph Company, when, after full consideration, the Hon. J. W. Holder proposed the following motion, viz.:—

"That the proposals of the Eastern Extension Telegraph Company for a Cape-Australian cable be accepted, with the following qualifications:—

- (a) The suggestion of Mr. Chamberlain to be agreed to.
- (b) The right to open local offices to be exercised only on the laying of the Pacific cable.
- (c) No exemption from Customs Duties to apply except to telegraph instruments, cables, and chemicals.

(d)

- (d) Sites in Perth, Fremantle, Adelaide, and Glenelg to be subject to satisfactory arrangements approved by the Governments of Western Australia and South Australia.
- (e) The Roebuck Bay cable not to be closed. The Postmasters-General to arrange details subject to these provisions."

A majority of Premiers were in favour of the above motion, but the Premiers of Victoria and Queensland having expressed a desire to obtain further information, it was unanimously agreed to postpone the final decision for a few days, and the Premiers of Victoria and Queensland to communicate with the President, who will thereupon record and notify to the Secretary of State the decision arrived at.

No. 32.

Manager, Eastern Extension Company, to Postmaster-General, New South Wales.

The Eastern Extension, Australasia, and China Telegraph Company, Limited,
 Melbourne, 13 February, 1900.

Sir,
 With reference to this Company's Cape cable proposals, I have the honor to inform you that my Board have agreed to the modifications recommended by the Premiers' Conference recently held in Sydney, subject to certain slight amendments, as follows:—

- (a) That Mr. Chamberlain's suggestions be agreed to.
- (b) The right to open local offices to be exercised only on the laying of the Pacific cable or on the laying of any other competing cable in the meantime. Formal notice of not less than six months to be given to the Eastern Extension Company to enable them to prepare for opening their offices simultaneously with the competing cable.
- (c) That clause 19 of the Draft Agreement, page 8, is to read, "Stationery and goods of the Extension Company or their assigns which are used solely for the purpose of the cable business of the Extension Company, &c., &c."
- (d) Landing-sites in Perth, Fremantle, Adelaide, and Glenelg to be subject to satisfactory arrangements approved by the Governments of Western Australia and South Australia.
- (e) The question of the removal of the Roebuck Bay cable to be left to the Western Australian Government and the Company to settle after the completion of the Cape cable.

I am authorised to say that the reduced rates could come into force within three weeks of the signing of the contract. This interval is necessary to enable the International Berne Bureau to notify the Telegraphic Administrations of the International Union of the alterations to be made in the Australian tariff. (*Vide* International Telegraph Convention and Service Regulations, 1896, page 29, article 27.)

If you will be kind enough to let me know when I can have an interview with you, I will come to Sydney.

I have, &c.,

W. WARREN,

Manager in Australasia.

No. 33.

Premier, Victoria, to Premier, New South Wales.

(Received 19th February, 1900.)

TELEGRAM.

EASTERN Extension Company's proposals.—Since matter discussed by Premiers in conference I have had several interviews with Company's Australasian manager, and I now communicate to you his latest communication, which embodies determination of his Directors' Board upon resolutions of Conference here. Letter begins dates 13th February,—Referring to my letter of the 7th instant, I have the honor to inform you that my Board have agreed to the modifications recommended by the Premiers' Conference recently held in Sydney, subject to certain slight amendments, as follows:—(a) That Mr. Chamberlain's suggestion be agreed to; (b) the right to open local offices to be considered only on the laying of the Pacific cable or on the laying of any other competing cable, in the meantime—formal notice of not less than six months to be given to Eastern Extension Company to enable them to prepare for opening their offices simultaneously with complying (qy., competing) cable; (c) that clause 19 of Draft Agreement, page 8, is to read stationery and goods of Extension Company, or their assigns, which are used solely for purpose of Extension Company, &c., &c.; (d) landing-site in Perth, Fremantle, Adelaide, and Glenelg to be subject to satisfactory arrangements approved by Governments of Western Australia and South Australia; (e) question of removal of Roebuck Bay cable to be left to Western Australian Government and Company to settle after completion. Am authorised any reduced rates could come into force within three weeks of signing contract; this interval is necessary to enable International Bureau at Berne to notify Telegraphic Administrations of International of the alterations to be made in Australian tariff (*vide* International Telegraphs Convention and Service Regulations, 1896, page 29, article 27, signed W. Warren)—here letter ends. For your information, in order that concert which happily exists between us may be preserved and strengthened, I take opportunity expressing views Victorian Government upon proposal. I concur in provisions of paragraph (a) and (d); with respect to paragraph (b), quite willing it should be amended read as follows:—Right to open local offices to be exercised only on laying Pacific cable or on laying of any other competing cable owned or partly owned by Australian Governments; in meantime no such right to be granted to any other cable before granted to Eastern Extension Company formal notice. I have put this alteration before Mr. Warren, and he is prepared place it before his London Board for sanction of its terms, also meet with approval your Government. *Re* paragraph (c) this modification of Draft Agreement was drawn by Victorian Postmaster-General to meet wishes of Conference and prevent any undue evasion of Customs tariff. *Re* paragraph (e), as Company apparently does not intend lift the Roebuck Bay cable until Cape cable completed, matter not of importance to Eastern Colonies, and we might with safety act on advice Premier Western Australia, who, I am informed,

is

is not averse to Company's intentions. May I point out that before the new contract signed will be necessary for contracting Colonies to arrive at some agreement as to mode of payment for use of land lines? I understand that, although Schedules submitted provide for allocation of 6d. per word amongst Colonies, Company indifferent whether it pay by mile or by word. Victorian Postal Department, however, urges arrangements be based on rate per word, so Colonies may participate in benefit derived from any expansion cable business. I may add my Government is animated by strong desire secure reductions cable tariff, and have gone as far as reasonably could to grant concessions to Eastern Extension Company with that object; but am fully convinced we cannot proceed one step further than indicated above without gravely endangering Pacific cable scheme, therefore venture hope you will give my propositions prompt and favourable consideration their importance demands, and that you will be prepared join with Governments New Zealand and Queensland in any steps they may hereafter take calculated to expedite Pacific undertaking.

A. W. McLEAN.

No. 34.

Postmaster-General, New South Wales, to Postmaster-General, Victoria.

(Sent 23 February, 1900.)

TELEGRAM.

Re your Premier's telegram 19th, I agree as follows: (a) Clause 8 to stand as printed, with following addendum, "except as provided in Clause 9." Clause 9 to read, "From and after the opening for traffic of the Pacific cable nothing," &c. (b) Agree with your proposed amendment, which we read to be as follows, although some ambiguity in your telegram: "right to open local offices to be exercised only on laying of Pacific cable, or on laying of any other competing cable owned, or partly owned, by Australian Governments. In the meantime no such right to be granted to any other Company before granted to Eastern Extension Company. Formal notice of not less than six months to be given to Eastern Extension Company to enable them to prepare for the opening of their offices simultaneously with the competing cable." Clauses (c) and (d) already agreed to. (e) Concur with you. With regard to payment for use of land lines, we concur with you that arrangements be based on rate per word.

I can only repeat my previous statements that we are anxious to facilitate our former undertakings in regard to carrying out Pacific cable, and agree with you that we cannot make further concessions to Eastern Extension Company without endangering it.

W. P. CRICK.

No. 35.

Cape Cable.

AMENDMENTS IN DRAFT AGREEMENT (ARRANGED BY CORRESPONDENCE) AND APPROVED BY POSTMASTERS-GENERAL OF NEW SOUTH WALES AND VICTORIA, SUBJECT TO CONFIRMATION BY GOVERNMENTS, AS CABLED BY MR. WARREN FOR CONSIDERATION OF HIS BOARD OF DIRECTORS. 23RD FEBRUARY, 1900.

(Words proposed to be omitted are erased. New matter underlined.)

Page 3. Recital to follow after line 27:—And whereas a project has been set on foot for the laying of a cable from Vancouver Island to Australasia, with mid-stations at Fanning Island, Fiji, and Norfolk Island, hereinafter called the Pacific Cable.

Page 5, Clause 6. Nothing herein or in the said Schedule contained shall prevent the Extension Company from varying the apportionment of any rate, provided the total rate is not increased, and the proportion payable to any of the contracting Colonies is not reduced beyond the limits contained in the said Schedule.

Page 6, Clause 8. After any reduction in the rates for Australasian traffic and in the terminals shall have been made under Clauses 5 and 7 hereof, the said rates and terminals shall not again be raised above the rates in those clauses mentioned, except as provided in Clause 9.

Clause 9. From and after the opening for traffic of the Pacific cable nothing in this agreement contained shall prejudice the right of the Extension Company and the Cis-Indian Administrations to at any time reduce the rates for the Australasian traffic, including Government and Press telegrams, and at pleasure to raise them, subject to the maximum limits in each case fixed by this agreement.

Page 7, Clause 14. The respective Governments of South Australia and Western Australia shall, subject to satisfactory arrangements approved by those Governments respectively, without charge, give to or procure for, &c. (as in the draft).

Page 8, Clause 16. On and after the opening for traffic of the Pacific cable, or any other competing cable owned, or partly owned by Australian Governments, the Extension Company shall, at all times, be entitled to open local offices and to collect direct from and to deliver direct to the public in the cities of Perth, Adelaide, Melbourne, Sydney, and Hobart, any telegrams forming part of the Australasian traffic: Provided that in the meantime no such right shall be granted to any other cable Company before being granted to the Extension Company, and formal notice of not less than six months shall be given to the Extension Company to enable them to prepare for opening their offices simultaneously with the competing Company.

Clause 19. Each of the Governments of the respective contracting Colonies shall cause all cables, cable apparatus, telegraph instruments, machinery, furniture, stationery, and all goods of any kind of the Extension Company, or their assigns, which are used solely for the purpose of the cable business of the Extension Company, &c. (as in draft).

Page 9, Clause 19, line 7. any such cable, cable apparatus and telegraph instruments, machinery, furniture, stationery, and goods as aforesaid, &c. (as in draft).

Line 18, after "contracting Colony" add:—

Except rates or taxes on premises occupied as local offices for the purposes referred to in Clause 16 hereof.

Clause 20. Add after "that place" subject to consultation with the Government of Western Australia.

No. 36.

Manager, Eastern Extension Company, to Deputy Postmaster-General, Sydney.

The Eastern Extension Australasia and China Telegraph Company, Limited.

Sir,

Sydney, 26 February, 1900.

For the information of the Honorable the Postmaster-General I have the honor to state that my Company accept the amendments submitted on the 23rd instant, with the following slight modifications:—

First. In Clause 9, read after "Pacific," "or other competing cables."

Second. In Clause 12, after "convenient speed," insert words "after the necessary landing rights have been obtained." This was omitted when the agreement was originally drafted.

Third. In Clause 16, insert in the first amendment after "Australian Governments," the words "or any of them," also the final word of the same amendment substitute "Cable" for "Company."

I am requested to say that before the agreement can be signed the contracting Colonies will have to decide whether Schedule 3 is to be inserted, or whether they will accept the proposed uniform terminal rates, as per Schedules 1 and 2, Tables A, B, C, and D?

I am also requested to ask whether the contracting Governments will sign the agreement locally, or whether they will instruct their Agents-General to complete it in London.

I have, &c.,

W. WARREN,

Manager in Australasia.

No. 37.

The Secretary of State for the Colonies, to the Governor, New South Wales.

(Received 26 February, 1900.)

TELEGRAM.

FOLLOWING is text of unanimous resolution passed by Pacific Cable Committee yesterday. Begins:—"That this Committee would urge that no concessions should be made by any of the Australian Governments to the Eastern Telegraph Company as a condition of laying a cable between Africa and Australia until this Committee has had an opportunity of considering and reporting on the effect of such upon the financial prospects of the Pacific cable scheme."—ends. Under existing circumstances, I concur, and hope that your Ministers have not yet communicated with Eastern Telegraph Company decision arrived at by Conference. Questions in Parliament, 27th February, ask whether concessions have been granted. Repeat this telegram to Governor of Victoria.

(This telegram was repeated to the Governor of Victoria.)

No. 38.

Postmaster-General, Victoria, to Postmaster-General, New South Wales.

(Received 28 February, 1900.)

TELEGRAM.

I AM gratified at the concurrence expressed in your wire of the 23rd instant. Am inclined to think, however, that your verbal alterations relating to Clause "A" are not sufficiently explicit. Since my last, vigorous protests against new proposals have arrived from Premiers Canada, New Zealand, and Queensland, also adverse report Pacific Board, endorsed by Secretary of State. In view of nature of last-mentioned, and its important bearing on Pacific scheme, do you not think that final action should be deferred until your Premier reaches Melbourne? If you could arrange to accompany him it would facilitate a settlement of this vexed question.

W. A. WATT.

No. 39.

Postmaster-General, New South Wales, to Postmaster-General, Victoria.

(Sent 1 March, 1900.)

TELEGRAM.

AM settling draft contract with Attorney-General to-day, and will post you copy, showing alterations, in red ink. Think you will find to your satisfaction. Will also forward you copy my replies to Canada, England, New Zealand, and Queensland. May see you next week.

W. P. CRICK.

No. 40.

Postmaster-General, New South Wales, to Postmaster-General, Melbourne, and
Minister in Charge of Postal Departments at Adelaide and Perth.

(Sent 2 March, 1900.)

TELEGRAM.

HAVE advised the Premier that the following cable message be sent to Secretary of State, and Premiers, Canada, New Zealand, and Queensland, namely:—"Eastern Extension proposals. Seems some misapprehension. We are ready and anxious to carry out our undertaking *re* Pacific cable. Admitted all sides this cannot be completed for three years, probably more. Meantime Eastern Extension offer immediate reduction of rates to four shillings, or about sixteen per cent.; and by sliding scale, coming three years to two shillings and sixpence as business increases; also lay cable Cape to Adelaide, and then reduce present excessive Cape rates from seven shillings and threepence to two shillings and sixpence word. No concessions asked for or given until Pacific cable completed. They then want direct offices so as compete on equal terms, and in meantime any reduction whatever to remain until Pacific cable laid. Our present agreement terminates 30th April, and if no fresh one made Company can, instead of reducing rates, increase them up to eight shillings word."

W. P. CRICK.

No. 41.

Governor, New South Wales, to Secretary of State for Colonies.

(Sent 2 March, 1900.)

TELEGRAM.

REFERRING to your telegram of 1st March, Prime Minister informs me that agreement not actually entered into. Eastern Telegraph Company aware of result of Premiers' Conference. Colony prepared to accept in terms of my cypher telegram of 24th February.

No. 42.

Secretary of State for Colonies, to Governor, New South Wales.

(Received 3 March, 1900.)

TELEGRAM.

IN reply to your telegram of the 2nd instant, in view of the deep anxiety felt by the other Colonies interested in the Pacific cable scheme as to the effect which the proposed arrangement may have on that undertaking, and the possibility that Canada and New Zealand may withdraw their support, I hope that your Ministers will defer concluding any agreement, as suggested in my telegram of the 24th February, until the Committee has examined the question.

No. 43.

Deputy Postmaster-General, New South Wales, to Permanent Heads of Postal and
Telegraph Departments, Victoria, South Australia, Western Australia, and
Tasmania.

(Dated 7 March, 1900.)

Re Eastern Extension Company's proposals.

Sir,

I am directed to enclose a copy of the Draft Agreement submitted by the Company, as altered in conformity with the amendments previously agreed upon, and with some further ones suggested by Mr. Crick in the interests of the Colonies, and in regard to which Mr. Warren is now communicating with his Board.

The writing in black ink is the Contract as submitted, and all alterations thereof are in red ink. Under the alterations only one schedule is necessary. Will you please inform me if your Government concur in the agreement as altered as early as possible?

I have, &c.,

S. H. LAMBTON.

No. 44.

Manager, Eastern Extension Company, to Deputy Postmaster-General, Sydney.

The Eastern Extension Australasia and China Telegraph Company, Limited,

Sir,

Sydney, 9 March, 1900.

For the information of the Honorable the Postmaster-General, I have the honor to state that my Company approve of the amendments made in the Cape Cable Agreement with the following exceptions:—

First.—The three new clauses to be added after clause 20, and to be numbered 21, 22, and 23 respectively.

Second.—At the end of clause 1, the word "third" to be inserted after "specified in the —."

Third.—On page 5 of original copy of Agreement, line 4, after "Australasian traffic" insert in parenthesis (except New Zealand, Queensland, and New Caledonia traffic).

Fourth.—Clause 7, insert "said" before "schedule."

Fifth.—Clause 9, to read as previously amended, namely, "From and after the opening for traffic of the Pacific cable, or any other competing cable, nothing in this Agreement, &c."

I

I am directed to point out that this wording is required to meet a possible French, American, or other competing cable, and I think the necessity for such wording will be apparent to the Honorable the Postmaster-General on reading the attached Press telegram announcing that an American cable from 'Frisco to Honolulu is likely to be laid very shortly, and, further, that when completed, an extension to Queensland and New Zealand would, probably, be arranged for by those Colonies, should there be any delay in carrying out the projected Government-owned cable to Vancouver.

Sixth.—At the end of the amendment made to clause 13, add after "working order" "it being understood that precedence shall always be given to International traffic."

Seventh.—Clause 19. My directors ask the Honorable the Postmaster-General's reconsideration of the amendment made in this clause, as they consider the Company ought not to be placed in a worse position than they occupied under the Guarantee Agreement, especially as they are waiving all right to renewal of subsidy and guarantee, and purpose reducing the rates three weeks after the signing of the Agreement. This interval, as already explained, is required by the Berne Bureau for notifying other countries of the alteration to be made in the Australian tariff.

My directors also direct me to point out that the other contracting Colonies have not—so far as they are aware—raised any objection to the Company being exempted from payment of rates and taxes as hitherto, and therefore ask that the words after howsoever, "And shall also repay to the Extension Company such sums as will be sufficient to recoup the Extension Company any income tax and any rates or taxes, Parliamentary or otherwise, which the Extension Company shall be required to pay in such respective contracting Colony except rates or taxes on premises occupied as local offices for the purposes referred to in clause 16 hereof," may be retained in clause 19. A similar clause is contained in the Agreements made with the South Australian and Tasmanian Governments, and is still in force, and the accompanying letter—enclosed for the Honorable the Postmaster-General's perusal—will show that Western Australia is prepared to renew the concession.

Eighth.—In the new clause 22, line 7, insert after "Extension Company" "in such Colonies."

I have, &c.,

W. WARREN,

Manager in Australasia.

No. 45.

Manager, Eastern Extension Company, to Deputy Postmaster-General, Sydney.

The Eastern Extension Australasia and China Telegraph Company, Limited,

Sir,

Sydney, 10 March, 1900.

For the information of the Honorable the Postmaster-General, I have the honor to state that if the Cape Cable Agreement can be signed by New South Wales and Victoria, and the other contracting Colonies notify their approval and acceptance of same by wire—not later than the 14th instant—my Company will announce by wire, instead of by letter, to the Berne Bureau that the reduced rates are to come into operation on 1st proximo.

I have, &c.,

W. WARREN,

Manager in Australasia.

No. 46.

Deputy Postmaster-General, Sydney, to Permanent Heads of Postal and Telegraph Departments, Melbourne, Adelaide, Perth, and Hobart.

(Dated 15 March, 1900.)

Sir,

Referring to my letter of the 7th instant, enclosing copy of the Draft Agreement with the Eastern Extension Company, as revised by the Postmaster-General, I am now directed to state that the principal alterations having been submitted by Mr. Warren to his Board in London, he has addressed a letter, a copy of which is enclosed, to the Postmaster-General.

Mr. Crick, having considered this letter, has decided, so far as he is concerned, to agree to the amendments respectively numbered 1st, 3rd, 4th, 6th, and 8th, but considers that the alterations made in clauses 9 and 19 of the original draft should stand as shown in the revised draft sent to you on the 7th instant (see clauses 10 and 20 of the revised draft).

The second amendment referred to in Mr. Warren's letter will be unnecessary if it is decided to adopt the third schedule, for in that case one schedule only will be required.

Mr. Crick would be glad of the views of your Minister.

I have, &c.,

S. H. LAMBTON.

No. 47.

Postmaster-General, New South Wales, to Manager, Eastern Extension Company, Melbourne.

(Sent 29 March, 1900.)

TELEGRAM.

REPLYING to your favour 27th, I propose clause 10 (9 in original draft) to read as follows:—From and after the opening for traffic of the Pacific cable, or any other competing cable, the Extension Company may at any time reduce the rates for the Australasian traffic, including Government and Press telegrams, and may raise them at pleasure subject to the maximum limits contained in the following proviso: Provided that the said Company shall not be entitled to raise the rates once they have been reduced until the said rates have reached the minimum of 2s. 6d. per word, under the operation of clause

clause 6, hereof or until such rates have previously been reduced by the Company to 2s. 6d. per word, and upon any further reduction being made the Company may at pleasure again raise the rates; but not so as to exceed the maximum of 2s. 6d. per word.

Clause 17 (16 in the original draft), I propose to read as follows:—On and after the opening for traffic of the Pacific cable, or any other competing cable, and the reduction of the rates to 2s. 6d. per word under the operation of clause 6 or clause 10 hereof, the Extension Company shall be entitled to open local offices, and to collect direct from and to deliver direct to the public in the cities of Perth, Adelaide, Melbourne, Sydney, and Hobart any telegrams forming part of the Australasian traffic; and shall pay to the contracting Colonies the terminal rates specified in the Schedule Table D in respect of all such messages so collected or delivered; provided that in the meantime no such right shall be granted to any other cable company before being granted to the Extension Company, and formal notice of not less than six months shall be given to the Extension Company to enable them to prepare for opening their offices simultaneously with the competing cable.

W. P. CRICK.

No. 48.

Postmaster-General, New South Wales, to Postmaster-General, Victoria.

(Sent 29 March, 1900.)

TELEGRAM.

CABLE question. At present think Conference not necessary. After careful consideration, I suggest, as compromise, that clause 10 (9 in original draft) read as follows:—

(Follows as in telegram to Mr. Warren, No. 47.)

I cannot see how report of Pacific Board can influence our action; all I want is that if rates are reduced with view to either defeat or delay Pacific cable public must retain advantage of reduced rates. Also, if Pacific cable so defeated or delayed, and other privately-owned competing cable constructed, no loophole for Eastern Extension Company to enter into agreement with such competing cable to tend towards monopoly.

W. P. CRICK.

(Telegrams in similar terms were sent to Postmasters-General, Hobart, on 29th March, South and Western Australia on 31st March.)

No. 49.

Postmaster-General, Victoria, to Postmaster-General, New South Wales.

(Received 30 March, 1900.)

TELEGRAM.

CABLE question. Deeply regret to learn that you are prepared to agree to such vital departure from our understanding relating to terminal facilities. Victorian Premier's wire of 19th February described utmost concession this Government was inclined to grant, and added that any further advance would gravely affect Pacific scheme. You heartily concurred in wire, date 23rd February, later in yours of 2nd instant, enumerating representations you proposed making to Imperial and interested Colonial Governments. You declared that "no concessions were asked for or given until Pacific cable completed." In view of fact that Eastern Extension Company signified willingness to accept such compromise, your proposed alteration of new clause 17 is inexplicable, and I cannot concur. Will postpone for present decision on suggested amendment of new clause 10 granting competitive privileges to Company. Am strongly disposed to await report of Pacific Board, and earnestly urge you to reconsider your determination, which is fraught with peril to projected Government cable. Present state of negotiations demonstrates futility of continuing without a Conference.

W. A. WATT.

No. 50.

Premier, Victoria, to Premier, New South Wales.

(Received 3 April, 1900.)

TELEGRAM.

THIS Government has decided to defer further negotiations *re* cable until report of Pacific Board arrives. Am cabling Agent-General to that effect; will also request him to expedite report.

A. McLEAN.

No. 51.

Minister for Education and Agriculture, South Australia, to Postmaster-General, New South Wales.

(Received 6th April, 1900.)

TELEGRAM.

AFTER careful consideration, I do not think modifications suggested in your telegram of 31st March are of sufficient importance to warrant any further delay in obtaining the advantages of an immediate reduction of rates. This Government are prepared to agree to the conditions as modified by you (*vide* Mr. Lambton's letter of 7th March) and accepted by the Company, the words "owned or partly owned by the Australian Governments, or any of them," being struck out.

E. L. BATCHELOR.

No. 52.

Postmaster-General, New South Wales, to Postmaster-General, Victoria.

(Sent 10 April, 1900.)

TELEGRAM.

IN reference to Mr. McLean's wire that your Government have decided to defer negotiations *re* cable until report of Pacific cable arrives, I regret I cannot concur in that course.

W. P. CRICK.

No. 53.

Postmaster-General, Sydney, to Manager, Eastern Extension Telegraph Company, Melbourne.

(Sent 10 April, 1900.)

TELEGRAM.

I AM without reply to my last containing my proposed alterations of agreement. Would like answer so as enable me decide reply to British Government.

W. P. CRICK.

(NOTE.—On the 3rd May, 1900, a Conference was held at Melbourne between the Postmasters-General of Victoria and New South Wales.)

No. 54.

Deputy Postmaster-General, Melbourne, to Deputy Postmaster-General, Sydney.

Sir,

Melbourne, 8 May, 1900.

I am directed to enclose herewith copy of the amendments of the proposed agreement with the Eastern Extension Telegraph Company, which were drafted at the Conference between the Postmasters-General of New South Wales and Victoria, held in Melbourne on Thursday last, the 3rd instant.

A copy of the proposed amendments has also been forwarded to Mr. Warren, Manager in Australasia for the Company.

Mr. Watt desires me to add that he will keep Mr. Crick informed of any determination in regard to the agreement that may be arrived at and communicated to him.

I have, &c.,

F. L. OUTTRIM.

[Enclosure.]

Re proposed agreement with Eastern Extension Company.

AGREED:—

1. "Australasian traffic" must be defined in recital as follows:—"Telegraphic messages to and from the terminal stations in Australasia."

2. Clause 8 (Adelaide agreement) to read:—"After any reduction in the rates for Australasian traffic and in the terminals shall have been made under clauses 5 and 7 hereof, the said rates and terminals shall not again be raised; but if the said rates and terminals are reduced by the Eastern Extension Company, or Cis-Indian Administrations of its own motion below the minimum in clause 5, the said Company or Administration may at its pleasure again raise them, provided they shall not exceed the said minimum."

3. Clause 16 (Adelaide agreement).—To stand as agreed between Messrs. Crick and Warren. (*See* Mr. Crick's draft.)

4. Clause 19 (Adelaide agreement).—Company must pay Parliamentary and Municipal taxation (except on cable goods through Customs), but may add sums so paid to £330,000.

5. Arbitration clause (as in Mr. Crick's draft) must be inserted

6. A purchase clause, to be read in conjunction with foregoing, must also be inserted.

7. Agreements embodying the above amendments to be submitted for approval of Parliaments of New South Wales and Victoria.

W. P. CRICK, } Postmasters-General,
W. A. WATT, } New South Wales and Victoria.

3rd May, 1900.

Section II.

SUBMARINE CABLE BETWEEN CANADA AND AUSTRALASIA
ACROSS THE PACIFIC OCEAN.

(PROPOSED CONSTRUCTION OF.)

No. 1.

Resolutions.

A MINISTERIAL Conference, at which the seven Colonies of Australasia were represented, was held in Sydney, in January, 1896, when the following resolutions regarding the proposed Pacific cable were adopted, namely:—

RELATING TO THE PROPOSED PACIFIC CABLE.

1. That, in the opinion of this Conference, the Pacific cable should be constructed and owned jointly by the various Governments interested.
2. That, in the opinion of this Conference, the landing-places of such cable should be only upon territory belonging to or under the control of the British Empire.
3. That, in the opinion of this Conference, the cost of its construction, working, and maintenance be borne in the following proportions, namely:—Great Britain, one-third; the Dominion of Canada, one-third; and the contributing Australasian Colonies, one-third.
4. That, in the opinion of this Conference, the route from Fiji to Australia be *via* Norfolk Island, thence bifurcating to the nearest convenient landing-places in the north of New Zealand and Moreton Bay respectively.
5. That, in the opinion of this Conference, it is highly desirable that South Australia join the other Colonies in the Pacific cable project; and having regard to their vested interests in the trans-continental line, Dr. Cockburn be invited to make a proposition, embodying the terms on which the South Australian Government would be prepared to join the other Colonies in the said project.

The Hon. Dr. Cockburn intimated the following as the proposal of the South Australian Government, viz.:—South Australia is willing to join in the project provided that a guarantee, either from the contributing Colonies alone, or jointly with the Imperial Government, be given, that the financial position of South Australia, as regards the Port Darwin line, be maintained on the basis of the average of the last five years.

The Hon. Mr. Reeves stated that he had received a cable from the Hon. Mr. Ward with regard to the terms on which New Zealand would come in as a contributing Colony, to the effect that of course it would be very disadvantageous to New Zealand to come in on an equally responsible footing with the other three Colonies; at the same time, Mr. Ward would be prepared to give way and do so, annexing, however, the stipulation that Victoria and New South Wales should join with New Zealand in facing any possible loss on the present cable.

6. That, in the opinion of this Conference, the Colonies joining contribute equally to the undertaking. (The Hon. Dr. Cockburn and the Hon. Mr. Reeves refrained from voting on the above.)
7. That, in the opinion of this Conference, in consideration of South Australia joining with the other contributing Colonies in the Pacific Cable project, they would be willing, jointly with Great Britain, to guarantee that Colony against further loss in connection with their transcontinental line in consequence of the construction of the new cable.
8. That, in the opinion of this Conference, Sir Saul Samuel, K.C.M.G., C.B., and the Hon. Duncan Gillies be nominated as representatives of the Australasian Colonies on the Commission in connection with the Pacific Cable, and that they be requested to consult on all important points the Agents-General for the Australasian Colonies.
9. That, in the opinion of this Conference, it be a recommendation to the Governments represented at this Conference to forward the foregoing resolutions to the Australasian Commissioners.

[*Note.*—A report of the abovementioned Conference was laid before Parliament on 20th May, 1896.]

No. 2.

Instrument of Appointment.

INSTRUMENT of Appointment of the London Committee to consider the Proposal for laying a Telegraph Cable between British North America and the Colonies of Australasia.

I APPOINT—

The Right Honorable WILLIAM WALDEGRAVE, Earl of SELBORNE, Under Secretary of State for the Colonies ;

GEORGE HERBERT MURRAY, Esquire, C.B., a Principal Clerk in the Department of the Treasury ;

Sir DONALD ALEXANDER SMITH, G.C.M.G., High Commissioner for Canada ;

The Honorable Sir MACKENZIE BOWELL, K.C.M.G., Member of the Privy Council of Canada ;

The Honorable Sir SAUL SAMUEL, K.C.M.G., C.B., Agent-General for New South Wales ; and

The Honorable DUNCAN GILLIES, Agent-General for Victoria ;

to be a Committee to consider in all its aspects the proposal for laying a telegraph cable between British North America and the Colonies of Australasia, and to report to me, for the consideration of Her Majesty's Government, their views upon the following questions :—

1. Is the laying of such a cable practicable, from a technical point of view ?
2. If so, what route should be selected for the cable ?
3. What will be the cost (*a*) of laying, (*b*) of maintaining, the cable, and (*c*) of the annual working expenses ?
4. What revenue will arise from the traffic which may be expected to pass over the cable ?
5. Should the cable be owned and worked by Government or by a subsidised private company ?
6. If the cable were to be a national property, what would be the proper method of management and administration ?
7. What should be the form of contract offered to a contractor for its construction.

It is desired that the report should embody the views of the Committee upon any subsidiary questions of a practical nature which may arise during the investigation.

Should the Report of the Committee, after it has been submitted to Her Majesty's Government, render such a course advisable, the Chancellor of the Exchequer and myself will be prepared to discuss with the representatives of the Dominion of Canada and of the Australasian Colonies the financial side of the question in its bearing upon the interests of the Governments concerned.

June 2, 1896.

J. CHAMBERLAIN.

FURTHER INSTRUMENT OF APPOINTMENT.

I APPOINT the Honorable A. G. Jones to be a member of the Pacific Cable Committee, in the place of the Honorable Sir Mackenzie Bowell, K.C.M.G., resigned.

November 10, 1896.

J. CHAMBERLAIN.

No. 3.

Report.

REPORT of the Committee appointed to consider the proposal for laying a Telegraph Cable between British North America and the Colonies of Australasia.

1. The Committee have the honor to report that, having been appointed by the Secretary of State for the Colonies on the 2nd of June last, they held their first meeting on the 5th of that month ; but that, owing to unavoidable delays, they were unable to begin the examination of witnesses till the 12th of November.

2. The Committee desire to express their obligations to Mr. Sandford Fleming, whose long labours on the subject of a Pacific cable have thrown much light upon the project and materially facilitated the task of the Committee, and to all the gentlemen who have been so good as to give evidence and whose answers range over the whole ground comprised in the reference to the Committee.

3. The Committee have carefully considered these answers and other materials bearing on the subject, which have been laid before them, and have the honour to report as follows upon the questions submitted to them.

4. The Committee consider that the most convenient course will be for them to deal with the points submitted to them in the same order as laid down in the instrument of appointment.

I. PRACTICABILITY.

5. No one disputes the practicability of the project from a technical point of view, although the depth, probably in places over 3,000 fathoms, is as great as that in which any cable has hitherto been laid. The Committee consider that a preliminary survey is indispensable, principally for the purpose of ascertaining, before the cable is laid, and of avoiding, while it is being laid, any serious inequalities in the bed of the ocean which might cause "suspension," and in course of time fractures, of the cable. Such a survey could, however, be made while the cable is being manufactured ; it could be made by the contractors under the supervision of an officer appointed for the purpose by the owners of the cable ; and the necessary provision for it, with all proper conditions, could be contained in the contract. The present information with regard to the route is sufficient for the purpose of estimating the expense of the cable, and it may be assumed that the further survey recommended would not lead to any material variation in the tenders.

6. Further, it will be necessary that a careful examination be made of the various islands to be presently mentioned, with a view to ascertaining the best spots available for landing stations.

II.

II. ROUTE.

7. The Committee recommend that the route should be from Vancouver, *viâ* Fanning or Palmyra Island, Fiji, and Norfolk Island, with branches from the lastnamed station to Queensland and New Zealand. No doubt there would be a decided advantage in taking the cable *viâ* the Hawaiian Islands, instead of *viâ* Fanning or Palmyra Island, as the section would in that case be shorter and therefore less costly for the same speed, or faster for the same cost, and some traffic would, if no line is laid from California, be obtained from Honolulu. But this route would involve a departure from the principle of using only British territory for landing-stations, and as this principle has been formally endorsed by the Canadian and Australasian Governments at the Conferences at Ottawa and Sydney the Committee consider that it should be adhered to, and that a departure from it would be a material change in the character of the scheme which was approved at those Conferences.

8. The length of the cable over the route recommended would be, allowing 10 per cent. for "slack" actually used, about 7,986 nautical miles, viz. :—

Vancouver to Fanning Island, 3,561, or a little less from Vancouver to Palmyra Island;
 Fanning Island to Fiji, 2,093, or a little less from Palmyra Island to Fiji;
 Fiji to Norfolk Island, 961;
 Norfolk Island to New Zealand, 537;
 Norfolk Island to Queensland, 834.

9. The Pacific cable as a means of communication between Australasia and Europe would be, of course, dependent on the land lines across America and on the trans-Atlantic cables; and it would be necessary for it to have some working arrangement with them. Such arrangements are universal in the case of submarine cable companies, which must obviously make terms with the land lines by which their traffic is received or forwarded. The only telegraph line which at present runs from the eastern seaboard to Vancouver is that of the Canadian Pacific Railway Company. This Company is in connection, at Canso in Nova Scotia, with the Commercial Cable Company, which possesses three cables from Great Britain to Canso; and the nature of the arrangement between them is shown in the telegraphic correspondence contained in the Appendix to this Report. The Commercial Cable Company is an American Company, but all the landing stations are on British territory. It is stated that the other trans-Atlantic cable companies, whether British or foreign, are in connection and alliance with the Western Union Telegraph Company, which is also an American Company.

10. The Western Union at present effects its junction with the Canadian Pacific Railway Company's telegraph lines at Montreal; but it is highly probable that were a Pacific cable laid from Vancouver to Australia it would (if it does not already possess such a connection) make its own connection with Vancouver through the United States territory as far as British Columbia.

11. The effect of this position of affairs is that the choice of routes would lie between an American cable company having its station, exclusively on British soil and in connection with a land system passing over British territory and controlled by a British company, and cable companies which, whether British or American, and which, whether possessing stations on British or American soil, are in connection with a land system controlled by an American company, and possibly passing through the greater part of its length over American territory.

III. COST.

12. The cost of laying the cable depends mainly on the materials used in it; and, as the quality of these can be tested, the question is practically one of quantity. The outer coverings are much the same in all specifications, according to the conditions of the case; but the conductor of copper and the insulator of gutta-percha vary in quantity in proportion to the speed of transmission required, and, therefore, the question of cost practically depends upon them—the heavier the cable in these respects the greater being the speed and the cost. With regard to all the sections, except the long one from Vancouver to Fanning Island, opinions as to the composition of the cable do not much vary, and as the speed of the whole line is limited, for through traffic, to that of the longest section, it will only be necessary to go into particulars with regard to that section.

13. On this branch of their inquiry, the Committee have taken a large amount of technical evidence from electrical experts. This evidence has been in some important respects conflicting, and the Committee have been obliged to form their own conclusions, weighing one authority against another.

14. The principal points which the Committee have had to consider are—

1. The weight per nautical mile of the core best suited for the purposes of the long section.
2. The theoretical speed of transmission obtainable from a given core over a given distance.
3. The deductions which have to be made from the theoretical speed of transmission to arrive at the actual practical speed in "paying" letters.
4. The number of hours per diem during which a cable can be worked for commercial purposes.

15. *The Core.*—The cores recommended to the Committee varied from 500 lb. copper and 320 lb. gutta-percha (Mr. Siemens) to 800 lb. copper and 550 lb. gutta-percha (Mr. Preece, of the General Post Office); but the Committee have decided to select for detailed consideration from between those limits, two types, which have been recommended from different points of view.

16. The first would contain 552 lb. copper and 368 lb. gutta-percha, and was that recommended to the India-rubber, Gutta-percha, and Telegraph Works Company by Lord Kelvin in November, 1895.

17. The Committee do not consider that it would be wise economy to lay down a cable of any lighter type than this. The speed of transmission would be reduced to too low a figure.

18. The second would contain 650 lb. copper and 400 lb. gutta-percha, and is that which was adopted for the cable laid by the Anglo-American Telegraph Company in 1894. There is a serious mechanical difficulty in handling cable of very heavy weight at great depths, and the Committee are of opinion that it would not be prudent in any case to lay a cable of a heavier core than this over the long section.

19. *Speed, Theoretical and Practical.*—It is, however, in connection with the speed obtainable from a given cable over a given distance that the opinions of the experts have differed most materially.

20. For instance, Dr. A. Muirhead gave it as his opinion that a cable of 552 lb. copper and 368 lb. gutta-percha over the long section would, with experienced operators and by the use of the automatic curb method of transmission, give a speed of 80 letters per minute; and, similarly, for a cable of 650 lb. copper and 400 lb. gutta-percha, 95 letters per minute.

21. Mr. Preece, on the other hand, stated that the same core as that last named, over the same distance and by the same process, would give a speed of not quite 63 letters per minute.

22. For the same cable Mr. M. H. Gray, Mr. Lucas, speaking for himself and for the late Admiral Sir George Richards, and the representatives of the Eastern Extension Telegraph Company, estimated a speed of 70 letters per minute.

23. On the other hand, Mr. Siemens estimated the same speed of 70 letters per minute for a cable of 500 lb. copper and 320 lb. gutta-percha; while, for a cable of 800 lb. copper and 550 lb. gutta-percha, Mr. Preece estimated a speed of 85 letters per minute.

24. Lord Kelvin wrote to the Committee that, in his opinion, they might reckon on getting 60 letters per minute, and that possibly they might get 80 letters per minute, out of a cable composed of a core of 552 lb. copper and 368 lb. gutta-percha over the long section.

In all cases the speed given was the theoretical speed for simplex working.

25. On the question of the deductions which have to be made to reduce the theoretical to the practical speed, the divergence of opinion was not less remarkable.

26. The explanation of this is to be found in the fact that much depends upon the system on which a line is worked. Thus, in the case of the trans-Atlantic lines, where the competition is very keen and the hours of business comparatively limited, and where the regulations of the International Telegraphic Convention do not apply, it has been found possible to reduce the non-paying traffic to about 16 per cent.

27. On the other hand, on the Eastern lines the proportion is much higher, because the reserve power of the lines is very great, and, therefore, there is more margin for non-paying traffic, the working hours are practically longer, and the regulations of the International Convention have to be followed. Mr. Preece estimated that a theoretical speed of nearly 63 letters per minute for the core of 650 lb. copper and 400 lb. gutta-percha would be reduced in practical working to 28 paying letters per minute. Mr. Lucas stated that a theoretical speed of 70 letters per minute for the same core was equivalent to four or five paying words a minute. Mr. Lamb, of the General Post Office, said that a deduction of 55 per cent. must be made from the theoretical to find the practical speed of a given cable. Mr. Ward, Manager of the Commercial Cable Company, calculated that a total allowance of 16 per cent. should be made for "dead" traffic; Mr. Carson, of the Anglo-American Telegraph Company, 15 per cent.; and Mr. Gray, of the India-rubber, Gutta-percha, and Telegraph Works Company, about 17 per cent. Mr. T. B. Finch, Director-in-Chief of the Indo-European Telegraph Department of the Government of India, and having charge of the telegraphs from Karachi up the Persian Gulf and through Persia, stated that the average number of service indications which have to be forwarded with a message of 12 paying words of a length of eight letters each would on the average be equivalent to 10 letters. Furthermore, he stated that the unavoidable use of the lines under his charge for administrative purposes would amount to less than 5 per cent. of the whole traffic. His estimate, therefore, of the total unavoidable "dead" traffic amounts to about 17 per cent.

By the theoretical speed of a cable the Committee understand the maximum number of words which can be transmitted in a minute, so that an experienced operator can certainly and easily read them. The practical speed is the proportion of that maximum number which remains after certain deductions have been made for the transmission of words for which no revenue is received and for loss of time.

28. The Committee ascertained that these deductions were made on account of—

1. Service indications and prefixes, such as station of origin, number of message, time, date, &c.
2. Repetitions, errors in transmission, corrections.
3. Necessary intervals between the messages, time lost by clerks, &c.
4. Administrative messages connected with the traffic.

There are, of course, other administrative messages which must necessarily be sent on the business of the line, but these could, in most cases, be left for periods when there was no traffic for transmission.

29. It must also be borne in mind, in considering this question, that though the speed of a cable is usually stated as being a certain number of words per minute, these words are "reputed" words of five letters each. In actual practice a word averages eight letters, the increase being due to the use of code words and to the omission of many conjunctions and prepositions when messages are sent "in clear."

30. The so-called "words," however, which have to be added to each message as service indications and prefixes do not consist generally of more than two or three letters each.

31. After weighing all the evidence carefully, the Committee are of opinion that a deduction of 33 per cent. from the theoretical speed is amply sufficient to give the practical speed, or the paying traffic.

32. This estimate is a cautious one.

33. There is no apparent reason why, with good management, the "dead" traffic on a Pacific cable should not be kept much nearer to the level which obtains on the Atlantic than to that which obtains on the Eastern lines. In addition, however, must be taken into consideration unavoidable losses of time in each working hour, and the fact that the use of code words (usually long ones) is increasing.

34. It has also been stated in evidence that possibly a Pacific cable would have to comply with the regulations of the International Telegraph Convention; but in the case of a line touching only British territory, this necessity may perhaps be avoided.

35. The estimate of 33 per cent. has been arrived at with the desire to include an allowance for every possible deduction from the earning power of the cable.

If the experience of the Atlantic Cable Companies can be relied on, the percentage would be considerably reduced.

36. *Number of Working Hours per Diem.*—In this matter, again, the expert evidence was somewhat conflicting, but the Committee consider that an estimate of eighteen hours per diem, during which the cable could be worked, would be a moderate one. A very small allowance for duplex working has been made in this calculation.

37. Duplex working is the system under which the same cable is made to transmit messages from both ends at the same time. It can be applied so as to add about 80 per cent. to the traffic sent by simplex working. But full advantage can only be taken of this system when the business hours are substantially the same at both ends of the cable. This, for instance, is the case between, say, London and Lisbon. As between London and New York, where the difference in point of time is about five hours, duplex is only regularly available for the few hours which may be considered part of the working day in both places; while as between this country and the east of Australia, where the difference is about ten hours, so that night here is almost synchronous with day there, duplex working would only be resorted to to a small extent.

38. The conclusion the Committee have arrived at is that the core of 552 lb. copper and 368 lb. gutta-percha might reasonably be expected to give 40 paying letters a minute.

39. The core of 650 lb. copper and 400 lb. gutta-percha similarly would give 48 paying letters per minute.

40. To get the carrying capacity of these cables in a year, the above numbers of letters should be multiplied by 60 (minutes to the hour); then by 18 (working hours per day); then by 300 (working days in a year). The totals on this basis would be:—

At 40 paying letters, or 5 paying words	1,620,000 words.
At 48 " " 6 " "	1,944,000 "

41. Thus the lowest of these totals considerably exceeds the whole of the Australasian traffic in any year except 1895.

42. *Cost of Laying.*—The India-rubber, Gutta-percha, and Telegraph Works Company has offered to lay the whole cable over the route recommended, with the first of the above-mentioned types for the long section, for the sum of £1,517,000, this sum, including the erection at each station of a suitable dwelling-house and operating room, with duplicate sets of all proper instruments; also the use of two cable-repairing ships, with the cost of maintaining them, as well as the cables themselves, for three years.

43. This estimate included an allowance for 10 per cent. slack.

44. This allowance of slack is, in the opinion of the Committee, a reasonable one for actual laying, but they are of opinion that another 10 per cent. should be manufactured, which would be properly chargeable to the repair and maintenance fund to be hereinafter mentioned.

45. The condition as to maintenance for three years was laid down by the Canadian Government in inviting tenders; but though there is some convenience in thus having maintenance guaranteed for the first three years, the Committee consider that such a period is unnecessarily long as a test of the original condition of the cable when laid, without being long enough to prove its durability while under water; and they would recommend that the contractors should be required to maintain the cable for six months. With this modification, the price would presumably be varied in approximately the following manner:—

	£
	1,517,000
Deduct cost of maintenance for three years; this was put at £40,000 a year for the two ships, and £30,000 a year for the cable used	210,000
	£1,307,000
Add for maintenance for six months at the same rate	35,000
Add for purchase of two repairing ships	80,000
	£1,422,000

or, in round numbers, and leaving a margin of £78,000 for miscellaneous expenses payable out of capital, £1,500,000.

46. It seems probable that another firm would offer similar terms.

47. As regards the probable cost of a cable of the second of the above types, the information laid before the Committee is to the following effect.

48. The Telegraph Construction and Maintenance Company estimated that the price for such a cable from Vancouver to New Zealand *via* Honolulu would be £1,870,000; this sum including the cost of five stations, estimated at £37,000. This distance (without slack) would be 6,352 nautical miles, and the longest span (Vancouver to Honolulu) 2,325. The route recommended is (without slack) 7,186, and the long section is about 3,200. The price of this type, therefore, on the basis of the above estimate, would considerably exceed £2,000,000.

49. The India-rubber, Gutta-percha, and Telegraph Works Company, stated, in reply to a question from the Canadian Government, that their price for a 15 word per minute cable would be £1,672,000, and for 18 words £1,880,000; but specifications for these cables have not been given.

50. The representatives of the Eastern Extension Telegraph Company estimated the cost of the cable, with a core of 650 lb. of copper and 400 lb. of gutta-percha between Vancouver and Fanning Island, allowing 15 per cent. or more for slack, and including the cost of erecting stations and supplying apparatus, at about £1,650,000. The Henley Telegraph Works Company tendered for a cable of this type, with completely equipped and furnished stations and cable huts, for £1,492,000.

51. Mr. Preece also estimated that a cable, of a heavier core over the section to Fanning Island (800 lb. copper and 550 lb. gutta-percha), would cost a little over £2,000,000. It seems therefore possible that a cable of the dimensions under consideration might be had for £1,800,000. It would not be prudent to put the whole capital required for such a cable at less.

52. *Working Expenses.*—The annual working expenses at the stations on the line may, the Committee consider, be put at £17,000, having due regard to their position and the cost of living.

53. For the central management £5,000 is allowed, making a total for annual working expenses of £22,000.

54. *Maintenance and Repairs.*—With regard to maintenance and repairs, it is, of course, impossible to forecast what interruptions would occur in any year, and what expenditure would be incurred in restoring communication. It may, however, be remarked that repairs of a cable are the substitution of new material for old; so that, in course of time, the whole of the cable might be replaced; and this circumstance affords some guide as to the annual sum which should be set apart, on the principal of providing, not merely for the cost of annual repairs in case of interruption, but for the entire replacement of the cable, so far as might be found necessary, within some definite period. Thus, the replacement of the cable would be completed in forty years by laying 200 miles of cable a year; and taking the cost of cable, in round figures, at £200 a mile, this process would, on that basis, be effected by devoting £40,000 a year to this purpose. It is not suggested that it would be necessary to replace every part of the cable in such a period, or that such a sum would be expended each year on repairs; but the fact that the sum named would not only meet current repairs, but would in forty years be equivalent to the replacement of the whole cable, indicates, in the opinion of the Committee, that it is as great a provision as need be made under this head. To it, however, should be added the fixed expenses of two repairing vessels, which may be put at £30,000, making £70,000 in all.

55. It should be added that the evidence clearly shows that the great depth of the Pacific will be a favourable factor in determining the life of the cable, while it will be an unfavourable influence on the facility and cost of the necessary repairs.

56. The provision suggested would therefore, it is estimated, in the shape partly of new cable and partly of unexpended balances, perpetually maintain the value of the cable as an asset.

57. *Total Annual Charge.*—To the expenses of working and maintaining the cable must be added the annual charge for interest, and provision for replacing the capital at the end of a certain period.

58. Having regard to the character of the work, the Committee think that a period of fifty years might reasonably be allowed for the latter purpose.

59. The rate of interest to be assumed must depend to a great extent on the conditions under which the capital is raised; and the Committee have therefore thought it better to append four estimates of the total annual charge which must be provided for, varying according to the type of cable selected and the rate of interest.

60. In each case the sinking fund is calculated to replace the capital in fifty years.

	With a capital of £1,500,000.		With a capital of £1,800,000.	
	Interest at 2½ per cent.	Interest at 2¼ per cent.	Interest at 2½ per cent.	Interest at 2¼ per cent.
Interest	£ 41,250	£ 37,500	£ 49,500	£ 45,000
Sinking Fund	14,311	15,387	17,173	18,464
Working Expenses	22,000	22,000	22,000	22,000
Maintenance	70,000	70,000	70,000	70,000
Total	147,561	144,887	158,673	155,464

61. The Agent-General for South Australia, under instructions from his Government, placed before the Committee the claim of that Government to be compensated for the loss which they will sustain by the diversion of traffic from the line of telegraph which they erected across the Continent of Australia, and over which a considerable proportion of the traffic now passes.

62. A somewhat similar claim may be put forward by the Eastern Extension Telegraph Company in the event of a cable being laid across the Pacific with Government assistance. No question of compensation has been referred to the Committee, and they therefore abstain from expressing any opinion upon the equity of any such claim.

63. The Government of India, whose position is in many respects similar to that of South Australia, have intimated that they do not propose to make any such claim.

IV. REVENUE.

64. The revenue depends on the amount of traffic obtained, and there are no certain data by which this can be calculated. The representatives of the Eastern Extension Telegraph Company, and Mr. Lamb, of the General Post Office, estimated that on the total traffic of 1895, the amount which would be diverted to the new cable would be 672,297 and 620,000 words respectively. Mr. Sandford Fleming, for the reasons given in his evidence, put it at one-half the existing traffic. The Committee having considered all the evidence bearing on the subject, and feeling that they must in such a matter be actuated by extreme caution, select 750,000 words (which are between a third and a half) as a basis of calculation for the

the year 1896. They further consider that the estimate may assume an annual increase of this traffic at a rate of 10 per cent. In 1875 the amount of the Australasian telegraphic traffic was 235,160 words; in 1885 this had risen to 537,355 words; and in 1895 to 1,860,423 words. Thus the estimated rate of increase is considerably below the ascertained average increase of recent years; but special caution is advisable in drawing an inference from this, as the increase has lately been out of proportion to the increase of business so far as shown by imports and exports, thus probably indicating a change of habit in transacting commercial business which must have some limit, and further, the rather special circumstances of the Western Australia gold discoveries must be taken into account. There are no materials for estimating the probable increase in the American-Australasian traffic, which is at present very small; but it is likely that with a Pacific cable it would substantially develop. A little local traffic in the Pacific may also be counted upon.

65. These circumstances appear to the Committee to show the moderation of their estimate; but they have not failed to bear in mind the fact that the Eastern Telegraph Companies possess an old-established business with wide connections, and that if any prolonged breakdown occurred on a Pacific cable great injury might, in the absence of a duplicate cable, be inflicted on its business. On the other hand, the Atlantic Cable Companies in England would be interested in collecting traffic for a Pacific cable.

66. The amount of the through rate would depend on the terms made with the trans-Atlantic Companies and the American land lines; but the Committee have been informed that a shilling rate could be obtained from Great Britain to Vancouver.

67. Taking, however, the existing rate to Australia of 4s. 9d. a word as a basis, and assuming that the existing rate of 1s. 6d. from London to Vancouver is maintained, a Pacific cable would be able to secure 3s. 3d. a word. On an estimated traffic of 750,000 words in 1896, this would amount to £121,875. If the tariff were reduced so as to admit of a Pacific cable retaining 2s. a word, the revenue would be £75,000; and at 1s. 6d. a word, £56,250. This calculation is based on the assumption that each word pays the full rate. No reduction is made for Government or press telegrams, because allowance for this consideration has been made by the Committee in arriving at the above estimate of the total traffic, and after reckoning that similar proportions of press and Government telegrams would be carried by a Pacific cable and at similarly reduced rates to those now transmitted by the Eastern route. According to the returns of the Eastern Extension Telegraph Company for 1895, the press words were about 10 per cent. of the whole, and the Government words about 2 per cent.

68. The Committee have only to add, with reference to the financial question, that the cable would be a competitive line, and would have to be managed accordingly. While they have felt themselves bound, as they have remarked, to show extreme caution in their estimates, they consider that the question of expenditure, and still more the question whether a business approximating more to the capacity of the cable could be obtained, would largely depend, as would similar questions in all industrial enterprises, on the energy and care shown by the management.

69. The evidence has clearly shown that the best management and the adoption of the most improved methods can get much more paying work out of a cable than inferior management and the use of older methods.

70. *Recommendation and Summary.*—In consideration of the traffic estimated for the cable, and of the opinion expressed below that a duplicate cable should be laid at the earliest possible moment, the Committee have arrived at the conclusion that a core over the long section from Vancouver to Fanning Island of 552 lb. copper and 368 lb. gutta-percha will be sufficient. On the assumption that this recommendation is adopted, and taking the total annual expenditure at £144,887, and the increase of business at 10 per cent. per annum on 750,000 words in 1896, a Pacific cable would, if it came into actual work on the 1st of January, 1900, earn £178,437 in its first year of working if the rate obtained by it per word were 3s. 3d., thus leaving a credit balance on the first year's working of £33,550. If the rate per word were reduced to 2s., in the year 1900 it would earn £109,897; in 1901, £120,788; in 1902, £132,867; and in 1903, £146,153. It would thus become a paying concern during the fourth year of working.

V. OWNERSHIP.

71. The Committee are of opinion that the cable should be owned and worked by the Governments interested.

72. In arriving at this conclusion, they do not underrate the importance of allowing all commercial undertakings to be carried out, whenever possible, by private enterprise unassisted by Government. But in the present case there seems to be no probability that private capital will be forthcoming for the purpose of laying a Pacific cable without a larger subsidy than the Governments interested in the project would be prepared to grant.

73. If Government assistance, in some form or other, is necessary, the Committee think that a scheme under which the cable would be constructed and owned by the Governments interested is much to be preferred to a private company working under a Government subsidy.

VI. MANAGEMENT.

74. The Committee are of opinion that the general direction should be in the hands of a manager in London, under the control of a small Board, on which the associated Governments would be represented. The manager would be in communication with the telegraph authorities of the respective Governments with regard to matters of local administration. The details could be arranged without difficulty by the Governments interested.

VII.

VII. CONTRACT.

75. The contract would in the main follow the ordinary forms, specimens of which are shown in the Appendix. Provision should be made for a preliminary survey under the supervision of an officer appointed by the Governments, and for the maintenance of the cable by the contractor for six months, as recommended above. The cable in shallow waters should be protected by brass taping against marine insects. The details of the specification would present no difficulty when the type for the long section has been fixed upon, as there is not much difference between the present modes of constructing submarine cables.

76. *Duplication.*—The Committee have only to add that it would in their opinion be necessary to lay a duplicate cable, and that, if a deviation from an all British route were permissible in the case of a duplicate cable, and if the circumstances of the time permitted of it, such a cable might advantageously follow a somewhat different route, *via* Honolulu. Most cables on important routes have been duplicated, but generally in the first they have been laid singly, and the duplication has followed when the success of the undertaking warranted a fresh outlay of capital.

77. There can be no doubt, however, that the duplication should be effected at the earliest convenient opportunity. Cables have usually been duplicated to protect and preserve their business in case of interruptions, even when there have been no competing lines ready to profit by their breakdowns. Duplication would be, therefore, the more necessary in the case of a new line, which would be laid in competition with an existing undertaking.

78. If a second cable were laid along the same route as the first, the annual expenditure entailed by it might be reckoned at £37,000 less than that of the first, as the additional working expenses would certainly not exceed £15,000, and there would be no additional standing charges for repairing ships. If a second cable were laid *via* Honolulu, not only would there be the above-mentioned reduction in annual expenditure of £37,000, but also a very material reduction in the charges for interest and sinking fund, as the capital required would be less.

79. In the event, therefore, of a second cable being laid along the route recommended for the first, and on the assumption that the tariff were reduced to 2s. a word, and that such a reduction brought no increase of business beyond the 10 per cent. per annum already estimated, the total annual receipts from the two cables would exceed the total annual expenditure upon them in the tenth year from the commencement of the work of the first cable in 1900. If a second cable were laid along the cheaper route, or if the tariff were not reduced to 2s. a word, or if the annual increase of business exceeded 10 per cent., the period during which the total annual expenditure exceeded the total annual receipts would be proportionately shortened.

80. Moreover, the financial position of the cables would be a very strong one.

81. The custom of the owners of cables is to put by such a sum of money every year as will enable their cables to be kept in continual repair, and the old cable entirely replaced by a new cable within a certain number of years. This they consider to be a sufficient provision for the replacement of their capital. The Committee have, however, suggested that in the case of a Pacific cable there should be what practically amounts to a double replacement of capital. They have recommended that a sufficient sum should be set aside for annual maintenance to ensure the complete renewal of the cable within forty years, so that at the end of that time the associated Governments should either be in possession of a new cable or, if the old cable had not been wholly renewed, of a reserve fund sufficient to replace such part of the original cable as still existed. And, further, they have provided for the complete extinction of the original loan at the end of fifty years. These facts must be borne in mind in considering the financial prospects of the cable.

82. The Committee cannot conclude this Report without expressing their strong sense of the value of the services rendered to them by their Secretary, Mr. W. H. Mercer. It has been mainly owing to his exertions that they have been enabled to carry through their work evenly and promptly since their regular sittings first commenced.

W. H. MERCER,
Secretary.
Colonial Office, 5 January, 1897.

[NOTE.—*Voluminous evidence, &c., omitted, the main features of which are indicated in the above Report.*]

Statement by Mr. Sandford Fleming.

THE following statement was prepared by request with the view of submitting it to the Pacific Cable Conference when it met in London on 8th July, 1896. As the Committee adjourned until 26th October, 1896, the Canadian Representatives transmitted the statement to the chairman, the Right Honorable the Earl of Selborne, Under Secretary of State for the Colonies:—

BEFORE expressing my views generally on the Pacific Cable, I am asked to relate to the Committee the circumstances which led to the proposal to span the Pacific Ocean by telegraph. I comply with the request with some hesitation, as I am obliged to allude to my personal connection with the matter. In referring to this part of the subject I shall confine my remarks to a very few brief sentences.

The projected submarine electric cable across the Pacific from the western seaboard of Canada has been before the public for many years. The proposal to extend a telegraph to Asia and Australia naturally followed the establishment of a trans-continental telegraph through the Dominion. So far back as 1863 the overland telegraph was projected in conjunction with the trans-continental railway. In that year the explorations for the eastern section of the railway between Halifax and Quebec were undertaken by the Imperial and Provincial Governments, and in 1871 the surveys westerly to the Pacific Ocean were commenced by the Government of the New Dominion. A few years after these dates the construction of the telegraph was proceeded with on each respective section. The Hon. Alexander Mackenzie, Premier and Minister of Public Works, was one of the first to take an active interest in the matter. Under his administration the policy was adopted of extending the telegraph from the waters of the St. Lawrence to the Pacific coast; and in 1874 the Government entered into contracts for constructing telegraph in advance of the railway over nearly 2,000 miles of territory.

Occupying

Occupying the position of Engineer-in-chief of the whole line of railway from Halifax on the Atlantic to Vancouver on the Pacific, the establishment of the overland telegraph came under my official charge, and in connection with my duties my attention was directed to the extension of the electric wire across the Pacific. It became plain to me that the national line of communication on which Canada was then expending so much would be incomplete without a connection with the telegraph systems of the countries beyond the Pacific Ocean, and it became equally clear that the spanning of the Pacific by an electric cable would prove of the highest importance to the whole Empire.

In the year 1879 I was called upon to visit London on public business with the then Premier, Sir John Macdonald. I had prepared a telegraph map of the world, with the projected line across the Pacific and its various eastern and western connexions laid down thereon. I pointed out that by spanning the Pacific it would be possible to open up a new means of communication, to be employed for purposes of general commerce at much lower rates than by existing channels; that it would at once complete the electric girdle of the globe, and bring Great Britain, Canada, India, Australia, New Zealand, and South Africa into unbroken telegraphic touch of each other, entirely independent of the lines which pass through foreign European countries. Sir John Macdonald submitted the map and explained the proposal to Lord Beaconsfield, and I was led to understand that both Premiers were very favourably impressed with the project, and regarded it to be of great Imperial importance. I am fully warranted in saying that the Canadian Premier so regarded it until his death in 1892. Public attention was for the first time directed to a British Pacific cable in my report as Engineer-in-chief of the Canadian Pacific Railway, which was laid before Parliament in 1880. In this report the map referred to is reproduced on a reduced scale.

Much correspondence followed, to which it is not necessary to allude. I will only remark that the route first projected was a northern one; this was owing to the absence of information respecting the Southern Pacific Ocean, and the impression which prevailed that physical difficulties existed which offered insuperable obstacles to the laying of a cable on a direct route between Canada and Australasia. In consequence of this impression it was designed to lay the cable from Vancouver to Japan, touching at islands in the Aleutian and Kurile groups as mid-ocean stations. From Japan the connexion with Australasia would be obtained by means of the telegraph to Singapore and the Eastern Extension Company's lines of telegraph.

Through the intervention of the Home Government, negotiations were opened with the view of securing one of the Kurile islands. Japan was asked to transfer to the British Crown one of these islands in order that the telegraph station should be under British protection. The cession of an island was not obtained, but permission to land at any suitable point in Yesso was granted, the landing to remain in charge of and under the protection of Japan. (*See* letter, December 14th, 1880, from Sir Harry Parkes, and December 23rd, from Sir A. T. Galt.)

An agent was sent to Washington who, after some difficulty, obtained conditional landing privileges on one of the Aleutian islands.

On March 1st, 1881, the Government of Canada introduced certain resolutions in Parliament with the view of promoting the establishment of the cable. After discussion the resolutions were withdrawn, and an Act passed incorporating a company to lay the cable. This company proved abortive, and when its charter expired, further information having meanwhile been obtained respecting the Southern Pacific, it was represented to the Canadian Government that the physical features of the Southern Ocean would admit of a cable being laid on a direct route from Canada to Australia, and that the long detour by the Aleutian Islands and Japan could be avoided. (*See* my letter of October 20th, 1885.)

Correspondence followed, and on June 8th, 1886, an Order in Council was passed by the Canadian Government recommending that means be taken to obtain an expression of opinion on the projected direct cable to Australia from the several Governments concerned, and to ascertain what amount of assistance each would be prepared to give, and that for this purpose a Conference of agents of the Colonies be invited to discuss the subject. The co-operation of Her Majesty's Imperial Government was likewise sought.

On November 25th, 1886, the Home Government summoned a Conference to meet in London the following year, to which the principal Colonial Governments were invited to send representatives. One of the questions to be specially considered was the development of telegraphic communications of utility to the Empire.

At the Colonial Conference, held in 1887, the Pacific cable was specially considered, and resolutions were passed in respect thereto strongly favouring its establishment. The published proceedings of the Conference give the discussions at length.

Since the Conference of 1887 repeated efforts have been made to induce the Admiralty to make a complete survey of the bed of the ocean on the most direct route for the cable. A statement respecting the nautical survey appears in the report of the Canadian Minister of Trade and Commerce on his mission to Australia in 1893 (pages 106 to 122).

In 1888 the Canadian Government invited the Governments of Australia and New Zealand to send delegates to Canada to consider the question of telegraphic connexion and trade relations. Correspondence resulted, when it was finally agreed that delegates should be sent from Canada to Australia. In 1889 the Hon. J. J. C. Abbott (afterwards Sir John Abbott, Premier of Canada) with several other gentlemen were appointed to proceed on this mission, but the proposed federation of the Australian Colonies, then actively discussed, had the effect of postponing the visit. It was felt that the time was inopportune, and that it would be advisable to wait until the Colonies would be united politically.

Early in 1893 a Postal and Telegraph Conference was held at Wellington, New Zealand, at which all the Australasian Colonies were represented, and resolutions were passed urging the establishment of a Pacific cable.

In September, 1893, the Canadian Minister of Trade and Commerce (the Hon. Mackenzie Bowell) was sent as a delegate to Australia to confer with the several Governments on the subject of the Pacific cable and the development of trade. A full account of this delegation will be found in the report on the mission to Australia (*see* pages 66 to 106).

As an outcome of the delegation to Australia, a Conference was held in Ottawa the following year (1894). At this Conference the Imperial Government, the Canadian, the South African, and all the Australasian Governments were represented.

The published proceedings of the Conference held in Ottawa in 1894 furnish a full account of the discussions. The following resolutions were passed in respect to the establishment of the Pacific cable:—

1. *Resolved*—That, in the opinion of this Conference, immediate steps should be taken to provide telegraphic communication by cable, free from foreign control, between the Dominion of Canada and Australasia.
2. *Resolved*—That the Imperial Government be respectfully requested to undertake at the earliest possible moment, and to prosecute with all possible speed, a thorough survey of the proposed cable route between Canada and Australia; the expense to be borne in equal proportions by Great Britain, Canada, and Australian Colonies.
3. *Resolved*—That it is for the interest of the Empire that, in case of the construction of a cable between Canada and Australasia, such cable should be extended from Australasia to the Cape of Good Hope, and for that purpose arrangements should be made between the Imperial and South African Governments for a survey of the latter route.
4. *Resolved*—That, in view of the desirability of having a choice of routes for a cable connexion between Canada and Australasia, the Home Government be requested to take immediate steps to secure neutral landing ground on some one of the Hawaiian Islands, in order that the cable may remain permanently under British control.
5. *Resolved*—That the Canadian Government be requested, after the rising of this Conference, to make all necessary inquiries, and generally to take such steps as may be expedient in order to ascertain the cost of the proposed Pacific cable, and promote the establishment of the undertaking in accordance with the views expressed in this Conference.

Acting under the instructions of the Conference of 1894, the Canadian Government invited cable-manufacturing contractors and others to state the terms upon which they would be prepared to lay and maintain in efficient condition a submarine electric cable across the Pacific from Canada to the Australasian Colonies. Proposals were invited in three different forms.

I herewith submit, for the information of the Committee, the detailed general conditions under which proposals were invited (*see* Appendix A); likewise the tenders subsequently received by the Canadian Government; likewise my report on the tenders, dated November 20th, 1894, made at the request of the Minister of Trade and Commerce (*see* Appendix B).

Soon after the tenders were received I prepared a memorandum giving my views respecting the establishment of the cable. As these views are strengthened and confirmed by subsequent events, I beg leave to submit this memorandum to the Committee as part of the present statement.

MEMORANDUM,

MEMORANDUM.

Ottawa, December 1st, 1894.

The information obtained since the meeting of the Colonial Conference in July last is of a character to call for special notice.

The Conference, by the 5th resolution, relating to the Pacific cable, requested the Canadian Government to take the necessary steps to urge forward the undertaking in accordance with the views expressed by the delegates and the resolutions passed by them.

On September 10th a Special Commission was appointed by the Canadian Government to proceed to Honolulu to enter into negotiations with the Hawaiian Government for the possession of a neutral landing ground for the cable, should it be deemed expedient or desirable to touch at Honolulu or at some other island in the Hawaiian Group.

The object was to obtain a choice of routes. While it was the decided feeling of the Conference that the cable should only touch islands on the route in the possession of Great Britain, there were technical as well as commercial reasons for obtaining the use of an island within the Hawaiian archipelago.

The report on the mission submitted for the information of His Excellency the Governor-General, November 15th, points out that while there is a fair prospect of obtaining the use of an island on conditions generally acceptable, the result of the mission remains undetermined, as it awaits the action of the United States Government, owing to a treaty engagement between the two countries.

Consequently, as the matter at present stands, there is no alternative line which can be chosen. The route known as No. 1, touching at Fanning Island, is the only route open for adoption. The question of carrying the cable by way of Honolulu or some one of the Hawaiian Islands rests with the Hawaiian Government and the Government of the United States. As soon as the Hawaiian Government feels at liberty to enter into an agreement, such as that suggested during the recent mission, which would secure to them the advantages of telegraphic connexion with the markets of the world, it will probably be heard from. Any offer it may make may be considered on its merits before contracts for laying the cable be entered into.

TENDERS.

On August 6th an advertisement appeared in the London newspapers asking for tenders. Cable-manufacturing contractors and others were invited by the Canadian Government to state the terms upon which they would be prepared to lay and maintain in efficient condition a submarine electric cable across the Pacific from Canada to Australasia.

Tenders have been received from some of the best and oldest firms; they establish four important desiderata:—

1. They set at rest all questions respecting the practicability of the project.
2. They establish indisputably that Great Britain can obtain direct telegraphic communication with the British Colonies of the Southern Hemisphere, without having resort to any soil not British territory.
3. They clearly prove that there is no requirement for delay in order to make elaborate preliminary surveys, offers having been received from cable manufacturers of the widest experience, who, with the information and data possessed, are prepared to lay the cable and guarantee its success.
4. The tenders give definite information as to the cost of the undertaking; moreover, they furnish proof that the outlay of capital required is less than the amount which has been estimated.

The definite data thus obtained overcome all obstacles which were supposed to stand in the way of the first resolution passed by the Conference, viz., that "immediate steps should be taken to provide telegraphic communication by cable, free from foreign control, between the Dominion of Canada and Australasia." The Governments concerned are now placed in possession of information essential to the consideration of the best means necessary to the consummation of the project.

As there might be some divergence of opinion as to the best means to be taken to carry out the undertaking, the Canadian Government, in asking for proposals, intimated that offers would be received in three different forms, viz.:—

Form A.—The cable to be owned and controlled by Government, to be worked under Government authority, and to be kept in repair by the contractor for three years.

Form B.—The cable to be owned, maintained, and worked by a company under a fixed subsidy for a term of years.

Form C.—The cable to be owned, maintained, and worked by a company under a Government guarantee of traffic for a term of years.

The only actual offers received are according to Form A. That no offers were received according to Forms B and C may be due to the fact that it was felt desirable to predetermine the maximum charges, so as to preclude a subsidised or traffic-guaranteed Pacific Cable Company amalgamating or combining with the existing company to the disadvantage of the public.

It was stipulated that under Forms B and C the maximum rates to be charged on messages to and from Great Britain and the Australasian Colonies shall be 3s. per word for ordinary telegrams, 2s. per word for Government telegrams, and 1s. 6d. for press telegrams. Trans-Pacific messages to be charged at proportionate rates. These are the rates agreed upon at the Postal and Telegraph Conference held in New Zealand in March last.

My opinion as to the best means of establishing the Pacific cable has been long given, and as early as the Colonial Conference of 1887. I submitted my views again at the recent Colonial Conference, and on occasions before and since that date I have explained the principles which, in my humble judgment, in view of the public interest, should be followed.

I do not think it necessary to repeat the arguments I have frequently used in favour of establishing the Pacific cable as a public undertaking, so that it may remain under Government ownership and control. I beg leave to refer to my remarks which the Minister of Trade and Commerce submitted in a memorandum, dated October 11th, 1893, to the Australasian Governments, likewise to what I said at the Colonial Conference in June last (extracts are appended). On both occasions I pointed out that it would be unwise to subsidise a company, when the object could be attained more economically, and far more advantageously to the public, by other means. It has since been suggested as an alternative to a subsidised company (Form B) to establish a company under a Government traffic guarantee (Form C). That is to say, the company to be guaranteed a gross revenue from traffic for a term of years; the deficiency between actual earnings and the guaranteed earnings to be made good by the Governments each year. To my mind this plan is scarcely less objectionable than the first mentioned. Let us, by way of illustration, assume that a company is formed under a Government guarantee of gross traffic equal to £200,000 per annum for a period of twenty-five years. What in this case would prevent the existing company and the new company entering into a secret pooling agreement by which it would be the policy of both to pass over the old line the great mass of the traffic, the object being to establish against the Governments each year of the twenty-five as large a claim as possible under the guarantee? I do not see that it would be possible to prevent the two companies amalgamating their interests in this or in some other way, and as a consequence a powerful monopoly would be built up to exact its own terms. Looking at the subject in all its bearings, the true plan, in my judgment, is to make the Pacific cable a public undertaking from its first construction. I am satisfied the more the subject is considered, it must become clear that only by the observance of the principle of State ownership will the greatest public advantage be permanently obtained. If, in establishing the Pacific cable as a public undertaking, the co-operation of the Mother Country with Canada and the Australasian Colonies be secured, the most advantageous consequences will undoubtedly proceed from this arrangement. The first effect of co-operation would be in connection with the initial cost of the work, as a joint guarantee would admit of the required capital being raised at the lowest possible rate of interest. I have only to point to the Intercolonial Railway of Canada as an illustration of the advantages attainable. In 1867 it was arranged between the Home Government and the Canadian Government to connect Quebec and Halifax by railway; for this purpose a loan of £3,000,000, bearing the Imperial guarantee, was effected at a low rate of interest, and by this means the Home Government rendered substantial aid in the construction of the National Railway of Canada without in any way drawing on the Imperial Exchequer. It can be clearly established that by the same principle of co-operation in the case of the Pacific cable undertaking, to which so much importance has been attached as a means of bringing in closer affinity the distant portions of the Empire with the Mother Country, it can be successfully effected without in any way taxing the people of Great Britain, of Canada, or the Australasian Colonies.

Assuming that the principle of co-operation and State ownership be assented to, the capital may be raised by one of three modes, viz.:—

1. The whole amount may be raised by the Canadian, the Australian, and New Zealand Governments, and the interest in each case guaranteed by the Imperial Government; the relative liability to be borne by the Imperial, Canadian, and Australasian Governments, to be apportioned by mutual agreement.

2. The whole capital may be raised by the Imperial Government; the payment of a sum equal to the interest on such portion of the capital as may be agreed upon, to be guaranteed by Canada and the Australasian Colonies, in proportion to be determined.
3. The capital may be raised on securities issued through the medium of an Imperial Colonial Cable Commission; a joint guarantee for the payment of interest to be given by the Imperial, the Canadian, and the Australasian Governments.

It is obvious that by either of these modes the whole of the capital may be obtained at the very lowest rate of interest. The interest would be a first charge against revenue, which it can be shown will be ample for all purposes, but as it is expedient to provide for every contingency, provision should be made for a deficit. The proportions in which any such possible deficit would be made up by each respective Government would be a matter to be determined by agreement.

As several distinct Governments will be concerned in the project, it may be advisable, in order to meet the difficulty of joint ownership, to create an organisation in which the administration would be centralised; an Imperial Colonial Cable Commission or trust, established by the authority of the several Parliaments. It might consist of three persons, representing the Imperial, the Canadian, and the Australasian Governments respectively, with authority determined by statutes, to obtain capital and to assume responsibility for establishing the work and carrying it on when completed.

Among the tenders received is an offer from an old-established and reliable firm to lay the cable on route No. 1, the all-British route by Fanning Island, for the sum of £1,517,000. This price includes maintenance and repairs for three years after the whole line shall have been completed and put in operation; consequently there would be no disbursements for these services during this period to be met by the earnings of the telegraph. The cost of working, and interest on capital, would be the only charges against revenue during the first three years after the cable shall have been laid.

The cost of working has been estimated by Mr. Alex. Siemens at £24,000 for the operating staff and office expenses at each station. If we add to this 25 per cent. for management, the whole cost of operating would be £30,000 per annum.

The interest charges on the capital expended will depend upon the value the securities may obtain in the money market. These securities, bearing the guarantee of the Imperial, Canadian, and Australasian Governments, would certainly be rated in no way inferior to consols. Admitting this view, the rate of interest may be estimated at 2½ per cent.

Should the most costly of the several routes which have been spoken of be adopted—that is to say, the route by Fanning Island, with branches to New Zealand as well as Australia—I am unable to see with this tender before us, offering to complete it in every respect for £1,517,000, that the capital to be raised need exceed £1,600,000. This capital raised at 2½ per cent. gives £40,000 as the total interest to be met yearly. As it is advisable in forming an estimate of this kind to make full and complete provision for unforeseen contingencies of whatever kind, 10 or 12 per cent. may be added. In this view, £45,000 may be considered the maximum interest charge, to which, if we add £30,000 for working expenses, we have the sum of £75,000 as the total fixed charges to be met by revenue in each of the three years after the cable shall have been opened for business.

REVENUE.

The next question which demands an answer is: What constitutes a fair estimate of revenue?

The subject of revenue has been diligently considered in all its bearings, and I have endeavoured to arrive at fair and reasonable estimates; these estimates have been based on carefully collated information respecting the existing telegraph business, which has been steadily and rapidly growing for nearly twenty years. I have submitted the views formed to men of experienced judgment in such matters, and of perfectly unbiased minds. It is with confidence, therefore, that I refer to these estimates, supported, as they are, by the opinions of gentlemen in high official stations, whose sense of responsibility necessitates the utmost care and caution in arriving at conclusions. Along with my own views on the subject of revenue I have much satisfaction in appending letters referring thereto from the following gentlemen:—

1. Mr. Geo. Johnson, Statistician to the Dominion Government, Ottawa.
2. Mr. J. M. Courtney, Deputy Finance Minister, Ottawa.
3. Mr. W. Hepworth Mercer, Colonial Office, London.

The Dominion Statistician, after an examination of the official returns, gives precise information respecting the volume of telegraph business between Australasia and Europe; he likewise presents evidence of its rapid growth, of which the following is an indication:—

1875, total words transmitted	235,160
1875 to 1880, increase in words transmitted	118,188
1880 to 1885 do do	184,007
1885 to 1890 do do	289,923
1890 to 1893 do do	574,015
1893, total number of words transmitted	1,401,293

This officer confirms my statements as to the volume of business, and more than bears out my estimate of the share of traffic which must become tributary to the Pacific cable.

It will be seen from the letters of the other gentlemen, that, after a careful examination of the data, they fully substantiate, as far as it is possible to do so, the estimates of probable revenue.

In my letter on this subject, addressed to the Honorable the Minister of Trade and Commerce, of the 20th July, 1894, I have set forth in detail the reasoning which justifies the view I take with respect to the business to be done by the Pacific cable, and I venture to think that the estimates submitted will be considerably within the actual revenue when it comes to be ascertained. According to these estimates the gross earnings in 1898, the first full year that the cable could be in operation, reckoned at the low tariff of 2s. per word, would amount to £110,000; for the year 1899, £126,500; and for the year 1900, £143,000. If from these estimated yearly earnings we deduct in each case the fixed charges for interest and working expenses of £75,000, we would have a surplus in 1898 of £35,000; in 1899 of £51,500; in 1900 of £68,000; showing a total surplus of £154,500 for the first three years the telegraph would be in operation. During the whole of this period the cable would be maintained by the contractor, and any expense incurred in effecting repairs would form part of the contract sum to be paid to him.

After the third year the cost of maintaining the cable would be a charge against surplus earnings, which I shall show would be ample for the purpose, and would, moreover, leave a considerable balance each year to be carried to a reserve fund.

The following table covers the remaining seven of the first ten years after the opening of the telegraph for traffic, and is computed on the principles set forth in the appended papers. The cost of repairs and maintenance, usually estimated at £6 per mile, would amount to £43,000 per annum; for this service I have allowed £50,000, which, added to interest and working expenses, increases the charge against revenue to £125,000 per annum.

	Gross Earnings.	Charges.	Surplus.
	£	£	£
Surplus for the three first years			154,000
1901	159,500	125,000	34,500
1902	176,000	125,000	51,000
1903	192,500	125,000	67,500
1904	209,000	125,000	84,000
1905	225,500	125,500	100,500
1906	242,000	125,000	117,000
1907	258,500	125,000	133,500
Total surplus in ten years			742,000

The estimate shows an increasing surplus year by year which is fully warranted by the data. That a surplus is a probable contingency is due mainly to the assumed low interest on capital; and the low rate of interest, so important a factor in the calculations, presupposes the identification of the Imperial Government with the Governments of Canada and the Australian Colonies in this Imperial-Colonial project. It is scarcely necessary to add that although there is no probability of loss, or insufficiency of revenue to meet all charges, it is indispensable that the precise responsibility attached to the several Governments which co-jointly undertake the work should be clearly defined. I do not take upon myself to suggest the proportion of liability each may bear, as this must be a matter for diplomatic arrangement hereafter.

It has been my object to show by the facts I have presented and the figures I have produced that a mutual effort on the part of Great Britain and the two great divisions of the Colonial Empire can establish the Pacific cable with ease, and practically without cost to the taxpayer in either country.

That the estimates I have presented will be borne out by actual results I feel perfectly satisfied. I have based them chiefly on the business which already exists between Australasia and England, and which is, year by year, increasing with a very rapid growth. I have taken little or no account of the traffic which undoubtedly will spring up across the Pacific when the means of telegraphing at low rates is provided—a new traffic, the whole of which will be tributary to the new line. I am satisfied that my estimates are reasonable and reliable; it has certainly been my aim to submit them in a form which time will substantiate and confirm. The first effect of the Pacific cable will be to confer a benefit on the merchants of Great Britain and Australasia, and, indeed, on the whole of that section of the community in both countries who resort to the use of the telegraph. This is obvious from the mere reduction in rates alone. The reduction from 4s. 9d. to 3s. per word will, within the first year after the Pacific cable shall be open, effect a gross saving in Australasia and the mother country of £190,000. This saving will be repeated annually, and will continually be augmented by the growth of business.

Canada may look for gains of another kind and in another way. As Miss Flora Shaw has recently so well pointed out, Canada “commands the commercial highroad of two hemispheres,” and, perceiving the value of the position, has taken means to secure its possession. But commerce can nowhere be developed without the ordinary facilities, and the telegraph is in this age the indispensable adjunct, and in some notable instances the actual pioneer, of commerce.

The mere laying of an electric cable between two opposite shores of an ocean has in our time become a comparatively commonplace affair; but to connect Canada with Australasia and New Zealand by telegraph has more than ordinary significance. The contemplated telegraph would greatly strengthen the commercial position of the lands connected by it, and would constitute a common bond between sister colonies now widely separated. In completing the “electric girdle” of the Empire the effect of the Trans-Pacific cable would be far-reaching, and its influence would be incalculable. Not the least valuable consequence of the proposal submitted would be its high moral and political import. The co-operation of Great Britain, Canada, and Australasia in establishing this telegraphic connection would present itself to the world as an ideal “co-partnership” unparalleled in history, and it would furnish a striking development of Britannic unity, perhaps foreshadowing still more important developments in coming years.

SANDFORD FLEMING.

The questions which the Committee are requested to consider and report their views upon are as follows:—

1. Is the laying of a cable between Canada and the Colonies of Australia practicable from a technical point of view?
2. If so, what route should be selected for the cable?
3. What will be the cost (a) of laying, (b) of maintaining the cable, (c) of the annual working expenses?
4. What revenue will arise from the traffic which may be expected to pass over the cable?
5. Should the cable be owned and worked by Government or by a subsidised private company?
6. If the cable were to be national property, what would be the proper method of management and administration?
7. What should be the form of contract offered to a contractor for its construction?

I beg leave respectfully to submit the following remarks, having reference to the first four questions. I have already expressed my views on question No. 5 decidedly in favour of Government ownership. I do not presume to offer any opinion on the financial question or the method of administration.

1. Doubts have been raised as to the possibility of passing messages through the section between Vancouver and Fanning Island on account of its unprecedented length, the distance being 3,240 miles, to which, if sufficient allowance for slack be added, the length of cable required will be about 3,600 miles, a length considerably exceeding that of any cable yet laid. Through the courtesy of Mr. Frederick Ward, manager in England of the Commercial Cable Company, I have had the question tested practically within the past few days. At my request Mr. Ward caused experiments to be tried through two of the main cables of his company. They were looped at Canso (Nova Scotia), so as to form a continuous cable-line from Waterville (Ireland) to Canso and back. The experiments were perfectly successful. Messages were passed through the whole length of cable, measuring 4,733 nautical miles, fully 1,100 miles greater than the Vancouver-Fanning cable. The result of this trial proves conclusively that there will be no difficulty in connection with the Pacific cable which cannot be overcome. The best possible evidence that the Pacific cable is practicable from a technical point of view is the fact that several of the most eminent cable manufacturing contractors in the world have offered to furnish the cable, of a given capacity for conveying messages, to lay it on the bed of the ocean, and maintain it in efficient working condition for three years for a specific sum.
2. There is only one route open for adoption, viz., that known as the Fanning Island route. There is no immediate prospect of any other route being available.
3. The lowest tender for manufacturing and laying the cable on the Fanning Island route, and maintaining it in perfect working condition for three years, is that of the India-rubber, Gutta-percha, and Telegraph Works Company. This firm asks £1,517,000 for a twelve-word per minute cable, £1,672,000 for a fifteen-word per minute cable, and £1,880,000 for an eighteen-word per minute cable, maintenance for three years being included in each case (see Appendix B).
4. The revenue to arise from the traffic which may be expected to pass over the cable would, I firmly believe, exceed the estimates submitted by me. I have estimated there will be a surplus of £742,000 in the first ten years over and above interest on capital, working expenses, repairs, and maintenance. The surplus would augment year by year in an increasing ratio, and would be placed in reserve for renewals at some remote period, or would otherwise be dealt with as the Governments may determine.

I have the greatest confidence in the estimates submitted by me, because I believe them to be based on correct data and calculated on sound principles. I have certainly striven to make them moderate, reasonable, and reliable. That the estimates are all that I claim for them, I beg leave to point out that they have been so far confirmed in a most striking manner.

First, with respect to cost. In my letter written at Sydney, New South Wales, October 11th, 1893, and transmitted for the information of each of the Australasian Governments (see Mission to Australia, page 69), I placed the cost of the Fanning Island route at £1,978,000. Tenders for laying the cable on that route were received at Ottawa in November, 1894, and the highest prices in the tender I have mentioned range from £1,517,000 to £1,880,000, and those prices include the cost of maintaining the cable for three years.

Second, with respect to traffic. In the same letter of October 11th, 1893, I estimated that the total number of words which may be expected to be telegraphed between Australasia and Europe would be, in 1894 and 1895, 1,275,191 and 1,453,716 respectively (see page 71). Through the courtesy of the Postmaster-General of New South Wales I have been placed in possession of the actual number of words transmitted in each of these years, viz., 1,323,241 in 1894, and 1,948,369 in 1895. These authentic returns establish conclusively that the actual business done has exceeded my estimate; that there has been an excess of traffic equal to 4 per cent. in 1894, and no less than 34 per cent. in 1895.

With respect to the proportion of the traffic which would fall to the share of the Pacific cable, I beg leave to submit a letter addressed to the Minister of Trade and Commerce, Ottawa, eighteen months ago, and I ask that it may be held as part of the statement which I now make.

“Dear Sir,

“Ottawa, December 28, 1894.

“Referring to our conversation this morning on the subject of the Pacific cable, and more especially on the question of probable revenue,

“The point which you rightly considered of importance relates to the sources of revenue, and you asked upon what grounds I assumed in my estimates that the Pacific cable would obtain one half the telegraph business between Australasia and Europe? You suggested as a possibility, from the fact that the existing lines of telegraph had been long established,

that

that there would be business relations between the Eastern Extension Telegraph Company and the owners of the Australasian land lines—perhaps an understanding or agreement of such a character as would give the existing cable company exclusive control of European traffic collected throughout the Colonies.

“In answer to this I have only to say that the land telegraphs in each one of the seven Australasian Colonies are owned and operated by the Governments under the Departments of Posts and Telegraphs. There cannot be any agreement of the kind referred to at present existing, and there is no probability of one being entered into. On the contrary, if the Pacific cable be established as proposed, through the co-operation of the Australasian Governments with Canada and Great Britain, the Colonies would have a direct interest in the success of the new line, and every telegraph and post office throughout Australia and New Zealand would practically become offices or agencies of the Pacific cable. It is easy to be seen, therefore, that there would be a tendency to send European telegraph traffic collected at these offices (unless specially directed otherwise) by way of the Pacific cable in preference to the old route. There can be no doubt whatever that with the Pacific cable established as proposed on the principle of State ownership, the several Governments at the sources of traffic would have it in their power to direct telegraph business over the new line as they may desire. It does not follow that the power in the hands of the Governments would be unduly exercised to the injury of the Eastern Extension Company. No doubt a division of the traffic would for a time diminish the profits of that company, but the establishment of the new route would stimulate telegraphy above its normal growth, and in a very few years the volume of business would be doubled, so that an equal division would restore to that company as much business as it now controls.

“For these reasons, and the additional reason that the Pacific cable will unquestionably command all the telegraph traffic between North America and Australasia, I feel more than warranted in basing the estimates of revenue on half the European-Australian traffic. I feel quite satisfied that the more the question is looked into my estimates will be found moderate, and considerably on the safe side. For my own part I feel perfectly assured that, if the cable be laid as a Government work, the estimates of revenue will be borne out by actual results, as fully as estimates of cost have been verified by the tenders received.

“Hon. W. B. Ives, Minister of Trade and Commerce.”

“Yours, &c.,

“SANDFORD FLEMING.

In the foregoing letter I have referred to the Eastern Extension Telegraph Company, and pointed out that its business would be diminished by the successful operation of the Pacific cable. The latter, however, would so stimulate telegraphy that in a few years the proportion of traffic which would fall to the share of the existing line would, I have reason to think, equal the volume of business which at present it commands. It is a question for the Governments to consider how far the company may be entitled to claim that its reasonable profits should be made good meanwhile. I have on all occasions recognised that every consideration should be extended to the company whose enterprise established the pioneer cable to Australasia, and first brought the Colonies into telegraphic connection with the Mother Country.

It is on higher than competitive grounds that a Pacific cable is advocated, and it is impossible to admit that the existence of the Eastern Extension Telegraph must for ever prevent the establishment of a national line across the Pacific. The discussions at the Colonial conferences of 1887 and 1894 go to show that the Pacific cable is demanded not only by the growing requirements of trade and commerce, but as an essential feature in the development of the telegraphic system of the Empire.

DOCUMENTS submitted for the information of the Committee by Mr. Sandford Fleming, July 8th, 1896.

1. General conditions under which tenders for laying the Pacific cable were invited.—App. A.		
2. The tenders received by the Canadian Government and letters connected therewith:—		
(a) Letter from Sir John Pender.....	October 19th, 1894.	} Not printed.

APPENDIX A.

THE PACIFIC CABLE.

THE Government of Canada invites cable manufacturing contractors and others to state the terms upon which they will be prepared to lay, and maintain in efficient condition, a submarine electric cable across the Pacific from Canada to the Australasian Colonies.

General conditions under which the offers are to be made may be ascertained on application at the Department of Trade and Commerce, in Ottawa, or at the office of the High Commissioner for Canada in London.

Offers addressed to the undersigned will be received by him until November 1st, 1894.

MACKENZIE BOWELL,

Minister of Trade and Commerce.

Ottawa, August 6th, 1894.

GENERAL CONDITIONS.

1. At the Colonial Conference, held in Ottawa between June 23rd and July 8th (inclusive), a series of resolutions were passed relating to the Pacific cable (copies appended). It was resolved, among other things, that immediate steps should be taken to provide direct telegraphic communication between the Dominion of Canada and the Australasian Colonies. At the unanimous request of the delegates present at the Conference, the duty of giving effect to the resolutions passed, and the views expressed, devolved upon the Canadian Government.

2. In order to obtain definite data to enable all the Governments concerned to consider and adopt the best means of carrying out the undertaking, the Canadian Government deems it expedient to invite proposals for establishing the cable, in three different forms, viz. :—

FORM A.—The cable to be owned and controlled by Government; to be worked under Government authority, and to be kept in repair by the contractor for three years.

Cable manufacturing contractors to state the lowest cash price for which they will be prepared to supply and lay the cable, the terms and conditions upon which they will guarantee its permanency, and the annual payment for which they will maintain it in efficient condition for three years after the whole line shall have been completed and put in operation.

FORM B.—The cable to be owned, maintained, and worked by a subsidised Company.

The contracting parties to find the capital, establish, work, and maintain the cable in efficient condition, for a subsidy to be paid to them annually for a term of years, by the contributing Governments. The offers to state the amount of subsidy to be paid yearly, and the number of years it is to be paid. The maximum rates to be charged on messages to and from Great Britain and the Australasian Colonies shall be as follows:—Three shillings per word for ordinary telegrams; two shillings per word for Government telegrams; and one shilling and sixpence for press telegrams. The charges on messages between Canada and the Colonies to be proportionate.

FORM

FORM C.—*The cable to be owned, maintained, and worked by a Company under a Government guarantee.*

The contracting parties to find the capital, establish, work, and maintain the cable in efficient condition. The offers to state what guarantee of gross revenue will be required; the difference between gross earnings and the amount guaranteed to be made good each year to the Company by the contributing Governments. The rates to be charged for the transmission of messages to and from Great Britain and the Australasian Colonies shall be as follows:— Three shillings per word for ordinary telegrams; two shillings per word for Government telegrams; and one shilling and sixpence per word for press messages. Trans-Pacific messages to be charged at proportionate rates. The tariff of charges to be approved and not changed unless by Governmental sanction.

ROUTE OF CABLE.

Offers will be received for laying the cable on each of the routes described as follows:—

Route No. 1.

Commencing at Vancouver Island the cable to extend to Fanning Island, thence to a suitable island in the Fiji Group. From Fiji to Norfolk Island, and at that point the route will bifurcate to the northern part of New Zealand, and to a convenient point near the boundary between New South Wales and Queensland.

	Knots
Vancouver Island to Fanning Island	3,232
Fanning Island to Fiji	1,715
Fiji to Norfolk Island	1,022
Norfolk Island to New Zealand	415
Norfolk Island to Tweed Mouth, near boundary New South Wales and Queensland	761
Total	7,145

Route No. 2.

From Vancouver Island the cable to be laid to a small unoccupied island indicated on the charts as Necker Island, situated about 240 miles westward from the most western island of the Hawaiian Group and about 400 nautical miles from Honolulu. From Necker Island the cable to extend to Fiji, and thence, as in Route No. 1, to New Zealand and Australia. On the section between Necker and Fiji possibly Howland Island or Baker Island may be available for a mid-station, but the exact position has not been ascertained.

	Knots
Vancouver Island to Necker Island	2,431
Necker Island to Fiji	2,546
Fiji to Norfolk Island	1,022
Norfolk Island to New Zealand	415
Norfolk to Tweed Mouth	761
Total	7,175

Route No. 3.

As in Route No. 2 the cable to extend from Vancouver Island to Necker Island, thence to Onoatua or some one of the eastern islands of the Gilbert Group. From this station in the Gilbert Group two branches to extend, one to Queensland and the other to New Zealand. The Queensland branch to touch at San Christoval Island in the Solomon Group, and terminate at Bowen, connecting at that point with the land lines, easterly to Brisbane and Sydney, westerly to the Gulf of Carpentaria.

	Knots
Vancouver Island to Necker Island	2,431
Necker Island to Onoatua (in Gilbert Group)	1,917
Onoatua to Fiji	980
Viti Levu to New Zealand	1,004
Onoatua to San Christoval (Solomon Group)	953
San Christoval to Bowen, Queensland	980
Total	8,265

Route No. 4.

As in Routes Nos. 2 and 3 the cable to be laid from the northern terminal point to Necker Island. From Necker Island to extend in a direct course to Bowen, touching at Apamana, a central island in the Gilbert Group, and at San Christoval, of the Solomon Group.

	Knots.
Vancouver Island to Necker Island	2,431
Necker Island to Apamana (Gilbert Group)	1,865
Apamana to San Christoval (Solomon Group)	970
San Christoval to Bowen, Queensland	980
Total	6,246

Route No. 5.

As in Routes Nos. 2, 3, and 4, the cable to run from Vancouver Island to Necker Island; from Necker Island to Fiji, thence to Jersey, thence direct to New Zealand.

	Knots
Vancouver Island to Necker Island	2,431
Necker Island to Fiji	2,546
Fiji to New Zealand	1,150
Total	6,127

Route No. 6.

From Vancouver Island the cable to extend to Honolulu; from Honolulu to Fiji, and from Fiji to follow route No. 1 to New Zealand and Australia. On the section between Honolulu and Fiji one of the Phoenix Islands may possibly be found available for a mid station.

	Knots
Vancouver Island to Honolulu	2,280
Honolulu to Fiji	2,600
Fiji to Norfolk Island	1,022
Norfolk Island to New Zealand	415
Norfolk Island to Tweed Mouth	761
Total	7,078

Route

Route No. 7.

From Vancouver Island the cable to extend to Honolulu; from Honolulu to Onoatua of the Gilbert Group; from Onoatua to San Christoval of the Solomon Group; from San Christoval to Bowen.

	Knots.
Vancouver Island to Honolulu	2,280
Honolulu to Onoatua	2,080
Onoatua to San Christoval	953
San Christoval to Bowen	980
Total	6,293

Route No. 8.

From Vancouver Island the cable to extend to Honolulu; from Honolulu to Fiji, possibly with a mid-station on this section if a suitable island be available. From Fiji the cable to run direct to New Zealand.

	Knots.
Vancouver Island to Honolulu	2,280
Honolulu to Fiji	2,600
Fiji to New Zealand	1,150
Total	6,030

The northern terminus of each route is on Vancouver Island. The cable will land at some suitable point to be determined, probably at Port San Juan, near the entrance of the strait of San Juan, or at Barclay Sound.

The several routes above described are shown generally on the accompanying map of the world. The distances given in each case are believed to be approximately correct, but are not guaranteed. Parties offering to provide and lay the cable must make their own calculations of distances and satisfy themselves.

Character of Cables.—Proposals will describe the type of cables intended to be used on each section, and state the weight of conductors and insulators per knot in each case.

Shore Ends.—The best description of landing cables must be employed at terminal points and all mid-stations. The proposals will describe the character, weight, and length of shore-end cables to be used in each case.

Speeds.—The calculated speeds for each section of the cable shall in no case be less than 12 words per minute.

Stations and Equipments.—Each offer will describe the character and approximate cost of buildings, instruments, &c., to be furnished for each terminal and mid-ocean station.

Repairs and Maintenance.—Proposals will state the provision intended to be made for repairs and maintenance, the number, tonnage, and value of repair steamers. In the case of offers made under Form A, the steamers and stores will be found by and remain the property of the contractor, until the end of three years from the completion of the cable, to be then taken over at a valuation as may be stipulated and agreed.

Surveys.—Charts may be seen at the Department of Trade and Commerce, Ottawa, and at the office of the High Commissioner for Canada in London, showing the soundings which have been made from time to time in the Pacific as far as recorded. It is expected that additional soundings will shortly be made, but parties making proposals must assume all risks, and in the event of a contract being entered into for establishing the cable, the contractors must themselves take means to find the most suitable points for landing the cable at all terminal and mid-ocean stations. It will be understood that in each instance the landing privileges are to be secured by the contributing Governments.

Time of Completion.—The time limited for the completion of the cable is three years, from the date of the contract; but as it is desirable to have telegraphic communication established as soon as practicable, proposals may state a shorter period; or the same parties may make two offers, one on the basis of three years, the other on the shortest period within which the undertaking may be accomplished.

PROPOSALS.

Proposals based on the above general conditions, and in either of the three forms set forth, to be addressed to the Minister of Trade and Commerce, and delivered at his Department in Ottawa, on or before the first day of November, 1894.

Department of Trade and Commerce,
Ottawa, August 6th, 1894.

4. *Resolved.*—That in view of the desirability of having a choice of routes for a cable connexion between Canada and Australasia, the Home Government be requested to take immediate steps to secure neutral landing ground on some one of the Hawaiian Islands, in order that the cable may remain permanently under British control.

5. *Resolved.*—That the Canadian Government be requested, after the rising of this Conference, to make all necessary inquiries, and generally to take such steps as may be expedient in order to ascertain the cost of the proposed Pacific cable, and promote the establishment of the undertaking in accordance with the views expressed in this Conference.

APPENDIX B.

REPORT ON TENDERS.

Sir,

Ottawa, 20th November, 1894.

I have the honor to report on the replies received by you on the 1st inst., in response to the public advertisement of the Government of Canada, inviting cable-manufacturing contractors and others to state the terms upon which they would be prepared to lay and maintain in an efficient condition a submarine electric cable across the Pacific from Canada to the Australasian Colonies.

1st. Sir John Pender, Chairman of the Eastern Extension Telegraph Company, 50, Old Broad Street, London, addressed a letter to you, dated 19th October, 1894, in which he represented (1) that full information respecting the depth and nature of the sea-bed has not been obtained, and in consequence reliable opinions cannot be formed; (2) that Mr. Alex. Siemens' estimates of revenue are fallacious, and that my own estimates are not much more reliable; (3) that a cable laid as intended would be quite useless, and would prove a commercial failure; (4) that a telegraph established across the Pacific as proposed would result in a loss of at least £90,000 a year to the company he represents. Sir John Pender, in short, discourages in every possible way the attempt to span the Pacific by a Canada-Australian telegraph; he states, however, that he will be most happy to enter into negotiations for accomplishing the work if sufficient inducements be offered him, and he pleads that his company "will be able to undertake the work on better terms than could be offered by any other company."

2nd. Mr. W. Sharpley Seaton, 57½, Old Broad Street, London, likewise addresses you 19th October, 1894. This gentleman sets forth at some length the great necessity which exists for a detailed survey. He considers this to be of primary importance, and counsels delay until such a survey be made.

3rd. The Chairman of the Telegraph Construction and Maintenance Company, 33, Old Broad Street, London, writes 19th October, 1894. He criticises generally the proposals which have been published by the Canadian Government, and raises objections to the conditions laid down for intending contractors. He objects to each one of the eight routes specified, and proposes a new route, taking in Honolulu and Samoa. On this route the firm he represents would lay a cable of a good type and weight between Vancouver and New Zealand (only) for £1,870,000. This amount, however, does not include maintenance for three years or for any period. Nor does it include a branch cable to Australia. He urges as a first step that the line should be sounded over its entire length on the exact route chosen, and he states that his firm cannot undertake to guarantee the repair of the cable until a further investigation has been made of the sea-bottom over which the cable is to be laid.

The writer of this communication estimates that a cable could be laid on route No. 8 for about for about £1,300,000, but this, he states, would depend upon its proving possible to find an available and safe mid-station between Honolulu and Fiji. He further states that maintenance on this or any route cannot under present conditions be guaranteed by this firm.

4th. Mr. Francis A. Bowen, 3, Tokenham Buildings, King's Arms Yard, London, sends a proposal dated 20th October, 1894. This gentleman, for himself and his associates, offers to construct and submerge a cable on any route which may be selected for £200 per knot of 6,082-66 feet. The offer presents itself to me as being in an exceedingly ambiguous form, as there is nothing to show what the total cost may be on any route, and there is no explanation as to how the total cost is to be ascertained, whether the number of knots shall be reckoned on the actual distance between stations, or on the

length

length of cable payed out; nor is it clear that the price stated includes the cost of buildings, instruments, &c. Moreover, and to my mind the most serious objection to this offer is the specification of the core to be used; the weight of copper and gutta-percha appears to be designed to be the same throughout without reference to the length of sections to be spanned. As specified the core would be too light for the long section and unnecessarily heavy for the shorter sections. Mr. Bowen places the additional charge for maintenance at £237,000 for the three years.

5th. The India-rubber, Gutta-percha, and Telegraph Works Company refer to the invitation for proposals under Form "C"—that is, on the basis of a traffic guarantee. This company is unable to make a *firm* offer under this form; they, however, submit an estimate in the following words:—"For your guidance, we may state that in our opinion a twenty-five years' annual guarantee, payable quarterly of the following amounts, as placed against the respective routes, should suffice for the effective establishment and maintenance of the cable."

	£
Route No. 1	226,000
Route No. 2	217,000
Route No. 3	215,000
Route No. 4	153,000
Route No. 5	202,000
Route No. 6	199,000
Route No. 7	184,000
Route No. 8	197,000

There is no other reference in any of the replies received to the establishment of the Trans-Pacific telegraph under a Government traffic guarantee (Form C), and none whatever to the formation of a company to carry out the undertaking under a Government subsidy (Form B).

With respect to the matter of soundings referred to in the first, second, and third communications above noticed, I would only remark that it would require soundings to be taken in a very comprehensive manner to give even an approach to a full knowledge of the sea-bed, and that it would involve much cost and prolonged delay. However valuable such a survey would undoubtedly prove in a scientific point of view, it is by no means indispensable to the laying of a cable or to its effectual maintenance. Cables have been laid, and successfully laid, when no such comprehensive surveys have been effected; indeed, the best information goes to show that a large proportion of cables at present submerged have been laid without any precise and detailed knowledge of the sea-floor. The majority of such cables are, I believe, in good working order, and few of them have ever required any great expenditure for repairs. Be all that as it may, the Government is now in possession of definite offers from firms of the highest standing and widest experience to lay the Pacific cable on any one of the eight routes specified. All the soundings required for securely and successfully laying the cable are to be made by the contractors themselves during the time occupied in manufacturing it, and so satisfied are they on this and all other points that they are quite ready to enter into contract to complete the undertaking, and guarantee its maintenance for three years for a definite sum.

There are four regular tenders according to Form "A," accompanied by ample details and full information on all essential points. After carefully and critically examining and comparing them I beg leave to submit the following abstract:—

Regular Tenders.

Form A. The cable to be owned and controlled by Government; to be worked under Government authority; and to be kept in repair by the contractor for three years.

No. 1. From Siemens Bros. & Co., 12, Queen Ann's Gate, Westminster, London.

No. 2. From the Fowler-Waring Cable Co., North Woolwich, London.

No. 3. From the W. T. Henley Telegraph Works Co., 27, Martin's Lane, Cannon-street, London, and North Woolwich.

No. 4. From the India-rubber, Gutta-percha, and Telegraph Works Co., 106, Cannon-street, London, and Silvertown.

These tenders are based on the general conditions prescribed; they include in each case the manufacture and laying of the cable; the providing of station buildings and instruments for the use of the operating staff; likewise the maintenance and repair of the entire length of the cable for a period of three years after the whole line shall have been completed and put in operation.

The parties tendering are prepared to enter into contract for the sums placed opposite the name of the firms, in each case as follows:—

Route No. 1.

Commencing at Vancouver Island with mid-stations at Fanning Island, Fiji, and Norfolk Island, and with branches from Norfolk Island to New Zealand and New South Wales—complete, including maintenance for three years in each case.

	£
No. 4. The India-rubber, Gutta-percha, and Telegraph Works Co.	1,517,000
No. 3. W. T. Henley's Telegraph Works Co.	1,826,000
No. 1. Siemens Bros. & Co.	2,170,000
No. 2. Fowler-Waring Cable Co.	2,350,000

Route No. 2.

Commencing at Vancouver Island with mid-stations at Necker Island, Fiji, and Norfolk Island, and with branches to New Zealand and New South Wales—complete, including maintenance for three years in each case.

	£
No. 4. The India-rubber, Gutta-percha, and Telegraph Works Co.	1,316,000
No. 3. W. T. Henley's Telegraph Works Co.	1,743,000
No. 1. Siemens Bros. & Co.	2,140,000
No. 2. Fowler-Waring Cable Co.	2,210,000

Route No. 3.

From Vancouver to Bowen (Queensland), with mid-stations at Necker Island and Onoatua (Gilbert Group), branching at Onoatua *via* Fiji to New Zealand and *via* San Christoval (Solomon Group) to Bowen—complete in each case, including maintenance for three years.

	£
No. 4. The India-rubber, Gutta-percha, and Telegraph Works Co.	1,403,000
No. 3. W. T. Henley's Telegraph Works Co.	1,723,000
No. 1. Siemens Bros. & Co.	2,240,000
No. 2. The Fowler-Waring Cable Co.	2,341,000

Route No. 4.

From Vancouver Island to Bowen (Queensland) direct, with mid-stations at Necker Island, Apamana (Gilbert Group), and San Christoval (Solomon Group)—complete, including maintenance for three years in each case.

	£
No. 4. The India-rubber, Gutta-percha, and Telegraph Works Co.	1,068,000
No. 3. The W. T. Henley's Telegraph Works Co.	1,554,000
No. 1. Siemens Bros. & Co.	1,710,000
No. 2. The Fowler-Waring Cable Co.	2,125,000

Route No. 5.

Vancouver Island direct to New Zealand *via* Necker Island and the Fiji Group—complete, including maintenance for three years in each case.

	£
No. 4. The India-rubber, Gutta-percha, and Telegraph Works Co.	1,291,000
No. 3. W. T. Henley's Telegraph Works Co.	1,658,000
No. 2. The Fowler-Waring Cable Co.	2,010,000
No. 1. Siemens Bros. & Co.	2,050,000

Route

Route No. 6.

Vancouver Island to Norfolk Island, with mid-stations at Honolulu and Fiji. At Norfolk Island, branches to extend to New Zealand and Australia proper—complete, and including maintenance for three years in each case.

	£
No. 4. The India-rubber, Gutta-percha, and Telegraph Works Co.	1,391,000
No. 3. The W. T. Henley's Telegraph Works Co.	1,740,000
No. 1. Siemens Bros. & Co.	2,120,000
No. 2. The Fowler-Waring Cable Co.	2,130,000

Route No. 7.

From Vancouver Island to Bowen (Queensland), with mid-stations at Honolulu, Onoatua (Gilbert Group), and San Christoval (Solomon Group)—complete, including maintenance for three years in each case.

	£
No. 4. The India-rubber, Gutta-percha, and Telegraph Works Co.	1,081,000
No. 3. The W. T. Henley's Telegraph Works Co.	1,589,000
No. 2. The Fowler-Waring Cable Co.	1,880,000
No. 1. The Siemens Bros. Co.	1,900,000

Route No. 8.

From Vancouver Island direct to New Zealand, with mid-stations at Honolulu and Fiji—complete, including maintenance for three years in each case.

	£
No. 4. The India-rubber, Gutta-percha, and Telegraph Works Co.	1,243,000
No. 3. The W. T. Henley's Telegraph Works Co.	1,655,000
No. 2. The Fowler-Waring Cable Co.	1,910,000
No. 1. The Siemens Bros. Co.	1,970,000

The cost of maintenance is variously estimated by the several firms, the highest being that of the W. T. Henley Telegraph Works Co., who place the cost at £115,000 per annum, or £345,000 for the three years. This is subject to a reduction if the spare cable provided for the purpose be not used. The Siemens Bros. Co. include in their offer for the purpose of maintenance £270,000, being at the rate of £90,000 per year; this also is subject to a reduction if the actual repairs cost less than the sum named. This mode of charging for the maintenance and repair of the cable has an obvious advantage. The Fowler-Waring Co. stipulate that a fixed sum, £300,000, be allowed to guarantee maintenance and repair for the three years. The India-rubber, Gutta-percha, and Telegraph Works Co. make no special charge for guaranteeing the maintenance and repairs, and as their offer for laying the cable on each one of the eight routes is the lowest, it is well to make this point perfectly clear by quoting from their proposal as follows:—

"The contract prices given hereunder for the different routes include the erection at each cable-landing place of a suitable dwelling-house and operating-room for the working staff, with duplicate sets of all proper instruments at each station; also the use of two steamships fitted with cable tanks and all necessary machinery for repairing the cable, and the cost of maintaining these ships, as well as the cables themselves, for three years." The contract prices for which this firm is prepared to manufacture, lay, and maintain the cable for three years on any one of the eight routes are as follows:—

	£
Route No. 1	1,517,000
Route No. 2	1,416,000
Route No. 3	1,303,000
Route No. 4	1,068,000
Route No. 5	1,291,000
Route No. 6	1,391,000
Route No. 7	1,081,000
Route No. 8	1,243,000

This company states that if entrusted with the contract, they will undertake to manufacture the cable at the rate of 20 miles a day, and will proceed to ship and lay it with the least possible delay.

An examination of this tender and accompanying documents shows that this company propose to use an approved type of cable; the core on the long section (Route No. 1) is to have a copper conductor weighing 533 lb. per knot, insulated with gutta-percha weighing 365 lb. per knot, the sheathing to be the same as the deep-sea type of cable adopted by the Anglo-American Telegraph Co. in the newest Trans-Atlantic cable laid this year. The shore ends and intermediate cables to be similar in character and weight to those generally adopted under like circumstances.

There is one apparent omission in this tender in connection with shore end and shallow water cables. I can find no special mention of a metallic protection against "teredos." In the opinion of the undersigned, the core of the cable should be enveloped in a brass tape. The additional cost is not great, and before any contract is entered into with this or any company it should be clearly stipulated that this effective means of protection against the ravages of marine life should be provided.

The Honorable Mackenzie Bowell,
Minister of Trade and Commerce, Ottawa.

I have, &c.,
SANDFORD FLEMING.

ADDITIONAL REPORT ON TENDERS.

Sir,

Ottawa, December 11th, 1894.

I have the honor to report on the letter addressed to you by the India-rubber, Gutta-percha, and Telegraph Works Company, of date the 22nd November, 1894, on the subject of the tender of that firm for manufacturing, laying, and maintaining the Pacific cable.

In my report on the tenders of date November 20th, 1894, I mentioned in the last paragraph that in my opinion it was expedient to make provision for protecting the core of the cable, under certain conditions, from the ravages of marine life. The letter of the abovenamed company which you have referred to me gives the assurance that all types of cable proposed to be laid by that firm will be provided with proper protection; that in fact all cables laid in less than one hundred fathoms are to have the core sheathed with metallic taping as a protection against the teredo. This assurance removes the objection which I raised.

In my report of November 20th all the tenders referred to were for the supply of cables having a speed capacity of 12 words per minute. For route No. 1 the price of the India-rubber, Gutta-percha, and Telegraph Works Company is, including maintenance for three years, £1,517,000. In the letter of this company of the 22nd November it is stated that higher-speed cables will be furnished for this route at the following prices, viz.:—

- A 15-word per minute cable for £1,672,000.
- An 18-word per minute cable for £1,880,000.

Compared with estimates previously made these prices must be held to be moderate. My own estimate for a cable on this route (No. 1) as given in your report on the mission to Australia (page 69) is £1,978,000; and the estimate furnished the Colonial Office, London, by the General Post Office authorities (see Appendix to the same report, page 79) is £2,924,000. Neither of these estimates includes maintenance for three years; moreover, the estimate from the General Post Office does not include a connexion with the mainland of Australia, which would probably be estimated at £200,000 additional.

We thus have in the tender of the India-rubber, Gutta-percha, and Telegraph Works Company a definite offer to lay and maintain for three years a cable from Vancouver to Australia and New Zealand with a speed capacity 50 per cent. higher than the cable referred to by the General Post Office authorities, and for a sum £1,244,000 less than their estimate, without any allowance for maintenance.

Hon. Mackenzie Bowell,
Minister of Trade and Commerce.

I have, &c.,
SANDFORD FLEMING.

APPENDIX C.

THE PACIFIC CABLE AS A PUBLIC UNDERTAKING OWNED BY GOVERNMENT.

(a.)

Extracts from Mr. Fleming's Address at the Colonial Conference, 1894.

"There are two distinct methods by which the Pacific cable may be established, viz. :—

"1. Through the agency of a subsidised company.

"2. Directly by Government as a public work.

"I have given this branch of the subject long and earnest attention, and I have arrived at conclusions which to my mind are confirmed by every day's experience.

"At one time I favoured the first method. It has been customary to have enterprises of this character carried out by companies, and it seemed to have been assumed that there was no other way by which the work could be accomplished. However, when it is considered that in the United Kingdom, in India, in the Australian Colonies, and in a great many foreign countries the telegraphs are owned and worked by Governments, there appears no good reason why Government ownership should be confined to land telegraph. No doubt it would give least initial trouble to Government to offer liberal subsidies in order to have the telegraph across the Pacific laid and owned by a company; but I am perfectly satisfied that in the long run the second method will be found in every respect more advantageous. The interests of a company and the public interests are not identical; they are in some respects the very opposite. While the primary object of a company is to exact from the public as much profit as possible, the interests of the public, on the other hand, are to secure cheap telegraphy, and to have it as free and untrammelled as possible. Suppose, for example, that a large subsidy be granted, such a subsidy as Sir John Pender has declared to be necessary, and that the whole undertaking passed over to the Eastern Extension Company to carry out, would not the effect be to confirm and perpetuate the telegraphic monopoly which at present exists between Australia and the outer world? Would it not simply shut out all prospect of obtaining the reduced charges to which we may confidently look forward? Would it not contract intercourse, instead of providing the fullest opportunity for its free and full expansion, so much to be desired? I look forward to the time, and I do not think it is far distant, when, if a wise and prudent course be followed, the telegraph will ramify in many directions under the ocean to all the principal colonial possessions, and that, in the not distant future, there will be a greater reduction in charges on messages than has taken place in letter postage during the past fifty years.

"Speaking for myself, I have arrived at the conclusion that the true principle to follow, looking solely at the public interests, present and prospective, is to establish the Pacific cable as a Government work. In my judgment it would be a grave and irremediable mistake to give it to the existing company on their own terms, or perhaps on any terms. Even to hand the work over to a new company entirely distinct from the Eastern Extension Company would scarcely mend matters. It would be impossible to prevent the two companies combining in some form to advance their common advantage to the detriment of the public interest.

"I have elsewhere endeavoured to show the advantages derivable from the establishment of the Pacific cable as a public work directly under Government control. It is a matter of constant experience that the promoters of companies, as a rule, set out with the determination to make large sums of money, that investors are promised large returns, and they are not satisfied unless they are forthcoming. In consequence 9 per cent., and in some cases much more than 9 per cent., is paid for money raised for private companies, while, on the other hand, Governments can borrow capital at 3 per cent. Hence it is possible under Government ownership to reduce charges on telegraphy much below the rates charged by private companies.

"With the proposed cable under Government control, it is not easy to assign a limit to the reduction in charges for transmitting messages, and with low charges there will arise, without any appreciable extra cost in working, a great expansion in the business of the telegraph. Thus the public will be benefited to an extent which would not be possible if the cable became the property or passed under the control of a private company.

"I had hoped to have seen present at this Conference His Excellency Sir Ambrose Shea, Governor of the Bahamas. He would, I am sure, have given the best testimony in favour of the plan of Government ownership. Less than two months ago I had a letter from him in which he furnished indisputable evidence as to the superiority of the principle of Government control. The Bahamas are connected with the mainland by a cable owned by Government. The first idea was to have it carried out by a company under a subsidy of £3,000 a year for twenty-five years. Fortunately it was decided to make it a Government work; the cable is entirely so established, and the policy of its operation is dictated primarily by the commercial requirements of the Colonies. Profits are of course desired, but these are held to be a subordinate consideration. This policy would have been reversed had the cable been controlled by a company, the interests of the company *per se* would have remained paramount. Sir Ambrose Shea informs me that even in a financial aspect it has proved fortunate that they kept the cable under Government control. Instead of paying £3,000 a year in the form of a subsidy, the charge on the Colony is already reduced to £1,800 after fully providing for a sinking fund to cover renewals as well as interest on the cost, and all other charges. Beyond the question of money, the Governor attaches much importance to the power held by the executive for adapting the policy of the cable management to the growing and varying wants and conditions of the Colony.

"It appears to me that in bringing two of the leading divisions of the Colonial Empire into telegraphic connexion, we cannot do better than place before us the experiment to which I have referred as having been so successfully tried. Great importance must be attached to the views and ripe judgment of Sir Ambrose Shea, strengthened in a matter of this kind by the experience of the Bahama cables. Every commercial object points to the expediency of retaining the Canada-Australian cable under Government ownership; and, apart altogether from commercial considerations, there is no reason to warrant that so important a work, undertaken for national purposes, should be removed from the effective control of the Governments by whose authority alone the great principles of its establishment would be fully observed."

(b.)

ESTIMATES OF REVENUE.

Extract from Mr. Fleming's Memorandum, Sydney, October 11, 1893.

"In many cases it is difficult, owing to the lack of information, to form estimates of the probable revenue of a projected undertaking. In this instance, however, the best data is available for our guidance. We have the published statistics of telegraph business by the existing line between Australia and Europe for a number of years, and it is fair to assume that on the establishment of the Pacific cable, rates and all other things being equal, the business will be equally divided between the two lines.

"I am unable to ascertain the business for the past year, but I gather from the published returns that the number of words transmitted in the year ending May 1, 1892, was 1,275,191. If we divide this into equal parts we have 637,595 words as a basis for estimating the revenue of the Pacific cable.

"In examining the returns for the previous years some striking peculiarities are apparent. During the eight years from 1882 to 1890 the telegraph business between the Australian Colonies and Great Britain increased on an average 54,441 words each year, equal to 14 per cent. per annum. This may be viewed as the normal increase under a high tariff, inasmuch as throughout these eight years the charges on ordinary messages were never less than 9s. 4d. per word. On May 1st, 1891, the rate was reduced from 9s. 4d. to 4s. per word, and within the twelve following months the business increased by 448,913 words—an increase of 54 per cent. on the business of the previous year, and 831 per cent. over the normal annual increase during the preceding eight years. The further expansion of business will no doubt for the present be disturbed and retarded by an increase in the charges on messages on the 1st January last; but there remains the experience of the year 1891-92 to establish the remarkable effect of a low tariff in stimulating telegraphy. In that single year the increase in the number of words transmitted under a 4s. rate was greater than the growth of the business during the whole of the preceding eight years under a 9s. 4d. rate.

"One of the direct benefits to the public from the Government ownership of the Pacific cable will be the reduction in charges for transmitting messages. I have already mentioned that with a full and efficient staff, such as the estimate for working expenses provides for, it will cost no more to do a large business than a small. There will, therefore, be no reason for preventing the freest expansion of telegraphy by the new line, by lowering the charges. In my humble opinion, the rates across the Pacific should be lowered to 2s. per word immediately on the cable being laid, in order that the public may have the advantage of cheaper communication at the earliest moment.

"The

"The proposed rate of 2s. per word for transmitting messages across the Pacific would reduce charges between Australia and England to 3s. 3d. in place of 4s. 9d. as at present. Moreover, messages from Australia received at Vancouver would be forwarded to all parts of Canada and the United States for an average charge not exceeding 2s. 9d. per word in place of 6s.—the present charge.

"I wish to avoid extravagant statements and too sanguine estimates. I would, in submitting my ideas, particularly desire to keep strictly within reasonable probabilities. If we base estimates on the existing volume of business merely, we must anticipate that there will be no great advance over the business of 1891-92 for a few years if the charges on messages are again raised as they already have been to some extent. In the calculations which follow, I shall, therefore, assume the business to be at a standstill for three years; that is to say, I shall assume that the business in 1894 will not be greater in volume than it was in 1891-92, and that thenceforth the normal increase of not more than 14 per cent. per annum shall apply. The number of words transmitted in 1891-92 was 1,275,191. It is assumed that the Pacific cable would, if in operation in 1894, obtain one-half of this business.*

Year.	Number of Words per Annum.	Earnings of the Cable at 2s. per Word.	Year.	Number of Words per Annum.	Earnings of the Cable at 2s. per Word.
1894	637,595	£ 63,759	1900	1,173,176	£ 117,318
1895	726,858	72,686	1901	1,262,439	126,244
1896	816,122	81,612	1902	1,351,703	135,170
1897	905,386	90,539	1903	1,440,967	144,097
1898	994,649	99,465	1904	1,530,230	153,023
1899	1,084,913	108,391			

"In connection with the estimates of revenue I have pointed out from statistical returns two elements of increase of business—(1) a normal increase under an exceedingly high tariff; (2) a very much greater increase under a lower tariff. There will be a third increase, which will be due to the development of traffic with Canada and in bringing the Australian Colonies into direct telegraphic touch with the whole telegraph system of North America. At present, telegraphic intercourse is insignificant, but with a 2s. or 2s. 6d. rate across the Pacific in place of a 6s. rate by a circuitous route, the circumstances will be favourable to the growth of telegraph business between the two continents, and in consequence the revenue to the Pacific cable from this source will rapidly develop to large proportions.

"In the foregoing estimates of revenue, I have reckoned only the normal increase under a high tariff, and take no account of the greater increase which certainly will result from the charges being lowered, as proposed. I have likewise added nothing from the Australasia-North American business, the whole of which would flow to the Pacific cable. I am quite warranted, therefore, in expressing the opinion that the estimates of revenue I have presented are not exaggerated or unreasonable, and that the Pacific cable, established by Government in the manner proposed, would effect very important results. It would practically extinguish all subsidies now paid, and render guarantees unnecessary. It would permanently establish low rates for ocean telegraphy. It would yield a revenue which, after paying working expenses, and providing for maintenance and renewals, would make good all interest charges on the whole cost of the undertaking from the beginning, and in a very few years would furnish large surplus earnings. I venture to think, then, that if the resolution passed by the Postal and Telegraph Conference in March last be generally assented to in these Colonies, the Governments need not hesitate in incurring the comparatively small, almost nominal, liability necessary to secure a telegraph connection across the Pacific, which every British subject will recognise to be of the greatest national and commercial value."

(c.)

Extract from Mr. Fleming's Letter to the Hon. Mackenzie Bowell, July 20th, 1894.

"With respect to the revenue: If it will take three years to establish the cable, 1898 will be the first year of its full operation. On pages 70 and 71 of the report on the mission to Australia will be found an estimate of the proportion of business which would fall to the share of the Pacific cable for that year—1898. The estimate was made a year ago and based on the assumed telegraphic business for 1893 between Australia and Europe, which has been exceeded by actual results. See footnote, p. 71. Correcting the estimate in this respect, the business for 1898 may be set down at 1,105,000 words, which, reckoned at 2s. a word, would yield a gross revenue for the first year's operation of the Pacific cable of £110,000. It will be borne in mind, moreover, that this estimate is for European business, and includes nothing for the business between Canada, the United States, and Australia, at present significant, but which, in a few years, with greatly improved facilities, will undoubtedly develop to considerable proportions. For these reasons I am satisfied that the estimates submitted will be fully realised and more than confirmed by actual results.

"Bearing on these estimates, a friend wrote me from London a few weeks back, as follows:—'I have been looking over the proceedings of the Colonial Conference of 1887, where a memorandum of yours is given, dated April 1886 (page 101). In it you show a probable traffic for the year 1893 of 133,000 messages, equal to 1,330,000 words. The actual business for the past year, according to Sir John Pender, was 1,306,716 words, and according to Australian returns, 1,401,292 words. In either case the prediction made eight years ago is approximately correct.' I mention this merely to bring out the fact that the principles on which the estimates are formed are sound, and that the estimates themselves may generally be considered safe.

"With respect to the charges on revenue, viz. :—

1. Interest on capital.
2. Working staff and management.
3. Repairs and maintenance.

"The first and second are constant, the third is variable. Experience goes to show that failure and interruptions in cables, due to defects in manufacture or causes connected with laying, generally take place within the first year or two. For this and other reasons I propose that the manufacturers should be asked to undertake to keep the cable in efficient working order for three years; we may thus eliminate from revenue account for that period all charges for repairs and maintenance.

"Assuming that the cost of the cable and its maintenance for three years will be, in round figures, £2,000,000, the revenue account for the year 1898 would stand as follows:—

Earnings, as estimated.....	£	£
Interest on £2,000,000 at 3 per cent.....	60,000	110,000
Staff and management	30,000	
		90,000
Surplus revenue.....		£20,000

In the above I have taken Mr. Siemens' estimate of the cost of staff required for stations, and office expenses at each point, viz., £24,000. I have increased Mr. Siemens' allowance for general management to £6,000, the two making in all £30,000 per annum. This charge will be constant, and will suffice, as pointed out by Mr. Siemens, for a business more than six times greater than that estimated for the year 1898, and, by introducing duplex working, for a traffic ten or twelve times greater. "I

* At the date of going to press (May 1894) it has been ascertained that the traffic for 1893 between Europe and Australia consisted of 1,306,716 words, showing that Mr. Fleming's estimate is considerably within actual results. If merely the normal increase of 14 per cent. under a high tariff be added to existing business, the number of words for 1894 in the table of estimated earnings which follows, should be 744,328 in place of 637,599, and the earnings for the same year £74,483 in place of £63,759, thus establishing that the estimates of revenue presented in this memorandum are in no way exaggerated.

"I have pointed out elsewhere that the average normal increase of telegraph business between the Australas an Colonies and Europe was 14 per cent. per annum, during the period when the high rates charged for a period of eight years were in force—that is to say, under a tariff rate of 9s. 4d. per word from 1882 to 1900. Manifestly, under the low rates proposed to be charged by the Pacific cable, the normal increase will be greater than 14 per cent. per annum; more especially as the whole North American business will receive a great incentive from direct communication, and all this additional and constantly growing traffic must find its way by the Pacific cable to and from Australia. I venture to think that it would not be too sanguine an estimate to place the annual increase of business at 18 or 20 per cent., but to be perfectly safe I shall limit it to 15 per cent. in the calculations which follow—that is to say, only 1 per cent. more than the average annual increase realised under the high tariff for the eight years previous to 1890.

" ESTIMATE

"of the business of the Pacific cable for ten years after its completion, calculated on the basis of 1,100,000 words, for the year 1893, an average normal increase of 15 per cent. per annum thereafter :—

	Gross Earnings.	Interest and Working Expenses.	Surplus.
	£	£	£
1898	110,000	90,000	20,000
1899	126,500	90,000	36,500
1900	143,000	90,000	53,000
1901	159,500	90,000	69,500
1902	176,060	90,000	86,060
1903	192,500	90,000	102,500
1904	209,600	90,000	119,600
1905	225,000	90,000	135,500
1906	242,000	90,000	152,000
1907	258,500	90,000	168,500

"As we have eliminated all but the fixed charges on revenue for the first three years, an examination of the above table will show that the surplus up to the fourth year will have accumulated to £109,500, which sum, together with the annually increasing surplus thereafter accruing, would be sufficient to meet all charges for repairs and maintenance and leave a balance to be carried to a cumulative reserve, for renewals at some future day.

"I may mention that I have submitted in outline this financial scheme to the delegates from New South Wales, Victoria, Queensland, and New Zealand, with whom I have had the advantage of frequent consultations since the Conference rose, and I have the satisfaction to state that it finds favour with each of them. That feature of the scheme by which all the uncertain charges for repairs and maintenance would be embraced in the contract with the manufacturers of the cable, would not only have a tendency to secure a cable of the very best make and character, but it would defer all charges against revenue which revenue could not fully meet until a date later than the payment of the last annual subsidy to the Eastern Extension Company. The Australian Governments now contributing to that subsidy could then, with greater ease, make up any possible shortage which may arise in connection with the new cable. The estimate, however, shows clearly that under this scheme there is every prospect of the Pacific cable being self-sustaining from the first.

(d.)

Letter from George Johnson, Esq., Dominion Statistician.

Dear Sir,

Office of the Statistician, Ottawa, 29 November, 1894.

I have examined your statements before the Intercolonial Conference in re the Pacific cable, and have the following remarks to make :—First, respecting the growth of business; and second, respecting the proportion the new route could hope to secure.

I.

Taking the statistics of growth I find the following :—

Year.	No. of words transmitted.	Increase.			Tariff per word.
		Actual	Per cent. for period.	Per cent. yearly.	
1875.....	235,160
1880.....	353,348	118,188	50	10·0	9s. 4d.
1885.....	537,355	184,007	55	11·0	9s. 4d.
1890.....	827,278	289,923	54	10·8	9s. 4d.
1891.....	1,275,191	54·0	9s. 4d. and 4s.
1892.....	1,321,412	3·6	4s.
1893.....	1,401,293	6·0	4s. 9d.

The actual increase in the three years 1891-93 over 1890 was 574,015.

The number of words transmitted is taken from returns submitted to the Postal and Telegraph Conference held in Adelaide in May, 1890, in Queensland in March, 1893, and in New Zealand, in March, 1894.

They show that during fifteen years (1875-90) of high tariff (9s. 4d. per word) the increase in the number of words was 251·8 per cent., and that during the three years 1891-92-93, in which period the rates were reduced to 4s. and 4s. 9d., the increase over 1890 was 69·2.

For the whole period covered by these statistics the increase is 496 per cent.

From these figures of percentage it appears: 1st, that during the period 1875-90 the growth of business under a 9s. 4d. tariff was equal to an annual average of 16·8 per cent.; 2nd, that under a 4s. and 4s. 9d. tariff the average annual growth from 1890 to 1893 (three years) was 23 per cent.

Your estimate of 14 per cent. increase appears, in the light of these facts, to be a very conservative one.

II.

How much of the business could a cable competing with the existing one hope to secure?

(a.) A telegram from Melbourne to London by the existing line has to travel 13,695 miles of wire, of which 2,704 miles is in Australia, and is, therefore, land wire. The land wire in Asia is, I judge, about 1,000 miles more of wire.

A telegram from Melbourne to London via Canada would travel 14,414 miles, of which 3,764 would be land wire.

In respect to the greater danger of stoppage and delay from land wire, the two lines would be, practically, on an equality.

(b.) Your estimate is that one-half of the words sent by cable between Australia and the rest of the world would be sent via the line across Canada.

According to the return of 1892 there would be, on this estimate, 660,706. But some portion of the total of 1,321,412 words must be Asiatic business, since Australia imports of tea alone 33,000,000 lb. a year, direct from Asia. From various data I estimate the Asiatic business at one-eleventh of the whole. Deducting this, we have 1,191,000 words to represent European business, of which the new proposed route would stand a fair chance to secure one-half. I would, therefore, place the estimate at 595,000 (or 600,000) words instead of 637,595.

Taking this estimate and applying to it the 16·8 per cent. increase, the estimate for 1895 would be 695,000 words, or 31,860 less than your estimate. For 1896 it would be 811,760 words, or 4,362 less. In 1897 it would be 948,000 words, or 42,000 more than your estimate. My calculation would give fewer words for 1895 and 1896 and more words for 1897, and still more in succeeding years.

I

I have taken the percentage of the period when the tariff was 9s. 4d. per word. If the percentage under a 4s. tariff were taken, the growth would be much greater, and undoubtedly the result of reduction in the rates would be an increase in messages, as the table above given shows.

I have not dealt with the development of business between North America and Australia, which must in the nature of things be very great when facilities are provided, and will also be tributary to the Pacific cable.

Sandford Fleming, Esq., C.M.G., C.E.,
Ottawa, Ontario.

Yours, &c.,
GEORGE JOHNSON,
Statistician.

(e.)

Letter from J. M. Courtney, Esq., Deputy Minister of Finance.

Dear Mr. Fleming,

Department of Finance, Ottawa, 1 December, 1894.

I have read over very carefully and, I may say, with a great deal of pleasure the blue books and documents you left with me for perusal in connection with the scheme for laying a Pacific cable to connect this country and Australasia. Both from the fact that it is the pioneer Pacific cable scheme and also from the magnitude of the work itself, the consideration of the subject is to me exceedingly interesting, especially as it has such an intimate bearing on the expansion of the Empire.

In writing to you now, however, I wish to be very careful, and to guard the position I take from misconceptions. I can, of course, have nothing to do with the policy of the Canadian Government, and in the present financial condition of the Continent I could not, if the matter were referred to me, on general principles, recommend any scheme that would increase the liabilities of the Dominion either directly or indirectly. From the examination of the facts and figures, however, submitted by you, I may say I have arrived at the same conclusion as yourself as to the cost of laying down the cable, and, in my judgment, the conclusion arrived at cannot be regarded as oversanguine or forced in any way.

As to the calculations of revenue, I have, of course, taken your own method, and have divided by two the number of words sent in 1892, taking one-half to come over the new cable. But, as it appears from the documents submitted, the cable could not be in operation for three years yet, or until 1898, even if commenced at once, and taking the average annual increase in the messages at 15 per cent., the estimate of the work to be done is, to my mind, very low.

It would follow, therefore, judging by the expenditure and by the revenue that, as far as I can see, with the limited knowledge at my disposal in the matter, and under the conditions named, the cable line could be laid down and a revenue derived which would meet all the charges.

Of course, in all this, it must be understood that I am looking at the financial features of the scheme from the documents before me, and that I have no personal or direct knowledge of the laying or working of cable lines. I do not know that a separate line may not be necessary, or that other contingencies may not arise which I have no means of anticipating or foreseeing.

Yours, &c.,
J. M. COURTNEY.

Sandford Fleming, Esq., Ottawa.

(f)

Letter from W. Hepworth Mercer, Esq., Colonial Office, London.

Dear Mr. Sandford Fleming,

Rideau Club, Ottawa, 11 October, 1894.

Before leaving Ottawa, I desire to congratulate you on the evidence which is now in the possession of the Canadian Government that your views as to cost of laying the proposed Pacific cable were moderate and reasonable. It must be a matter of great gratification to you to find after so many years of controversy and opposition that your estimates are more than borne out by the practical offers now received.

With regard to the question of the prospective revenue of the cable, I have carefully examined the data and studied the principles upon which you have formulated the estimates contained in your memorandum dated Sydney, 11th October, 1893, and your letter to Mr. Bowell, of 20th July, 1894, and I have satisfied myself that your conclusions are thoroughly sound. Assuming that the cable is to be a Government enterprise, participated in by Great Britain, Canada, and Australasia, I think that the estimates of revenue would at least be fully borne out by actual results.

It seems to me that there is now an excellent case for presentation to the various parties interested, and the Australasian Colonies in particular will no doubt look forward to the accomplishment of an enterprise which will, we may fairly hope, give them an unprecedentedly low telegraphic tariff in return for a smaller expenditure than they have been paying for a comparatively high one.

I hope, speaking for myself, that in a matter of such wide concern, and involving, besides the direct commercial benefits, results the importance of which cannot be estimated in figures or weighed in a balance-sheet, the Australasian, the Dominion, and the Imperial Governments will all be able to join in the project.

I am, &c.,
W. HEPWORTH MERCER.

No. 4.

Précis.

THE following is a précis of subsequent action taken in New South Wales in connection with the Pacific Cable project:—

A Ministerial Postal and Telegraphic Conference took place in Melbourne on the 1st March, 1897, at which the Colonies of New South Wales, Victoria, Queensland, New Zealand, Western Australia, and Tasmania were represented, when the following resolution was adopted by all except West Australia, whose representative would not bind that Colony, namely:—

‘Resolved.—This Conference hereby expresses its great satisfaction that the Pacific Cable Commission has decided to recommend the adoption of the proposals formulated at the Sydney Conference, and, in view of the great importance to the Empire of the construction of the cable, expresses the hope that means may at an early date be found for its speedy realisation.’

On 26th June, 1897, the Sydney Chamber of Commerce addressed a letter to the Hon. the Postmaster-General, Sydney, intimating that at the Conference of Chambers of Commerce of Australasia, held in Sydney, 17th to 22nd May, 1897, the following resolution was carried, namely:—

“Pacific Cable.—That this Conference is of opinion that the early establishment of telegraphic communication with the mother country *via* the Pacific Ocean and the Dominion of Canada, under Imperial control and passing through British Possessions only, is a necessity not only in commercial interests but for Imperial strategic reasons, and will materially assist, not only the great cause of Australian Federation, but will also form a strong bond of union between Great and Greater Britain. Further, that it be a recommendation to the Governments of the various Colonies represented at this Conference to urge upon the Imperial Government to carry out the laying of the Pacific Cable at the joint expense of the Governments interested with the least possible delay.”

It should, at this stage, be mentioned that, on the 22nd March and 12th November, 1897, the Managing Director of the Eastern Telegraph Company (Limited) addressed letters to the Imperial Government, making proposals respecting the construction of a cable touching only at British Possessions from (1) England to Perth, in Western Australia, by way of Gibraltar, Sierra Leone, Ascension, St. Helena, the

the Cape, and thence by land to Durban, Mauritius, Rodriguez and Keeling Cocos Islands, with a branch from the Seychelles (already connected with Mauritius) by Diego Garcia, to Galle, in Ceylon; and (2) Gibraltar to Capetown, by Sierra Leone, Ascension and St. Helena.*

In March, 1898, a deputation from the Sydney Chamber of Commerce, waited upon the Postmaster-General of New South Wales, to urge that the Pacific Cable be no longer delayed.

The following cablegram was forwarded by the Acting Agent-General for New South Wales in London to the Colonial Treasurer, dated 26th March, 1898:—

"I am informed that some doubt still prevails in Colonies as to the attitude of the Imperial Government towards Pacific Cable scheme. If this be so, please understand that Chancellor of Exchequer has clearly intimated the decision of Imperial Government not to take any part in the Pacific scheme, as I advised you in telegram of 22nd instant."

The message of the 22nd referred to seems to have miscarried, and the letter confirming it was not received until the 5th May, 1898, some weeks after the close of the Postal and Telegraphic Conference at Hobart in March-April, 1898, at which the following resolution was adopted:—

"That this Conference reaffirms the opinion that, in the interests of Australasia, the Pacific Cable project should be consummated as speedily as practicable, and that the Governments of the various Australasian Colonies be requested to represent to the Imperial and Dominion Governments the foregoing opinion, together with the proposal of the Premiers, as agreed to at their recent Conference held in Melbourne, viz.:—That if Great Britain and Canada would each contribute one-third of the cost, the Colonies would be prepared to contribute the remaining one-third."

In a despatch dated 27th May, 1898, the Acting Agent-General for New South Wales stated that the intimation conveyed in his cable of the 26th March should read, "The Lords Commissioners of Her Majesty's Treasury are not prepared to advise Her Majesty's Government to take any part in the scheme for laying a cable across the Pacific, between British North America and the Australasian Colonies."

On 20th July, 1898, a cablegram was received by the Premier from the Agent-General of New South Wales, in the following terms:—

"Canadian Postmaster-General now in London. Have ascertained that Canadian views on Pacific Cable friendly, but indefinite. It is proposed to arrange informal conference between Imperial Government, Canada, and Agents-General for New Zealand, Queensland, Victoria, and self, with a view to facilitate adoption some scheme. No binding decision to be arrived at, but opinions of Conference to be forwarded to respective Governments. If you concur, please telegraph full authority for me to act."

The Acting Agent-General was duly authorised to represent New South Wales at the informal Conference.

On 29th July, 1898, the following cablegram was received from the Acting Agent-General in London, viz.:—

"Pacific Cable.—Informal Conference held to-day. Canada represented by Postmaster-General and High Commissioner for Canada; New South Wales, Victoria, Queensland, South Australia, New Zealand, by Agents-General. Canadian representatives suggested Canada would probably guarantee two-ninths of total cost, but not more. Her Postmaster-General undertook to do his best for scheme on this basis. Imperial Government contribution will certainly not exceed one-third. Can Australian Colonies guarantee remaining four-ninths? Please telegraph reply before 10th proximo. Please inform other Governments."

On 30th July, 1898, the Acting Agent-General further cabled:—

"Referring to my telegram of 29th July, I beg to point out that Imperial Government, Western Australia, and Tasmania were not represented at informal Conference."

The Acting Agent-General's cables were repeated to the Premiers of the Australasian colonies, and the following replies received:—

From the Right Hon. the Premier of South Australia, 2nd August, 1898:—

"Your telegram of yesterday received. As you are aware, we are erecting second wire, Port Darwin, at cost £50,000, and whatever Colonies decide *re* Pacific Cable, we only ask that South Australia may, as promised, be safeguarded from loss."

From the Right Hon. the Premier of Tasmania, 3rd August, 1898:—

"Tasmanian Agent-General was asked co-operate with Victoria *re* Pacific Cable Conference."

From the Right Hon. the Premier of New Zealand, 4th August, 1898:—

"Pacific Cable. Your message first received. Kindly let me know replies from other Colonies, and what your Colony prepared to do. New Zealand strongly favours the Pacific Cable."

From the Right Hon. the Premier of Victoria, 4th August, 1898:—

"Pacific Cable.—Referring to your telegram of 1st instant, Postmaster-General states matter too important to be settled off-hand. Australasian Governments would have to discuss matter thoroughly before answer can be sent. As Imperial Government was not represented on Conference, there is no guarantee as to its taking any share in undertaking."

From the Premier of Queensland, 10th August, 1898:—

"Pacific Cable.—Queensland is prepared to join with other Colonies in guaranteeing four-ninths of cost of construction. Shall be glad to learn decision of your Government in the matter."

The Postmaster-General (Mr. Cook) then wrote the following minute:—

"The Right Hon. the Premier,—This matter might, perhaps, be discussed at the projected Premiers' Conference. Personally, I would be prepared to guarantee, in conjunction with other Colonies, four-ninths of the capital cost. It is important also that some definite communication be made with the E. E. Company on the question of the Cape proposal. The present subsidies expire next year, and the Company declines to consider proposals for reduction in rates until a definite reply has been given on their Cape scheme.—J.C., 12/8/98."

The following cable, dated 12th August, was received from the Acting Agent-General:—

"* * * With regard to the Pacific Cable, Secretary of State for the Colonies stated (in House of Commons the previous night) Imperial Government had received no proposals from Canada, South Australia, Western Australia, and New Zealand; and until formal and definite proposals are received from the Governments concerned, Imperial Government cannot proceed further in the matter." The

* These proposals form the subject of a separate set of papers laid before Parliament.

The Premiers of the Australian Colonies having concluded their sitting, the following cable was dispatched to the Acting Agent-General on 26th August, 1898 :—

“ Pacific Cable.—Conference of Premiers New South Wales, Queensland, Victoria, just held Sydney, agreed that if Great Britain and Canada paid five-ninths, and New Zealand one-ninth, then New South Wales, Queensland, Victoria, will contribute one-ninth each.”

(NOTE.—Mr. Cook, Postmaster-General, relinquished office on the 26th August, 1898, and Mr. Varney Parkes took office on the 27th idem.)

A deputation from the Sydney Chamber of Commerce waited on the Postmaster-General on the 13th October, 1898, and again urged the necessity for the construction of a Pacific Cable under Government control, and passing through British possessions. The Postmaster-General informed the deputation that until a reply was received from the Imperial Government respecting the terms proposed in the Cable message of the 26th August, nothing further could be done.

The Agent-General, London, cabled to the Premier, Sydney, on the 13th April, 1899, as follows :—

“ Pacific Cable.—Secretary of State for the Colonies agrees to publication of Report of Committee; but any acceptance scheme by Imperial Government must not be implied. *Please defer publication of annexures. Corrected copies will be sent as soon as possible.”

Cablegram from Agent-General, London, to the Premier, Sydney, dated 3rd May, 1899 :—

“ Pacific Cable.—Imperial Government conveyed to me their decision. Opinion that cable of minor importance to United Kingdom; therefore, consider construction and working should be borne by Canada and Australasian Colonies. Only offer twenty years' subsidy not exceeding twenty thousand pounds (£20,000) in any year. Colonies construct and maintain line. Imperial Government to approve all rate charges. Government messages at half rates. Treasury to pay five-eighths of amount by which net receipts short of expenses, subject to maximum limit of £20,000. Agents-General interested have together considered Government letter. I think terms unreasonable and unacceptable and substantially different to assumed basis of previous negotiations, which, I understand, was joint contributions, not subsidy value. Subsidy outweighed by onerous conditions. We are communication with Secretary of State for the Colonies. Letter to follow.”

The following telegram was sent by the Postmaster-General of New South Wales to the Postmasters-General of Victoria, New Zealand, and Queensland on the 11th May, 1899 :—

“ Pacific Cable.—Presuming you have notification of Great Britain's decision, do you think any action should be taken out here and so strengthen the hands of Agents-General, who are apparently trying to get better terms. Would a Conference of Postmasters-General be desirable at this stage?”

The Victorian Postmaster-General replied 11th May, 1899 :—

“ Greatly disappointed at Imperial attitude towards cable; think it absolutely necessary that we should meet to discuss cable question and agreement with Eastern Extension Company. The sooner we meet the better. Would you like the meeting to be in Sydney or Melbourne or where?”

The Postmaster-General, New Zealand, replied 12th May, 1899 :—

“ Pacific Cable.—Am of opinion that prompt and vigorous action should be taken to impress upon Imperial authorities that decision arrived at is unsatisfactory, and that we consider Great Britain should be joint owner with Canada and the Colonies. Suggest your communicating with Canada, and acting with her. Conference would emphasise protest; but, as our session begins next month, regret I would be unable to go to Australia. Recommend Conference being held in New Zealand. Assume you are communicating with other Colonies.”

The Postmaster-General, Queensland, replied 13th May, 1899 :—

“ Queensland Premier has not yet received any notification from Imperial authorities *re* Pacific Cable. Must await official intimation. Has your Premier been communicated with?”

The following telegram was forwarded by the Right Hon. the Premier of New South Wales to the Premiers of New Zealand, Victoria, and Queensland, on 20th May, 1899 :—

“ Pacific Cable.—As a Conference could not be arranged without some delay, I advise that a message be sent to our Agents-General expressing great disappointment at Imperial Government's decision; that we fully expected that Great Britain would have agreed to share in the actual cost of this important work in the proportions recommended at Premiers' Conference in August last, namely :—Great Britain and Canada, five-ninths; New South Wales, Victoria, New Zealand, and Queensland, remaining four-ninths. Strongly urge on Government a reconsideration of decision. Please say if you concur in above, and, if so, whether we should send instructions to our respective Agents-General.”

The Right Hon. the Premier of New Zealand replied, 22nd May, 1899 :—

“ Pacific Cable.—Concur in views expressed in your message of twentieth. In addition to sending instructions to respective Agents-General, I think that each Colony should send message to Secretary of State, through its Governor, urging importance of Imperial partnership.”

The Premier of Queensland replied, 20th May, 1899 :—

“ *Re* your telegram to-day. I cordially approve of apportionment of contributions recommended at Premiers' Conference, and stated by you, and demur to the reported attitude of Imperial Government in this connection, but have not yet received official information of their views. Have you received such? I am now telegraphing our Agent-General, to learn why no advice has reached us and what decision is.”

The Right Hon. the Premier of Victoria replied, 22nd May, 1899 :—

“ Pacific Cable.—I approve of your suggested message to Agent-General. I think each Colony should instruct its own Agent-General, and I have cabled accordingly to ours to-day.”

The following message was then cabled by the Right Hon. the Premier of New South Wales to the Agent-General, London, under date of 25th May, 1899 :—

“ This Government desire to press most strongly on the favourable consideration of the Imperial Government that the original project of partnership in the proposed Pacific Cable should be adhered to.”

Further reply from the Premier of Queensland, dated the 26th May, 1899 :—

“ Further *re* your telegram twentieth instant. Have now received from Agent-General report of decision of Imperial Government, and have instructed him to join other Agents-General in expressing disappointment and urging reconsideration with view of obtaining agreement to terms recommended by Premiers' Conference, and recapitulated in your telegram.”

The

* MEMO.—The whole of the Report and annexures have since been published by the Imperial Government.

The following Cable from The Right Honorable The Secretary of State for the Colonies was received by His Excellency The Governor of New South Wales.

My Lord,

Downing-street, 28 April, 1899.

I have the honor to transmit to you, for communication to your Ministers, a copy of a letter which has been addressed to the High Commissioner for Canada and the Agents-General for the Australasian Colonies, from which you will learn the nature and extent of the assistance which Her Majesty's Government are prepared to render to the Canadian and Australasian Governments in connection with the Pacific Cable scheme.

I have, &c.,

J. CHAMBERLAIN.

[Enclosure.]

Sir,

Downing-street, 28 April, 1899.

I am directed by Mr. Secretary Chamberlain to convey to you the decision at which Her Majesty's Government have arrived as to the form and extent of the assistance which they are prepared to give to the scheme for connecting Canada with Australasia by a direct submarine cable across the Pacific.

I am to remind you that in the various communications which have been from time to time addressed to the Colonial Governments on this subject, Her Majesty's Government have never concealed their opinion that the construction of a Pacific Cable is a matter of much greater importance to Australasia and Canada than to the United Kingdom; and they would not have themselves been disposed to recommend Parliament to aid it, but for their desire to afford the support and assistance of the Mother Country to her great self-governing Colonies in a project the success of which cannot fail to promote Imperial unity. For this reason they consider that the responsibility for constructing and working the cable should be borne by the Governments of Canada and Australasia, to whom any profits which may hereafter accrue from the undertaking would consequently fall; and that the aid to be given by the United Kingdom should take the form of an annual subsidy, which has hitherto been adopted by Parliament in promoting the establishment of important lines of telegraphic communication between different parts of the Empire.

In considering the question, Her Majesty's Government have had regard to the report of the Committee of 1897. The estimate of initial cost and annual expenses put forward by that Committee was £1,500,000 for original cost, and £144,900 for total annual expenses. Against this it was anticipated, on the basis of the latest returns available, that the traffic receipts in the first year would amount to £132,000, leaving a deficit of £12,900, diminishing annually until it ceases altogether at the end of the third year.

It is not, however, possible to act with certainty on these estimates, for the prices of materials have risen since they were made, and in other respects the cost of establishing the cable may possibly exceed the estimate of the Committee.

Her Majesty's Government have accordingly decided to offer, for a period not exceeding twenty years, an annual subsidy, calculated on the basis shown below, not exceeding a maximum limit of £20,000 in any year, on the following conditions:—

1. That the Canadian and Australasian Governments undertake to construct the line, and to provide in each year any further sum that may be necessary for its efficient maintenance and working.
2. That the subsidy runs only from the opening of the cable for traffic, and so long as it is so open, with the allowance of a reasonable time for repairs in the event of interruption of communication.
3. That the cable is, in accordance with a specification and samples, to be approved by the Treasury and to the satisfaction of an officer appointed by the Treasury for that purpose, constructed, submerged in proper working order, and established with proper stations and offices, at such places as the Treasury may approve, and effectually worked with a sufficient staff of proper and efficient officers, being British subjects.
4. That messages of the Imperial Government are transmitted in priority to all other messages at rates not exceeding one-half of those charged to the general public.
5. That all rates charged to the general public, whether for messages to, from, or between intermediate stations, or for through messages between this country, Australia, and New Zealand, are approved by the Treasury.
6. That an account, duly certified and audited, is rendered annually to the Treasury, as soon as possible after the anniversary of the opening of the cable, showing:—
 - (a) The net traffic receipts in the past year for messages sent over the line, after the deduction of money paid out for the further transmission of messages on other lines.
 - (b) The expenses incurred in the same year, including interest, sinking fund, maintenance and repairs, and working expenses.

The Treasury will cause this account to be duly examined, and will pay over to such persons as the associated Governments of Canada and the Australasian Colonies may nominate in their behalf, five-eighteenths of the amount by which the net receipts shown by this account, after examination, shall fall short of the amount of the expenses, subject to the maximum limit named above.

7. That the cable is worked in accordance with the International Telegraph Convention of St. Petersburg, of the 10th (22nd) July, 1875, and the Regulations in force for the time being thereunder.

Her Majesty's Government trust that the liberal arrangements proposed will meet the views of the Colonies, and that it will be accepted as a proof of their cordial desire to co-operate with the Colonial Governments in any undertaking of general concern, even though the Colonial interest in the matter may be more direct and apparent than that of this country.

Agents General for the Australasian Colonies.

The

The Agent-General for New South Wales forwarded to the Premier and Colonial Treasurer, under date of the 12th May, 1899, a copy, as under, of the joint letter of the Representatives of the Colonies interested in the Pacific Cable to the Right Honorable the Secretary of State for the Colonies, in reply to the despatch from the Imperial Government on the subject:—

Office of the High Commissioner for Canada,

Sir,

17 Victoria-street, London, S.W., 9 May, 1899.

We beg to acknowledge your letter of the 28th ultimo, in reference to the form and extent of the assistance which Her Majesty's Government are prepared to give to the scheme for connecting Canada with Australasia by direct submarine cable across the Pacific.

It has always been contemplated that the construction and operation of the cable would be under the joint control of the Mother Country and the Colonies, and that there would be a joint ownership on some conditions to be agreed upon. Her Majesty's Government now appear, however, to have in view a departure from this principle, and we venture to express the hope that the matter may be further considered, as the proposals communicated to us are certainly open to the gravest objections so far as Canada and the Australasian Colonies interested are concerned.

You observe that in considering the question Her Majesty's Government have had regard to the Report of the Committee of 1897; but in this connection we may be allowed to quote from the Report of that Committee upon the question of the ownership of the proposed cable:—

"71. The Committee are of opinion that the cable should be owned and worked by the Governments interested.

"72. In arriving at this conclusion, they do not underrate the importance of allowing all commercial undertakings to be carried out, whenever possible, by private enterprise unassisted by Government. But in this present case there seems to be no probability that private capital will be forthcoming for the purpose of laying a Pacific cable without a larger subsidy than the Governments interested in the project would be prepared to grant.

"73. If Government assistance in some form or other is necessary, the Committee think that a scheme under which the cable would be constructed and owned by the Governments interested is much to be preferred to a private company working under a Government subsidy."

It will at once be seen that the proposal now submitted is very different in its nature from the course recommended by the Committee. What is suggested is that Canada and Australasia should construct and operate the cable, and that they should be responsible for raising the necessary funds. On the other hand, it is proposed that the Mother Country should simply contribute an annual subsidy for twenty years of five-eighths of any deficiency between the receipts and expenses, the amount of such contribution not, however, to exceed £20,000 in any one year.

In consideration of this offer, Her Majesty's Government imposes conditions which will, in effect, give them the control of the undertaking. They stipulate, among other things:—

- (a) That the cable is, in accordance with a specification and samples to be approved by the Treasury, and to the satisfaction of an officer appointed by the Treasury for that purpose, constructed, submerged in proper working order and established with proper stations and offices at such places as the Treasury may approve, and effectually worked with a sufficient staff of proper and efficient operators, being British subjects.
- (b) That all rates charged to the general public, whether for messages to, from, or between intermediate stations, or for through messages between this country and Australia and New Zealand, are approved by the Treasury.
- (c) That messages of the Imperial Government are transmitted in priority to all other messages at rates not exceeding one-half of those charged to the general public.
- (d) That the accounts are to be subjected to the supervision of the Treasury.

In connection with the attitude now taken by her Majesty's Government, you point out that:—

- (1.) Her Majesty's Government have never concealed their opinion that the construction of a Pacific cable is of greater importance to Australasia and Canada than to the United Kingdom, and that they would not have been disposed to recommend Parliament to aid it but for their desire to afford the support and assistance of the Mother Country to her great self-governing Colonies in a project the success of which cannot fail to promote Imperial unity.
- (2.) That her Majesty's Government consider the responsibility for constructing and working the cable should be borne by the Governments of Canada and Australasia, to whom any profits which may hereafter accrue from the undertaking would consequently fall.

The question of the relative interest of the Colonies and the Mother Country in the matter is open to argument, but the dominating principle which has governed Canada and Australasia is that the scheme "cannot fail to promote Imperial unity"—a principle which we are glad to notice is accepted by Her Majesty's Government. The cable affords an alternative route to the East, passing entirely through territory under British control; its importance from a strategical point of view is manifest; and the possession of the first cable across the Pacific appears to be a matter of the highest commercial importance. And again, there is the question of connecting Canada and Australasia. If, as we believe, the cable cannot fail to promote Imperial unity, and Her Majesty's Government share that opinion the proposal certainly seems to justify the principle of joint ownership and control, which has formed the keynote of the discussions and negotiations for so many years.

The opinion seems to be very generally expressed, as the result of the presentation to Parliament of the recent correspondence, that the responsibility of constructing and working the cable should be borne by the different parts of the Empire interested, including, of course, the Mother Country, and that to them jointly should accrue any profits, direct or indirect, which may arise from the undertaking. From no point of view in any case can the proposal now submitted be regarded as either satisfactory or equitable to Canada and the Colonies we represent. It may be pointed out that if the loss on the undertaking during the first three years of working the cable were to largely exceed the sum estimated by the Committee of 1897, the total contribution of Her Majesty's Government even then might be less than £20,000 spread over that period; and, as already mentioned, a very large measure of the control over the enterprise is demanded in consideration of the offer to accept this small contingent liability.

But

But the serious part of the proposal is that Canada and Australasia would be called upon to raise the money on their own responsibility. It is evident that this could not be arranged by them on such favourable terms as if Her Majesty's Government were associated with the enterprise, and that their abstention would add materially to the expenses of constructing and working the cable. It cannot be questioned that the reduction of the annual outlay for these services would operate to the advantage of the Mother Country as well as to the Colonies, and it is this aspect of the case that we desire to commend to the serious consideration of Her Majesty's Government.

We trust that you will give us an opportunity of discussing this matter with you, in the hope that Her Majesty's Government may be disposed, after reconsideration, to join the Colonies in raising funds for the cable, and in constructing and operating it. Such a decision would practically involve little or no more liability than the suggestions you have made to us. At the same time we feel justified in stating that Canada, at any rate, and we think the Australasian Colonies also, would not be prepared, as we are advised, to proceed with the matter on the lines laid down in the communication now under acknowledgment.

We are, &c.,

STRATHCONA,
High Commissioner for Canada.
JULIAN SALOMONS,
Agent-General for New South Wales.
ANDREW CLARKE,
Agent-General for Victoria.
W. P. REEVES,
Agent-General for New Zealand.
HORACE TOZER,
Agent-General for Queensland.

The Right Honorable Joseph Chamberlain, M.P.,
Secretary of State for the Colonies.

The following cablegram was received from the Agent-General dated the 9th June, 1899:—

“Pacific Cable.—Secretary of State for the Colonies now writes willing to consider matter on the basis of utilising credit United Kingdom providing capital; but as this makes necessary discussion on mode raising capital, construction, and control, suggests Colonial Governments appoint delegates to meet Chancellor of Exchequer, and, or Chamberlain. Letter to follow.”

The following reply to the above was sent by the Premier:—

“Pacific Cable.—You are authorised to act as New South Wales delegate to discuss matter with Chancellor of Exchequer.”

The Agent-General for New South Wales, under date of 19th May, 1899, forwarded the following copy of a further joint letter, addressed to the Secretary of State for the Colonies by the London representatives of the Colonial Governments interested in the proposed Pacific Cable:—

Sir,

London, 18 May, 1899.

At the meeting you were good enough to grant us on the 15th instant, we placed before you our views on the proposals for connecting Canada with Australasia by direct submarine cable across the Pacific, very much on the lines of our letter of the 9th instant, in reply to the communication you caused to be addressed to us on the 28th ultimo.

What we have stated so far, in writing, relates chiefly to the commercial aspect of the proposals in question. We have pointed out the belief that has all along been held in the Colonies, that the construction and working of the cable would be undertaken jointly by the Governments interested. This view was also adopted by the Pacific Cable Committee, and we think it is not surprising that the proposition Her Majesty's Government have communicated to us should have caused some dismay in Canada and the Colonies we represent.

The abstention of the United Kingdom would inevitably add greatly to the cost of raising the capital required for the work, and consequently on the annual interest payment; and the suggestion to contribute for twenty years a proportion, not to exceed £20,000 annually, of any deficiency that might arise, cannot be regarded as adequately meeting the requirements of the case. The loss, part of which Her Majesty's Government are prepared to meet, can only be large (according to the estimate placed before the Committee after full inquiry) if the credit of England is withheld when the capital is being raised. Otherwise the obligations Her Majesty's Government are ready to assume, must be considered as in the nature of a contingent liability, and any adverse balance in the first few years would need to be very much greater than has been estimated, to require the payment of a sum such as that mentioned—even spread over a period of years. It can scarcely be considered by the Colonies as satisfactory that the Imperial Government should in effect first create a deficiency much larger than has been contemplated as probable, by increasing the annual cost of the requisite capital, and then offer to defray a certain proportion of the loss. It certainly seems to us more desirable that the object to be kept in view should be to reduce as far as possible both the initial and the subsequent cost of the undertaking to the taxpayers of England and the Colonies.

Therefore, on commercial grounds, it would not, in our opinion, be possible to accept the scheme as submitted, apart from the fact that the offer of the subsidy carries with it conditions virtually placing the construction and working of the cable under the control of the Treasury. Amongst the terms we would draw special attention to the veto reserved upon rates to be charged for messages, a condition which we venture to think would meet with the strongest objection in the Colonies.

But there is an aspect of the question, other, and even more important, than the commercial. It is undoubtedly the feeling in Canada and the Colonies concerned, that the proposed cable is an Imperial work, and that its success cannot fail—as stated in your letter—to promote Imperial unity. Indeed, the desire of the Colonies for the cable has been in no small degree based on the belief that the enterprise would be an Imperial undertaking. The Colonies concerned have relied on the co-operation of the Mother Country, and it will be a great disappointment if the Imperial Government do not accept the share of the responsibility which we venture to think properly attaches to the Mother Country in the matter, in virtue of her position as the head of the Empire.

The

The cable, as already mentioned, is destined to provide an alternative route to the East, entirely through British territory, and under British control. It will be important for commercial and for political reasons, apart altogether from its value as bringing Australasia and Canada into closer connection, and it is not necessary to dwell at any length on the advantages that must accrue to the Empire from the fact that of the first cable across the Pacific being in British hands. These facts are fully recognised in the outlying parts of the Empire, which take the warmest possible interest in the question of Imperial unity; and it will cause widespread regret and disappointment if anything should be allowed to occur to prevent the scheme being carried to a satisfactory conclusion in the near future. We are gratified to notice that similar views, according to the Press, appear to be entertained very largely in the United Kingdom.

It is for these reasons, as well as for those that have been referred to in our previous letter, that we earnestly commend the matter to the attention of Her Majesty's Government; and we feel every confidence that they will, on reconsideration, adopt the recommendations made by the Pacific Cable Committee after a very thorough and exhaustive inquiry into the whole question.

We are, &c.,

STRATHCONA,
High Commissioner for Canada.
JULIAN SALOMONS,
Agent-General for New South Wales.
ANDREW CLARKE,
Agent-General for Victoria.
W. P. REEVES,
Agent-General for New Zealand.
HORACE TOZER,
Agent-General for Queensland.

The Right Hon. Joseph Chamberlain, M.P.,
Secretary of State for the Colonies,
Downing-street, S.W.

The following cables (2) were received from the Agent-General for New South Wales on the 7th July, 1899:—

Pacific Cable.—“Meeting, Tuesday, Secretary of State for the Colonies and Chancellor of the Exchequer with High Commissioner for Canada and Agents-General for New South Wales, Victoria, New Zealand, and Queensland. Imperial Government now offer to co-operate fully with Colonies in raising capital for cable, and in construction and management; proposes this should be carried out by Board of Commissioners located in London selected by contributing Governments as follows:—The United Kingdom three members, Canada two, Australia and New Zealand together, three. England asks for this proportion of representatives as proposes virtually provide the capital any annual deficiency for interest, and perhaps sinking fund being met in proportion already agreed upon. Imperial Government suggests preliminary steps should be taken by provisional board thus appointed to invite tenders, arrange scheme of management, settle rates, and other preliminaries with a view to preparing for legislation. Imperial Government suggests that rates should be unanimously agreed to at outset, subsequent changes to be authorised by a fixed majority of board. If you generally agree to scheme thus provisionally outlined desirable that members of board be notified promptly, and should be capable business men. This message to be communicated by you to three Colonies interested.”

The second cable is as follows:—

Pacific Cable.—“Message cabled to-day previously seen by Secretary of State for the Colonies and cabled by High Commissioner to Canada. It was agreed at suggestion of Secretary of State that should be left to Australia and New Zealand Governments to decide whether one of three Australian delegates should be specially representative of New Zealand. Please inform other Governments interested.”

Copies of the messages duly forwarded to the Governments interested.

The Premier of Queensland replied 11th July, 1899:—

“Referring to your telegram of yesterday embodying two messages received from your Agent-General communicating results of Pacific Cable Conference I am strongly of opinion that each contributing Colony should have a separate representative on the proposed Board of Commissioners, making four for Australia and New Zealand, and that the representation of the other contributaries should be proportionally increased.”

The Right Hon. the Premier of New Zealand replied, 12th July, 1899:—

“Re Pacific Cable, New Zealand Government agrees to suggestion Imperial Government that provisional board should be appointed for the purpose of inviting tenders, arranging scheme of management, settling rates and preliminaries, that rates should be unanimously agreed to at outset, and that subsequent changes be authorised by fixed majority of permanent board, it would be a graceful act on the part of Australian Colonies and be much appreciated if they would agree to one of the three representatives on the board specially representing New Zealand.”

The Agent-General for New South Wales, under date of 9th June, 1899, forwarded the following copy of a despatch received from the Secretary of State for the Colonies in reply to the joint letters (2) of the 9th and 18th May, 1899, signed by the High Commissioner for Canada, and the Agents General for Victoria, New Zealand, Queensland, and New South Wales:—

My Lord,

Colonial Office, Downing-street, 6 June, 1899.

I am directed by Mr. Secretary Chamberlain to acknowledge the receipt of the letters of the 9th and 18th ultimo, signed by your Lordship and the Agents-General for New South Wales, Victoria, New Zealand, and Queensland, in reference to the offer of Her Majesty's Government to assist the scheme for connecting Canada with Australasia by a submarine cable.

2. Mr. Chamberlain desires me to point out in reply that though the proposal that the construction and operation of the cable should be under the joint control of the Mother Country and the Colonies concerned was advocated by the committee of 1897, and was adopted by the Colonies, Her Majesty's Government had distinctly stated that they were not in any way committed to that or any of the other recommendations of the committee.

3. In approaching the question of what assistance they should render to the project, Her Majesty's Government had to consider—as was pointed out by the Secretary of State at the Conference with the Premiers in 1897—that it was not one which the Imperial Government regarded as urgent, or in which, apart from their desire to afford the support and assistance of the Mother Country to the Colonies, they would have been anxious to take part.

4. They had also to bear in mind that the cable will be remote from this country, with one of its terminals in Canada and the others in Australasia, and that it must be worked by the Postal Administrations of the Colonies where it is landed.

5. It appeared to them, therefore, that it was preferable—as likely to avoid any possible friction in the management—that Her Majesty's Government should refrain from seeking any active participation in the construction and control of the cable, and should give their support to the scheme, untrammelled by any conditions except such regulations of a general nature as are generally considered advisable in connection with any cable project in which they give assistance.

6. The arrangement submitted on behalf of the Colonies was for the joint ownership and control of the cable, the Imperial Government guaranteeing five-eighteenth's of any loss on the working and receiving the same proportion of any profits, the Colonies guaranteeing the remaining thirteen-eighteenth's, and taking a similar proportion of profits.

7. Her Majesty's Government accepted without hesitation the estimate of the Colonial Governments of the proportion of the annual cost of the undertaking to be allotted to them as their share, and in offering therefore to guarantee the proportion asked for of any deficiency on the working and payment of interest and sinking fund, while foregoing any share in possible profits, and any active control over the cable, Her Majesty's Government considered that they were proposing an arrangement which might be more acceptable to the Colonies, as leaving them a free hand in the management of an enterprise more intimately affecting their interests, and which was at least as favourable to them from a pecuniary point of view as that which had been submitted on their behalf.

8. If the original outlay would have been, as you anticipate, considerably increased by this arrangement, it must be remembered that, while the United Kingdom would have had to bear its full share of any deficiency so created, the whole of any profits would have been left to the Colonies immediately interested and responsible for the efficient working of the cable, which, subject to the general conditions laid down, they would have been entirely free to work in the manner which appeared to them to serve their own interests best.

9. But although Her Majesty's Government are unable to admit that their previous offer was other than fair or even generous, they feel the force of the considerations based upon higher grounds than mere commercial expediency which are emphasised in your letter of the 18th ultimo. You point out that it is the feeling in Canada and the Colonies concerned, that the proposed cable is an Imperial work, and that its success cannot fail to promote Imperial unity, in the furtherance of which the Colonies are warmly interested; you say, further, that the desire of the Colonies for the cable has been in no small degree based on the belief that the enterprise would be an Imperial undertaking, that the co-operation of the Mother Country has been relied upon, and that great disappointment would be felt if Her Majesty's Government do not accept the share of the responsibility which attaches to the Mother Country, in virtue of her position as head of the Empire.

10. Her Majesty's Government highly appreciate the sentiments which have prompted the Colonies concerned to urge the close co-operation of the Mother Country with themselves in a work of great importance to the Empire. They are, therefore, willing, in order to meet the wishes of the Colonies, to consider the matter on the basis of utilising the credit of the United Kingdom in the provision of the capital necessary for the undertaking. But, as the adoption of this principle must involve the previous discussion of many questions relating to the mode of raising the capital, and to the construction and control of the cable, I am to suggest that for this purpose the Colonial Governments should appoint delegates to meet the Chancellor of the Exchequer and Mr. Chamberlain.

I am, &c.,

EDWARD WINGFIELD.

The following telegram was addressed to the Right Hon. the Premier of New South Wales by the Right Hon. the Premier of New Zealand, on the 22nd July, 1899:—

"I intend asking House of Representatives next week to authorise the Government to proceed with Pacific Cable question on basis of agreement indicated in Agents-General's telegrams sent through you, our share of cost to be as set out in our committee's report of last year, which assumed that Colonies share would be four-ninths, New Zealand's not to exceed one-eighth of whole cost. I shall be much obliged if you will advise other Premiers. Kindly inform me what you and other Premiers intend doing."

On 26th July, 1899, the Right Hon. the Premier of New South Wales replied as follows:—

"*Re* Pacific Cable. We are awaiting complete replies from other Colonies concerned before replying to Agent-General's message. With regard to your share may I remind you that although your committee recommended that you should join with other Colonies on basis of guarantee of four-ninths of the cost, your proportion not to exceed one-eighth of the whole cost, your letters of 30th September and 1st October stated that when the committee's report was being considered the Government would recommend that New Zealand should guarantee one-ninth of the liability. Would like to know clearly whether your final decision is one-eighth or one-ninth."

The Agent-General for New South Wales, under date of 23rd June, 1899, forwarded to the Right Hon. the Premier, the following copy of a joint letter, which was addressed to the Colonial Office, signed by the High Commissioner for Canada, the Agents-General for Queensland, Victoria, New Zealand, and himself, notifying Her Majesty's Government that they had been formally requested by their respective Governments to confer on the subject, as desired:—

Sir,

17, Victoria-street, S.W., 16 June, 1899.

We beg to acknowledge your letter of the 6th instant, with reference to the scheme for connecting Canada with Australasia by a submarine cable.

We observe with the liveliest satisfaction that you refer to the proposed work as one of great importance to the Empire, and that the considerations we ventured to bring to your notice have induced Her Majesty's Government to adopt, in effect, the recommendations of the Pacific Cable Committee to regard the enterprise as an Imperial undertaking, and to accept the share of the responsibility which attaches to the Mother Country, in virtue of her position as head of the Empire. It

It gave us great pleasure to communicate, by telegraph, to the Governments we represent, the willingness of Her Majesty's Government, as conveyed in your letter, to meet the wishes of Canada and the Colonies concerned, and to consider the matter on the basis of utilising the credit of the United Kingdom in the provision of the capital necessary for the undertaking; and further, its readiness to discuss the questions relating to the mode of raising the capital, and to the construction and control of the cable, which the adoption of this principle must involve.

Replies have now reached us with reference to the suggestion contained in the concluding paragraph of your letter that delegates should be appointed by the Colonial Governments, and we have been formally requested to confer with the Chancellor of the Exchequer and yourself on the subject as desired. In the meantime, we desire to express our appreciation of the decision of Her Majesty's Government, and of the terms in which it has been communicated to us, which we feel sure will also cause much gratification in the portions of the Empire we have the honor to represent.

We are, &c.,

STRATHCONA,
High Commissioner for Canada.
JULIAN SALOMONS,
Agent-General for New South Wales.
ANDREW CLARKE,
Agent-General for Victoria.
W. P. REEVES,
Agent-General for New Zealand.
HORACE TOZER,
Agent-General for Queensland.

The Right Hon. Joseph Chamberlain, M.P.,
Secretary of State for the Colonies.

No. 5.

Telegram from The Right Hon. the Premier of New Zealand to The Right Hon. the Premier of New South Wales, dated 27th July, 1899.

PACIFIC Cable. Have now decided that our share of cost shall be fixed at one-ninth.

No. 6.

Telegram from The Right Hon. the Premier of Victoria to The Right Hon. the Premier of New South Wales, dated 28th July, 1899.

PACIFIC Cable. I will consult Cabinet. Is it understood that agreeing to the appointment of representatives commits us to joining in the scheme which may be agreed upon;—if so, it will, I consider, be necessary to get Legislative sanction. Do you propose to do so?

No. 7.

Telegram from The Right Hon. the Premier of New South Wales to The Right Hon. the Premier of Victoria, dated 29th July, 1899.

PLEASE say if you concur to the following cablegram being sent to the Agent-General:—

“Agree with scheme proposed *re* Pacific Cable, but think Board should comprise nine members, one to represent New South Wales, one Victoria, one Queensland, one New Zealand. Nomination of New South Wales representative would be made if above suggestion approved. Other Colonies agree. Queensland suggests representation of other contributors be proportionally increased.”

No. 8.

Telegram from Premier of Queensland to The Right Hon. the Premier of New South Wales, dated 29th July.

PACIFIC Cable. Our Agent-General fears delay in constitution—joint committee may endanger project. Rather than run the risk I would consent to proposed representation of Australia, but I should be glad of a prompt reply to my telegram on this subject of 11th inst.

No. 9.

Telegram from The Right Hon. the Premier of Victoria to The Right Hon. the Premier of New South Wales, dated 1st August, 1899.

PACIFIC Cable matter has been discussed in Cabinet, and it has been decided to bring subject before Parliament as soon as possible.

No. 10.

Cablegram from The Right Hon. The Premier of New South Wales to The Agent-General, on the 3rd August, 1899.

WE agree to your proposals regarding Pacific Cable. We think it advisable that Board should consist of nine members—New South Wales one, Victoria one, Queensland one, New Zealand one. New Zealand and Queensland concur. Victoria will submit matter to Parliament as soon as possible. Is understood with regard to New South Wales recommendations of provisional Board must be subject to approval. We are quite prepared to nominate representatives.

No. 11.

Cablegram from The Secretary of State for the Colonies to His Excellency the Governor, dated 9th August, 1899.

REGRET to learn through Agent-General that your Government object to proposed representation of Australasia on Pacific Cable Board by three members. Question was closely considered here, and it was on acceptance of proposed scale of representation that Her Majesty's Government agreed to take an active part in undertaking as desired by the Colonies. Unless therefore your responsible advisers, and other Australasian Governments, waive their objections, and accept representation on basis proposed the whole question must be re-opened, and position of project seriously prejudiced.

Repeat the above message to Governments of Victoria and Queensland.

CHAMBERLAIN.

No. 12.

Telegram from The Right Hon. the Premier of Victoria to The Right Hon. the Premier of New South Wales, dated 11th August, 1899.

LAST night Assembly passed resolution authorising co-operation in construction Pacific Cable.

No. 13.

Cablegram from The Right Hon. the Premier of New Zealand to The Right Hon. the Premier of New South Wales, dated 11th August, 1899.

SECRETARY of State cables that unless Australasian Governments waive their objections, and accept prepaid (proposed?) Pacific Cable terms as regards representation, entire subject will have to be opened and reconsidered, no doubt prejudicing seriously the position. What do you propose to do?

No. 14.

Telegram from The Right Hon. the Premier of Victoria to The Right Hon. the Premier of New South Wales, dated 16th August, 1899.

PACIFIC Cable Board. We have telegraphed to our Agent-General as follows, viz.:—It is very inconvenient for four Colonies to have to choose three representatives, but, rather than delay matters, we will accept the proposed number. Glad to know, however, what is objection to increase of representatives from eight to eleven. Communicate to Secretary of State for Colonies.

No. 15.

Telegrams from The Right Hon. the Premier of New South Wales in the following terms were despatched to The Hon. the Prime Ministers of Victoria and New Zealand on 16th August, 1899.

URGENT. Consider that four Colonies should not re-open question of representation Pacific Cable since strong objection made, and that we should proceed to nominate. Dickson suggests, I concur, that probably best way out of difficulty would be that New South Wales and Queensland nominate one, Victoria and New Zealand one, and that the two agree upon a third.

No. 16.

Cablegram from The Right Hon. the Premier of New Zealand to The Right Hon. the Premier of New South Wales, dated 17th August, 1899.

Re Pacific Cable. In respect to this question, New Zealand took initiative. As stated in previous telegrams, it would be gracious act on part yourself, Premiers Queensland and Victoria to permit New Zealand to appoint one of the three representatives to the Board. This was practically conceded at the Conference in London, but, in deference to the wishes of your Agent-General, the appointment was left to the several Australasian Colonies interested to determine. We cannot delegate our powers, as suggested by the Premier of Queensland. Hope you, Dickson, and Turner may see your way to appoint two, and leave New Zealand to nominate the third, you agreeing to such nomination, and I, on the other hand, agreeing to the two you nominate.

No. 17.

Telegram from The Right Hon. the Premier of Victoria to The Right Hon. the Premier of New South Wales, dated 18th August, 1899.

PACIFIC Cable Board. We are satisfied that we should proceed at once to nominate representatives, but as to Dickson's suggestion we would prefer that the four Colonies agreed as to the three representatives. It would be as easy for this to be done as for the Colonies grouped as Dickson suggests to agree upon one, and more satisfactory. Our Postmaster-General still thinks a confidential meeting of the Postmasters-General of the Colonies interested should be held to settle this question and arrange the numerous details that will have to be decided by the representatives when selected. Mr. Duffy is also anxious that the proposal of the Eastern Extension Company should be discussed by the Postmasters-General before final decision.

No. 18.

Telegram from The Premier of Queensland to The Right Hon. the Premier of New South Wales, dated 19th August, 1899.

SIR George Turner has sent me a copy of his telegram to you on subject of Pacific Cable, and I have replied as follows:—

"Pacific Cable. I see no necessity for meeting of Postmasters-General to decide on the formation of the preliminary Board, and am quite agreeable to the four Colonies electing the three representatives. I distinctly object to Mr. Duffy's proposal as to discussion of Eastern Extension Company's scheme, which would merely delay necessary action. I take it that final decision has been already announced save as to Colonial members of preliminary Board."

No. 19.

Telegram from The Right Hon. the Premier of Victoria to The Right Hon. the Premier of New South Wales, dated 28th August, 1899.

PACIFIC Cable representatives. You do not suggest any method of selecting representatives, and discussing points of necessary agreement between Colonies interested. In absence of any suggestion our Postmaster-General is still of opinion that a meeting of Postmasters-General should be held. In any case the representatives should be chosen without delay, and Victoria's position to the Eastern Extension Company finally determined, as any act by Victoria in a direction sought may prejudice other Colonies. Delay at this juncture goes to prejudice the Pacific Cable scheme.

No. 20.

Cablegram from The Right Hon. the Premier of New Zealand to The Right Hon. the Premier of New South Wales, dated 31st August, 1899.

PACIFIC Cable. Suggest as solution of difficulty appointment Agent-General, New South Wales, Victoria, and New Zealand to represent Australia on Provisional Board for first time. By united action later on we should get four representatives instead of three.

No. 21.

Minute of His Excellency the Governor to The Right Hon. the Prime Minister of New South Wales, dated 8th September, 1899.

ADVERTING to the enclosure to my letter of the 11th ultimo, I have now to transmit, for the information of my Ministers, the subjoined copy of a further telegraphic despatch which I have this day received from the Secretary of State for the Colonies:—

"My telegram of 9th August, anxious to know whether Australasian Colonies are agreed in accepting representation of Australasia on Pacific Cable Board by three members. Serious difficulties caused by delay in settling matter, and early answer necessary.

"I shall be pleased to have an early decision in the matter from my Ministers in order that I may communicate the same to Mr. Chamberlain."

No. 22.

Minute of The Prime Minister of New South Wales to His Excellency the Governor, dated 9th September, 1899.

THE Prime Minister presents his humble duty to His Excellency the Governor, and begs to state, in answer to Mr. Chamberlain, the Secretary of State's cablegram, that the Colonies of New South Wales, Victoria, Queensland, and New Zealand have consented that they should have only three representatives.

(NOTE.—A cable and despatch in terms of the Prime Minister's minute were forwarded by His Excellency the Governor to the Secretary of State for the Colonies on the 11th September, 1899.)

No. 23.

Telegram from The Right Hon. the Premier of Victoria to The Right Hon. the Premier of New South Wales, dated 11th September, 1899.

PACIFIC Cable Committee. Our Postmaster-General suggests that the three Australian Colonies allow one representative to New Zealand, and that the other two representatives be balloted for. Each Australian Colony nominating one. Australian interests practically identical. Please reply whether you agree, as urgent necessity exists for making appointment without delay.

(NOTE.—A change of Government took place on the 13th September, 1899, Mr. Lyne taking office as Premier and Mr. Crick as Postmaster-General.)

No. 24.

Minute of His Excellency the Governor to The Prime Minister of New South Wales, dated 13th September, 1899.

THE Governor has to transmit, for the information of his Ministers, the subjoined copy of a telegraphic despatch which he has received from the Secretary of State for the Colonies:—

“Referring to your telegram of 11th September, Pacific Cable Board, received with much gratification. Hope to hear shortly names of representatives.”

No. 25.

Telegram from The Right Hon. the Premier of New Zealand to The Hon. the Premier of New South Wales, dated 15th September, 1899.

I HAVE sent following to Premier, Queensland:—“Pacific Cable Board Press message published here to effect that when speaking at Wynnum you said, as means of solving difficulty, you approved New South Wales and Queensland conjointly appointing one representative, New Zealand appointing another, and that these two should name the third.” Kindly say if these are your views, and if message should not read Victoria, New South Wales, and Queensland.

No. 26.

Minute of The Hon. the Postmaster-General, New South Wales to The Hon. the Premier, New South Wales, dated 18th September, 1899.

I CONCUR with the Premier of Victoria, that the appointments to the Provisional Board to consider the Pacific Cable question should be no longer delayed.

I also concur with the Postmaster-General of Victoria, that New Zealand be allowed one representative, and that the three Australian Colonies, namely, New South Wales, Victoria, and Queensland, nominate the other two, and that these be balloted for.

It might be desirable, in the first instance, to get Queensland's acquiescence *re* the appointment of delegates.

No. 27.

Telegram from The Right Hon. the Premier of New Zealand to The Hon. the Premier, New South Wales, dated 19th September, 1899.

Re Pacific Cable Board. Hope you will see your way to assent to proposition made by Premier, Victoria, to which I understand Premier, Queensland, has already agreed, that New Zealand be allowed one representative, and that the other two be balloted for by New South Wales, Victoria, and Queensland. I hope this may be agreed to; it would be much appreciated here. Imperial authorities are pressing for final decision, and further delay may imperil realisation of scheme.

No. 28.

Telegram from The Right Hon. the Premier of Victoria to The Hon. the Premier of New South Wales, dated 20th September, 1899.

PACIFIC Cable Board. Do you agree to proposal in my telegram of the 11th instant, that one representative be allowed to New Zealand and that the other two representatives be balloted for by New South Wales, Queensland, and Victoria, each Colony nominating one. Premier of Queensland wires that he will agree to this course if all contributing Colonies concur. New Zealand also concurs. An early expression of your views will oblige, as there is an urgent necessity for an immediate decision.

No. 29.

Telegram from The Hon. the Premier, New South Wales to The Right Hon. the Premier, Victoria, dated the 21st September, 1899.

PACIFIC Cable. I concur that one representative be allowed New Zealand and two to New South Wales, Victoria, and Queensland. These two to be chosen by ballot, each Colony nominating one. Will you arrange ballot? If so, we will send our nomination to you under sealed cover. Queensland to be asked to do the same.

No. 30.

Telegram from The Right Hon. the Premier of Victoria to The Hon. the Premier of New South Wales, dated 21st September, 1899.

PACIFIC Cable Board. Your telegram received, approving New Zealand having one representative and of New South Wales, Victoria, and Queensland balloting for the other two. I will arrange ballot as you propose. I think best plan will be for you to telegraph the name of your nominee, and for Queensland to do the same. I will then have each name along with that of your nominee placed in separate envelopes exactly alike, will then place the three envelopes in a ballot box and will myself draw out two, and the two so drawn to be accepted by us all as the representatives of the three Colonies. I have telegraphed similarly to Queensland.

No. 31.

Telegram from The Right Hon. the Premier of Victoria to The Hon. the Premier of New South Wales, dated 27th September, 1899.

PACIFIC Cable Board. Premier of Queensland has given me name of his nominee. Can you let me have yours, so that ballot may be taken? It is very desirable that representatives should be appointed at earliest possible moment.

No. 32.

Telegram from The Hon. the Premier of New South Wales to The Right Hon. the Premier of Victoria, dated 27th September, 1899.

PACIFIC Cable Board. We accept your offer to conduct the ballot for the representatives of New South Wales, Victoria, and Queensland. This Colony's nominee is Sir Julian Salomons, Agent-General.

No. 33.

Telegram from The Right Hon. the Premier of Victoria to The Hon. the Premier of New South Wales, dated 28th September, 1899.

PACIFIC Cable Board. The nominations for the Board were, by New South Wales, Sir Julian Salomons; the Agent-General, by Queensland, Sir Henry Norman, and by Victoria, Sir Andrew Clarke, the Agent-General. I accordingly caused three sealed envelopes containing, respectively, the words New South Wales, Queensland, and Victoria to be placed in a ballot-box, and I then drew out two, which proved upon being opened to be New South Wales and Victoria. The nominees of those two Colonies, viz., Sir Julian Salomons and Sir Andrew Clarke, are, therefore, the chosen representatives to act with the representative of New Zealand. Sir Andrew Clarke is at present absent from England, but will be back shortly. I am, therefore, cabling to ascertain when the Board proposes to sit, and if I find that the sitting must be held before Sir Andrew Clarke can be back, then we must name someone else in his place. I purposely put the names of the Colonies, and not the names of the representatives, in the ballot-box, so that what was balloted for was as to which Colonies' nominees should be on the Board without binding any Colony as to its nominee, as there was, and still is, a doubt Sir Andrew Clarke being back in time. I presume you will approve of this, and accept the result.

No. 34.

Minute of The Hon. the Postmaster-General of New South Wales, dated 5th October, 1899.

I ADVISE that His Excellency the Governor be asked to cable to the Right Honorable the Secretary of State for the Colonies that the colonies of New South Wales, Victoria, and Queensland have agreed to be represented by the Agents-General of New South Wales and Victoria at the Pacific Cable Committee, it being, of course, understood that recommendations thereof shall be subject to approval of Governments concerned.

The Agent-General for New South Wales should be requested, by cable, to act as proposed.

The Premier of Victoria should also be told what action New South Wales is taking to give effect to the recent selection by ballot of the representatives in question.

W.P.C., 5/10/99.

The Under Secretary for Finance and Trade.—S.H.L., 5/10/99.

Urgent.

No. 35.

The Under Secretary for Finance and Trade to The Deputy Postmaster-General.

Sir,

The Treasury, New South Wales, Sydney, 10 October, 1899.

With reference to your blank cover communication of 5th instant, I have the honor to inform you that His Excellency the Governor has been duly requested to advise the Right Honorable the Secretary of State for the Colonies of the appointment of the Agents-General of Victoria and New South Wales to represent Victoria, Queensland, and New South Wales on the Pacific Cable Committee.

The Agent-General for this Colony has also been informed of his appointment as a representative, and the Right Honorable the Premier of Victoria has been advised of the actions taken.

I have, &c.,

F. KIRKPATRICK,

Under Secretary for Finance and Trade.

Note.—Cable and confirming despatch were duly forwarded by His Excellency the Governor to the Secretary of State for the Colonies on the 11th October, 1899.

No. 36.

Telegram from The Right Hon. the Premier of New Zealand to The Hon. the Premier of New South Wales, dated 5th October, 1899.

I HAVE introduced Bill authorising effect be given to resolutions *re* as to Pacific Cable maximum cost fixed at £1,700,000, as is done in the Canadian Act. Shall be glad to have your opinion on this.

No. 37.

Minute of The Hon. the Postmaster-General of New South Wales, dated 10th October, 1899.

I BELIEVE it was considered by the late Premier, and by the late Postmaster-General, that nothing need be done in the matter of obtaining legislation, or of putting the matter before Parliament, until the Pacific Cable Board—lately appointed to prepare estimates, invite tenders, suggest tariff, &c., with a view of preparing for legislation—had furnished its report. Mr. Reid distinctly stated to the Imperial Government that, so far as this Colony was concerned, any proposals must be subject to the approval of our Parliament.

I recommend that, in reply to his cablegram of the 5th instant, the Right Hon. the Premier of New Zealand be informed in the foregoing terms, and that it be stated that this Government concurs in this view of the matter.

W.P.C., 10/10/99."

The Under Secretary for Finance and Trade.—S.H.L., 10/10/99.

No. 38.

The Under Secretary for Finance and Trade to The Deputy Postmaster-General.

Sir, The Treasury, New South Wales, Sydney, 12 October, 1899.

Referring to your blank cover communication of the 10th instant, in the matter of the Pacific Cable, I have the honor to inform you that, in accordance with the Honorable the Postmaster-General's request, the Right Honorable the Prime Minister of New Zealand's cablegram of the 5th instant has been replied to as per copy message attached.

I have, &c.,

F. KIRKPATRICK,

Under Secretary for Finance and Trade.

Copy of Message referred to.

YOUR cablegram of 5th, Pacific Cable. The late Government considered that nothing need be done in matter of obtaining legislation or putting matter before Parliament until Board appointed to prepare estimates, invite tenders, suggest tariff, &c., with a view of preparing for legislation, has furnished its report. Imperial Government were distinctly informed that, so far as this Colony was concerned, any proposals must be subjected to approval of our Parliament. We concur in our predecessor's view of the matter.

No. 39.

Cablegram from The Agent-General to The Hon. the Premier of New South Wales.

14 December, 1899.

PACIFIC Cable Committee met to-day. The questions submitted by Colonial Office considered next meeting, 8th January. See my letter of 5th (? 8th) instant.

No. 40.

Telegram from The Hon. the Premier of Victoria to The Hon. the Premier of New South Wales, dated 13th January, 1899.

THE following is copy of our Agent-General's telegram asked for by you, namely, London, 9th January, Pacific Cable. Agents-General for New Zealand and Queensland and myself most strongly deprecate accepting proposals of Eastern Extension Cable Company, as, in our opinion, result would seriously cripple Imperial Pacific Cable. High Commissioner for Canada emphatically concurs with this view. Agent-General for New South Wales cabling separately.

A. McLEAN.

No. 41.

The Agent-General to the Hon. The Premier of New South Wales.

ON the 30th January, 1900, the following letter was received from Sir Julian Salomons:—

PACIFIC CABLE COMMISSION.

Westminster Chambers, 9, Victoria-street,

Westminster, S.W., 8 December, 1899.

Sir,

I have the honour to forward, herewith, for your information, copy of a letter addressed to me by the Secretary of State for the Colonies, informing me of my appointment as a member of a Committee to further examine and elaborate the scheme for laying a Telegraph Cable between British North America and the Colonies of Australia, which was submitted by the Pacific Cable Committee, and reported upon in 1896.

This

This is the Report, copies of which were transmitted to you from this Department, on the 4th May last.

Mr. Chamberlain's letter, you will observe, encloses a copy of the instrument of appointment (copy herewith), and asks upon what date it would be convenient for me to attend the first meeting. I have replied to this communication stating that I shall have pleasure in attending the meeting upon receiving timely notice.

Up to the time of writing this, I have received no reply.

I have, &c.,

JULIAN SALOMONS,

(per S.Y.).

The Honorable the Postmaster-General.—W.J.L., Jan. 27, 1900. The Deputy Postmaster-General.—F.K., 29/1/00. Seen.—W.P.C., 31.

Colonial Office to Agent General.

Downing-street, 30th November, 1899.

The Agent-General for New South Wales,—

Sir,—

I am directed by Mr. Secretary Chamberlain to inform you that he has appointed you to be a member of a Committee to further examine and elaborate the scheme for laying a Telegraph Cable between British North America and the Colonies of Australia, which was submitted by the Pacific Cable Committee which reported in 1896, and I am to enclose a copy of the instrument of appointment.

2. I am to enquire at what date it would be convenient for you that the first meeting should be held.

I am, &c.,

H. BERTRAM COX.

I hereby appoint—

The Right Honorable William Waldegrave Earl of Selborne, Under Secretary of State for the Colonies,

Sir Francis Mowatt, K.C.B., Permanent Secretary to the Treasury,

Sir George Herbert Murray, K.C.B., Secretary to the Post Office,

The Right Honorable John Campbell, Earl of Aberdeen, G.C.M.G.,

The Right Honorable Donald Alexander Baron Strathcona and Mount Royal, G.C.M.G., High Commissioner for Canada,

Sir Julian Emanuel Salomons, Q.C., Agent-General for New South Wales,

Lieutenant General the Honorable Sir Andrew Clarke, R.E., G.C.M.G., C.B., C.I.E., Agent-General for Victoria, and

The Honorable William Pember Reeves, Agent-General for New Zealand, to be a Committee to further examine and elaborate the scheme for laying a Telegraph Cable between British North America and the Colonies of Australia, which was submitted by the Pacific Cable Committee which reported in 1896.

Sir Francis Mowatt will act as Chairman.

The first duty of the Committee will be to consider the following points:—

1. The cost of (a) laying and (b) maintaining the line, and whether as a single or duplicated cable.

In order to arrive at a conclusion on this point, the Committee will be at liberty, if they think proper, to advertise for tenders on the understanding, however, that no tender can be accepted without reference to the several governments concerned.

2. The rates to be charged for messages, and the revenue which the cable may be expected to earn therefrom.

3. The steps which should be taken in order to secure that all messages between this country and Australasia should be sent solely through British territory or through cables owned and worked by British Companies.

4. The framing of a scheme for the permanent administration and working of the cable when laid.

The conclusions arrived at by the Committee on these points will be laid before the several governments concerned, who will then decide what further steps should be taken.

All questions as to the mode of raising the capital necessary for the undertaking are reserved for the Imperial Government alone.

J. CHAMBERLAIN.

November 25th, 1899.

No. 42.

Cablegram from The Right Hon. the Premier of Canada to The Hon. the Premier of New South Wales, dated 22nd January, 1900.

WOULD sincerely hope that project of Eastern Extension Telegraph Company will not be accepted. Any kind of delay at this moment might be fatal.

No. 43.

Minute of The Hon. the Postmaster-General of New South Wales, dated 31st January, 1900.

I WOULD advise that the following reply be sent to the cablegram from the Right Honorable the Premier of Canada to the Honorable the Premier, Sydney, dated the 22nd January, 1900:—

“If the Eastern Extension Company alter their proposals as suggested by Premiers' Conference, acceptance of same, it is considered, would not seriously affect building of Pacific Cable.”

W.P.C.

The Under Secretary for Finance and Trade.—S.H.L., 31/1/00.

No. 44.

Cablegram from The Right Hon. the Premier of Canada to The Hon. the Premier of New South Wales, dated 5th March, 1900.

HAVE ascertained from best manufacturers Pacific Cable can be made and laid within eighteen months. Its advocacy has already greatly reduced Australian cable rates; its completion will doubtless occasion further reductions, and (if) Governments concerned stand together will lead to further cable extensions likely to meet Australia's and other Governments cable requirements beyond anything private capital likely to afford. Deeply regret appear opposing temporary advantage offered Australia. Hope Australian colonies will postpone consideration proposals Eastern Telegraph Company until Pacific Cable in operation.

No. 45.

Memo.

THE Pacific Cable Committee's Report has reached the Government, but is marked "Secret and Confidential." The following figures show the financial estimates of the Committee, and the probable liabilities of this Government:—

	£
Estimated cost of single cable	1,800,000
Annual interest and sinking fund	70,000
Annual working expenses	25,000
Annual maintenance	55,000
Total...	<u>£150,000</u>
Estimated annual receipts based on a 2s. a word tariff	96,000
Estimated annual loss	54,000
Estimated New South Wales share of interest on sinking fund, working expenses, and maintenance	16,667
Estimated New South Wales share of revenue	10,666
Estimated New South Wales share of loss	6,000

The two shillings a word provides only for the cable rate; the one shilling a word is the estimated tariff beyond.

NEW SOUTH WALES.

METROPOLITAN BOARD OF WATER SUPPLY AND
SEWERAGE.

(TWELFTH REPORT—FROM 1 JULY, 1899, TO 30 JUNE, 1900.)

Printed under No. 18 Report from Printing Committee, 29 November, 1900.

7 November, 1900.

To the Honorable the Secretary for Public Works,—

Sir,

The Board of Water Supply and Sewerage have the honor to submit to you their Twelfth Report, embracing the period from 1 July, 1899, to 30 June, 1900.

WATER SUPPLY.

2. The average daily consumption of water per head of estimated population supplied was 41·62 gallons, as against 41·72 gallons during the year 1898–9. The average daily supply was 19,885,953 gallons, and the estimated population supplied 478,000.

3. During the year, 2,822 houses were connected to the Water Supply, making a total at present supplied of 95,192 houses. The total number of properties, including vacant land, liable for water rates is 117,654.

4. The total length of trunk and reticulation mains laid was 31 miles 649 yards; and 14 miles were cleaned. Of the mains laid, a distance of 2,323 yards was of 30 inches in diameter, and 837 yards of 24 inches diameter, 527 ball, 17 screw-down, and 15 spring hydrants were fixed.

The total length of water-mains, exclusive of trunk mains, now under the Board's control, is 1,130·33 miles, with 1,910 screw-down and 19,786 ball and 15 spring-valve hydrants.

5. During the year the catchment area has been regularly patrolled, and the settlement thereon systematically inspected by the Board's Ranger.

The Board have steadfastly refused to acquiesce in the granting of applications to mine on the area or to approve of the establishment of any industry which would in any way induce further settlement, and thereby increase the chances of pollution.

Although it may be, and indeed has been, said that the Board by their action in reporting against these applications are crippling an important industry, it must be remembered that the trust imposed upon the Board of maintaining the supply of water to half a million of people in its present state of purity is of far greater national importance from a health point of view than the benefit of the comparatively few who would derive a livelihood by mining operations on the reserve.

No doubt the time is not far distant when the question of acquiring the whole of the lands on the area which were alienated by the Crown before the initiation of the present water supply scheme will have to be seriously considered.

The canal, tunnels, and aqueducts are in a satisfactory condition.

6. The work of strengthening the walls of the upper canal was continued at intervals during the year, the total length dealt with being 11,132 lineal feet.

Two unimportant slips occurred, which were promptly attended to.

7. The works for the supply of water to the town of Camden from a point on the canal near Kenny Hill were completed in October, when the water was turned on and the scheme has given every satisfaction since.

The supplies to the towns of Liverpool, Campbelltown, Smithfield, and Richmond were also efficiently maintained.

8. All the works at the Prospect Storage Reservoir are in excellent order. Tree-planting was continued briskly, and it is the intention of the Board to make forestry an important feature in this locality.

In the early part of the year, when the water-level was at its lowest, a subsidence on the inner slope of the reservoir embankment took place at Transverse Section, No. 44. To remedy this, the toe of the slope was weighted by the deposition thereon of blue metal from the Board's quarry close by, and the puddle core was restored to its original height. The whole of the work was completed in August, 1899, since which date no sign of movement is apparent.

A new road has been constructed below the bank, and all traffic is now excluded from the bank itself.

9. The canal, including the long brick aqueduct between Prospect and the pipe-head basin at Guildford, has been cleaned and repaired.

The duplicate 6-foot steel main between pipe-head basin and Pott's Hill Reservoir has been completed by the Government, and is being made use of by the Board, although not yet formally transferred to their control.

10. Advantage was taken, when the Pott's Hill Reservoir was emptied for the purpose of connecting up the duplicate trunk main, to carefully examine the bottom and sides thereof, which were found in good condition. All submerged iron-work was cleaned and painted.

The screening chamber at Pott's Hill is working efficiently, and twelve new screens have been placed in position, in place of old ones, which had been in for many years.

11. A new arterial main, from the Centennial Park Reservoir, to improve the supply to the high-level zones of the districts of Glebe, Balmain, Petersham, and portions of the City, has been completed, and the supply to the following districts has been augmented :—Petersham, Enfield, Paddington, and Woollahra.

12. The number of water meters fixed was 1,974. Of these, 1,903 were issued on the rental system, and 71 were purchased. The total number now in operation is 9,567, and of these, 5,542 are the property of the Board.

13. The work of testing water fittings at Crown-street Reservoir is increasing year by year; the number dealt with being 114,194, as against 72,102 during the previous year.

14. The pumping machinery at the various stations has been maintained in an efficient condition.

The cost of pumping 1,000 gallons of water 100 feet high, as compared with former years, was as follows:—

	1890.	1891.	1892.	1893.	1894.	1895-6.	1896-7.	1897-8.	1898-9.	1899-1900.
Crown-street ...	d. ·75	d. ·70	d. ·48	d. ·32	d. ·35	d. ·347	d. ·345	d. ·387	d. ·339	d. ·290
Ryde	·324	·312	·422	·373	·377
Chatswood	1·025	·805	·615	·671
Carlton	·984	1·149	·844	·917
Richmond	1·452	1·788	1·308	1·300

15. The total quantity of water pumped within the Metropolitan Area was, 4,296,401,968 gallons, being an increase of 529,984,192 gallons, and representing 59·19 per cent. of the total discharge from Prospect, whereas last year the percentage was 54·9.

It is satisfactory to note that, although the quantity of water pumped during the year was 14 per cent. more than that so dealt with during the previous year, the consumption of coal was 2 per cent. less.

16. The various reservoirs and tanks have been maintained in good condition.

A concrete reservoir of a capacity of 500,000 gallons is in course of construction at Pymble. From this reservoir the districts between Pymble and Chatswood will be served, which will reduce the abnormal pressure at present existing by reason of the supply being from so great a height as Wahroonga.

17. An additional block of land forming portion of the old Botany Water Reserve has been leased at a satisfactory figure for a term of ten years for wool-scouring and fellmongering purposes to the Sydney Wool-scouring Company (Limited).

There are now six establishments of this kind carrying on operations on the Water Reserve, resulting in considerable accession of revenue to the Board.

The usual return of the results of analyses by Mr. William M. Hamlet, Government Analyst, of samples of water taken from different points of supply, is appended hereto, showing that the quality is pre-eminent.

For the facilities afforded of obtaining these valuable analyses monthly, the Board desire again to thank Dr. Ashburton Thompson, Chief Medical Officer and President of the Board of Health.

SEWERAGE.

SEWERAGE.

19. During the year, 12·92 miles of sewers were transferred from the Government to the control of the Board, and 59·48 miles of reticulation sewers were constructed by the Board. The total length of sewers now under the jurisdiction of the Board is 461·41 miles.

20. 3·10 miles of storm-water ducts were also handed over to the Board by the Government, ·01 miles were constructed by the Board, who also took over 0·26 miles built by municipal councils. The total length of these channels now under the Board's control is 25·678 miles.

21. The sewage outfall works at North Sydney were transferred to the Board early in the year by the Government.

22. The number of houses connected to the sewers during the year was—in the City, 631, and Suburbs, 8,709. The total number now connected is 68,060, representing a population of 340,300.

23. The whole of the storm-water channels, main outfall and reticulation sewers have been maintained in an efficient condition.

The flushing and ventilation arrangements instituted by the Board have proved very effective; this is testified to by the fact that the health of the men engaged underground in the cleansing and maintenance of these works has been uniformly good.

24. The total quantity of silt removed from the sewers was 1,000 tons, and from the storm-water channels, 9,260 tons.

25. The quantity of sewage lifted into the main southern outfall sewer by the Shone Ejector Plant at Alexandria was 202,572,000 gallons, being a daily average of 556,000 gallons.

Now that the low-level pumping station is approaching completion it is intended shortly to dismantle this machinery, which was only erected some five years ago as a temporary expedient, pending erection of the permanent plant.

26. The pumping plant at Double Bay is working well.

27. Although the low-level pumping station at Marrickville has not yet been formally transferred from the Government, the machinery is being run by the Board's staff, in order that they may become thoroughly conversant with the mechanical details connected therewith prior to transfer.

28. At the North Sydney outfall works, it was found that the tank accommodation was insufficient to meet the requirements of the rapid expansion of the sewerage system; additional works were therefore authorised, and are in progress.

The methods for the proper disposal of the sludge at these works have proved unsatisfactory as well as expensive. Various experiments for improvement have been tried, as detailed in the report of the Engineer, and recently, profiting by the experience of experts in other parts of the world, it was decided to convert one of the precipitation tanks into a bacteria bed, on the Scott-Moncrieff principle, and it is confidently hoped that this will be the means of satisfactorily solving the difficulty.

29. The average daily flow of sewage on to the Botany Farm was 3,000,000 gallons, as against 2,376,000 gallons during the previous year.

30. Tree-planting has been made an important feature on the Botany and Rockdale Sewage Farms, over 700 osier cuttings having been put in under the advice of Mr. Maiden, Director of the Botanic Gardens,

Five new workmen's cottages have been erected.

The revenue received from agistment, sale of produce, and live stock, &c., was £210 0s. 3d., as against £197 8s. 6d. during the previous year.

The whole of the leaseholds comprised within the farm area are in a satisfactory condition.

31. In the last report of the Board it was mentioned that it was intended to construct a tank for experimenting with the treatment of sewage from the main southern outfall on biological principles, but the Board regret that the then Minister did not see his way to approve of the necessary expenditure, in view of the works which had then just been carried out at Rookwood.

The results at the latter place have, however, proved of little use to the Board, as the class of sewage is entirely different.

As there can be little doubt, in the light of the experience gained in England and on the Continent, that the biological treatment of sewage is the most modern approved scientific principle, the question of making the necessary alterations at the Botany and Rockdale Outfalls, in the interests both of public health and economy, must shortly form a subject for the serious consideration of the Board.

32. The total number of premises connected to the sewers by the Board Contractors was 431, of these 297 were dealt with under the compulsory clauses of the Act, and 134 under the Deferred Payment System.

33. There are in the city still a considerable number of houses the drainage of which is defective and dangerous to the health of the occupants.

A good many, as a result of the plague visitation, were attended to, but these only formed a small proportion of those requiring attention.

As pointed out so often in previous reports, the Board are unable, owing to defects in the Acts under which they work, to proceed compulsorily except in a very cumbersome and round-about way through the Board of Health and the local authority.

The Board cannot too strongly urge upon the Minister the vital importance of passing into law before the present session of Parliament closes the Amending Water and Sewerage Bill now with him, which contains so many valuable provisions for safeguarding the health of the community, as they view with alarm the lamentable consequences likely to ensue should the dread plague, of which such sad experience was gained last year, recur.

34. The number of official certificates issued on completion of plumbing and drainage works was 5,917, as compared with 3,011 during the previous year, showing that the public are beginning to fully appreciate the value of this provision made in their interests.

35. One thousand and twelve ventilating shafts were erected, and three automatic combined flushing tanks and induct sprays completed; the quantity of steel tubing used was 42,632 lineal feet.

A large brick ventilating shaft is also in course of erection at Percival-road, Petersham.

36. The total length of sewers now ventilated is 430 miles, and the quantity of tubing comprised in the shafts 189,243 lineal feet.

FINANCIAL.

WATER SUPPLY.

37. The following table shows the working of the Water Branch:—

Year.	Revenue.	Working Expenses.	Capital Cost.	Capital Cost, excluding item City Council's Water Fund.	Percentage of Working Expenses to Revenue.	Percentage of Working Expenses to Capital Cost.	Percentage of Revenue on Capital Cost.	Interest on Capital Cost after Paying Expenses.
	£	£	£	£				
1888	125,486	19,205*	3,004,557	2,623,837	20·40	0·97	4·78	3·81
1889	138,923	36,568	3,088,068	2,707,500	26·32	1·35	5·13	3·78

1891	165,831	38,291	3,306,649	2,925,987	23·09	1·30	5·66	4·36
1892	155,886	45,078	3,394,581	3,013,919	28·91	1·49	5·17	3·68
1893	157,426	37,141	3,409,731	3,029,059	23·59	1·22	5·19	3·97
1894	161,167	39,274	3,440,614	3,059,957	24·36	1·21	5·26	4·05
1895 for six months.	85,364	19,693	4,078,979	3,698,323	23·06	1·06	4·60	3·54
1895-6	174,357	37,495	4,154,261	3,776,879	21·50	0·99	4·61	3·62
1896-7	175,984	40,821	4,244,550	3,867,168	23·19	1·05	4·55	3·50
1897-8	178,881	45,220	4,327,543	3,950,161	25·27	1·14	4·52	3·38
1898-9	194,332	47,147	4,398,945	4,021,563	24·26	1·17	4·83	3·66
1899-1900	195,618	47,040	4,541,499	4,164,117	24·04	1·12	4·69	3·57

* For nine months only.

38. There is an increase in the revenue of £1,268 over that of the previous year. Of this sum the assessment rates are responsible for £1,150, which is a healthy sign, showing as it does that the gradual fall in values which has been going on for some years has ceased.

39. The working expenses are less by the sum of £107, which cannot but be regarded as satisfactory, when it is remembered that each year the mileage of water-mains to be maintained is considerably increased.

40. The capital cost has been increased by the sum of £142,554, representing the value of new works constructed.

41. The revenue was £195,618, and the working expenses £47,040, or 24·04 per cent. of the gross revenue, leaving a net revenue of £148,578, or a return of 3·57 per cent. upon the capital cost.

42. The following tables in connection with the towns of Campbelltown and Liverpool speak for themselves, and call for no particular comment:—

CAMPBELLTOWN WATER SUPPLY.

Year.	—	Annual Instalment required to pay off Cost of Reticulation and Interest thereon in 100 years.	Maintenance (including proportion of Head Office expenses).	Charge for Water supplied from Canal, 32 gallons per head per day at 3d. per 1,000 gals.	Total Charges.	Revenue.

1899-1900	Reticulation, £13,624..... } Population supplied with water, 2,109..... }	492 12 10	210 5 2	307 18 3	1,010 16 3	912 16 1

43. The financial result of the Richmond Water Supply Works still continues unsatisfactory, and, as pointed out in previous reports, must remain so until the Amending Water and Sewerage Bill, properly vesting the scheme in the Board and clothing them with the usual powers of rating, is passed into law.

RICHMOND WATER SUPPLY.

(Date of Transfer to Board, 26 May, 1893.)

Year.	Capital Cost.	Annual Instalment required to pay off Cost of Works and Interest in 100 years.	Maintenance (including proportion of Head Office Expenses).	Total Charges.	Revenue.

45. The revenue shows an increase of £12,861, due to the extension of sewerage facilities to new districts.

46. The working expenses have increased by the sum of £5,245, which may be regarded as moderate, when it is remembered that over 72 miles of sewers and other new works have to be maintained, over and above those in existence during the preceding year.

47. The capital debt has increased to the extent of £397,311, representing the value of main works transferred by the Government and reticulation sewers constructed by the Board.

48. The revenue was £116,816, and the working expenses, £37,678, or 32·25 per cent. of the gross revenue, leaving a net revenue of £79,138, or a return of 2·82 per cent. upon the capital cost.

WATER AND SEWERAGE.

49. The following table shows the working of the two Branches taken together:—

Year.	Revenue.	Working Expenses.	Capital Cost.	Capital Cost, exclusive of Items on which Interest is not charged.	Percentage of Working Expenses to Revenue.	Percentage of Working Expenses to Capital Cost.	Percentage of Revenue on Capital Cost.	Interest on Capital Cost after paying Expenses.
	£	£	£	£				
1890	227,790	57,037	4,470,125	3,986,026	25·03	1·43	5·71	4·28
1891	247,133	63,702	4,783,936	4,269,843	25·77	1·49	5·78	4·29
1892	243,813	72,383	5,001,529	4,517,436	29·68	1·60	5·39	3·79
1893	251,087	61,233	5,101,183	4,617,090	25·53	1·39	5·43	4·04
1894	251,301	67,327	5,185,734	4,701,646	26·17	1·43	5·40	3·97
1895 (6 months).	128,474	33,943	5,910,590	5,426,503	26·42	1·24	4·72	3·48
1895-6	259,843	67,799	6,046,517	5,555,704	26·09	1·21	4·67	3·46
1896-7	263,637	70,502	6,262,670	5,781,857	26·74	1·21	4·56	3·34
1897-8	268,569	75,784	6,443,849	5,963,036	28·21	1·27	4·50	3·23
1898-9	298,287	79,580	7,098,371	6,448,058	26·67	1·23	4·62	3·39
1899-1900	312,432	84,718	7,615,370	6,967,923	27·11	1·21	4·48	3·27

50. The total revenue was £312,432, and the working expenses £84,718, or 27·11 per cent. of the gross revenue, leaving a net revenue of £227,714, or a return of 3·27 per cent. upon the capital cost.

51. The amount required to pay interest, calculated at rates varying from 6 per cent. to 4 per cent., upon municipal debentures taken over by the Board, and 3·5 per cent. on moneys provided out of loans raised by the Government for general purposes, is £241,297 7s. 2d., to which must be added £4,942 10s. 2d. for depreciation in the value of machinery, working plant, buildings, &c., and £84,718 16s. 5d. working expenses, making the total expenses of the Board £330,958 13s. 9d., whilst the revenue actually receivable was £312,432 16s. 11d., leaving a net deficiency of £18,525 16s. 10d. on the year's transactions.

52. As pointed out in previous reports, the revenue receivable does not represent by any means the total earnings, as by Statute the Board are compelled to supply, free of charge, large quantities of water, nearly all of which is pumped and consequently expensive, to charitable institutions and public hospitals, and to municipal councils for street watering, &c. The value of this water is estimated at over £20,000. If, therefore, credit were taken for this sum, as it should be, the deficiency would entirely disappear.

53.

53. Moreover, the construction of water supply and sewerage works, such as those under the jurisdiction of the Board, cannot be looked upon and dealt with in a purely commercial sense, but must be regarded rather as national undertakings, carried out as much for the benefit of posterity as for the present generation; consequently, much larger provision must be made to meet the requirements of the future. Viewed in this light it must be expected that for some few years an annual deficiency must be faced, which will disappear in time to come when the main works are completed and the population increases.

54. Another point which must not be lost sight of is that the construction of these works has reduced the death rate and improved the health rate of the general community to such an extent that, if the value of the lives saved could be reduced to figures, the annual deficiency would sink into insignificance.

With this aspect before the Board sewerage works are frequently extended to serve sparsely-populated districts, which will not immediately return a revenue sufficient to meet requirements.

55. The amount of revenue outstanding to 30th June, 1900, was £32,017 9s. 1d., or £9,761 0s. 5d. less than the arrears at the end of the previous year. This result is a matter for great congratulation, the arrears being less now than at any period since the inception of the Board. The principal items are:—Meters, representing consumption to 30th June, accounts for which have only just been issued, £13,650; churches and charities, £10,354; vacant lands, £4,872; house properties, £2,603.

56. The receipts paid into the Consolidated Revenue, exclusive of Richmond, amounted to £320,147 10s. 7d., as against £293,580 0s. 6d. during the previous year, or an increase of £26,567 10s. 1d.

57. The gross receipts paid into the Treasury since the inception of the Board are as follows:—

	£	s.	d.
Water	2,037,213	9	7
Sewerage	957,542	14	2
	<hr/>		
	£2,994,756	3	9

58. Legal proceedings were taken for the recovery of £5,022 5s. 1d.

59. The total amount expended by the Board, exclusive of Richmond, was £259,103 19s. 6d., made up as follows:—

	Water.			Sewerage.		
Chargeable to Loans ...	£66,427	4	11	£111,153	1	6
Chargeable to Revenue ...	£45,158	12	11	£36,365	0	2

60. The number of premises which became liable for water rates was 2,169; sewerage rates, 13,398; and drainage rates, 44; making the total number, including vacant land now rated,—water, 117,654; sewerage, 75,348; and drainage, 3,803.

61. Rate notices to the number of 323,416 were delivered.

62. The value of goods received by the Comptroller of Stores was £25,904 6s. 9d., and issued £26,544 5s. 10d. The value of stock on hand was £12,843 4s. 9d.

63. Several interesting reports by the Medical Adviser (Dr. T. Mailler Kendall) on the health of the metropolis, as affected by the works of the Board, also in regard to the health of the employees, are attached hereto.

64.

64. On 22nd March the President (Hon. Jacob Garrard) was re-appointed for a period of four years.

On the same date Alderman John Taylor, Vice-President, was re-elected as a city member; and Alderman J. G. Griffin, as a suburban member, in place of Alderman J. Ahern, whose period of office had expired.

Mr. James Ward was also appointed an official member, *vice* Mr. G. Allen Mansfield, who had occupied the position since 10th April, 1895.

65. In addition to the usual weekly meetings at the Board's offices, at which the attendance of members was as recorded below, the Board paid frequent visits of inspection to works in progress and completed.

MEETINGS OF BOARD FROM 1 JULY, 1899, TO 30 JUNE, 1900.

	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	April	May.	June.		
Meetings held ...	4	5	4	4	5	4	5	3	5	4	7	4	54 meetings.	
													Present.	Absent.
Hon. J. Garrard ...	4	5	4	3	4	4	5	3	5	4	5	4	51	3
Alderman J. Taylor...	4	5	4	4	5	4	5	3	5	1	7	4	51	3
David Davis ...	4	5	4	4	4	4	5	3	5	3	41	13
Henry Chapman ...	4	5	4	4	4	4	5	3	4	4	7	4	52	2
G. A. Mansfield ...	3	5	4	4	5	4	5	3	4	37	17
Jno. Ahern ...	4	5	4	4	5	4	5	3	4	38	16
J. Macpherson ...	4	5	4	4	5	4	5	3	5	4	7	4	54	Nil.
J. Ward	1	4	5	4	14	2
J. G. Griffin	1	4	7	4	16	Nil.

Hon. J. Garrard re-appointed President, 22nd March, 1900. Messrs. Mansfield (official member) and Ahern (suburban representative) retired by effluxion of time, 22nd March, 1900. Mr. Taylor (Vice-President) re-elected as city representative, 22nd March, 1900. Mr. Ward appointed official member, 22nd March, 1900. Mr. Griffin elected as suburban representative, 22nd March, 1900.

On 19th April the Board granted six months leave of absence to Mr. David Davis, suburban representative, to enable him to visit Great Britain and Europe, and from advices received from that gentleman, who is devoting a considerable amount of time and attention in inquiring into various water and sewerage systems, particularly with respect to the treatment of sewage on biological principles, the Board anticipate—although he has been absent from their counsels round the Board table—receiving on his return a fund of useful information to guide them in their future deliberations.

66. The balance-sheets prepared by the Accountant, and reports by the Board's Chief Engineer (Mr. J. M. Smail, M.Inst.C.E.) and other officers, are attached.

J. GARRARD,
President.

WILLIAM HOLMES,
Secretary.

Description

Description of Sydney Water-works at end of June, 1900.

THE Nepean, Cordeaux, and Cataract Rivers are the sources from which the Sydney Water-works are supplied. The combined catchment areas of the three rivers enjoy a copious and regular rainfall, and extend over an area of 354 square miles. By the aid of a dam, 10 feet high, built of concrete, across the Nepean River, a portion of the flow is diverted into the tunnel, $4\frac{1}{2}$ miles in length, which conducts it into the Cataract River.

Across this river a similar dam to that on the Nepean is built, just below the outlet of the Nepean tunnel, and the water is thence conveyed by another tunnel about $1\frac{3}{4}$ miles, and, afterwards, through a series of open canal and tunnels, making in all about $40\frac{1}{2}$ miles from the source, to the Prospect Reservoir. Of this distance, $11\frac{3}{8}$ miles are in tunnel, and $28\frac{3}{4}$ miles in open canal. Several creeks of considerable magnitude are crossed on the way, some by inverted siphons and others by pipe aqueducts.

Prospect Reservoir.

When the reservoir is full the surface of water covers an area of 1,297 acres, and has a gross capacity of 11,392,713,000 gallons. The earthen dam is 7,300 feet long. The maximum height is 85.67 feet, with slopes of 3 to 1 on the water side, and $2\frac{1}{2}$ to 1, with two 15 feet berms, on the outer side, and is 30 feet wide on the top. When quite full there are available by gravitation 7,324,343,000 gallons.

The water is drawn off from the reservoir through a valve-tower by cast-iron pipes, enclosed in a brick tunnel, carried outside and round the northern end of embankment, and is discharged into a basin, at the end of which is a gauge-weir, measuring the volume passing over daily. From thence it proceeds by canal, 5 miles in length, to the Pipe Head Basin, situated $16\frac{1}{4}$ miles from Sydney. It is then conveyed for a further distance of 5 miles by two wrought-iron pipes, 6 feet in diameter, to Potts' Hill Reservoir.

Potts' Hill Balance Reservoir.

This tank, having a capacity of 100,000,000 gallons, is built partly in excavation and partly in bank. The bottom is lined with hydraulic lime concrete, and the sides, laid to a slope of 1 to 1, are lined with dry-coursed rubble masonry. This work is designed to tide the city over any interruption of supply from Prospect, and to prevent fluctuation of pressure.

Screening Tank and Trunk Mains.

The screening-tank at Potts' Hill is built of brick in two concentric rings. The water is delivered into the outer ring, and passes through a series of copper-gauze screens of 840 meshes to the inch. These screens are arranged so that the orifice which they fill can be closed by the insertion of a dummy, and the screens taken out and cleaned. From this tank the water proceeds towards the city in two 48-inch cast-iron mains.

The first laid main is 48-inch as far as Lewisham, whence it bifurcates, one branch (48-inch) leading to Petersham Reservoir, the other (42-inch) to Crown-street Reservoir. The new 48-inch main, completed in 1893, continues of the same diameter to Crown-street Reservoir.

The two trunk mains are connected at New Canterbury Road, Petersham.

Crown-street Reservoir and Pumping-station.

The Crown-street Reservoir is built of brick, and holds 3,250,000 gallons. The top-water level is 141 feet above high-water mark. Here is situated the main pumping-plant, consisting of three pairs of compound high-duty pumping-engines. No. 1 Worthington pumping-engines are capable of raising 400,000 gallons per hour to the Centennial Park Reservoir, a height of 104 feet above the pumps; No. 2 Worthington pumping-engines are capable of raising 210,000 gallons per hour to Woollahra Reservoir, a height of 140 feet above the pumps, and also of raising 200,000 gallons per hour to Waverley, a height of 220 feet above the pumps; No. 3 pumping-engines, of the horizontal compound condensing rotative direct-acting type, designed and erected by the Mort's Dock and Engineering Company, are capable of raising 100,000 gallons per hour to the Waverley tanks.

Four 142-h.p. boilers of the Babcock and Wilcox type are used.

Centennial Park Reservoir.

The Centennial Park Reservoir, built by the Public Works Department, was completed in the early part of 1899, and handed over to the Board. It is constructed of brickwork, roofed in with coke-concrete groined arches. It has a capacity of 17,000,000 gallons, and a top-water level of 245 feet above high-water mark, a height of 31 feet superior to that of Paddington Reservoir, which tank has since been abandoned.

Woollahra Reservoir.

Woollahra Reservoir, with a top-water level of 282 feet above high-water mark, or 141 feet above Crown-street, is built of brick, and contains 1,000,000 gallons, supplied by a $24\frac{1}{2}$ -inch wrought-iron main from Crown-street, and distributes the water through a 20-inch main.

Waverley

Waverley Reservoir.

Waverley Reservoir, with a top-water level of 360 feet above high-water mark, is built of brick, and contains 1,087,000 gallons. Water is distributed therefrom through two outlets of 24-inch and 15-inch diameter respectively. Supplemental tanks in Waverley Park, erected at an elevation of 20 feet above the present reservoir, supply the upper zones of the district.

Petersham Reservoir.

This reservoir is built of brick, and contains 2,157,000 gallons. The top-water level is 166 feet above high-water mark. It receives its supply by gravitation from Potts' Hill. Water is distributed therefrom through one 20-inch and two 18-inch outlets.

Ashfield.

Part of Ashfield being too high to receive a supply by gravitation from Potts' Hill, the more elevated parts are supplied from the Woollahra Reservoir by a main, which conveys the water to a 100,000-gallon wrought-iron tank, erected on a brick circular support, at an elevation of 223 feet above high-water mark.

Hurstville, Kogarah.

The bulk of the supply to Kogarah is by gravitation through a 12-inch main connected with the Petersham Reservoir. The higher portions of this district are supplied from Penshurst, where is erected an elevated steel tank having a capacity of 1,000,000 gallons, and also a 20,000-gallon cast-iron tank, built on brick piers. The tanks are filled from the Carlton pumping-station. The pumping-plant consists of small Blake's duplex pumps, having a capacity of 12,000 gallons per hour, and Worthington compound high-duty pumps, having a capacity of raising 30,000 gallons per hour.

Rookwood, Granville, and Auburn.

Rookwood and Auburn receive their supply through an 18-inch main along Joseph-street from Potts' Hill Reservoir.

Granville is supplied through a 15-inch main laid along Woodville-road for a distance of $2\frac{1}{2}$ miles, connected with the 6-foot trunk main immediately below Pipe Head Basin; and also by an 18-inch and 15-inch main laid along Parramatta-road from John-street, Rookwood.

North Sydney Supply—Ryde Pumping-station, Ryde Hill Tank, and Chatswood Tanks.

North Sydney receives its supply from Potts' Hill, delivered through a 24-inch and 20-inch diameter pipe into Ryde Pumping-station Reservoir, which contains 2,116,000 gallons, from whence the water is pumped through a 24-inch wrought-iron main into a 1,000,000-gallon tank at Ryde village, 234 feet above high-water mark, and, by a continuation of the same main, into a pair of steel tanks of a joint capacity of 3,000,000 gallons at Chatswood, at an elevation of 370 feet above high-water mark.

From the Ryde village tank the whole of Ryde, Gladesville, and Hunter's Hill get their supplies. A 9-inch main extends over the Parramatta River and Iron Cove Bridges to supply the heights of Balmain.

The tanks at Chatswood supply Lane Cove, Willoughby, North Sydney, and Mosman.

Gordon, Wahroonga, Hornsby, Thornleigh, and Beecroft.

This district, extending from Chatswood to Beecroft, *via* Hornsby, and adjacent to the Milson's Point Railway and Northern Railway Lines, is supplied by Chatswood pumps, which lift water into the Wahroonga tanks, one a steel tank having a capacity of 1,000,000 gallons, and the other a wrought-iron tank of 40,000 gallons, the smaller one being specially reserved to supply the high zone in its immediate environment. These tanks are at a height of 720 feet above sea-level.

The pumping-main from Chatswood to Wahroonga, which is also used as a main distributory, is 10 in. in diameter and $7\frac{1}{2}$ miles in length; a further extension, also of same diameter, is laid to Hornsby. From Pierce's Corner an 8-in. steel main branches off this 10-in. pipe, and supplies Thornleigh, Beecroft, &c. About $19\frac{1}{4}$ miles of reticulation mains of 6-inch and 4-inch diameters have been laid along such roads and streets in the various centres of population as are sufficiently built upon to warrant the outlay.

Campbelltown.

Campbelltown is supplied by gravitation direct from the main canal, through a 6-inch pipe from the canal laid to the town, a distance of $2\frac{1}{2}$ miles, the reticulation mains being 4 inches in diameter. The offtake is at $16\frac{1}{2}$ miles from Nepean.

Liverpool.

Liverpool receives its supply by a 9-inch pipe from the main canal at Cecil Hills, which is extended as far as Mount Young, and thence by a 6-inch main to the town. In order to tide over any possible interruption to the flow in the canal a 4,000,000-gallon earthen reservoir has been constructed close to the canal, and is filled therefrom.

Camden.

Camden.

The Camden Water-works were completed and officially opened in November, 1899. They cost £8,200 and will benefit a population, principally located in the towns of Camden and Narellan, of about 1,600. A concrete tank, having a capacity of 100,000 gallons, has been built alongside the main canal of the Sydney Water Supply at Kenny Hill. Into this tank water is conducted by a 15-inch pipe. A drop-bar weir has been built across the canal to ensure a reserve of water should the supply from the Nepean be shut off at any time. From the tank to Camden, *via* Narellan, is laid an 8-inch pipe. At the crossing of the Nepean River the pipe is reduced to 6-inch, and branch pipes 4-inch, diameter are laid throughout the township. About $6\frac{1}{4}$ miles have been laid.

Smithfield.

The Smithfield Water-works, completed in July, 1895, were designed to supply the township of Smithfield, which is situated on the Prospect Creek, about 3 miles south-east of the reservoir. The works included may be briefly summarised as under:—

An off-take on the main canal, about 3 miles below Prospect Reservoir; a circular concrete tank on the bank of said canal, having a capacity of 100,000 gallons; a 4-inch main to the township; and mains totalling about $3\frac{1}{2}$ miles of the same diameter laid in all streets occupied by dwellings. The works cost about £2,900, and supply a population of 300.

Richmond.

In July, 1893, the Board assumed the temporary management of the Richmond Water-works, which were completed in 1892, and had since then been worked locally by the Richmond Municipal Council. The scheme, which is entirely unconnected with the Sydney supply system, consists of a small pumping-plant—two horizontal 6-horse power engines, coupled and geared, working two brass-lined single-barrel deep-well pumps (Tangye's), fixed 61 ft. 6 in. below floor of engine-room—erected on the left bank of the Hawkesbury River, just below the confluence of the Grose and Nepean; a circular brick service tank, 60 feet in diameter, having a capacity of 225,000 gallons; a 6-inch supply main to Richmond, 4 miles in length; and $5\frac{1}{2}$ miles of reticulation mains, 3-inch and 4-inch diameter, within the town.

Description of the Metropolitan Sewerage System.

City.

THE Metropolitan Sewerage System, now under the jurisdiction of the Metropolitan Board of Water Supply and Sewerage, comprises the old and new systems. The old system was initiated by the City Commissioners in 1853, and continued by their successors, the present City Council, since their incorporation in 1857.

The City Council had control of the water and sewerage works in the city until the year 1888, when the water-works were transferred to the Board. The transfer of the existing sewerage-works followed in 1889.

The old system of sewerage was designed on the principles of what is known as the "combined system." It comprised four main outfalls, with subsidiary sewers along the principal streets; these in turn received the reticulation sewers of the minor thoroughfares. The four main outfalls discharged the city sewage of the city into the harbour at Blackwattle Bay, Darling Harbour, Fort Macquarie, and Woolloomooloo Bay respectively. The pollution of the harbour, and the consequent menace to public health, led to the appointment of a Commission to inquire into the best means of diverting the sewage from the harbour, and its disposal when thus diverted. The new intercepting system was the outcome of the labours of the Commission.

The new system adopted is on the lines of the partially "separate system," and intercepts all sewage from the gravitation zone, *i.e.*, all above a contour line about 40 feet above high-water mark. The sewage from the low-level areas, *i.e.*, those below that contour line will eventually be pumped into the gravitation sewers.

The system consists of two main outfalls, the northern and southern respectively. The northern outfall discharges into the Pacific Ocean, at a point named "Ben Buckler," near Bondi, and will, when the low-level systems are complete, take all sewage previously discharged into the harbour.

The southern outfall discharges into the sewage farm at "Webb's Grant," and provides for the remainder of the city, together with some of the suburbs.

The main works were constructed by the Government, and on completion were transferred, with all other existing works, to the control of the Board by Act of Parliament. The works are of considerable magnitude, and have not been constructed without considerable difficulty and outlay.

Northern Outfall.

The northern system commences at "Ben Buckler," where a large chamber is constructed in the sandstone rock. From this chamber two channels bifurcate, so as to ensure a free discharge during either northerly, easterly, or southerly gales. Above the chamber a shaft has been erected for ventilation and escape of air when the sea breaks into the discharge channels. The dimensions of the main outfall at the chamber are 8 ft. x 7 ft. 6 in., and decreases by decrements to 6 ft. 10 in. x 5 ft. 10 in. at the Oxford and Liverpool Streets junction.

Between these places it receives the discharge of the following branch sewers:—

- (a) The Waverley and Bondi branch, now in course of construction and approaching completion, which will drain the sea slopes of Waverley and Bondi.
- (b) The Woollahra and Waverley branch, extending along the eastern side of Double Bay Valley, passing under Edgecliffe-road, and terminating in Denison-street, Waverley. This sewer drains the northern watersheds of Woollahra and Waverley.
- (c) The Darling Point branch, joining the main outfall near Harris-street, Paddington, and extending along the eastern side of Rushcutters' Bay, with a sub-branch running towards Double Bay, into which the Double Bay low-level sewage is now pumped. This branch sewer drains portions of Paddington and Woollahra.
- (d) The Elizabeth Bay branch, joining the main outfall at Great Barcom Street and extending along the western bank of Lacrozia Creek and Rushcutters' Bay, intercepting sewage formerly discharged into both these places.
- (e) The Potts' Point branch sewer, commencing at Bourke-street, near Darlinghurst Gaol, and extending along that street for some distance, then passing along Victoria-street, and terminating at Challis Estate, intercepting a considerable quantity of sewage previously discharged into Woolloomooloo Bay.
- (f) Riley-street branch, extending northwards along Riley-street, a little past Stanley-street, and intercepting portion of sewage prior to its construction discharged into Woolloomooloo Bay.

The Double Bay Creek storm-water channel and an overflow sewer discharging into Rushcutters' Bay are connected with the main outfall to carry off surplus water during heavy rainfalls. The Rushcutters' Bay overflow was carried across low-lying ground on arches and circular piers; the latter were constructed on the same principle as that adopted in India.

At the large chamber at Oxford and Liverpool Streets three different branches discharge into the main outfall sewer:—

1. The northern branch, passing under Hyde Park to Castlereagh-street, where it bifurcates, one sub-main terminating in Macquarie-street below the tram terminus, and intercepting sewage formerly discharged into harbour at Macquarie Point; the other sub-main terminating in Argyle-street and intercepting sewage previously discharged into Sydney Cove.

2. The western branch, which extends along Liverpool and Kent Streets to Miller's Point, intercepting sewage which formerly discharged into Darling Harbour.

3. The south-western branch, passing under Belmore Gardens, Benevolent Asylum, and along George-street West to Carlton-street, where it bifurcates into two sub-mains, one passing through Darlington, University Grounds, and Camperdown, terminating at Liberty-street, Newtown, and intercepting old city sewers and draining new areas at Darlington, Camperdown, Newtown, and Petersham. The other sub-main passes along George-street West by a long syphon, on account of a depression in the ground. Connected with the syphon is a scour-chamber and valves for periodic cleansing. This branch extends through the Glebe, Annandale, and Leichhardt, to Balmain, being carried across Johnstone's and White's Creeks on aqueducts. At Foucart-street the sewer bifurcates, one branch draining the south-eastern slopes of Balmain, the other branch, now almost completed, draining the north-western slopes of the same suburb. This sub-main drains the Glebe, portions of Annandale, Leichhardt, and Balmain. The scheme for the drainage of the low-level areas in Balmain and Leichhardt is now in course of construction.

The work in connection with the whole of these sewers was carried through varying formations—in some instances the stratum was indurated sandstone; in others, shale, clay, and water-charged drift-sand. Concrete enters largely into the construction of the works, the lining of rock tunnels being principally bluestone concrete rendered with cement mortar. Wherever the outfall sewer crossed natural creeks or watercourses, offset and scour valves were provided.

Southern Outfall.

The southern main outfall commences at the inlet chamber on the north side of Cook's River, near its junction with Botany Bay. The sewer is 5 ft. 6 in. in diameter, constructed of concrete, with brick lining rendered with Portland cement. In places the sewer is above the level of the adjoining ground; in others it passes through low sandhills and swampy ground. Where natural watercourses are passed over, concrete culverts and overflow chambers and valves are provided. Some distance to the south of Bourke-street the Macdonaldtown and Alexandria branch discharges into the main outfall. This branch is carried on aqueduct over low-lying ground at Alexandria, and receives the sewage from portions of Alexandria, Erskineville, and Newtown.

At Botany-road the main outfall receives the discharge of a branch running along that road, and draining portion of Waterloo.

The main outfall continues along Bourke-street to Phelps-street, Surry Hills, receiving on its way the discharges from the Elizabeth-street branch, draining large portions of Waterloo and Redfern, and several small branches draining parts of the Surry Hills portion of the city.

Inlet House.

The sewage passes from the main outfall to the screening-chambers of the inlet house. The chambers are in duplicate and controlled by valves, so that when one series is in use the other is being cleaned out. The sewage in each series is strained by means of three circular screens, which are worked by one central shaft, with suitable gearing fixed on the platform at one end, the meshes varying from 3 inches to 1 inch, which intercept all extraneous matter before the sewage passes to the siphon-well. The sludge thus intercepted is grabbed out of the various chambers and deposited in trucks to be conveyed on to the farm, *via* the temporary bridge now crossing Cook's River. The grab is operated by means of "Capitaine" oil-engine, working on an overhead traveller. Owing to the cost of keeping the temporary bridge in an efficient state of repair being excessive, it has been decided to force the sludge across the river through a submarine line of ball and socket pipes by means of compressed air, and the necessary plans are approaching completion, when tenders will be invited for carrying out the work. Owing to the exposed situation of this house, it was deemed necessary to protect it against being struck by lightning, and a contract was let to erect the necessary conductors, and it is now considered practically lightning-proof. From the siphon-well the sewage passes under the bed of Cook's River by a cast-iron inverted siphon, 3 ft. 9 in. diameter, laid in a trench and surrounded with concrete. The siphon is connected with a well in the outlet house on the south side of river, from which the sewage flows along a main carrier, and is distributed over the irrigation-beds and settling-tanks by valves of simple construction, and the distribution of the sewage is easily controlled by the farm manager. Both the inlet and outlet houses are provided with storm offset valves, to allow the superabundant storm-water to pass direct into Cook's River. The outlet house is also treated in a similar manner to the inlet house as regards lightning conductors.

Botany and Rockdale Sewage Farms.

The Sewage Farm is situated on a neck of land called Webb's Grant, on the eastern end of which the southern outfall discharges, while the western outfall discharges on the western end. The formation is raw drift-sand, originally covered with low dense scrub, that portion adjoining Muddy Creek being submerged at high water until the fascine training-banks were built there by the Public Works Department.

For agricultural purposes, to be worked at a profit, this land is useless, except on the eastern end, which has been a number of years in use, and upon which fair crops can be grown if the sewage is applied to it in a state capable of being assimilated by plant-life. That being the case, it is evident some course of treatment is necessary for this particular class of sewage, which contains a large amount of grease from the boiling-down establishments, before it can be utilised for agricultural purposes.

The southern main carrier runs through the centre of the neck of land, the northern side of which is laid out in irrigation beds, at different levels, so as to allow the manager to command the whole area. On this area the sludge, which is dredged from the inlet house, is conveyed in trucks by a small locomotive to the various beds, and used as manure. This sludge is also used as a top dressing to the newly-formed sandbanks to prevent them being demolished by the wind. It is the intention, when the new system of pumping the sludge on to the farm comes into vogue, to pump it into a tank, from which it will be distributed over the farm by means of the loco. or specially-built carts. At the end of the irrigation area three new filter-tanks have been constructed with mains for distributing the sewage evenly over their surface. As soon as these tanks are underdrained they will be brought into active operation.

On the southern side of the main carrier the ground is laid out in a series of these filter-tanks, and to facilitate filtration some of these beds have been underdrained, with satisfactory results, and at times, when circumstances admit, they are cultivated, which assists in keeping the ground clean and improves the soil as a filter. Numerous types of underdrains have been tried, and the one finding most favour at present consists of a coir mat wrapped around each joint and sewn on. Cattle and pigs are reared on the surplus products of the farm. The pig-styes are built of concrete, and kept clean by daily washing. Cattle and horses are also taken for agistment. The average daily discharge on to the eastern or Botany farm for last year was 3,000,000 gallons, and disposed of over 71 acres of land prepared to receive same, the effluent water discharging above high-water mark into Botany Bay.

Five new cottages have been built at the end of the southern carrier and midway between Botany and Arncliffe for the accommodation of farm labourers.

The sewage from the Western Suburbs is conveyed to the western end of the farm, where it has all paper and rags separated from it before being distributed over the filtering area, of which about 127 acres have been prepared for the purpose. A gauging weir is about to be constructed on the open carrier for the purpose of estimating the rate of flow, which is still of small proportions in dry weather, though a gradually increasing quantity.

Most of the land on the southern side of this carrier has been underdrained, is performing its work well, and a contract has just been accepted by the Board for the underdrainage of the land on the northern side.

A series of tanks, for the experimental treatment of sewage on the Scott-Moncrieff system, has been constructed and are now ready for receiving the sewage, the results of which will, no doubt, be looked forward to with interest.

The land in the immediate neighbourhood of these tanks has all been reclaimed and is in its virgin state. An area of about 2 acres will be properly prepared for agricultural purposes, and irrigated with the filtrate from this source.

Western Outfall.

The sewerage system for the Western Suburbs is being carried out by the Government Sewerage Branch under a special Act of Parliament and vote as regards the main ducts.

The main western outfall sewer commences at a receiving chamber in the Rockdale end of the Sewage Farm. From thence it runs in open channel, 8 ft. 8 in. x 5 ft. 3 in., across portion of the Sewage Farm to another receiving chamber, about a quarter of a mile to the north-east of Muddy Creek. From this chamber it continues in 6-foot circular triplicate sewers to a penstock chamber in Premier-street, Marrickville, being carried on aqueducts over low-lying ground near Arncliffe Station and over Woollli Creek and Cook's River. Over the Premier-street penstock chamber a lofty ventilating shaft has been erected. This chamber receives the combined discharges of the following three main branch sewers, viz. :—

(1.) The eastern main branch sewer which passes along the Illawarra-road (partly in syphon, owing to a depression in the ground), then across Marrickville and Petersham, passing under the suburban railway near Stanmore Station to the Parramatta Road, and from thence along Ferris-street, terminating at Collins-street, Annandale.

A scour discharging into the low-level system is connected with the syphon in Illawarra-road, and is used occasionally for cleansing.

This main branch sewer receives the discharges of the following sub-mains:—

- (a) The Renwick-street sub-main, draining portion of Marrickville.
- (b) The Camden-street sub-main, meeting the main branch at Emily-street then passing along that street, and Sarah-street, and terminating at Union-street, Newtown. This sub-main, with two short branches in Tupper-street and Edgeware-road, drains portions of Newtown and Marrickville.
- (c) The Parramatta-road sub-main, leaving the main branch at Corunna-road and passing along Parramatta-road, terminating at Johnstone's Creek, drains portions of Annandale, Camperdown, and Petersham. The Nelson-street sub-branch, running along Nelson-street and terminating at Booth-street, discharges into this sub-main and drains portion of Annandale.

The area sewered by the eastern main branch and its sub-mains included portions of Marrickville, Newtown, Petersham, Leichhardt, Annandale, and Camperdown.

The work in connection with the scheme for draining low-level areas in St. Peters, Newtown, Erskineville, Alexandria, and Marrickville is now practically complete. The sewage therefrom will be pumped into the eastern main branch sewer at a point near Marrickville Station.

(2.) The northern main branch sewer which crosses Marrickville, passing under the Belmore Railway, near Livingstone-road, along Wardell-road; through Petersham, crossing the suburban railway near Lewisham Station; through Leichhardt, passing along Flood, James, and Church Streets, terminating at Glover-street.

On its way the following sub-mains discharge into it, viz. :—

- (a) The Marrickville-road sub-main, draining portion of Marrickville.
- (b) The Livingstone Road sub-main, draining a portion of Marrickville.
- (c) The Dobroyde sub-main which joins the main branch sewer at Frazer's-road, Petersham, passes under the suburban railway, west of Lewisham Station, crosses Long Cove Creek on aqueduct, and terminates in Sloane-street, Summer Hill. This sub-main receives the discharges of the Canterbury Old Road and Long Cove Creek sub-branches. The latter sub-branch joins the sub-main in Dover-street, Summer Hill, crosses the suburban railway, and extends along the western bank of Long Cove Creek to Pigott-street. This sub-main and its branches sewer portions of Petersham, Summer Hill, and Ashfield.
- (d) The Station-street sub-main, draining portion of Petersham.

The area sewered by the northern main branch and its sub-mains includes portions of Marrickville, Petersham, Summer Hill, Ashfield, and Leichhardt.

The sewage from the low-level areas adjoining Long Cove Creek will be pumped into this branch when the scheme is carried out.

(3.)

(3.) The western main branch, which passes through Marrickville crossing the Belmore railway near Wardell-road Station; through Ashfield, crossing the suburban railway near Croydon Station; through Burwood, passing along George-street, again crossing the railway about midway between Burwood and Strathfield Stations, then passing along Morwick-street; through Strathfield, passing along Margaret-street and Albert-road, terminates in that road about half a mile to the west of Homebush-road.

(On its way this branch sewer will receive the discharges of the following sub-mains, viz. :—

- (a) The Canterbury sub-main, terminating for the present in Terrace-road, Marrickville.
- (b) The Frederick-street sub-main, which joins the main branch sewer in Walter-street, Ashfield, passes under the suburban railway at Albert Grove, and terminates in Henry-street, Ashfield. This sub-main sewers portion of Ashfield.
- (c) The Carshalton-street sub-main, which joins the main branch in Milton-street, Ashfield, passes along Milton and Carshalton Streets, terminating in Arthur-street, and drains portions of Ashfield and Enfield.
- (d) The Webb-street sub-main, which joins the main branch in Webb-street, Burwood, passes under the suburban railway, and terminates near Devonshire-street. This sub-main sewers portion of Burwood.
- (e) The Five Dock sub-main to be constructed in the future.
- (f) The Elsie-street sub-main, which meets the main branch sewer in Elsie-street, Burwood, passes through Burwood Park, and along the Parramatta-road, and terminates in that road near Bourke-street, Concord. The area to be sewered by this sub-main includes portions of Burwood and Concord.

The western main branch sewer and its sub-mains will sewer portions of Marrickville, Petersham, Summer Hill, Ashfield, Croydon, Burwood, Strathfield, Canterbury, Enfield, Five Dock, and Concord.

Coogee Outfall.

The Coogee outfall sewer discharges into the Pacific Ocean to the north of Coogee Bay. From thence it runs to Dolphin-street, then along that street to Melody-street, from thence to Rainbow-street, passing along that street and Bunnerong-road to its termination in Eastern Avenue.

This outfall sewer, when complete, will sewer Randwick, Coogee, and Kensington.

North Sydney Sewerage.

On 2nd August, 1899, the outfall works situated at Long Bay, Middle Harbour, were completed by the Public Works Department and transferred to the Board for management, thus completing the North Sydney system as far as this outfall is concerned, with the exception of a sub-main draining the Middle Harbour slopes.

The outfall works were designed to treat the sewage from an area of 2,328 acres by a system of lime precipitation and intermittent land filtration, the configuration of North Sydney being such that a suitable area of land could not be found within reasonable distance for broad irrigation.

The scheme was practically initiated in 1891 by the construction of the main outfall sewer from Milson's Point to Willoughby Bay, a distance of nearly 2 miles, and, on its way, it receives the discharges of the following sub-mains :—

- (a) The Willoughby sub-main, joining the main near the outfall works, and extending to a creek near the junction of West and Marks Streets.
- (b) The Ernest-street sub-main.
- (c) The Neutral Bay and Mosman sub-main, extending along the foreshores of Neutral Bay at the head of Shell Cove, crossing Mosman's Bay and Little Sirius Creek.
- (d) The High-street sub-main.
- (e) The Lavender Bay and Blue's Point sub-main, the former terminating at Dumbarton-street, the latter at East Crescent Road.
- (f) Two small sub-mains in McDougall and Willoughby Streets respectively.
- (g) Glen-street sub-main, joining the main in Broughton-street, and extending to Glen-street.

The sewage, on reaching the outfall, has the larger solids removed from it by screens (such solids being afterwards burnt), and is then treated with milk of lime to the extent of practically 1 ton of lime per million gallons of sewage.

The sewage, after receiving its dose of lime, is run into settling tanks, where it is allowed to subside, the supernatant water then being decanted and distributed over the sand filters, from whence it finds its way into the tidal waters of Long Bay.

Sludge.—After the supernatant water has been decanted, the remaining sludge is run into two steel cylinders, each of 900 gallons capacity, where a fresh dose of lime is applied in order to facilitate pressing. Compressed air of 80 lb. pressure above the atmosphere is now applied, and the sludge is forced through filter presses, thus reducing the moisture from 90 per cent. to about 50 per cent. or 55 per cent.

When the presses are fully charged they are opened, and the resultant cakes removed in trucks, and either buried in sand or burnt in suitably designed destructors, a certain amount of fuel being necessary for complete combustion.

Sufficient land was resumed to enable tanks and other works to be erected, and an additional area reclaimed from the harbour waters, the whole amounting to about 13 acres, the reclaimed portion being about 8 acres.

Rates and Charges for Water, Sewerage, and Stormwater Drainage.

METROPOLITAN WATER RATES.

1. The following rates and charges are those which the owners and occupiers of houses, tenements, and lands shall pay in respect of water supplied by the Board, that is to say:—

For water supplied for domestic purposes otherwise than by measure.

2. (I.) In respect of lands and tenements of which the assessed annual value is £17 or under, 10s. per annum.
- (II.) In respect of lands and tenements of which the assessed annual value is over £17, a rate of 7d. for each pound sterling on the amount of the assessed annual value up to £300 inclusive; 5d. for each pound sterling on the amount of the assessed annual value in excess of £300 up to £700 inclusive; 4d. for each pound sterling on the amount of the assessed annual value in excess of £700 up to £1,000 inclusive; 3d. for each pound sterling on the amount of the assessed annual value in excess of £1,000 up to £4,000 inclusive; and 2d. for each pound sterling on the amount of the assessed annual value in excess of £4,000.

3. The following rates shall be paid in each year in respect of lands and tenements which are not supplied with water for domestic purposes, and which are not more than 60 yards distant from a main constructed by or vested in the Board, that is to say:—

- (I.) In respect of lands and tenements of which the assessed annual value is £10 or under, a rate of 1s. in the pound.
- (II.) In respect of lands and tenements of which the assessed annual value is over £10, a rate of 10s. per annum up to the assessed annual value of £17 inclusive.
- (III.) In respect of lands and tenements of which the assessed annual value is over £17, a rate of 7d. for each pound sterling on the amount of the assessed annual value.
- (IV.) In respect of lands on which no building is erected for human habitation, a rate of 4d. in the pound of the assessed value.
- (V.) The like rates as those above mentioned shall be charged on all lands and tenements not included in any valuation by the Municipal Council of the City of Sydney or Redfern, or of any Borough or Municipal District, and on all lands for the time being valued by the said Municipal Council of the City of Sydney or Redfern, or by such Borough or Municipal District, at a sum less than the true value thereof.
- (VI.) When any lands or tenements become liable to a rate, or to an increased rate, during the currency of any half-year by reason of the extension of a main or for any other reason whatsoever, then a part of such rate or increased rate, as the case may be, proportionate to the unexpired period of the current half-year, shall become due and be paid forthwith.

Supply of water by meter.—Charges for water supplied by meter.

4. The charge for water supplied by meter shall be 1s. per 1,000 gallons for all water consumed up to 20,000,000 gallons per annum, and 9d. per 1,000 gallons for all water consumed in excess of 20,000,000 gallons per annum: Provided that the minimum quantity of water to be charged for, where water is so supplied, shall be 10,000 gallons per annum. Her Majesty's ships will be supplied free of charge.

5. All charges for water supplied by meter shall, unless otherwise provided by a contract made between the Board and the person to be supplied, be paid within one month after service by the Board upon the person liable to pay such charge of a notice in writing setting forth the amount due for water so supplied, and demanding payment thereof within the period of one month aforesaid. Service of any such notice may be effected by serving the same personally on the person named therein, or by sending such notice through the post to the person named therein at his last known place of abode or business; and where the place of abode and the place of business of such person are unknown to the Board, by sending it through the post addressed to him at the lands and tenements to or in respect of which the water is supplied, or by leaving it on such lands and tenements.

For water for other than domestic purposes otherwise than by measure.

- (VI.) The charge for water supplied to gas-engines or oil-engines shall be 5s. per annum for each engine of two horse-power and under, and for every additional horse-power beyond two horse-power an additional charge of 2s. 6d. per annum for each horse-power.

(VII.)

(VII.) The charge for water supplied to steam-boilers shall be £1 per annum for each steam-boiler up to three horse-power, and for every additional horse-power beyond three horse-power an additional charge of 5s. per annum for each horse-power.

(VIII.) The charge for water supplied for actuating ventilators or refrigerators shall be by special fee, according to the following scale, namely:—

Class A.—Passing 60 gals. per hour at 65 lb. pressure—

1 nozzle,	£6 per annum.
2 nozzles,	£4 10s. per annum each.
3 ,,	£3 10s. ,,
4 ,,	and upwards, £3 per annum each.

Class B.—Passing 40 gals. per hour at 65 lb. pressure—

1 nozzle,	£3 15s. per annum.
2 nozzles,	£3 per annum each.
3 ,,	£2 10s. per annum each.
4 ,,	and upwards, £2 per annum each.

Supply for twelve hours only in each day.

Provided, however, that the supply of water under this By-law shall be for twelve hours only in each day, and no person having such supply shall continue to use the same for more than twelve hours in any one day.

Water for trade purposes, &c.

(IX.) The charge for water supplied for purposes of the under-mentioned or other trades shall be at such rates, upon such terms, and subject to such conditions as may be agreed upon by the Board and the person requiring to be supplied, provided, however, that for any year or part thereof, the minimum charge for water supplied for the under-mentioned trades shall be that in each hereunder case set opposite the trade, viz. :—

Photography, and any like process...	5s. per annum.
Tripe-cleaning	5s. ,,
Tyring purposes	5s. ,,
Laundries	5s. ,,
Dyers	10s. ,,
Condiment-making	5s. ,,
Bottle-washing	5s. ,,
Small goods (sweets)	5s. ,,
Waterfalls and fountains	5s. ,,
Shop-fronts, by hose	5s. ,,

Washing Vehicles.

(x.) The Board may supply water for the washing of vehicles with a hose, without meter, at the rate of 5s. per annum for each vehicle.

In all cases where special fees are charged the Board reserve to themselves the right of insisting upon a meter being fixed at any time, notwithstanding the fact that the special fee may have been paid. All special fees are in addition to the assessed annual rate of the premises on which such fees are charged, and are payable in advance. All premises on which water is used for other than domestic purposes, and upon which special fees are paid, shall be open for inspection by the inspectors of the Board at any reasonable hour.

2. Assessed rates shall be paid half-yearly in advance, whether a meter is used or not. In the case when a meter is used the meter account will be rendered only when it is in excess of the assessment. Cheques and Post-office orders will be received in payment of rates; but if the cheque tendered by any person as payment for rates due is dishonored, the Board may cut off his service, and proceed for the recovery of the amount by warrant for distress or otherwise. Cheques and Post-office orders must be crossed in favour of the Board.

3. The minimum charge for water, whether supplied through meter or otherwise, for domestic purposes and for purposes other than domestic, is the assessed annual rate. If the water is supplied by meter, and the meter account exceeds the assessment (calculated at the rate of 1s. per 1,000 gallons), then such excess shall be charged in addition to the assessment.

4. One meter may be allowed to supply several tenements when such tenements are occupied by one person or firm as a place of business or abode, and the meter account will be credited with the assessments of all such tenements. One service only will be allowed under these conditions, upon which the meter will be fixed, and all the water for such tenements must pass through such meter. Where peculiar circumstances entail a departure from the above, and two services are absolutely necessary, then there shall be a meter on each service pipe.

Building

Building Charges, &c.

- (XI.) The charge for water supplied for building and plastering purposes shall be at the rate of one half-penny per cubic yard on the cubical contents of each building. The Board will also supply water by meter at the rate of 1s. 6d. per 1,000 gallons (excepting Gordon and Richmond, which shall be 2s. per 1,000 gallons), or at the rate above mentioned per cubic yard on the cubical contents of each building, provided that the meter so used shall be $\frac{1}{2}$ inch in size; and the minimum charge in each case for water so supplied through meter shall be 15s.
- (1.) The charge for water supplied for plastering rooms only shall be 2s. 6d. for each room, and for the building of wash-houses, water-closets, coppers, and chimneys only, 2s. 6d. each.
- (2.) The charge for water supplied for making and mixing of concrete for foundations of wooden blocks, stone cubes, or other form of permanent roadway or pavement shall be at the rate of £1 1s. per 1,000 square yards by superficial measurement of road surface, and for all other concrete, brickwork, or masonry, at the rate of three half-pence per cubic yard, as measured on the work.
- (XII.) Any person who maintains horses or cows may be supplied with water, without meter, from the domestic service for the sum of 5s. per annum for each animal, in addition to the assessed annual rate of the premises on which such animal is maintained or supplied with water.
- (XIII.) All lands or premises actually supplied with water by the Board, on which any one or more head of horses or cattle shall be kept or maintained, shall be liable to an extra rate or charge (beyond and in addition to the assessed annual rate of the premises) of 5s. per head for each head of horses or cattle kept or maintained on such lands or premises. And where such lands or premises are not actually supplied with water by the Board they shall be liable to an extra rate or charge (beyond and in addition to the assessed annual rate of the premises) of 2s. 6d. per head for each head of horses or cattle kept or maintained on such lands or premises.
- (XIV.) The Board may supply water for gardens, which do not exceed 1,000 square feet superficial in area (and for such purpose may permit a hose and stand-pipe to be used), without meter, at the rate of 10s. per annum, in addition to the assessed annual rate of the premises to which such gardens belong or are attached.

METROPOLITAN SEWERAGE RATES.

1. The following rates and charges are those which the owners and occupiers of houses, tenements, or lands shall pay for or in respect of sewerage, or for or in respect of the liability of such houses, tenements, or lands to rates and charges for sewerage, that is to say:—

- (I.) Where the premises are of the assessed annual value of £10 or under, a rate of 1s. in the £ per annum on the amount of the valuation.
- (II.) Where the premises are above the assessed annual value of £10, a rate of 10s. per annum up to the assessed annual value of £17 inclusive.
- (III.) Where the premises are above the assessed annual value of £17, a rate of 7d. for each pound sterling on the amount of the valuation.

2. The following rates shall be paid in each year in respect of vacant and unoccupied lands and tenements, on which no building is erected for human habitation, and which are not connected with any sewer or drain under the control of the Board, and which are situated within 150 feet from a sewer or drain belonging to the Board, that is to say:—

- (i.) A rate of 4d. for each pound sterling on the amount of the assessed value.

Western Suburbs Outfall Sewer, Rockdale.

The following rates and charges are those which shall be paid by the owners or occupiers of houses, tenements, or lands liable to be rated in respect of the Western Suburbs Outfall Sewer at Rockdale and reticulating sewers connected therewith, that is to say:—

A rate of 1s. for each pound sterling on the amount of the valuation of such houses, tenements, or lands.

North Sydney Sewerage Works.

The following rates and charges are those which shall be paid by the owners or occupiers of houses, tenements, or lands liable to be rated in respect of the North Sydney Sewerage Works and reticulating sewers connected therewith, that is to say:—

A rate of 1s. for each pound sterling on the amount of the valuation of such houses, tenements, or lands.

Double Bay Low Level Sewerage Works.

The following rates and charges are those which shall be paid by the owners or occupiers of houses, tenements, or lands liable to be rated in respect of the Double Bay Low Level Sewerage Works and Reticulating Sewers connected therewith, that is to say:—

A rate of 1s. for each pound sterling on the amount of the valuation of such houses, tenements, or lands.

FOR COUNTRY DISTRICTS IN COUNTY OF CUMBERLAND.

1. The following rates and charges are those which the owners and occupiers of houses, tenements, and lands shall pay in respect of water supplied by the Board, that is to say:—

For water supplied for domestic purposes otherwise than by measure.

- (I.) On every house, tenement, or land of £10 assessed annual value and under, 10s. per annum.
- (II.) On every house, tenement, or land above the assessed annual value of £10, a rate of 1s. for each pound sterling on the amount of the valuation.

2. The following rates shall be paid in each year in respect of lands and tenements which are not supplied with water for domestic purposes, and which are not more than 60 yards distant from a main constructed by or vested in the Board, that is to say:—

- (I.) On every house or tenement a rate of 1s. in the £ on the amount of the assessed annual value.
- (II.) On lands on which no building is erected for human habitation, a rate of 4d. in the £ on the assessed value.
- (IV.) The like rates as those above mentioned shall be charged on all lands, tenements, and hereditaments not included in any valuation by any Borough or Municipal District, and on all lands for the time being valued by any such Borough or Municipal District at a sum less than the true value thereof.

For water supplied by measure:—

- (V.) The charge for water supplied by measure shall be 1s. per 1,000 gallons for all water consumed up to 20,000,000 gallons per annum, and 9d. per 1,000 gallons for all water consumed in excess of 20,000,000 gallons per annum.

District of Gordon.

For water supplied for domestic purposes otherwise than by measure.

- (I.) On every house, tenement, or land, a rate of 1s. for each pound sterling on the amount of the valuation.
- (II.) In respect of vacant or unimproved lands not supplied with water, and which are not more than 60 yards distant from a main constructed by or vested in the Board, a rate of 6d. for each pound sterling on the amount of the valuation.

For water supplied by measure.

- (III.) The charge for water supplied by measure shall be 1s. 6d. per 1,000 gallons.
- (IV.) Any person who maintains horses or cows may be supplied with water, without meter, from the domestic service for the sum of 7s. 6d. per annum for each animal, in addition to the assessed annual rate of the premises on which such animal is maintained or supplied with water.
- (V.) The Board may supply water for gardens which do not exceed 1,000 square feet superficial area (and for such purpose may permit a hose and stand-pipe to be used), without meter, at the rate of 15s. per annum, in addition to the assessed annual rate of the premises to which such gardens belong or are attached.

METROPOLITAN DRAINAGE BY-LAWS.

Whereas by the "Metropolitan Water and Sewerage Act Extension Act of 1894" the Board of Water Supply and Sewerage is authorised and empowered to make, alter, and repeal By-laws: Now, the Board of Water Supply and Sewerage, under and by virtue of the powers contained in the above-mentioned Act, do hereby make the By-laws following, that is to say:—

Assessment and Rates.

1. For the purposes of these By-laws the value of lands and tenements in each year shall be the value (if any) at which the same are for the time being assessed for rating purposes by the Municipal Council of the City of Sydney or the Borough or Municipal District respectively in which such lands or tenements are situated, on the 1st day of January and the 1st day of July respectively, as the case may be, in each year; and such value shall continue to be the value of such lands or tenements for the purposes aforesaid during such year.

2. The rates which are respectively set opposite to the descriptions of stormwater drains hereunder mentioned are those which shall be paid by the owners or occupiers of the lands or tenements situated within the boundaries of the drainage areas respectively proclaimed in respect of such stormwater drains, and for the purpose of assessing such rates, the valuation of such lands and tenements by the Municipal Council of the City of Sydney or the Borough or Municipal District respectively within which the same respectively are situated, shall be taken as the valuation thereof by the Board under the said Act. The minimum rate payable under these By-laws shall be in each case 1s. per annum:—

Rushcutters' Creek Drain.—A rate of 7d. for each pound sterling on the amount of the valuation of the lands or tenements.

Willoughby Falls, Neutral Bay, and Careening Cove Drains.—A rate of 7d. for each pound sterling on the amount of the valuation of the lands or tenements.

Blackwattle, Glebe, and Denison Ward Drain.—A rate of 7d. for each pound sterling on the amount of the valuation of the lands or tenements.

Beattie-street,

Beattie-street, Balmain, Drain.—A rate of 2d. for each pound sterling on the amount of the valuation of such lands or tenements.

Iron Cove Creek, Ashfield, Burwood, Enfield, and Canterbury Drain.—A rate of 6d. for each pound sterling on the amount of the valuation of all lands or tenements situated within the drainage area described as Class A, and a rate of 4d. for each pound sterling on the amount of the valuation of all lands or tenements situated within the drainage area described as Class B.

Shea's Creek, Waterloo, Drain.—A rate of 7d. for each pound sterling on the amount of the valuation of the lands or tenements.

Iron Cove Creek Extended, Ashfield, and Burwood Drain.—A rate of 7d. for each pound sterling on the amount of the valuation of the lands or tenements.

Homebush Creek, Burwood, and Strathfield Drain.—A rate of 7d. for each pound sterling on the amount of the valuation of the lands or tenements.

Homebush Creek Extended, Strathfield, Drain.—A rate of 7d. for each pound sterling on the amount of the valuation of the lands or tenements.

Long Cove Creek, Leichhardt, Ashfield, and Petersham Drain.—A rate of 3d. for each pound sterling on the amount of the valuation of all lands or tenements situated within the drainage area described as Class A, and a rate of 1d. for each pound sterling on the amount of the valuation of all lands or tenements situated within the drainage area described as Class B.

Erskineville and Munni-street, Newtown, Alexandria, and Erskineville Drain.—A rate of 7d. for each pound sterling on the amount of the valuation of the lands or tenements.

Euroka Creek, North Sydney, Drain.—A rate of 2½d. for each pound sterling on the amount of the valuation of the lands or tenements.

Easton Park, Balmain, Drain.—A rate of 4d. for each pound sterling on the amount of the valuation of the lands or tenements.

Double Bay, Woollahra, Drain.—A rate of 7d. for each pound sterling on the amount of the valuation of the lands or tenements.

3. All such rates as before-mentioned shall be paid in advance by equal payments on the first day of January and the first day of July in each year, and the first payment shall be made at the time when an owner or occupier becomes liable to pay such rates.

Sydney, 15 August, 1900.

T. KENNEDY, Examiner of Accounts and Auditor, M.B.W.S. & S., 22 November, 1900.

MELBOURNE GREEN,
Accountant.

Report on Health of the Officers and Employees of the Board.

Sydney, 28 August, 1900.

To the Secretary, for presentation to the President and Members of the Board,—

Sir,

I have the honor to inform you that 163 persons presented themselves for medical examination during the past financial year; 29 were examined as to their fitness for being employed by the Board; 4 were ordered to return to work; 3 were reported unfit for further duty; and 5 caused their illness through their own fault; 789 days of leave were recommended, or 361 days less than were recommended, during the preceding financial year, so that the general health of the officers and employees shows a decided improvement.

I have, &c.,

THEO. MAILLER KENDALL,
Medical Adviser.

Medical Adviser's Report on the Health of the Metropolis, Year 1899.

Metropolitan Board of Water Supply and Sewerage.

To the Secretary, for presentation to the President and Members of the Board,—

Sir,

I have the honor to submit my report for the year 1899.

The population of the Metropolis has increased by 9,700 souls since the year 1898, and the increase is to be noted both in the City and the Suburbs.

Population.	1896.	1897.	1898.	1899.
City	100'000	95'850	97'500	98'250
Suburbs... ..	308'500	314'150	319'750	328'700
Metropolis	408'500	410'000	417'250	426'950
Density per acre in City	44'9	42'0	42'7	43'9

The rainfall was greater than it was during the previous year by 12'65 inches, and it was spread over 173 days, or 25 days more than it was during the year 1898.

Rainfall.	1894.		1895.		1896.		1897.		1898.		1899.

The mortality from diarrhoea was considerably less than it was during the year 1898. It is now an assured fact that epidemic diarrhoea is "caused by the pollution of air, water, and food by the products of the decomposition of organic matter during very hot weather." An important point is the vulnerability of the individual, and the general state of the individual's health, for a low state of health renders the individual more prone to contract disease, more especially as unwholesome gases are given off from a filth-sodden soil in which anaërobic organisms are found and putrefaction is going on. Dr. Newsholme maintains that it is necessary to preserve the soil in a pure state, as "diarrhoea is essentially a filth disease, due to a micro-organism which flourishes in a polluted surface soil," and while every effect has an ancestry of causes, and every cause a posterity of effects, the unconditional cause of diarrhoea is a micro-organism, possibly the bacillus *Enteriditis sporogenes* of Klein. This fact is of great importance, as this bacillus has been found in the horse droppings in streets, and consequently may be carried about in dust, which is a vehicle of infection.

MORTALITY from Diarrhoea.—Metropolis rate per 10,000 of population.

The installation of a water carriage system of sewerage has always been followed by a diminution of the mortality from diarrhoea, and this good result is due to the drying of the ground by the laying of deep sewers and the consequent improvement in the general health.

MORTALITY—Rate per 10,000 of Population.

Diphtheria is a toxic disease which creeps slowly from place to place. It is a filth disease and its specific organism has a saprophytic nature and favours damp soils. Although the bacillus of diphtheria has never yet been found in sewer air, still the emanations of foul drains may induce an adynamic state of health which may bring about a physical change in the system so as to increase its susceptibility, either through the simple vulnerability of the respiratory mucous membranes by which the infection enters, or by lessening the refractoriness of the whole system to infection. Diphtheria is an air-borne disease and its infection is carried by air convection, and as its bacillus is capable of a lengthened survival outside the body, particularly when surrounded by dust, it is quite patent to any observer that through neglect in preserving the purity of the soil this disease may through the agency of dust be carried from an unhealthy into a healthy zone. Diphtheria is a disease beyond the scope of a sewerage system, still sewerage systems do assist in preventing the spread of diphtheria by drying the soil and by improving the general sanitary conditions, and thus they do away with the existence of many of the breeding places of the diphtheria bacillus. The mortality from diphtheria during the year 1899 was lower than it has been for some years.

That dire scourge, tuberculosis, which is now recognised as a preventable disease and not as an inevitable disaster inflicted by a mysterious fate, is the result of man's ignorance and carelessness. The micro-organism of tuberculosis is contained in the spores derived from dried sputum, such as is constantly cast heedlessly upon our streets by the pernicious, unnecessary and filthy habit of expectorating in the public thoroughfares and conveyances. Every man is not constituted like his fellow, and heredity in phthisis consists only in the tissues of some bodies being so constituted as to form an unusually suitable soil for the bacillus. Virchow remarks that "the nature of disease depends upon the behaviour of the organs and tissues with which the bacteria or their products meet." Therefore, if the germs of disease can be kept away, specially structured individuals will have a much greater chance of survival, even if they be somewhat more delicately constituted than their neighbours. "If, then, the existence of the tubercle bacillus, which is a toxin and an intracellular poison, is to be avoided, sanitary measures must be pushed to further perfection, great attention must be paid to street scavenging, and our milk supply must be more strictly controlled." Pasteur has said that "now is the time to enter the enchanted grotto of sanitary science, full of its priceless treasures"; but such an entry would be useless unless practical use is made of the knowledge thus gained, and man and other animals will be able to offer some defence to oppose the disease and death-producing poisons by which they are so constantly endangered.

Since the installation of the sewerage system there has been a considerable decrease in the mortality from phthisis, more especially in those districts where there has been considerable drying of the ground through the laying of deep sewers. The diminution of this mortality in the sewered districts has been most marked since the laying of sewers, and in some of these districts has been reduced by one-half. The mortality from phthisis had, in the various suburbs, the greatest incidence in the following order:—Five Dock, Drummoyne, Willoughby, Ashfield, Canterbury, Waterloo, Darlington, Camperdown, Randwick, Glebe, Paddington, City of Sydney, Balmain, Burwood, Botany, Marrickville, Concord, Woollahra, Redfern, Rockdale, Strathfield, Newtown, Manly, North Sydney, Enfield, Petersham, Alexandria, Ryde, Annandale, Leichhardt, Kogarah, North Botany, St. Peters, Waverley, Hurstville.

The number of cases of typhoid fever reported during the year 1899 was less than the number reported during the year 1898; but, although there was a decrease in the total number reported, the City of Sydney reported 76 cases more than for the year 1898. Typhoid fever can be communicated in various ways—by water, food, &c., and by personal infection. Dr. Priestly considers that in all probability typhoid fever spreads by actual contact oftener than is generally supposed, and that as cases frequently remain unrecognised for long periods, “such cases are mainly responsible for spreading the disease.” The existence of personal infection is no doubt true, but except in rare instances, I feel certain that this mode of infection is the result of the proper want of recognition of individual responsibility, and is due in most instances to individual carelessness.

Sir Charles Cameron looks upon typhoid fever as a semi-miasmatic disease which clings to individual houses and infects succeeding tenants. Recent investigation tends to show that typhoid fever is communicated by means of the soil, and the late Sir Richard Thorne Thorne considered the soil highly favourable to the vitality and propagation of the typhoid bacillus. Instances of infection by means of the soil have presented themselves during the past year, and so long as obsolete house sanitary systems are allowed to exist in this city so long will typhoid fever annually demand its victims, as its bacillus will be festered in the contaminated soil and air. In a recent report on the plague by the Board of Health attention was drawn to the “seriously defective drainage of the house,” and in a footnote it goes on to say, “This is too generally the case within the City of Sydney, which, in this respect, is very sharply distinguished from the rest of the metropolitan area.” The chief channel of infection between a typhoid infected soil and man is dust, and unless the culpable fouling of the soil is discontinued it can never be expected that disease will be avoided, for infection occurs not only through fouling of the water beneath the soil, but also through the escape of pathogenic germs from the soil into the air.

Professor Ray Lankester, Drs. Lorrain Smith and Tennant and Saranelli see some danger to the human being through the bacillus *coli communis* which is perfectly innocent while it remains alone, but becomes an adjuvan-factor of Typhoid fever, and is roused into intense pathogenic activity if a bacillus of the same nature from the intestines of animals comes into contact with it in the intestines of man. This, then, emphasises the necessity for keeping the soil as pure as possible. Typhoid excreta should always be destroyed by fire, for otherwise the soil must become contaminated if it is buried, and it is folly to imagine that disease will not rise from ill-managed garbage tips. The practice of covering garbage with a few inches of earth will not prevent the egress of those foul gases which are the products of decomposition, and which carry with them the germs of disease, so that this air sewage may be carried by air convection into healthy zones.

Number of Cases Reported.		Districts Reporting the Greatest Number of Cases.
January ...	69	Botany, Canterbury, Annandale, Concord, St. Peters, Petersham
February ...	91	Botany, Petersham, Balmain, Leichhardt, Newtown, City of Sydney
March ...	146	Annandale, City of Sydney, Burwood, Petersham, Redfern, Marrickville

May ...	98	Burwood, Randwick, Balmain, Leichhardt, Redfern, City of Sydney
June ...	52	Balmain, Petersham, City of Sydney
July ...	46	City of Sydney, Marrickville, Balmain
August ...	32	Balmain, City of Sydney, Botany
September ...	26	Waverley, Leichhardt, City of Sydney, Newtown, Botany
October ...	21	City of Sydney, Leichhardt, Balmain
November ...	24	City of Sydney, Botany
December ...	79	City of Sydney, Randwick, St. Peters, Hunter's Hill.

As compared with last year, 1898, Typhoid fever has decreased in Canterbury, Burwood, St. Peters, Annandale, Lane Cove, Leichhardt, Ashfield, Hunter's Hill, Enfield, Glebe, Five Dock, North Sydney, Marrickville, Manly, Waterloo, Kogarah, Alexandria, Waverley, Drummoyne, Erskineville, Hurstville, Ryde. The returns for 1899 show that this fever has increased in Botany, North Botany, Randwick, Balmain, Mosman, Redfern, City of Sydney, Camperdown, Newtown, Rockdale, Darlington. Thirteen per cent. of the total number of cases reported in January came from the City of Sydney; 21.9 per cent. of the total number reported in February; 10.8 per cent. in March; 14.9 per cent. in April; 18 per cent. in May; 34.6 per cent. in June; 63 per cent. in July; 21.9 per cent. in August; 29 per cent.

in September; 19·9 per cent. in October; 21·8 per cent. in November; 36 per cent. in December. An investigation of the environment of the 795 reported cases showed:—

	Jan.	Feb.	Mar.	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Total.
Sewers not laid... ..	35	42	78	63	63	26	8	9	10	9	14	29	386
Sewers laid, but houses not connected...	4	9	29	6	6	1	11	4	1	4	2	12	89
Houses insanitary	22	32	34	29	24	18	16	6	8	5	7	29	230
Regulations complied with	8	7	4	5	7	7	15	13	6	3	1	7	83
Came into port with fever	0	0	1	1	0	0	0	0	1	0	0	0	3
No fixed abode	0	1	0	1	0	0	0	0	0	0	0	2	4
Total	69	91	146	107	98	52	46	32	26	21	24	79	795

The greater number of cases came from districts in which sewers have not yet been laid, but a large number came from dwellings reported in an insanitary state. The inspectors' reports were most appalling and revealed the existence in the city of obsolete house sanitary systems, broken water connections, cracked pans, faulty cisterns (in some cases not provided with water), choked drains, deficient ventilation, dirty dwellings, bath wastes connected directly with the main sewer and a general state of indifference as to keeping any sanitary system in proper working order.

Notwithstanding that a fewer number of cases of Typhoid fever were reported during the year 1899 than during the year 1893 the mortality from this disease increased by 14 cases. Thirty-three out of the 87 cases reported as fatal, or 38 per cent. of the total number, were reported as occurring in the city, but actually only 12 cases came from the city, or 14 per cent. of the total number of fatal cases.

The general public do not yet understand how easily milk can become the vehicle of Typhoid fever. Blame must not be attached to the vendors, as the usual place of contamination in milk is the home and the milk shop. Milk is sent out from the dairy in a pure state, but sufficient care is not taken in its storage in the dwelling and the milk shop. Milk does not obtain typhoid infection from the cow, but becomes infected after it is taken from the animal; it therefore should be received by the householder in carefully protected and cleansed vessels, so that the risk of contamination which may occur through a faulty

faulty delivery may not be increased by a faulty storage. A careful inquiry was made into the environment of these cases, with the following result:—

	Jan.	Feb.	Mar.	April	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Total.

Total	10	12	19	11	11	6	2	2	3	1	4	6	87

Only one case, therefore, or 1.1 per cent. of the total number, came from a dwelling in which the regulations of the Board had been complied, and on inquiry I found that the patient was only a lodger who had come from the country suffering from Typhoid fever. In proportion to the population, Canterbury reported the most of the fatal cases. Then in order came:—Botany, Burwood, Lane Cove, Enfield, Randwick, Leichhardt, Strathfield, Petersham, Mosman, Newtown, Waterloo, Balmain, St. Peters, City of Sydney, Waverley, Woollahra, Ashfield, Annandale, Redfern, North Sydney, Glebe, Paddington.

The review of the year 1899, so far as Typhoid fever is concerned, is most unsatisfactory, for although a fewer number of cases were reported, still the death roll was greater, and the weakness of the city itself to withstand epidemics of this disease was revealed. It would be natural to suppose that having in view the giant strides made by sanitary science during the past century, that a city like Sydney would be provided with the most recent method of sewerage, and that householders would have shown their anxiety to avail themselves of it. The main sewerage system of our city is one of the best it is possible to have; but, unfortunately, owing to an omission in the Act, householders for the most part have shown gross apathy in availing themselves of the opportunity offered, and it is evident that sanitation must be forced upon the public by Act of Parliament. The results of the inspections show this and more, for it has been found, even in those houses where the Board's regulations have been complied with, that the tenants regard the system as automatic, and do not consider it necessary to give them any attention, forgetting altogether that a neglected trap may become a source of death. To enable the Board to cope with these evils further legislation is necessary, and nothing short of a proper house to house inspection, will ever enable those in authority to deal with individual carelessness, and to ensure clean persons safety against the acts of their unclean neighbours. Diarrhœa, Diphtheria, Phthisis, and Typhoid fever are called preventable diseases, and are attributed to man's ignorance and carelessness, but how can such diseases be avoided unless there is a proper appreciation of individual responsibility and a due exhibition of care from municipal authorities? It is appalling to know that in our city, provided as it is with a most excellent sewerage system, that out of 22,000 houses only about 1,000 are properly connected with the sewers, and that for the most part, the others act as ventilators of the sewers, admitting foul gases into the interior of the dwelling to be breathed by the inmates *ad nauseam*. Without the introduction of any new disease such as the plague, sufficiently formidable diseases exist in our midst, and it is necessary for the public to rouse itself from its apathetic state and to demand that these systems, which have been installed at great cost, shall be used to the full for the public good.

I have, &c.,

THEO. MAILLER KENDALL,

Medical Adviser.

22nd February, 1900.

Medical Adviser's Report on the Health of the Metropolis, Quarter ending 31 March, 1900.

To the Secretary, for presentation to the President and Members of the Board,—
Sir,

I have the honor to submit my report for the first quarter of the year 1900. The population of the Metropolis has increased since the corresponding quarter of last year, by 655 souls in the City and 9,900 souls in the suburbs.

	1895.	1896.	1897.	1898.	1899.	1900.
City	103·870	100·000	93·850	95·250	97·875	98·500
Suburbs... ..	319·730	308·000	316·150	315·050	324·225	334·125
Metropolis	423·600	408·000	410·000	410·300	422·100	432·625
Density per acre in city...	48·7	45·9	42·7	42·7	43·9	43·93

The rainfall during the past quarter exceeded that of the corresponding quarter of last year by 4·53 inches, and was spread over 33 days or three days less than during the corresponding quarter of last year.

1894.		1895.		1896.		1897.		1898.		1899.		1900.	
Inches.	Days.												
17·61	61	16·20	43	9·97	43	5·95	37	11·61	36	4·83	41	36·9	38

The highest temperature 92·4 was registered January 27th, and the lowest 57·5 on March 22nd and 24th. The greatest range 31·2 occurred on January 19th. Although the extremes of temperature were not so great as they were during last year still the humidity was so great that it caused feelings of weakness and depression. During January the humidity reached 94°, February 90°, and March 99°.

Metropolis	95	144	63	88	37	67

Epidemics of diarrhoea can usually be traced to the indolent habits of man. Indolence which causes pain, suffering and death to human beings. If through a well concealed murder a few persons were to disappear the outcry would be great, but hundreds are allowed to die annually without any attempt being made to prevent their death. Science has made gigantic strides during the past century, and has placed in the hands of man the means to stem the tide of advancing disease. But who cares? Who values life? And who thinks that in becoming a municipal councillor he undertakes any obligation for the welfare of his fellow citizens. It is very painful to have to reiterate on every occasion that through the wanton apathy which exists, through indolence and lack of appreciation of individual responsibility, disease is hurled at the heads of innocent people when all that is needed is the application of common sense to matters of every day observation so that the fullest benefit may be taken of the revelations of scientific research. Our public school system is greatly at fault in that it does not provide for the proper teaching of domestic science. If domestic science were better taught, homes would be healthier and happier, squalor would be absent, and the searing iron of poverty would not be so much felt, for decency and sanitation would be maintained. Unless the growing generation is better taught the value of cleanliness, how can it be expected but that disease will continue in our midst, and that there will be an appalling loss of infant life, and a miserable physique for the poorer inhabitants of cities. To keep our streets clean is the first duty of our municipal authorities, and they should remember that in former times a scavenger was a petty magistrate whose duty it was to ensure cleanliness, and that the usual man with the cart is no scavenger, since he has no proper training for his duties. The dust of streets contains the seeds of disease, and proper street scavenging is material to the maintenance of health and the increasing of the National Wealth. The mortality from diphtheria shows a slight increase as compared with the mortality for the corresponding quarter of last year.

	1895.	1896.	1897.	1898.	1899.	1900.
City	2	0	3	0	0	0
Suburbs	23	10	12	11	2	3
Metropolis	25	10	15	11	2	3

It has been before pointed out that this disease has only an indirect relation to sewerage systems and that although an a dynamic state of health may be induced through the foul emanations of ill-kept drains, yet the neglect can generally be traced to the householder and not to the fault of any public authority. The safe and speedy removal of all house garbage, the abolition of stagnant waterholes, and the filling in of hollows with sound ballast and not decomposed horse droppings, greatly assist in the maintenance of health and the prevention of disease.

The mortality from phthisis was much less than it was during the corresponding quarter of last year. The benefits received through the installation of a proper sewerage system has been shown in dealing with the disease called phthisis.

	1895.	1896.	1897.	1898.	1899.	1900.
City	56	41	31	31	49	37
Suburbs	107	43	59	87	74	65
Metropolis	163	84	90	118	123	102

The necessity for the most vigorous efforts in attempting to avoid this disease is shown for the most part by the fact that it is so fatal to the young adult. The gradual application of the great principles of hygiene

hygiene has rendered homes happier through the admission of air and sunlight, and the gradual abolition of the slum and the alley. "In Germany, where insurance against sickness and old age is compulsory for all whose income is below £150 a year, the insurance companies have found that it pays them to erect and maintain institutions where they keep those who develop symptoms of phthisis in pure country air, with wholesome food, until the disease was so far cured as to enable them to return to their occupations." This shows how much can be done to eradicate a disease which will always be rife in our midst as long as the present unsatisfactory Building Act is allowed to stand, for it is only through teaching people the value of fresh air and sunlight, that we can ever hope successfully to deal with this dire scourge, which is the outcome of man's neglect. Scores of persons die annually from this disease, and much wealth is lost to the state by lack of appreciation of individual responsibility and the want of a proper appreciation of the value of the general principles of hygiene, not only with regard to man but also with regard to animals. Individual carefulness is necessary so that expectorating in public thoroughfares may be checked, for this expectoration, dries, becomes pulverised into fine dust, and is blown about to be inhaled by human beings. If only man would obey nature's laws all would be well, for nature so orders her ways that each act of obedience makes the next act easier, and step by step she leads on to that obedience which is complete mastery of her actions.

The fatal cases came from the following districts which are arranged in the order of greatest incidence: Strathfield, Camperdown, Willoughby, Erskineville, Alexandria, Kogarah, North Botany, Mosman, Manly, Annandale, Ashfield, Petersham, Balmain, City of Sydney, Waverley, St. Peters, Glebe, Woollahra, Paddington, Redfern, North Sydney, Newtown, Marrickville. During the quarter just ended a greater number of cases of typhoid fever were reported than for the corresponding quarter of last year.

CASES of Typhoid Fever reported, quarter ending March 31, 1900.

VOLUNTARY NOTIFICATION.				COMPULSORY NOTIFICATION.		
1894.	1895.	1896.	1897.	1898.	1899.	1900.
214	186	253	150	339	306	533

Such an increase of typhoid fever can only mean great national disaster, for not only is much labour lost to the State through the incapacitation of the person sick, but also through the loss of time caused by others being required to care for the sick. Reduced to a money value the loss to the state during the past quarter was £11,080 or £2,788 more than it was during the corresponding quarter of last year. A careful inquiry was made into the environment of these 533 cases.

Total	131	198	204	533

What could be the cause of this excessive outbreak? It needed the advent of a new disease, the bubonic plague, to point out the cause which for years past I have emphasised—dirt, neglect, individual apathy. As soon as the plague made its appearance the authorities were on the alert to combat its advance and if possible to stamp it out, but although I have repeatedly shown how danger threatened our metropolis through the increase of typhoid fever, not one of them would lift a finger to avoid it. This newly awakened activity on the part of our municipal authorities comes late to stem the tide of death dealing disease, and although they were repeatedly warned through the medium of these reports, they were always ready to shelve their responsibility and to attribute a falsity of statement and a distortion of fact to your Medical Adviser. Owing to the advent of the plague my statements have been proved, and although they were in themselves appalling they fell short of the actual truth. Dirt and neglect were rampant in a city provided with an excellent sewerage system, and a city which ought to be and could be made the queen city of the South as far as cleanliness is concerned. Typhoid fever is a disease due to filth. Filth in the air, filth in the food, and filth in the soil. A polluted and filth impregnated atmosphere is dangerous to human life, and those who bring about such a state of affairs are guilty of a crime. That the air in many dwellings in our city was impregnated with filth is evident from the discovery of our Inspectors who only now have had a proper opportunity to search for faulty fittings and for the causes of disease. An omission in the Act failed to give the Board sufficient powers over the reconstruction of the sanitary systems in our city, and, consequently, although the Inspectors' reports were appalling still they were not surprising. Faulty fittings were in abundance, and it is astounding that the owners of dwellings should have been so callous in dealing with human life that they neglected to properly avail themselves of an excellent sewerage system. As long as sewer gas was impartially laid on for the benefit of the tenants through absence of proper traps, proper connections and proper ventilation, so long would these tenants prove subjects for disease. Drains poured their contents not into the sewer but into the ground, to soak beneath the houses and to foul the soil, so that it, through its evil emanations, became a menace to the health, not only to the present but also of future generations.

Sir

Sir Charles Cameron has long ago pointed out that typhoid fever will always be present as long as there is any fouling of the soil, and the dangers which arise from this source have been continually pointed out in these reports. The cause of the excessive outbreak of typhoid fever can easily be pointed out, and the only wonder is that it is not still more excessive, and that more lives have not been sacrificed to its virulence in this city, where people are allowed to move a few boards of a floor and to use the space between the floor and the ceiling of the room below as a receptacle for faecal matter.

DISTRIBUTION of Reported Cases of Typhoid Fever, quarter ending March 31, 1900.

District.	Density of population per acre.	1898.	1899.	1900.	District.	Density of population per acre.	1898.	1899.	1900.

14 Leichhardt ...	14·13	17·7	9·0	12·2	34 Waverley ...	5·86	3·8	·9	2·8
15 Ryde ...	·34	0	0	12·1	35 Alexandria ...	8·16	8·8	4·9	2·4
16 Darlington ...	94·03	2·9	2·9	11·0	36 Lane Cove ...	·59	52·1	7·0	0
17 Petersham ...	11·16	11·1	12·0	10·1	37 Willoughby ...	·79	0	2·4	0
18 Balmain ...	33·38	7·7	5·6	9·2	38 Five Dock ...	1·01	0	0	0
19 Redfern ...	56·38	4·7	6·9	9·1	39 Drummoyne ...	4·15	13·4	0	0
20 Manly ...	1·65	30·3	4·2	9·0					

It will be seen from above table that typhoid fever has increased in St. Peters, Glebe, Mosman, Hunter's Hill, Ashfield, City of Sydney, Erskineville, Marrickville, Leichhardt, Ryde, Darlington, Balmain, Redfern, Manly, Newtown, Camperdown, Strathfield, Waterloo, Hurstville, Rockdale, Waverley. It has decreased in Botany, Burwood, North Botany, Annandale, Petersham, Enfield, Randwick, North Sydney, Paddington, Canterbury, Kogarah, Alexandria, Lane Cove, Willoughby. It has neither increased or decreased in Concord, Five Dock, Drummoyne. The cause therefore is dirt which has been allowed to accumulate through individual and municipal neglect, and consequent fouling of the soil. Dirt is the chief cause, but there are subsidiary causes, such as apathy of householders in failing to avail themselves of the existing excellent sewerage system laid down, and failure to protect air, water, and food from the emanations of foul drains. Faulty house sanitary systems contaminate air, food and soil, and the evil of allowing the soil to become contaminated was shown during the past quarter in Ultimo which in a small radius became attacked with disease through the excavations made for the telephone tunnel, as through these proceedings much made ground was disturbed and the latent germs of disease assumed an increased activity. During the quarter just ended 49 cases of typhoid fever proved fatal, and one case of typhus fever.

The cause of the typhoid outbreak is very evident, and so is the remedy. Cleanliness is the remedy, speedy removal and destruction of all garbage, properly regulated dirt boxes, and above all properly arranged connections with sewers. Too much care and money cannot be spent on house sanitary systems, and everyone should insist on the owners of houses producing a proper certificate that the sanitary systems in houses are in proper working order.

I have the honor to be,

Your obedient servant,

THEO. MAILLER KENDALL,

Medical Adviser.

Medical Adviser's Report on the Health of the Metropolis for the Quarter ending June 30, 1900.

To the Secretary, for presentation to the President and Members of the Board,—

Sir,

I have the honor to submit my report for the second quarter of the year 1900.

The population has greatly increased both in the City and the Suburbs since the corresponding quarter of last year.

POPULATION.

	1896.	1897.	1898.	1899.	1900.
City	100,000	95,850	95,250	98,250	98,750
Suburbs	308,000	314,150	315,050	328,700	339,500
Metropolis	408,000	410,000	426,950	426,950	438,250
Density per acre in city	44·9	42·7	42·7	43·8	44·0

The rainfall was greater than it has been during any corresponding quarter for the last six years, and exceeded that for the corresponding quarter of last year by 9·46 inches. It fell upon fifty-two days, or on five days more than it did during the corresponding quarter of last year.

RAINFALL.

Inches.	Days.										
5·12	41	18·70	34	17·70	33	17·53	45	20·74	47	30·20	52

The mean temperature for the quarter just ended was lower than it was for the corresponding quarter of last year. The highest temperature, 77, was registered April 10; the lowest, 43·1, May 13; and the greatest range, 21·3, occurred April 28. No temperature over 77·1 was recorded, the highest for the corresponding quarter of last year being 8·1, registered April 7, 1899.

TEMPERATURE.

	1896.		1897.		1898.		1899.		1900.

Notwithstanding the presence of the plague, the death rate from all causes has been much lower than it has been for the corresponding quarter of the last three years. A decrease is to be noted in the mortality from diarrhœa, diphtheria, and typhoid fever. There is a slight increase in the number of deaths from phthisis.

DEATHS due to all causes, quarter ending 30 June.

	1895.	1896.	1897.	1898.	1899.	1900.
City	358	361	444	429	477	350
Suburbs	962	840	954	980	926	889
Metropolis	1,320	1,201	1,398	1,409	1,403	1,239

DEATHS from Diarrhœa, quarter ending 30 June.

	1895.	1896.	1897.	1898.	1899.	1900.
City	18	7	7	6	7	5
Suburbs	46	35	25	25	26	13
Metropolis	64	42	32	31	33	18

The mortality from diarrhœa was less during the past quarter than it has been for the corresponding quarter of the last six years, and was almost half of that for the corresponding quarter of last year. Much of this decrease may be due to the meteorological changes, but still some of it may be with justice attributed to the extension of the sewerage system, and to the activity of the various councils during the last few years. There is, however, room for much improvement if we are to be altogether rid of this disease.

THE Zymotic Death Rate.

	1897.		1898.		1899.		1900.

May	·4	·9	·6	1·1	·6	·8	1·1	1·4
June	·6	·6	·6	1·3	·3	·7	·5	·6

The mortality from diphtheria was lower during the past quarter than it has been during the corresponding quarter of the year for the last 11 years. As before pointed out, this disease is beyond the scope of the Board's operations, but all the other remedial agents have been materially assisted by the extension of these operations, and, therefore, although antitoxin has proved itself a boon to mankind, still it must be remembered that sanitation has had also an effect on this disease. "Antitoxin can never take the place of improved sanitary conditions in doing away with the breeding-places of the diphtheria bacillus outside the human body."—(Herman Biggs, M.D., Medical Officer of Health, New York). Diphtheria is a disease, the contagion of which is spread through inhalation, and consequently the air sewage of a filthy dust-bin or an ill-ventilated school may disseminate this disease. Schools may become diphtheria exchanges owing to the congregating of children of many ages and differences as to their state of health.

MORTALITY from Diphtheria, quarter ending 30 June.

	1894.	1895.	1896.	1897.	1898.	1899.	1900.

Suburbs	25	39	14	30	7	3
Metropolis	75	29	43	16	32	7	4

The mortality from phthisis is slightly higher than it was during the corresponding quarter of last year, and the increase is to be noted in the suburban death rate from this disease. The incidence of mortality was greatest in the western suburbs. Of the individual suburbs the greatest incidence occurred in the following order:—Waverley, Petersham, Concord, Hunter's Hill, Botany, Ashfield, Burwood, North Botany, Rockdale, Mosman, Marrickville, Darlington, Woollahra, Annandale, Glebe, North Sydney, City of Sydney, Camperdown, Waterloo, Balmain, Paddington, Redfern, Erskineville, Hurstville, Randwick, Leichhardt, Newtown.

MORTALITY from Phthisis, quarter ending 30 June.

Sunlight and fresh air have a damaging effect on the life of any micro-organism, especially those of a pathogenic nature. The ability of the bacillus tuberculosis to form spores, and the obstinacy with which these retain their vitality in dried sputum, amply compensates for its inability to live outside the human body, and points to the danger likely to arise through dust. The evils which accrue through the filthy habit of expectoration are past imagining, and it will be well-nigh impossible to avoid this disease unless some measures are taken for the abolition of this dangerous habit. Good environment of healthy dwellings provided with plenty of sunlight and fresh air prevent the germs of this disease thriving, and help to effect a cure, but when these germs are placed in suitable surroundings such as over-crowded, badly-lighted, and ill-ventilated dwellings, they will grow apace and become a menace to human life. Unhealthy dwellings foster disease, but a proper sanitary dwelling promotes the physique and happiness of the occupants as well as being a wealth-producing power for the owner.

The study of the laws which govern the prevalence of diseases has brought about a knowledge of that science of counteracting those influences of environment which are injurious to health. With the march of civilisation and the congregation of the people many causes arose which could not fail to bring into existence new diseases. Man, ever careless and apathetic, failed to obey the simple laws of nature, and only when too late saw the necessity of applying common-sense principles to matters of every day observation, forgetting altogether that the majority of diseases and the greater part of the "low tone" of health arise from causes within man's control. Although the disaster which followed this course of action was lamentable, still we now have the machinery to prevent its recurrence within our grasp, and we have no right to perpetuate the faults of our ancestors. Modern science has shown that the causes of all preventable diseases can be ascertained, and that all these causes are dominated by the presence of micro-organisms or bacteria which are found everywhere and chiefly make their presence evident through an evil odour. It is well known that a sewage sodden soil to which little air can have access does not bring about nitrification, and consequently herds of pathogenic micro-organisms are produced to be disseminated through the soil and to pass into the external air by upward diffusion. The researches of Sidney Martin and others have proved that the soil is not only capable of retaining for a period the germs of disease, but that it also has the tendency to yield them up during certain atmospheric changes. Consequently there is every necessity to preserve the soil pure so that the ground air may not become contaminated, for it has been proved by Sir Douglas Galton "that this ground air moves in and out of soil in proportion to the barometric pressure." Notwithstanding all this evidence we continue to perpetuate the faults of our ancestors and to allow masses of festering pollution to be dumped down in districts adjacent to our dwellings and thus allow the healthiness of our towns to be disturbed. On this matter Gresswell, of Melbourne, observes: "Such enormous masses of putrefying animal and vegetable matter," as are contained in garbage tips, "exhale not only poisonous vapours into the atmosphere, but without question the very specific agents of disease, and these in a special amount during the dry weather, during the high winds, and during marked barometric pressure; the latter acting as a pumping mechanism for the pollution of the city. These grossly unwholesome conditions should surely not be allowed in the midst of a populace of a progressive city." Of what use is scientific research if those very evils it endeavours to remove are still allowed to exist? Practical sanitary science means pure air, pure water, and pure subsoil; but the indolent, prejudiced citizen values none of these things so long as he has a roof over his head or can make money. Raising the tone of the health of the people means raising the amount of the wealth of the State, and means also happiness and morality. Science tells us that if we fail to be clean we encourage the life of those organisms which promote disease; it tells us that typhoid fever is a disease eminently amenable to sanitary control, and that such sanitary control when once started is easily kept going. The greater number of the citizens, however, scoff at science and refuse to be clean unless compelled by law. Recently thousands of houses have been inspected in this city. Houses owned by wealthy men—men in prominent public positions, banks, insurance companies, and others, not excepting the Government itself. These houses were used as dwellings, barracks, churches, parsonages, public schools, &c. The inspection revealed many faults and evils. Pit-closets in our city, pit-closets in a suburb provided with sewerage, no traps, no ventilation, no water supply, no sanitary fittings at all in a great many instances, sinks under floors to pour foetid gases into the rooms, bath wastes opening direct into drains, leaking cisterns, broken pans, brick cesspits, broken sewer pipes sending a stench into the windows of dwellings, no closets at all, four closets to eleven houses, choked drains, blocked sinks and other dreadful evils. It is impossible to regard the apathy displayed but with astonishment, more especially as one of our public hospitals possessed an extremely faulty sewerage system, and it is more disgraceful to the members of the community that these evils have been allowed an existence in the city of Sydney in an age when scientific research is at its highest. Can the blame be fixed on anyone? Yes. Owners of houses, who up to the present time have looked upon their property as a mere wealth-producing power, have shirked their responsibility to humanity and have neglected to appreciate the need to care for the general health. But what of the man who has been content to occupy these dwellings—who has been content to live in filth, and to expose his children to the dangers arising from foul emanations from faulty sewerage systems? This is the one chiefly to blame on account of his indolence, ignorance, apathy, and prejudice, for health is a precious gift and he who jeopardises it deserves any disaster which may befall him.

Notwithstanding the discovery of all these evils, still, thanks to the cool weather, the plentiful rainfall, and the cleansing operations of the Government, a fewer number of cases of typhoid fever were reported than for the corresponding quarter of last year.

TYPHOID Fever—Cases reported quarter ending 30 June.

1896.	1897.	1898.	1899.	1900.
216	165	252	257	213

A careful inspection was made of the environment of these 213 cases with the following result:—

	April.	May.	June.	Total.
Sewers not laid	33	10	8	51
Sewers laid, houses not connected	22	14	9	45
Dwellings insanitary	33	26	10	69
Regulations complied with	16	15	12	43
No fixed abode	2	1	1	4
Came into port suffering from disease	1	0	0	1
Total	107	66	40	213

That so many cases occurred in dwellings where the regulations had been complied with might cause anyone to suppose that the sewerage system was not exercising the beneficial effect which naturally might be demanded of it. It is to be borne in mind, however, that even where the regulations have been complied with a sanitary system is not automatic, and that it needs care as well as anything else, so that it may be kept in proper working order. If the inlet and outlet ventilation of a drain becomes a nuisance it shows that there is some defect in the drain itself, otherwise the ventilators would act in a perfect manner. The susceptibility to attacks of disease varies greatly in degree according to age and condition of health. If there is any exposure to frequent and continual breathing of sewer gas, an adynamic state of health will follow, and there will be a lowering of the tone. A sanitary system needs careful looking to, and in a properly-managed water-closet there is nothing to disinfect, and the use of any agent to wash or destroy effluvia will only lead to the obscuring of the ready perception of leakage of sewer gas, or of the necessity for proper ventilation. If bad gases are given off from drains it is because proper ventilation has not been provided, or because these waste has been allowed to stagnate, either through the drain being badly laid or through its being stopped.

TYPHOID FEVER—Cases reported Half-year ending 30 June.

The incidence of typhoid fever during the last quarter of the year was greatest in the western suburbs, and next greatest in the east central suburbs. Since the corresponding period of last year typhoid fever has decreased in Botany, Concord, Burwood, Annandale, North Botany, Petersham, Balmain, Newtown, Randwick, Canterbury, Paddington, Alexandria, Lane Cove, Willoughby, Five Dock—it has increased in St. Peters, Mosman, Glebe, Ashfield, Hunter's Hill, Leichhardt, Enfield, city of Sydney, Darlington, Marrickville, Redfern, Erskineville, North Sydney, Ryde, Woollahra, Camperdown, Hurstville, Strathfield, Manly, Waterloo, Vacluse, Waverley—and has neither increased or decreased in Hurstville, Kogarah and Drummoyne.

The mortality from typhoid fever is less than it was during the corresponding quarter of last year.

DEATHS from Cases of Typhoid Fever, quarter ending 30 June.

	1894.	1895.	1896.	1897.	1898.	1899.	1900.
City	2	13	4	23	12	2
Suburbs	17	32	22	3	16	22
Metropolis	27	19	45	26	26	28	24

A careful inquiry was made into the environment of these 24 cases.

	April.	May.	June.	Total.
Houses not connected with sewers	4	2	1	7
No sewers laid	5	2	2	9
Dwellings insanitary	3	5	0	8
Regulations complied with	0	0	0	0
Total	13	9	3	24

That the epidemic of typhoid fever has been disastrous and deadly is seen from the record for the first quarter of this year, and that there has been a diminution of the disease and the death-rate therefrom during the second quarter of this year, may be safely ascribed to the coolness of the weather and to the copious rainfall. It must be remembered that owing to the carelessness exhibited in the past and the consequent pollution of the soil, cases of typhoid fever are likely to arise through the disturbance of the soil during the operations necessary for extending the sewerage system. It is therefore important that in all projected new towns measures should be taken to prevent any such danger arising through the defilement of the soil. Up to the present time all systems of sewerage have been difficult to establish on account of the obstacles encountered in the ultimate disposal of sewage. To turn it into the most adjacent watercourse meant defilement of the water supply, to establish a sewage farm meant the acquirement of land suitable in nature of soil and acreage, and also was the cause of sentimental objection. The genius of Pasteur revealed that romance of modern science, that micro-organisms, although the cause of the disease in many cases may be made to work for the common good, and the labours of others have brought to perfection this good work of micro-organisms so that we are now in possession of methods for dealing with sewage according to the natural method. The institution of bacterial tanks for dealing with sewage has rung the death-knell of costly sewage farms, and will enable the sewage of different towns to be dealt with according to the location of the city or its various suburbs—that is to say, that it will be quite possible to deal with the sewage for any suburb or any locality in that locality itself without the great expenditure which, up to the present time, has been unavoidable. The great question which any authority controlling a water supply has to consider is how to preserve the purity of the source of supply. The source of supply ought to be laid waste and kept free from the occupancy of man and animals, for it is now accepted that the *bacillus coli communis* which exists in the intestines of man and animals may at times take on an exalted pathogenic activity and become an adjuvant factor of typhoid fever. Nature provides a virgin soil free from pollution, and man should accept her teaching, for nature is only governed by obeying her.

I have, &c.,

THEO. MAILLER KENDALL,

Medical Adviser.

The Recent Plague Invasion and the Sewerage System.

IN the time of Justinian, A.D. 550, an epidemic of disease occurred in Egypt, which was characterised by buboes or swollen glands. A similar epidemic was described by Thucydides. In the year 1348 an epidemic of plague spread from China to the Crimea, thence to Genoa, and put a stop to the war between England and France. The population of England was reduced by one-third. Plague was detected in many countries during the years 1609, 1665, 1720, 1743, 1771. It broke out in Rajpootana in 1834, was frequent in Egypt during 1844, occurred in Arabia 1853, in Tripoli 1858, Kumaon 1877, and caused great alarm in Russia in 1878. The disease raged in China from 1892 to 1895, made its appearance in Bombay, while Calcutta was officially declared infected in 1898. Persia reported it in 1899, and it was known to exist in Russia, Suez, and Madagascar during 1898 and 1899. It became prevalent in Portugal in 1899 and 1900, and was carried thence to Santos and Asuncion in South America. Plague became epidemic in Honolulu and New Caledonia at the end of the year 1899, and at the present time the city of Sydney is not free from the disease. The clinical characters, pathology and etiology, of plague have been admirably described by Dr. Frank Tidswell, who has also very fully related its mode of dissemination. He first of all shows that "dissemination depends upon a microbe endowed with pathogenic properties, such as enable it to exhibit a very vigorous existence within the bodies of man and certain lower animals, more especially rats." He then proceeds: "The modes of exit of the bacillus from the bodies of those infected are by way of sputum, urine, bowel excretions, and discharges from buboes. It may be carried on linen or clothing, but, with the exception of clothing and house dust, there is very little evidence that inanimate objects play an important part in the dissemination of plague. There must be an intermediary host between man and man, and this role is now believed to be played by the rat. Defective sanitary arrangements, dilapidated houses, and accumulation of refuse figure largely in all the reports." It would have been thought that in this century of enlightenment, when so much attention is being paid to the improvement of general hygiene, that the chance of miasmatic contagion, through neglect of cleanliness, and particularly through defilement of houses and soil, would have been sufficiently recognised to be efficiently guarded against. It scarcely needed a disease like the plague to demonstrate to anyone the necessity for cleanliness, and to direct attention to the evils of dirt, overcrowding, poverty, dilapidated houses, accumulations of refuse and defective sanitary arrangements. Typhoid fever has been more prevalent of late than it has been for years, but typhoid fever is an old friend which is always with us, and as use is second nature it evidently needed an advancing wave of disease to break upon the shore, and from its foam to vomit plague—a monster dire and grim—before those in authority were able to appreciate the great necessity of rousing themselves and of using a besom to sweep away filth and the diseases which accompany it. Hitherto we have been living in the crater of a smouldering volcano, and well might Pettenkofer describe filth as gun powder and disease as the spark. Now, however, we have roused ourselves from our slumbers and have put on a new activity which is to be hoped will last through all time. In what way can such a disease as plague have any connection with a sewerage system? Defective sanitary arrangements encourage and permit of the entrance of sewer gas into houses, and the constant inhalation of sewer gas induces an adynamic state of the system, and increases the vulnerability of the mucous membranes. Where there are defective drains there will be an increase in the number of rats, and, consequently, if rats are to be regarded as the "intermediary host of plague," defective drains, by allowing these animals free entrance into dwellings, may indirectly be a cause of the disease, which will the more readily seize upon those persons in whom the refractoriness of the system has been lessened through the continual inhalation of foul gases. Defective sewerage or absence of any sewerage system may assist in spreading this disease through fouling of the soil. It is well known that a sewage sodden soil is a fine breeding ground of disease, and that such a soil may be a subsidiary cause of plague is referred to by Dr. Frank Clemow, who says: "That rats may become infected from the soil is probable. It is among the oldest belief in regard to the causation of plague that the disease arises from some miasmatic exhalation from the earth. Modern observation lends little support to this view, but it has shown that the soil or its surface can under certain conditions receive and retain for a time the virus of plague in an actively infective state. If the soil, rich in organic matter, contains a certain amount of moisture, and is only slightly exposed to air and light, it may retain the plague bacillus for a considerable period." The recent action of the Government has revealed that there existed in the city accumulations of filth, the magnitude of which far exceeded the flights of a fertile imagination. Although there has no doubt been some laxity of supervision shown by our municipal authorities, still the blame must be put upon the right person—the indolent, unbelieving, prejudiced, and apathetic house-holder who is content to cast out his refuse anywhere, caring little where it goes so long as it passes for the time being from his own range of vision. If only sufficient appreciation had been shown of our sewerage system, not only would the present epidemic of typhoid fever have been avoided, but it is probable that area of the present visitation would have been lessened, if the disease had not been arrested, at its outset. M. Millerand, Socialist Minister of Commerce in France, says: "Science has with admirable prodigality multiplied the means placed by it at the disposal of man to bend external forces under its laws or to fortify him against their operations. It has rendered mankind a service by showing him the real secret of the material and moral greatness of communities. We are heirs of the faults of our forefathers, and we are already writing the history of our sons. One with our ancestors as we are, how should we fail to be so with our contemporaries? The houses of the poor where lurk the germs of disease, the uncultivated brains in which superstition and hatred ferment, are perils the speedy disappearance of which scientific foresight has taught us to regard as necessary." To combat such diseases as the plague a proper building Act which would arrange the proper housing of the working classes is necessary. Given such a building Act, in conjunction with our sewerage system, disease would be avoided and the moral tone of the community raised. With the present outbreak of plague therefore the sewerage system has no direct connection.

THEO. MAILLER KENDALL,
Medical Adviser.

Annual

Annual Report, 1899-1900.

Sydney, 17th September, 1900.

I have the honor to submit the following report on the working of this Branch during the year ending 30 June 1900.

Rate Notices.

During the year 323,416 notices were served, which included those for new mains, new sewers, and finals for payment of overdue rates, which is an excess of 13,875 over the preceding year's issue.

New Works—Water-mains and New Sewers.

831 properties became liable for water rates from new mains, and 12,793 for sewerage rates from the construction of new sewers, being an increase over the previous year's progress of 3,130; due chiefly to the expansion of sewerage facilities in the Western Suburbs.

New Assessments.

1,138 new buildings were erected within the rating limit of existing water mains during the year, and were assessed accordingly (this shows a slight reduction in the number of new houses built as compared with the previous year, which totalled 1,434).

In addition to properties in unincorporated areas and properties within municipal boundaries not assessed by the Councils, the village of Narellan has been added to the annual work of assessments which the Board requires to perform. Narellan is an unincorporated village, situated on the line of pipes between Kenny Hill and Camden, and the water was made available in December, 1899.

Compulsory Drainage and Deferred-payment System.

In consequence of the visitation of the Plague to the city during the year, together with the expansion of the Sewerage System, a considerable increased volume of work in enforcing connections with the sewers had to be coped with; and the Trust Account, whereby the Board executes the work and charges owners with the cost, has been fully operated upon.

Recovery of Rates.

During the year the payment of rates and meter accounts has been very satisfactory, and I have pleasure in chronicling a substantial reduction in the amount of arrears carried forward under every heading, excepting churches and charities where the rates are in abeyance. The earnings from rates on house property for the year amount to £232,950 8s. 5d., while the rates remaining unpaid at the 30 June, which represent the accumulated arrears for all time, amount only to £2,603 16s. 9d., or about 1% (£1 2s. 4d.) for one year's revenue. This is a considerable improvement on the effort of any past year.

Comparative Return of Arrears carried forward.	1897-98.	1898-99.	1899-00.
House property—	£ s. d.	£ s. d.	£ s. d.
Water Rates	2,713 9 8	2,355 11 9	1,489 5 11
Sewerage Rates	1,440 19 2	1,507 12 7	1,056 6 1
Drainage „	128 15 10	133 9 11	58 4 9
Vacant Land—			
Water Rates	5,150 19 0	4,502 18 11	3,598 15 10
Sewerage Rates	1,161 1 6	1,105 16 9	962 17 7
Drainage „	344 7 2	309 7 9	310 19 10
Churches and Charities—			
Water Rates	4,643 8 6	5,233 17 6	6,114 4 0
Sewerage Rates	4,084 5 0	4,264 2 11	4,067 5 7
Drainage „	100 12 11	137 5 6	173 0 7
Stock Fees	314 17 7	6 17 2	1 12 6
Garden „	131 3 8	Nil.	Nil.
Special „ trade purposes	134 11 7	2 1 3	1 0 0
Meter Accounts	16,252 14 4	20,375 15 4	13,607 0 4

Special Fees.

The fees received for supplying water for stock (horses and cows) were £2,585 4s. 11d., gardens £1,440 6s. 2d., and water for trade purposes £597 2s. 11d. Pursuant to the resolution of the Board, some 1,300 gardens, which formerly paid a special fee, were metered. This change has reduced the special fee earnings but the shortage will be amply repaid in the meter revenue.

Transfer

Transfer of Meter Staff.

To simplify the working of meter accounts, arrangements were made for the transfer of the meter section to my control from 1 July, 1900. It is anticipated that this amalgamation will facilitate the processes, and be more satisfactory to consumers.

Summons Work.

The summons proceedings for the year have materially aided in reducing the amount of arrears to be carried forward, which the foregoing comparative return sets out. 44,354 final notices were served, and 4,033 summonses issued as against 40,844 final notices, and 4,049 summonses respectively in the previous year. The following table shows the issue from each Court, viz.:—

Balmain Court	304
Burwood Court	137
Campbelltown Court	8
Camden Court	7
Central Court	313
District Court	45
Glebe Court	507
Hunter's Hill Court...	22
Liverpool Court	9
Newtown Court	923
North Sydney Court	491
Paddington Court	376
Parramatta Court	88
Redfern Court	264
Richmond Court	Nil
Ryde Court	29
Water Police Court	510
Total	4,033

The property market has been so depressed for some eight years past that it is satisfactory to note a general improvement in values—indeed, the downward tendency in rentals, except in isolated cases, is becoming a thing of the past, and higher figures are asked in nearly all localities now when places are retenanted. This is a very satisfactory change from the Board's point of view, and it is therefore much to be desired that the improvement may become permanent.

Secretary.

THOMAS ROSEBY,
Assessor.

68

Stores and Pay Branch.

Sir, 15 August, 1900.
Subjoined are the classified Returns showing the volume of work done in the Branches under my control during the past financial year:—

Contract Supplies.

Article.				Contractor.				Amount.		
								£	s.	d.
General stores	J. Keep & Son	975	8	11
Pig lead	"	G. T. Savage	1,276	10	5
"	"	Sydney Lead Works	521	5	0
Uniforms	Gibson, Battle, & Co.	323	4	11
Iron pipes	Hatfield Bros.	210	3	9
"	"	Pope, Maher, & Co.	5,149	13	2
Valves	G. & C. Hoskins	15,094	6	2
Hydrants	"	872	17	7
Cement	J. Danks & Sons	121	16	6
Building material	Goodlet and Smith	217	14	4
Hydrant fittings	S. Wales	43	2	3
				Pope, Maher, & Co.	175	12	4

Apart from the above, an extra sum has been expended in purchases out of contract, as it is obviously impossible to prepare a schedule embracing the multifarious requirements of the several branches of the Department; but the Board, alive to the necessity of passing its expenditure for supplies within review of an ample public competition, have directed that all out-of-contract goods shall be purchased through the Stores Branch, partly for the purpose of economy, but more particularly to secure the inclusion of all such lines as can reasonably be comprised in a contract schedule.

Stock Balance.

	£	s.	d.		£	s.	d.
Balance in hand, 1st July, 1899	...	13,483	3 10	Goods issued	...	26,544	5 10
Goods received	...	25,904	6 9	Balance in hand, 30th June, 1900	...	12,843	4 9

Fettling.

Very little work was done this year in the way of replacing old mains. With slight exception, such as were lifted—110 tons—were found to be fit for relaying after cleaning and coating. The cost of this work was £87 2s. 3d., or 15s. 10d. per ton.

Sales.

Only scrap-iron and brass were disposed of, and it is significant to observe that the former realised the high rates of 80s. per ton, being considerably more than half the price paid for the pipes when originally purchased and laid as water-mains.

Stock-taking.

The Regulations require that stock of small stores that are kept under lock shall be sighted annually, leaving ironwork and other exposed goods for a biennial check. Following this rule, the annual stock-taking was effected last October, and the detailed report thereon was accepted by the President as satisfactory.

Mail.

The official postbag brought 37,929 letters, of which 16,719 contained remittances to the value of about £79,800. That about a quarter of the total revenue should have been entrusted by ratepayers to the medium of the Post Office, without a single complaint of miscarriage, is an argument in favour of the extension of this method of transmission, for which facility is given by the growing practice of drawing cheques for sums under £1.

Tenders.

In response to public advertisements, we received 354 tenders in respect of eighty-nine contracts, chiefly sewerage. The total value of the securities held by the Board for the proper performance of current contracts, amounted at the close of the year to £10,539, as against £10,435, at the end of the previous year, showing that the magnitude of the works in course of construction is not lessening.

Library

Library.

The Board has added seventy-seven volumes to its professional library, raising the total of books available for the use of the staff to 547.

Disbursements.

The payments made in this office during the year amounted in the aggregate to the sum of £103,389 18s. 11d. distributed under the following heads:—

	£	s.	d.
Board Members' Fees	2,050	0	0
Salaries	22,847	12	11
Wages	74,341	5	11
Petty Cash	1,265	1	8
Refunds of over-payments	185	6	1
Compensations for Damages	1,235	6	2
Temporary Clerical Staff	1,465	6	2

A. ELLICE FLINT,
Paymaster and Comptroller of Stores.

Engineer's Report.

Sir, Engineer's Office, 20 September, 1900.
I have the honor to submit, for the information of the Board, the Annual Report on the working of the Engineer's Department for year ending 30th June, 1900.

1.—WATER SUPPLY BRANCH.

Catchment Area.

The rainfall has been more copious than preceding year. From returns kindly furnished by observers at Sherbrooke and Cordeaux, the rainfall was 102·95 inches and 92·5 inches respectively, as against 40·15 and 42·53 inches. Owing to the abundant feed, there was not much trouble with the stock-owners with regard to straying cattle, and the vigilance of the Rangers minimised any danger from unhealthy cattle straying on the watershed.

The health of the permanent settlers is reported to be good, and the sanitary arrangements of the dwellings are being gradually improved without friction. I attribute this favourable state of things to the vigilance and tact displayed by the Ranger having to deal with such cases.

Until the whole of the area is free from residential occupation, by resuming the various holdings, the settlers must be educated up to the necessity of providing proper sanitary conveniences to minimise the danger to pollution.

Ranger Harris reports that four new residences were erected on the watershed, at a considerable distance away from permanent water, the danger from pollution under favourable sanitary conditions being considerably less than the holdings of older date. Several other alterations have been made in an amicable manner at the instance of the Ranger.

The Rangers have been invested with powers of Crown Lands Bailiffs, and are, therefore, in a position to deal promptly with persons turning cattle on to the area without permits.

Directly the revenue of the Branch on water service is in a favourable financial state, I would urge the advisability of resuming at least the most objectionable holdings on the catchment area. Those holdings which are remote from permanent water could be subsequently dealt with.

A contract was let for the completion of boundary posts, marking the northern boundary of the area, from the "Pheasant's Nest" to the Coast Range, and on completion the lines will be clearly defined.

Ranger Harris was instructed to note any suitable sites for storage dams within his district, and he has brought several likely positions under my notice. These will be visited and reported upon in due course.

In January the low state of the rivers afforded an opportunity of inspecting the Nepean and Cataract tunnels. It was found that several falls of rock from the roof of tunnels had taken place, one in the Cataract tunnel being of considerable extent. As this obstructed the flow of water it was promptly removed, and line made clear.

Upper Canal.

The Prospect Reservoir being reported overflowing on 16th September, the water was cut off to admit of the work of strengthening the walls of canal being pushed on; this was continued at intervals during the year, the work being carried out by day labour under the supervision of the Resident Engineer.

The total length dealt with was 11,132 lin. feet, at a cost of £14,686. The work comprised a full section of concrete lining, trimming banks, and making roads, &c., the average cost being 23s. 1d. per foot run of canal.

The absence of a continuous road along the line of canal necessitated detours away off same. These difficulties are gradually being overcome by making a driving road along the side of the channel.

A contract is in progress for the renewal of 2 miles of fencing.

A slip took place at 13½ miles, on a section of dry rubble walling. This was replaced with a stronger section of walling, built in cement mortar.

A slip also occurred in the outside slope at 46 miles. That was attended to, and bank drained to carry off surplus moisture.

The shale pitching on portions of the upper canal is deteriorating every year by disintegration, and it is only a question of time, within reasonable distance, when the whole of this description of stone will have to be replaced with concrete.

Many of the larger timber flumes will have to be replaced with work of a more permanent character.

The works of the Camden Water Supply were finished, and water turned on, in October, 1899. This service, together with that of Campbelltown and Liverpool, have been regularly attended to, and supplies have been satisfactory.

Prospect Reservoir and Works.

On 30th June, 1899, the reservoir was recovering from the depletion caused by the previous drought, and on 16th September was overflowing the by-wash. Water was then cut off to admit of work of strengthening canal walls, previously referred to, being taken in hand. No water passed into the reservoir until 21st October, when the level having fallen from 194·54 R.L. a full flow was passed down canal, and reservoir refilled to overflowing. A large quantity of water was drawn off by the scour-pipes to get rid of deposit by sedimentation. On

On 5th November the water was again cut off until 17th December, when the level stood at 193.29 R.L. The rivers having dropped to their summer flow, all water available was taken; but the inflow was not equal to the demand, and reservoir level continued to fall until it touched 191.54 R.L. on 24th January, 1900.

Rain having set in enabled it to be refilled to 194.40 R.L., at which level it remained until the beginning of April, when it was refilled. Canal work was then resumed until the reservoir level stood at 194 R.L. on 10th June, 1900, when it was refilled and kept full to July.

It will be seen that, if the canal had not to be stopped in order to carry out necessary works, the reservoir could have been kept full for the remainder of the year except the month of December, when the available flow into the reservoir was not equal to the outflow, and during that period the loss of level would not have exceeded 2 feet.

When the water was at its lowest in 1899, a subsidence in inner slope of the embankment took place at T.S. 44. After inspection by the Board, it was decided to increase and strengthen the bank over the portion affected between T.S.'s 40 and 46. Arrangements were completed and about 12,000 yards of stone from the Board's quarry were deposited at the inner toe of the bank for a length of 600 feet, by an average width of 35 feet, and 15 feet high. The work was completed in August, 1899, and upper part of bank and puddle core restored to its original height. Since completion there has been no sign of movement.

The drains constructed on outer slope removes the excess moisture after rain, and prevents those local inequalities of settlement which at one time were numerous.

In the outlet tunnel false roofs were constructed over the pipes where the subsoil water penetrated through the brick lining, and caused a deposit of free lime from the necks on the pipes. This deposit prevented the pipes from being cleansed, and caused corrosion principally at the flanges. The pipes have now been cleaned, and look in first-class order.

The inlet basin and quick race were emptied, cleaned out, and necessary repairs effected.

A cottage has been erected for the gardener, and, together with other cottages, has been supplied with a constant water service. A small reservoir was constructed at rear of Veteran Hall, into which the water from 30-inch main is forced by an hydraulic ram.

A new road has been constructed below the embankment in lieu of the one over the same. This keeps all traffic off the works, and appears quite as useful.

The revenue from agistment was £266 19s. 8d. This is lower than previous years; but when it is taken into consideration that feed has been ample in the district, and the Board does not enter into competition with private persons, inasmuch as the rates are 50 per cent. in advance, the return is satisfactory.

Where the surplus land cannot be utilised for agistment purposes, it has been decided to form forests of commercial timbers suitable to the soil and climatic conditions. I have no doubt that the initiation of forestry will, in time, form a source of revenue to the Board.

The approaches to and grounds around Veteran Hall have been improved.

Supply from Prospect Reservoir.—The quantity of water drawn from Prospect Reservoir for metropolitan area during the year was 7,258,373,000 gallons, or an increase over preceding year of 398,227,000 gallons, the average daily supply being 19,885,953 gallons, showing an increase of 1,111,033 gallons. This increase is not due to consumption alone, as the new duplicate main was tested at various times, and Potts' Hill reservoir had to be repleted after being used as a storage reservoir for metropolitan supply while canal was cut off.

Lower Canal and Works below Prospect.

The lower canal was emptied and cleaned out. While water was off, the aqueduct at Boothtown was rendered in cement mortar internally. The Resident Engineer reports that this has proved effectual by almost entirely stopping the leakage which, for some time past, has been an eyesore in the structure.

The duplicate 6-foot steel main, although not handed over by the Government to the Board, was charged in February last and put into partial operation, and on 23rd June the old main was shut off to admit of the construction of inspection chambers, &c., and since that date it has been doing the whole duty of supply to metropolis.

In connection with this main it was decided, on consultation between the Engineer-in-Chief for Public Works and the Board's Engineer, to have expansion joints in same to provide for expansion or contraction; and the Government were requested to provide for a by-pass to admit of both or either main being worked as contingency required.

Provision has been made to pass the water into the Woodville-road main through a fine screen, as the water supplied to the districts served by the main was not screened as at Potts' Hill. This will be a material advantage in connection with house fittings and meters.

When the Potts' Hill reservoir was empty, for the purpose of making a connection with the duplicate main, an examination of bottom and sides showed it to be in good order. All submerged iron-work was cleaned and painted.

New screens are being gradually introduced into the screening chamber at Potts' Hill in lieu of the old ones which had become useless for the purpose. Twelve have been fitted and placed in position.

Trunk and Arterial Mains.—The trunk mains to the city and Ryde are in good condition. During the year the number of fractures exceeded that of previous year, there being thirty-three bursts and eight blown joints. The bursts occurred as follows, viz.:—One in the 48-inch main at Ashfield, and one in the 36-inch pumping main to Centennial Park Reservoir at Green's-road, Paddington—these two mains are of cast iron, imported, and had every appearance of being of good metal; nineteen in the new arterial main from Oatley-road to Parramatta-road—with exception of four, the fracture started at the socket; three breaks occurred on the 24 $\frac{3}{4}$ steel rising main from Ryde to Chatswood, two being in connection with stop-valves, which were split on the sides, and the other in a cast-iron special; one in the 20-inch main at Rockdale, six in the 18-inch mains in Alexandria, Redfern, Rookwood, and Strathfield, and one in the 15-inch main in Petersham. The blown joints were confined to the 48 and 24 $\frac{3}{4}$ mains. All the repairs were promptly effected without interfering with the supply by feeding through other mains. The side connections for Glebe and other districts will be completed before the summer sets in.

General Reticulation.

The condition of the reticulation system is satisfactory.

The work during the year consisted of laying 31 miles 649 yards of mains, ranging from 30-inch to 3-inch diameter; cleaning and fettling 14 miles of mains of various sizes; lowering 894 yards of mains to suit altered road-levels; raising 192 lineal yards; removing $3\frac{1}{4}$ miles, and relaying 544 lineal yards.

The following have been fixed, viz.:—527 ball hydrants, 17 screw-down hydrants, and 15 spring hydrants. 265 spring-valves have replaced the hydrant balls, and 280 spring dirt-caps have been fixed to prevent ingress of dirt, &c., during scouring or other operations.

The mid-level arterial main from Centennial Park Reservoir was completed during the year, and the supply to the high-level zones of the following districts have been put in a satisfactory position, viz., Glebe, Balmain, Petersham, and portions of the city.

The following improvements have been carried out, viz.:—Petersham, 523 lineal yards 15-inch pipes; Enfield, 953 lineal yards 10-inch pipes; Paddington, 643 lineal yards 10-inch pipes and 1,988 lineal yards 8-inch pipes; Woollahra, 511 lineal yards 10-inch pipes.

Upwards of 5 miles of 6-inch and 17 miles of 4-inch pipes have been laid for extensions of the system, details of which are shown in accompanying Appendix.

Fires.

During the year the Board's staff attended fifty calls of fire in the Metropolitan area, none of which called for special mention.

Analyses of Water.

Monthly analyses have been made by the Government Analyst of samples of water drawn from different points of supply of Metropolitan and country districts, and reports on same have been uniformly satisfactory.

The coupling of "dead-ends" is carried out as opportunity presents itself, which in a great measure accounts for the decrease in complaints as to water from mains being charged with suspended matter.

In many instances investigation by the Staff showed that the cause of complaint was confined to the house services.

Spring-valves and spring dirt-caps are being gradually brought into use in the system.

During the year many samples of centipedes were forwarded to the office, purporting to have passed from the Board's mains into domestic supply. The majority of cases was investigated, and, apart from the fact that the centipedes could not exist in the mains, the surroundings of the house supply were such as to afford suitable breeding-grounds for vermin.

House Services.

The number of private services connected to the Board's mains was 2,822, a decrease of forty on last year's return. The number of permits issued amounted to 14,158, being an increase over last year of 1,422, the increase being due to the large amount of work being done in Petersham, Balmain, Ashfield, and Leichhardt. About 1,450 inspections of properties were made by the Staff.

Great trouble is experienced in getting recalcitrant property-owners to provide a proper water supply to premises, the absence of direct power being much felt. In the extended powers now being sought in amended Bill, this defect will be provided for.

Meter Sub-branch.

The operations of this branch show satisfactory results.

Meter Clerk.

During the year, 1,974 meters were fixed; of these, 1,903 were issued on the hire system, and 71 were purchased. The total number now in operation is 9,567. Of these, 5,542 are the property of the Board. The number of meters that became inoperative was 385. These were either promptly repaired or replaced with new ones. The number of meters fixed shows an increase over previous year of 451.

The financial results of the meter system continue to be satisfactory, viz.:—

- (a) Revenue in excess of assessment, June, 1899, to June, 1900, £55,943 7s. 9d., as against £54,797 17s. 1d. for previous year—an increase of £1,145 10s. 8d.
- (b) Amount earned by Board's meters included in above was £15,747 14s. 11d., as against £13,020 4s. 6d. for previous year—an increase of £2,727 10s. 5d.
- (c) Revenue from rents of meters on the hired system was £1,637 1s. 6d., as against £1,299 3s. 5d. for previous year—an increase of £337 18s. 1d.

The quantity of water supplied free of charge on meter to public parks, charitable institutions, &c., was 85,215,000 gallons; value of same, £4,274 16s. This service shows a reduction equal to 7,692,000 gallons, as compared with previous year. This can be largely attributed to the favourable season, which reduced the quantity used in public parks.

Owing to the expansion of this sub-branch, it was necessary to increase the clerical staff by two junior clerks.

The work of this sub-branch being closely connected with that of the rating and revenue collecting branches, it was considered advisable for administrative purposes by the President that the clerical staff should be transferred to the Secretary's branch; the transfer was effected in July last. I take this opportunity of expressing my high appreciation of the zealous and tactful manner in which Mr. Absell and his late assistant, Mr. O. G. Hughes, carried out the work connected with this branch.

Mechanical

Mechanical Sub-branch—Tap-testing.

The number of water fittings submitted for examination and test was 114,194, as against 72,102 for previous years, or an increase of over 58 per cent. Of this number 12,568 were found defective, and finally dealt with as follows:—1,268 were rejected on account of bad material and workmanship; 4,545 were altered to comply with the Regulations and stamped; and 790 were returned to the owners unstamped.

During the year the contractor for the supply of meters delivered the following, viz.: 96 $\frac{1}{2}$ -inch., 1,361 $\frac{3}{4}$ -inch., 75 1-inch., 40 1 $\frac{1}{4}$ -inch., 15 1 $\frac{1}{2}$ -inch., 22 2-inch., 14 3-inch., 1 2-inch stand-pipe meter, and 1 by-pass valve.

Fifty-five private meters were tested, and 206 old meters were received for repairs and testing; 104 old meters owned by consumers were condemned as unreliable.

The Board's staff fixed 1,340 meters in new services, and 1,100 meters of various sizes were disconnected and exchanged for cleaning and regulating.

In connection with country districts, 232 meters of standard type passed through the shop, also 40 old meters.

The Board's type of meter has become the standard for all country water supplies carried out by the Government.

The employees of the branch, which now number twenty-five, have been fully employed in examination and testing of water fittings and meters, maintaining all electrical appliances; also carrying out light repairs and fitting work for both water and sewerage branches.

Returns have been prepared showing the result of testing Board's meters reported by meter-readers; also meters specially tested at request of consumers; also meters which have been disconnected and tested before being repaired. In connection with the latter, the majority have been in use for five years. A summary of results is as under:—

Total number reported as in error	146
Number found in error	98
The total number on hire	5,700

The number found in error in registration, as compared with the total number of hired meters fixed, shows a percentage of 1.7. This result can be considered as satisfactory, and shows that the type of meter adopted possesses all the good points of an "Inferential" meter. The details are shown in Appendix hereto.

The financial result of the working of this branch is satisfactory, but I am not prepared at present to recommend any reduction in the rent for meters.

The machinery in this branch is written down every year; but, owing to the system of book-keeping at present carried out in the Treasury, the branch does not receive credit for same, interest being charged on the first cost, and not on the reduced amount. The actual financial result can only be seen in the statements prepared by the branch.

Pumping Plants.

No. 1 Worthington pumps, and No. 3 Waverley pumps received their usual overhaul this year. Details of the various repairs done in connection therewith will be found in report of Chief Mechanical Engineer. The Ryde pumps (western engine), were laid up for repair, and the pump-buckets were re-bushed. The results are most satisfactory, the slips being much diminished. Of the smaller pumping plants, that of Chatswood has received no more than the usual minor repairs incidental to ordinary wear and tear.

The Carlton No. 2 pumping engines were overhauled thoroughly, and left in first-class working order.

The Richmond plant is now undergoing various repairs.

The electric light and electric motive power have been maintained in an efficient condition during the year. Boilers have been examined and cleaned, and are in good order and condition.

Volume of Water pumped and Cost of Pumping.

The total volume pumped this year equalled 4,311,379,968 gallons—an increase for the year of 529,011,359 gallons. At Richmond a decrease of volume pumped is recorded.

The following table gives quantities pumped at each station, together with the cost of lifting same:—

	Gallons.	Cost of lifting 1,000,000 gallons 100 feet high.	Cost of lifting 1,000 gallons 100 feet high.
		£ s. d.	
From Crown-street to Centennial Park	2,658,546,300	} 1 4 2	.290d.
" Woolahra	382,106,750		
" Waverley	419,015,850		
" Ryde to Ryde Village	99,468,000	} 1 11 5	.377d.
" Chatswood	549,360,000		
" Carlton to Penshurst	88,739,440	3 16 5	.917d.
" Chatswood to Wahroonga	99,165,628	2 15 11	.671d.
" North Richmond to North Richmond Tank	14,978,000	5 8 4	1.300d.
Total	4,311,379,968		

The pumping cost] less this year than last at Crown-street station, and slightly more at all the other stations. Coal

Coal Consumed.

						Tons.	cwt.	qrs.	lb.
Crown-street Station	3,746	1	0	13
Ryde	"	1,624	13	1	14
Carlton	"	315	18	2	8
Chatswood	"	549	15	2	0
North Richmond	"	67	7	3	16
Total	6,303	16	1	23

Showing a decrease of 138 tons as compared with previous years.

Duties of Pumping Engines.

Crown-street to Centennial Park	69,820,634	ft. lb. per cwt. coal.
" Woollahra	68,809,797	" " "
" Waverley	56,242,061	" " "
Ryde to Ryde Village	58,223,470	" " "
" Chatswood...	63,807,081	" " "
Carlton to Penshurst	33,837,727	" " "
Chatswood to Wahroonga	42,846,356	" " "
North Richmond to North Richmond	29,140,078	" " "

It is satisfactory to note a higher duty at all the stations, although the difference at the smaller stations is so slight as to be hardly worth recording.

The pumping returns show an increase of 14 per cent. on the quantity pumped at all stations, as compared with previous year, and the coal account shows a reduction of 2 per cent. on last year's returns.

A rearrangement of the supply to the high level zones has increased the quantity pumped to the Centennial Park Reservoir, and decreased that pumped to Woollahra and Ryde Tank. Large areas which were formerly supplied from the latter reservoirs are now connected to the larger reservoir at Centennial Park. The higher levels of Woollahra being connected to Waverley Reservoir will partly account for the increase of pumpage at same. An increase in the pumpage to Centennial Park Reservoir must be looked for, as the new arterial main to the Western Suburbs will afford a larger supply to the districts served by same, as against the somewhat restricted service in the past.

The increase in duty at the different stations is satisfactory, considering that the work at all places is not constant.

Mains, &c., under Board's Control, &c.

The length of mains, inclusive of trunk and pumping mains, is 1,130.33 miles; screw-down hydrants, 1,910; ball hydrants, 19,786; and spring valve ditto, 15.

Reservoirs and Tanks.

The various reservoirs and tanks are in good condition. The elevated tanks at Waverley have been cleaned and repainted, and No. 2 tank at Chatswood has been painted internally.

It is proposed to deal with other tanks when the plant for cleaning and painting by compressed air has arrived; a portion of same is to hand. In addition to dealing with the elevated tanks the plant will be used in connection with other metal structures under the Board, and it is considered that considerable saving will be effected in the Maintenance Vote in connection with same.

A concrete reservoir at Pymble is in course of construction, the capacity of which is 500,000 gallons. This will supply the districts lying between Pymble and Chatswood, and will reduce the great pressure between Wahroonga and districts served from same.

The reservoir will be fed by existing pumping main, which also serves as a supply main. It will be necessary to provide a separate service in order to obtain a constant pressure due to Pymble head.

New Districts.

The only new district added to the Board's control is that of Camden. The works were completed in November, and properties were rated from 1st January, 1900. The residents were not slow to avail themselves of the new supply, and since its inception has worked satisfactorily. The system is worked by the district turncock, in conjunction with Liverpool and Cambelltown, with the services of a super-numerary turncock in the latter place and Camden.

Country Towns Water Supply.

The works in connection with the water supply to the towns of Liverpool, Campbelltown, Smithfield, Richmond, and Camden are in a satisfactory condition.

With exception of Camden, there was only one extension made during the year, viz., at Richmond. The mileage of mains connected with Camden supply is, viz.:—7,741 lineal yards 8-inch main, 964 lineal yards 6 inch, and 2,795 lineal yards of 4-inch main.

Botany Water Reserve.

All the embankments and works connected therewith are in fairly good order, as are also the reserve fences.

During the heavy rain in August, 1899, much damage was done by the overflowing of the little dam. The water cut a trench near the outlet into No. 1 dam, 50 yards long, 7 yards wide, and 3 yards deep. To prevent further scouring a new turfed weir was formed; but unfortunately this work was further damaged by the heavy rains of May and June last. The necessary repairs are now in hand. The

The leasing of allotment No. 5 to Messrs. Hughes necessitated certain alterations in existing fences, the making of new roads, and the extension of concrete scour to take effluent water from works on this new lease.

To ensure a better get-away for the water from this sewer, where it debouches into the Blackwater Creek, it has been extended for about 18 feet. A marked improvement is noticeable in the flow. There are now six wool-scouring establishments in the water reserve, two of which also carry on the tannery business.

Messrs. Swinburne and Stephens' lease has been extended, and now includes the old pumping engine-house and ground.

Wool-scouring operations have not been so active this year as last.

Owing to the heavy rains the flood-gates have not been closed since the 23rd May last. Repairs to works during year necessitated an expenditure of £96.

Contracts let during the year.

During the year contracts were let, and the work is now proceeding, for the erection of four cottages for the accommodation of the pumping staff at Ryde station; also for the building of cottage for the gardener at Prospect, and one for the caretaker at Leichhardt Depôt. A contract was signed for the erection of a 500,000 gallon tank at Pymble. The minor works let were—For Monier pipe sewers at Botany water reserve; fencing within Prospect water reserve; providing manholes in Chatswood and Ryde Village steel service tanks; supplying two 36-inch special stop-valves to control inlets to suction wells, Crown-street pumping station; making roadway into Carlow-street Depôt, North Sydney; supplying new reflux, and foot valves for No. 1 Worthington pumping engine; fencing along canal; supplying strainers for outlets to the various tanks and reservoirs; screens for 15-inch main to Granville; supplying and fitting new bushing to pumps, Ryde pumping station; strainers for services off 6-feet mains, pipe head to Potts' Hill; supply of new rods for valves at screening chamber at Potts' Hill; lengthening smoke-stack at Carlton; and other minor works.

The supply of cast-iron pipes—specials, under five years' contract—has been supervised by the staff, and various annual contracts have also come under the staff. A considerable amount of work has been carried out by day labour, under the supervision of the officers.

Wrought-iron bands have been placed on collars of the 36-inch arterial main where same are weak. This work will be continued until the whole has been dealt with.

Expenditure on Loan Vote.

The expenditure on Loan Vote for the year has been as follows:—		£	s.	d.
New mains, including arterial and mains in Gordon, Beecroft, and Camden districts	...	40,921	16	0
Strengthening Upper Canal	...	14,715	13	1
New buildings, machinery, &c.	...	1,184	13	3
Weighting toe of inner slope, Prospect Dam	...	1,114	1	10
Improvements to Canal	...	756	4	7
Sundry works	...	7,746	1	0
		£66,438	9	9

The following table shows the expenditure on Loan Vote since 1890 to June, 1899:—

	£	s.	d.	
1890	101,012	0	0	
1891	117,589	0	0	
1892	87,932	0	0	
1893	14,751	0	0	
1894	32,516	0	0	
1895-96	90,278	0	0	(eighteen months' period.)
1896-97	90,952	0	0	
1897-98	83,008	0	0	
1898-99	71,609	0	0	

Expenditure on Revenue Vote.

The expenditure on Revenue Vote for the year was £31,650 8s. 8d., showing an increase of £1,520 16s. 3d. on previous year.

The reports of Chief Mechanical Engineer, Resident Engineer Prospect, appendices, diagrams, &c., are attached hereto.

Annual Report.

Metropolitan Board of Water Supply and Sewerage, Pumping Works,
Crown-street Reservoir, Engineer's Department, 12 July, 1900.

Sir, I have the honor to submit the following Report upon the working of pumping engines, &c., and water pumped for the year ended 30th June, 1900.

The work during the year was of the usual routine character, consistent with keeping the machinery in working order. That of any moment was the general overhaul to Nos. 1 and 3 engines in July-August for renewals and adjustments where found necessary, and which consisted of (No. 1 engine) opening

opening out cylinders, steam-valves, casings, air and main pumps; all pistons were drawn, piston rings done up and readjusted; steam-valves done up and adjusted; air-pump's bucket done up and fitted with new V.I. valves throughout; all valve gear and air and main pump connections were stripped and adjusted, compensator pressure pump fitted with steel pin and brass bushes, feed-pump connections rebushed with new pins; fitted compensator buckets, rebushed where found necessary; 106 iron valve cups replaced by brass ones; new charging pipes fitted throughout. No. 3 engine underwent similar overhaul, fitted with new air-pump rings; new main pump-valves removed where found defective. These engines have been running satisfactorily since overhauled. No. 2 engine is now due for general overhaul, and is being proceeded with.

The yard hydrant fire connections have been attended to, and periodically tested in order to maintain their efficiency.

The efficiency of electric-lighting power has been maintained. Boilers have been attended to in the way of cleaning, &c., as required, and are now in fair working order.

Water pumped during the year ended, and for the quarter, is given in tabulated form herewith attached, and as under, viz.:—

Water pumped by Crown-street pumps during the year to Centennial Reservoir was 2,659,546,300 gallons, being 591.91 million gallons more than the year previous; and for the quarter 712,864,000 gallons, being 242.71 million gallons more than the corresponding quarter of the year previous.

The quantity of water pumped to Woollahra Reservoir during the year was 382,106,750 gallons, being 58.69 million gallons less than the year previous; and for the quarter 89,890,400 gallons, being 12.75 million gallons less than the corresponding quarter of previous year. This falling off is, no doubt, attributable to several supplies being taken off and put on to Centennial Reservoir.

The quantity of water pumped to Waverley Reserve during the year was 419,015,000 gallons, being an increase on the year previous of 40.79 million gallons, and for the quarter, 94,003,200 gallons, being 12.84 million gallons more than corresponding quarter of previous year. The quantity of water pumped at Ryde works for the year to Ryde Hill was 99,036,000 gallons, being 32.00 million gallons less than the previous year, and for the quarter, 17,226,000 gallons, being 9.58 million gallons less than corresponding quarter of year previous; the falling off is somewhat attributable to its supplies being relieved by having been put on to Centennial Reservoir, and favourable season. To Chatswood for the year was 550,320,000 gallons, being an increase on the previous year of 40.0 million gallons.

The pumping for the quarter was 120,576,000 gallons, being nearly similar to the corresponding quarter of previous year.

The efficiency of Ryde pumps have been maintained by the staff during the year, and running fairly satisfactorily. The W. engines were found to be passing water, owing to buckets being much worn, and are now being rebushed.

The quantity of water pumped at Carlton during the year was 88,629,440 gallons, being 12.33 millions less than the year previous, and pumping for the quarter 23,010,000 gallons, being 3.64 millions more than corresponding quarter of previous year.

The requirements of renewals, &c., have been met by the staff during the year, and pumps are now in fair working order and condition.

Chatswood pumping for the year amounts to 97,439,062 gallons, being 11.08 million gallons less than previous year, and for the quarter, 19,714,502 gallons, being 9.34 million gallons less than similar quarter of year previous; this is also attributable to favourable season. The usual routine-working, packing, &c., has been attended to, and the machinery is now in fair working order and condition, but is now due for general overhaul.

J. FYFE,

The Engineer-in-Chief.

Chief Mechanical Engineer.

Annual Report, Prospect Reservoir and Conduit from Nepean River to Potts' Hill,
1st July, 1899, to 30th June, 1900.

Prospect, 24 July, 1900.

THE past year has seen a return to normal conditions of abundant water supply. At 30th June, 1899, the Prospect Reservoir was recovering from the low level caused by the previous drought, and by 16th September was overflowing.

Water was then cut off to allow of the work of strengthening canal walls being proceeded with, and remained so till 21st October, when, the level having fallen to 194.54, a full flow was put on and reservoir refilled, overflowed, and a large quantity of bottom water drawn off by the scour pipes. On 5th November water was again cut off till 17th December, when R.L. was 193.29. The rivers having then dropped to their summer flow, all water available was taken; but was not equal to the outflow, and the reservoir continued to drop till it touched R.L. 191.54, on 24th January, 1900. Rain then enabled it to be refilled to 194.40, about which level it was kept till the beginning of April, when it was again refilled. Canal work was then resumed till water level was at R.L. 194.00, on 10th June, 1900, when reservoir was refilled, and has been kept full till date of writing.

It will be seen from the foregoing that but for the work in progress, the reservoir, after its first recovery in September, could have been kept at overflow level for the remainder of the year, with the exception of the month of December, when the available inflow was exceeded by the output, and during that period the loss of level would not have amounted to 2 feet.

On account of a subsidence which took place at T.S. 44 in the Prospect Reservoir embankment while the water was at its lowest in 1899, it was decided to increase and strengthen the section of bank over the portion affected between sections 40 and 46. 12,000 cubic yards of ballast from the quarry were deposited at the inner toe, extending for a length of 600 feet by (average) 35 feet in width and 15 feet in height. This was completed in August, 1899, and the upper part of bank restored to its original height, and there has been no sign of any further subsidence.

In all other parts the bank remains in very good order, the drains provided in the outer portion work well, and by removing the excess moisture rapidly after rain prevent those local inequalities of settlement which at one time were frequently apparent.

Very good progress has been made during the year with the work of strengthening the upper canal lining and substituting concrete lining where weakness in the original work developed. The total length dealt with was 11,132 lineal feet, at a cost of £14,686, and for introducing the full section of concrete lining the average cost has been 23s. 1d. per foot run of channel.

Where the strengthening, &c., has been completed, culverts, flumes, &c., have been rearranged and approaches widened, and a road formed to admit of convenient inspection of the whole of the works.

Up to the present there has been no continuous road, owing to interruptions, made by spoil-banks, culverts, and flume inlets and outlets, &c.; but these obstacles are gradually being done away with.

A contract is in progress for the renewal of 2 miles of fencing on upper canal.

The works in connection with Camden water supply were finished, and water turned on, in October, 1899. This, together with Campbelltown and Liverpool water supplies, has had regular attention as to scouring, &c., and the supplies have been satisfactory.

A roadway has been made below the embankment in lieu of the road along the top.

A new brick cottage was built during the year for occupation by the Board's gardener. This and the other two cottages on the main avenue from Western-road to embankment are now supplied with water, which is pumped by the hydraulic ram to a brick tank, of 4,500 gallons capacity, on the hillside above Veteran Hall, and thence supplies the cottages by gravitation.

The duplicate 72-inch main between Pipe-head Basin and Potts' Hill is not yet handed over to the Board by the Public Works Department; but it was charged in February last and put into partial operation, and on 23rd June the old main was closed to admit of the construction of inspection chambers on it, and the duplicate main has since been doing the whole duty.

Such of the Board's cottages as were not painted last year have been painted this year.

New screens are being gradually introduced into the Potts' Hill screen tank, twelve having been obtained, which are now being fitted and placed.

Other matters worthy of note may be mentioned as under:—

July, 1899.—Slip in canal at 13 $\frac{3}{4}$ miles. The ground hereabouts has always been bad, and the heavy rains suddenly, after a long spell of drought, caused slips which overturned the walling. A stronger section of walling was adopted for this and similar spots, and the wall built in cement.

Slip in concrete bank at 46 miles. This was an outside slip, and was made good after the introduction of drains to carry surplus moisture out of the bank.

August, 1899.—Lower canal emptied and cleaned. At the same time the Boothtown aqueduct was rendered inside. This has proved very effectual by almost entirely stopping leakage. A slip at 14 miles was dealt with in the same manner as slip at 13 $\frac{3}{4}$.

October, 1899.—Pointing and repairing quick race on section 9 in hand; 60 chains of this work have been carried out.

November, 1899.—Potts' Hill Reservoir emptied to allow of connections for duplicate 72-inch main being put in. Inspection of the sides and floor showed it to be in very good order. All underwater iron-work, &c., was cleaned and painted. Iron aqueducts on upper canal painted this month.

January, 1900.—The low flow in the rivers afforded an opportunity for inspecting the Nepean and Cataract tunnels throughout. Some small falls of rock had taken place, and one considerable one in the Cataract tunnel. As this was obstructing the waterway to a great extent, it was cleared out later on.

February and March.—In the Prospect outlet tunnel roofing was constructed over the pipes, as sufficient dripping from the roof existed to keep the pipes in a dirty condition and prevent their being cleaned. It also caused some corrosion, particularly at the flanges. After erecting the roofing, the pipes were cleaned and coated, and are now in first-class condition.

April, 1900.—The inlet basin and quick race at end of section 10 were emptied, cleaned out, and repairs to concrete work effected where necessary.

The revenue from agistment was £266 19s. 8d., a smaller return than usual, but very satisfactory in face of the facts that grass has been very abundant everywhere this year, while the Board is not competing with private owners for custom, but charges 50 per cent. higher rates than they do.

A. F. JACOBS,

The Engineer.

Resident Engineer, Prospect.

RETURN

	Totals	48	4	22		

These meters have been tested at request of consumers, principally in position on the premises. Out of the 74 there are 48 which proved correct, 4 showed a percentage on the slow side, and 22 on the fast side; and all those 26 in error were, on examination, found to be very dirty; in fact, some of them were almost choked up.

RETURN of Board's disconnected meters specially tested before repairing.

This return refers to meters which have been replaced by new ones on the exchange system, and tested as received. We have exchanged 1,100 during the year, and the above are a few tested for the purpose of obtaining some idea of the result after a few years' work. Most of these meters have been in use over five years.

W.J.G.,
Mechanical Engineer, 20/9/00.

* Total supply for eighteen months

TABLE showing Water Pumped from various Pumping Stations yearly from 1890 to 30th June, 1900.

Year.	Paddington	Centennial Park	Woollahra.	Waverley	Ryde Tanks	Chatswood Tanks	Wahroon gan Tank.	Penshurst Tanks.	Richmond
1890	992,457,980		367,108,960	85,113,600
1891	1,141,080,760		411,200,880	121,828,160				
1892	1,325,649,600		365,152,880	144,753,350	68,209,000	123,957,000			
1893	1,515,949,800		393,094,500	177,265,100	75,456,000	187,392,000		10,497,000	..
1894	1,628,251,000		430,102,000	207,209,000	83,328,000	199,008,000		21,371,000	.
1 Jan, 1895, to 30 June, 1896.	2,768,150,300		656,661,200	366,343,200	146,592,000	372,000,000		55,210,000	13,800,000
1 July, 1896, to 30 June, 1897	1,810,904,600		446,529,340	277,802,880	181,463,000	333,354,000	27,096,853	61,617,500	13,050,000
1 " 1897, to 30 " 1898	1,858,043,700		432,468,150	328,456,620	111,425,000	392,208,000	60,561,990	65,137,529	12,064,000
1 " 1898, to 20 " 1899	424,980,000	1,681,796,000	440,803,000	377,599,160	121,014,000	510,772,000	108,278,296	101,224,620	15,950,000
1 " 1899, to 30 " 1900		2,658,546,300	382,106,750	419,015,850	99,468,000	549,360,000	99,165,628	88,739,440	14,978,000

In the years 1890 and 1891, the Waverley water was pumped from Woollahra.
In 1892, 21,314,520 gallons were pumped from Woollahra, the balance was pumped direct from Crown-street.

II.—SEWERAGE BRANCH.

During the year the following storm-water drains were constructed by the Government Sewerage Branch, and transferred to the control of the Board, under the provisions of the Amending Act of 1894:—

White's Creek Storm-water Channel, 2nd division.
 Dolphin-street " and branch channel.
 Johnstone's Creek " (part).
 Taylor-street branch.
 Gehrig's branch.
 Fowler's branch.
 Stanmore branch.
 Bay-street overflow sewer.
 Lyndhurst-street branch.
 Denham-street branch and sub-branch.
 Mitchell-lane branch.
 Crown-street branch.

During the same period the following main sewers, constructed by the Government Sewerage Branch, have been transferred to the Board, under provisions of Amending Act of 1889, Western Suburbs Sewerage Act and North Sydney Sewerage Act:—

Western Suburbs System.—Main Western branch.
 Main Western branch, 1st division.
 Canterbury branch.
 Main Western branch, 2nd division.
 Main Western branch, 3rd division.
 Frederick-street sub-branch.
 Webb-street sub-branch.
 Carshalton-street sub-branch.
 Main Northern branch.
 Main Northern branch, 1st division.
 Marrickville-road sub-main.
 Livingstone-road sub-main.
 Main Northern branch, 2nd division.
 Dobroyd branch.
 Station-street branch.
 Canterbury Old Road sub-main.
 Short-street sub-main.

Northern System.—Waverley and Bondi eastern slopes intercepting sewer (part).
 Pyrmont branch.
 Balmain north-western slopes branch.
 Callan Park branch.
 Margaret-street overflow.
 Randwick main sewer.
 Mosman main sewer, 1st division.

During the year the out-fall works at Willoughby have been transferred to the Board. The following municipal storm-water drains have been transferred to the Board, viz.:—
 Leichhardt.—Beeson-street drain.
 Edith-street drain.

The length of sewers and stormwaters transferred to the Board during the year were, viz.:—
 Sewers—12·92 miles. (*Vide Appendix A. Table 1.*)
 Stormwater ducts—3·36 miles. (*Vide Appendix A. Tables 2 and 4.*)

Surveys, &c.

Surveys have been carried out to determine the position and level of side inlets for the Government Sewerage Department in connection with the reticulation sewerage for the following sewer:—

Kensington sewer.

Surveys have been made for storm-water drains at Victoria-street and Botany Sewage Farm, and for reticulating sewers at Alexandria, Ashfield, Balmain (low-level), Burwood, Camperdown, City, Enfield, Erskineville, Marrickville (low-level), Newtown (low-level), North Sydney, Petersham, St. Peters (low-level), Strathfield, Waterloo, Waverley, Willoughby, and Woollahra. Surveys are also in progress for dealing with the reticulation of portions of Balmain (low-level), Glebe (low-level), Burwood, Mosman, North Sydney, Strathfield, and Waverley.

Sewerage Table.

New sewers laid during the year:—

By Board	59·48 miles.
By Government	12·92 "
Existing sewers	389·01 "

Total length of sewers 461·41 miles.

Storm-water drains laid:—

By Board	·01 miles.
By Government	3·10 "
By municipalities	0·26 "
Existing	22·308 "

Total 25·678 miles.

Sewerage

Sewerage.

During the year, 12·92 miles of sewer were transferred from the Government to the control of the Board, and 59·48 miles of reticulation sewers were constructed by the Board. The total length of sewers under the jurisdiction of the Board is 461·41 miles.

The Willoughby outfall works were also transferred to the Board during the year.

In addition to the foregoing, 3·37 miles of storm-water ducts were vested in the Board. The total length of these channels now maintained by the Board is 25·678 miles.

New Sewers.

The new sewers constructed by the Board during the year was 59·48 miles, as against 59·96 miles in the preceding year. Storm-water ducts ·01 miles as against ·08 miles previous year (*vide Appendix B*).

The aggregate length of sewers and storm-water ducts now under the control of the Board is—

Sewers	461·41 miles
Storm-water ducts	25·68 ..
Total	<u>487·09 miles</u>

It will be seen from the mileage of sewers constructed during the year that the average progress has been over 1 mile per week, the work has been carried out in varying strata.

The transfer of a number of main ducts to the Board enabled the public to have the advantage of improved sanitation within reasonable time from the completion of the Board's work. Although the Board has pushed on the reticulation for the ratepayers' benefit, the application of the compulsory clauses of the Act has to be made with recalcitrant owners who do not comply with the statutory notices to connect to the sewers.

In many cases the cost of connecting is a tax upon some of the community who are struggling to establish a home, more especially in districts where the natural formation is rock, such cases are provided for by the system of defined payments on one hand, and by constructing the reticulation sewers through private property where levels are favourable.

Contracts in Progress.

During the year the work of constructing new sewers has been pushed on, 65 contracts were in progress during the year as against 60 the preceding one—the contracts comprised a total length of nearly 100 miles of sewers of varying sizes in different formations. In addition to above several miles of effluent drains were laid at Rockdale Sewage Farm, also building over screening chamber; 5 new cottages erected and additions to Manager's residence. A new cottage was also erected at Cook's River, Marrickville, on Board's land, and is occupied by one of the maintenance men.

A brick vent-shaft, with cottage attached, is being erected at Percival Road, Petersham, for the ventilation of Main Eastern Branch, Western Suburbs.

Storm-water Drains.—The storm-water drains under the Board's control are in satisfactory condition—the principal item of cost in maintenance is the removal of the silt and sand. Many of the ducts are subject to tidal influence, which causes deposits of sand during rain storms which occur concurrently with high water. The maintenance of these works must for some time continue to be a drag on the revenue of this branch.

Outfall Sewers.—The various outfall sewers have been maintained in good condition. Necessary repairs to the invert of Bondi outfall sewer have been carried out without the necessity of bringing the side overflows into operation. Bulkheads were constructed above and below the section to be dealt with, and ample fluming was provided to carry the sewage flow. Arrangements being made for the safety of the men engaged by giving warning in case of rainfall in any of the upper portions of the drainage area.

The extension of the reticulation system causes an increase in the depth of flow and velocity of current; this, under ordinary circumstances, prevents any material deposit of silt; but heavy rain storms bring a large quantity of road detritus into the main sewers, and causes deposit in places. Owing to new districts being opened up, and funds not admitting of the staff being increased, the silt has not been removed as I would like, owing to the maintenance men having to be spread out; but arrangements will be made to overcome this difficulty. The appointment of an experienced fitter to this branch has been of considerable advantage with regard to the various penstocks, and other mechanical work, the whole of which have been overhauled and are in good working order. The wrought-iron aqueducts over Cook's River and Wooli Creek will require painting during the current year.

Reticulation Sewers.

The whole of the suburban sewers in operation are in a satisfactory condition, and the steel and cast-iron pipe aqueducts have been painted or tarred, as required.

The flushing arrangements are attended to and work satisfactorily. This work is carried out by means of automatic flushing chambers in connection with water spray air inducts, the water used in inducing a current of air into the sewer being afterwards used for flushing same; each manhole in the pipe sewers is also a flushing station, so that any section of sewer can be flushed with the flow in same.

With the flushing referred to and ventilation of the sewers, formation of sewer gas is prevented, and the absence of sick reports from the number of men engaged in sewer maintenance is ample proof of the aerated condition of the sewers.

In the old City reticulation, where sewers are found to be defective, they have been either totally reconstructed or rejointed with proper joints. There is no doubt that many of the old sewers are on forgotten lines, and it is only by their falling in or disclosed by building operations that the Board can trace their existence.

The following works have been carried out by day-labour under the staff:—

Empire-lane	relaying 9-inch sewer.
Lower Fort-street	new 6-inch sewer.
Little Queen-street	extending 6-inch sewer.
George-street	9-inch sewer at "Royal Hotel."
Alma-street, Pyrmont	9-inch sewer extended.
Power-house, Ultimo	18-inch sewer laid.
Foster-street	9- " " "
Forsyth-street, Glebe	9- " " "
Holdsworth-lane	9- " " relaid.
Queen and Regent Streets	9- " " extended.
Surrey-street	9- " " laid.
York-street, opposite Lassetter's	12- " " lifted and relaid.

The pipes in this lane, although laid over thirty years were in good condition, but joints were all oper.

Moore's-road	9-inch sewer relaid.
Liverpool-street	9- " " "
Perry's-lane	9- " " "

The heavy falls of rain last year disclosed certain weak points in the suburban reticulation system; the sewers became surcharged and flooded some low-lying properties. It was evident from an examination of the manholes that the flood water from premises was finding its way into the sewers far in excess of the quantity calculated upon, and the necessity of flood reliefs became apparent. These have been provided for, and, the Board having approved, were put in hand and will be pushed on.

Removal of Silt.

The quantity of silt removed from the various sewers is, viz.:—Metropolitan district sewers, 800 tons; storm-water drains, Rushcutters' Bay, 650 tons; Neutral Bay and Careening Cove, 593 tons; White's Creek, 185 tons; Beattie-street, Balmain, 782 tons.

Bondi and Botany outfalls, 100 and 30 tons respectively; Macdonald Town branch, 70 tons; and storm-water drains—Long Cove, 1,200 tons; Iron Cove Creek, 600 tons; Powel's Creek, 250 tons; and Double Bay, 5,000 tons. With regard to the latter, the deposit is not due to normal conditions, but to an inrush of water heavily charged with sand from an adjoining estate—the adjustment of cost of removal will be a question either of amicable settlement or legal process.

Pumping Plant.

During the year the Thone's Ejector installation continued to give satisfaction, the quantity of sewage raised into the Botany outfall was 202,572,000 gallons, the daily average being 555,000 gallons.

Owing to the approaching completion of the low-level pumping station at Marrickville, which was intended to receive the sewage from the district served by the ejector, it will be necessary to abolish this station and pump from the main works, as it would not be economical to run two stations when one could do the work. The machinery is in good order, and, with the ejectors, could be used in other districts, if more economical power than compressed air cannot be obtained.

This system was instituted over five years ago to serve a district which was too low to admit of it being connected with the gravitation sewers, and which had a very high death rate from enteric fever.

The operations of the Board have raised the sanitary condition of the district to such a standard that it now compares favourably with any in which the sewerage system exists.

The value of the work done as affecting health will no doubt be dealt with by the medical adviser in his report. There is one important point in connection with this temporary system, viz., the lowering of the level of ground water, which has no doubt materially contributed to the low death rate of the district.

Double Bay Pumping Station.—The plant at this station is in good running condition, but, owing to the high minimum charge for electric power, the cost of pumping is not economical, and no improvement can be made until the system is extended to Rushcutters' Bay section, and cost of power be spread over a larger return.

The quantity of sewage pumped since 5th March to 30th June, 1900, was 10,673,880, and estimated B.T.U. 8382.2.

The Watt meter at the station was loaned by the Railway Commissioners, and had to be returned. One was, however, purchased, and it is now fixed in position, and a check can be kept on the power supplied, as well as ascertaining the efficiency of the plant.

The Marrickville low-level pumping station has not yet been transferred to the Board, although the Board's staff is running the plant. This was considered advisable on account of the engines being new to the Colony, and the staff required time to become accustomed to same, as well as other mechanical details.

Outlet Works.

Cook's River, Botany.—The machinery and valves are in good working order, and nothing of import has occurred during the year.

The laying of submarine pipes has been delayed, owing to the Department not being able to obtain the services of a dredge, but arrangements have now been made, and I hope to see an early start. The locomotive has been repaired, but has reached the limit of its usefulness, and should be replaced with one of more suitable type for local conditions of running.

The temporary bridge has been attended to, to make it safe until sludge pipes have been laid.

Outfall, Willoughby.—These works were transferred to the Board in August last, and are maintained in good working order. A general description of the works is attached hereto.

After the works were in complete running condition, it was apparent that the tank accommodation would not be sufficient for any further expansion of the sewerage system, and steps were taken to provide same on land resumed for that purpose; also for intercepting the large quantity of sand brought down in time of heavy rain, and providing machinery for disposing of same. The Board, having visited the works, approved of the above works being proceeded with, and a contract was put in hand.

With precipitation systems, either mechanical or chemical, in other parts of the world, the disposal of the sludge has been a difficult matter, and the Willoughby works is no exception. In

In America, and some parts of Great Britain, it is run into tanks constructed for the purpose, and allowed to dry in the air until it can be dug out. It is then disposed of to farmers and others, if they are disposed to take it, which in many cases they are not, and the material becomes an incumbrance. In order to reduce the bulk, it is in other places pressed into sludge cake for convenience of handling, and disposed of to those who wished to have it for the carting.

This inducement, however, does not appear to be financially successful, as burning of the sludge in conjunction with town refuse appears to be the common method of disposal, when the two could be combined. I have no doubt that it could be economically managed.

With the North Sydney works such favourable conditions do not obtain, and unless the sludge is disposed of by digging in on the filter bed, it must be destroyed by fire. To convert the filtering area into a sludge pit would defeat one of the objects of the system, and this method could only be adopted in a small way to make up depressions or banking up the distributors. A quantity has been disposed of in this manner without causing a nuisance or deteriorating the bed as a filter.

After some months of working it was found that the cost of lime for precipitation and forming sludge cake, together with cost of fuel for burning the latter, was so great that experiments were tried in mixing some combustible material with the sludge. Sawdust and coal-dust were tried, but in neither case was the result conclusive as to economy, and mixing lime with the sludge to form the cake had to be reverted to.

If lime precipitation has to be continued, some other method of mixing lime and sludge will have to be adopted to obtain satisfactory results. The quantity of coal used for burning the sludge-cake is 9 cwt. to 2½ tons of "cake" during an eight-hour shift, or 18 per cent.

The "destructors" have not acted satisfactorily, and an alteration to one of the furnaces will be made, when it is hoped that better results will be obtained. The cost of working the outfall works, including wages, lime, coal, &c., from 1st August, 1899, to 30th June, 1900, was £1,334 2s. 5d.; of this amount, wages absorbs £661 10s. 3d., and coal-lime, £613 0s. 6d.

In view of the heavy cost of working, the system it is desirable, in the interests of the ratepayers, that some more economical method of disposal should be tried, and with this object the Board approved of one of the precipitation tanks being converted into a bacteria bed on the Scott-Moncrieff principle. If this mode of treatment is successful—and there is every ground for thinking it will—an important question in connection with these works will be solved. Before the end of the year I hope to be in a position to report favourably.

It was considered necessary to have the filtering area regularly harrowed in order to aerate the ground, as it had every appearance of becoming sour and sewage sick. A harrow and horse was provided, and foreman reports that harrowing the ground regularly has improved the condition of same. It was noticed that fungus was growing on the internal surface of pipes. If this was allowed to accumulate, the filtering power of the underdrains would be considerably impaired. Suitable brushes were provided, and the growth removed. The levels of inlets of subsidiary subsoil drains have been badly arranged. Instead of the soffits of main and side drains being common, the latter joins the former at the invert. The result, when main line is flowing with any depth, is obvious.

Sewage Farms, Botany and Rockdale.

There being ample area of sand to be covered, there is no difficulty in disposing of the sludge.

The average daily flow of sewage on to the Botany farm is 3,000,000 gallons. The quantity flowing into the Rockdale farm cannot be estimated until a proper gauging apparatus has been provided. The quantity of stormwater which passed down the main carrier taxed the carrying capacity, but the provision made for reliefs enabled the manager to deal with the maximum flow. What the overflow could not take passed on to the farm—the available area being 125 acres, 40 of which have been underdrained into agricultural pipes with coir-mat joints. This system of underdraining has been successful on the Botany as well as this farm. Mats that have been in the ground for eighteen months were taken up, and showed no signs of deterioration. This is the only system of jointing that has given satisfaction in letting the subsoil water pass through and preventing the ingress of sand, and there is every appearance of this difficult question being successfully solved.

The beds on Rockdale Farm which have been underdrained are working satisfactorily, and have proved a good stand-by. Material is being manufactured for underdraining other beds on both farms. The pipes and coir-mats will be supplied by the Board, and the laying of same, with constructing chambers, &c., will be done by contract.

As reported in previous reports, tree-planting is made a part of the annual work on the farms. These are for break-winds and ornamental as well as for commercial purposes. During the season, the manager has planted out about 700 osier cuttings. This planting will be continued each season, and will in a few years, it is hoped, be a source of revenue to the Board. The trees planted out under the suggestion of Mr. Maiden, Director of Botanic Gardens, are thriving, and will in a few years considerably improve the appearance of the farm.

Five workmen's cottages have been built, and are occupied by the men. They form a pleasing feature in the farm, and in a short time, with the gardens in front, will be further improved. Provision has been made for transporting the children to the farm boundary to enable them to attend school.

A neat building has been erected over the screening chamber on Rockdale outfall for protection of the gearing, &c.; also a coal bunker and store.

The live stock, the property of the Board, on the farm is in a healthy condition.

A fair return has been obtained from the sale of pigs. Six good pedigree pigs from imported stock was obtained from the Agricultural College to improve the farm stock. A trial crop of broom millet was sown, and the result of the crop is promising for future cultivation, as if proper seed can be obtained it can be grown on the farm, and with a good local market it can be disposed of at a profit.

The cost of maintenance of the different services is, viz. :—Inlet house—wages, £136 6s.; cost of coal, oil, stores, repairs to loco. and oil engine, £99 14s.; Botany Farm—maintenance, £859 14s. 2d.; the cost of ploughing and harrowing, including forage, seeds, tools, live stock, &c., £481 18s. 3d.; Rockdale Farm—maintenance, £531 10s.; ploughing and harrowing, material, tools, &c., £178 1s. 11d.

The returns are as follows, viz. :—Sale of produce, £66 19s. 3d.; sale of live stock, £60 17s.; agistment, £82 4s.; total, £210 0s. 3d. The estimated value of live stock is £194 10s.

The whole of the leaseholds are in a satisfactory condition. Improvements have been made to two buildings, and holdings have been let to satisfactory tenants.

Works

Works to the amount of £4,059 3s. 10d. have been carried out on loan account.

The cost of working these farms on present lines, apart from the interest on future expenditure on loan account for extending the filtering area, is one for serious consideration, and has not been overlooked. In reports submitted for the Board's consideration it was pointed out that economy in the future could only be attained by a complete departure from the present lines of disposal, and adopting one more in line with modern science, viz., by biological treatment. The Board were fully seized with the importance of a change being made, and in order that the Department would not be working in the dark, it was necessary that certain factors should be obtained to guide future working of the system. These factors could only be arrived at by chemical analysis, and the President of the Health Board approved of the request of this Board that Mr. Hamlet, the Government Analyst, should arrange for conducting the investigation.

In order to have the investigations carried out in a proper manner, the Hon. Minister for Works was asked to approve of the expenditure of a sum of £500 for constructing a series of tanks for the purpose. It was pointed out that the improved cultivation would in time freely cover the cost. In reply it was pointed out that, as the Government were constructing a septic installation at Rookwood Asylum, it was not considered advisable to expend money on experimental purposes on the same lines. That the two installations were not on the same lines was apparent to any one who had studied and investigated the question, and this opinion has been fully borne out by the investigations by the Government Analyst of the filtrate from the tentative system which the Board had to fall back upon. The results of his investigations were considered of such importance by Mr. Hamlet that they formed part of his annual address as President of the Royal Society.

The factors which are necessary for the successful working of a biological system must be obtained from the sewage to be dealt with, and not from samples, which may be of a totally different character.

House-drainage Sub-branch.

The following is the number of houses connected with the metropolitan and suburban sewers under the control of the Board during the past twelve months:—

	1890.	1891.	1892.	1893.	1894.	1895-6.	1896-7.	1897-8.	1898-9.	1899-1900.	Total.
City ...	961	541	1,070	1,223	1,050	1,384	971	1,147	400	631	9,378
Suburbs ...	3,804	3,578	3,448	3,437	2,853	3,113	2,160	2,685	6,895	8,709	40,682
											50,060
Connected with city sewers prior to Board's control ...											18,000
Total ...											68,060

It may be observed that a great majority of those returned in the city are reconstructions, and are included in the 18,000 connected with the sewers prior to Board's control.

An analysis of the houses connected with sewers in the suburbs during the past twelve months gives the following result:—Alexandria, 42; Annandale, 228; Ashfield, 1,278; Balmain, 2,558; Camperdown, 144; Erskineville, 21; Glebe, 238; Leichhardt, 922; Marrickville, 625; Newtown, 182; North Sydney, 660; Petersham, 1,263; Paddington, 114; Redfern, 54; Randwick, 37; Waterloo, 53; Waverley, 148; Woollahra, 136; Burwood, 6.

House-drainage Plan Fees.

The fees for house-drainage plans, and the number of plans prepared, are as follows:—

	1890.	1891.	1892.	1893.	1894.	
Plans prepared ...	2,213	2,303	2,485	2,669	2,119	
Fees... ..	£1,033	£1,036 15s.	£1,013 2s. 6d.	£1,224 2s. 6d.	£788 12s. 6d.	
	1895-6.	1896-7.	1897-8.	1898-9.	1899-1900.	Total.
Plans prepared ...	2,624	2,557	3,219	6,655	8,676	35,520
Fees... ..	£875 2s. 6d.	£690 5s.	£894 12s. 6d.	£1,933	£2,444 6s. 6d.	£11,932 19s.

The number of houses surveyed and charted on records was 3,271, and the number of building plans lodged, 250.

Compulsory Drainage.

During the twelve months ending June 30 there were 431 houses connected with sewers by Board's contractor, of which 134 were done under the system of deferred payment, and 297 under the compulsory clause of the Act.

The number of plans prepared last year is 2,021 in advance of the previous year, and the increase in fees is £511 6s. 6d. There is no doubt that the visitation of the plague is responsible for the marked increase in the number of houses connected with the sewers in the suburbs. The reconstructions in the city do not bear favourable comparisons, and the cause is not far to seek. In the suburbs the Board can move direct; on the other hand, the compulsory power in the city was confined to the City Council, or in their default, in the Health Board. The process being so circumlocutory, action on the part of owners was not in proportion to the necessity for same, as the notes of the inspecting officers revealed.

House Drainage Certificates.

The number of official certificates issued during the year was:—City division, 900; suburban, 5,017. The number issued from 1891 to 1899 were:—City, 3,849; suburban, 6,437.

Defective Drainage.

During the year, in the City division, 188 first notices and 34 final notices to repair or alter defective drainage; North Sydney, 4 first notices and 2 final notices; Leichhardt, 7 first notices; Glebe, 5 first and 5 final notices. In most cases action was taken without unnecessary delay. In the City Leichhardt, Glebe, and North Sydney, 20 chokages were cleared and 33 premises smoke-tested.

Sanitary Plumbing.

The past year has been particularly busy under this head. The difficulties of dealing effectively and promptly with properties in the city have previously been pointed out, and it is to be hoped that full power will shortly be granted by the Legislature to deal direct in these matters. During the recent outbreak of plague, the City Council and the Health Board, with the help of four trained inspectors appointed by the Board, made special house to house inspections in the city in addition to the ordinary work of inspection incidental to the Board's regular work. There were 7,968 special inspections made, and reports on same were forwarded to City Council as the local authority under the Health Act. The state of things, in many cases, was awful, necessitating entire reconstruction. To

Drawing Office.

During the year 430 tracings and 270 sheets of drawings for various works have been prepared Heliographs printed, 1,404; plans mounted, 919; and various photographs.

Expenditure on Loan Vote.

The expenditure on Loan Account for the year was £111,153 1s. 6d.

Expenditure on Revenue Vote.

The expenditure on Revenue Vote for the year was £26,293 12s. 6d., against £21,710 9s. 6d. for previous year. The increase is due to provision having to be made for new outfall and pumping works which were transferred; also increase in the inspecting staff, on account of the rapid expansion of the sewerage system, and to cope with applications to connect to same.

Cement and Pipe Testing Room.

Parcels of cement, representing 6,810 casks, and 36,000 bags, were tested during the year, one parcel only failing to come up to the standard required. Besides issuing this cement, 1,842 casks that had been tested and approved by the Sewerage Branch of the Public Works Department, were branded and sent away by us.

Seventy stoneware pipe tests were made for porosity and crushing strain, of which 16 failed to pass for porosity.

Nine samples of bricks were tested for cross-breaking strain and absorption.

Nine Monier oval pipes were sent up for test as to crushing strain.

Three tests were made of different sands for use on Board's work.

Thirty-seven special shafts were tested at various times during the year, besides 3,455 ventilating shafts.

Thirty observations in connection with sewer temperatures were taken.

General.

The President and the Board paid visits of inspection to the Botany and Rockdale farms, also the outfall works at Willoughby, and considered the various proposals for expenditure at above places.

The information furnished by the Government Astronomer and Government Statistician has been of the greatest assistance to the Department, and I take this opportunity of recording my thanks for the courtesy shown by them.

The Assistant Engineer and other officers of the staff have ably assisted me in carrying out the various works. The work of the Sewerage staff was materially increased by visitation of the plague, and the extra duty was performed with a spirit which is creditable to them.

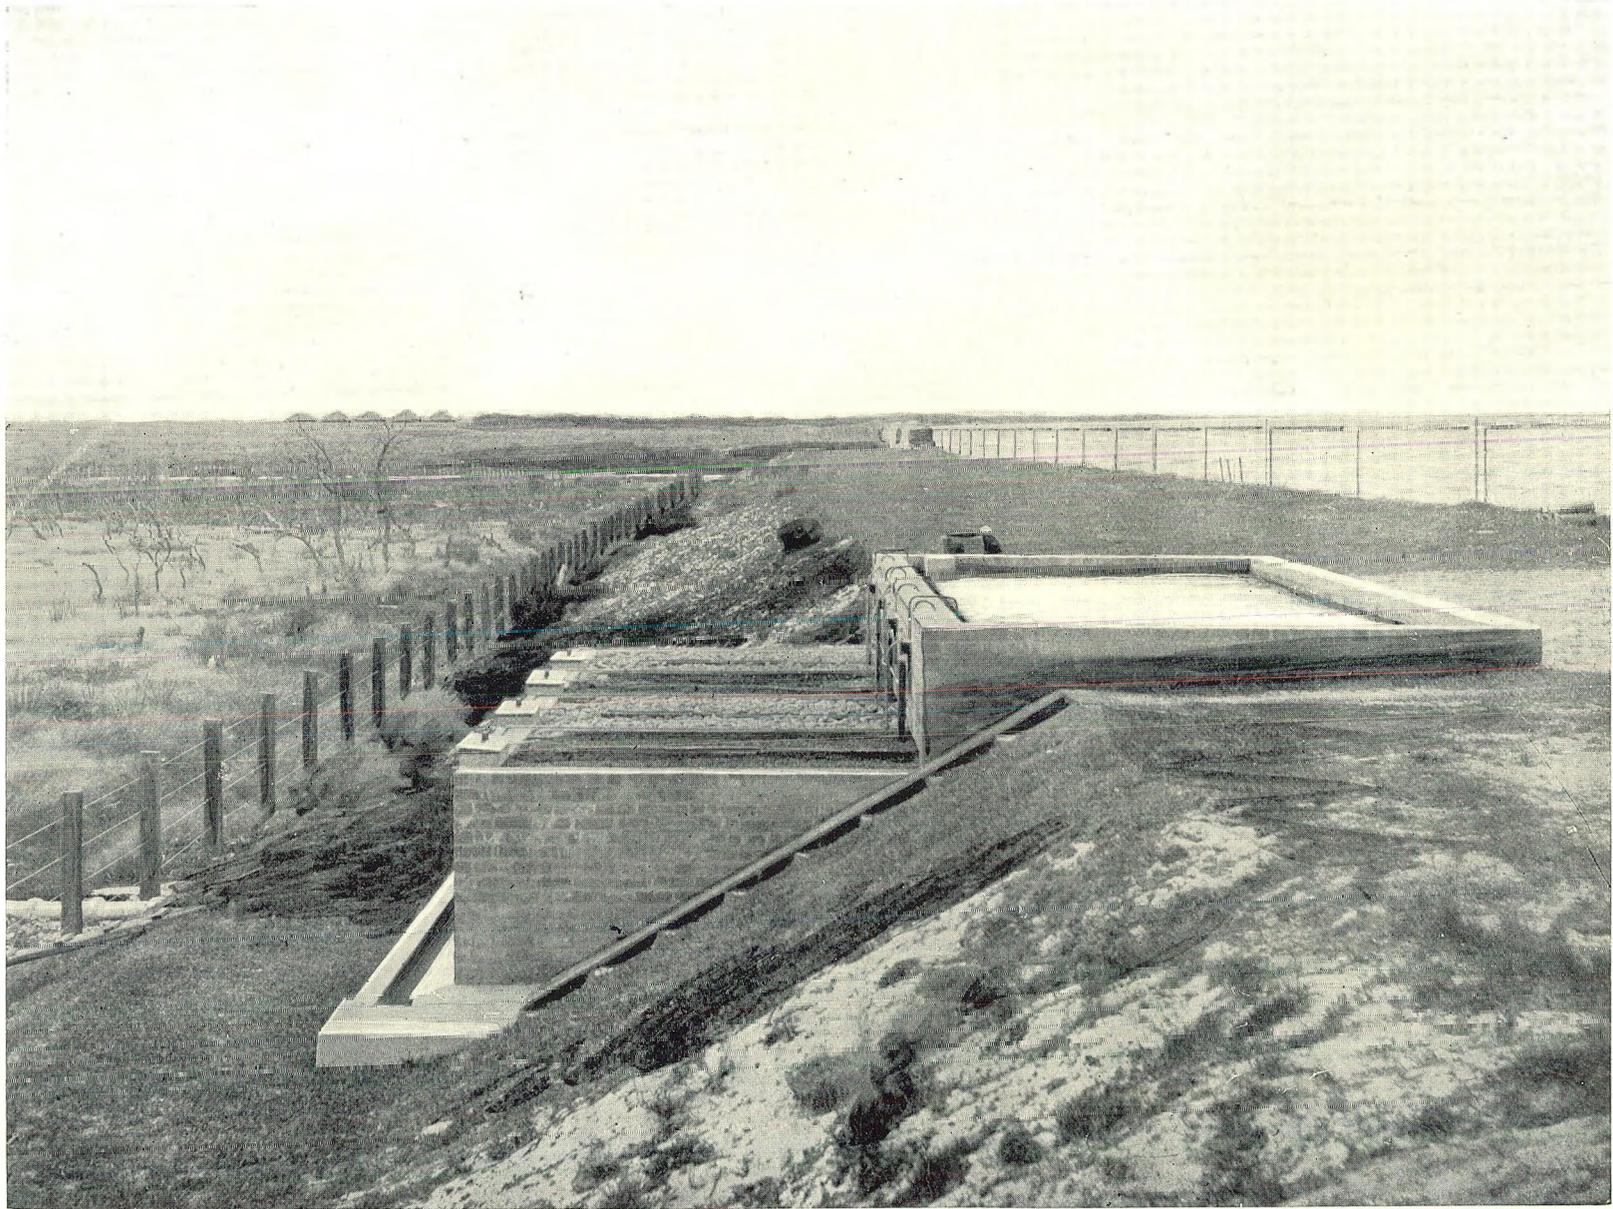

I have, &c.,

J. M. SMAIL, M.Inst.C.E.,
Board Engineer.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

METROPOLITAN BOARD OF WATER SUPPLY AND SEWERAGE.
(INFORMATION RESPECTING.)

Printed under No. 9 Report from Printing Committee, 16 August, 1900.

[Laid upon the Table of this House in answer to Question No. 8 of Tuesday, 14 August, 1900.]

Question.

- (1.) MR. PRICE asked the COLONIAL SECRETARY,—
- (1.) Is he aware that the business of the Water and Sewerage Department is extravagantly managed, and that a large amount of unnecessary expense is entailed in the working of the Board?
 - (2.) If so, is such extra expense met by rates charged upon the city and suburban users of the water supply and sewerage works?
 - (3.) Will he cause an inquiry to be held by the Public Service Board, and a report laid upon the Table of this House prior to the passing of the Estimates of 1900-1901 on the working of the Water and Sewerage Department?

Answer.

- (1.) The Board is not aware of any extravagant expenditure or unnecessary expense.
- (2.) If the cost of carrying out works which are revenue-bearing is meant as extra expense, then rates are charged upon all properties liable to either water-mains or sewers, as the case may be.
- (3.) The Public Service Board, on 4th February, 1897, were appointed a Royal Commission to make a full inquiry into the management of the Board, which extended over a period of eight months, and their report was presented to Parliament.

After making certain recommendations to increase the salaries of several officers, the Commission go on to say:—"We do not feel called upon to make any further reference to individual officers: the staff as a whole may be considered as a satisfactory one, while the individual salaries are certainly not fixed at an extravagant rate."

Attached is a comparative statement of the cost of working of this Board and similar institutions in the neighbouring Colonies.

WILLIAM HOLMES,
Secretary
(per S.P.)

The Under Secretary for Public Works, &c., &c.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

HUNTER DISTRICT WATER SUPPLY AND SEWERAGE BOARD.

(REPORT FROM 1 JULY, 1899, TO 30 JUNE, 1900.)

Printed under No. 15 Report from Printing Committee, 1 November, 1900.

Newcastle, 29 September, 1900.

To the Honorable the Secretary for Public Works,—

Sir,

The Hunter District Water Supply and Sewerage Board have the honor to submit to you their Report for the year ending 30 June, 1900.

WATER SUPPLY.

2. The average daily consumption of water per head of the estimated population was 21·57 gallons as against 21·94 gallons during the preceding year.

3. During the years 520 houses were connected with the mains.

4. The number of properties rated at the close of the year was 14,030, of which 8,423 were connected, leaving 2,301 vacant lands and 3,306 houses not connected. During the year 33,606 rate notices have been served.

5. It is a matter for regret that such a large number of householders have failed to connect. The Board have not considered it advisable to compel ratepayers to connect their premises with the mains, but have, by the deferred payment system, offered every inducement to even the poorest ratepayer to do so, repaying the cost by quarterly instalments extending, if required, over three years. During the year 71 ratepayers have been assisted to obtain the water supply under this system, making a total of 679 who have availed themselves of the privilege since its inception.

6. During the year 1 mile 557 yards of 3 inch pipes, 1177 yards of 4 inch pipes, and 87 yards of 6 inch pipes, making a total of 2 miles 61 yards, have been laid. The total length of reticulation mains of different sizes laid by the board since its inception (a period of eight years), has been 38 miles 800 yards. The lengths of the mains now under the Board's control are as follows :—

Suction Mains	1 mile 176 yards.
Rising Mains	15 miles 1407 yards.
Gravitation Mains	17 miles 762 yards.
Reticulation Mains	144 miles 482 yards.
Total	178 miles 1067 yards.

7. The main pipe-line bridges crossing the swamps between Buttai and Lambton reservoirs are in good condition.

8.

8. The rainfall on the watershed of the Hunter River above the intake at Walka exceeded the fall recorded for the previous year. During the year, the river rose above its ordinary level on several occasions. On the 26th August last a height of 32 feet was recorded by the gauge at the Belmore Bridge, West Maitland. The river subsided during the following month, and an examination showed that no damage had been done to the intake works.

9. During the year the Board continued the work of removing the soft sludge which has accumulated on the bottom of the Storage Reservoir beyond the action of the scour pipe. The worst area has now been dealt with, and a very large quantity of sludge removed. This work has been done by means of a syphon scour-pipe, to which a long flexible jointed suction length is fitted. The pipe is made to operate on the bottom of the reservoir wherever required by means of floats and a pontoon, and has worked satisfactorily, removing the sludge with the minimum of disturbance of the water in the reservoir. As the worst area has been dealt with, and the condition of the water in the reservoir is satisfactory, the work has been suspended for the present, but will be at once resumed should necessity arise.

10. During the year the work of removing water weeds from the storage reservoir also received the necessary attention.

11. The filter-beds at Walka Pumping Station continue to work satisfactorily, and particular attention is given to the aeration of the water in the settling and clear water tanks, with good results. It will be necessary to renew the sand in the filter-beds, and the matter is now receiving attention.

12. The work of covering in the clear water tank has been completed, and, as anticipated, by excluding the light, has prevented the growth of the very fine weed, the removal of which has hitherto caused expense and inconvenience.

13. Samples of water have been taken regularly every month from the river, storage reservoir, settling tank, and clear water tank at the Walka Pumping Station, and from the reticulation mains, and submitted to the Government Analyst (Mr. William M. Hamlet, F.I.S., F.I.C.) for examination. His reports show on the whole an improvement on last year's results. The filtered water delivered into the mains for consumption maintains its reputation as a good, wholesome water, fit for drinking and all domestic purposes.

14. The river water during the year continued moderately hard, and varied considerably, ranging from only 6 degrees during freshets to as high as 21 degrees during spells of dry weather. This is accounted for by the fact that the dissolved substances in the water vary from time to time with the rainfall over the watershed of the Hunter, increasing in time of drought, partly due to the long-continued evaporation, and partly to the streams being principally fed with spring and subsoil water, which, in its passage through the ground, has become charged with soluble minerals. The filtered water has ranged in hardness from 14 to 19 degrees (Clark's scale). The Board would like very much to soften the water, but unfortunately the variations in the soluble matter and the high percentage which give a permanent hardness to the river water prevents the application at present of any economical softening scheme which would be within the Board's resources.

15. The pumping plant at Walka has worked satisfactorily during the year. The machinery has been thoroughly overhauled and found to be in good order, showing good original workmanship and evidence of careful maintenance on the part of the Engineer-in-charge. The quantity of water pumped during the year was as follows:—

follows:—From the river to the storage reservoir, 252,506,532 gallons; from the storage reservoir to the settling tank, 213,403,661 gallons; from the river to the settling tank, 132,740,931 gallons, making the total quantity of unfiltered water pumped 598,651,124 gallons, an increase over the previous year of nearly 43 million gallons. The quantity of filtered water pumped from the clear water tank to the service reservoirs was 331,651,180 gallons, showing an increase over last year of over 14 million gallons. The quantity of water pumped from the Newcastle reservoir to the high-level tank supplying the higher parts of Newcastle was, approximately, 2,400,000 gallons.

16. The cost of pumping 1,000 gallons, 100 feet lift, for last year was 430d., as against 427d. for the preceding year. The cost of coal delivered at the pumping station was 6s. 6d. per ton during the first half, and 7s. per ton during the second half, of last year. The coal used contains from 15 to 20 per cent. of ash. The cost of pumping is based on the out-of-pocket expenditure only, viz., for wages, fuel, stores, and ordinary repairs, but does not include either interest on the capital cost of the works or instalments to sinking fund for reconstruction.

17. The whole of the main buildings, engineer's residence, and employees' cottages at Walka pumping station are in good order. During the year additions have been made to the cottages occupied by the caretakers at East Maitland, Hamilton, Wallsend and Lambton, and suitable quarters have also been provided for the caretaker of the Board's offices at Newcastle. The Board have under consideration the necessity of additions being made to the caretaker's cottage at the Newcastle reservoir. The rent paid to the Board by the occupants of the residences mentioned provides for interest on the outlay and necessary maintenance expenses.

The suction, rising, and reticulation mains under the Board's control have been maintained in proper working order.

18. Regular inspections of the river for a distance of 20 miles above the intake at Walka have been made to prevent the pollution of the river or watershed. There is comparatively little settlement of population in the neighbourhood of the river for the distance, but the sanitary arrangements of these holdings receive strict attention and supervision. The results of the inspections of the river, its banks, and watershed have been satisfactory.

19. Whilst the new duplicate suction main from the river and the duplicate rising main to Buttai have considerably improved the facilities for pumping to Buttai reservoir, the best results will not be obtained until another gravitation main is also laid from Buttai to Newcastle. The supply for Newcastle and suburbs is at present dependent on one 15 in. cast-iron main. The capacity of the service reservoirs in the Newcastle district would not be sufficient to cope with the demand for water in the event of any serious accident to this main.

One of the most noticeable features of the Board's operations during the eight years which have elapsed since its incorporation has been the great increase from year to year in the quantity of water consumed. A comparison of the figures for the years ending 30th June, 1893, and 1900 respectively is interesting:—Year 1893—Average daily supply 451,005 gallons, consumption for year 164,616,850 gallons; year 1900—Average daily supply 908,634 gallons, consumption for year 331,651,180 gallons, and shows that the Board have now to provide for a consumption twice as large as in 1893. And it must be recollected that there are still no less than 3,306 houses, on which rates are being paid, not yet connected with the reticulation mains.

The

The Board feel that the prospects of the district are such that a still further increase in the consumption may be reasonably anticipated, and there can be little doubt that the duplication of the existing 15 in. main from Buttai cannot be safely postponed much longer.

As this work will involve an expenditure of, approximately, £80,000, the Board will defer its construction as long as possible, but when the sewerage scheme for Newcastle and suburbs is completed, and the Board believe this much-needed work is nearer accomplishment now than it has ever been, the larger use of water for the flushing of water closets, &c., will render the duplication a pressing necessity.

20. During the year it was found necessary to raise the 6 in. pipe supplying Minmi reservoir out of the reach of subsoil waters. This pipe was found badly decayed, owing to the action of water percolating to it from the decomposing pyritous refuse in the adjacent railway embankment, which has been formed mainly with coal pit refuse. This alteration and renewals of a number of reticulation mains in Newcastle and suburbs, where similar conditions prevail, have caused trouble and expense.

Strong leaks in the 15 in. cast-iron gravitation mains at Brook's Swamp, and Racecourse Swamp at Plattsburg, were found to be due to decay of metal, owing to corrosive action of the subsoil water similar to that experienced at Minmi. On the recommendation of the Engineer it was decided to lay a new line of piping at each place above the ordinary level of the swamp and subsoil waters, and to remove the existing lengths where the pipes have been corroded. This work will involve an expenditure of £1,825. The laying of the new pipes, which will be specially coated before being placed in position, has been delayed by the winter's rains.

21. During the year 1,961,400 gallons of water have been supplied free to public hospitals, benevolent asylums, churches, parks, mechanics' institutes, and schools of arts, and the Board have made liberal provision for water supplied for public purposes. For street-watering and public baths, water is charged for at the specially reduced rate of 6d. per 1000 gallons, and is supplied free for gutter flushing and cleansing sumps and drains.

22. For the year 138 meters have been hired out by the Board, making a total of 726 since the inception of the system. The hire charges are moderate, and the meter issued is of a high-class pattern, specially designed by the Metropolitan Board of Water Supply and Sewerage, to whom the Board desire to acknowledge their obligations.

During the year 120 meters have been tested. The total number of meters on private services at the close of the year was 1,235, an increase of 47 over the preceding year.

FINANCIAL.

23. The revenue struck for the year was £26,356 13s. 6d. Adding to this the arrears outstanding at the 30th June, 1899, (£10,809 11s.) gives the total revenue receivable £37,166 4s. 6d. Of this amount £30,252 4s. 4d. was collected and remitted to the Treasury, leaving £6,914 0s. 2d. outstanding at the close of the year.

24. The Board are unable at present to submit a proper balance-sheet, shewing the revenue and expenditure for the year, as the Capital Debt has not yet been determined.

The

The management expenses for the year amounted to £4,085 10s. 2d., and the working expenses to £5,489 5s. 6d. The amount of interest for the year on the Capital Debt, and the statutory instalment to the Sinking Fund for the renewal and reconstruction of Renewable Works cannot be ascertained until the Capital Debt is finally determined.

25. The total amount expended by the Board during the year was:—

Chargeable to loans	£2,838 12s. 2d.
Chargeable to revenue... ..	£9,645 8s. 0d.

CAPITAL DEBT.

26. This important subject has received the most serious attention of the Board since its incorporation in July, 1892, and unfortunately is not yet definitely settled.

The amount of the Capital Debt determined in accordance with the provisions of the principal Act was found to be so high, that it was a matter of impossibility unless the maximum rate were increased for the Board to provide annually the interest on the Debt, the annual instalments to the Sinking Fund for the re-payment of the amounts, and the ordinary maintenance, management and working expenses for the year, as required by the Act.

To give the Board relief an Amending Act was passed, the financial provisions of which repealed the Sections of the Principal Act dealing with the Capital Debt, provide for same being ascertained on a fairer basis to the 30th June, 1897, and that the Board shall not be compelled to repay for the works, but shall only be called upon to levy in each year such a rate as shall be sufficient to provide for (a) the year's interest on the Capital Debt, (b) the annual instalments to a sinking fund for the maintenance, renewal, and reconstruction of renewable works, (c) and the management and working expenses for the year.

The Act further includes a similar provision to that contained in the Country Towns Water and Sewerage Act, by which the Governor in Council is empowered to make such partial remission of or deductions from the Capital Debt, as he may think just under any special circumstances.

On the 26th June, 1899, the Board were furnished with the Capital Debt figures to the 30th June, 1897, as follows:—

Permanent and Renewable Works	£399,795
Capitalized Interest	£132,910
	<hr/>
	£532,705
Less the difference between the revenue and the expenditure of the Board since its incorporation	£58,928
	<hr/>
Capitalized debt at 30th June, 1897:—	£473,777

The Board, carefully considered the figures, reported fully on them to the Minister as required by law, and asked that the then Minister (the Honorable Charles A. Lee) would receive a deputation from the Board in reference to the matter. Mr. Lee granted the Board an interview at Newcastle, on the 21st July, 1899, and after going fully into the question promised to consider the representations made to him, and if possible to devise a scheme to enable the Board to carry on its business financially in a sound manner. On

On the 16th November last, a deputation was received by the Honorable E. W. O'Sullivan, Minister for Public Works.

At this interview the President explained that the Board were anxious that the figures in connection with the Capital Debt should be finally dealt with as soon as possible, but, before this was done, desired to put their case to the Minister. In August, 1897, the Board waited upon the then Minister for Public Works (the Honorable J. H. Young), and requested that he would reduce the debt by such a sum as would enable the Board to pay their way on the shilling rate at present struck, which is the maximum allowed by law.

Mr. Young said he would prefer to wait and see how much increased revenue the Amending Act would give, and that if it were found insufficient he would treat the Board as fairly and as generously as he had treated any municipality in the country.

The President then explained that the Board had now two years' experience of the working of the Amending Act, and found that even with the additional revenue that it gave, it would be impossible for them to pay their way. To comply with the Act the Board would have to provide annually:—

Interest on the Capital Debt (£473,777) at 3½ per cent.	£16,582
Instalments to Sinking Fund for renewals and reconstruction	4,288
Working Expenses	5,300
Management Expenses	4,200
Total Annual Expenditure	£30,370
The revenue had been carefully estimated as follows:—	
Water Rate, at 1s. in the £ (maximum allowed by law)	20,200
Meter Accounts	4,577
Special and Miscellaneous Fees	723
Estimated Annual Revenue	£25,500

From these figures it will be seen that if the debt as at 30th June, 1897, were fixed at £473,777, the result would be a deficiency of £4,870 on the year's operations. Since that date, however, the laying of the new duplicate suction and rising mains had been completed at a cost of £22,000, and vested in the Board. These works will involve an additional annual charge for interest and instalments to Sinking Fund of £1,030, and, whilst absolutely necessary, will not return a single penny of revenue.

It will thus be seen that unless the Capital Debt is considerably reduced the Board must face an annual deficiency of £6,000.

But the duplication of the existing 15-inch gravitation main from Buttai cannot safely be deferred much longer.* This duplication would involve an expenditure of from £80,000 to £90,000. The interest upon this sum and the necessary provision for renewal and reconstruction would increase the annual sum, which the Board would be required to find, by about £4,000. So that when this work was completed the deficiency would have increased from £6,000 to £10,000 per annum.

The President pointed out that the working of the Department had been fully inquired into by a Royal Commission whose report showed that the Board's management was efficient, that the maximum revenue was being collected, and that the expenditure could not be reduced if efficiency were to be maintained.

The Board, therefore, asked that the sum of £133,777 be written off and the capital debt (as at the 30th June, 1897) fixed at £340,000, so as to enable the Board to pay their way on the 1s. maximum rate now struck.

The Minister in reply said the position was a serious one, and something must be done. He recognised that the Board were, through no fault of their own, in a difficult position, and would lay the matter before the Cabinet.

The Board regret to have to report that the matter is still in abeyance, and respectfully urge that the promise made to them in August, 1897, by the then Minister (the Honorable J. H. Young) that "he would be prepared to treat the Board as fairly and as generously as any municipality in the country had been treated," should be carried out. There is every prospect of a sewerage scheme for Newcastle and suburbs being put in hand shortly, and the Board are naturally anxious that before they are called upon to strike a rate in connection with same the present unsatisfactory state of affairs in regard to water supply finance should be remedied.

SEWERAGE.

26. At the close of last year the Board had under consideration the scheme of sewerage for Newcastle and suburbs, designed by Mr. J. Davis, M. Inst. C.E., Chief Engineer for Sewerage Construction, a brief description of which is attached.

This

* See paragraph 19.

This report was sent to the Board for an expression of opinion as to whether, from a financial point of view, the scheme should be referred to the Parliamentary Standing Committee on Public Works for investigation.

The first step taken by the Board was to request the District Medical Officer of Health to furnish them with a report on the present sanitary condition of the areas proposed to be sewered, the prevalence of typhoid fever, phthisis, and other diseases which the construction of efficient sewerage works might reasonably be expected to prevent or mitigate.

Dr. Dick promptly supplied the Board with an able and exhaustive report, copy of which is submitted herewith. He has dealt very fully with the existing sanitary arrangements of the Borough of Newcastle, and the Municipalities of Hamilton, Wickham and Merewether, and has given statistics of the cases of phthisis, diphtheria, diarrhoea, and typhoid fever. Referring to these diseases he states:—

A consideration of the tables given discloses the fact that the typhoid fever death-rate and the attack-rate, and the diarrhoeal death-rate in the local centres, considerably exceed the rates which obtain in a completely sewered locality, such as the city of Sydney. As already stated, the prevalence of these two diseases is, to a large extent, influenced by insanitary conditions, such as are at present in the local centres, and these conditions are such as can practically be done away with in the most effectual way by the institution of a sewerage system.

Dealing with the existing municipal sanitary systems, he reports:—

As regards the present systems in use in the different localities, it may be said that in Merewether the methods generally adopted are entirely at variance with sound principles of hygiene. In Hamilton and Wickham, whilst the pail system is a marked step in advance, the question of the disposal of the slop waters (which are practically equally as foul as the sewage of a water-closeted town) remains to be satisfactorily dealt with. In Newcastle the present mixed system as regards the removal of the contents of pail-closets cannot be deemed to be by any means a good one. The patent pails which are connected with the drains are filthy contrivances. The present sewerage system, judging from a limited experience, appears to stand in need of much improvement in important particulars.

In concluding his report, Dr. Dick says:—

Considering the great benefits from a health standpoint which have resulted from the establishment of sewerage systems, as judged from the statistics given, it is reasonable to expect that similar benefits will follow the institution of an efficient sewerage system in the localities under review.

The Board next asked that Mr. Davis should come to Newcastle and explain his scheme personally. This request was readily complied with, and Mr. Davis dealt fully with the most important points such as the disposal of storm-waters, polluted yard waters, situation of the reticulation sewers, average cost of house connections, connecting houses with the sewers for ratepayers by the Board on a system of deferred payments, possibility of the pollution of the beaches adjacent to the outfall works, extension of the scheme to the outlying areas later on, and the system of discharging sewage in the ocean as compared with the biological and other systems of treating it.

With regard to the estimated capital cost of the works the Board pointed out that in the event of the scheme being carried out, they hoped the estimated cost would not be exceeded, and although they felt they could hardly expect the Minister to give a guarantee to that effect, they would be glad to have some assurance on the point, so as to prevent subsequent disappointment and dissatisfaction. Mr. Davis suggested that the object the Board had in view might be obtained by arranging that all the tenders for the works close at the same time, so that the total of the lowest tenders could be ascertained, when it could be seen at once whether the works could be carried out for the sum named in his report or not, and the Minister could then decide as to acceptance.

Mr. Davis also furnished the Board with a detail reticulation plan of the area to be sewered, which shewed that it was only proposed to sewer portions of Hamilton
and

and Wickham, and that no sewerage at all was provided for Carrington. The Board felt that the two Councils first referred to would find it awkward and expensive to be compelled to provide a sanitary service for the more scattered portions of the municipality not provided with sewers, and that the best results, from a health point of view, could not be obtained in any municipality whilst the two systems were in operation side by side.

It was therefore decided to ask that estimates of cost should be furnished for the necessary extensions to complete the sewerage of Hamilton and Wickham and to provide for Carrington. These estimates were duly furnished, together with a detail plan of the proposed reticulation extensions.

The estimated cost of the original scheme for the sewerage of Newcastle, Merewether, and portions only of Hamilton and Wickham is £75,308, and Mr. Davis estimated that a rate of 6½d. in the £ would be required; but pointed out, however, that he had not had the best opportunity of correctly estimating the revenue. The Board had the revenue carefully calculated by their officers, and after making an extra allowance for working and incidental expenses, it is found that a rate of 9d in the £, with a minimum charge of 10s. per annum for small properties, will be necessary. Taking the extended area (embracing practically the whole of Newcastle, Merewether, Hamilton, Wickham, and Carrington) it has been ascertained that the rate will be increased by 1d. in the £, making it 10d. in the £ with a similar minimum of 10s. per annum.

The report of the District Medical Health Officer places beyond all question the urgency of sanitary reform in Newcastle and suburbs, and amply demonstrates the necessity of an efficient sewerage scheme to supersede the existing defective arrangements. These merely provide for the removal of the nightsoil pans, no provision whatever being made for dealing with household slops and polluted yard waters.

Dr. Dick has drawn special attention to this serious defect in existing sanitary arrangements, and shews that the prevalence of preventable diseases is in a large measure due to it. The proposed scheme will, at a slight increase of cost over the pan fees paid at present, provide for the removal of all slops, polluted yard waters and faecal matter.

The necessity of a sewerage system having been proved, the Board next considered whether the proposed scheme was, from a financial point of view, within the resources of the district, and, believing that it is, it was decided to recommend to the Minister that the Extended Scheme should be referred to the Parliamentary Standing Committee on Public Works for investigation.

The reference to the Committee has now been made, and the Board hope that the result of the inquiry will be to give the ratepayers of Newcastle, Merewether, Hamilton, Wickham and Carrington an efficient and economical scheme of sewerage as soon as possible.

GENERAL.

28. The Board understand that a Bill to amend the Fire Brigades' Act will shortly engage the attention of Parliament, and desire, therefore, to again point out that as the water used at fires here has by law to be supplied free, practically at the expense of the ratepayers of the Hunter District, the Board are interested in seeing that the brigades are kept in a state of proper organization and efficiency, so that when fires break out the water is not wasted, and the mains and fittings are not injured.

In

In February last year the Board brought under the notice of the Chief Secretary the result of a special investigation made by Mr. Alfred Webb, Superintendent of the Metropolitan Fire Brigades, into the organization and working of the local fire brigades. Mr. Webb's report showed conclusively the need of better supervision and organization, and recommended that a proper Fire Brigades' Board should be established.

The Board asked that they should be represented thereon, and the Chief Secretary promised to give the matter consideration.

29. During the year the Board have again brought under the notice of the Minister a recommendation that their officers should have restored to them the opportunity of transfer to other Departments which they had before the passing of the Public Service Act, but which, no doubt by an oversight, that Act deprived them of. In order to accomplish this the Board do not consider it necessary or advisable that the control of their staff should be taken out of their hands by placing the whole of their officers under the Public Service Board, but think that arrangements could be made whereby deserving officers who may desire it could be transferred to other branches of the Public Service.

The Board have been favoured with a reply to the effect that certain amendments have been found necessary in the Public Service Act, and when the Amending Bill is being drafted the matter will receive consideration. The Board feel certain the justice of their recommendation will be admitted, and hope that the Amending Act will soon be passed, affording the opportunity to any of their officers who may desire it, of transfer to, and that promotion in the Public Service which they reasonably expected to have when they joined the Board's service.

30. The Board have during the year made inspections of the pumping station, Buttai, and several of the service reservoirs and pipe-line bridges.

31. Fifty-eight meetings of the Board were held, at which the attendances were as follows:—

MEETINGS OF THE BOARD FROM 1 JULY, 1899, TO 30 JUNE, 1900.

	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	April	May.	June.

10

Board's Offices, Newcastle, 29th September, 1900.

ALFRED E. FRY,
Secretary and Accountant.

Report of Assessor's Branch for year ending 30 June, 1900.

I HAVE the honor to submit a report of the work of this branch during the year ending 30 June, 1900.

RATE NOTICES.

During the year 33,606 notices have been served upon ratepayers, including those for new mains, new assessments, special fees, and final notices, for overdue rates.

REVENUE STRUCK.

The total amount of revenue struck for the year was £26,356 13s. 6d.

REVENUE COLLECTED.

The revenue collected for the year was £30,252 4s. 4d., the total receivable for the year with arrears from previous years was £37,163 4s. 6d., leaving outstanding at 30 June, 1900, £6,914 0s. 2d. The Board's officers have been in attendance for the collection of rates on specified days at the several Municipal Council Chambers, for the convenience of ratepayers.

PROPERTIES RATED AND SUPPLIED AT 30 JUNE, 1900.

At 30 June, 1900, there were 14,030 properties rated, namely, 2,301 unimproved land, 3,303 properties unconnected, and 8,423 properties connected with the Board's mains, showing an increase of 106 charged at 30 June, 1900.

SUMMONS WORK.

During the year 5,011 final notices have been served, 591 summonses, and 58 executions issued.

METER HIRE.

During the year 138 Board's meters have been hired by private consumers, making a total of 726 since the inception of the hire system.

METERS AT 30 JUNE, 1900.

1,235 meters were on private supplies at 30 June, 1900, showing an increase for the year of 47 during the year, and 120 meters have been tested.

DEFERRED PAYMENTS.

During the year 71 ratepayers have availed themselves of the deferred payment system, of connecting their premises with the Board's mains, making a total of 679 since the inception.

FREE SUPPLY.

Hospitals...	1,037,000 gallons.
Fire Stations	53,500 "
Churches	32,900 "
Parks	38,500 "
Mechanics Institutes	9,800 "
Benevolent Asylums	789,700 "
Total	1,961,400 gallons.

Detailed returns attached.
The Secretary.

P. de MESTRE HART,
Assessor, 7/9/00.

Rates and Charges for Water in force for the year ending 30 June, 1900.

1. Water By-laws Nos. 1, 2, 3, 4, 5, 6, 7, 8, and 9, published in the *Gazette* of 18th August, 1899, are hereby repealed, and the following By-laws shall be substituted in lieu thereof: Provided that such repeal shall not prejudice or affect the payment or recovery of any rate, charge, or sum now due under the repealed By-laws.

2. The following shall be the rate to be paid in respect of property ratable for water supply, whether such property is connected with any main, or is otherwise supplied with water by the Board or not.

WATER RATES ON PROPERTY.

- (I.) Where the land or premises are of the assessed annual value of Ten Pounds or under, Ten Shillings per annum. Lands and Premises.
- (II.) Where the land or premises are above the assessed annual value of Ten Pounds, a rate of One Shilling for each pound sterling of the amount of the assessed annual value.
- (III.) Where the land or premises, on which no building is erected for human habitation, are of the assessed annual value of Five Pounds or under, Five Shillings per annum.
- (IV.) Where the land or premises, on which no building is erected for human habitation, are above the assessed annual value of Five Pounds, a rate of One Shilling for each pound sterling of the amount of the assessed annual value.
- (V.) Vacant lands of the assessed annual value of Ten Pounds and under, a rate of Three Shillings and Fourpence per annum; and on all such lands above the assessed annual value of Ten Pounds, Fourpence for each pound sterling of the amount of the assessed annual value. Vacant lands.

WATER SUPPLIED BY MEASURE.

Supply to
property by
measure.

3. Unless otherwise determined by special agreement between the Board and the consumer, the charge for water supplied by measure shall be Two Shillings per 1,000 gallons. The minimum quantity of water to be charged for where water is so supplied shall be the quantity which, calculated at the charge prescribed by the By-laws, amounts to the rates paid in respect of the property.

CHARGES IN ADDITION TO RATE ON UNMETERED SERVICES.

Special fees.

4. The following shall be the charges to be paid in addition to the rate in respect of property where water is used for other than domestic purposes, and the supply is not through a meter, and are hereinafter referred to as Special Fees.

Trade purposes.

(I.) The Special Fees for water supplied for:—

Photography and any like process shall be...	...	10s. per annum.
Tripe cleaning	10s. "
Tyring purposes	20s. "
Small goods (sweets)	10s. "
Waterfalls and fountains	20s. "
Shop fronts, by hose	20s. "
Organ motors and such-like mechanism	4Cs. "
Washing vehicles, by hose	10s. "
Washing yards, by hose	20s. "

Vehicles.

Yards.

(II.) All Special Fees shall be payable in advance.

Nozzle and
waste pipes.

5. No person shall use water in connection with any Motor unless the nozzle supplying such Motor has been first approved of by the Board. The waste-pipe from each Motor shall be so fixed that the waste water can be measured at any time.

Gardens.

6. The charge for water supplied for watering gardens or lawns, by hose, shall be at the rate of Five Shillings per annum for every five hundred square feet, superficial area, or part thereof, and Two Shillings and Sixpence for every additional two hundred and fifty square feet, superficial area, or part thereof.

Meters may be
insisted upon.

7. In all cases where special fees are charged, the Board reserve to themselves the right of insisting upon a Meter being fixed at any time, notwithstanding the fact that the Special Fee may have been paid.

Building
charges, &c.

8. (I.) The charge for water supplied for building and plastering purposes, for buildings to be used either wholly or partly as dwelling-houses, shall be at the rate of One Half-Penny per cubic yard on the cubical contents of each building. The Board will supply water for all other buildings, either by meter or at the rate above mentioned per cubic yard on the cubical contents of each building, as the Board shall determine: Provided that before any water shall be used through meter for building purposes such meter shall be submitted to the Board in each case for examination, and must pass the sensitive test; and the minimum quantity of water to be charged for where water is so supplied shall be Twenty Thousand Gallons.

(II.) The charge for water supplied for plastering rooms and for the building of wash-houses, water-closets, coppers, and chimneys only shall be Two Shillings and Sixpence each.

(III.) The charge for water supplied for the making and mixing of concrete for foundations of wooden blocks, stone cubes, or other form of permanent roadway or pavement, shall be at the rate of Three Pounds per 1,000 square yards, by superficial measurement of road surface; and for all other concrete, brickwork, or masonry, at the rate of Sixpence per cubic yard, as measured on the work.

Premises where
horses and cows
kept liable to
extra rate.

9. All lands or premises actually supplied with water by the Board, on which any one or more head of horses or cattle shall be kept or maintained, shall be liable to an extra rate or charge (beyond and in addition to the rates hereinbefore imposed) of Five Shillings per head for each head of horses or cattle kept or maintained on such lands or premises. Where such lands or premises are not actually supplied with water by the Board, they shall be liable to an extra rate or charge (beyond and in addition to the rates hereinbefore imposed) of Two Shillings and Sixpence per head for each head of horses or cattle kept or maintained on such lands or premises.

Board Engineer's Report.

Sir,

Newcastle, 14 September, 1900.

I have the honor to submit my report relating to the Water Supply for the year ending 30th June, 1900.

QUANTITY OF WATER SUPPLIED.

A constant supply of water at a satisfactory pressure was maintained in the reticulation water mains throughout the Newcastle and Maitland districts during the year. The total quantity of filtered water pumped to the distributing reservoirs was 331,651,180 gallons, being an increase of 14,476,044 gallons over the quantity pumped during the preceding year; the total quantity of unfiltered water pumped to the settling tank from the river and the storage reservoir, and to the storage reservoir from the river, amounted to 598,651,124 gallons, an increase of 42,863,307 gallons.

The number of properties exclusive of vacant lands liable for water rate, amounted to 11,729 at the close of the official year, representing an approximate population of 58,615 persons contiguous to the water mains. The number of these properties actually connected to the water mains was 8,423, estimated to contain 42,115 inhabitants; 520 houses were connected to the water mains during the year. The total population of the municipal and other areas reticulated with water mains is estimated to be about 61,480, many of these, however, reside in houses beyond reach of the water pipes.

The average daily consumption of water per inhabitant of the 8,423 properties connected to the water mains was 21.37 gallons, as against 21.94 gallons for the preceding year. Averaging the daily consumption separately for the Newcastle District (comprising city of Newcastle, suburbs, and mining townships), and the Maitland District (comprising East and West Maitland, Morpeth, &c.), the former gave 23.95 gallons per head, and the latter, 13.01 gallons per head. The

The quantity of water supplied by meter to sixty-six large consumers, such as railways, collieries, shipping, breweries, and factories of various kinds, was, for Newcastle District, 94,715,400 gallons, and for Maitland District, 3,053,200, together making 97,768,600 gallons, and equal to 29·5 per cent. of the total consumption. The remaining 70·5 per cent. was the consumption for domestic purposes, street watering, small gardens, stock, &c., and averaged 16·03 gallons per head, per day in the Newcastle District, and 12·12 gallons per head, per day in the Maitland District.

The consumption of water by railways, factories, &c., abovementioned, shows an increase of 13,759,180 gallons over previous year's record, and this increase is about thirteen fourteenths of the total increase recorded for the year.

The water supplied by the Board is hard, and consequently house holders store rainwater and use it for laundry and similar purposes for which soft water is preferred. The actual consumption of water by the inhabitants is therefore greater than that stated above.

Particular attention was given throughout the year to the prevention of waste of water from consumers' pipes and fittings. The practice of re-washing taps by the Board's employees without charge to consumers, inaugurated during the preceding year, was continued. The total number of taps re-washed was 1,422, as against 854 for the preceding year.

WALKA PUMPING STATION.

The pumping machinery has been maintained in first-class order; working parts exposed to view during annual overhaul I found to be in very satisfactory condition, showing the good original workmanship, and the care in maintenance exercised by the Engineer-in-Charge, Mr. E. Hackett.

The cost of pumping 1000 gallons 100 feet high at Walka Pumping Station was 430 pence, showing a slight increase on 427 pence, the cost for the previous year. There was an increase in the wages and in the price of coal.

QUALITY OF THE WATER.

The filter beds at the Walka Waterworks performed their work satisfactorily. The results of analyses of samples of the filtered water sent monthly to the Board of Health showed the water to have maintained its good character; on the whole, it was slightly better than the previous year. The filtered water ranged in hardness from 14 degrees to 19 degrees, Clark's scale. The river water varied in hardness between wider limits, viz., from 6 degrees during freshets to as high as 21 degrees during dry weather. The periodical examination of the storage water showed a slight deterioration in quality as compared with the previous year; this would probably be accounted for by the slight disturbance caused by the dredging done in the reservoir. It was found necessary to construct a roof over the clear water tank to exclude sunlight from the freshly filtered water, and, in this way, prevent the growth of aquatic vegetation, the removal of which had previously been a constantly recurring expense. The completion of the roofing satisfactorily accomplished the object sought.

PIPE LAYING.

New watermains laid during the year comprised 1 mile 557 yards 3-inch, 1177 yards 4-inch, and 87 yards 6-inch, together making a total length of 2 miles 61 yards. The work was carried out by day labour. The total length of reticulation water mains of all sizes laid by the Board during the past eight years is 38 miles 800 yards.

MAINTENANCE OF PIPE LINES.

The long suction pipes at Walka Pumping Station, the rising mains to East Maitland and Buttai Reservoir and the gravitation main from the latter to Newcastle were all maintained in good working order. Leaks at the joints along some parts of the steel rising main at West Maitland have been somewhat frequent caused by the lead shifting under the pressure. The maximum working capacity of the above system of piping has not yet been reached, but is being closely approached in dry summer weather, and, to meet probable further demands for water in the Newcastle District, measures for improving the supply from Buttai Reservoir will require consideration.

The decay of the cast-iron water mains in certain parts of the reticulation of Newcastle suburbs and mining townships continues to give trouble. The work of raising that portion of the 6-inch main pipe line to Minmi where the pipes passed through swampy ground and were badly decayed was carried out during the year, and the pipes are now out of reach of the corroding agencies. A strong leak which took place in the 15-inch gravitation main at Brook's Swamp, Plattsburg, was found when the pipe was exposed for repairs to be due to decay of the cast-iron. Subsequent examination of the other portion of the pipe line at this place and at Racecourse Swamp showed decay of the metal to be taking place irregularly along the bottom of the pipes where laid below swamp surface level. It was decided to lay a new line of piping above the ordinary level of swamp and subsoil water to supersede the sections where the metal is very corroded. Spare 15-inch pipes in stock were specially coated with tar composition for this work and preparations for a start made, but the winter rains coming on, operations at the swamps had to be suspended.

STORAGE RESERVOIR.

The dredging operations over the bottom of the reservoir which were started at the close of the previous year, were continued until the worst area had been dealt with when operations were suspended. In some cases thick sludge to the depth of 3 feet was removed. The average working cost per acre for the 8½ acres treated was £11 3s 7d. The plant now provided for cheaply removing sludge from the bottom of the reservoir affords the means for materially assisting in improving the quality of the water therein, and a resumption of operations at an early date is desirable. The reservoir was kept well filled throughout the year. The river water pumped in amounted to 252,506,532 gallons; about 44,700,000 gallons were discharged through the main scour pipe, and an estimated amount of 18,000,000 gallons through the dredge discharge pipe. Rainfall draining from the catchment area of the reservoir and water pumped in from the river caused the contained water to range in hardness between 14 and 19 degrees of Clark's scale.

RAINFALL AND RIVER.

The rainfall on the watershed of the Hunter River above the intake of the Walka Waterworks exceeded the fall recorded for the previous year.

From reports furnished by the Government Astronomer, the following information respecting the rainfall during the year ended June 30, has been compiled.

CATCHMENT

CATCHMENT AREA.

Cassilis	25.58 inches.	Singleton	36.45 inches.
Denman	22.69 "	Wingen	31.26 "
Merriwa	22.60 "	Broke	29.81 "

WATER SUPPLY DISTRICT.

Newcastle	64.16 inches.	Maitland	41.59 inches.
------------------	---------------	-----------------	---------------

The level of the Hunter River at the gauge on Belmore Bridge, West Maitland, is read and recorded once daily, Sundays excepted; during freshets and floods when the level varies rapidly the gauge is read two or three times daily and the maximum flood height recorded. This practice has been followed since the big flood of 1893.

During the past year the principal rises in river level were as follows:—July 13th to 18 feet, August 2nd to 14 feet, fell to 4 feet 9 inches on the 12th, rose to 16 feet on the 13th, fluctuated about this height until the 23rd, when flood conditions prevailed, and the level rose to 32 feet at 4 p.m. on the 26th August, then gradually subsided to ordinary level in September. From this month until June, 1900, the river level remained practically stationary. A rise commenced on June 8th, 19 feet was reached on the 11th, and the level then fell to 6 feet 6 inches on June 30th.

The quality of the river water is largely influenced by the prevalence or absence of rainfall over the catchment area, particularly the hardness. Samples of river water taken in July after rainfall showed a total hardness of 6 degrees, of which 4 degrees were permanent hardness. During the dry period which followed, the hardness of the river water rose to a maximum of 21 degrees in March, of which 11 degrees were permanent.

The sudden variation which rainfall causes in the quality of the river water interferes with the proper action of the filter beds. The bacteria which effect the purification work best under uniform conditions. These conditions are upset by the sudden advent of floods and freshets. Whilst these changes cannot be avoided, the management of the works is so arranged as to moderate these effects as much as is at present practicable.

Tabular statement of operations, results, and comparisons are annexed, also a plan showing the watershed of the Hunter River above the waterworks intake at Walka.

J. B. HENSON, Assoc. M. Inst. C.E.

Board Engineer.

The Secretary.

Results of Analysis of Water.

Tabulated from Reports by W. M. Hamlet, F.C.S., F.I.C., Government Analyst, Sydney.

Description of monthly samples as numbered in column 3 :—No. 1, Storage Reservoir, Walka; No. 2, Settling Tank, Walka; No. 3, Clear Water Tank, Walka; No. 4, Tap, Board's Office, Newcastle; No. 5, Tap, Hydraulic Power-house, Carrington; No. 6, Hunter River at intake, Walka. Nos. 1 and 6 are raw waters; No. 2 is raw water specially aerated for immediate filtration, and may be No. 1 or No. 6, or a mixture of both. No. 3 is No. 2 after it leaves the filters. Nos. 4 and 5 are the filtered water as supplied to consumers, and are taken from the water-mains at points distant over 20 miles from the filter beds.—J.B.H.

Description of Hunter District Water Works at
30 June, 1900.

The supply of water for the district under the control of the Board is pumped from the Hunter River, at the apex of the Hunter River Delta, about $1\frac{1}{2}$ miles up stream from Belmore Bridge, West Maitland. Between this point and the sea coast at Newcastle the river is subject to tidal influence, and the water is unfit for domestic purposes.

The drainage area of the Hunter River above the intake is 7,090 square miles, on which the average annual rainfall is about 25 inches.

The Hunter River and its principal tributary, the Goulburn River, rise in the Great Dividing Range. There are no permanent snow-fields on the mountains, and no lakes in the valleys. The river for about 50 miles of its course above West Maitland, where it is at about sea-level, has an average surface grade of 2 feet per mile, and consists in ordinary summer weather of long reaches of deep still water separated by gravel and rock bars, over which the water rushes; it is subject to floods which at times are severe and destructive, and prolonged droughts have been known during which it is said the flow of water was so much diminished as to be scarcely observable. The immense stores of water in the long deep pools would afford an inexhaustible supply should the river actually cease running during a prolonged drought.

A natural bar of gravel extends across the river immediately below the intake, and is the limit to tidal influence. From this bar up stream there extends a long reach of deep water.

The greater part of the drainage area consists of sedimentary strata of Carboniferous and Permo-Carboniferous age. In the north-west, along the Liverpool Range, there is an extensive area of eruptive rocks, and isolated masses of similar rock are distributed over the eastern and north-eastern parts of the river basin. The Hawkesbury sandstone measures extend into the valley from the south at its extreme western end, and cover a fair extent of country. These measures overlie the Carboniferous beds, and afford a superior class of soft water, but are too remote for their capabilities in this respect to be directly availed of. Limestone is comparatively rare; a few isolated outcrops of limited area occur in the valley of the Upper Hunter. The lime and magnesia, which cause the hardness of the river water, together with salt, are probably derived mainly from the marine beds of the Permo-Carboniferous measures.

The productive coal measures of the Hunter Valley extend over a considerable portion of the contributing drainage area, but actual coal-mining operations are at present of a limited extent above the intake. In course of time, no doubt, a greater development of this industry will take place, and precautions will have to be taken to prevent pollution of the river water, especially at periods of minimum flow. The principal coal workings of the Hunter District are situated between Maitland and the coast.

The river water is moderately hard, but the dissolved substances contained in it vary from time to time with the rainfall over the drainage area, increasing in time of drought, partly to the long continued evaporation, and partly to the streams being principally fed with spring and subsoil water, which in its passage through the ground has become charged with soluble minerals. In times of flood, although the amount of material washed down by the current will show a large increase in the suspended matter, yet the dissolved matter is not so noticeable, owing to the greater dilution over a given volume of the water.

The number of persons now settled on the drainage area is approximately 30,000, which gives 4.23 persons per square mile. The Board have jurisdiction over the river for a distance of 20 miles above the intake, and frequent inspections are made for prevention of pollution. There is comparatively little settlement of population in the neighbourhood of the river along this length.

The scheme of water supply was originally designed by the late W. Clark, M. Inst. C.E., in the year 1877, and it provided for the requirements of the City of Newcastle and suburbs, and the municipalities and townships on the southern side of the Lower Hunter River from the sea coast to West Maitland. Its construction, with some modifications in the details, was commenced by the Government in the year 1879.

Towards

Towards the end of 1885 an urgent demand for water arose in the Newcastle District, caused by a prolonged drought, and the main pipe lines being completed, a temporary pumping plant was erected at the intake on the Hunter River, and water was in this way first delivered into Newcastle on 23 November, 1885. The temporary pumping plant was kept almost constantly at work until January, 1887, when it was superseded by the permanent pumping engines.

The Hunter District Water Supply and Sewerage Board was formed and took control of the water-works on 1 July, 1892. During the eight years which have elapsed extensions and improvements to the works have been effected.

The pumping engines are situated above flood-level on a hillside about 44 chains back from the right bank of the river. The pumping plant consists of three independent Woolf compound beam pumping engines of about 150-horse power each. Two engines are designed to force water to the summit reservoirs; each works two main pumps of the bucket and plunger type—one pump, having 19-inch bucket and 14 $\frac{1}{2}$ -inch plunger, is at the crank end of the beam, and the other, having 15-inch bucket and 10 $\frac{1}{2}$ -inch plunger, is at the cylinder end of the beam. The third engine is designed to raise water from the river, or the storage reservoir, to the settling tank, or to raise water from the river to the storage reservoir as required. It works three main pumps; two, having 21 $\frac{1}{2}$ -inch buckets and 15-inch plungers, are placed one on each side of the beam centre; the third pump is double-acting, having a pump barrel 24 inches diameter, and is worked from a supplementary beam linked to a cross-head on the pump rod of the pump at engine side of main beam centre. This third pump was added in 1896, and is designed mainly to pump water from the Hunter River to the storage reservoir. Each engine averages thirteen to fourteen revolutions per minute, and all the pumps have a uniform stroke of 4 feet 6 inches.

There are two river suction pipes, each 44 chains in length; one is 18 inches diameter, cast-iron; the other 20 $\frac{3}{4}$ inches diameter, riveted steel plates.

The boiler-house contains five 50-horse power Lancashire boilers, two of which ordinarily supply sufficient steam for the engines. A coal store is attached, having a capacity for 120 tons. A residence is provided for the engineer in charge, and five cottages for workmen.

At the pumping station are a settling tank of 1,390,500 gallons capacity, which receives the water pumped from the river; four filter-beds, 100 feet by 100 feet each; a covered clear water tank of 589,500 gallons capacity; and a storage reservoir of 172,403,100 gallons available capacity; all except the clear water tank are uncovered. The storage reservoir has been formed by constructing an earthen embankment with puddle core across an old lagoon. It contains a reserve supply of clear water, which is resorted to when the river-water is turbid, and is replenished by rainfall on its catchment area of 200 acres, and by water pumped up from the river.

Water is pumped into the settling tank, from which it descends to the filter-beds; the filtered water is collected in the clear-water tank.

The filtered water is pumped from the clear-water tank into two summit reservoirs—one at East Maitland and one at Buttai. The latter is on the top of a range about 5 $\frac{1}{2}$ miles distant from the pumps. These reservoirs are built of brick and concrete, and are covered over.

East Maitland Reservoir is supplied through a 10-inch cast-iron rising main, 4 miles 310 yards in length, and has a capacity of 463,430 gallons. It commands East Maitland, West Maitland, Morpeth, and neighbouring places.

There are two rising mains to Buttai Reservoir—one riveted steel pipe 20 $\frac{3}{4}$ inches diameter, common to both, extends from the engine-house a distance of 155 yards, then it bifurcates, one line continues as a 20 $\frac{3}{4}$ -inch riveted steel pipe—the other is a 15-inch cast-iron pipe. The length of the line of rising mains from the pumps to Buttai Reservoir is 5 miles 983 yards.

Buttai Reservoir has a capacity of 1,051,010 gallons. The district commanded comprises the following places:—City of Newcastle, Carrington, Wickham, Hamilton, Waratah, Merewether, Adamstown, New Lambton, Lambton, Wallsend, Plattsburg Minmi, and Cockle Creek.

There are six district reservoirs which are supplied by gravitation from Buttai Reservoir, and receive the water for distribution. Their location and respective capacities are as follows:—

Minmi, 62,209 gallons; Hamilton, 402,909 gallons; Wallsend, 452,472 gallons; Newcastle, 523,613 gallons; Lambton, 402,610 gallons; Obelisk Hill, Newcastle, 137,125 gallons. All these reservoirs are built of brick and concrete, and are covered over.

The gravitation main from Buttai Reservoir to Newcastle is cast-iron, 15 inches diameter, and 17 miles 762 yards in length. On the hill at Newcastle there is a high-level tank constructed of iron on timber supports, which has a capacity of 20,000 gallons; it is supplied with water by a small duplex steam-pumping engine placed on the roof of Newcastle Reservoir.

A cottage is provided for the caretaker in charge of the three reservoirs at Newcastle, and similar provision is made for caretakers at each of the other reservoirs.

The length of mains now under the Board's control are as follows:—

Brief description of the Scheme proposed for the Sewerage of Newcastle and Suburbs by Mr. J. Davis, M. Inst. C.E., Chief Engineer for Sewerage Construction, Department of Public Works, N.S.W., dated 5 January, 1899.

THE scheme is designed ultimately to embrace the whole of the City of Newcastle, Merewether, Hamilton, and Carrington and the greater part of Adamstown, Lambton, New Lambton, Waratah, and Wickham, covering an area of 4,656 acres, on which the estimated ultimate population for which provision has been made in determining the capacity of the sewers is 138,660 persons; the present population is 40,548.

It is, however, proposed at first to construct only a portion of the scheme to provide for the more densely inhabited areas.

The districts to be thus sewered comprise the whole of the City of Newcastle, nearly the whole of the Municipality of Merewether, considerable part of Hamilton, and a small part of Wickham, covering in all an area of 1,222 acres, having an estimated present population of 23,000; the estimated ultimate population is 46,380.

Of the 1,222 acres comprised within the first division of the scheme, 867 acres are to be drained by gravitation, while the sewage of 355 acres will require to be pumped. In that portion of the scheme left for future extension 2,056 acres can be drained by gravitation and 1,378 acres of low-lying lands will need to be dealt with by pumping.

The scheme advocates the adoption of the Water Carriage Separate System of Sewerage. The distinguishing feature of this system is the rigid exclusion of rain-water aimed at—the sewers being restricted to the conveyance of sewage only. The dimensions of the sewers and works and the volume of the sewage to be disposed of are each by this system reduced to the minimum.

The sewers have been designed of sufficient capacity, running not more than two-thirds full, to carry off 50 gallons per head of population per day, one-half running off in six hours.

It is proposed to discharge the sewage into the ocean after it has been carefully screened, and all paper, fruit-peelings, and other solids arrested. This method is simple and will entail the least expense, but if it should be eventually found necessary, by reason of pollution of the beaches, to put a stop to the discharge of screened but otherwise untreated sewage into the ocean, the design provides for the construction of tanks near the outfall into which the sewage, having previously been mixed with lime, will pass, and deposit the greatest part of the offensive matter before it finally flows into the ocean. Nothing but actual experience can determine whether in this particular case the discharge of crude sewage into the ocean will or will not be a success, and one of the advantages of the position chosen for the outfall is that if it be not a success the method of disposal can be altered at the least possible expense.

The outfall is on the coast, about one-eighth of a mile north-easterly from Merewether Beach. At this point flat rocks extend out from the coast for more than 200 feet. A suitable inlet exists here in which there is deep water, and the sewer will be led to this as a point of discharge. Rocks, submerged at high water, run out from the inlet for a considerable distance, which will have a tendency to assist the flow of sewage seawards. A tidal flap will be provided where necessary.

The outfall sewer, constructed of concrete with dimensions 5 ft. by 3 ft. 6 in., begins at the point on the coast above-mentioned, and runs in a south-westerly direction to the screening chamber near the intersection of Darby and Junction Streets, at which latter point the two main sewers join.

One of these sewers, 3 ft. 3 in. by 2 ft. 2 in., extends northerly, and, with subsidiary sewers, provides for the reception of the sewage from the northern portion of the City of Newcastle and Hamilton and the part of Wickham embraced in the first division of the scheme, also provides for the ultimate reception of the sewage from the whole of Carrington and additional portions of Wickham and Hamilton. The other sewer, 4 ft. by 3 ft., will extend westerly, and, with subsidiary sewers, provides for the sewage from the western suburbs—Merewether, Adamstown, New Lambton, Lambton, Waratah, and parts of Hamilton and Wickham. As, however, these districts, with the exception of Merewether, are not included in the first division, it is intended to provide for the present requirements of Merewether by laying a 16-inch pipe, which will be replaced by the larger sewer referred to above when the occasion demands it.

Reticulation sewers for that portion of the district proposed to be dealt with at once consist of 5 miles $14\frac{1}{2}$ chains of 9-inch pipes and 19 miles $72\frac{1}{2}$ chains of 6-inch glazed stoneware pipes, with 472 man-holes. In locating reticulation sewers, great attention has been given to the question of economy in house connections; and with this end in view many of the sewers are designed to run through the blocks instead of in the streets. The report states this arrangement will lead to a very considerable saving to individual owners when connecting their properties with the sewers.

Two pumping stations will be required to deal with the sewage from the low-level areas laying within the first division of the scheme. One will be located near the corner of Brown and King Streets, and the other near the intersection of Cottage Creek storm-water channel with Landford-street. These pumping stations will consist of subterranean cast-iron cylinders, provided with chambers for the reception of sewage. The sewage will be raised from the cylinders into the gravitation sewers by means of pumps driven by electric motors. At No. 2 Station—viz., the one situated at Cottage Creek—a power-station will be installed for the purpose of generating electricity for the electric motors. It is proposed to install the electrical plant on what is known as the three-phase system, and the cables will be carried overhead on poles.

The estimated cost of that division of the scheme now proposed to be carried out is £75,308 12s. 6d. annual interest and repayment (in 100 years) will be £2,723 2s., the working expenses £2,109 5s., making together the annual cost £4,832 7s.

The total annual value of property within the area covered by the first division is estimated at £177,000; consequently, the rate necessary to cover interest, repayment, and working expenses will be about $6\frac{1}{2}$ d. In

In the event of experience showing the necessity of abandoning the method of turning crude sewage into the ocean, and, consequently, some form of treatment being required, these estimates will have to be modified thus:—Capital cost, £89,130 2s. 10d.; interest, and repayments in 100 years, £3,222 10s.; working expenses, £3,510 1s.; making together the annual cost £6,732 19s. As before, the annual value of property sewered is taken at £177,000; hence a rate of about 9d. in the £ will be necessary to cover interest and repayments and working expenses.

Short Note by Dr. Robert Dick, M.B., Syd., D.P.H., Camb., Medical Officer of Health for the Hunter River Com- bined Sanitary District, on the present systems in vogue for dealing with Sewage Matters in the localities con- cerned.

NEWCASTLE.

A fairly extensive sewerage system is in existence. This was originally constructed for conveying away surface waters and household slops, but some 830 water closets are at present connected with the sewers. A fee of 10s. for each closet per annum is charged by the council. The sum of £380 was received from this source during 1898.

In addition to the water closets there are in use some 1,900 pails, and 220 cesspits exist.

As Regards Pail Closets.—Householders are required to supply their own pails, which must be of specified size. The municipality provides scavengers. The sum of 9d. is charged per removal, if done at irregular intervals, and 7d. if removed weekly or fortnightly. Very few pails are emptied at these shorter intervals—about $\frac{1}{10}$ of the number are emptied weekly, $\frac{1}{10}$ fortnightly, and the remainder at much longer intervals. In a few cases, probably about 20, a type of pail exists which is so constructed as to allow fluids to pass through perforations at the bottom or sides to the drains. When the pail becomes full, which it does at long intervals; the contents are removed by the scavenger.

Fæcal matter collected from pits and pails is disposed of by being punted to sea, as a rule twice weekly, in the meantime being stored at a depot in tightly closed wooden tanks.

As Regards Drains.—There are a number of premises—some 500—without drains. In these cases house slops are disposed of by being cast about the yard areas. In other cases where pail closets are provided and where water closets are present, provision is made for the removal of slop and surface water by means of drains. The yard gullies in connection with these channels have been noticed in many cases to be of antiquated and inefficient types. During the last nine months opportunity has occurred for examining the condition of a limited number of drains, which have been tested and found imperfect, and serious defects were found in connection therewith.

There are eight ventilating shafts only attached to the sewers of the city. It appears the exception for drains to be disconnected from the sewers, and water closets are rarely provided with anti-syphonage or ventilating pipes.

Mode of Discharge of the Sewage.—A small quantity from the highest parts of the city is discharged into the ocean; the main bulk, however, flows into the harbour. Certain of the effluents, owing to their position, lead to considerable fouling of the foreshores in the vicinity.

HAMILTON.

A duplicate pail system, with a fortnightly service; about 100 pails are removed weekly, and 25 twice weekly. The charge for fortnightly removal is 9s. per annum, and *pro rata* for a more frequent service. About 14 cesspits still exist.

Excrement is disposed of by burial at a depot situated within the municipality. This depot appears suitable for present purposes, but, undoubtedly, with increasing settlement towards Newtown, will have to be abandoned. The yard areas in the more densely populated part of the municipality are very small. Householders are not allowed to dispose of slop waters by running them into the street gutters. The want of an efficient method to get over the slop water difficulty is keenly felt in this municipality.

WICKHAM.

The present duplicate pail system has been in vogue for the past six years. Pails are removed at weekly intervals, about 20 of them bi-weekly. The charge is 12s. per annum for the weekly removal. Pails are provided by the council. There are still about 200 cesspits in existence.

Excrement is disposed of by burial at a depot situated within the municipality, but removed some distance (quarter mile) from the nearest settlement.

There is no system of drainage apart from street gutters. Householders make use of these for getting rid of the slops.

MEREWETHER.

In this municipality there is no uniform system for dealing with excrement. A few of the residents who live near the Hamilton boundary take advantage of the Hamilton sanitary service. A fairly large number of cesspits are in existence; where these are not present, pails are used for the reception of excrement. In the absence of a regular system of scavenging householders are obliged to dispose of the contents of pail closets, and this they do by burial on their own premises. The pails for the reception of excrement are in many instances of an unsuitable type, and, as a result, pollution of the ground in and around the privy takes place.

In this municipality underground tanks are not at all infrequent as sources of water supply. These tanks are in many cases poorly constructed and covered, and with no provision made to prevent the inflow of ground waters. The burial of excreta—normal as well as infectious—on premises where under-ground

under-ground sources of water supply are made use of, is not by any means a safe procedure. A householder will, as a rule, endeavour not to endanger his own water supply, but he does not always extend to his neighbours the same consideration.

The street gutters are the only channels provided for conveying away surface and slop waters.

STATISTICAL EVIDENCE.

In attempting to judge of the health conditions of communities by statistical evidence importance is given to the following points, amongst others:—The corrected death rate, death rate from typhoid fever, diphtheria, diarrhœa (zymotic diseases), phthisis death rate, infantile mortality rate (number of deaths under one year, per 1,000 births).

The diseases typhoid fever, diarrhœa, and diphtheria are those the prevalence of which depend to a considerable extent on faulty sanitary states, and a high death rate from these affections may be taken as indicative of the presence of insanitary conditions.

The phthisis death rate, if excessive, indicates dampness of soil, unhealthy workrooms, and overcrowding of tenements.

The infantile mortality rate is influenced by the prevalence of the epidemic diarrhœa, the occurrence of epidemics of whooping-cough and measles, and by a want of proper care and management on the part of mothers.

In addition to the death rate, the sickness rate is a very important factor to be taken into consideration, for it is clear that the number of deaths from a particular disease by no means represents the total number of cases of that affection which may exist. Under the provisions of the Public Health Act, the diseases typhoid and diphtheria have been made notifiable diseases since January, 1893, so that it is now possible to obtain definite information as to the prevalence of these maladies. Where conditions exist which are favourable to the development and spread of typhoid and kindred diseases, there we should expect to find the most cases, but not necessarily the greatest number of deaths, for the death rate may vary according to the type of disease and other factors. Hence the importance of considering the attack rate.

Points to be taken into account in calculating and comparing rates.

Correct estimate of the population is necessary. The population figures given are taken from the Statistical Registers. In comparing death rates certain corrections need to be applied, such as for differences as regards age and sex distribution, and the exclusion of the deaths of non-residents who have died in public institutions in a district, and the inclusion of residents who have died elsewhere. This correction has as far as possible been made so far as Newcastle and other places are concerned, but the same cannot be said of the Sydney rates except for the year 1898.

POPULATION and General Death Rate per 1,000 of the Population for the Years 1895–1898.

	1895.		1896.		1897.		1898.	
	Popula- tion.	Death- rate per 1,000.						
Newcastle	13,500	13·30	14,800	12·16	15,150	10·75	15,700	10·50
Hamilton	5,200	10·38	5,200	11·70	5,350	12·15	5,420	11·20
Merewether	4,350	16·70	4,420	14·70	4,470	10·51	4,450	15·90
Wickham	6,650	13·30	5,650	10·80	5,900	11·60	6,100	16·50
Sydney (City)	101,935	16·51	97,925	16·50	98,125	16·03	98,250	17·33

It will be seen that, with the exception of Merewether, in 1895, the general death rates locally are lower than those of Sydney. Now, a mere comparison of such rates alone cannot yield conclusions of any value as regards health conditions, for several reasons as follows:—(1.) The constitutions of the populations are without doubt dissimilar as regards age and sex distribution (a large number of very young or very old people in a district considerably increases the death rate, and also the mortality among males and females at different age period differs). (2.) The great influence which density of population has in increasing the death rate in large centres. In Sydney the average density is 34 persons per acre, whereas in Newcastle there are 14, in Wickham 6, in Merewether 4, in Hamilton 3 persons only per acre. (3.) In large centres of population people tend to become of lowered vitality and prone to hereditary diseases. There are more accidents, increased indoor occupations, greater intemperance, and other evil conditions, the result of co-existent poverty and modes of living.

Though the general death rates compare favourably with those of Sydney, it will be seen later on, when diarrhœa and typhoid fever are considered, that these affections are much more prevalent, and exact from the inhabitants of the local centres a greater death roll than occurs in completely sewered localities.

It is therefore in the reduction of the prevalence of these diseases which are to a very great extent preventable that every effort should be made.

Phthisis.

Death Rates per 1,000 of the Population for the years 1895–98.

	1895.	1896.	1897.	1898.
Newcastle	1·11	·87	·66	·63
Hamilton	1·15	·38	1·12	·36
Merewether	1·14	1·13	·22	1·30
Wickham	·75	·53	·85	·32
Sydney (City)	1·07	·98	·91	·92

It will be noted that the local death rates are lower than those of Sydney, with certain exceptions, viz.: Newcastle in 1895, Hamilton in 1895, 1897, Merewether in 1895, 1896, 1898.

As already stated phthisis is most prevalent and also most fatal in those places where overcrowding of dwellings and workshops occur, and where dampness of soil exists. In the local districts the important factor of overcrowding and the unhealthy conditions resulting therefrom do not obtain to any extent. This no doubt conduces in a great measure to the more satisfactory rates which prevail locally, as compared with those which obtain in a large centre, such as Sydney.

Diphtheria.

Death Rate per 1,000 of the Population.

	1895.	1896.	1897.	1898.
Newcastle	·22	0	·06	·19
Hamilton	·19	0	·37	0
Merewether	·46	·22	·22	·22
Wickham	·60	·17	·50	·16
Sydney (City)	·09	·06	·05	·10

Merewether rates exceed those of Sydney in 1895, 1896, 1897, 1898.

Wickham rates exceed those of Sydney in 1895, 1896, 1897, 1898.

Hamilton rates exceed those of Sydney in 1895, 1897.

Newcastle rates exceed those of Sydney in 1895, 1897, 1898.

Diphtheria.

Attack rate per 1,000 of the Population, 1898.

Locality.	Population.	Cases of Diphtheria.	Attack rate per 1,000.
Newcastle	15,700	11	·70
Hamilton	5,420	6	1·10
Merewether	4,450	2	·44
Wickham	6,100	8	1·30
Sydney (City)	98,250	89	·90

For the past year the attack rate in Hamilton and Wickham exceeds the Sydney rate.

Diarrhœa.

Death Rates per 1,000 of the Population in various districts for the years 1895-98, compared with those which obtained in the City of Sydney (where a complete sewerage system is present.)

	1895.	1896.	1897.	1898.
Newcastle	1·70	1·60	1·40	·51
Hamilton	2·50	1·90	2·40	1·10
Merewether	2·70	2·40	1·50	1·10
Wickham	1·80	1·70	1·70	3·40
Sydney (City)	·65	·59	·36	·40

With one exception (Newcastle, 1898) the rates are much higher in the local centres than in Sydney.

Important factors which contribute to the prevalence of, and death rate from, diarrhœa are the following:—Want of cleanliness, foul air from sewers, drains, accumulations of filth, improper food, maternal neglect, soil pollution (loose, porous soils, contaminated with organic matters derived from slops, soakage from cesspits, &c., being favourable).

The good effect which the institution of a sewerage system has had in reducing the death rate from diarrhœa is shown in the following table:—

Death Rate from Diarrhœa per 1,000 of the Population.

	Before laying of Sewers.	After laying of Sewers.
Sydney (City)	·67	·58
Glebe	1·00	·34
Paddington	1·05	·50
Newtown	·52	·30

Typhoid Fever.

Death Rate per 1,000 of the Population.

	1895.	1896.	1897.	1898.
Newcastle	·37	·60	·26	·38
Hamilton	·57	·38	·18	·92
Merewether	·68	·22	·22	·67
Wickham	·15	·17	·00	·49
Sydney (City)... ..	·19	·42	·16	·07

Newcastle rates exceed those of Sydney in 1895, 1896, 1897, 1898.

Hamilton rates exceed those of Sydney in 1895, 1897, 1898.

Merewether rates exceed those of Sydney in 1895, 1897, 1898.

Wickham rates exceed those of Sydney in 1898.

Typhoid Fever.

Attack Rate per 1,000 of the Population, 1898.

Locality.	Population.	Cases of Typhoid.	Attack rate, † 1,000.
Newcastle	15,700	23	1·40
Hamilton	5,420	27	4·90
Merewether	4,450	30	6·70
Wickham	6,100	20	3·20
Sydney (City)... ..	98,250	103	1·04

It will be seen that the numbers per 1,000 who became affected with this disease in the local centres were much in excess of those who were attacked in Sydney.

- The prevalence of this disease locally calls for close attention.

Typhoid fever is one of the maladies which are classed as preventable, since by the absence or removal of those conditions which engender and act as media by which the affection spreads the occurrence of the disease may be obviated.

It is an established fact that the germs of typhoid thrive in a soil polluted by excrement and other filth, and measures which have been effected in order to do away with such insanitary conditions have been followed by a reduction in the prevalence of this particular malady.

The actual means of dissemination is mostly by water and milk, and the increased precautions taken in guarding these liquids from pollution have had the effect in reducing the extent of the disease which is often water and milk borne.

The most important local matters which need consideration in connection with the occurrence of this disease may be briefly stated:—1. How soil becomes polluted so as to encourage the growth of the germs of typhoid. (a) By excremental matters derived from leaky sewers, drains, cesspits, &c. ; (b) By household slops. From absence of a drainage system these are disposed of by surface gutterage, or by being thrown on yard areas. (c) Other organic matters, such as are contained in garbage. 2. Soil pollution dangerous, in that it leads to water pollution. This is of special import in those places where underground sources of water supply are made use of, as to Merewether. 3. The disease may be spread by infected dust particles derived from soils polluted with solid or fluid excreta.

Measures which are needed to remedy the conditions which have been mentioned as being favourable to the occurrence of the diseases are the following:—(a) Paving of yards in crowded areas to prevent soakage and exhalation, sub-soil drainage to remove dampness. (b) Frequent removal of house refuse, and proper disposal of same. (c) A proper system of drainage to carry off all waste products.

The effect of underground drainage in reducing the prevalence of and death rate from typhoid is shown in the following tables:—

England and Wales.

Typhoid death rate per 1,000 of the population.

1870... ..	38
1871-75	37
1880-85	21
1890-97	17

In England underground drainage systems have been in existence for more than fifty years, but during recent times many improvements have been made in regard thereto.

An investigation by the Medical Officer of the Local Government Board into the effect of sanitary works in reducing the death rate of typhoid fever in England and Wales showed that of 25 towns taken into consideration where such works had been carried out, in nine there was a reduction exceeding 50 per cent., and in ten others a reduction between 30 and 50 per cent.

These

These good effects have been experienced not only by England, but many other instances might be added of Continental cities and others showing similar beneficial results following the provision of sewerage systems. Coming nearer home, we may take the case of the city of Sydney and its suburbs :—

City of Sydney.

Death rate from Typhoid Fever per 1,000 of the population.

Year.							Death rate per 1,000.
1889	·50
1890	·37
1891	·26
1892	·17
1893	·14

1898	·07

The present sewerage system was instituted in the year 1889.

The reduction in mortality which has followed the laying of sewers has been marked, as the following table shows :—

Death rate per 1,000.

							Before laying of Sewers.	After laying of Sewers.
Sydney (City)	·50	·24
Glebe	·25	·11
Paddington	·27	·16
Newtown	·66	·38

In conclusion, a consideration of the tables already given discloses the fact that the typhoid fever death rate and attack rate, and the diarrhoeal death rate in the local centres, considerably exceed the rates which obtain in a completely sewered locality, such as the city of Sydney. As already stated the prevalence of these two diseases is to a large extent influenced by insanitary conditions such as are present in the local centres, and these conditions are such as can be practically done away with in the most effectual way by the institution of a sewerage system.

As regards the present systems in use in the different localities, it may be said that in Merewether the methods generally adopted are entirely at variance with sound principles of hygiene. In Hamilton and Wickham, whilst the pail system is a marked step in advance, the question of the disposal of slop waters (which are practically equally as foul as the sewage of a water-closeted town) remains to be satisfactorily dealt with. In Newcastle the present mixed system as regards the removal of the contents of pail closets cannot be deemed to be by any means a good one. The patent pails which are connected with the drains are filthy contrivances. The present sewerage system, judging from a limited experience, appears to stand in need of much improvement in important particulars.

Considering the great benefits from a health standpoint which have resulted from the establishment of sewerage systems as judged from the statistics given, it is reasonable to expect that similar benefits will follow the institution of an efficient sewerage system in the localities under review.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

DEPARTMENT OF PUBLIC HEALTH.

(REPORT OF THE BOARD OF HEALTH FOR 1898.)

Printed under No. 8 Report from Printing Committee, 9 August, 1900.

The Secretary to the Board of Health to The Under Secretary for Finance and Trade.

Sir,

9 June, 1900.

I have the honor, by direction of the Board, to present herewith the Reports of the Board and of the President of the Board, with Appendices, on the working of the Department during the year 1898; and as they contain matter relating to the management of the public health of New South Wales which is of great practical interest, to suggest that they should be laid before Parliament.

I have the honor to be,

Sir,

Your obedient servant,

C. A. SIMMS,

Secretary.

DURING the year the organisation called into existence by the Public Health Act of 1896 continued to be developed, and considerable progress was made.

The report of the President deals with the changes in or additions to the staff of the Board, and with the inauguration of a medical sanitary staff attached to combined districts of local Authorities under the Act. Among these the Board views the appointment of Dr. Tidswell to the Board's staff, and of Drs. Armstrong and Dick to be medical officers of Health to combined districts, with great satisfaction; as being likely to result in great benefit to the community.

The vital statistics are presented in a way somewhat different from that adopted by the Registrar-General; they are arranged after great thought and care with special reference to the management of the public health. It will take some time before the collection of statistics of the incidence of disease in different localities is so complete as to make it possible for the Board to ascertain with certainty the districts requiring special attention, but a foundation is being laid, and in course of time, through the operation of the notification clauses of the Public Health Act, the requisite information will be obtained.

The Board notes with regret the continued fall in the mean annual birth-rate, and would urge legislation with a view to some check on a certain class of advertisements, which are of an extremely mischievous character. The history of peoples shows that practices such as those to which the Board is now referring have never been fraught with anything but disaster to individuals and to nations, and in the opinion of the Board, the suppression of these advertisements would be a step in the right direction.

The Board notes with satisfaction the diminution of the general death rate, but regrets that, while the death rate of children under 1 year is diminished in the metropolitan district, there is no such diminution in the country districts, where the rate is even higher for 1897 than for 1888. This is the more to be regretted in that it is generally admitted that many of the disorders carrying off young infants are, to a great extent, preventible, being largely caused by ignorance and carelessness in the management, especially of the food, of infants.

The Board may be permitted to draw attention specially to that part of the report dealing with the outbreak of typhoid fever at Bulahdelah (page 21), as illustrating a state of matters far too common in the Colony wherever works requiring much labour are in progress. At the beginning of the work too little care is taken in the selection of the site of the camp and in securing a good water supply and efficient drainage, and in the end the men pay the penalty in disease and death. These remarks apply not only to such private temporary settlements as existed at Bulahdelah. The Board has endeavoured to secure some attention to the regulation of railway camps through the Department of Public Works (Railway Construction Branch); and through the Commissioners for Railways, where deviation and other works have been in progress; but admits that it is not an easy thing to secure the co-operation of the men employed, and, without this, the best laid schemes of departments will be spoiled.

The pollution of watercourses used for domestic supply has engaged the Board's attention for years, and active steps were taken during the year to put in force the clauses of the Public Health Act relating to this subject. A preliminary inquiry, through the police, having shown that some of the proprietors of wool-scours had spontaneously taken precautions to prevent the foul effluent passing directly into the watercourses. Steps have been taken to compel the remainder to do so. The required measures are, as a rule, simple and inexpensive, and it, therefore, does not appear that the pollution referred to need be any longer tolerated to the inconvenience and danger to health of the people dwelling on the banks of the stream lower down.

The Board draws special attention to its action under the Public Health Act in recommending the interdiction of certain lands for building purposes (see page 25). In all these cases the areas had been garbage tips, and building on them was interdicted until the garbage is removed.

The Noxious Trades and Cattle Slaughtering Act, Part I—*i.e.*, the part dealing with noxious trades—continues to be eminently successful, and the Board refers with satisfaction to the Borough of Alexandria. Case mentioned on page 27.

Small-pox has been imported over sea three times, but each time the quarantine restrictions have succeeded in preventing the spread of the malady to the community. The Board, however, does not expect that this will always be the case, and once more deplures the practically unvaccinated condition of the people.

The condition of the dairies continues to give the Board much solicitude, and that, mainly, because of the inefficiency of the supervision by Municipal local authorities. Indeed, in spite of the manifest advantages to be derived from observance of the Board's rules which would accrue to the trade itself as well as to the public, there is too much reason to believe that, were it not for the Board's supervising Inspectors, the Act would soon become practically a dead letter in the districts referred to.

The Diseased Animals and Meat Act has undoubtedly limited, and in some places suppressed, the wilful exposure of diseased animals and meat for sale as food for man, but this has required the utmost vigilance on the part of the Board's officers and of the police. Its good effect on the export trade in meat must redound to the credit and advantage of the Colony. It is much to be regretted that its provisions do not extend to cows on dairy premises, and the Board recommends that they should be extended to do so.

The Noxious Trades and Cattle Slaughtering Act, Part II—*i.e.*, the part dealing with cattle-slaughtering—has, under the Board's administration, been productive of great improvements in the conditions under which the butchering trade is carried on, formerly often too disgusting for words. Yet, in spite of all this, improvements have been noted as still required in ninety-one out of the 142 slaughter-houses inspected during the year by the Board's inspectors.

In view of the contemplated early removal of the Abattoir at Glebe Island, the Board has done no more to it than was absolutely necessary in the way of structural improvement and modification, though it has closely supervised the general management. Additional inspectors for service at suburban slaughterhouses are needed, for it is to these places that, in order to avoid inspection at the Abattoir, suspicious animals are taken for slaughter. (See page 42).

The work of the Chemical and Micro-Biological Laboratories has been copious and important, and the Board draws attention to the valuable reports on a variety of important subjects appended to this report.

By order,

C. A. SIMMS,
Secretary.

PRESIDENT'S REPORT FOR 1898.

October, 1899.

THE Board of Health continued to administer the Public Health Act, together with other Acts previously entrusted to it by Parliament, and developed the organisation sketched in the Report for 1897 (sections 15 to 24, pp. 4, 5, and 6).

2. Dr. Frank Tidswell, M.B., Ch.M. (Syd.), D.P.H. (Camb.), was appointed to the post of Principal Assistant Medical Officer of the Government and Micro-Biologist to the Board; he began duty on 1st January, and in the course of the year was provided with two laboratory assistants. Authority was given for appointment of a Second Government Analyst, to be chiefly occupied under the Public Health Act, Part VIII, but no appointment could be made during the year owing to the late date at which the Estimates were passed. In November two additional Veterinary Inspectors were appointed, with a view to setting two senior members of the Veterinary Staff at liberty to take up resident duty in two of the important dairying districts during the ensuing year (see Report, 1897, section 44, p. 9). Two or three additions were made to the clerical staff, among which it is only necessary to mention the special assignment of a clerk to the Notification Bureau, where work began on 1st January.

3. Execution of the Act remained in the hands of 184 municipal and 88 police local authorities. Municipal local authorities are assisted by Inspectors of Nuisances, appointed under the Nuisances Prevention (Consolidation) Statute of 1897, and seldom possess more than one such officer, who most often has other duties to perform. Police local authorities were assisted by 470 sanitary inspectors, appointed under the Public Health Act; and they are police officers, stationed at the minor centres of population which have grown up on the unincorporated lands which the 88 police districts comprise. The estimated total population on 31st December, 1897, was 1,334,850; the number living within municipalities was 758,295, and the number living on unincorporated lands was 576,555. At conclusion of the second quarter of the year, local authorities made their first quarterly return, under the Public Health Act, section 15, showing, on a form supplied to them, details of their execution of the Act. (Appendix D, page 56.)

4. On 1st April, Dr. W. G. Armstrong, M.B. (Syd.), D.P.H. (Camb.), began duty as Medical Officer of Health to the Metropolitan Combined District, and Dr. Robert Dick, M.B. (Syd.), D.P.H. (Camb.), as Medical Officer of Health to the Hunter River Combined District. These gentlemen are municipal officers, and are not Civil Servants; they were consequently selected by the Board and appointed by the Minister; and tenure is secured to them by their being paid from Consolidated Revenue, in accordance with the provisions of the Public Health Act, section 77. They are wholly occupied with their official duties,

duties, and their services are entirely at disposal of the several local authorities they serve, whom it is their business to advise on the results of their constant supervision, as well as whenever they are specially desired by them to do so. By the Public Health Act, section 12, local authorities are required to forward to the Board a copy of every report made by the Medical Officers of Health.

5. The Metropolitan Combined District comprises forty-eight municipalities, which cover an area of 127,236 acres, as well as portions of three adjacent police districts, and which carried an estimated population, at the middle of the year, of 450,870 persons. This area will, no doubt, turn out to be too extensive for effectual supervision by one Medical Officer of Health; but no difficulty was experienced during the nine months now referred to in which acquaintance had to be made with the various councils, their equipment, and their methods. The Hunter River Combined District comprises seventeen municipalities, which cover 37,500 acres, and that area carried an estimated population of 66,037 at the middle of the year; but it also includes a very large tract of neighbouring police districts which carried a population guessed, rather than estimated, at 14,000; the total population being thus brought up to (say) 80,000. The population placed under skilled guidance in executive matters relating to the public health amounts to about 530,000, and this is more than a third of the total population.

6. Both the Medical Officers of Health made a first annual report to their local authorities at the end of the year, and both gave a course of lectures to the sanitary inspectors within their combined districts during the winter months, which were well attended.

VITAL STATISTICS.

SYNOPSIS.

A. Population—

Census populations in sexes and ages, 1861-1891.

Progress of population, 1861-1891.

Racial composition, sex, age, and place distribution, 1861-1891.

Mean population, ages, and sexes, 1898.

B. Marriage and marriage-rate, 1878-1897.

C. Births and birth-rate, 1878-1897; sexes, &c.

D. Deaths and death-rates, 1888-1897, in places, under and over 5 years, infantile, seasonal. Mortality index.

E. Notifiable infectious diseases—

Previous rates of mortality—

Scarlet fever, 1898; incidence, mortality, and fatality.

Diphtheria, 1898; incidence, mortality, and fatality.

Typhoid fever, 1898; incidence, mortality, and fatality.

7. Analysis of the vital statistics with a view of using them as a guide to management of the public health, and as a check on the efficiency of public health administration was first undertaken during the year under review. With the means at command it was not found possible to do more than lay a foundation, and the present statement is preliminary.

8. The available figures are contained in the four Census reports (1861-71-81-91), in the long series of reports on vital statistics annually made by the Registrar-General, and in the yearly volume on the Wealth and Progress of New South Wales, issued by the Government Statistician (Mr. T. A. Coghlan, M.I.C.E.), since 1888. From these sources the facts relating to population, births, marriages, and deaths which are contained in the following account have been selected, arranged, or combined anew.

9. Registration of births, deaths, and marriages, otherwise than by ministers of religion, was first provided for by law in 1855. The first census of the population living within the present territorial limits of New South Wales was taken in 1861. But, while the latter is necessarily the point from which every review of the vital statistics must start, it is not possible to present exact particulars even of their more important aspects for all of the thirty-six years presently dealt with. Collection of the requisite facts, and the compilation of abstracts have been matters of gradual and slow development; the returns begin to approach completeness only during the latter years of the period named.

A.—POPULATION.

10. Table I gives the population of New South Wales as enumerated at the four censuses of 1861, 1871, 1881, and 1891, distinguishing the sexes and certain age groups:—

Census.	Enumerated Population.	Less Ages unspecified	0 --	5 --	10 --	15 --	20 --	25 --	35 --	45 --	55 --	65 --	75 --	Total.
1861.....	Males	81	60	52	47	52	106	71	49	26	8	2	1,000
	Females	80	61	51	51	45	70	45	26	12	4	1	
	Total	350,860	6,631	161	121	103	98	97	176	116	75	38	12	
1871.....	Males	83	71	58	42	42	93	73	44	26	12	3	1,000
	Females	80	69	56	43	42	69	44	28	15	5	2	
	Total	503,981	1,073	163	140	114	85	84	162	117	72	41	17	
1881.....	Males	75	66	60	51	54	86	69	28	23	11	4	1,000
	Females	73	66	58	50	46	62	46	47	16	7	2

-45 ,,	24,332	15,435	39,767	36,495	22,371	58,866	51,580	34,360	85,940	72,115	49,619	121,734
-55 ,,	17,176	8,846	26,022	22,082	13,897	35,979	35,075	20,731	55,806	50,009	33,566	83,575
Over 55 years	11,782	5,146	16,928	20,565	10,799	31,364	28,953	18,285	47,238	46,366	30,396	76,762
Age not stated	6,416	215	6,631	771	302	1,073	1,788	628	2,416

11. *Progress.*—The population is increasing at a rate which has caused it to more than treble during the thirty years covered by the censuses. The actual progress from census to census is illustrated by the following figures, the population in 1861 being represented as 100* :—

Census.	Growth of Population.
1861	100
1871	144
1881	214
1891	323

12. The increase is due partly to natural increment (excess of births over deaths), and partly to excess of immigration over emigration. The figures with reference to this point are as follow† :—

Period.	Births.	Deaths.	Excess by Births over Deaths.	Excess by Immigration over Emigration.
1861-71	174,267	68,190	106,077	47,044
1871-81	236,214	95,832	140,382	107,105
1881-91	349,450	138,149	211,311	161,185

13. The percentage increases due to the respective factors are shown in the following statement † :—

Period.	Natural Increment.	Increment by Immigration.
1861-71	69.28	30.72
1871-81	56.72	43.28
1881-91	56.73	43.27

14. The average annual rate of increase for the ten years ending 1897 has been estimated at 2.64 per cent., with a maximum of 3.87 in 1891, and a minimum of 1.55 in 1896.

15. *Racial Composition.*—The census of 1891 gave a population of 1,123,954 persons (males 608,003, females 515,951). Of this number 1,080,906 persons (males 571,715, females 509,191) were natives of the British Empire; 39,787 persons (males 34,204, females 5,583) were foreign born; the remainder were either born at sea, or their birthplaces were not specified.

16. A comparison of the racial composition of the people at the last four census periods shows that in the course of the thirty years, 1861-1891, the proportion of Australian-born to the total population advanced from 47.03 to 71.43 per cent., whilst that of persons born in the British Isles declined from 45.19 per cent. to 23.5 per cent.

17. The influx of Chinese and other aliens regarded as undesirable has been the subject of several legislative enactments which impose capitation fees, limitation of the number to be carried in relation to the tonnage of vessels, &c. They appear to have effected their object of checking the immigration, but complete returns on this subject have not yet been made.

18. The census figures quoted above do not include aboriginals. In 1891 they numbered 8,280, including 3,183 half-castes. There is evidence that the aboriginals are decreasing.

19. *Sex Distribution.*—The percentage proportion of males to females at four census periods is shown by the following figures † :—

Period.	Males.	Females.
1861	56.57	43.43
1871	54.67	45.33
1881	54.71	45.29
1891	54.10	45.90

20.

* Statistician's Report on Census, 1891, p. 129.

† Compiled from figures given in Statistician's Report on Census, 1891, p. 130.

‡ Statistician's Report on Census, 1891, p. 131.

20. The increase of males and females by excess of births over deaths, and immigration over emigration, is shown in the following Table II* :—

	Period.	Births.	Deaths.	Excess by Births over Deaths.	Excess by Immigration over Emigration.
Males	1861-71	89,632	40,922	48,710	28,353
	1871-81	120,745	56,440	64,305	71,293
	1881-91	178,904	80,718	98,186	98,668
Females	1861-71	84,635	27,268	57,367	18,691
	1871-81	115,469	39,392	76,077	35,812
	1881-91	170,546	57,431	113,105	62,517

21. The increase from excess of births over deaths during the thirty years covered by the censuses has been greater for females than for males. The male births are in excess of the female births, but the male deaths are much more in excess of the female deaths.

22. If the increase of males by excess of births over deaths for each period be considered as equal to 100, then the increase of females by excess of births over deaths was as follows† :—

1861-71	117·77
1871-81	118·31
1881-91	115·20

23. The increase arising by excess of immigration over emigration is much greater for males than for females. If the increase of males by excess of immigration over emigration be considered as equal to 100, then the increase of females was as follows† :—

1861-71	65·92
1871-81	50·23
1881-91	63·36

24. Combining the two sources of increment, then the total male increase has been in excess of the total female increase. If the total male increase for both periods be considered as being equal to 100, then the total female increase would be as follows† :—

1861-71	98·70
1871-81	82·52
1881-91	89·22

25. The increase of males by excess of immigration is so considerable that though the natural increment favours female excess, the actual excess in the total population is male. But although this is so the difference in proportion between the sexes has a tendency to become smaller.

26. *Age Distribution.*—The percentage proportions of persons of 5 years of age and under, and of persons over 5 years of age, at each census are shown in the following statement :—

Census.	1861.	1871.	1881.	1891.
0-5 years	15·91	16·26	14·78	14·63
Over 5 years	84·09	83·74	85·22	85·37

27. The proportion of children of 5 years of age and under showed a tendency to increase during the decade 1861-71. In the decade 1871-81 the proportion decreased by 1·48 per cent. In the decade 1881-1891 it remained practically constant, but with a slight tendency to decrease.

28. The numbers and percentage proportions of infants under 1 year at each census are shown in the following table :—

Census.	1861.	1871.	1881.	1891.
Number under 1 year	12,049	18,092‡	34,799
Proportion per cent. total population	3·43	3·59	3·07

29. The proportion of infants under 1 year of age showed a tendency to increase during the decade 1861-71. Since 1871 there has been a decrease.

30. In his Report on the Census of 1891 (p. 145) the Government Statistician gives a table showing approximately the ages of persons who composed the increments by immigration during the ten years 1881-1891. The table shows that the great majority were between 10 and 40 years of age in 1891. The numbers for both sexes together are the largest in the age periods 20-25, and 25-30 years. For males alone in the period 20-25, 25-30 (especially), and 30-38, and for females 20-25, and 25-30 years. The

Statistician

* Ibid, p. 130; compiled.

† Statistician's Report on Census, 1891, p. 130.

‡ Figures not available.

Statistician observes that "It would probably be a fair assumption that the majority of the persons referred to arrived when they were some six years or so younger than when their ages were recorded (in 1891), and it would appear that the great bulk of immigrants who arrived were considerably under 25 years of age."

31. *Place distribution.*—For the purposes of the present Report the only place classification attempted is to distinguish between residents in the city of Sydney and its suburbs (metropolitan district) and those in the rest of the Colony (country districts including cities and towns).

32. The percentage proportions of the population in the respective districts at each of the four censuses are shown in the following table* :—

Census.	Metropolitan.	Country.
1861	26·70	73·30
1871	26·73	73·27
1881	30·34	69·66
1891	34·26	65·74

33. The figures illustrate the well-known tendency of population to accumulate in large cities. The Statistician remarks that over 57 per cent. of the increase due to immigration during the period 1881–1891 was retained in the Metropolis ; but it is now believed that many have left for the country. At the end of 1897 it was estimated that the Metropolitan district contained 31·53 per cent. of the population of New South Wales.

34. The percentage proportion of the sexes in the two districts at each census are shown in the following statement† :—

	1861.	1871.	1881.	1891.	
Metropolitan {	Males	48·60	48·51	50·13	50·55
	Females	51·40	51·49	49·87	49·45
‡Country ... {	Males	59·29	56·72	56·42	55·64
	Females	40·71	43·28	43·58	44·36

35. In the Metropolitan district the sex distribution has changed from a female excess at censuses 1861 and 1871 to a male excess at censuses 1881 and 1891. This alteration appears to be due to the large increase of male immigration during the decennium 1871–1881 (p. 5), and its retention in the Metropolitan district. In the country district the males have always been in excess, but the proportion of females has increased in each successive decennium.

36. Table III, compiled from figures supplied by the Government Statistician, gives the estimated mean population of New South Wales in the Metropolitan and in the country districts for the year 1898, distributed under age and sex.

TABLE III.—Mean Population in Age-groups, 1898.

Age Groups.	Metropolitan District.			Country Districts.			New South Wales.		
	Males.	Females.	Total.	Males.	Females.	Total.	Males.	Females.	Total.

The population as estimated by the Statistician is arrived at in the usual manner by calculations based on the Census figures, on births and deaths, and on arrivals and departures. The machinery for the registration of births and deaths ensures fairly correct returns under these heads, but it is not so easy to obtain exact particulars respecting arrivals and departures. The Statistician remarks :—"The lists of passengers arriving by sea are usually accurate ; but in the case of persons leaving the Colony, it is found that large numbers go on board steamers at the last moment, without having previously booked their names, and so are not recorded amongst the emigrants. It therefore becomes necessary, when estimating the population, to make allowance for unrecorded departures." The amount of allowance made in this respect is estimated from the Census figures.

B.—MARRIAGES.

* Wealth and Progress of New South Wales, 1897–8, p. 644.

† Compiled from Statistician's Report on Census, 1891, p. 132.

‡ Extra Metropolitan

B.—MARRIAGES.

37. Of the 1,123,954 persons enumerated at the Census of 1891, there were 748,664 unmarried (including children), 43,000 who had been married, and 332,282 married persons.

38. The marriage rates per 1,000 of the mean population are given in the subjoined table for the twenty years 1878-1897* :—

TABLE IV.

Year.	Marriages registered per 1,000 of mean population.	Year.	Marriages registered per 1,000 of mean population.
1878	8.08	1888.....	7.57
1879.....	7.80	1889.....	7.06
1880.....	7.65	1890.....	7.15
1881.....	8.21	1891.....	7.39
1882.....	8.70	1892.....	6.79
1883.....	8.33	1893.....	6.40
1884.....	8.47	1894.....	6.20
1885.....	8.22	1895.....	6.35
1886.....	8.06	1896.....	6.60
1887.....	7.55	1897.....	6.72

The marriage rate shows a settled tendency to fall between the years 1883 and 1894, but since that time it has risen again being, in 1897, the highest since 1892.

C.—BIRTHS.

39. The mean annual birth rate for New South Wales for ten years ending 1897 was 32.61 per 1,000 of the population. The birth rate is steadily declining in New South Wales as a whole, and in both metropolitan and country populations, but more markedly in the metropolitan population. Commenting upon this fact the Statistician remarks that "The depression which has prevailed in the Australian Colonies for a number of years has not only had an adverse influence on the marriage rate, and through the marriage rate upon the birth rate, but, in addition to this, has in many cases led to the adoption of artificial checks on procreation."

40. In 1896 the birth rate in New South Wales had fallen below that of the great majority of European countries.

41. The male births per annum during the past twenty-seven years have always exceeded the female births, the excess varying from 2.08 per cent. (1875) to 7.65 per cent. (1889), the average being 5.01 per cent.

42. Table V shows the birth rate per 1,000 of the population for the twenty years, 1878 to 1897, distinguishing between metropolitan and country districts† :—

TABLE V.

Year.	Births per 1,000 of the Population.		
	Metropolis.	Country.	New South Wales.
1878	38.15	38.65	38.50
1879.....	39.18	38.92	38.99
1880.....	39.00	38.73	38.81
1881.....	39.21	37.34	37.90
1882.....	40.23	35.90	37.20
1883.....	40.81	35.92	37.32
1884.....	44.70	35.75	38.44
1885.....	45.46	35.18	37.79
1886.....	44.53	34.32	37.43
1887.....	43.21	34.31	37.06
1888.....	41.92	35.02	37.20
1889.....	38.73	33.18	34.97
1890.....	37.23	34.44	35.36
1891.....	35.95	33.76	34.50
1892.....	34.70	33.48	33.89
1893.....	33.52	33.23	33.33
1894.....	31.65	31.28	31.48
1895.....	30.67	30.65	30.66
1896.....	30.06	27.55	28.35
1897.....	29.00	28.15	28.42

43. The male births exceed the female, but the mortality of male infants is much greater than that of female infants, and such as to result in a greater addition of females to the community. During the ten years 1886-1897, the number of females thus added to the community exceeded the males by 15,028, or 13.61 per cent.

44. For the period 1888-1897 the excess of births over deaths averaged annually for males 11,037; and for females, 12,540, the net increase being therefore in the proportion of 1,136 females to 1,100 males.

45.

* Wealth and Progress of New South Wales, 1897-8, page 662.

† Wealth and Progress of New South Wales, 1897-8, page 682.

45. Table VI shows the number of births of each sex registered in New South Wales in each of the eleven years, 1888 to 1898, distinguishing those recorded in the Metropolitan and in country districts :—

TABLE VI.

Year.	Sydney and Suburbs.			Country.			New South Wales.		
	Males.	Females.	Total.	Males.	Females.	Total.	Males.	Females.	Total.
1888	6,942	6,765	13,707	12,674	12,144	24,818	19,616	18,909	38,525
1889	6,938	6,406	13,344	12,397	11,554	23,951	19,335	17,960	37,295
1890	6,920	6,609	13,529	12,967	12,464	25,431	19,887	19,073	38,960
1891	7,243	6,765	14,008	13,143	12,307	25,450	20,386	19,072	39,458
1892	7,194	6,876	14,070	13,338	12,633	25,971	20,532	19,509	40,041
1893	7,288	6,668	13,956	13,534	12,852	26,386	20,822	19,520	40,342
1894	6,874	6,317	13,191	13,119	12,641	25,760	19,993	18,958	38,951
1895	6,520	6,241	12,761	13,357	12,656	26,013	19,877	18,897	38,774
1896	6,339	5,963	12,302	12,352	11,852	24,204	18,691	17,815	36,506
1897	6,197	5,812	12,009	12,792	12,446	25,238	18,989	18,258	37,247
1898	6,090	5,823	11,913	12,633	11,676	24,309	18,723	17,499	36,222

46. The excess of births over deaths is shown in the following table* :—

TABLE VII.

Year.	Metropolis.	Country.	New South Wales.	Percentage of Population at end of previous year.
1878	3,186	11,379	14,565	2·26
1879	3,947	12,786	16,733	2·26
1880	3,434	13,497	16,931	2·39
1881	4,560	12,897	17,457	2·33
1882	4,608	12,278	16,886	2·16
1883	5,342	13,690	19,032	2·33
1884	5,946	13,780	19,723	2·29
1885	5,773	13,988	19,761	2·18
1886	6,860	14,837	21,697	2·28
1887	7,874	15,914	23,788	2·40
1888	7,449	16,668	24,117	2·36
1889	7,006	15,493	22,499	2·14
1890	7,938	16,804	24,742	2·29
1891	7,588	15,584	23,172	2·07
1892	8,558	17,073	25,631	2·14
1893	7,472	16,848	24,320	2·03
1894	7,406	16,328	23,734	1·94
1895	7,276	16,684	23,860	1·91
1896	6,713	13,954	20,667	1·62
1897	6,789	16,194	22,983	1·77

The mean annual increase by births over deaths for the twenty years, 1878–1897, was 2·17 per cent.

D.—DEATHS.

47. The general rates per 1,000 for the ten years, 1888 to 1897, are given in the following table† :—

TABLE VIII.

Year.	Males.	Females.	Total.
1888	14·94	12·67	13·91
1889	14·93	12·61	13·87
1890	13·82	11·81	12·90
1891	15·41	12·86	14·24
1892	13·38	10·81	12·20
1893	14·23	12·07	13·24
1894	13·08	11·30	12·26
1895	12·77	10·66	11·79
1896	13·41	11·02	12·30
1897	11·84	9·78	10·88
Mean	13·72	11·49	12·69

The range of death rates for males has amounted to 3·57; for females, to 3·08; and for both sexes together, to 3·36 per 1,000 living.

48. With the exception of the year 1891, when a severe epidemic of influenza occurred, and the year 1893, a period marked by a financial crisis, the general death rates show a continuous diminution during the ten years. The decline in the death rate for males (3·10 per 1,000) is greater than that for females (2·89). For both sexes together the drop has amounted to 3·03 per 1,000 living.

49.

49. The death rates per 1,000 living for Metropolitan and country districts during the ten years 1888-1897 are shown in the following table*:-

TABLE IX.

Year.	Metropolis.	Country.	New South Wales.
1888	18·76	11·61	13·91
1889	18·03	11·83	13·87
1890	15·10	11·79	12·90
1891	16·48	13·09	14·24
1892	13·59	11·47	12·20
1893	15·57	12·01	13·24
1894	13·94	11·39	12·26
1895	13·18	11·11	11·79
1896	13·66	11·67	12·30
1897	12·61	10·09	10·88
Mean	15·31	11·44	12·69

Range of death rate, 3·36 per 1,000 for New South Wales, 6·15 for metropolis, and 3·00 for country.

50. In the Metropolitan district, with the exception of the years 1891, 1893, already noticed, and 1896, there has been a marked and practically steady diminution of the death rate, amounting during the ten years to 6·15 per 1,000 persons living.

51. In the country districts the death rate has remained nearly constant. The rate for 1897 is certainly lower than for former years of the series, but whether any special significance attaches to it remains for the future to show:—

52. Death rates per 1,000 of the population at ages under and over 5 years are given in the following table, 1888-1897†:-

TABLE X.

Year.	Under 5 years.			Over 5 years.		
	Metropolitan.	Country.	N.S. Wales.	Metropolitan.	Country.	N.S. Wales.
1888	60·19	31·33	40·92	11·38	8·28	9·28
1889	61·74	31·56	41·68	10·36	8·47	9·09
1890	45·85	30·83	35·92	9·79	8·55	8·97
1891	50·89	33·21	39·10	10·77	9·61	10·00
1892	41·20	29·74	33·69	8·86	8·33	8·51
1893	52·58	33·07	39·64	9·34	8·32	8·67
1894	40·74	28·31	32·40	9·50	8·40	8·77
1895	37·30	26·23	29·80	9·12	8·47	8·68
1896	37·85	28·26	31·24	9·58	8·77	9·03
1897	32·57	22·54	25·71	9·18	7·95	8·33
Mean	46·35	29·10	34·69	9·98	8·41	8·92

53. There has been an improvement in death rates both in children under 5 years of age and in persons above that age, but the reduction has been specially marked in the former class. Amongst children the decline of the death rate in the whole Colony amounted to 15·21, in the Metropolitan district to 27·62, and in the country to 8·79, per 1,000 living.

54. Amongst adults the reduction in the whole Colony has amounted to ·95, in the metropolitan district to 2·20, and in the country to ·33, per 1,000 living.

55. The detailed statistics for a strict comparison between the mortality rates in the metropolitan and country districts have not yet been prepared, but it is obvious that the death rate amongst children under 5 years of age is disproportionately high in the Metropolitan district. The populations of the metropolitan and country districts are in the ratio of about 1 to 2; the death rates amongst children under 5 years are in the ratio of about 3 to 2.

56. *Infantile Death rate.*—The death rates of children under 1 year are given in the following table for years 1888-1897‡:-

TABLE XI.

Year.	Metropolis.		Country.		New South Wales.	
	No. of Deaths.	Per 1,000 Births.	No. of Deaths.	Per 1,000 Births.	No. of Deaths.	Per 1,000 Births.
1888	2,084	152·0	2,187	88·1	4,271	110·9
1889	2,301	172·4	2,371	93·0	4,672	125·3
1890	1,823	155·4	2,249	88·4	4,072	104·5
1891	2,075	148·1	2,616	102·8	4,691	118·9
1892	1,832	130·2	2,413	92·9	4,245	106·0
1893	2,048	146·7	2,592	98·2	4,640	115·0
1894	1,765	132·0	2,483	97·0	4,248	109·1
1895	1,669	130·8	2,437	93·7	4,106	105·9
1896	1,710	139·0	2,725	112·6	4,435	121·5
1897	1,551	129·1	2,250	89·2	3,801	102·0
Mean	141·9	96·0	111·0

For the whole Colony the infantile death-rate shows a diminution during the ten years, but this is entirely due to the satisfactory decline of the rate in the Metropolitan district, where it has amounted to 22·9 per 1,000 births. In the country there has been no such diminution, the rate being higher in 1897 than in 1888. 57.

* Wealth and Progress of New South Wales, 1897-8, p. 701.

† Ibid., p. 703.

‡ Wealth and Progress of New South Wales, 1897-8, p. 704.

57. *Seasonal Death rate.*—As a rule, the season of the year in which deaths are most numerous is the quarter ending March (summer-autumn), but they are nearly as great in the December quarter (spring-summer). The numbers for each quarter during the past ten years, 1888–1897, are given in the following table* :—

TABLE XII.

Year.	Quarter ending March 31.	Quarter ending June 30.	Quarter ending September 30.	Quarter ending December 31.
1888	3,642	3,595	3,387	3,802
1889	4,101	3,728	3,158	3,809
1890	3,652	3,448	3,516	3,602

1897	3,299	3,657	3,291	4,017

58. *Index of Mortality.*—In order to have a comparison of the mortality of the principal countries of the world on an uniform age basis, the International Statistical Institute, Berne, 1895, decided to recommend adoption of the population of Sweden in $\frac{1}{2}$ age groups as ascertained at the Census of 1890, as the standard population with which the index of mortality should be calculated. Applying the co-efficient of mortality at each age group in New South Wales to the age constitution of the standard population, the index of mortality for the Colony during the past ten years is found to be as follows† :—

Year.	Index of Mortality per 1,000.	Death rate per 1,000.
1888.....	17·26	13·91
1889.....	17·22	13·87
1890.....	16·51	12·90
1891.....	18·68	14·24
1892.....	15·65	12·20
1893.....	16·71	13·24
1894.....	16·32	12·26
1895.....	15·69	11·79
1896.....	16·45	12·30
1897.....	14·97	10·88

E.—NOTIFICATION OF INFECTIOUS DISEASES.

59. Notification and prevention of infectious diseases is provided for under the Public Health Act, Part III, which was brought into operation on 1st January, 1898, by Proclamation of scarlet fever, diphtheria, and typhoid fever to be infectious diseases for the purposes of the Act. *Cases.*—The cases recorded and dealt with are those notified by legally qualified medical practitioners only. *Deaths.*—The mortality rates are struck on the mean estimated population with all deaths from the notifiable diseases which were registered during the year. The fatality rates are struck on the notified cases with the deaths which occurred among them. *Distribution.*—Medical officers of all public institutions are required by Regulation to fill blanks left in the notification certificate for this purpose with the address from which the patient was removed for admission. All institution-deaths are entered to the districts from which they were admitted in the register kept at the central bureau. *Localisation.*—Notifications are sent to the Local Authority of the district within which the case is. The certificate, after being recorded by the Local Authority in its register, is forwarded by it in one or other of the following ways :—If the district lies within either the Metropolitan or the Hunter River combined district, the certificate is forwarded by the Local Authority to the Medical Officer of Health, and the latter, after recording it in his register, transmits it to the central bureau ; but if the district does not so lie, then the Local Authority forwards the certificate to the central bureau direct. The notification form also contains a blank for use of the Local Authority on which its officer acknowledges that the house mentioned lies within its district ; but if the house should have been ascribed to a wrong district by the medical man reporting, then the Local Authority makes no entry in its register, does not fill the form last referred to, but forwards the certificate by post to the Local Authority for the district within which the house does stand. (See Regulations, Appendix C, Regs. 3 and 4). *Reduplicated notifications.*—The total number of notifications received was 11,906 ; the number notified a second time by practitioners subsequently called to the case in consultation, &c., &c., was 777, a percentage of 6·52. *Administration.*—This part of the Act worked from the beginning without friction, as also did the machinery of registration. The cases in which Local Authorities misunderstood their duties and instructions at first were extremely few, and the amount of correspondence necessary on this or similar scores during the first few weeks was very slight.

60. The following statistical tables deal with small numbers, being those for a single year's notification ; only the more obvious facts are therefore regarded. After a few years the accumulation will be large enough to warrant useful inferences, by which the application of preventive measures to the neighbourhoods in which there is most need for them may be guided.

Comment on Table XIII.

62 *Scarlet Fever.*—In the Colony as a whole the rates have been very irregular, ranging from .03 to 1.82, and being generally between 2 and 4 per 1,000 living. In the Metropolitan district the rates were also irregular, ranging from .02 to 2.71, and being usually between .02 and .2 per 1,000 living. In the country districts the rates were less irregular, ranging between .02 and 1.47, and being usually between .02 and .06 per 1,000 living.

There is no indication that any special factor has interfered with the natural progress of the disease since the epidemic of 1875-6.

63 *Diphtheria.*—In the whole Colony from 1875 to 1896 the rates ranged from .13 to .41; were usually between .2 and .4; and never fell below .13 per 1,000 living. In 1897 there was a marked drop to .09 per 1,000, and this rate has obtained also in 1898. In the Metropolitan district, 1895-1896, the rate ranged from .13 to .53, and was usually between .2 and .4 per 1,000. The figures for 1897-1898 show a marked drop, but the rate for 1898 is higher up than those for 1881, 1882, 1886, and 1897. In the country districts up till 1895 the rates ranged from .14 to .49; were usually between .2 and .4, and never fell below .14 per 1,000. Since 1896 the rate has not been above .11, but was higher in 1898 than in 1896 or 1897.

The year 1896 marked the introduction of the curative serum into this Colony, and its widespread use followed in 1897 or 1898. It is, perhaps, yet too soon to decide whether or not the very obvious decline in the death rate from diphtheria has been brought about by the use of this valuable remedy.

64 *Typhoid Fever.*—The mortality rate for the whole Colony shows a tendency to progressive diminution; as does also, and more markedly, the rate for the Metropolitan district. But in the country this decline is much less distinct. As regards the whole Colony the period under consideration can be divided into an earlier part (1875 to 1889) during which the mortality was excessively high, and a later part (1890 to 1898) during which the mortality has been much more moderate. In the earlier period the rates ranged from .31 to .67, were usually between 4 and 6, and never fell lower than .31 per 1,000. In the later period the rates ranged from .18 to .32, were usually between 1.5 and 2.5, never rose above .32, and on three occasions have been below 2 per 1,000. The figures for the Metropolitan district can also be divided into an earlier high rate period (1875 to 1889) during which the rate was never lower than .4, and a later low rate period (1890 till 1898) during which the rate never rose above .39 per 1,000. The figures for the country districts do not show such marked division into high and low rate periods. The figures recorded since 1890 are in general lower than those for previous years, but in particular years since 1890 the rates have been still very high. For instance the rate for 1896 (.42) was nearly as high as that for 1875 (.43), and the rate for 1898 was higher than in 1879, 1881, &c.

65 *Comment.*—These results indicate that amongst the factors influencing the mortality from typhoid fever in this Colony there was one of pre-eminent importance which came into action in or about the year 1890, and was such as to operate most powerfully and favourable upon the death rate of the Metropolitan district. An influence of this kind could only be exerted by the completion of some great sanitary enterprise, and in the case of typhoid fever the most natural explanation is to be sought for in the metropolitan water supply.

66. *Incidence.*—The notification returns show that during 1898 scarlet fever attacked 6,342 persons in this Colony, an incidence at the rate of 4·75 per 1,000 of the estimated mean population. It is obvious from the great number attacked that the disease had epidemic prevalence during the year. As usual with scarlet fever, the main incidence was upon persons under 15 years of age, with special predilection for age-group 5–10 years. There were 64 cases in infants under 1 year of age, and 34 in babies under 6 months old. The incidence rate increased with each year up to 5 years. At ages above 20 years the incidence was comparatively slight. In accordance with the usual behaviour of scarlet fever, females suffered more than males. The total attack rate for females (6·13 per 1,000 living females) was nearly twice as high as that for males (3·56 per 1,000 living males), and the rate for females was higher at all ages except between 2 and 3 years. The disease was most prevalent during the late summer and autumn, and was fairly well maintained even during the winter, but with a downward trend which continued till the end of the year. Whilst, therefore, the seasonal incidence exhibited the usual autumnal rise, this seems to have been unduly prolonged into the winter owing to the epidemic prevalence of the disease. The attack rate was higher for the metropolitan district (5·75) than for the country (4·29) (Table XIV). But the comparison made in Table XIV shows that the rate for metropolitan municipalities (5·75) was much less than that for country municipalities (7·21), and that the apparently lower rate in the country was entirely due to the slight incidence upon the sparsely-populated police districts (2·51). The greater proportionate incidence upon country municipalities is further shown by the figures in Table XXII. Wilcannia, with an incidence rate of 55·61 per 1,000 inhabitants, suffered more severely than any other place in the Colony. Next in order came Yass (40·95), Carcoar (32·31), Inverell (32·01), and Parkes (29·69). Then follows the metropolitan municipality Willoughby (28·97); but between it and the next highest metropolitan municipality (Mosman, 13·23) there intervenes a whole series of country places—Molong (26·67), Murrumburrah (26·67), Cudgegong (24·81), Mudgee (24·31), Goulburn (22·58), Bega (20·22), Adamstown (20·14), Ulladulla (17·86), Wingham (16·81), Muswellbrook (16·62), Coonamble (15·87), Richmond (15·83), Burrowa (15·81), Mittagong (15·46), Cobar (14·38), Glen Innes (14·06), Temora (13·77), Katoomba (13·68), and Warren (13·58). In the metropolitan district the only municipality from which no cases were notified was Marsfield, which has a very low density and scattered dwellings. In the country several places appear to have been unvisited by the disease.

67. *Mortality.*—The notified deaths from scarlet fever in the whole Colony during 1898 numbered 51, a mortality at the rate of 0·4 per 1,000. By comparison with the "permissible" mortality of English sanitarians (4 per 1,000) our rate during the past year was extremely low. For this Colony the rate is an exceptionally low one, having been as low once (1896) and lower twice (1878 and 1891) only during the past twenty years (Table XIII). The mortality rates were highest in persons under 10 years, but especially in young children between 2 and 3 years. In this respect the disease exhibited the same characters as in England. There was no mortality at ages over 35 years. The death-rate was higher in females than in males, and this obtained for all ages except between 3 and 5 years. The seasonal mortality was very irregular, the maximum number of deaths per fortnight (6) being reported twice—in February and in August. So far as the small numbers admit of decision, the seasonal mortality would not appear to have followed the incidence very closely. The death-rate was higher in the metropolitan district (0·5) than in the country (0·3), and this holds also for the respective municipalities (0·6 as compared with 0·4) (Table XIV). In the police districts the mortality rate was 0·2 per 1,000. Deaths occurred in 14 of the 41 metropolitan municipalities, the highest rate being for Kogarah (3 per 1,000 inhabitants), but closely approached in Waverley (2·9) and Annandale (2·6). In the country deaths occurred in 11 on the 143 notification districts, the highest rate being for Inverell (1·17 per 1,000 inhabitants).

69. *Incidence.*—The notification returns show that during 1898 diphtheria attacked 1,493 persons in this Colony, an incidence at the rate of 1·12 per 1,000 of the estimated mean population. (Table XVI.) As usual with diphtheria the main incidence was upon persons between 1 and 15 years of age, with a special predilection for children between 3 and 5 years old (Table XVI). There were 31 cases in infants under 1 year of age, and 3 of these were in babies under 6 months old. The incidence was not above the mean at any age over 15 years. The incidence rate for males, ·85 per 1,000, was less than that for females, 1·43 per 1,000, and the greater incidence upon females holds good at all ages above 3 years, except the age-group 0-5. The special liability of females to attack by diphtheria is in accordance with the results of English observations, and is attributed to the greater opportunities for direct infection to which females are exposed by reason of their domestic life and habits. The disease was most prevalent in the autumn, with the maximum in May (Table XVII), and less prevalent in the spring and early summer. The attack rate was higher in the metropolitan district (1·45) than in the country (·96) (Table XVI); but the attack rate for country municipalities (1·51) was higher than that for metropolitan municipalities (1·45); and was lowest (·63) in police districts (Table XXII). The incidence in individual municipalities (Table XXII) was highest in Dungog, 13·79 per 1,000 inhabitants, followed in order by Cowra, 8·54; Coonamble, 7·94; Parkes, 7·50; East Maitland, 7·48; and Bega, 6·45. In the metropolitan district North Sydney, 4·05; Ryde, 4·04; Hurstville, 3·87; and Hunter's Hill, 3·46 were the places most affected.

70. *Mortality.*—There were 126 deaths from diphtheria notified during the year, a mortality at the rate of ·09 per 1,000 of the estimated mean population (Table XVI). This rate is below the "permissible" mortality (1 per 1,000) of English sanitarians. For this Colony it was as low as it has ever been during the last twenty-four years (Table XIII), but not lower than in 1897. The death-rate was above the mean at all ages under 10 years; the maximum rate being for age group 1-2 years. The mortality was higher for females (·11) than for males (·08), and this relationship is preserved in all ages except under 1 year and between 4 and 5 years. The mortality was highest in the autumn, but remained high during the winter, there being little substantial decline until September (Table XVII). The death-rate was higher in the metropolitan district (·17 per 1,000) than in the country (·06 per 1,000) (Table XVI). Reference to Table XXII will show that the rate for metropolitan municipalities (·18) was much higher than that for country municipalities (·08), and that it was lowest in police districts (·04). The rate for individual municipalities was highest at Forbes, 1·90, but was nearly approached at Coonamble, 1·59. In the metropolitan district the highest rates were at Kogarah, ·60, and Hurstville, ·50.

71. *Fatality.*—The fatality from diphtheria during 1898 was at the rate of 8·45 per cent. of notified cases (Table XVI). It is impossible to make any precise comparison between this and the English rate at the present time, since the latest data available have reference to a period prior to the introduction of treatment by curative serum—"antitoxin." But there is no doubt that the recorded rate for this Colony during the past year is very low. The rate was above the mean only at ages up to 5 years, and was highest for age-group 1-2 year. The fatality was higher for males (9·52 per cent.) than for females (7·68 per cent.), but notwithstanding this, the rates for females were higher at all ages except under 1 year, and between 4 and 5 years, and for age-group 0-5 years. The fatality rates were highest during the winter months (Table XVII). The fatality in the metropolitan district, 12·23 per cent., was much higher than in the country, 5·79 per cent. (Table XVI); and higher also in metropolitan (12·23 per cent.) than in country municipalities (5·17 per cent.) In police districts, the fatality, 6·70 per cent., was a little higher than in country municipalities. The rates for individual municipalities (Table XXII) exhibit a range from 0 per cent. to 100 per cent. The latter proportion was usually the result of a single case with a fatal issue (Narramine, Canterbury). At Albury, the fatality was

72. *Incidence.*—The notification returns show that during 1898 typhoid fever attacked 3,302 persons in this Colony—an incidence at the rate of 2.47 per 1,000 of the estimated mean population (Table XVIII). As there were no epidemics of consequence during the year, this rate may be taken as representing the endemic incidence of the disease. As usual with typhoid, the main incidence was upon persons between 10 and 25 years of age, with a special predilection for age-group 10 to 15 years. The attack rate for infants was insignificant, and it was not above the mean at any age under 5 years nor over 35 years. The incidence upon males (2.56 per 1,000 living males) was slightly higher than that for females (2.36 per 1,000 living females), though the difference between the sexes (2 per 1,000) was not marked. The attack rate for males was higher at all ages except between 3 and 4 years and above 35 years; but, even at these ages, there was little difference between the sexes. The disease was most prevalent during the autumn and least during the spring—a seasonal course similar to that exhibited by the disease in England (Table XIX). The rate was higher in the country (2.71 per 1,000 of the estimated mean country population) than in the Metropolitan district (1.95 per 1,000 of the estimated mean Metropolitan population) (Table XVIII). At first sight, this would appear to be at variance with the accepted opinion that typhoid is more especially a disease of towns; but a glance at the statements in Table XX will explain this apparent discord. A certain proportion of the residents in the country districts of this report virtually live under urban conditions. The numbers so living are approximately represented by the figures for country Municipalities, and the real country population by the figures for police districts. Compared on this basis, the incidence rate for the extra Metropolitan urban communities (4.74) is greatly in excess of that for the Metropolitan population (1.95), whilst the rate for the sparsely populated police districts (1.48) is the lowest. The state of affairs was thus exactly as might have been anticipated from a general knowledge of the usual behaviour of typhoid fever. It is satisfactory to find the incidence rate on the Metropolitan population almost as low as that upon rural communities, *i.e.*, police districts, but it is evident that there is room for much improvement in the case of country towns. The details contained in Table XXII will show that the incidence in some country Municipalities was extremely high. Thus Tumut, with an incidence rate of 34.94 per 1,000 inhabitants, suffered more severely than any other place in the Colony; and Blayney (33.60), Bourke (27.35), Wilcannia (25.37), Bingara (23.31), Greta (22.12), Cootamundra (15.92), Temora (15.74), Dungog (14.66), and Parkes (14.06), show unduly high rates. In the Metropolitan district the highest rate was for St. Peters, 7.27 per 1,000 inhabitants; followed, in order, by Canterbury, 6.57; Burwood, 6.00; Lane Cove, 4.83; Enfield, 4.68; Concord, 4.68; Leichhardt, 4.29; Ashfield, 3.82; Manly, 3.81; and Five Dock, 3.57. In the Metropolitan district no cases were reported from Marsfield nor Vaucluse. In the country several places appear to have escaped visitation by the disease. The special attention of the Department was required in the case of minor local outbreaks at Manly, Bulahdelah, and Canterbury, accounts of which will be found elsewhere in this report.

73. *Mortality.*—There were 245 deaths from typhoid fever notified during 1898—a mortality at the rate of .18 per 1,000 of the estimated mean population (Table XVIII). This rate is below the "permissible" mortality (.2) of English sanitarians. For this Colony it was as low as it has ever been during the last twenty-four years, but not lower than in 1893, and but little lower than in 1890 (Table XIII). The death-rates were highest in persons between 10 and 35 years of age, but especially in age-group 20–25 years. In this respect the disease exhibited the same characters as in England, except that the recession of the English rate at ages between 5 and 15 years was not apparent in the returns under consideration. The mortality rate was not above the mean at any age under 10 years nor over 45 years. The period of high rates—*i.e.*, rates above the mean—had a slightly longer age extent in the case of mortality (10 to 45 years) than in the case of incidence (5 to 35 years). The death-rate was very slightly higher in males than

than in females, the difference amounting to .06 per 1,000. The death-rate for males was higher than that for females at all ages except between 15 and 20 years, and between 45 and 55 years. The seasonal mortality, like the incidence, was greatest in the autumn and least in the spring (Table XIX). The death-rate (Table XVIII) was higher in the country (.20 per 1,000) than in the metropolitan district (.13 per 1,000). Reference to Table XX will show that the death-rate was higher in the country (.33) than in metropolitan municipalities (.14); and that in the latter the rate was but little higher than in police districts (.13). The mortality rate was highest at Wilcannia (7.80 per 1,000 inhabitants—Table XXII), and next in order came a series of country places, the most important of which are Bourke, 3.24; Blayney, 3.20; Dungog, 2.59; and Tumut, 2.23. In the metropolitan district the highest death-rate was at St. Peters (1.09 per 1,000 inhabitants), and next in order at Botany, .78; and Five Dock, .71.

74. *Fatality*.—The fatality from typhoid fever during 1898 was at the rate of 7.42 per cent. of notified cases (Table XVIII). This is very much below the usual English rate of about 17 per cent. The liability to a fatal issue was in general in direct proportion to the age, the maximum rate being in persons over 55 years of age; but there were recessions in the course of the fatality at age-groups 10 to 15 years and 45 to 55 years. Save in children between 1 and 2 years of age, the fatality was not above the mean at any age under 15 years. Termination in death was more frequent in males (8.21 per cent.) than in females (6.49 per cent.), the difference between the sexes in this respect amounting to 1.72 per cent. The fatality rates, though somewhat irregular, were distinctly highest during the winter months (Table XIX), at a season of the year, therefore, when both incidence and mortality were comparatively low. The fatality was a little higher in the country (7.55 per cent.) than in the metropolitan district (7.04 per cent.—Table XVIII). A comparison between the rates for country (7.00 per cent.) and metropolitan municipalities (7.04 per cent.) shows that there was little difference between them in this respect. In view of the marked difference of incidence it would appear that typhoid fever was much less fatal in country towns than in the metropolis. The highest fatality rate (8.61 per cent.) was in police districts, this being no doubt dependent on the difficulties in the way of obtaining skilled attention, medical comforts, &c. The highest fatality in country municipalities (Table XXII) was at Gunnedah (33.33 per cent.), and Cudgegong (33.33 per cent.), but nearly approached at Wilcannia (30.77 per cent.). In the metropolitan district the highest rate was at Botany (28.57), followed in order by Kogarah (25.00 per cent.) and Five Dock (20.00 per cent.).

75. In view of the statistical evidence collected, it would appear that during 1898 typhoid fever displayed even less than its usual moderate virulence in this Colony. Judged by English standards there is reason to be thankful; but even at that the burden is yet heavy, for as the evidence clearly shows, typhoid selects its principal victims from amongst persons in the prime of life—at a period of their existence when they are at their best as individuals and most useful as members of the community. The significance of this fact may be illustrated by the following examples:—Amongst the persons attacked during 1898 there were 773 males, aged between 20 and 45 years—that is, bread-winners and supporters of families. Of these, ninety died—an irreparable loss of 11.6 per cent. The 683 survivors were each invalided for probably not less than two months; the aggregate incapacity for work thus amounting to about 5,461 weeks. If the probable loss in wages be estimated, even on the low figure of £1 per week, the loss in money due to their illness was, at the lowest, nearly £5,500. No doubt the actual loss in wages was very much greater, even in the particular class selected. Of the other costs in money, in misery, and in death, no estimate is possible; but the example given is sufficiently indicative of the expensiveness of typhoid fever.

LOCAL INCIDENCE OF NOTIFIED CASES OF THE INFECTIOUS DISEASES.

76. The objects of notification are, in the main, two; early knowledge of the occurrence of the first cases which occur in neighbourhoods, with a view to their prompt isolation in a sanatorium so as to prevent them from starting a general epidemic; and, secondly, record of the localities in which such cases occur, and the different proportions in which they occur in different localities, with a view to careful inspection and sanitary improvement of those neighbourhoods on which the recorded incidence is heaviest.

77. With reference to the second of the above objects, the two tables, XXI and XXII, show the estimated population, number of houses, area in acres, density of persons and of houses per acre, and the number of persons per house, in each of the municipalities in the metropolitan area, and in the remainder of New South Wales, together with the number of notified cases of each kind, the number of registered deaths

deaths from each, the case-rate and death-rate per 1000 persons living, and the fatality-rate per cent. It should be noted with reference to the last-mentioned rates that the numbers dealt with are too small to give them absolute value, but also that their value will increase with each successive year of record.

78. This statement is made with reference to municipal districts only, because these comprise the populous portions of New South Wales.

TABLE XXI, showing the Incidence of notified Cases of Infectious Disease on the Municipalities comprised in the Metropolitan District:—

INFECTIOUS DISEASES SUPERVISION ACT, 1881 (SMALL-POX).

79. Only two cases were reported during the year as reasonably suspected to be small-pox. They occurred at the following places:—Prince Alfred Hospital; North German Lloyd S.S. "Bremen" (at the Quay).

The first was a case of chicken-pox, the second of syphilis.

LEPROSY ACT, 1890.

80. During the year, nine cases of illness were reported to the Board under this Act. It was found that six were cases of leprosy, while three were cases of some other disease. Of the six lepers, warrants were issued for removal of four to the lazaret; one of them was a Chinese woman; the other three were whites of native birth, who had never left New South Wales, nor travelled far within it. The remaining two lepers were Chinese males; one of them was admitted to Sydney Hospital, suffering from beri-beri (wet form), and was observed to be suffering also from leprosy (*lepra nervorum*) as soon as he recovered somewhat from the anasarca; his case as regards leprosy was probably of very old standing, and not well marked; he died in the hospital soon afterwards of beri-beri. The second was in an early stage of tuberous leprosy, and was allowed to return to his own country on expressing his willingness to do so. Aetiological, clinical, and pathological reports on these cases are published in a separate paper, as usual.

SPECIAL INQUIRIES TOUCHING OUTBREAKS OF INFECTIOUS DISEASE.

81. On several occasions special inquiries into local epidemics have been necessary. The three following, which all had reference to typhoid or enteric fever, are worth noting.

Bulahdelah.—This is a small village, in latitude 152°15' E., longitude 32°30' S., on the Myall River. The outbreak occurred at, and was confined to, a hamlet about a mile distant. The following minute made on the full report, which it is unnecessary to reproduce, sufficiently describes the matter:—

The outbreak of typhoid fever in the neighbourhood of Bulahdelah is a fair example of a class of events which is still far too common in New South Wales. It illustrates both causes and effects in a more than usually striking way; but this is due rather to the care with which the Principal Assistant Medical Officer of the Government (Dr. Frank Tidswell) has investigated it, and to the effective manner in which he has described its salient points, than to the facts themselves. The latter are such as are usually met with on similar occasions, though they are not always revealed.

The sequence of events was, and generally is, as follows:—Labour being required at some new centre, which may be a saw-mill, or a mine, &c., &c., and the work being likely to continue for a long time, cottages are erected by the workmen, which are roughly constructed, placed haphazard, usually without enclosures round them, and generally overcrowded. Household wastes are thrown on the surface of the land about each dwelling, and either some rough structure erected over a shallow hole scratched in the soil is made to serve the purposes of a privy, or perhaps no privy at all is provided. From the same area of soil which receives the household wastes, and contains the cesspit, drinking water is drawn by means of shallow wells, which are quite inadequately constructed, and which, though usually covered, are unprovided with any coaming, and, consequently, do not prevent the inflow of foul water to them from the surrounding surface. For a long time the inhabitants live under these unwholesome conditions without suffering any illness which attracts attention, though their general health is often deteriorated by them. At last some person who has caught typhoid fever at a distance joins the little community, and presently communicates the infection of that disease,—not to other inhabitants directly, but, in the first place, to the soil of the inhabited area. Thence, after soaking through the earth, the infection reaches the wells; the infected water is drunk, and then the disease begins to assume epidemic proportions. Cesspit after cesspit, or spot after spot, becomes specifically infected; well after well takes the infection from the cesspits or the infected spots, and the end is that all the community who are not protected by having had a previous attack of the fever suffer, with exception of a few who are either lucky enough to avoid taking the infection, or, if they do take it, have at the time a habit of body (previous attack, for instance) which enables them to throw it off without falling ill.

In the present instance the centre was a saw-mill, and the imported case with which the epidemic probably began was identified. The total population endangered numbered about 70 persons; no less than 47 suffered, and 7 of them (or 14·6 per cent.) died. Terror struck the neighbouring villagers, and the infected hamlet was thrown very much on its own resources. It became necessary to officially engage the services of the medical practitioner resident in the neighbourhood (Dr. Thrower), to establish a temporary hospital; to despatch two experienced nurses and a male member of the Maritime Quarantine Staff; to request the Inspector-General of Police to post an experienced officer on the spot; and to place direction of the whole service under the Principal Assistant Medical Officer, who visited the locality. The total direct expense to the Government of these measures amounted to more than £300; but the indirect losses caused by sickness and death must not be lost sight of. It is gratifying to be able to say that the number of fresh cases which occurred declined steadily from the time the epidemic fell under suitable skilled management; and there seems reason to believe that the instructions given to the survivors, together with the material improvements effected by the staff mentioned, have extinguished the infection, or at all events have placed it under a restraint which, it may be hoped, will be effectual for the future.

82. *Bolwarra*.—The outbreak at this village, which is situated about 2 miles from West Maitland, did not reach alarming proportions, but yet demanded special attention. There were 25 houses in the village, situated on high land in open country; 5 were invaded, and they yielded 8 cases; each invaded house took its drinking-water from overground tanks filled from iron or shingle roofs; all were furnished with cesspits; each had a separate milk-supply. The incidence of the disease was entirely on servant girls and children; but careful inquiry failed both to elicit the cause of this limitation, and to reveal any probability of spread by personal contact. The houses were in good order as to three of them, in fair order as regards two. Some minor nuisances were observed in the village. The notification register showed an undue incidence of the disease on the whole of the West Maitland district, as compared with other districts. It was asserted that typhoid had not occurred at Bolwarra for sixteen years; but after inquiry it remained doubtful whether some cases of illness which had occurred during 1897 might not have been typhoid fever. The Principal Assistant Medical Officer, who conducted the inquiry, concluded that

that the probable cause could be discovered only by a detailed investigation, which should include much of the surrounding district for comparative and other purposes; and he drew attention to the extreme prevalence of cesspits in West Maitland (the neighbouring town), both in use, and abandoned without having been first emptied. He suggested, in conclusion, that the small epidemic was perhaps due to infection localised either at Bolwarra or at West Maitland, and recrudescing under seasonal conditions. The case was not further pursued.

83. *Mainly: Church Industrial School.*—There were about 100 residents—girls of from about 5 years to 17 years old and the Sisterhood. Laundry work was carried on, the linen being received from houses in the town; to the school some town-children also went as day-scholars; the children who did not work in the laundry were usually taken through the town to the beach during the day. The children attacked had nothing to do with the laundry; careful inquiry failed to reveal anything in common between them, beyond the fact of their living under one roof. Between January 8th and 15th, 7 children fell ill. Milk was supplied from cows possessed by the institution. Water was taken from three sources—from the service main, and this was used for washing, etc., only; from tanks; and from a well, called “artesian,” but probably not of that description, and this furnished the drinking water. The well-water was found to afford evidence of pollution with recent sewage of some kind,—the closets were furnished with pails, emptied by the Local Authority. There were only some minor general defects—evidences of imperfect drainage from the laundry, and of insufficient tidiness of parts of the premises. The inmates were recommended to discontinue the use of the well-water, and to substitute service-water for drinking, boiled before use (though no suspicion attached to it). No further cases occurred. Subsequently the Local Authority applied to the Board, as provided by the Public Health Act, section 49 (i), for its consent to closure of the well; this was given, and the well was closed accordingly.

PAMPHLETS ON INFECTIOUS DISEASES.

84. An organisation having been established under the Notification Part of the Public Health Act by which Local Authorities were brought into direct communication with infected households, advantage was taken of it to draw up pamphlets concerning the prevention of scarlet fever, typhoid fever, and diphtheria, to which were added instructions for isolation and disinfection, and an explanation of the law on infectious diseases (see Appendix E, p. 68). And a new regulation was made by which Local Authorities were required to distribute them to infected households at the same time.

SANITATION OF RAILWAY CAMPS, &c.

85. Establishment of camps in various parts of the country where large numbers of workmen were to be employed for varying but rather prolonged periods during construction of public works, has in the past been conducted without any attention to the slight precautions known to be necessary to prevent outbreaks of those diseases which are sure to arise in the presence of filth and with the use of foul water. Accordingly it may be said to be within the knowledge of the Board that no such camp, which has continued long enough, has been established for many years past at which outbreaks of typhoid fever, of dysentery, or of diarrhoea have not occurred. Attention has been drawn to such outbreaks in different ways. Sometimes a municipal authority has feared the extension of the disease to its town, or such extension has actually occurred with lamentable results to the town's people; or a hospital at some distance from the camp has become overloaded with the patients sent in to it, and the Committee has appealed for help to meet expenses which they could not have foreseen, and for the occasion of which neither they nor the Local Authority for the district could be said to be responsible; or the amount of illness and consequent distress at the camp itself have perforce fallen to be dealt with by the local police, and have thus been brought to notice of this Department which has always directed remedial operations, and usually has found the money to pay for them.

86. Under these circumstances the Board's attention has for many years been actively engaged by this matter, though with slight success until recently. The outbreaks most usually occur in connection with railway camps; and these are established by two different authorities, Railway construction is the business of a branch of the Department of Public Works; but maintenance works, duplication of line, deviations, and alterations in the original plan, are the business of the Commissioners for Railways.

87. The circumstances under which such camps are established are necessarily those which exist at the spots where work became necessary. Very often they have to be established in uninhabited country. Sources of running water are rare, and although it is sometimes possible to select a site near a waterhole or creek containing water, often it is necessary to bring water from a distance in iron tanks run on the existing line, or on the new line as far as it has been constructed. This is an unavoidable difficulty, but one which has to be met; and probably the workmen run the best chance of escaping illness when the water has to be brought from a distance—provided the source is not one which has already served a camp, and already become polluted. No effort whatever has usually been made either to secure continued purity of imported water, which was pure at collection, or to protect the purity of any waterhole at the camp. In the former case the imported water is usually turned into service-tanks on the field which are unprovided with taps, or even special dippers, whence, consequently the workmen bail the water by dipping their own vessels into it; in the latter the camp is most often so established on the banks of the creek and waterhole that its pollution with wastes and with human and animal excreta is made a matter of certainty. It has appeared to the Board that it would be but reasonable and quite easy to cause those simple measures to be taken in selection of site and subsequent management which would be taken as a matter of course in connection with the smallest camp established for military purposes; and this view it has diligently kept before the Railway Construction Branch during ten or twelve years past.

88. The practical results have not so far been striking. The first difficulty raised was that, though the work was being done for and under the direction of the Government, the workmen were employed by, and were under direction of, contractors alone. Insertion of a clause in contracts giving the Government power to enforce such sanitation as appeared essential was suggested, and a clause empowering the Engineer-in-Chief to make regulations for the purpose was accordingly inserted. On an occasion which occurred, however, it appeared that, while the clause had been duly inserted in the contract then in course of being carried out, no regulations had been made. Nothing had been done, and disease occurred as usual.

89. As regards Commissioners' camps, the prospect that some systematic action will be taken by them in the near future is more hopeful; although, as regards contractors, the conditions are similar. Attention of the Board was drawn during the year to deviation camps established between Junee and Coolamon, by an appeal for assistance in nursing and money from the committee of the district hospital at Junee, which was overtaxed by cases sent in from them. On inquiry and report made by the Government Medical Officer at Junee (Dr. Button) it appeared that the camps were unregulated, had no latrines but such makeshifts as the workmen erected wherever it suited them, was unscavenged, and that water carried from many miles away was dipped from service tanks in the men's own vessels—the places had been thus occupied during many weeks or several months, and typhoid fever had occurred just before inquiry was made. Those faults were remedied as far as possible, and the Commissioners assisted Junee Hospital Committee with a donation, extra nurses having been supplied by this Department.

90. Some supervision was also exercised by the Board over camps established on the Parkes-Condoblin line (constructing), and at Aberdeen on the Northern main line. On the former works there had been a considerable number of cases of typhoid fever towards the end of 1897, and, in the opinion of the Government Medical Officer at Parkes (Dr. Oswin Johnson), had thence been introduced to the town of Parkes with serious results to the population.

91. Such occurrences are avoidable, and must be prevented. No difficulty should be found in the way of carrying out the recommendations already made by the Board; they are, briefly, as follows:—That contractors should be brought under control in this relation by the articles of contract; that the area to be occupied by the camp should be carefully chosen with reference to the water supply by the engineer-in-charge, and marked out in allotments; that constructed privy houses should be erected over deep pits at selected spots only, accommodation being provided for families apart from single men; that a scavenger should be appointed in charge of them, and of the general surface in and near the camp, and made responsible for cleanliness; that water, if turned into service tanks, should always be drawn from a tap, and never taken by dipping; that waterholes and the like should be guarded—horses, &c., being watered at troughs to be filled by pumping, and not allowed to enter the water, in which, also, bathing and washing clothes should be prohibited; and that instructions as to the dangers of drinking foul water, and, as to the desirability of boiling water before drinking it, should be posted about all camps (see Appendix F, p. 77). There can be no doubt that observance of these precautions would go far to prevent the outbreaks of fever, dysentery, or diarrhœa which hitherto have invariably followed establishment of such camps, and should, therefore, be insisted on by the responsible officers in charge of the works. The country being now placed under Local Authorities which have considerable powers, it has become possible for the Board to cause a little more to be done than was possible in former years; but, without co-operation, and, in the case of each new camp, initiatory action of supervising engineers or engineers-in-charge, the best results are not likely to be attained.

POLLUTION OF RIVERS BY WOOLSCOURING.

92. For many years complaints have been received from different parts of the country concerning alleged pollution of the waters of streams which were drawn upon for domestic use by the washing of greasy wool in them, and by return of the effluent from woolscours established on their banks without previous purification. Inquiry made during the year, through agency of the police, resulted in a return showing that there were 148 woolscours, and that the proprietors of 79 had spontaneously arranged their plants so that the foul effluent either did not return to the stream at all, or did so only after running over the land, and filtering through banks of earth. Thus it appeared that there was no good reason why the remainder should not take similar precautions; and, accordingly, the Inspector-General of Police was requested to cause a copy of the Public Health Act, section 50, to be served on the owner of every woolscour, together with a warning that the provisions of the section would for the future be strictly enforced (see Appendix G, p. 77).

PUBLIC HEALTH ACT. PART VI.—NUISANCES.

93. Many complaints of nuisances reached the Board direct. The following method of dealing with them was followed:—(a) As regards such complaints from all parts of the country, if complainant does not show that he has already appealed unsuccessfully to the Local Authority for the district within which the alleged nuisance exists, he is requested to make such application (see Appendix, H, p. 78). (b) If complainant alleges that he has complained to the Local Authority without success, then the Local Authority is informed, and, if its district forms a part of the Metropolitan or of the Hunter River combined districts, is required to obtain a report on the matter from its Medical Officer of Health within a specified number of days, and to forward a copy to the Department, on which any further action which may appear necessary is taken by the Board (Appendix H, p. 78). (c) Under similar circumstances to those last described, but concerning a district not comprised within a combined district, inquiries are made of the Local Authority concerned, and if the matter requires it, either a report is sought from the Government Medical Officer on the spot, or an officer is despatched from headquarters to inquire further into details. On many occasions the advice and assistance of the Department was sought by Local Authorities themselves.

94. The number, general character of the minor class of complaints, and the manner in which they were dealt with is sufficiently shown in the following Table XXIII:—

Nature of Complaint:—		Action taken:—	
Refuse and drainage nuisances	92	Nuisances abated	70
Nightsoil nuisances	17	*Result not reported	59
Insanitary premises	26	Complaint groundless	11
Noxious trades nuisances	23	Still incomplete	6
		Referred to other Departments	12
Total.....	158	Total.....	158

* In these cases the attention of the Local Authority having been drawn to the matter, and no further communication being received from complainant, it was assumed that the nuisance had been abated.

95. In the case of certain complaints touching more important, more urgent, or more complicated matters, the Sanitary Inspector (Mr. P. E. Getting) was directed to make special inquiry and report. Among such cases the following may be mentioned:—

Albury.—General report on the disposal of nightsoil, garbage, and slop-waters.

Orange and East Orange.—As to methods and plant in use for collection and disposal of nightsoil.

Moss Vale.—As to pollution of the catchment area of the local water supply by large piggeries.

Bathurst.—As to methods and plant used in collection and disposal of nightsoil.

Tamworth.—Revisited to ascertain result of inquiry into methods of nightsoil-scavenging, and recommendations made.

Newcastle.—To ascertain what steps had been taken by the Local Authority consequent on proclamation of the municipality to be a sanitary area. (Public Health Act, section 48.)

Braidwood.—To inquire into ground of local agitation for repeal of proclamation declaring the municipality to be a sanitary area.

Mudgee.—On perusal of proposed by-laws under the Nuisances (Consolidation) Act, it was observed that the Local Authority desired to omit a portion of the municipality from operation of some of them; to examine the ground of exception.

96. There was also occasion to make similar inquiries regarding the large gaols at Parramatta, Bathurst, and Orange, which have walled gardens in which the Comptroller-General of Prisons proposed to use the gaol nightsoil for manurial purposes. Eventually this course was permitted on condition that the soil was run into furrows between 6 and 9 inches deep, and there intimately mixed with the earth by spading at once on deposit; and, as two of these establishments stood within municipalities, advantage was taken of the Nuisances Prevention (Consolidation) Statute, 1897, section 20, to except them from its general provisions and from operation of municipal by-laws.

97. In still other cases which occurred in districts which lay outside a combined district, assistance was sought from medical men residing in the town or neighbourhood of the matter requiring attention, by requesting them to make inquiry on special points and to report; and for this duty one or other of the Government Medical Officers was referred to as a rule.

98. But there remained a comparatively small number of cases which, for one reason or another—their urgency, apparent difficulty, or the nature of the interests involved—seemed to require the attention of a medical officer of the Headquarters Staff, occasionally in the first place, and occasionally after preliminary inquiries and reports, had served to define the important points under consideration. These were entrusted to the Principal Assistant Medical Officer for the most part, and he inquired into the following:—

Ashfield.—Methods and means of garbage disposal.

Strathfield.—Sanitary state of Strathfield post-office.

Leichhardt.—Special inspection of dairy premises.

Waterloo.—State and uses of storm-water drains.

There were also others which had a local, but little general, importance to which it is necessary only to refer.

99. As regards the combined districts, the number of direct references to the Department on minor matters of this kind diminished as the year went on, and as the nature of the relationship between the Medical Officers of Health and Local Authorities began to be better understood, as had been expected.

BY-LAWS UNDER NUISANCES PREVENTION (CONSOLIDATION) ACT, 1897:—

100. This Act is not administered by the Board, but when municipal councils propose to adopt new, or to amend existing, by-laws, the draft, after having been passed and duly sealed by the council, is referred to the Board for perusal, in view of the power it has under the Public Health Act, section 18, of amending, altering, or repealing any by-laws made for preservation of the public health, which in its opinion are unsuitable or improper.

101. Proposed by-laws under this Act were perused and passed, or amended, altered, or struck out, as the case seemed to require, in the case of the following municipalities:—

Ballina.	Tenterfield.	Warren.
Tumut.	Dubbo.	Bourke.
Mudgee.	Uralla.	Braidwood.
Armidale.	Orange.	Parramatta.
Taree.	Bathurst.	

102. The objects kept in view in considering such by-laws are prevention of construction of fresh cess-pits, abolition of existing pits, extension of pail-closets, prevention of collection and disposal by any but the appointed scavenger at the appointed place; and, whenever possible, introduction of the double-pail service, and daylight removal in suitable waggons, with assistance of air-tight lids to the full pails. Better conservancy of nightsoil, and greater freedom from pollution of the soil with it, appear to be important considerations in a country where typhoid fever is prevalent in almost every unsewered and populous area for more than six months of the year. A circular on this subject was supplied to all Local Authorities for distribution (see Appendix I, p. 78).

UNHEALTHY BUILDING AREAS.—PART V.

103. The practice of levelling irregular sites, and of filling up old excavations preparatory to erection of dwellings has been not less prevalent in the town areas of New South Wales than elsewhere. A flagrant and remarkable instance which occurred in the Borough of Redfern was made the subject of special report by the Board in 1892, when, also, the subject in general was reviewed. No power to prevent this dangerous method existed, and it continued to be followed.

104. Two causes contribute to perpetuate it. Proprietors of irregular sites which cannot be built upon until they have been levelled, are anxious to prepare them at least cost, and can usually get house-refuse and street-sweepings tipped on their land for nothing; but it was ascertained during the year that, in one case at least, the proprietor of the land was actually charged a small sum by the Municipal Council for each load tipped. Secondly, municipal councils which collect house-refuse, are (with the single exception of North Sydney, population 19,300) unprovided with the only means of disposal which in practice has been found effectual, namely, a destructor; and, consequently, they are relieved of a difficulty and of expense if they can persuade themselves that it may be used in the manner now referred to without danger to health, for the tips placed at their disposal in building neighbourhoods are usually more centrally situated than the more or less remote corners, which alone they are themselves able to set aside for this purpose.

105. With these facts in view, section 37 was introduced into Part 5 of the Public Health Act; it gives the Board power to make inquiry concerning any land; and if in its opinion it would be prejudicial to health to build upon it in its then condition, it may so report to the Minister. The Minister may then declare that it shall not be built upon until the measures recommended by the Board have been taken. For the purposes of inquiry any authorised person may enter any land, dig holes therein, and remove the soil thereof.

106. Under this section action was taken by the Board in the following cases:—

	Situation.	Owner.	Area.	Date of Gazette.
1	Septimus-street, Erskineville	Alderman Robinson.....	14½ perches	13 April.
2	Pleasant-street, „	D. Monk	35½ „	6 June.
3	George-street, „	J. Stone.....	12 „	26 July.
4	Elizabeth-street, Camperdown	R. B. Preston	3 acres	23 August.
5	John-street, Waterloo	Cooper Estate	1 acre 2 roods	18 November.

In the first case the area on which a cottage was being built in an urban district was being made up with house-refuse. The effect of the proceeding was to cause the offensive rubbish to be forthwith removed and clean earth substituted for it; building was then allowed to proceed. In the second and third cases small water-holes, or the like, had long ago been filled up with house-refuse and street-sweepings, as was ascertained by digging trial holes, and was advertised for sale for building purposes; building was interdicted until the refuse should have been removed. In the fourth and fifth cases very large quantities of house-refuse had been tipped during several years past on land which might be used for building purposes, and which, though situated in populous neighbourhoods, had been the appointed municipal tip for such refuse; in these cases also use of the land for building purposes was interdicted until the rubbish should have been removed.

107. It is to be observed that proceedings were taken by the Board in these instances; that they were not requested to move by the Local Authorities of either of the three municipalities concerned; and that, although complaints of nuisance caused by municipal garbage-tips are not infrequently made to the Board by ratepayers, in no case has a municipality requested the Board's assistance in procuring abatement of the nuisance by proclamation under the Public Health Act, section 37.

NOXIOUS TRADES AND CATTLE-SLAUGHTERING ACT, 1894.

PART I—NOXIOUS TRADES.

Sanitary Inspector—Mr. Paul E. Getting, A.I.S.E.

108. The Board's function under this Act is, briefly, (a) to declare which trades shall be reckoned noxious; (b) to frame by-laws for regulating them; (c) after inspection to give or withhold permission to Local Authorities to issue licenses; (d) and thereafter to supervise Local Authorities in their execution of the Act and by-laws.

109. The Act now applies to the following trades, for governance of which three sets of by-laws suitable to each class of trade have been framed, as under:—

Class A.	Class B.	Class C.
Fat-melter.	Fig-keeper.	Gut-scrapers.
Fat-extractor.	Poultry-farmer.	
Bone-boiler.		
Bone-grinder.		
Blood-boiler.		
Blood-drier.		
Glue-maker.		
Soup-drier.		

But its operation is confined to the county of Cumberland, and to the municipality of Moree, in the county of Courallie, to which it was extended by proclamation at request of the Municipal Council on 7th December, 1898.

110. The following Table shows that the number of licenses current on 31st December was greater in all three classes than at end of the previous year ; in Class A by 3, Class B by 10, Class C by 5:—

TABLE XXIV.—Showing the number, nature, and distribution of the Noxious Trades carried on, the number of current licenses on 31st December, 1898, and the number of visits to such premises paid by the Sanitary Inspector during the year.

111. It was necessary on several occasions to prosecute traders for offences against the by-laws, and the informations were laid in some cases by the inspector to the Local Authority ; but in others by the Board's sanitary inspector, as shown in the Table below. The more important prosecutions were against fat-extractors, and this class is found chiefly in the Borough of Alexandria, where, consequently, they are well represented on the Council, which is the Local Authority under the Act, the Mayor for the year having been a fat-extractor, and having himself been summoned and fined for offences against the by-laws. Under these circumstances the inspector to the Local Authority has a difficult duty to perform, and one which he cannot duly execute unless the Council is with him ; hence the need not merely for intervention of the Board's inspector as prosecutor of offenders, but also for a constant exercise of active supervision over the traders in the district.

NOTE.—On 31st December, 1898, three prosecutions of traders in Alexandria and North Botany were pending.

112. That the administration of the Act has been eminently successful in abating the nuisances formerly caused by these traders was proved during the year in the following way:—On the 23rd August a trader in the Borough of Alexandria was summoned by the inspector to the Local Authority for allowing offensive vapours to escape from his works. The accused was represented by his solicitor, but the Local Authority was represented by its inspector only. The solicitor for the defence raised the point that Local Authorities under this Act were not empowered by it to institute such proceedings, and the Magistrate allowed it, and dismissed the case. The Local Authority did not appeal. The Board was advised that there was nothing in the point; but this case made it necessary for its Sanitary Inspector to keep watch over the district with a view to instituting proceedings should any infringement of the law be detected by him, and such infringement was detected, and successful proceedings taken on December 8th—that is to say, twelve weeks after dismissal of the case referred to above. During this interval several traders, believing themselves free from danger of prosecution, had conducted their business as it suited them. Now, on December 9th, a deputation of Members of the Assembly and Mayors of surrounding Boroughs, some of them at a great distance from Alexandria, was received by the President; it complained that the offensive smells which in former years they had been accustomed to, but which, they said, had entirely ceased, had recurred and were intolerable; and they set the date of commencement of the recurrence at some time (no note of it having been made) about three or four months ago. The necessity for this law, and the success of the Board's administration of it were thus proved in the most practical way; and it is not at all likely that a similar occasion will be allowed to recur, traders having thus learned that they could not conduct their business without due regard for their neighbours without raising an outcry which was practically universal, and therefore not to be resisted.

113. Nevertheless, although all-important and far-reaching nuisances have been stayed, it is the case that the atmosphere in the near neighbourhood of some works is far from being free from offence. This matter will receive attention during the coming year. The policy hitherto pursued has been to tell traders that they must obey the by-laws so as to avoid causing a nuisance, but not to desire them to adopt any particular arrangement of their plant. This course must for the future be modified, and in view of the practical experience gained during the past five years may safely be modified. The Sanitary Inspector was accordingly directed to prepare the accompanying sheet of drawings and explanatory description. The most important points are complete control of all gases and vapours by conducting them to a chemical chamber; and adoption of that form of the two chambers hitherto in use (Annual Report, 1897, p. 12), which experience, dating from 1895, has shown to be efficient and in every respect satisfactory.

DESCRIPTION OF A FAT-EXTRACTING PLANT DESIGNED TO AVOID NUISANCE.

In tracing the gases from the digester it will be seen that they are first condensed as far as possible in a surface condenser, formed of convoluted piping, on which a spray of cold water descends from an overhead trough.

The condensed portion of the vapours is caught in a sealed receptacle which can be emptied into the sewer at will. The free vapours are then allowed to pass on to the chemical chamber.

The chemical chamber shown in the diagram is one of "Somes' Patent" and consists of a series of bays of compartments built of concrete with wooden doors, and furnished with a succession of wooden trays placed zigzag fashion, as shown in cross-section C-D. The large absorbing surfaces thus presented do not necessitate any mechanical means such as blowers or fans to draw the gases through the chemical absorbent.

The chemicals used are slacked lime and ferric oxide. These are spread on the shelves to a depth of 2 or 3 inches, the former where the gases first enter and the latter in the third or last compartment.

The lime absorbs the sulphuretted hydrogen and volatile acid fat vapours until the carbonic acid gas gradually expels the former from the lime. The sulphuretted hydrogen is then absorbed by the ferric oxide. So effectual is the agency of lime and ferric oxide that no darkening of lead acetate test papers, placed upon the examining vent of the chamber, is noticed.

The plant is so arranged as to prevent any offensive vapours escaping into the open air without having previously passed through the condenser and the chemical chamber. All unnecessary cocks and valves are cut out so as to prevent a careless trader from "blowing off" into the atmosphere. Formerly safety valves were found on all digesters, but this sort of appliance has been discarded by nearly all the traders, on the following grounds:—The valve-seats become corroded, and either stick fast just when they are most needed, or else they allow the gases to escape as soon as they are generated. If the steam-boiler carries more pressure than required for boiling, then a safety valve can be inserted between the boiler and the stop-valve on digester. If a still better safeguard is required, some kind of reducing valve can be fitted.

The tallow and soup receivers are also connected with the condenser and chamber, and it only requires a small puff of steam from the boiler to be blown into the condenser to create a vacuum when all offensive odours would be drawn out of these receivers and dealt with in the chamber.

The majority of traders are in the habit of drying their "hash" after the soup and tallow have been blown over, with clean dry steam. Even this steam, after fulfilling its duties is charged with most offensive gases. With the former appliances the nuisance caused by their escape could not be prevented, but with the plant recommended this can be efficiently and quickly accomplished. It is only necessary after the "hash" has been dried to allow the steam to enter the condenser wherein a vacuum will be created by the condensing of this steam, and thus all offensive gases will be drawn out of the "hash" in a few minutes. The vapours are then conducted to the chemical chamber in the ordinary way. The effect of allowing these gases to escape into the atmosphere can be traced on the galvanized iron immediately over digesters. On examination this will be found seriously corroded, at times even worn through.

With small modifications such plant has been erected at Elliott's, Botany; Charlish's, Lane Cove; Godfery's Alexandria; and Northcote's, at Canterbury. I have paid frequent visits to these works, and found that the apparatus will act efficiently if properly fitted.

One of the main objects held in view when designing this plant was to simplify the process as much as possible. Indolent and careless workmen are often the cause of much complaint, but with the contrivances shown on the diagram any nuisance could be reduced to a minimum. This is achieved principally by the perfect control which is exercised over all gases and effluvia.

The cost of this plant is not nearly so high as estimated by the trade, the chemicals used are cheap and easily procured, and as the chamber only requires replenishing once in three or four months this apparatus has very many advantages over the old and defective appliances still in use at some places.

P. E. GETTING.

114. Inspection, regulation, and licensing of traders carrying on the businesses of pig and poultry farmers—being traders who keep pigs or poultry for purposes of trade, and who receive on their premises, kitchen, butcher's, or slaughterhouse wastes, or other putrescible material—began about the middle of 1897. Down to that date the operations of such traders had been a constant source of complaint in every municipality where they carried on their business. Operation of the by-laws (see Appendix M, report 1897), and execution of the Act was the cause, during the months immediately succeeding of many complaints against the Department, and of many tales of oppression and hardship which were made public. But the result can now be described in the following terms:—No complaints from offended neighbours have

have been heard of during the year under review; the number of licenses issued to such traders has increased; a good many such traders have given up feeding their stock on the objectionable materials in which the nuisances they caused arose; and the remainder have at a small initial expense reaped substantial benefits from the improved methods they have been compelled to pursue. Drawings which showed the best method of arranging such premises were appended to the annual report, 1897.

QUARANTINE (CONSOLIDATION) ACT, 1897.

Port Health Officer, Sydney, Dr. W. Peirce.

Port Health Officer, Newcastle, Dr. G. E. Miles.

115. All vessels arriving from ports beyond Australasia were boarded between sunrise and sunset, and inspected in detail, all persons on board included—except such of those vessels as had already received pratique at an Australian port and had not on arrival, nor within fourteen days before arrival, had had any case of infectious disease on board. Against ports in certain parts of the world proclamations were in force; vessels arriving thence were inspected with especial care, and were detained for a few hours while being cleansed. The proclaimed parts were “China, Hongkong, and other ports and places on the East,” “ports and places on the east coast of South Africa between and including Delagoa Bay and the northern boundary of Natal,” and “ports and places on the east coast of South America.” Practically all such vessels were treated in the same way—if they arrived from ports infected with cholera, malaria, yellow fever, or plague, drinking water was discharged, wooden casks burnt, fresh-water tanks limewashed, bilge-water pumped out, all except stone ballast discharged under water, the vessel in general cleansed as far as seemed necessary, and such special parts disinfected as in opinion of the Port Health Officer required that treatment.

116. While there are many ports of entry in New South Wales, for the present purpose it may be said that Sydney and Newcastle are the only ports at which ships coming foreign are entered. The following Table XXVI shows the total tonnage entered at these ports during the year; the number of ships which fell under routine inspection; the number of passengers and crew they carried; and the number which were detained for special action under the rules just described in the preceding paragraph.

Port of Entry.	Vessels entered.		Examined by Health Officers.			No. vessels detained for special action.
	Number.	Total tonnage.	Vessels.	Passengers.	Crews.	
Port Jackson	1,787	2,406,473	369	3,080	17,160	96
Newcastle	680	868,062	138	189	3,394	38
Totals.....	2,467	3,274,535	507	3,269	20,554	134

117. *Smallpox.*—Three mail steamers were quarantined as being infected with smallpox:—

(a) S.S. “Caledonien,” Messageries Maritimes, Marseilles to Sydney; took on board at Suez 33 Arabs of whom 4 were ill; one of them, who had syphilis, was reported by the ship’s surgeon to have become very ill on 19th January, to have developed a rash like varicella, and to have died on 23rd January. The cause of death was thought to have been syphilis, and the rash a part of that disease. She arrived at Albany on 29th January where she landed 8 passengers. On 1st February another of the Arabs received at Suez developed fever and a rash which the surgeon pronounced to be small-pox. The ship was quarantined at Adelaide, where the last-named patient and 9 other persons were landed at the quarantine station. Between Adelaide and Melbourne a New Caledonian kanaka fell ill and subsequently developed small-pox; he was landed in quarantine at Melbourne, together with 11 other persons. The vessel arrived at Sydney on 8th February carrying crew, 170, passengers, 75. She was cleansed and disinfected, and handed over to the agents on 11th February, after a detention of 75 hours. No further case occurred. Persons under detention were released as they reached the fifteenth day from successful revaccination, done either on board or in quarantine; and it was necessary to detain only 45 persons for the full term of 21 days from the date of leaving the infected vessel.

(b) S.S. “Himalaya,” P. & O. Company, London to Sydney, arrived at Albany 16th March, where 11 passengers were landed. On the 17th a lascar was found to be suffering from small-pox, in all probability contracted from coal-lumpers at Colombo. He was landed with 20 other persons at Adelaide in quarantine; 54 others were landed in quarantine at Melbourne, and the vessel reached Sydney, her terminal port, on 25th March, carrying crew, 268, passengers, 61. She was cleansed and disinfected and handed over to the agents on 28th March, after a detention of 74 hours. No further infectious illness occurred. Two hundred and seventy-two persons were successfully revaccinated, either before or on arrival; they were released as the fifteenth day from performance of the operation came round; and it was necessary to detain only 78 of the whole number for the full term of 21 days.

(c) S.S. “Orizaba,” Orient Company, London to Sydney, arrived at Albany 22nd April, and landed 24 passengers. On 22nd April, after the ship had left Albany, a third-class passenger fell ill; no suspicion of small-pox was entertained, and the case was not reported at Adelaide, where 38 passengers landed. Melbourne was reached on 27th April, and there the disease was recognised by the Port Health Officer; the patient, with 62 others, was landed in quarantine, where his mother subsequently developed the disease. The infection had, in all probability, been contracted at Colombo, where the patient slept one night on shore. The ship reached Sydney 1st May, carrying crew 175, passengers 147, and, after cleansing and disinfection, was handed over to the agents on 4th May, after a detention of 75 hours. Revaccination was begun at Melbourne, and continued during the voyage to Sydney; it was accepted by all except 10 third-class passengers; the results

results were watched day by day, and apparent failures were made good; of the 309 persons thus dealt with 293 reacted well. The 10 passengers who declined vaccination at first, declined it when offered again on arrival at Sydney. On 14th May, one of them, a man travelling with his wife and two young children, fell ill; the children had been successfully vaccinated after leaving Melbourne, and at the first signs of the man's illness (which under the circumstances clearly betokened small-pox), his wife submitted to revaccination; the whole family was removed to a small cottage in the hospital enclosure. The patient, who had been vaccinated in infancy only, and exhibited three scars well foveated, and sufficient in area, had a confluent eruption, and died on the twelfth day of illness. No further case occurred. The patient and his family had been familiar with the patient landed at Melbourne, and fell ill on the fifteenth day after removal of that case, and on the thirteenth day after leaving the ship; but it was not certain that his illness really began as he alleged on the fifteenth day, which was the day on which he was isolated and when he already showed a profuse mulberry rash in the groins and over the lower abdomen. It is most probable that he would have escaped illness had he been successfully revaccinated at Melbourne on the day the first patient was removed, or the day after, and it is fortunate he did not then refuse vaccination for his two children.

118. It will be noticed that in the case of each of these vessels passengers had been landed at Albany before the infected state of the ship was discovered; in one a large number of passengers was also landed at Adelaide, where, it would appear, the illness of the first patient (then in the course of the first day of eruption at least) was not detected.

119. The following were the prosecutions directed by the Board during the year:—

Date.	Defendant.	Offence.	Result.
1898. 22 March..	F. E. H. F. ...	Boarding barque "Palmyra" at Newcastle before Port Health Officer had gone on board.	Fined £2 and 6s. 2d. costs.
22 ,, ...	E. G. C.	Boarding barque "Palmyra" at Newcastle before Port Health Officer had gone on board.	Fined £5 and 6s. 2d. costs.
5 August.	T. S.	Illegally boarding barque "Chittoor" at Sydney	Case dismissed on technical point; but prosecution upheld on appeal to Supreme Court.

MARITIME QUARANTINE STATIONS, SYDNEY AND NEWCASTLE.

120. A sum of £10,000 having been provided on the Estimates for improvement of the station at North Head, plans were prepared for enlargement of the accommodation, which had been a little overtaxed, to lodge the 329 persons landed from the "Himalaya"; in addition to which a scheme of sewerage was designed and adopted (*see* Report, 1897, section 29). No part of these works was begun during the year. None of the works mentioned as requisite at Newcastle in that Report (sections 32-5) were begun.

121. The question, whether it were possible to lighten the disadvantages under which shipowners whose vessels are quarantined for small-pox at present lie, had attention during the year.

122. The 35th Article of the Convention which resulted from the Australasian Sanitary Conference, Sydney, 1884, ran as follows:—

That persons able to satisfy the Health Officer that they have been successfully revaccinated at a date being not more than six months previous to their arrival in an infected ship may at discretion of the Health Officer be released after such time as is necessary to cleanse and disinfect their clothing on shore.

And the 9th Article of the Australian Sanitary Conference, Melbourne, 1896, ran as follows:—

That the Colonial Health Authority, if satisfied that any persons have been vaccinated with unmistakable success within a period of six months, may release those persons after such time as is necessary to disinfect them and their clothing, providing that a period of at least fourteen days shall have elapsed after the performance of the vaccination, thus giving release not earlier than the fifteenth day from such vaccination.

123. The word "satisfy" in the first of the Articles cited has always been interpreted by the Board to mean "satisfy by objective evidence offered by the scar," a proposal to accept documentary evidence of the recent date of a scar said to be the result of a revaccination which the Article as presented for discussion contained having been rejected, and the word "revaccination" therein has always been interpreted to include primary vaccination done within the term mentioned. These interpretations the Board has continued to apply to the Article cited secondly above. The hardship to which the Board's attention has been turned is involved in the interpretation put by it on the word "satisfy," an interpretation from which it cannot depart in view of the exigencies of this branch of medical police unless a means of furnishing irrefragable documentary evidence of revaccination could be devised and adopted by the several Boards which are the quarantining authorities within their several territories. If this were done no reason appeared why the term of six months should not be very considerably extended, it being generally recognised that a revaccination performed successfully in adult life is sufficient to protect the subject from ordinary risks for the remainder of his life. For the present special purpose, the term of five years was suggested. Secondly, it appeared desirable that such revaccinations should not be recognised unless performed and certified by permanent officers specially nominated for this duty by each of the several Boards. Thirdly, the difficulty of identification might, it seemed, be got over by requiring that the certificate should be endorsed on a photograph of the subject, both to be stamped with a seal which should impress both photograph and certificate at once so as to avoid fraudulent substitutions. These proposals were referred to the other quarantining authorities in Australia, and were favourably received by all but one, which one, however, did not decline it. It appears, therefore, that as soon as a third Conference can be organised it is not likely that any serious opposition to this scheme will be raised.

VENICE PLAGUE CONFERENCE, 1897.

124. On a circular despatch from the Right Honorable the Secretary of State for the Colonies, dated 24th May, 1897, with which a copy of the Convention signed at Venice was enclosed, and in which the hope was expressed that all self-governing colonies would signify their adherence to it, the question whether adherence should be given was referred by the Government to the Board for its advice. The Convention, as regards the points of importance in this connection, was that persons who arrived in "suspected" ships should be allowed to go about their business after disinfection of their effects, provided they were kept under "surveillance" at their houses for a period of ten days after arrival; while persons who arrived in "infected" ships but who were not ill might either be treated in the same way or might alternatively be remitted to "observation" (quarantine) for a similar term.

125. It was pointed out to the Government that the treatment accorded by the Convention to "clean" ships arriving from infected places was the same as for many years had been accorded to ships which arrived under similar conditions from (for example) cholera-infected ports, and that this treatment would be extended to "clean" ships arriving from plague-infected ports; it had, indeed, been already accorded to the steamships of the two lines which trade between Sydney and Hongkong all the year round, as well as to all casual vessels arriving after having touched there. It was further pointed out that the Convention must be accepted as authoritative, that its rulings were welcome, and that it would be adhered to as far as possible. But it was advised that adherence to it without reserve would be inexpedient, because the method designated "surveillance," which is neither more nor less than "medical inspection," had long ago been seriously considered in relation to this country, and had been reluctantly rejected in view of circumstances still obtaining in which it appeared and still appears to be impracticable here. These circumstances are: extent of territory; comparative sparseness of population except at the greater centres; deficiency of trustworthy medical aid at very many places which are not necessarily or exclusively at very great distances from more populous places; the freedom with which members of all classes take very long journeys by sea, by rail, and by road: the fact that Sydney is a terminus at which large numbers of people disembark every week merely in order to continue their journey to remote parts of the continent or to other countries; and the further fact touching such persons, that a large proportion of them are travellers who either have not acquired, or do not propose to acquire, any fixed residence in this part of the world. Whence it appeared certain that people released under "surveillance" while in the incubatory stage of the disease would often fall ill at no place of residence, but on public conveyances, where recognition of their case and their isolation would be at least tardy; that they would fall ill at hotels and boarding-houses; that when they fell ill at their destination and residence it would not infrequently happen that no competent medical advice would be promptly available. It can now be added that the case of the passenger by the "Orizaba," mentioned above is one in point. His destination was Queensland, whither he would have proceeded immediately after disembarking, and whither he would have introduced the infection of his disease. It is true that he might have reached his home (if he had one, which is not known) before he fell ill, owing to his disembarkation at this port at the very beginning of the incubation period, and that he might there have been isolated before any very serious consequences had ensued; but on other occasions it has happened that the patient, if so released, would have fallen ill at sea, while on one occasion—the "Preussen," 1886—the number of persons incubating the disease on landing here was so large, and their destinations were so various and widespread, that the disease would have been introduced by them to every eastern colony within and beyond Australia, and, additionally, would have seriously impeded commerce by causing several vessels, on board which some of them would have fallen ill, to be arrested.

126. It is very much to be desired that this country were in the position of older countries in which, no doubt, "medical inspection" is usually a sufficient precaution against importation of exotic infections; but, clearly, this is not yet the case. Under these circumstances the Board was compelled to advise that "as the circumstances of New South Wales prevent execution of the scheme, defined in the Convention, of 'surveillance' of persons who may arrive in plague-suspected ships, the Government be advised that to adhere to the Convention would be inexpedient."

UNWHOLESOME OR ADULTERATED FOOD AND DRUGS (PUBLIC HEALTH ACT, PART VIII).

Government Analyst—Mr. W. M. Hamlet, F.I.C., F.C.S.

Assistant—Mr. W. M. Doherty.

Junior Assistant—Mr. H. V. Nicholls.

CHEMICAL LABORATORIES.

127. The chemical laboratories extend over the first floor of the building occupied by the Department, and although the latter had been finished in September, 1897, they were not ready for occupation until 24th August, 1898. The interval had been taken up in fitting the rooms for the purposes to which they were to be devoted; and this was done under direction of, and from designs by, the Government Analyst who, at the same time, carried on the usual work of his branch on temporary premises. The laboratory formerly in use having for fifteen years stood on the same site ample experience of its merits and failings had been gained, of which advantage was taken in allotting positions and uses to the various rooms, so that delicate operations might be conducted under the best light and at equable temperatures. The latter object is assisted by the adoption of hollow walls.

The

The available floor space measures 2,140 square feet, and is divided into the following rooms:—

	Floor space.
Main laboratory	840 square feet.
Balance room	364 "
Principal Chemist	200 "
Photometric room	104 "
Reference museum	154 "
Water room	238 "
Corridor (workshop)	180 "
Refrigerator, lavatories	180 "
	2,140 square feet.

The main laboratory is a well-lighted apartment, which has been arranged so as to afford ample bench space, cupboards, shelving, and fittings for six chemists working at once. It contains all the most modern appliances likely to be required. The photometric room, the reference museum, and the balance-room, open out of it. The latter is fitted with slate-topped tables of brick, specially supported on girders, for the delicate balances, the kathetometer, the photo-spectrometer, and other instruments which require a specially steady base; and, as it has a cool south-easterly aspect, a part of it is devoted to gas analysis. Water analysis is carried on in a separate room. The equipment includes muffles, furnaces, fusion and organic combustion furnaces, fume chambers, some fine chemical balances by Oertling, Paul Bunge, and Sartorius, a sensitive barograph, a thermograph, a large induction-coil, and storage cells. Water is supplied at high and at low pressure; power is furnished both by electro-motors and by water turbines; many time and labour-saving appliances have been introduced. In the basement is a cremating furnace for getting rid of discarded organic matters.

128. The work which occupies this branch may be generally described as State chemistry, and can be indicated under the five following heads:—1. Analysis of foods, condiments, drugs, patent medicines, and alcoholic liquors collected under the Public Health Act, Part VIII. 2. All sanitary work requiring analyses, public water supplies, fouling of streams, sewage, and sewage effluents, chemical examination of disinfectants, purity of air, &c., &c. 3. Investigations relating to questions of tariff involving the amended nomenclature of articles of commerce, comparison of standards of purity, denaturisation of spirits, examination of methylating materials, and other matters affecting the Customs and Inland Revenue. 4. Toxicology, or the detection and estimation of poisons; microscopical examinations, and determination of the physical constants of various toxic bodies. 5. Examination of Government stores and building materials; of articles tendered or supplied by contract; composition and value of fuels; safety of mineral oils; composition of stone, cement, brick, steel, iron, oils, paints, asphalts, inks, and of clothing, paper, and other textile fabrics. From time to time it becomes necessary to give evidence in Courts of Law concerning the matters mentioned under the above headings.

TABLE XXVII.—Showing the number of analyses made in the Analytical Branch, the Department by which the samples were referred, and the number of cases in which evidence was given by the Government Analyst during the year 1898.

Total..... 1,002	Total..... 56

129. The number of samples taken under Part VIII (Adulteration) of the Act, was 155; of these 64 were taken by officers of the Department, 58 by Local Authorities, and 2 were submitted by a firm which sought to move the Board as prescribed in section 54. The number found to be adulterated was 53. There were 64 samples of milk among them, and these were adulterated more commonly than any other article, and by addition of water in quantities ranging up to 68 per cent. Details of these analyses and of the result of the proceedings instituted against vendors are given in Table XXVIII.

PUBLIC HEALTH ACT.—PART VIII.

130. On 18th February a deputation, representing the Beekeepers' Association, waited on the President to represent the injury done to their trade by the quantity of adulterated honey which they believed to be placed on the market to their injury and loss, and to request the Board to take active steps to protect them by prosecuting offenders. It was pointed out that the Association could protect its members by purchasing samples for itself, and that a central authority could scarcely hope to keep watch successfully over vendors in all parts of the country. It was also mentioned that honey had been rather frequently analysed during past years, and had very rarely been found to be adulterated. Eventually three samples were taken, but all turned out to be genuine.

DAIRIES SUPERVISION ACT, 1886.

(Amended by Public Health Act, 1896, sections 71-4).

Veterinary Staff.

5th "	Mr. A. E. G. Robinson, M.R.C.V.S.
6th "	Mr. E. Rivett, M.R.C.V.S.

131. The provisions of this Act apply to districts by proclamation on recommendation of the Board of Health. The whole of that part of the country in which milk is produced for manufacture, and almost all those parts where milk is produced for sale, have now been so proclaimed. Each such district is under a local Authority, charged to execute the Act within it, and these authorities are either municipal or police, municipal councils being by the Act made the authorities within municipalities. The function of the Board in respect of this Act is purely administrative; its veterinary inspectors perambulate the districts in order to ascertain whether the Act is being duly executed by Local Authorities. The proclaimed parts of the country are divided into administrative districts, which number 16; these are subdivided into 219 sub-districts, of which 157 are under municipal, and 62 under police Local Authorities. Eight administrative districts, which comprised 45 municipal and 17 police districts, were completely inspected during the year.

Number of Premises, Cattle, Factories, and Separators.

132. *Premises.*—The number of registered premises was 3,268, and the number actually inspected was 3,151.

133. *Cattle.*—The number of dairy cattle on the 3,151 premises was 85,503, and all were actually inspected. The number condemned on inspection, that is to say, the number which the veterinary inspectors found visibly diseased, was 739, or less than 1 per cent.; but local Authorities reported destruction on their own initiative and during the year ended on December 31st, 1897, of 278 diseased dairy cattle.

134. *Factories and Separators.*—Among the total premises mentioned above were fifty-two creameries, forty-six butter factories, and eleven cheese factories. The number of separators in use, additional to those found at factories and creameries, was 531, and as more than one separator was seldom found on any private premises, it consequently appears that about 16 per cent. of farmers employed this machine. But as separators are in use at all factories as well, and as the recorded number of suppliers to factories was 2,706, it would appear that nearly all milk in these districts is separated, and that scarcely any can be skimmed.

State of Premises.

135. *Water Supply.*—Of the 3,151 premises actually visited, 175 only stood within reach of a public water-main; but all so placed were connected with the main. Of the remainder about 1,300 are reported as having no underground source or reservoir of water; and in these cases they were served by ponds and streams, together with the universal over-ground galvanized-iron tank, which is filled with rain-water from iron roofs. But about 1,700 were returned as having some underground source of water, being either an underground tank holding rain-water, or a well. In this relation supervision is directed to securing connection with the public water-supply of all premises which stand within reach of mains; and in causing wells and tanks to be fitted with pumps covered and protected from inflow of surface-water, lined, repaired, or removed to safer situations.

136. *Privies.*—Only twenty-five of the inspected premises stood within reach of a public sewer, and these were all connected with it; of the remainder 1,700 had pail-closets, and 1,200 had pit-closets. In four of the eight administration districts the number of pail-closets exceeded the number of pits (in one sub-district only there were no pits); in the other four districts the number of pits exceeded the number of pails. There were altogether 143 premises which were returned as having no privy accommodation at all. Nevertheless, progress in this matter is being steadily made, and the relative proportions of pails and pits a few years ago was such that the latter vastly preponderated. A circular was issued during the year explaining the reasons for entirely condemning cesspits on dairy premises. (See Appendix I, page 78).

137. *Impervious flooring.*—The returns show that only 857 dairies had bails provided with impervious flooring—that is to say, of brick, squared and well-bedded stone, asphalt, &c., or sawn hardwood planks securely bedded, joined, and caulked—only 138 had such flooring to cow-sheds, which, however, in the proper sense, are not in general use; only 626 had milk-rooms furnished with floors made of one of the impervious materials mentioned, but in this case excluding wood; and the method of registering these particulars does not show how many separate premises are represented by these three totals. The number of bails, at all events, having such flooring should correspond with the number of premises; but the number under the last heading, though it should be very much higher in proportion to the total number of premises, would not at the best correspond with the latter, for sufficient reasons which arise in the local conditions under which this trade is carried on.

138. *Detached Milk Rooms.*—In 2,590 cases the milk-room was entirely detached and separated from the dwelling.

139. *Hot Water at Milk Rooms.*—In only 798 cases was the milk-room provided with means attached to it of making water hot for cleansing purposes; in all the others there must have been as much communication between the dwelling and the business part of the premises as the preparation and fetching of hot water may necessitate. This is a serious fault, and every effort is made to correct it.

140. *General State of Premises.*—This was reported as good in 1,168 cases, fair in 1,655, and bad in 327.

Creameries, Butter Factories, &c.

141. The number of factories in the eight administration districts inspected was 100. The returns show that most of them are built of wood and iron, and that few are constructed in all respects as they should be; for instance, only thirty-two are returned as having the ground under the tank to which separated milk is pumped, and from which it is distributed to the suppliers for farm purposes, floored with impervious material capable of being kept thoroughly clean. The general state of the premises is returned as good in seventy-five cases, fair in twenty-two, and bad in three. Considering the nature of these establishments, this return must be considered far from satisfactory. Each should present a model by which the farmers in the neighbourhood might guide themselves. It should never be necessary to return the general state as "bad," or even as merely "fair." This is so important a matter, not only on account of the quantity of milk handled, but because neglect there nullifies all the care farmers may have taken on their own premises, that the individual factories are mentioned, together with the classification to which they were entitled in opinion of the Veterinary Inspector at the date of his visit.

Disposal of Separated Milk.

142. In the case of three factories the separated milk was fed to pigs kept in connection with the premises. In all other cases (97) it was returned to suppliers, who fed it to their own pigs and calves. In no case was it boiled before being returned or used for feeding. For remarks already made on this matter, which is one of the highest importance to stock raisers, reference should be made to the report for 1897 (Appendix I, sections 11 and 17, and Appendix P, section 45). Boiling of all milk, or separated milk, which is fed to stock should be a routine step in ordinary farm management; it is a most important aid to prevention of tuberculosis, and to prevention of recurrence of that disease after a herd had been freed from it. But when separated milk supplied by factories is used for that purpose ordinary prudence requires that it should be first boiled. The reason is that no farmer gets back from the factory his own separated milk alone, but a mixture of milks, and, consequently, if any farmer has taken pains to get rid of tuberculosis from his own herd—so that his own separated milk is probably free from the infection of this disease—he might very likely receive from the factory and feed to his healthy stock the diseased milk produced by some negligent or ignorant neighbour, and this would bring to nothing the care he had himself taken. It should, therefore, be made illegal to return any separated milk from a factory to its suppliers unless it has first been brought to boiling-point, this being enough to kill the cause of tuberculosis if it happen to be present; but suppliers themselves, who often own the factory, should insist on this being done without waiting for intervention of the law. Copies of the pamphlet on Prevention of Tuberculosis in Man and in Animals (see Report, 1897, Appendix I, p. 34) were forwarded to local authorities for distribution among the more intelligent and energetic farmers in their districts.

Value of the Supervision actually exercised by Local Authorities.

143. Veterinary Inspectors are instructed to estimate the efficiency of local supervision, after having inspected each sub-district, and to classify it as "efficient," "poor," or "inefficient," as the case, in their opinion, may require. In municipal sub-districts supervision was classed as follows: efficient, 21; poor, 18; and inefficient, 6. In the police sub-districts the classification was as follows: efficient, 11; poor, 2; inefficient, 4. So that, while supervision was classed as "poor" or "inefficient" in more than half the municipal sub-districts visited during the year, among the police sub-districts one-third were so classed. In the former, and especially in declared "dairying districts," local influences interfere with strict execution of the law by local authorities; in the latter this influence is not so greatly felt, but is far from being absent. But for the periodical visits of the inspectorial staff it is much to be feared that the Act would fall largely into desuetude. Nevertheless, with growth of the home and export trade, and increase in the number of companies drawing their supplies from dairying districts, it is only fair to add that farmers are beginning to perceive that the Board's rules are practically useful, and, if observed, assist their best interests.

Resident

Resident Veterinary Inspectors.

144. During the year appointment of three additional inspectors was authorised, with the object of releasing three experienced members of the inspectorial staff for posting as resident officers (see Report for 1897, page 9, section 44) in three of the more important dairying districts, the intention being to continue and extend this method after some preliminary experience of its working has been got. Several applications were received, but three only from qualified veterinary surgeons; of these, two were considered suitable for appointment. The whole staff, however, remained on usual duty for the short remainder of the year which had not elapsed at the date of making the appointments mentioned. Advertisements were put forth by the Agent-General in London inviting applications for the third vacancy.

Deputation—Protests.

145. Two important deputations waited on the President during the year. The first represented the greater milk companies, and spoke mainly concerning the milk brought by them from various country districts into the metropolitan area. Several points were raised by it. They desired inspection of milk in course of delivery, but that it should be uniformly and actively carried out; they pointed out that municipal inspectors could not overstep the boundary of the municipality to which they were appointed, and consequently were often at a disadvantage with milkmen who sometimes designedly kept on that side of the road which was out of the district of the inspector who happened to be on the lookout; that samples had to be collected by municipal inspectors who had many duties to perform, and therefore could only occasionally attend to this one; that informations were usually laid several weeks after the date of the alleged offence, and that in the interval the third, or reference sample, had gone bad and was no longer a fair reference if the two analyses of the fresh milk should differ; and that the fact that Local Authorities had to pay for analyses out of municipal funds in cases in which it turned out there had been no adulteration was likely to prevent them from keeping effectual watch over vendors; and, lastly, it appeared that the companies, while taking every precaution to see that milk was supplied to their carters in its pure state, were well aware that they always had a few among the very large number of men they employed who probably did water it. In reply, it was suggested that municipal inspectors might perhaps be made officers of the Board for this special purpose, and in that capacity independent of municipal boundaries; but, on taking legal advice at a later date, it was found that this could not be done under the Act; arrangements were subsequently made by which the third sample could be deposited in a cold chamber, under control of the Board of Exports, pending hearing of the case (*Appendix K*, p. 79); and, as regarded the metropolitan district, it was pointed out that analyses of milk would be done in the Board's laboratories as soon as a second Government Analyst should be appointed. In the meantime, it will be seen from Table XXVIII, p. 32, that a moderate number of samples were so analysed during the year by the existing analytical staff; and, it may be added, that although it would no doubt have been necessary to restrain this branch of work, had anything approaching a suitable number of samples so taken been forwarded, as a matter of fact, the laboratory was able to deal with all which the energy of individual local authorities caused to be gathered and submitted. An amendment of the law is certainly desirable, and would probably be unobjectionable, to permit power to be given to inspectors to follow a milk-vendor outside their own municipal district, and there take samples. The cold chamber was utilised in a few instances during the remainder of the year for the purpose indicated above.

146. A second deputation was received by the President, which included eight members of the Legislative Assembly, for dairying districts in various parts of New South Wales, and sixteen mayors and aldermen, all of municipalities on the South Coast specially interested in the dairying industry. The deputation complained that animals were unjustly condemned by inspectors, and that after death and a long search some small spot was pointed out and said to be the disease, while the owner was unable to judge whether it were evidence of disease at all; and it was urged that when it was found after slaughter that an animal had been unnecessarily condemned the owner should be compensated. It was pointed out that while the deputation had not distinguished between the veterinary inspectors of the Board and inspectors appointed by Local Authorities, no inspector had power to do more than seize a suspected animal and apply to the Court for an order for its destruction, and that when the Board's veterinary inspectors did make a mistake compensation was paid, but during several years past had been claimed in only four cases widely separated in time. Secondly, it was said, with reference to the flooring of bails, that inspectors appeared to differ in opinion as to what was required, and that farmers who, in accordance with inspectors' requirements, had laid down a well-caulked hardwood flooring, had been compelled to take it up and substitute some other material. In reply, the Board's manual was referred to as setting forth unmistakably what the Board required in this matter (*See Appendix L*, p. 79); and it was pointed out that while in this case, again, no distinction was drawn by the speakers between the Board's veterinary inspectors and inspectors appointed by Local Authorities, in neither case had any specific instance of alleged unjust condemnation of cattle nor of vexatious condemnation of bail-flooring been cited. Thirdly, the deputation represented that somewhere on the northern rivers a dairy-farmer who milked eighty or 100 cows, and in whose family some infectious disease had appeared, had been compelled to destroy all his milk, although he had hired new hands, camped them at a distance from his dwelling, and had thus continued milking under circumstances which rendered contamination of the milk absolutely impossible. It was pointed out, in reply, that such action would be condemned by the Board as strongly as by the deputation. Fourthly, the deputation complained of the cost which execution of the Dairies Supervision Act threw on municipalities, and the opinion was expressed that it ought to be borne by the Government, since the Act was passed for protection of the public health. This point—as being one of policy and concerning the Government—the President declined to discuss. It was then announced that appointment of three resident veterinary inspectors to three of the more important districts had been authorised, and that appointments were then in course of being made which, it was hoped, would prove of substantial use to dairy-farmers, and would tend to avoid for the future any misunderstanding of which they could justly complain.

Manufacture and Sale of Margarine.

147. About the middle of the year the Board became aware that margarine was being manufactured in Sydney, and sold in Sydney and Newcastle. While inquiry was in progress a deputation, representing the interests of the butter trade, waited on the President, and, while drawing attention to some of the facts

facts of the case, urged that immediate steps should be taken to stop this trade before it had obtained proportions which might make it difficult to deal with. The facts revealed by the Board's inquiry are given in Appendix M, p. 80. The margarine-makers were required to take out licenses as fat-extractors, under the Noxious Trades Act, Part I; and a retail vendor in Newcastle, and one in Sydney, were prosecuted for selling margarine as butter, and were convicted. These being the only steps open to the Board, a further deputation waited on the Right Honorable the Premier and requested him to introduce a Bill to control this manufacture more effectively, and such a Bill was promised and was drafted; but no opportunity of introducing it occurred before the end of the year under review. About the same time exaggerated statements concerning the extent of the retail trade in this substance having appeared in the public press, twenty-five samples of butter selling at from 5d. to 8d. a pound were taken at as many different retail shops in and around Sydney. All of them turned out to be genuine butter in bad condition (see Table XXVIII, p. 34); and the truth seems to have been well represented in the Board's first report on this subject, except that a pastry-cook was discovered who acknowledged that he made for use in his own trade as much as 2 tons of margarine a week.

148. Cases of infectious disease on dairy premises were reported during the year under Regulation 44, as follows:—

Number of Districts affected.	Total number of cases reported.	Kind of Disease.	Number of Cases.
31	85	Measles	52
		Scarlet fever	21
		Typhoid fever	8
		Diphtheria	4
		Total	85

149. The manner in which such cases are dealt with is shown by the following extract from the Manual:—

44. *When infectious sickness occurs in human beings.*

The several diseases mentioned in Schedule A, hereto, must be reported by the dairy-farmer when they occur in persons living on his premises, or engaged in his business. Greatest danger exists when the infectious disease is typhoid fever, scarlet fever (or scarlatina), or diphtheria. While, therefore, all the diseases in the list must still be reported, as provided by law, the following special rules are made for dealing with any of those three of them:—

A.—When either diphtheria, typhoid fever, or scarlet fever (sometimes called scarlatina), occurs on dairy premises, it is the duty of the Local Authority to take care that communication between all persons belonging to the infected household, and the milk business in all its details is strictly prevented. This may be effected in one of the two following ways:—

- (1.) The business may be entirely suspended until the patient has been removed, and the premises disinfected; or
- (2.) Arrangements may be made for milking and for carrying the milk to the factory, railway, or customer, by persons who neither belong to nor enter the infected premises. This strict separation between the milk business in all its details (from the milking herd to the factory, &c.), and all members of the infected household, must be strictly maintained as long as the illness lasts, and until the premises have been disinfected after it.

B.—It is the duty of the Local Authority to carry out this most important part of the law, and to consider the circumstances of each case as it arises with a view to deciding whether the precautions proposed to be taken by the dairy farmer are such as may be relied upon to safeguard the cattle and the milk consuming public. The Local Authority derives its powers to order whatever steps may in its opinion be necessary, and is charged with the duty of ordering them to be taken by the dairy-farmer, under the Dairies Supervision Act (1886), section 4 (iv), 9, 10, and 11. The Local Authority must always act so as to effectually guard the public health; but if in any case a dairy-farmer should see fit to consult a medical practitioner, the Local Authority may take the latter's opinion into consideration (provided it is communicated in writing) before exercising the peremptory and final powers conferred on it by the Dairies Supervision Act (1886), section 4 (iv).

150. The following persons were successfully prosecuted by local authorities for breaches of the Act:—

Name.	Neighbourhood or District.	Offence.	Result of Prosecution.
P. Bros.	Glen Innes	Trading without license	Fined £1 and costs.
J. F.	Camden	Storing milk in unsuitable place..	Fined £5 and costs.
F. G. R.	Cobargo	Storing milk in unsuitable place..	Fined £1 and costs.

Tuberculin Test.

151. The instructions under which the tuberculin test is applied are given in Appendix N, p. 81, together with the form of record. The record is supplied both to veterinary and to lay observers; but the abstracts compiled from them are separated into two series. Series "A" comprises only those observations which were made by veterinary surgeons; series "B" contains all observations made by others.

152. An abstract of the more important of the points mentioned in the register (which is itself a copy of the record form) is given in Appendix O, p. 83. In most cases, the tuberculin used was Koch-Libbertz; in a few cases, Bang's; in other few, that of the Pasteur Institute; in still fewer, it was that of the Jenner Institute. The doses given are shown in each case. A systematic record was first kept towards the end of 1897 (Report 1897, Appendix "K.", p. 39), although tuberculin had been in use in New South Wales during several preceding years, and varying doses were employed; during 1898, it will be noticed that the doses were much more uniform. Experience having been gained and recorded, the quantities will, it is expected, be absolutely uniform in the ensuing year.

153. *Series A.*—The test was applied 148 times to 147 animals, of which 25 were bulls, 122 cows. A valuable imported bull was tested twice at the Stock Quarantine; a reaction of above 2.5° Fahrenheit was got each time (the interval having been ten weeks), and, on slaughter, the animal was found to have tuberculosis of the post-pharyngeal glands.

Animals

Animals not killed.—Of the 147 animals, 88 were not killed. In 8, the temperature remained constant after injection; in 35, it fell slightly below the highest observed before injection; in 42, it rose above the highest observed beforehand by from 2° (one case) to .1, but usually by .8 or less. In animals 47, 48, and 126, there was reaction of more than 2.5°, but they were not killed; 47 and 48 were stud bulls, and were gelded for use as working bullocks; 126, also a bull, broke away, and no further statement concerning it is available.

Animals killed.—The remaining 59 animals were killed. A reaction of above 2.5° reckoned from the highest temperature observed before injection was got in 48 cases, and all were found to be tuberculous after slaughter; to these must be added 136 (reaction 2.5°) which was killed but not in presence of the veterinary surgeon, so that no account of the *post-mortem* appearances is available. A reaction of less than 2.5° was yielded by 7 which were killed nevertheless; the temperature before injection as compared with the reaction got, or the clinical signs, or both together, having sufficed to satisfy the veterinary surgeon of the nature of the disease from which they were suffering. The cases were the following:—

No.	Highest temperature observed before injection.	Rise after injection.	Organs found tuberculous after slaughter.
17	101.9	1.9	Pharyngeal, bronchial, mediastinal glands; lungs.
18	103.4	.8	Pharyngeal, bronchial, and mediastinal glands.
22	102.4	1.6	Lungs, liver, diaphragm.
69	101.4	2	Lungs, liver, small intestine.
78	102.1	2.3	Thoracic lymphatic glands, lungs, pleurae.
91	103	2.4	Bronchial and hepatic glands.
128	102.6	1.9	Lungs, liver, throat glands.

In cases 19, 112 and 145 reaction was either wanting or much below 2.5°; but the animals were killed at request of the owners, being unthrifty, and none of them were tuberculous.

154. *Series B.*—The test was applied without assistance of a veterinary surgeon to 59 animals, of which 55 were cows.

Animals not killed.—Of the 59 animals, 47 were not killed. In 2, the temperature remained steady; in 26, it fell slightly; and in 13, it rose by from .1 to 1.9° above the highest observed before injection. In the remaining six cases a reaction of 2.5° or more was obtained; five of these animals were in calf, and were to be slaughtered after calving; while the sixth (which gave a reaction of 7.2°) was a valuable stud bull, which the owner was advised to destroy.

Animals Killed.—Thirteen were killed; twelve gave a reaction of 2.5° or more; one gave a reaction of 1° only, but was killed, and was reported tuberculous in both lungs; all the others were also reported tuberculous in various organs.

155. *Conclusion.*—Whenever an animal yielded a reaction temperature of 2.5°, reckoned from the highest temperature observed before injection, and was killed, clear evidence of tuberculosis was discovered in one or more, usually in several, parts of its body. In three cases (*Series A*) in which the reaction temperature was much less than 2.5°, but in which the animals were, nevertheless, killed at the owners' request, no signs of tuberculosis were discoverable after death by the veterinary surgeon. *No animal, therefore, yielded the standard reaction temperature of 2.5° which was not tuberculous* (though there were a few cases in which the fact of tuberculosis was not ascertained, because the animals were held for calving, &c.). These results are entirely in accord with those obtained by the best foreign observers in other parts of the world, and consequently have a higher practical value for stock-owners in New South Wales than the small number of the observations would otherwise allow them. Copies of the circular, concerning the uses and mode of applying the tuberculin test (Report, 1897, Appendix I., p. 37), were forwarded in large numbers to local authorities for distribution among the more progressive farmers in their districts.

DISEASED ANIMALS AND MEAT ACT, 1892.

156. This Act is designed for execution by persons authorised to take proceedings under it; and the Board's function is to grant such authority to suitable persons, who thereafter may act independently of it. Their power is to seize animals they consider to be diseased, or carcasses they consider to be diseased or unwholesome or unfit for the food of man, and to carry them to the nearest Court, where they apply for an order to destroy. If, after the Court has ordered destruction, it appears necessary to take criminal proceedings against the offender, the Board is often consulted before they are commenced, but it is not necessary that its advice should be thus sought. The persons who had authority to execute the Act during the year were as follows:—

Officers of Municipal Local Authorities	80
Officers of Police Local Authorities	530
Government Medical Officers	130
Stock Inspectors	46
Medical Officers of Health	2
Officers of the Board (Headquarters Staff)	7
						795

The medical officers mentioned do not usually initiate inspections, but are called in on occasion to advise or testify, and are therefore given all the powers which the Act confers on persons authorised to act under it.

157. Tables XXX to XXXIII show the number of animals and pieces of meat which were seized under the Act during the year at city and suburban sale-yards, meat-markets, and at various country places, being as to the latter largely made up of diseased animals, detected by veterinary inspectors under the Dairies Supervision Act, though contributed to by others. The following prosecutions under the Act were directed:—

Name.	Offence.	Result of prosecution.
O'C.....	Selling immature veal	Fined £5 and 5s. 6d. costs.
J. C.	Exposing diseased meat.....	„ £10, £2 7s. 6d. costs.
G. R. H.....	„ for sale diseased meat	„ £5 and 5s. 6d. costs.
W. J. B.	„ „ „ „	„ £5 and costs.
T. P.	„ „ „ „	„ £5 and 5s. 6d. costs.
N. & T.	For having diseased cow on slaughtering premises	„ £5 and costs.
J. B. C. M.	Exposing diseased bullock for sale	„ £5 and costs.
F. B.	Exposing four bodies of immature veal for sale	„ £5 and costs.
C. P.	For consigning diseased cattle to Flemington for sale.....	„ £40 and costs.
P. M.	Selling immature veal	„

158. The Chief Veterinary Inspector to the Board (Mr. E. Stanley) is regularly occupied in executing this Act in the metropolitan district. His first duty in this connection is to pay regular visits to the several cattle sale-yards and meat-markets. Animals which it is found impossible to condemn unreservedly during life, but which are strongly suspected of disease, are sent from the sale-yards to the Abattoir, and there slaughtered; 108 animals were thus transferred, of which 59 were condemned on examination after slaughter, while 49 were passed. He also pays occasional visits to the abattoir to decide in cases of dispute between butchers and the abattoir inspector. Other inspections made by this officer are tabulated below:—

Inspections of Animals and Meat.

Darling Harbour Meat Market	11
Riverstone Meat Market	31
Metropolitan Meat Market	28
Meat-preserving Works	3
Riverstone and Auburn Meat-works	7

Suburban Slaughterhouses.

Auburn.	Hurstville.	St. Peters.

Randwick.....	12

NOXIOUS TRADES AND CATTLE-SLAUGHTERING ACT, 1894.

PART II, CATTLE-SLAUGHTERING.

The Veterinary Staff (see above).

159. This part of the Act provides for the annual licensing of premises on which animals are killed for the food of man, and for inspection of them and the apparatus used in them. It gives power also to inspect any carcasses found on them, but it does not contemplate the state of such carcasses; and any action necessary to prevent a diseased carcase from going into the market must be taken under the Diseased Animals and Meat Act. It took effect from September 1st, 1894. Licenses lapse on June 30th in each year, and are granted or renewed by the local authority for the district without reference to the Board. Local authorities are the same as under the Public Health Act and some others; the Board causes such inspections to be made from time to time, as is necessary, to ascertain whether the various Local Authorities are executing the law efficiently.

160. Before the date mentioned, slaughterhouses were under no regular supervision; for, although municipal councils could regulate them under the Municipalities Act they were, for the most part, placed outside municipal districts. In the neighbourhood of the larger towns some stood within municipal districts; but even these were not in many cases so regulated as to be free from nuisance, nor constructed of materials, and in a manner which would even admit of their being kept reasonably clean.

161. Very considerable improvements have been effected in the construction and state of private slaughterhouses by the Board during the past four years by its regulations and supervisory inspections directed by it and carried out by the veterinary staff. These consist in the main of construction of impervious flooring, of pits so placed that blood and wash-waters can drain into vessels placed in them, and so that the vessels can be removed and the contents be suitably disposed of at a distance; in lining the

the lower parts of walls with sheet-metal, or else in seeing that they are kept clean by frequent lime-washing; in removing pigs, hide stores, and the coppers in which wastes are boiled to extract the fat to a suitable distance from the slaughterhouse; and in discountenancing the feeding of uncooked offal and blood to pigs.

162. The Board's inspections have been made by the veterinary staff, and usually in conjunction with their tours of inspection under the Dairies Supervision Act. The slaughterhouses in forty-one of the sub-districts, mentioned under the Dairies Supervision Act (see p. 35), were completely inspected during the year. The number of premises was 142; improvements were reported to be still required in ninety-one instances.

163. Annual reports are also required from the municipal and police local authorities on this subject. There should have been 272 returns; the number actually received was only 195. The 195 districts were reported to contain 1,556 premises. The number of horned cattle usually killed per annum was said to be just under 196,000, and the number of diseased animals found and destroyed was returned as 718, or '003 per cent. of the number said to be slaughtered—a proportion which is very small in comparison with the proportion of animals condemned at Glebe Island. The number of prosecutions undertaken for offences against the Act was returned as 18, and the number of convictions as 14.

THE ABATTOIR ACT, 1850.

(Amended by Noxious Trades and Cattle-slaughtering Act, 1894).

Consulting Engineer—Mr. T. H. Houghton, M.I.M.E., M.I.C.E.

Inspector-in-Charge—Mr. G. W. Shelley.

164. The number of cattle slaughtered was 77,323; of calves, 13,372; of pigs, 52,448; of sheep, 1,140,697. The revenue was £9,459; the working expenses amounted to £6,119, showing a gross profit of £3,340. But out of this the sum of £862 was expended on repairs, so that the net profit was £2,478. This statement can be compared with similar statements for all former years, but it should be noted that in none of them is any account taken of interest on capital expenditure. This omission—at all events, in an institution of this kind—is quite wrong, but beyond the power of the Board (which took it over only at the middle of 1894) now to supply. In the nature of the case, however, it is certain that this establishment might, and should have been, more than self-supporting from the first, and should long ago have repaid its first cost, for its size should have been commensurate with the revenue it would yield in view of the amount of slaughtering to be done—which could always have been closely estimated—and should have been gradually increased as its trade increased. It is necessary to make these remarks at this time, when apprehensions that abattoirs established at all populous centres would not pay their way, seems to be a chief obstacle to execution of the schemes suggested and shown to be necessary in 1897. (See Annual Report, *Appendix P*, p. 48.)

165. The number of sub-inspectors was increased by three in the fourth quarter of the year. From the figures shown in Table XXXIII, and just quoted above, it is plain enough that a much larger staff would be required for thorough inspection of every animal killed; but the construction and arrangement of the buildings are so entirely unsuitable that a larger number would be unable to perform their duties without obstructing work. Attention of the staff is, therefore, chiefly concentrated on inspection of oxen and pigs, these animals being found to suffer from a greater variety of diseases than sheep, and alone suffering from tuberculosis. Probably no one wishes to eat the meat of diseased animals, whether their diseases are communicable to man or not; rejection of all such carcasses is quite possible in this country without either great loss or appreciable enhancement of the price of meat, and it is the Board's desire to see that nothing but meat which is healthy in the broadest sense shall get upon the market. None know better than the Board that, for the present, it cannot fulfil this wish, and it has framed its advice accordingly. (Annual Report, 1897, *Appendix P*, p. 50.) Under these circumstances it has also thought fit to concentrate attention on those animals which suffer from that communicable disease from which most is to be feared for man—namely, tuberculosis.

166. The more important improvements and repairs effected during the year included alterations in the gas and water supplies. As regards gas, new mains were laid, one master-meter supplied, and all the old connections altered. All that remains to be done is to remove defective fittings in the houses and supply improved descriptions, but in view of the expectation that this establishment will be abolished at an early date, it would not be prudent to incur this expense at present. The fresh water supply which was taken off a 4-inch main by pipes to the houses, each of which was furnished with its own meter, has been practically replaced by one main supply for the whole establishment, provided with one meter, by new supply pipes in place of the old ones which were choked, and by connecting up all the services so as to secure complete circulation, and as far as possible absence of dead-ends. The salt water supply has been improved by laying new mains, coupling up dead-ends, and by cleaning pipes and the reservoir. These services are now considerably more efficient than before. Fences on the south side have been put into good repair, and new gates supplied to the pumping station. Gates and fences of the cattle-yards to the west have been renewed, a great deal of guttering and down piping has been replaced, crab-winch, the offal-shoot, and a good deal of stone pitching have been renewed or repaired. Costly repairs were effected on the offal barge in 1897, and further minor repairs were done during the year under review. It is certain that in another year or so large sums will be required to keep it seaworthy.

167. A heavy expenditure on repairs will continue next year, and probably increase from year to year, the buildings now approaching the term of their useful existence, and every repair undertaken now unavoidably extending far beyond what was expected, in consequence of the discovery of perished materials and bad work as soon as the decay in visibly faulty portions is touched. For this, as well as for more important reasons, it is desirable that the question of rebuilding the abattoir here or elsewhere should be settled by the Corporation of Sydney, which has agreed to take it over. The course which would be taken in repairing the existing structure, if it were to remain for several years, would differ materially in point of expense from that which would be taken if it were known that it would continue in use but one or two years more.

168. Regulations made by the Board under the Act were revised (*see Appendix P, p 86*). It was necessary to order the following prosecutions under them:—

Name.	Date.	Offence.	Fine.	Clause.

169. Tables XXIX and XXX show the number of animals slaughtered, the number condemned and destroyed, and the diseases for which the latter were condemned. But these figures, it must be borne in mind, relate to the Abattoir alone, where alone efficient inspection is approached. The following brief statement will suffice to show how much remains to be done to secure a wholesome meat supply even for Sydney alone:—

Year 1898.	Sheep.	Cattle.
Number of animals sold at Homebush	2,692,250	113,508
Number of animals slaughtered at Abattoir	1,140,697	77,323
Difference	1,551,553	36,185

The difference represents the number of cattle and sheep taken by the suburban trade, the various meat-preserving works, and the coast country to north and south, as well as some inland towns to a distance of about 70 miles. The proportion reaching these several destinations cannot be mentioned; but all (except one or two of the larger meat-preserving establishments) are killed at small private slaughter-houses and are practically uninspected there. Now the number of horned cattle condemned at the Abattoir for tuberculosis fluctuates greatly from month to month, and such fluctuations are practically governed by the proportion of aged Queensland stock reaching the saleyards. There are certain brands of Queensland cattle which are well known at the Abattoir and to the trade to be tuberculous in unusual proportions; and, while there are doubtless carcass butchers who would not buy them if they could help it, the state of the market sometimes compels them to purchase these or nothing. There are firms which, under these circumstances, still send them to the Abattoir to be killed knowing they will lose many of them, but trusting doubtless to the insurance fund to cover the greater part of the loss; but it is also well known that other buyers, when they are obliged to purchase them, do not send them to the Abattoir in the usual course, but send them to be killed at one or other of the fifty or so private slaughter-houses which exist just outside the 3-mile radius from the city boundary within which private slaughtering has for many years been prohibited. At these places the probability is that diseased carcasses will escape seizure, and the small proportion likely to be seized by the local municipal inspector are still subjects of claim on the insurance fund; but it is manifestly better for the butcher to sell his diseased beast for food than to have his trade arrangements disturbed by its total seizure. In this way a large amount of diseased meat finds its way into the metropolitan market quite regularly, and is not detected at shops by municipal officers. This state of affairs will necessarily continue until some such fundamental change of method and rational organisation are adopted as were sketched in the Annual Report, 1897.

170. Direct evidence on this head was gained by the Board during the year in the following way:—Two experienced inspectors were detached from the Abattoir, and, during the months of June to September, were instructed to pay flying visits to as many of the private slaughter-houses as they could reach on each day. The object in view was to gather information; it was not expected that this supplementary inspection would be at all complete, nor was it possible that it should be so. The result was that, although the two inspectors had to travel very great distances, they seized and destroyed 100 head of cattle, 2 calves, 52 sheep, and 17 pigs. These carcasses would (with one or two exceptions) beyond doubt have gone into consumption.

171. The Board's efforts to explain the dangers which attend the consumption of tuberculous meat and milk had considerable success, and this singular result—that the public began to regard it as responsible for the presence of every diseased carcass found in the markets, whatever its provenance might be. This was brought about chiefly in the following way:—Greater attention began to be paid by one or two municipal councils to inspection of meat in butchers' shops, and several prosecutions were directed by them. The defence pleaded that the carcass in question had been killed at the Abattoir, and had there passed inspection; the prosecution, either content to have got the carcass destroyed or unwilling to press the case against a ratepayer, invariably "admitted" the allegation, although entirely unable to say whether it were true or not, and thereupon the magistrates inflicted a lighter fine than they would probably have otherwise

otherwise imposed. As a matter of fact, it was never shown, nor was any attempt to show it ever made, that the animal had been killed and inspected at the Abattoir; and, at the same time, the fact that the Diseased Animals and Meat Act specifically throws the whole onus of exposing diseased or unwholesome meat for food on the person so exposing it seemed to be entirely overlooked.

172. With these occurrences in view, arrangements were made towards the end of the year for impressing with a stamp at least all horned cattle and pigs which were killed at the Abattoir before they were taken away. But no sooner was execution of this scheme commenced than the butchers unanimously protested against it, and practically (since the Abattoir Act contained no provision under which stamping could be enforced) refused to permit it. Their ground was that they would have no objection were all meat killed under inspection and stamped; but they could not expose meat in their shops some of which was stamped, and some other part (killed elsewhere than at the Abattoir) not stamped, without, as they feared, rendering the unstamped meat unsaleable. It could not be denied that there was reason for this fear; and, although the scheme had to be given up in consequence, it was, nevertheless, gratifying to have this testimony to the probable state of public opinion against the consumption of diseased meat, or, at least, of meat of unascertained quality.

173. The following Tables show the diseased animals and meat reported to have been destroyed during the year 1898:—

TABLE XXIX.—METROPOLITAN.

* Condemned at country meat-works, chiefly for want of condition.

BIOLOGICAL LABORATORY.

Principal Assistant Medical Officer—Dr. Frank Tidswell.

First Assistant—Mr. Robert Grant.

Second Assistant—Mr. G. G. Grant.

174. Micro-biological work was first begun by formal direction of the Board in January, 1895. The officers were then in a large private house; and the only available space for laboratory purposes was under the roof. Much apparatus was there installed; but the room at command was quite insufficient for active operations, and the heat in summer was much too great. However, a good deal of the work was completed at the laboratories of the University, and this small establishment continued to answer very useful purposes under Dr. Tidswell's supervision until the end of 1896, when, for reasons unnecessary to describe, it was temporarily closed. No account of the work done there down to the date just mentioned having ever been given, the following Table XXXIV is here inserted:—

(a) Bacteriological examinations,—		
Actinomycosis	4
Anthrax	17
Diphtheria	173
Leprosy	45
Malaria	1
Typhoid fever	31
(b) Pathological examinations,—		
Malignant growths	3
Benign growths	2
Non-parasitic cysts	2
Parasitic cysts	4
Other pathological conditions	2
(c) Medico-legal examinations,—		
Seminal stains	8
Blood-stains	3
Total	330

175. Dr. Tidswell entered on the duties of his permanent post on 1st January, 1898. His first occupation was designing, and superintending the construction of, the fittings for the rooms in which this laboratory is placed, and which occupy the whole of the second floor of the building. It was not until the

the end of September, 1898, that this business was completed, and that it became possible to begin to receive the very efficient equipment which had been authorised by the Right Honorable the Premier and Treasurer. It was not until then, therefore, that plans for regular work could be laid, and parts of it begun.

The available floor space amounts to 1,740 square feet, apportioned as follows :—

	Square feet.
Main laboratory	625
Workshop	112
Culture-room	80
Experiment room	306
Flat roof ..	290
Landing ..	135
Superintendent's room	192
Total.....	1,740

176. The equipment includes, besides the usual apparatus and stock of glass, a Zeiss micro-photographic apparatus with arc-lamp, a kymograph, bench-centrifuges, various forms of section-cutters, &c., &c. Power is furnished by electro-motors and water-turbines (the water-pressure is 90lb.) of various sizes, including a large one which drives bench-shafting with cone pulleys; in the basement is a large electro-motor centrifuge (3,500 to 4,000 revolutions per minute), and a crematory furnace; alongside is an enclosed concreted yard where cages are kept, which are taken up to the flat roof when necessary.

177. The work done during the year under review was necessarily restricted. The papers which follow have been selected for publication.

178. *Pathological Condition of "Fluky Liver" in Sheep.*

The specimens examined were submitted by the Chief Veterinary Inspector of this Department as typical samples of advanced stages of the disease.

The livers were all much enlarged. They were uneven in contour, showing irregular gutter-like and dimpled depressions. Their consistence varied from cartilaginous hardness in some places to extreme friability in others. They were discoloured various shades of green, yellow, and brown. The capsule was smooth and shining for the most part, but here and there roughened areas indicated the occurrence of patchy perihepatitis. Distended and tortuous bile ducts were visible through the capsule. On being laid open they were found to be occupied by many flukes (*distoma hepaticum*), and a brown fluid containing innumerable fluke ova, inspissated bile, and debris.

On section the liver was found to be irregularly traversed by bands of white and pinkish-white fibrous tissue of various sizes. The subcapsular tissue was little, if at all, affected, the thickening having occurred in the interlobular connective tissue (capsule of Glisson). The intersection of the fibrous bands (Portal areas), was marked by sections of distended bile ducts, containing flukes and brown fluid. From the principal bands smaller extensions of fibrous tissue passed in different directions, splitting up the parenchyma of the organ into irregular areas. The hepatic tissue itself was discoloured green, yellow, and brown, and showed various degrees of necrotic change, being occasionally converted into a grumous mass.

Microscopical examination of sections showed that the fibrous tissue extended in from the interlobular septa into the lobule, separating the cells in the peripheral zone, and sometimes cutting off columns of cells from the rest of the lobule. The fibrous tissue contained many thin-walled blood vessels and showed numerous double rows of cells (newly-formed bile ducts). The tissue was otherwise not markedly cellular. The liver cells, where distinct, showed distortion and shrinkage, with cloudy or granular protoplasm, and fragmentation of the nuclei. In many lobules the definite cell structure was lost, in others the cells of the central zone were healthier looking.

The pathological lesions just described are characteristic of the condition known as hypertrophic, monolobular, or biliary cirrhosis of the liver. Its production is most likely the result of chronic irritation due to the presence of flukes in the bile ducts. In the stage described the disease would be incurable.

F. T.

179. *Pathological Note on a form of Blindness in Horses.*

The disease appeared amongst horses in the Darling River districts. When first affected the animals only show defective vision in dim lights. Horses, whose sight seemed good in bright daylight, were noticed to shy and stumble in the evening after sundown. They appeared to see less readily in the stable than outside. Later on the sight became bad, even in the daytime; the horses advanced cautiously with tremulous limbs, and appeared as if frightened. No cases of total blindness were reported, and it is said that the animals generally recover after a time. There was no external sign of disease of the eye. Except for the defective vision the animals appeared to be in good health.

The examination was undertaken on behalf of the Stock Branch of the Department of Mines and Agriculture. The specimens submitted consisted of three brains and three pairs of eyes. They were compared with similar parts obtained from horses slaughtered at the Zoological Gardens.

Brain.—Membranes normal; vessels slightly congested; convolutions normal. Careful examination of the surface and sections of the occipital cortex, angular gyrus, pulvinar, geniculate bodies, optic tract, chiasma, and corpora quadrigemina showed no evidences of disease.

Eye.—Periocular connective tissue and muscles normal. Bulbar conjunctiva and cornea normal. Mesial sections showed no abnormality of the coats of the eyeball or dioptric media. The optic nerves were found to be harder than the normal specimens, and had a greater tendency to slip from between the scissor blades used to cut them.

Microscopical sections were made from the parts of the brain concerned in vision, and of the retina and optic nerve. No abnormality was detected in the brain or retinal sections. Transverse and longitudinal sections of the optic nerves showed fibrosis and atrophy of the nerve fibres. The fibrosis was mainly

mainly interfascicular, but the intrafascicular tissue was also involved. The connective tissue contained more cellular elements than the normal nerve, the cells being round and spindle-shaped. Individual nerve fibres of a bundle were atrophied, refused to take the stains, showed breaking up of the myelin sheath into droplets, and granularity and interruption of the axis cylinders. There were no evidences of inflammation.

The pathological investigation indicates that there was a simple degeneration of the fibres of the optic nerve, with hyperplasia of the connective tissue. The lesions were such as would lead to general progressive imperfection of vision. Some degree of recovery would be possible, but it is doubtful whether vision could be completely restored. The appearances suggest the operation of some toxin or poison.

F. T.

180. *Preliminary Communication on the Aetiology of Lymphadenitis in Sheep.*

In certain lots of sheep slaughtered at Glebe Island and elsewhere, a variable proportion show inflammatory, caseopurulent, or suppurative enlargement of the lymphatic glands. The glands usually affected, or at least, most commonly sent in for examination, are those of the inguino-femoral or axillary groups. But in the comparatively few cases where the internal viscera have been examined, similar lesions have been seen in the internal glands, and even in the viscera themselves. In one case, in addition to the external glands, the abdominal, posterior mediastinal, bronchial, and cervical glands were involved, forming a chain extending along the vertebral column from the pelvis to the neck. In this case also, there were small suppurating nodules in the lungs. Not every gland in a group or chain suffers; here and there an individual gland will escape. The degree of enlargement varies, but the glands are commonly as large as a hen's egg. There is a certain amount of periadenitis, but the glands are not matted together.

The appearances on section vary with the size of the gland. In the smaller glands there is thickening of the capsule and trabeculae, with deposits of whitish or yellowish material, mostly in the cortical follicles. The superficial resemblance to tuberculosis in these cases is sometimes very marked. In the larger glands the capsule was thickened, and the interior entirely converted into greenish-yellow semi-fluid material. Other glands presented intermediate appearances.

Under the microscope, sections of the smaller glands show increase in the connective tissue framework, and necrosis of the lymphoid tissue. The capsule and trabeculae were hyperplastic, showing a great number of round or elongated nuclei. Rod-like smooth muscle nuclei were also conspicuous. The lymph sinuses were crowded with cells and difficult to define. Many of the cells contained brownish pigment. The cortical follicles varied in appearance. In some there was a dense packing of lymphoid cells essentially normal in appearance. In others the cells showed cloudy or fatty degeneration, and often fragmented nuclei. In still others, the nuclei and cell outlines were lost, and a number of cells appeared to have become fused into irregular more or less translucent denuded masses (coagulation necrosis?), the rest having undergone caseous degeneration or become converted into granular debris. These last formed the necrotic areas visible to the naked eye. In the medullary follicles there were similar changes, but of much less extent. The blood vessels were congested, but not otherwise abnormal in appearance. In the larger glands the capsule was densely thickened by fibrous tissue containing few nuclei. The contents presented the ordinary appearance of pus, and contained shreds of trabecular tissue.

Cover glass preparations made from both kinds of glands showed micrococci, occurring singly and in groups (staphylococci). No bacilli of tubercle or other were detected by general or special staining. Material from recently affected (small) glands was used to make plate cultivations, and to inoculate animals.

The plate cultivations yielded four varieties of bacteria—three micrococci, and a bacillus. Two of the micrococci were identified as staphylococcus pyogenes albus, and staphylococcus pyogenes aureus. Neither the third micrococcus nor the bacillus were identified. Their description is held over pending further research.

The animals inoculated were four guinea-pigs, infected two at a time with material from two different glands taken at different dates. After superficial washing in mercuric chloride solution (1 per mille), the glands were laid open with a sterilised knife, some of the necrotic material removed and inoculated into a small pocket under the skin of a shaved and disinfected area of the flank. The small incisions were closed with a stitch. In all cases slight thickening occurred round the site of inoculation, but no further consequences were observed in three of the guinea-pigs. After some weeks the swelling subsided, and the animals were perfectly healthy when killed four to six months later. In the fourth guinea-pig the local swelling also subsided, but during the second week an enlarged and tender inguinal gland was detected on the same side as the inoculation. About two weeks later the gland had increased to the size of a marble. The skin over it then became dusky red, tense, and shining, and in the fifth week it ruptured. There followed a discharge, consisting at first of thick pus and shreds of tissue, and afterwards of thin seropurulent fluid which caused matting together of the hair of the part. In the course of another ten days, the ulcer so formed had commenced to heal. At this stage (sixth week) the animal was killed. *Post-mortem* examination showed nothing abnormal except slight enlargement of one of the lumbar glands, which on section was of a pink colour, but not obviously diseased.

Tubes of gelatine, agar and serum inoculated from the heart's blood remained sterile. Of two glycerine agar tubes inoculated from the enlarged lumbar glands one remained sterile, the other showed, in forty-eight hours at 37°C, a smooth, moist, white glistening growth along the streak. This was found to be due to a micrococcus 8μ in diameter, showing under high powers division into halves, staining readily with the usual aniline dyes, but becoming discoloured by Gram's method. In culture it liquefied gelatine with the formation of a white sediment, and gave growths on serum and potato similar to that on agar. Except for the decolourisation by Gram, concerning which the observations cannot be regarded as final, the characters presented close resemblance to those of staphylococcus pyogenes albus, a species already detected in cultures made from the original material. A loopful of a young agar culture was inoculated into a pocket under the skin of the flank of a guinea-pig. There followed local swelling, and during the second week an indefinite enlargement of the inguinal gland, but both these lesions subsided without further trouble. When killed at the end of the fifth week the animal showed no *post-mortem* signs of disease. Neither the original guinea-pig, nor that inoculated from the culture showed any constitutional symptoms. Both remained fat and lively, and took food well.

So

So far as the investigation had proceeded it appears to show that the disease in sheep has not, or not usually, any association with tuberculosis. The pathological appearances in certain glands, and the results of inoculation in one of the guinea-pigs, certainly showed close similarity to the lesions of this disease. But had bacillus tuberculosis been present, it is unlikely that it would have escaped detection in one or other of the numerous microscopical examinations, or would have spared three out of four guinea-pigs. These animals are very susceptible to tuberculosis, which is usually well developed in them six weeks after inoculation. This was not the case in our guinea-pig. On the other hand, the results suggest that the pathological effects may be due to *Staphylococcus Pyogenes Albus*, or some *Staphylococcus* greatly resembling it. But, even so, there is no reason to suppose that this micro-organism had any specific relationship to the disease. It will be remembered that the plate cultivations made from the glands gave *Staphylococcus Pyogenes Albus* and *Staphylococcus Pyogenes Aureus*. Sometimes one alone, sometimes both were present in a plate. It is possible that *Staphylococcus Pyogenes Aureus* might have produced similar effects to *S. p. albus*, but no information was obtained on this point. Unfortunately, the experiments were interrupted at this critical time, and their resumption later on was prevented by the death of the cultures. No opportunity has occurred of obtaining fresh material. Control experiments performed with the pyogenetic cocci from the laboratory stock cultures failed to produce pathogenic effects of any kind; this lack of virulence being not unusual with cultivated cocci.

However, it is submitted that the suggestion afforded by the experiments hitherto performed may be misleading, and that definite conclusions cannot safely be drawn until the subject has been further investigated. The lengthy interval that has elapsed since the last supply of material, and the apparent difficulty in obtaining more, have induced me to present this preliminary communication in order to show the progress made in the research. It is proposed to continue it at the first opportunity that offers.

181. *Observations on "Epizootic Ophthalmia" in Cattle.*

The specimens examined were forwarded from Glebe Island Abattoir by the Chief Veterinary Inspector. Mr. Stanley informs me that this disease is found occasionally attacking many animals in a herd simultaneously. It is met with all the year round, but is perhaps most common between March and August. It is characterised by lachrymation, photophobia, conjunctival congestion, and corneal ulceration. As a rule the disease is of short duration, being usually recovered from after a few weeks illness. Permanent leucomata of the cornea may result. When both eyes are attacked, the resulting corneal opacity may cause partial blindness. In rare cases this may be great enough to prevent the animal from finding food and water, and so involve loss of condition or death from starvation. The disease is not believed to be contagious. Sheep are sometimes affected.

Twelve specimens of bullocks' eyes were examined. The periocular tissues were normal. Eyelids and lashes normal. Palpebral conjunctiva normal as a rule, but occasionally showing congestion. Bulbar conjunctiva markedly congested. In three of the twelve specimens there were slight subconjunctival hæmorrhages. In every specimen there was ulceration of the cornea. The ulcers were usually single and centrally placed, but in one case there were two ulcers situated horizontally side by side in the line of the palpebral fissure. The ulcers were circular, measured 2 to 4 millimetres in diameter, and were surrounded by a narrow leucomatous ring. Except in the immediate neighbourhood of the ulcers the cornea was transparent. The ciliary vessels were congested.

Microscopical examination of sections. The ulcers were never found to extend deeper than the outer third of the substantia propria of the cornea. The anterior squamous epithelium, normal at the periphery of the cornea, was lost layer by layer at the edge of the ulcer, and was entirely wanting over the base. At the surface of the ulcer the substantia propria was ragged, and in the immediate neighbourhood the fibres were swollen, and failed to take the stain. Surrounding the base of the ulcer there was a dense accumulation of leucocytes. The peripheral and deeper parts of the cornea, including Decemet's membrane, were essentially normal. The remaining parts of the eyeball showed no pathological changes.

No bacteria were detected within the tissue of the cornea. Scrapings from the surface of the corneal ulcer, and fluid from the conjunctival folds, showed numerous forms of micro-organisms, micrococci, diplococci, and short and long bacilli. Cultivations on gelatine and serum gave *Staphylococcus pyogenes albus*, *Bacillus fluorescens liquefaciens*, and a short bacillus resembling *Proteus vulgaris*, but not exhibiting the typical characters of that micro-organism. The diplococcus seen in the smear preparations failed to reproduce itself in culture.

Some of the material scraped off the ulcers was inoculated on to the abraded corneæ of two guinea-pigs and two rabbits. No pathological effects resulted.

The investigation failed to reveal any specific cause for the ophthalmia, and did not indicate that it was communicable to guinea-pigs and rabbits. The position of the ulcers suggests a traumatic origin, but no foreign bodies, such as small thorns or seeds, were to be seen in the specimens examined.

F.T.

182. *On the Pathogenic Characters of Bacillus Typhi Murium.*

In April, 1897, an application was made, under the Animals Infectious Diseases Act, for license to use *Bacillus Typhi Murium*, imported from Germany, for the purpose of destroying flying-foxes. In the ordinary course of business the matter was submitted for the opinion of the Board of Health as to the safety of the procedure. The Board considered the subject at a meeting held on 4th May, 1897, and in view of the fact that nothing was known as to the possible behaviour of the micro-organism under the circumstances of climate and food in Australia, advised that some preliminary investigation should be made in all such cases before granting licenses.

Nothing further was heard of the matter until March, 1898, when a renewed application led to the submission of cultures to this Department for examination. The experimental work has been much interfered with by the operations connected with the fitting up of the new laboratory, and consequently the carrying out of the Board's instructions has been unduly, but unavoidably, delayed. It is only within the last few months that the experiments have reached a stage sufficiently advanced to serve for guidance on the question at issue.

Bacillus

Bacillus Typhi Murium is classified amongst the bacteria of the "septicæmia hæmorrhagica" group. This group includes several species having certain characters in common, especially the power of producing acute septicæmic infection in one or other rodent. The principal described members are the bacilli of rabbit septicæmia (Koch), Davaine septicæmia (Davaine), chicken-cholera (Pasteur), duck-cholera (Cornil), fowl enteritis, grouse disease (Klein), swine fever, Rinderseuche (cattle plague), Wildeseuche (deer), mouse typhoid (Loeffler), and the bacillus of bubonic plague (Kitasato and Yersin). In addition to the species mentioned, others have been isolated from animals dead or diseased, and assigned to the group, but the data concerning them are still too indefinite to admit of their exact classification.

These group relationships have been mentioned in order to call attention to the fact that bacteriologists are not yet agreed as to specificity of many of the members. At all events this is the case as regards the better known species. Thus Sternberg writes:—

It is now generally admitted by bacteriologists that Koch's bacillus of rabbit septicæmia is identical with the bacillus of fowl-cholera described by Pasteur. The similar bacilli found in the blood of animals dead from the infectious diseases known in Germany as Wildeseuche, Rinderseuche, Schweineseuche, and Buffelseuche, appeared also to be identical with the bacillus of rabbit septicæmia and fowl-cholera. This view is sustained by Hueppe, and by Baumgarten, and by the recent comparative researches of Caneva and Bunzl-Federn.

Similar statements are made in other standard works on bacteriology. On the other hand there are not wanting authorities who uphold the distinctiveness of the various members of the group, mainly on the grounds of differences in pathogenicity and cultural characters. Without entering further into the discussion of the question, it would appear that information concerning the septicæmia hæmorrhagica bacilli has not yet reached an extent permitting of dogmatic assertions as to the limits of pathogenicity in any particular species.

Bacillus Typhi Murium itself was described by Loeffler in 1892⁽²⁾. The substance of his communication was as follows:—In 1889 a fatal epizootic occurred amongst the mice kept for experimental purposes in the Hygienic Laboratory at Griefswald. Large numbers of the mice died, and from the enlarged spleens Loeffler isolated the bacillus, which he called *Bacillus Typhi Murium*, on account of its cultural characters, resembling those of the bacillus of typhoid fever in man. There was no evidence concerning the original source of the epizootic. Cultures of the bacillus proved to be virulent for house, field, and white mice, producing on inoculation, and also on ingestion an acute fatal septicæmia, the blood and spleen teeming with the microbes. The mice died in one or two days after inoculation with bouillon cultures, and in eight to twelve days after being fed with bread or potato moistened with a culture. Man, horses, sheep, goats, cats, dogs, pigs, rabbits, guinea-pigs, rats, fowls, pigeons, and small singing birds, are said to have remained unaffected after feeding upon infected material. It has also been found that foxes, weasels, and ferrets did not suffer by eating the bodies of mice dead of the disease.

Laser⁽³⁾ reported an epizootic amongst the mice in his laboratory very similar to that recorded by Loeffler. The mice suddenly began to die off without apparent cause. From the dead bodies Laser isolated a bacillus regarded as identical with *Bacillus Typhi Murium*, but his account shows one important difference, viz., two sheep died after being fed with material containing the bacillus.

Klein⁽⁴⁾ also records a "spontaneous septicæmia" in mice and guinea-pigs caused by a bacillus which he places amongst the septicæmia hæmorrhagica group, but he makes no comparison with *Bacillus Typhi Murium*, and its exact identification is left undetermined.

In the further bacteriological literature available there is little additional information. Loeffler's observations are usually quoted without comment. Beyond the fact that one or two observers have performed experiments with cultures, generally corroborative of Loeffler's, no work appears to have been done on the subject.

From the above statements it will be seen that there are blanks in our knowledge that make it eminently desirable to inquire carefully into the pathogenic properties of *Bacillus Typhi Murium*. The advice given by the Board of Health with reference to its introduction into this Colony, carries additional weight in that the bacillus will here be associated with animals differing in kind and habits from those met with in the old world.

The procedure suggested for the destruction of flying-foxes is to expose fruit and other substances infected with cultures of the bacillus in situations where it will probably be eaten by the flying-foxes. It is further proposed to infect captured animals by inoculation, and by smearing their bodies with culture material, and then to turn them loose in the hope that they will infect other flying-foxes, and so produce a destructive epizootic. The plan involves two distinct propositions, viz.:—

- (a) That the bacillus will produce disease in flying-foxes by ingestion, and
- (b) That the disease so produced will be communicated directly from animal to animal.

The position taken up by the Board refers to the uncertainty as to whether these effects, or either of them, would be confined to the flying-foxes, or would extend to other animals exposed to equal chances of infection under the conditions proposed. The experiments performed in this laboratory were designed to resolve this doubt concerning the pathogenicity of *Bacillus Typhi Murium*. The specimens of this micro-organism used by us were those submitted in connection with the application which raised the question. In subcultures the specimens displayed vigorous growth and exhibited typical characters on comparison with the laboratory stocks of *Bacillus Typhi Murium*. In accordance with the plan already enunciated, our experiments comprised two series, one dealing with the effects of ingestion of the bacillus, the other with the communicability of the disease produced by it.

Series I.—Effects of ingestion of material infected from cultures of Bacillus Typhi Murium.

The first experiments were undertaken to ascertain whether the statements of European authorities held good under the climatic and other conditions met with in this Colony. The results are briefly summarised in the following notes:—

Expt. 1. A mouse fed on bread and milk infected from a bouillon culture, died in eight days. P.M. Splenic enlargement, congestion of other viscera, and enteritis. Bacilli were recovered from the blood.

Expt.

- Expt. 2. A mouse fed on powdered biscuit moistened with a bouillon culture, died in 10 days. P.M. Splenic enlargement, congestion of other viscera, little if any enteritis. Bacilli recovered from the blood.
- Expts. 3, 4, 5, 6. Four guineapigs, repeatedly fed on material infected from bouillon cultures, remained perfectly healthy.
- Expts. 7, 8, 9, and 10. Four rabbits repeatedly fed on infected material remained perfectly healthy.
- Expt. 11. A fowl repeatedly fed on infected material remained perfectly healthy.
- Expt. 12. A pigeon repeatedly fed on infected material remained perfectly healthy.
- Expt. 13. A canary fed on biscuit moistened with a bouillon culture died in seven days. Bacilli were detected in, and recovered by cultivation from, the blood of the heart. Control canary fed on biscuit, moistened with distilled water only, remained perfectly healthy.
- Expt. 14. A canary fed on powdered biscuit moistened with a bouillon culture, died in four days. Bacilli were recovered by cultivation from the blood of the heart.

Taken, as a whole, the results are in accord with those of European authorities; but they differ as to the effect on canaries, which were chosen as the type of "small singing birds" said to be unharmed by feeding upon the bacillus. Further investigation was obviously necessary, and, for purposes of experiment, small native birds were selected, partly because of the indication afforded by the lethal effect on canaries, and partly because they would be the animals most exposed to risk by the practical application of the suggested method of exterminating flying foxes. The following experiments were performed:—

- Expt. 15. A small bird ("Black Nun"), fed with biscuits moistened with a bouillon culture, died in three days.
- Expt. 16. A small bird ("Diamond Sparrow"), fed with biscuit moistened with a bouillon culture, died in two days.
- Expt. 17. A small bird ("Redhead"), fed with biscuit moistened with culture, died in three days.
- Expt. 18. A small bird ("Black Nun"), fed with biscuit moistened with a bouillon culture. As soon as the bird was seen to have partaken of the material, the infected food was removed, and clean food and water substituted. The bird died in three days.
- Expt. 19. A parrot ("Rosella"), fed with biscuit moistened with a bouillon culture, died in three days.
- Expts. 20 and 21. Two small birds ("Black Nun" and "Redhead") fed with clean food, but repeatedly given infected water, remained perfectly healthy.

The experiments show that the bacillus under examination was fatally pathogenic when fed to small native birds. The result in experiment 18 shows that even a small amount of infected material is capable of causing death. The disease produced is a septicaemia. When sickening, the birds become very quiet, roosting on the perch with feathers erected and eyes closed. They suffer from diarrhoea towards the end, the motions being very dark coloured (malæna?). The principal *post mortem* sign was enteritis. The bacilli were recovered by cultivation from the blood of the heart in all cases. The controls remained healthy.

The negative result with infected water was unexpected. The water was not sterilised, but the admixture of bouillon culture was fairly large. The observation would indicate that the bacillus does not long survive, or retain its virulence, in natural water. In this connection it may be mentioned that the virulence in cultures was found to attenuate very rapidly, even to the extent of becoming non-pathogenic for mice. It was only by repeatedly sub cultivating, and using young cultures, that we were able to keep up the virulence. The following experiments tend to show that the use of attenuated cultures established immunity:—

- Expts. 22 and 23. Two small birds were fed three times with material infected with bouillon cultures non-virulent for mice. On the first occasion they showed slight sickness, but recovered. The two latter feedings were without obvious effects. After being left alone for a month they were again fed with material infected from a young virulent culture. They showed no sign of illness, whilst a mouse fed at the same time with the same material died in a week. This test was twice repeated with the same results.

Series II.—Experiments to determine whether the disease produced by Bacillus Typhi Murium is directly communicable from animal to animal.

The second proposition involved in the suggested method of destroying flying foxes, assumes the more or less direct communicability of the disease produced by *Bacillus Typhi Murium*. All the statements to hand concerning susceptibility to this micro-organism, refer either to inoculation or feeding. There is no mention of contagion, or direct communication of the disease from sick animals to healthy ones. It became necessary, therefore, to test this point. For this purpose, animals were placed in an uncleaned and undisinfected and, therefore, presumably infected, cages in which other animals had had their sickness, and died as the result of feeding upon *Bacillus Typhi Murium*. In one case, a healthy animal was associated with a sick one during the illness.

The following is a brief summary of the experiments:—

- Expt. 24. A small bird ("Black Nun"), placed in the cage immediately after the death of the bird in Expt. 15, remained perfectly healthy.
- Expt. 25. A small bird ("Diamond Sparrow"), placed in the cage immediately after the death of the bird in Expt. 16, remained perfectly healthy.

- Expt. 26. A small bird ("Redhead"), placed in the cage immediately after the death the bird in Expt. 17, remained perfectly healthy.
- Expts. 27 and 28. Two mice placed in the cages immediately after the death of the mice in Expts. 1 and 2, remained perfectly healthy.
- Expt. 29. A small black bird ("Redhead"), was fed with infected food until obviously sick. The food was then removed, and clean food and water substituted. A second healthy bird ("Redhead") was then placed in the cage with the sick one. The first bird died on the third day, the second remained perfectly healthy.

The results of these experiments show that animals sick and dead after feeding on material infected with *Bacillus Typhi Murium* do not infect their surroundings in such a way as to cause the dissemination of the disease. In other words, the disease does not appear to be contagious.

The pathogenicity of *Bacillus Typhi Murium* towards flying foxes did not come within the scope of our inquiry. We were more concerned to know its effects upon other animals. But the point has received attention in Queensland, where experiments were conducted by Mr. C. J. Pound, Director of the Stock Institute, Brisbane (5.) Mr. Pound has ascertained that flying foxes died after feeding or inoculation with the bacillus. He further reports that his observations have proved that with flying foxes kept in captivity in the laboratory, "a number of healthy ones living in company with others specially fed or inoculated, also became infected, and died of the disease". The experiments conducted under natural conditions in camps of flying foxes were, "owing to unavoidable difficulties, not so successful." Mr. Pound considers that the disease was spread from infected animal to others kept in the same cages by means of the food becoming contaminated with the bacilli-laden excrement of the former. The infection appears, therefore, to have occurred by feeding, not by contagion. Such contamination of the food would obviously not be operative under natural conditions, and probably this was the principal factor rendering the field experiments unsuccessful. It would appear, indeed, that flying foxes, like other animals, may become infected by feeding (or inoculation), but there is no evidence that the disease can be spread amongst them by contagion.

So far as can be gathered from the information to hand, the pathogenicity of *Bacillus Typhi Murium* is comparable to that of a mineral poison. If taken, it may kill, but the disease produced by it is not communicable directly from one animal to another, and so is not capable of producing an epizootic in the ordinary sense. The idea of contagiousness appears to have had its origin in the apparently successful application of the microbe for the destruction of field mice in Thessaly. The ravages of grain, &c., by mice in the agricultural districts near Larissa had become very serious, and ordinary expedients had failed to check them. Loeffler had just described *Bacillus Typhi Murium*, and expressed the opinion that the microbe would be found useful in ridding cornfields, houses, &c., of mice. He was invited by the Greek Government to put this opinion to the test, by using the bacillus to exterminate the mice in Thessaly. He accepted the invitation, and with his assistant, Dr. Abel, visited Greece to superintend the process. His method was to soak bread with culture material, and expose it in, and near, the mouse runs. It was eaten by the mice, and, as all the world knows, the mice disappeared, and the destruction of grain came to an end. But the most curious part of the tale is that, when the mouse runs are opened up, very few mice were found in them, and these few were either dead or in a dying condition. Many of them showed evidence of having been partly eaten. There was no sign of the hordes of mice which just before had threatened to ruin the agricultural interests of the districts. It had been observed that sick mice left the runs, and moved about in the open during the daytime—a thing which they never did whilst healthy. This circumstance is held to account for the failure to find the mice in the opened-up runs. The mice, on leaving their usual shelter, are supposed to have been seized upon and eaten by mouse-destroying birds. That the birds performed this office may be true; but there is no record of its actual observation. The fact is, the mice disappeared. There is no strict evidence as to what became of them.

It is stated in the application-papers, with which this report is more particularly concerned, that the proposed method of destroying flying foxes with *Bacillus Typhi Murium* has been successfully applied in Samoa. Official information does not adequately support this contention. Whilst it seems that flying-foxes became less numerous about the time the experiments were performed, other influences, such as severe drought, were regarded as possible causes of the decrease. The dead bodies of flying foxes were not found in such numbers as to indicate the prevalence of a destructive disease amongst them. In the Queensland field experiments the evidence is of the same kind. On visiting a "camp" after experiment a few dead flying foxes were found; the rest had gone away.

All that may safely be asserted with regard to the three experiments just narrated is the fact of the disappearance. They afford no proof that *Bacillus Typhi Murium* possesses the power of producing a destructive epizootic by contagion. In the Thessaly experiment Professor Loeffler laid great stress on the necessity that the mice should feed upon material containing the bacillus—either specially infected material, or on the bodies of mice dead of the disease, in which the bacillus would be present in myriads. He does not appear to have ever stated that the bacillus could produce a contagious disease. Our own experiments tend to show that it does not possess this property.

Further, it is not clear that *Bacillus Typhi Murium* played more than a minor part in Thessaly. The grain was saved—that was the essential thing. The scientific explanation of the means was commercially unimportant, and nobody seems to have bothered much about it; but in considering the proposition now before us it is necessary to take stricter account, and the fact of the disappearance of the mice seems to admit of an explanation other than that already mentioned, in which the birds are alleged to have taken a share.

There is another microbe pathogenic for mice, and allied to *Bacillus Typhi Murium*, viz., the bacillus of bubonic plague. When plague attacks mice, these animals disappear from their usual haunts. Many of them are, no doubt, destroyed by the disease; but the majority migrate to uninfected regions. They disperse, leaving the dead and dying behind them. This has been observed many times, and is said to be so well known that the native races of India regard the emigration of mice and rats as an ominous signal of an approaching outbreak of plague. Such removal from the scene of sickness and death seems to be an instinctive act of self-protection very common among the lower animals, and even amongst savage races of mankind. It is the way by which the Australian blacks endeavoured to avoid small-pox when it first appeared.

appeared amongst them. It seems at least possible that it may have been operative in the case of the Thessaly mice. Their disappearance may be accounted for not so much by destruction as by dispersal, and this would be in keeping with the fact that their dead bodies could not be found. The same reasoning applies also to the flying foxes in Samoa. This explanation does not appear to have been offered hitherto, and even now it is a mere suggestion; but had there been the wholesale destruction as alleged, surely there would have been more evidence of it.

Nevertheless, it must be confessed that the information to hand furnishes unsatisfactory data for the discussion of the question at issue, and decision upon it must be left open. There is certainly some comfort in the "disappearances"; but one would like to know more about them. Are they temporary or permanent, and what becomes of the animals when they vanish so mysteriously? Assurance that the trouble was not merely transferred from one place to another would be encouraging; but it is not forthcoming.

In the meantime we are called upon to decide as to the advisability of permitting the use of *Bacillus Typhi Murium* for the destruction of flying-foxes in this colony. We have seen that, although the bacillus may destroy flying-foxes, our own experiments show, and clearly show, that it will also destroy small native birds. To expose infected material in the manner proposed might obviously prove as injurious to the birds as to flying-foxes. Probably the destruction of either would not be very great; but for the sake of the birds the procedure should not be sanctioned.

The outcome of the experiments affords justification of the advice given by the Board of Health in their resolution of May 4th, 1897, viz., that in all such cases as the present the unrestricted dispersal of bacteria in this colony should not be permitted without foreknowledge of the probable consequences. The very valuable aid that bacteriology is capable of furnishing to commerce is only to be gained by its skilled application. Its indiscriminate use by persons ignorant of the means they employ may be not only inimical to the interests of the industry immediately concerned, but may cause unexpected and even harmful results of far wider effect.

APPENDIX C.

SUPPLEMENT to the New South Wales *Government Gazette*, Thursday, 14th July, 1898, No. 609.

The Treasury, New South Wales, 14 July, 1898.

THE following Amended Regulations for carrying into effect the provisions of the "Public Health Act, 1896," in substitution for those gazetted on 10th December, 1897, which are cancelled, having been approved by His Excellency the Governor and the Executive Council, are published in accordance with the requirements of that Act

G. H. REID.

GOVERNOR'S REGULATIONS UNDER "PUBLIC HEALTH ACT, 1896 "

PART III

1. The form of certificate for notification of cases of infectious disease shall be the form in Schedule A
2. Medical officers to public institutions shall, in addition to giving the address at which the case is, give the address whence it was removed
3. (a) The Local Authority for any district included in the "Metropolitan Combined Districts," or in the "Hunter River Combined Districts" on receiving a notification certificate signed by a legally qualified medical practitioner, after ascertaining that the house referred to in it is within its district, shall copy the certificate in the prescribed Register, and shall then transmit it by the first post to the Medical Officer of Health for the Combined Districts of which its district forms a part.
 - (b) The Local Authority of every district which is not included either in the Metropolitan Combined Districts or the Hunter River Combined Districts on receiving a notification certificate signed by a legally qualified medical practitioner, after ascertaining that the house referred to in it is within the district of the said Local Authority, shall copy the certificate in the prescribed Register, and shall then transmit it by the first post to the Secretary to the Board of Health.
 - (c) The Medical Officers of Health for the Metropolitan and for the Hunter River Combined Districts on receiving a notification certificate from the Local Authority of any district within their Combined Districts, shall forthwith enter it in the register to be kept by them in the prescribed form, and shall transmit it by post to the Secretary to the Board of Health.
 - (d) The form in which Medical Officers of Health for the Metropolitan Combined and the Hunter River Combined Districts shall record notification certificates received by them shall be the form in Schedule G.

- 4 If the certificate has been received by the wrong Local Authority it shall be forthwith sent by the said Local Authority to the Local Authority within whose district the house named in it is situated
- 5 Legally qualified medical practitioners shall prepare their claims for fees in the usual official voucher forms, and shall state therein the name of the district in respect of which each claim is made, the date of report, and the patient's name, and shall forward such vouchers to the Secretary to the Board of Health at the close of each month
- 6 The form of register to be kept by the Local Authority for a Municipal District shall be the form in Schedule B.
- 7 The form of register to be kept by the Local Authority for a Police District shall be the form in Schedule C.
- 8 When the case of infectious disease notified is that of a person of school age, the Local Authority shall forthwith notify the head teacher of the school usually attended by such person, in the form in Schedule D
- 9 The Local Authority shall deliver at every premises on which the presence of a case of infectious disease has been notified, the notice ordered to be given in section 26 of the Act in the form in Schedule E
- 10 The form in which Registrars of Death shall notify the Board of Health that they have registered a death ascribed to an infectious disease shall be the form in Schedule F
11. The owner or occupier of infected premises on whom notice has been served by a Local Authority to cleanse and disinfect the same or part thereof, and to disinfect or destroy infected articles thereon, who has informed the Local Authority that he will carry out the said cleansing and disinfecting himself, shall, if he fails to complete it to the satisfaction of a legally qualified medical practitioner, as certified by the latter to the Local Authority in writing, within the time named in the said notice, be liable to a penalty not exceeding (£20) twenty pounds
- 12 The body of every person who has died of an infectious disease shall be wrapped as soon as may be after death in a wrapper so as to envelop it completely, which wrapper shall be wet with a solution made by mixing five parts of carbolic acid with ninety-five parts of water
- 13 Every such body shall be cofined, and the lid of the coffin shall be permanently fastened down, within twenty-four hours after death
- 14 The joints of the lower part of every coffin used to contain the body of a person who has died of an infectious disease shall be watertight
- 15 Any person wilfully offending against any of the three last preceding regulations shall be liable to a penalty not exceeding (£5) five pounds
- 16 When any Local Authority is notified that a case of infectious disease is at a hospital within its district, it shall, after entering the notification in its Register, cause notice to be sent to the Local Authority for the district from which the case is reported to have been removed to the hospital, in the form given in Schedule H.

SCHEDULE A

THE Medical Practitioner attending or called in to visit must send this certificate, duly filled and signed, to the Local Authority for the District within which the patient is ill, forthwith on becoming aware that the disease is one which has been declared to be an infectious disease under section 20 of the Public Health Act, under a penalty for neglect not exceeding five pounds

I hereby certify that in my opinion (1) _____, aged _____, ex _____, an inmate of _____, in the District of (2) _____, is suffering from _____, Signed _____ Legally Qualified Medical Practitioner

* * * The following must be filled by Medical Officers of Public Institutions, and should also be filled by others whenever the place where the patient is clearly is not the place at which the illness was contracted —

I am of opinion that the date of attack was (4) _____, and at that time the patient was living at _____

The following Additional Information is desired

The patient attends school at (5) _____ I have been informed that the milk consumed by the patient shortly before attack was supplied by (6) _____ Any matter on or near the premises, probably connected with the occurrence of illness, which requires attention — _____

For use of the Local Authority.

The house mentioned stands in the District of [If the district is correctly assigned repeat here, if incorrect make no entry but transmit the Certificate by post to the proper Local Authority at once]

Received [Date] _____

(Signed) _____

Local Authority

NOTICE — This Certificate, having been received by the proper Local Authority and the particulars entered in the prescribed Register, is to be forwarded forthwith to the Secretary, Board of Health, Sydney

SCHEDULE B

INFECTIOUS DISEASES—NOTIFICATION AND PREVENTION.

(60 Vic. No. 38, Part III.)

To the Head Teacher of _____ School,
 (1) _____, sex _____, age _____, having been notified to the Local Authority for the District of _____ as being ill at (2) _____ of the infectious disease (3) _____ no child living on the said premises should be admitted to your school, until the provisions of section 28 of the "Public Health Act, 1896," have been complied with.

Date _____

Sanitary Inspector.

¹ Full name. ² Full address. ³ Name of infectious disease.

Section 28. Any person who knowingly or negligently sends to school a child who, within the previous two months, has been suffering from an infectious disease, or who has been resident in any house in which such disease has existed within the space of six weeks, without furnishing the head teacher of the school with a certificate from a legally qualified medical practitioner that such child is free from disease and infection, and causing the clothes of such child to be disinfected to the satisfaction of a legally qualified medical practitioner, shall be liable to a penalty not exceeding ten pounds.

SCHEDULE E.

LOCAL AUTHORITY FOR THE DISTRICT OF _____

(60 Vic. No. 38, Part III.)

In accordance with the provisions of section 26 (III) of the Public Health Act of 1896, your attention is specially directed to the subjoined copy of the said section 26.

To _____

(Signed) _____

Date of Service. _____

Sanitary Inspector.

26. (I) Where a person ceases to occupy any house or part of a house in which any person has, within six weeks previously during his occupancy, been suffering from any infectious disease, and either—

- (a) Fails to have such house or part of a house and all articles therein liable to retain infection disinfected to the satisfaction of a legally qualified medical practitioner as testified by a certificate signed by him, or such articles destroyed; or
- (b) Fails to give to the owner or occupier of such house or part of a house notice of the previous existence of such disease, he shall be liable to a penalty not exceeding five pounds.

(II) And if, on being questioned by the owner or occupier of, or by any person negotiating for the hire of such house or part of a house, as to the fact of there having within six weeks previously during his occupancy been therein any person suffering from any infectious disease, he knowingly makes a false answer to such question, he shall be liable to a penalty not exceeding ten pounds.

(III) The local authority shall cause their officers to serve notice of the provisions of this section on the occupier of any house or part of a house in which they are aware that there is a person suffering from an infectious disease.

27. Any person letting for hire, or showing for the purpose of letting for hire, any house or part of a house in which or in part of which, within his knowledge, there has been within the previous six weeks a person suffering from an infectious disease (whether the said house or part of a house has or has not been disinfected) who fails to state that fact to the person negotiating for the hire of the house, or part of a house, or being shown over the house, or part of a house, for the above purpose, shall be liable to a penalty not exceeding twenty pounds.

28. Any person who knowingly or negligently sends to school a child who, within the previous two months, has been suffering from an infectious disease, or who has been resident in any house in which such disease has existed within the space of six weeks, without furnishing the head teacher of the school with a certificate from a legally qualified medical practitioner that such child is free from disease and infection, and causing the clothes of such child to be disinfected to the satisfaction of a legally qualified medical practitioner, shall be liable to a penalty not exceeding ten pounds.

30. Any person who—

- (a) While suffering from any infectious disease exposes himself without proper precautions against spreading the said disease in any street or public place, shop, inn, theatre, church, chapel, or place of public resort, or any public conveyance, or any vehicle or vessel hired or plying for hire, or enters any public conveyance, vehicle, or vessel aforesaid without previously notifying to the owner, conductor, driver, or master, or, in the case of conveyance by railway, the station-master, that he is so suffering, and obtaining his consent to ride or be carried in the said conveyance, vehicle, or vessel; or
- (b) Being in charge of any person so suffering so expose such sufferer; or
- (c) Gives, lends, sells, transmits, removes, or exposes without previous disinfection, any bedding, clothing, rags, or other things which have been exposed to infection from any such disease, shall be liable to penalty not exceeding five pounds unless such person satisfy the Court that he was ignorant of the existence of such disease: Provided that no proceedings under this section shall be taken against persons transmitting or removing with proper precautions any bedding, clothing, rags, or other things, for the purpose of having the same disinfected or destroyed.

SCHEDULE F.

APPENDIX E.

Department of Public Health, New South Wales.—(Public Health Act, 60 Vic. No. 38.)

DIPHTHERIA.

I.—NATURE OF THE DISEASE.

1. *Diphtheria is catching.*

DIPHTHERIA is a very catching disease. It commonly attacks young children, but older persons also sometimes suffer from it.

2. *How the infection is taken.*

The infection of Diphtheria may be caught from persons ill of it, from clothing, bedding, linen, books, and any other articles handled by them, from rooms which have been occupied by them, and from infected milk.

3. *Infection from the sick themselves.*

From sick persons the infection of Diphtheria is given off in the secretions from the nose and mouth, in the urine, and in the bowel discharges.

4. *Infection by articles infected by the sick.*

Clothing and other articles which have been in contact with the sick, or which have been soiled by the discharges are infective for others. The infection may remain in them for long unless they are thoroughly washed and disinfected.

5. *Time between infection and illness.*

After a person has been exposed to the infection of Diphtheria, from one to fourteen days may elapse before the disease shows itself.

6. *Signs of Diphtheria.*

The first signs of the disease are usually languidness, paleness, bad smell of the breath, sore throat, and slight feverishness; but sometimes the first signs are breathlessness and choking. Sometimes, again, scarcely anything is noticeable at first except a painful swelling of the glands under the jaw, which may be mistaken for mumps. Whenever such signs appear, the sick person should be immediately kept separate from the rest of the household until a medical man has settled whether or not the disease is Diphtheria.

7. *Patient should be kept apart from the family.*

If the disease be Diphtheria, it is most advisable for the safety of other members of the family that unnecessary communication with the patient should be prevented forthwith, by separating him as much as possible from the rest of the household.

8. *Exposure in public of Children of infected households.*

The children in a family of which some member has Diphtheria should not be allowed to play where they may meet other children. Although quite well, they are likely to carry the infection in their clothes and so spread the disease. Such children are expressly forbidden by law to go to school, and if allowed to expose themselves in the streets or other public places while wearing infected clothes, their parents may be prosecuted (Public Health Act, sections 28 and 30).

9. *Animals.*

Animals (cats, dogs, birds, &c.) should be kept out of the sick-room; they may carry the infection to other rooms, and even to other houses.

II.—TO AVOID DIPHTHERIA.

10. *Slight cases of Diphtheria.*

Although Diphtheria is a very serious and often a fatal disease, still mild cases are sometimes met with; these can communicate the disease to others, and in its worst forms. Yet such mild cases cause but little illness in the person so suffering—some slight sore-throat only, a slight hoarseness perhaps, or something which is thought to be only a cold. Hence they are likely to be overlooked or mistaken, and consequently are more dangerous to others than the severe and recognised cases.

11. *Avoid persons with sore throats.*

Sore throats are always to be regarded with suspicion,—they are often infectious even apart from Diphtheria; and when Diphtheria is about, any sore throat may really be Diphtheria. Beware of any person who has a sore throat. Do not kiss, nor take the breath of such a person; nor drink from the same cup, nor use the same towel or handkerchief, nor any article which has been near such a person's mouth until it has been scalded and cleaned.

12. *Common sore throat may lead to Diphtheria.*

Persons with ordinary sore throats are very liable to contract Diphtheria. Such persons should therefore be specially careful to avoid any chance of infection. They should remain away from school, church, theatres, meetings, and the like, until the soreness has gone.

13. *Diphtheria spreads from those who are ill of it.*

Do not let a child go near a case of Diphtheria, nor enter a house, nor receive anything from a house, nor associate with persons belonging to a house in which there is a case of Diphtheria. Adults, although less liable to the disease, should be careful not to expose themselves unnecessarily to infection. Any person who has been exposed should take the earliest opportunity of bathing and changing all his clothes. The clothes taken off should be disinfected or boiled before being put with the general wash or used again.

14. *Children at play.*

Whenever any infectious disease is about it is a good plan to cause the children to play only where they are not likely to join with little-known or strange children.

15. *Diphtheria may be spread by milk.*

Milk is known to carry the infection of Diphtheria sometimes, and therefore it should always be boiled at once on receipt. This is enough to kill the infection if it happen to be in the milk.

16. *Sick animals.*

Sick animals should be avoided at all times. Cats with "colds" can sometimes communicate Diphtheria.

17. *Moving house.*

Do not move into a house without inquiring as to Diphtheria. Every person negotiating for the hire of a house or part of a house is by law entitled to be truthfully informed by the person letting, as to the existence of Diphtheria (as well as of other infectious diseases) in the house within the previous six weeks. The penalty for refusing to inform the inquirer, or for deceiving him, is a sum not exceeding Ten Pounds (Public Health Act, section 26).

18. *Visiting bereaved families.*

The feeling of sympathy which leads the friends of a bereaved family to visit it and to see the corpse, is natural and creditable; but when the cause of death has been an infectious disease such visits are dangerous. There is risk even for adults; and the taking of children to see the body of their deceased playmate in these cases should be strictly forbidden.

19. *Prudence and care.*

It is advisable to take some of the above precautions at all times as a matter of prudence; observance of all of them is especially necessary when Diphtheria is known to be about.

Department of Public Health, New South Wales.—(Public Health Act, 60 Vic. No. 38.)

SCARLET FEVER (OR SCARLATINA).

PART I.—NATURE OF THE DISEASE.

1. *Scarlet Fever is catching.*

SCARLET FEVER is a very catching disease. It most commonly attacks children under 15 years of age, but older persons also suffer from it. It is sometimes called Scarlatina; this is only a different name for it, which does not indicate any difference either of kind or severity in the disease itself.

2. *How the infection is taken.*

The infection of Scarlet Fever may be caught from persons ill of it; from clothing, bedding, linen, books, or any other articles handled by them; from rooms occupied by them; and from infected milk.

3. *Infection from the sick themselves.*

From sick persons the infection is given off by the breath, and in diseased secretions from the nose, throat, and ears; probably also in the urine and in the bowel discharges. The fine scaly particles, or larger pieces of skin which the patient commonly sheds during convalescence are also infective.

4. *Infection by articles infected by the sick.*

Clothing, bedding, and other articles which have been in contact with the sick, or which have been soiled with discharges, or with loose scales or pieces of skin, are infective for others. The finer particles of skin can float on the air, and settle like dust on clothing, linen, carpets, furniture, &c., &c., to which they cling with great persistency. Articles remain infective and can communicate the disease for months, unless they are thoroughly washed and disinfected.

5. *Time between infection and illness.*

After a person has been exposed to the infection of Scarlet Fever, from one to six or seven days may elapse before the disease shows itself.

6. *Signs of Scarlet Fever.*

Scarlet Fever usually begins suddenly. In children vomiting is sometimes the first sign, and it may be accompanied with chilliness; tender swelling of the glands at the angle of the jaw is a common sign which may attract attention first; but often feverishness and sore throat mark the commencement of illness, while there may or may not be in addition the fine red rash from which the disease takes its name. Usually this rash first appears on the upper part of the chest and neck where it should be looked for, and afterwards spreads; but the face remains free from it. As soon as these signs are noticed the sick person should be kept separate from the rest of the household until a medical man has settled whether or not the disease is Scarlet Fever.

7. *Patient should be kept apart from the family.*

If the disease be Scarlet Fever it is most advisable for the safety of other members of the family that unnecessary communication with the patient should be prevented forthwith, by separating him as much as possible from the rest of the household.

8. *Exposure in public of Children of infected households.*

The children in a family of which some member has Scarlet Fever should not be allowed to play where they may meet other children. Although quite well themselves, they are likely to carry the infection in their clothes, and so to spread the disease. Such children are expressly forbidden by law to go to school, and if allowed to expose themselves in the streets or other public places while wearing infected clothes their parents may be prosecuted (Public Health Act, sections 28 and 30).

9. *Animals.*

Animals (cats, dogs, birds, &c.) should be kept out of the sick-room; they may carry the infection to other rooms, and even to other houses.

10. *Scarlet Fever is a serious disease.*

It is often thought that Scarlet Fever is a disease of no great importance. The reason for this belief seems to be that different epidemics vary very much in severity. The proportion of attacked persons who die is sometimes as low as 1 or 2 in the hundred, or even less, and sometimes as high as 30 in the hundred. But even when the general character of an epidemic seems slight no one can tell whether any particular person who may be attacked will have a slight or a fatal illness. For in severe and mild epidemics alike, and in all cases, the infection is one and the same; and the mildest case can cause the worst form of this disease in others who take the infection from it. Every effort should be made, therefore, to avoid spreading even the mild form, and, in short, to stamp out the infection.

11. *After-effects of Scarlet Fever.*

The mildest attacks are liable to be followed by serious illnesses of other kinds. Inflammation of the kidneys and dropsy is one of them, a disease like rheumatic fever is another, disease of the ears and deafness is another. These, even if they do not cause death, sometimes inflict permanent damage on the constitution, and leave the patient injured for life. Scarlet fever, therefore, is a very serious disease. Even in the form in which it appears to be mildest it is not to be treated lightly; it should at all times be most carefully avoided.

12. *Scarlet Fever is not a necessary disease.*

It is also commonly believed that almost all people must have Scarlet Fever at some time or other, and, therefore, that the sooner they get it over the better. This belief is altogether wrong. Scarlet Fever naturally attacks the largest proportion of people at early periods of life, and a smaller and smaller proportion as age advances; and, again, Scarlet Fever is naturally most fatal at young ages, and becomes less and less fatal as age advances. Consequently, the longer any person escapes being attacked the more likely it becomes that he never will be attacked, and the more likely it becomes that, if attacked, he will not die. Parents acquainted with these facts will see that they must take every precaution to shield their children from infection.

13. *Peeling of skin a sign of Scarlet Fever.*

When the disease attacks a person in a very mild form it sometimes causes a trivial illness, the true nature of which may be easily overlooked. But cases of Scarlet Fever are commonly followed by peeling of the skin in larger or smaller pieces, or in quite fine scales. Whenever a child is observed to be shedding his skin it must be assumed that he has had Scarlet Fever, although no particular illness may have been noticed. The peeling is often seen plainly about the hands and feet, as well as elsewhere. Such a child is infectious, and a dangar to others; and slight as his own illness may have been, he can give the disease to others in its worst forms.

PART II.—TO AVOID SCARLET FEVER.

14. *Avoid Persons with sore throats.*

Sore throats are always to be regarded with suspicion,—they are often infectious even apart from Scarlet Fever; and when Scarlet Fever is about, any sore throat may really be Scarlet Fever. Beware of any person who has a sore throat. Do not kiss, nor take the breath of such a person; nor drink from the same cup, nor use the same towel or handkerchief, nor any article which has been near such a person's mouth until such article has been scalded and cleansed.

15. *Common sore throat may lead to Scarlet Fever.*

Persons with ordinary sore throats are very liable to contract Scarlet Fever. Such persons should, therefore, be specially careful to avoid any chance of infection. They should remain away from school, church, theatres, meetings, and the like until the soreness has gone.

16. *Scarlet Fever spreads from those who are ill of it.*

Do not let a child go near a case of Scarlet Fever, nor enter a house, nor receive anything from a house, nor associate with persons belonging to a house in which there is a case of Scarlet Fever. Adults, although less liable to the disease, should be careful not to expose themselves unnecessarily to infection. Any person who has been exposed should take the earliest opportunity of bathing and changing all his clothes. The clothes taken off should be disinfected or boiled before being put with the general wash or used again.

17. *Children at Play.*

Whenever any infectious disease is about it is a good plan to cause the children to play only where they are not likely to join with little-known or strange children.

18. *Scarlet Fever may be spread by milk.*

Milk is known to carry the infection of Scarlet Fever sometimes, and therefore it should always be boiled at once on receipt. This is enough to kill the infection if it happen to be in the milk.

19. *Moving House.*

Do not move into a house without inquiring as to Scarlet Fever. Every person negotiating for the hire of a house or part of a house is by law entitled to be truthfully informed by the person letting, as to the existence of Scarlet Fever (as well as of other Infectious Diseases) in the house within the previous six weeks. The penalty for refusing to inform the inquirer, or for deceiving him, is a sum not exceeding Twenty Pounds (Public Health Act, section 27).

20. *Visiting bereaved families.*

The feeling of sympathy which leads the friends of a bereaved family to visit it, and to see the corpse, is natural and creditable; but when the cause of death has been an infectious disease, such visits are dangerous. There is risk even for adults; and the taking of children to see the body of their deceased playmates in these cases should be strictly forbidden.

21. *Prudence and care.*

It is advisable to take some of the above precautions at all times as a matter of prudence; observance of all of them is especially necessary when Scarlet Fever is known to be about.

Department of Public Health, New South Wales.—(Public Health Act, 60 Vic. No. 38.)

TYPHOID FEVER.

I.—NATURE OF THE DISEASE.

1. *Typhoid Fever is communicable.*

TYPHOID FEVER is communicated from those ill with it to the healthy. It most usually attacks persons in the prime of life, but no age is exempt.

2. *The infection is given off by the sick.*

Persons who suffer from Typhoid Fever give off the infection in the bowel discharges and in the urine. Clothing, bedding, linen, utensils, and all other articles which become soiled with those discharges (or excreta) are infective and can communicate the disease to the healthy.

3. *How the infection is taken.*

The disease can be taken direct from the sick, but that is very uncommon. More often it reaches the healthy indirectly, or in a roundabout way—that is to say, with food and drink, and from other articles soiled with the excreta either in the moist state, or after they have dried and broken into dust which floats on the air.

4. *Time between infection and illness.*

The disease usually shows itself between ten and fourteen days after the infection has been taken; but both shorter and longer periods sometimes elapse.

5. *Signs of Typhoid Fever.*

As a rule the disease comes on very gradually. At first there are feelings of languor and weariness, and of being out of sorts; later there are headache, painful sensations in the back and limbs, loss of appetite, and feverishness. After three or four days, or it may be a week, the patient feels obliged to stay in bed, and then has definite fever. In some cases all the symptoms are so mild that the patient can keep about till a late stage of the illness, or even throughout it. However, when the symptoms mentioned are observed, a medical man should be at once consulted.

6. *Patient should be kept apart from the family.*

As this disease is not easily taken direct from the patient, such rigid isolation is not necessary with Typhoid Fever as with other diseases of its class, provided care is taken and great cleanliness observed; but there is some danger, and, both for the patient's sake and for the safety of others, it is advisable that none but those engaged in nursing should be allowed in the sick-room.

7. *Exposure in public places of children from infected houses.*

Children who live in houses where there are cases of Typhoid Fever are expressly forbidden by law to go to school, and if allowed to expose themselves in the streets or other public places while wearing infected clothing their parents may be prosecuted (Public Health Act, sections 28 and 30).

8. *Animals.*

Animals (cats, dogs, birds, &c.), should be kept out of the sick-room; they may carry infection to other rooms, and even to other houses.

II.—TO AVOID TYPHOID FEVER.

9. *Origin of the infection.*

THE origin of the infection in every present case of Typhoid Fever lies in some past case which may be more or less distant in time or place, or in both, from the present case. The medium of communication between the past and the present case is the excreta (bowel discharges and urine) of the past case. They contain the infection which, under ordinary circumstances, can live, increase, and remain capable of causing Typhoid Fever for very long after it has left the body. Hence it follows that the precautions to be taken against contracting this disease must be described under two heads—those which are necessary in the sick-room, and those which are necessary in common life.

Precautions to be taken in the Sick-room.

10. *Scrupulous cleanliness.*

Keep the patient, his bedding, bed-linen, and clothing scrupulously clean. If the body becomes soiled with excreta, at once wash it with a rag and disinfectant solution; burn the rag. If the linen or clothing become so soiled, soak the spot at once with disinfectant and change the article. Let the excreta always be received in a vessel containing the prescribed quantity and kind of disinfectant; stir well together, breaking up when necessary, and allow to stand in the same vessel not less than two hours. The infection having been thus killed, disposal may be by putting into the water- or pail-closet. Though disinfected, do not put such excreta into a cesspit, nor bury them in the earth of the premises, however extensive. Persons nursing the patient must be very careful to keep their hands and clothing clean; they should not eat or drink in the sick-room if it can be helped, and they must never eat or drink without first washing their hands. Those who visit the sick-room should invariably wash if they touch the patient or articles in the sick-room. 11.

11. *Visiting infected premises.*

It is best to avoid visiting infected premises. Call at the door, but do not enter, except on necessary business. Above all, casual visitors should not eat or drink there.

12. *Neighbours should help in nursing, if required.*

The way in which this disease spreads having now been described, it is easy to see that those who take reasonable care run very little risk of catching it from the patient. Neighbours who are required to help in nursing the patient may fearlessly do so; but if they eat and drink in the house they should eat only cooked food which has not been in the sick-room, and they should drink only recently-boiled liquids (water, milk, tea, &c.). Experience on a very large scale teaches clearly that with care there is no more risk in nursing Typhoid Fever cases than is run in the ordinary course of daily life; for in all large hospitals the nurses are daily in contact with such cases for several months of the year, and yet it is rare for a nurse to contract the disease from the patient. The reason of their escape is that the only precautions which are necessary are extremely simple, easy to take, and effectual.

Precautions to be taken in Common Life.

13. *Typhoid Fever could be stamped out.*

As the infection of Typhoid Fever is given off from the diseased body in the excreta, it follows that if the latter were always completely collected and destroyed, fresh cases would soon become rare, and probably it would not be very long before this disease was almost stamped out.

14. *Conservancy of nightsoil in general.*

But, as there are many mild cases of this fever in which the patient is not prevented by it from walking about, either during the whole course of his disease, or at all events during the earlier weeks of it, the attempt to stamp out Typhoid Fever would not fully succeed if effort were confined to destroying the excreta of recognised cases. It is strictly necessary to success that all excreta, without, exception, shall be conveyed away from inhabited areas regularly, quickly, and completely, to some uninhabited spot where they can do no harm.

15. *The uses of sewers.*

The uses of sewers in relation to Typhoid Fever are precisely those just mentioned. In sewered and water-closeted towns all excreta are prevented from touching the earth, and are also forthwith carried away to places where they can do no harm. Accordingly, wherever properly constructed sewers and house-drainage have been completely introduced, a marked diminution in the amount of Typhoid Fever has been observed to follow.

16. *Cesspits to be avoided.*

In every country where but few towns are completely sewered, some other method of dealing with excreta must be adopted. The cesspit is a common expedient. It is the worst of all. It stores up on inhabited premises a vast accumulation of filth, which should be got rid of day by day, or at least week by week, and it allows that filth to leak into the earth. Even if brick lined, the best built cesspit allows its contents to leak out into the earth sooner or later. The alternative to the cesspit is the pail-closet. This every orderly householder will take care to furnish with dry earth or ashes, whereby it will be rendered as inoffensive as possible. There are objections to the pail-closet, even in municipalities where the service is best managed; but it is the only alternative, and in relation to Typhoid Fever it has this invaluable advantage over the cesspit—it prevents the earth of the inhabited area from becoming polluted.

17. *Why the earth of inhabited places must be kept free from pollution with excreta.*

All excreta must be kept away from the earth of inhabited places, because the infection contained in typhoid excreta can live in the earth, and because it is known to reach man by way of the earth in the vast majority of cases, or as a rule.

18. *The infection can exist after leaving the body.*

The infection of typhoid fever can increase millionfold after it has left the diseased body. It can live and increase in moist earth, provided that earth is filthy, and in water; it can live in milk. Thus it can grow in masses of filth, in cesspits and dung heaps, in foul ditches which carry house-slops, in the earth which is filthy with animal matter in various forms (including slops) around houses which are habitually carelessly kept; again, it can live within houses in the earth in the cracks of floors or paved rooms. The risks which are run by man from such infected places are two—they are connected in part with air, and in part with water.

19. *The infection can be carried on the wind.*

If infected earth becomes dry, infective dust is formed. This, like other dust, can be raised by the wind and reach man in one of two ways—it may be taken into the mouth with the breath, or it may be scattered over articles of food or drink and so come to be swallowed. Infective dust is an important cause of this fever; but it is formed only from earth which has been polluted and infected by excreta.

20. *The infection is commonly conveyed by water.*

Experience shows that the infection very often indeed reaches the healthy from polluted earth by means of water. The reason why this should be the case is thoroughly simple: it is because of the prevalent custom of depositing excreta and of drawing drinking-water from one and the same neighbourhood. The earth is porous, and the ground-water in it is always flowing through it in a stream. The water therefore washes the earth as it flows along, and takes from it some of whatever qualities it happens to possess—mineral qualities, for instance, if it happens to contain partly soluble minerals, or filthy qualities if it happens to contain filth.

21. *How the underground stream reaches man.*

The underground stream keeps rivers flowing by soaking into the channel through banks and bed; it breaks out at the surface in springs; it washes against the walls of underground tanks, and soaks through them; it is tapped when wells are sunk. The water appearing in one or other of those ways is used by man for drinking, and it will be hard or soft, pleasant or disagreeable, harmless or infected, according to the character of the soil through which it has soaked. If excreta are put in the soil (cesspits) or carelessly scattered upon it, or thrown on dung heaps, they soak in, and fall towards the underground stream, or are washed down to it by rain. Water may also be infected by excreta thrown into it, or placed where they can be washed over the surface into it. Lastly, if the formation of the earth is favourable, water may be infected by a deposit at a great distance away.

22. *Infected water may seem quite pure.*

There is usually nothing about the appearance or taste of a water to show that it is infectious—it may be quite clear, sparkling, and agreeable. For infective soaks sows the water with the infection, which is alive, so that only a minute quantity is necessary; thenceforth it increases and spreads through the whole body of water. The polluting excreta do not increase; the infection alone does so. Now, the infection has no quality of odour, taste, or appearance which can be recognised by the unaided senses. Even the extremely delicate tests of chemical analysis cannot reveal it. Such tests may easily show that a water is dirty, and therefore dangerous, but never that it is free from this infection and safe.

23. *The uses of Town Water-supplies.*

When a town has been thoroughly supplied with water which has been collected on a clean gathering-ground, impounded in dams protected from chance pollution, and so distributed in the mains and reticulation-pipes that nothing is added to it from the town soil, Typhoid Fever at once abates. A pure water-supply is of more importance in this connection even than sewers.

24. *Infected water dangerous even in small quantities.*

It is not necessary to drink infected water as such, or in draughts, in order to take typhoid fever from it. Such water is dangerous in small, or even minute, quantities, on account of the power of the infection to increase. Any of the various kinds of drinks, or ices, or clear ice, &c., made with it are dangerous. Salads which are only washed in it are dangerous. Not everybody who drinks infected water, or eats infected food, will fall ill. The body can sometimes defend itself. Yet, as neither youth, nor strength, nor good health are among the body's means of defence against this disease, no one can drink infected water without danger.

25. *Boiled Water is Safe.*

Water which has been boiled not more than twelve hours before drinking it is the safest to drink. Quite a short boiling will destroy the infection if it happen to be in it. It is everywhere easy to get tea. Tea without milk is always safe. Tea with milk is safe too, provided the milk has been separately boiled; the heat of the tea is not enough to destroy the infection in infected milk, and the small quantity usually added to tea is enough to cause the disease. If all milk and water could be quite regularly boiled before being drunk, there would be comparatively little Typhoid Fever; and if all nightsoil were kept out of the earth of inhabited areas there would probably be scarcely any at all.

26. *Prudence and Care.*

It is advisable to take the above precautions at all times as a matter of prudence; observance of them is especially necessary when Typhoid Fever is known to be about.

PART III.—ISOLATION AND DISINFECTION.

(1.) The Nature of Infection.

27. *Infection is a solid substance.*

INFECTION is not visible to the naked eye, nevertheless it consists of solid particles. The particles of infection are alive. If a few of them are taken into the healthy body they grow in it, and increase in number enormously; thus they set disease going. As long as the disease lasts they are freely thrown off from the body. After being thrown off they can still live, independently of the body, for a longer or shorter time according to circumstances. As long as they continue alive they can cause disease if they enter a healthy body.

28. *Diffusion of the infectious particles.*

After being thrown off, the infectious particles are sometimes diffused by the air, on which they can float; but they cannot live long in that situation, and consequently infection spreads by the air only to very short distances indeed, and in the immediate neighbourhood of the patient (the infection of smallpox excepted). When the particles are given off attached to scales of skin, or in small drops of spit, or in other discharges, they survive longer; but, again, being thus weighted, they cannot float far. When they stick to clothes, carpets, furniture, and the like articles, or to walls, and when they fall into crevices of the floor or into dark and damp corners, they live still longer.

29. *How epidemics begin.*

Diseases are said to be epidemic when many people are attacked at the same season. When epidemics are very carefully watched and examined it is always found that they began in one, or in a few, cases from which the disease spread to more and more of the healthy.

30. *How infection reaches the healthy.*

Sometimes infection spreads by direct communication or contact between the sick and the healthy; at others it spreads in an indirect or roundabout way, by means of articles, or of water, milk, &c., &c., infected by the sick. Such infected things may be carried or may travel a great way from the person who infected them, and may start a fresh outbreak of the disease in the neighbourhood they reach. Epidemics so caused generally seem to have arisen mysteriously until they come to be very carefully inquired into.

(2.) To Prevent the Spread of Infection.

31. *Isolation and disinfection.*

Two precautions are chiefly necessary to prevent the spread of infection. First, the patient must be set apart from the healthy who might take the infection from him; secondly, all articles which have been near him, and all discharges from him, must be so treated as to kill the infection he has communicated to them before the healthy come near them. The first of these precautions is called "isolation," the second "disinfection."

32. *Isolation at home.*

In the large and roomy houses occupied by the well-to-do effectual (or safe) isolation of the patient can sometimes be managed; but in most houses safe isolation is very difficult. Whenever the attempt to isolate at home must be made, the instructions given below should be followed as closely as circumstances permit (see sections 36 to 47).

33. *Isolation in Sanatoria.*

When household circumstances render safe isolation at home difficult or impossible, the patient should be removed to a Sanatorium, whenever such an institution is within easy reach. In the first place this course is most favourable to the patient himself, who is more likely to have a short illness and to do well in an airy place entirely devoted to his care, than in a small room in a crowded dwelling; secondly, it is safer, of course, for the other members of the household who might take the disease from him; thirdly, it is best in the public interest, since a great epidemic may start from a single case which has not been safely isolated. Epidemics cannot be controlled unless sanatoria are easily available, and unless the first cases which occur in a town or neighbourhood, and all those which cannot be safely isolated at home, are removed to them.

34. *How to remove patients to a Sanatorium.*

The proper way to get an infectious patient to a Sanatorium, when one is available within easy reach, is to send a request to the institution for his removal, and to keep him at home until an ambulance comes for him.

35. *Duty of Householders to prevent infection.*

Heads of households should bear in mind, not merely that it is their duty to prevent the spread of infection to the best of their ability, and so to avoid doing others a serious, and perhaps a mortal, injury; but also that the law enforces this obligation by providing penalties which may be inflicted for neglecting the requisite precautions (see Public Health Act Part III).

(3.) Isolation at Home.

36. *Give the patient a room to himself.*

The patient must have a room to himself. Perhaps the bedroom in which he is when he falls ill will do. If it should be more convenient or safer to remove him to some other room, then that other should be one at the end of a passage, or at the top of the house, or in some way a little removed from the more frequented parts of the dwelling, so that the rest of the family are not obliged to pass its door often.

37. Preparation of the sick-room.

Prepare the sick-room by removing all curtains and pictures, and all clothes and other articles from drawers and cupboards, reduce the furniture to what is actually required for use, and take up the carpet. Thus there will be fewer things to disinfect at the end of the illness, and the patient will get more and better air.

38. Disinfection of any room occupied before removal.

If the patient has to be moved from the room in which he fell ill, first prepare the room to which he is to go, and then remove him. But remember that he has probably already infected the room from which he has been removed; it must therefore be immediately disinfected, cleansed, scrubbed, and aired (see sections 48 to 69).

39. Choice of nurses.

The patient must be nursed, so one or perhaps two persons must necessarily be in contact with him. Unless professional nurses are employed they should be chosen among the elder members of the family; not only because they will be more competent to nurse, but because they are less likely to catch the commoner infectious diseases.

40. Everything in the sick-room is infectious.

The patient having been installed, everything in his room must thenceforward be looked upon as infectious, and dangerous to others. Nothing must be sent out of it until it has been mixed or wetted with a disinfectant (see sections 57 to 59). No one but those appointed to nurse must enter the room. It is a good plan to hang a sheet over the door on the outer side; the careless are thus reminded that they must not go in. The sheet can also be wetted with a disinfectant if thought desirable.

41. Care to be taken by nurses who leave the sick-room.

Nurses must sometimes leave the sick-room. Except when the patient is an infant or very young child, they should not sleep in it; also they should take a daily walk. But their clothes become infectious like any other articles in the room. Before going into the room, therefore, they should remove their usual outer dress, including boots, and when they have entered should put on a dressing-gown or other outer garment which covers them completely from neck and wrists to below the petticoat, and noiseless slippers; this wrapper and the slippers should be taken off and left in the room immediately before leaving it. They should then repair to a neighbouring room, where their usual outer dress has been left, and thoroughly wash the exposed parts of the body. After washing they may resume their usual outer dress and boots, and then may enter other rooms or leave the house. Nevertheless they should still keep from close contact with others as much as possible, and, above all, should not allow children who are still well to go very near them.

42. Disinfection of articles sent out of the sick-room.

Inside the sick-room should be placed a tub or other large vessel, partly filled with a disinfectant solution (see section 57). In this, bed-clothes, blankets, towels, aprons, diapers, and all other washable articles must be steeped before being sent out of the room to the laundry. Cups, spoons, plates, knives, and all other articles of table service should be similarly treated before being sent out. Everything which has been in the room, and which must be sent out of it during the illness, must first be treated in the same way. Things which cannot be so treated must remain in the room until the sickness is over, when they can be disinfected in some other way.

43. Disinfection of excreta and discharges.

The patient's excreta, spit, vomit, and other discharges must be received into vessels containing a disinfectant (see section 59). Soiled spots on linen, the floor, &c., &c., must be at once freely saturated with a disinfectant, and special care must be taken to apply it before the spots have had time to dry.

44. Books, toys, and animals.

Only such books, papers, and toys must enter the sick-room as can be burnt afterwards. Cats, dogs, birds, and other animals must be kept out.

45. Supplying food.

Food and other supplies for the patient should be taken to the door of the room and set down outside it. The messenger should retire. The nurse may then take the things in.

46. Scrupulous cleanliness necessary.

Scrupulous cleanliness of the patient, his nurses, and his surroundings is essential. Plenty of fresh air and light are most important.

47. Time of recovery from illness.

The time at which the patient has recovered from his illness, and has ceased to give off the infection and to be a danger to the healthy, will vary according to the nature of the disease, and some other circumstances; the decision on this point must be left to the medical man in attendance. After the patient has been pronounced fit to leave his room and to mix again with others, he should be bathed, wrapped in a clean blanket, and taken to another room, where he can put on uninfected clothes. The sick-room must be disinfected, and it must be kept closed until disinfection can be begun.

(4.) Cleansing and Disinfection.

48. What disinfection is.

Thorough cleansing in the usual household sense is an important part of disinfection. But, as it is not always possible to remove the minute, living, particles of infection by cleansing however thorough it may be, special methods have to be employed which can be relied upon to kill the particles where they lie hid, and so to render them harmless. Use of these special methods is called "disinfection." Hence the making of an infected thing not infectious is usually referred to as "cleansing and disinfection," for both processes are necessary.

49. Action of disinfectants.

There is nothing mysterious about disinfectants; they are not charms. They are used to do certain definite work; namely, to kill the living particles of infection. They must therefore be applied intelligently, and according to three fixed rules. The first rule is that they must be capable of doing the required work—that is they must be of certain suitable kinds; these are named below. Secondly, they must be used of certain strengths, which also are mentioned below; they must not be used weaker, but no other harm than waste will be done by using them stronger. Thirdly, though chosen of suitable kinds and used in proper strengths, they must still be allowed sufficient time in which to act; the proper times, again, are stated below, but it will not matter if they are exceeded.

50. Kinds of disinfectants.

The disinfectants recommended are of three kinds: gaseous (for fumigation), liquid, and solid; each has its proper use. The fumigating disinfectants are paraform, and sulphur. The liquid disinfectants are formalin, and carbolic acid. The solid disinfectant is chloride of lime; but this can also be used as a solution. There is also one simple process which is thoroughly efficient: this is boiling in water, or in water containing soap and soda, just as in ordinary laundry washing; but to disinfect the boiling must be continued for half an hour.

51. How paraform is used.

Paraform is sold in little white tablets. They are used by being heated over a spirit-lamp made for the purpose, when they gradually turn to vapour and disappear from sight into the air. Twenty tablets are enough for a room of 1,000 feet cubic capacity, and two more must be added for each additional 100 feet or part of a hundred. Paraform is not poisonous. It does not injure any articles exposed to its vapour. The vapour is very irritating to eyes and nose at first; but it can do no harm, and the irritation soon passes off.

52. *How sulphur is used.*

Roll or rock-sulphur is to be preferred, because it can be made to burn better than the flowers. It is used by being broken into pieces between the size of a cherry and a loquat, placed in an iron vessel supported over a tub of water, wetted with a little methylated spirit, and set on fire. In burning, the sulphur turns to a vapour which fills the room. One-and-a-half pounds of sulphur is enough for a room of 1,000 feet of cubic capacity, and proportionately more must be burnt for each 100 feet above 1,000. A little more than the strict proportion should be taken because the whole never burns off. The vapour produced by burning sulphur (sulphur dioxide) is also sold in tins in which it is condensed to a liquid which turns to gas again as soon as it is liberated; this may be substituted for burning sulphur and then there is no risk from fire. Sulphur is not poisonous. Its vapour is irritating, and must not be breathed while it is strong.

53. *How formalin is used.*

Formalin is sold in bottles which hold 16 fluid ounces. For use, one part of formalin is to be mixed with nineteen parts of water—*i.e.*, one bottle of formalin and nineteen bottles of water, or one tablespoonful of formalin and nineteen tablespoonfuls of water, &c., &c. Formalin is not poisonous.

54. *How carbolic acid is used.*

Carbolic acid is sold of many different qualities. The most refined is white, the less refined is brown. The brown is the proper quality to use for disinfecting, not the white. That known as Calvert's No. 5 is a suitable quality, and is very cheap. It is to be prepared by stirring half a pint up in water and gradually making the quantity up to 1 gallon. Carbolic acid is poisonous, and before being diluted it burns the skin.

55. *How chloride of lime is used.*

Chloride of lime, or bleaching powder, is used in its solid form to sprinkle over the contents of cesspits, or other masses of filth before removing them, and on the ground after they have been removed, and to sprinkle in gutters, ditches, &c., &c. A solution can be made from it; and this is to be done by stirring up half a pound in a gallon of water. The liquor may be used before or after settling. Chloride of lime loses its virtue if left exposed to the air, and should be kept in tightly closed receptacles. It is not poisonous.

56. *How to measure the number of cubic feet in a room.*

When a room is to be fumigated the quantity of fumigating disinfectant used must be proportioned to the size of the room (see sections 51 and 52). To ascertain this, proceed as follows: if the room be square, measure any two of its sides in feet, and multiply the two measurements together; then ascertain its height in feet, and multiply the number got by multiplying the length of the two sides together by it; this second result gives the number of cubic feet the room contains. If the room be not square then the length of one long side and of one short side must be taken and multiplied together, and the result multiplied by the height.

57. *To disinfect linen and woollens.*

All linen and woollen articles which have to be sent out of the room while the illness lasts are to be soaked in a tub partly filled either with the solution of formalin or of chloride of lime, or of carbolic acid (see sections 53 to 55). They must be allowed to soak for two hours at least; they may then be wrung out and sent out of the room to the wash. At the laundry the articles which have been soaked should be first boiled for half an hour, and then finished in the usual way. If they cannot be boiled (blankets, woollens, &c.) they should be hung exposed to light and air for many hours, and then washed.

58. *To disinfect hardware.*

Cups, glasses, plates, knives, forks, &c., &c., and other articles of table-service should be soaked in either of the solutions of formalin, or chloride of lime, or carbolic acid (see sections 53 to 55), for two hours at least, before being sent out.

59. *To disinfect excreta and discharges.*

The patient's excreta, liquid as well as solid, must be received into vessels always kept ready, and containing at least a quart of either of the three solutions (see sections 53 to 55); they must be thoroughly stirred and, if necessary, broken up with a piece of stick, so that they are really mixed with the solution, and before being disposed of must be allowed to stand for two hours at least. The infection in them will then be killed, and they may be disposed of in any convenient way. Other discharges must be similarly dealt with by being mixed or treated with an excess of either of the three solutions. If there is a fire in the room it is better to use old pieces of rag, or soft Japanese paper, which can be burnt, than pocket-handkerchiefs, &c.; however, if handkerchiefs and diapers have to be used they should be changed before they have time to get dry, and must be steeped in either of the three solutions for two hours at least before being sent out of the room. Should the night-dress, bed-clothes, floor &c., become accidentally soiled with any discharge, the spot must be at once wetted with either of the three solutions, and kept wet, so as to kill the infection. From what has been said above of infection it will be perceived easily that dust must be very dangerous. With wetted dust (or mud) there is little danger, if ordinary care be used, because it cannot fly about.

60. *Preparation of the sick-room for fumigation.*

After the patient has left his room it must be prepared for fumigation. This would be done best by the person who has nursed him. First of all prepare sufficient tubs containing either of the three solutions, and place in them all those pieces of soft goods which can be so treated without spoiling; put the tubs against the wall, out of the way; turn the contents over from time to time; leave them until the fumigation is completed. Arrange all other soft goods, which cannot be so treated, so that the fumes can reach them on both sides; a good plan is to stretch a couple of lines across the room about a foot apart, and to hang each article spread out over both lines. Arrange all other articles so that the fumes can reach them all round as much as possible. Open all drawers and cupboard, so that the fumes can enter them freely. Paste a sheet of paper over the fire-place, and over all air-bricks and ventilators, and strips of paper over the crevices round the window frames, so as to prevent the fumes from escaping. Ascertain the size of the room (see section 56). Take the requisite quantity of paraform or sulphur (see sections 51 and 52). See that the lamp or the iron dish is safely arranged so as to avoid risk of fire. Light the paraform lamp, or the sulphur (as the case may be), shut the door of the room, and paste up the cracks round the door and the keyhole on the outer side. If paraform is used leave the room closed for six hours at least; if sulphur, then for twelve hours at least. At the end of that time throw the door open. The fumes of paraform are pungent, but can do no harm. The fumes of sulphur must not be breathed while they are very strong. As soon as possible the windows may also be opened.

61. *Cleansing the room after fumigation.*

Proceed to complete the disinfection by cleansing everything in the room thoroughly. Go over every article separately with a cloth moistened with either of the three solutions; take care to wet and wipe all dust from them; if pictures have been left on the walls take them down, wet and wipe all dust from corners, mouldings, and backs; go over each piece of furniture separately, take the bedstead to pieces, wash all dust out of corners and angles, and the parts not usually seen; go over the inside of all drawers and cupboards; go over the skirting boards. Thoroughly wet the floor with one of the three solutions, and afterwards scrub it in the usual way.

62. *Cleansing walls.*

Walls, if colourwashed or kalsomined, should be done over again. If hung with varnished paper, or painted, they can be washed down with the cloths wetted in either of the three solutions. If hung with paper, it is best to remove and burn the old paper, and hang a new one; if this cannot be done and the paper will not bear wetting without spoiling, it may be thoroughly rubbed with stale bread, the crumbs being carefully gathered and burnt. Never paste a new paper over an old one; always wash off the old one first.

63. *To disinfect bedding, &c.*

Beds, mattresses, and pillows should be opened along the seams, and the filling spread on the floor of the room before beginning the fumigation; the coverings should be put in the disinfecting tubs (see section 57) at the same time. The coverings can afterwards be boiled. Horsehair may also be soaked in the disinfecting tubs. Feathers, flock, and kapok should be spread in the sun for a day or two after the fumigation.

64. *To disinfect upholstered furniture.*

Upholstered furniture should not be left in the sick-room. Any which has been so left should be fumigated with the other things, and afterwards taken into the open air, well beaten with sticks, and left exposed for a day or two.

65. *To disinfect curtains, heavy clothing, &c.*

Heavy clothing, curtains, silks, &c., which have been (improperly) left in the sick-room, and which cannot be washed, must be taken out of doors after the fumigation and left there for a day or two, being so turned occasionally that every part may be exposed to sunlight and air.

66. *Airing the sick-room.*

After everything has been washed and cleansed, the windows and door should be set open, and the room be left freely exposed to light and air for a time.

67. *Disinfection of closets.*

Closets should be specially disinfected during the illness and after it is over. A water-closet should be treated by discharging a couple of buckets full of hot soap and soda very rapidly into the basin; then a similar quantity of clean water; lastly a bucketful of disinfectant solution of either kind; this is called flushing, which consists in feeding to the pipe-drain a larger quantity of liquid than it can carry off at once, so that it runs full bore. Flushing cannot be done by setting a tap running. Yard-gullies and other house-drains may be similarly treated to disinfect them. A pail-closet is to be disinfected by getting the pail thoroughly scrubbed out with chloride of lime solution. Treat a cesspit by first freely serving it with solid chloride of lime. After a time cause it to be emptied; then serve its walls freely with chloride of lime solution. Afterwards scrape its walls, remove the bricks if it be lined, and fill it up with clean earth. Move the house a little to one side, and fit it with a pail. If the house cannot be moved, build a brick pillar up from the bottom of the pit to the surface, fill up with clean earth well rammed, and lay a square of concrete for the house to stand on and to form its floor. It is necessary to deal thus with cesspits after every infectious disease, but especially so after typhoid fever. Cesspits are dangerous things, and pails should be substituted for them everywhere that sewers and water-closets are not available.

68. *Destruction of infected articles.*

The only articles which always must be burnt are books, papers, and toys; they cannot be safely disinfected. It is rarely necessary to destroy any other infected articles. Things which can be boiled need never be destroyed. Articles which might be disinfected are sometimes so old, worn out, and filthy that it is not worth while to spend time in attempting to cleanse them, or of no value (as the straw filling of a mattress, for instance) so that there is no reason for wasting time in disinfecting them. In all other cases, though destruction of articles by fire is a short and certain way of getting rid of infection, it is unnecessary and extravagant.

69. *Municipal disinfection of some articles.*

In municipalities provided with a disinfecting station and a steam disinfector, it is better to get many articles taken there, and disinfected by steam. Such articles are—bedding stuffed with feathers, heavy clothing, carpets, &c., &c. In municipalities which possess a disinfecting staff it is easier and better to call upon the latter to disinfect houses and rooms as well.

PART IV.—THE LAW OF INFECTIOUS DISEASES AS IT REGARDS HOUSEHOLDERS.

70. *Local Authorities.*

The Local Authorities charged to administer the Public Health Act within their respective districts are as follows:—Within the boundaries of any municipal district, the Council of that municipality; within a police district (but exclusive of land within the boundaries of any municipality as aforesaid), such member of the police force as may have been appointed by notification in the *Gazette*.

71. *Householders to report cases.*

As soon as the person responsible for the patient becomes aware that the illness is an infectious disease, he or she must report to the Local Authority, in writing, under a penalty not exceeding Five Pounds; no delay is allowed.

72. *On whom the responsibility of reporting is laid.*

In every case some person is by the law held responsible to report; either it is the head of the family or the nearest relative present; or any person in charge of the patient; or any person merely attending on the patient; or, in the last resource, the occupier of the house (Public Health Act, section 21).

73. *Local Authorities to distribute this Manual.*

The Local Authority is required by Regulation to serve a copy of this Manual at every house in which presence of a case of Typhoid Fever has been reported to it.

74. *Patient must be kept away from the public.*

Exposure in public without proper precautions against spreading the infection, either of a person suffering from an infectious disease, or of any infected articles, is an offence punishable by law with a penalty not exceeding Five Pounds (Public Health Act, sections 30 and 31).

75. *What are the proper precautions.*

What are the proper precautions is a matter to be decided according to evidence in each case in which any person is prosecuted for exposing himself, or for exposing any person of whom he is in charge, in public, while suffering from an infectious disease, or for exposing infected articles. The responsibility for taking proper precautions lies on the person suffering or in charge of the person suffering, or in charge of infected articles, but they cannot be defined.

76. *Using public vehicles.*

The following law applies to all public conveyances and vehicles, or vessels hired or plying for hire, ships, boats, omnibuses, trams, cabs, railway carriages, &c., &c. :—

- (a) If any such conveyance, vehicle, or vessel be used to convey a person suffering from an infectious disease, the owner, driver, conductor, or in the case of a railway carriage, the station-master, must cause it to be disinfected, immediately afterwards under a penalty not exceeding Five Pounds (Public Health Act, section 31).
- (b) No person suffering from an infectious disease may enter any such conveyance, vehicle, or vessel without first informing the person in charge that he is so suffering, and obtaining the consent of that person, under a penalty not exceeding Five Pounds (section 30).
- (c) If the person in charge (who, in the case of a railway carriage, is the station-master at the station where the journey begins) agree to carry a person so suffering, he is entitled to be paid by such person a sum sufficient to cover any loss he may incur in having his conveyance disinfected afterwards (section 31).

77. *Children must not go to school.*

The law forbids the sending to school of any child who, within the previous two months, has suffered from an infectious disease, or who within the previous six weeks has lived in the same house as a person so suffering, unless medically certified free from infection both as to person and clothing, under a penalty for neglect not exceeding Ten Pounds (Public Health Act, section 28).

78. *Leaving infected premises.*

People who leave their dwelling within six weeks after a case of infectious disease has happened among them are required by the law to do two things before they leave:—

- (a) They must have the house, or if they only rented part of it then they must have that part, disinfected, together with all articles therein liable to retain the infection; and this must be done to the satisfaction of a legally qualified medical practitioner, as certified by him in writing. This certificate is the proof that they have complied with the law.
- (b) They must also without any delay *voluntarily warn* the owner of the house immediately they leave, that they have had a case of infectious disease among them. If they only rented part of the house, then the notice must be given to the occupier or principal tenant from whom they rented their part.

The penalty for neglect to do either of these two things before moving is a sum not exceeding Five Pounds (Public Health Act, section 26).

79. *After having left infected premises.*

People who have left a house or part of a house within six weeks after a case of infectious disease has happened in it during their occupancy are required to give information as follows, if asked for it:—

- (a) Any person who *is asked* by the owner or occupier of the house in which he has lived whether there has been a case of infectious disease in it, or in the part of it occupied by him, while occupied by him, within six weeks before the question is asked, must answer truthfully, under a penalty not exceeding Ten Pounds.
- (b) Any person who has left a house, or part of a house, must answer truthfully *if asked*, the above question by any person negotiating for the hire of the house (or part of it); in this case also the penalty for not answering truthfully is a sum not exceeding Ten Pounds (Public Health Act, section 26).

80. *Letting or showing infected premises.*

Every person who lets premises on which there has to his knowledge been a case of infectious disease within six weeks previously, also every person who shows such premises for the purpose of letting them, must *voluntarily tell* the person proposing to take them, or looking over them with a view to deciding whether he will take them, of the previous occurrence of a case of infectious disease upon them. This information must be given whether the premises have been disinfected or not. The penalty for neglect is a sum not exceeding Twenty Pounds (Public Health Act, section 27).

81. *After death from Typhoid Fever.*

The body of a person who has died of Typhoid Fever is infectious and dangerous to others. The law, therefore, requires that every such body shall be completely wrapped, as soon as may be after death, in a sheet or similar covering which has been wetted in a solution of five parts of carbolic acid to ninety-five parts of water. Every such body must be coffined, and the coffin must be permanently fastened down, within twenty-four hours after death. A penalty for wilful neglect, not exceeding Five Pounds, may be inflicted (Public Health Act, Regulations 12 and 13).

82. *Burial within a Limited Time.*

The body of a person who has died of an infectious disease must be buried within a certain time. If lying in a municipal district it must be buried within thirty-six hours of death; if outside a municipal district, that is to say, within a police district, it must be buried within forty-eight hours of death (Public Health Act, section 32).

83. *The time for burial can be extended.*

But such a body may be kept longer, if absolutely necessary, under the following circumstances:—(a) If it be in a public mortuary, or (b) if the Local Authority, for some special and very good reason, sanction a longer delay in writing (Public Health Act, section 32).

84. *On whom the responsibility for due burial is laid.*

It is the duty of the occupier of the place where the body is to see that the body is buried within the time named; if there be no occupier then it is the duty of the owner; in either case the penalty for neglect is a sum not exceeding Fifty Pounds (Public Health Act, section 32).

85. *Removal of Body from a Hospital, &c.*

If a person die of an infectious disease in a hospital, &c., the body must not be removed therefrom except for burial, if any legally qualified medical practitioner certifies that in his opinion it is desirable that it should not be removed in order to avoid risk of spreading the infection, under a penalty for wilful neglect not exceeding Ten Pounds (Public Health Act, section 33).

PART V.—PROVISION FOR PUBLIC DISINFECTION IN MUNICIPAL DISTRICTS, AND SANITARY AREAS.

86. *Powers and duties of Local Authorities.*

The law contemplates disinfection by Local Authorities only within municipal districts and (outside them) in sanitary areas proclaimed under section 48 of the Act. The Local Authority for any such district or area is required by the Public Health Act to provide a proper place, together with all necessary apparatus and attendance, where articles removed from infected dwellings may be disinfected (Public Health Act, section 25, subsection ii). Also it may disinfect drains, houses, or parts of houses, and any articles therein likely to retain infection (Public Health Act, section 24, this power it is enjoined to exercise (Public Health Act, section 9, subsection ii). If it should fail to act the Board of Health can take measures to cause it to remedy such failure (Public Health Act, section 16).

87. *Householder has some discretionary powers.*

The Local Authority may serve a notice on the householder requiring him to disinfect his premises. The householder may then (a) give the Local Authority notice that he will do the disinfection himself under the supervision of a legally qualified medical practitioner, or (b) he may allow the Local Authority to do it. If a householder, after notice, informs the Local Authority that he will do the disinfection himself, but fails to do it within the time fixed in the notice, the Local Authority may do it, and the householder is liable to a penalty of not exceeding Twenty Pounds (Public Health Act, sections 24 and 78). No householder need wait until the Local Authority serves such a notice upon him; he can proceed to disinfect his house as soon as it seems time to do so, but the Local Authority may and should inquire in every case which comes to its knowledge whether disinfection has been done and whether it has been done effectually. The only evidence of effectual disinfection which a Local Authority would be justified in accepting is a certificate of a legally qualified medical practitioner.

88. *Cost of disinfecting premises.*

The cost of disinfecting premises and articles may be recovered by the Local Authority from persons able to bear the expense. Power is given them, however, to disinfect at the public cost when the occupant is too poor, &c.

89. *Compensation for damage to premises.*

When a Local Authority causes any damage in the course of disinfecting any drain, house, or part of a house, or articles therein, it must compensate the occupier or owner. Damage need not, and in practice very rarely would be done. If alleged, the clearest proofs would be necessary to support the claim.

90. *Compensation for destruction of articles.*

If it appear to a Local Authority necessary to destroy any infected article rather than disinfect it, it has power to destroy, and if it do destroy must compensate the loss to the owner. Generally speaking destruction is necessary only when articles are so old and filthy that they would probably fall to pieces under any process of thorough cleansing; consequently either no compensation will be necessary in such cases, or it will be of a trivial amount at most.

91. *Why compensation is authorised.*

It is clear that these rights to compensation are conferred on the householder partly for prevention of carelessness and wilful damage, and that they cannot be so enforced by him as to hamper Local Authorities in the discharge of this important public duty.

92. *Shelter to be provided.*

If a Local Authority think it necessary to turn any family out of the room or house they occupy in order to disinfect thoroughly, then it must provide them with shelter and attendance for the time during which they are kept out of their dwelling for that purpose. But it is entirely within discretion of the Authority whether in any case it turns the occupants of infected premises out or not.

93. *Separate pail-service.*

In municipal districts and sanitary areas in which there is a pail-service for collection and disposal of nightsoil, separate pails, suitably distinguished by being painted of a conspicuous colour, should be supplied to houses in which there is infectious disease. Such pails should be removed, emptied, cleansed, charged with a disinfectant, and replaced daily, as long as the illness lasts. Local Authorities are not obliged to take this precaution except when the infectious disease is typhoid fever (Public Health Act, section 25, subsection iii); but it is most desirable that it should be taken in cases of infectious disease of all kinds.

APPENDIX F.

NOTICE.

Department of Public Health.

It is a common thing for workmen in camp to be seized with Typhoid Fever, Diarrhoea, Dysentery, and similar preventible Diseases.

Except when a person comes to camp already ill, these diseases are almost always due to the drinking water being dirty.

They can be prevented by keeping the water clean; and this can be done by preventing the deposit of filth or slops on the ground round the waterhole, &c., from which it is taken, and by preventing people from washing dirty clothes in or near the water, and from bathing in it.

It is to the interest of every person in camp that the water should not be fouled. The carelessness or disregard of decency by a single person may endanger the health of all. You are therefore asked, in your own interest, not only to do what you can yourself to avoid befouling the only water there is for you to drink, but also to do what you can to prevent others from fouling it. Your personal assistance is necessary.

As with every care taken it is still possible that foul matters may reach the water, you should

Drink only water which has been boiled the same day.

If you drink only boiled water you are most likely to escape the illnesses mentioned.

J. ASHBURTON THOMPSON, M.D.,
Chief Medical Officer, President.

Sydney, June, 1898.

APPENDIX G.

Department of Public Health, New South Wales.

Sir,

The Board of Health having decided strictly to enforce the provisions of Section 50 of the Public Health Act, I am directed to request that you will have the goodness to instruct each of your officers, within whose district a woolscour may exist, to hand to the owner or manager thereof a copy of portion of that Section (appended hereto), and in so doing to inform him that the same is to be regarded as a sufficient and conclusive notice, the infraction of which will be followed by prosecution for breach of the Act.

I have, &c.,

C. A. SIMMS,
Secretary.

The Inspector-General of Police.

"Any person who pollutes by causing or knowingly permitting any solid or liquid matter to fall or flow or to be carried into any stream of water used for, or in connection with the supply of water for drinking or domestic purposes, shall be liable to a penalty not exceeding Five Pounds for every day that he causes or permits the said matter to fall or flow or to be carried into the said stream or water in contravention of this Section."

(Public Health Act, 1896 (60 Vic. No. 38), Sec. 50).

Department of Public Health, New South Wales.

Form No. 193.
Sydney, October, 1898.

Sir,

PUBLIC HEALTH ACT, 1896, SECTION 50.

Complaints having been frequently made to this Department by residents on the banks of the different rivers throughout the Colony of pollution by woolscourers of the only water available to them for domestic purposes, I am directed to inform you that an inquiry into the method of disposal of foul water from all woolscours was directed by the Board of Health. It was found that a majority of proprietors had taken steps to prevent the pollution of rivers. It was, therefore, resolved at a meeting of the Board held on the 20th September, that every woolscourer should be informed that, as long as the water of the stream on which his premises are situated, is or may be required by residents along its banks for domestic purposes, he must neither wash wool in the stream nor allow the unpurified effluent from his works to return to it.

2. I am to draw your attention to this decision, and to request that, so far as your circumstances require, you will be good enough to act accordingly.

3. I am to warn you that this notice is to be considered final.

I have, &c.,

C. A. SIMMS,
Secretary.

APPENDIX I.

Department of Public Health, New South Wales (Dairies Supervision Act, 1886 : MANUAL OF INSTRUCTIONS TO DAIRYMEN AND MILK VENDORS, Part VII, paragraphs 51 and 53).

MEMORANDUM ON CESSPITS AND PAIL-CLOSETS.

The Board's rule that no cesspit shall be allowed to continue on dairy premises is sometimes appealed against, especially when the Dairies Supervision Act first comes into force in a newly proclaimed district. It appears possible that such appeals may be in part grounded in some misunderstanding, both of the nature of the Board's objections to cesspits, and of the management and uses of pail-closets; and that a few words of explanation on both these points may be welcome.

2. In the first place cesspits are discountenanced by the Board (and by every other competent health authority) wherever they are found, and as much on ordinary as on dairy premises. The reason is that they preserve in the neighbourhood of dwellings and of sources of water, a kind of filth which is not only highly offensive, but, as a cause of disease, exceedingly dangerous. A most important duty of Local Authorities under existing conditions—perhaps it may be said the most important—is to provide for such careful collection, scavenging, and disposal of nightsoil, as shall entirely secure the inhabited area from pollution with it.

3. This being the view of the Board on cesspits in general, that is on ordinary premises, it is not to be supposed that it will hold less stringent views on cesspits on dairy premises, where an article of food capable of conveying infection to others is produced and handled; and the more that it is a matter of common knowledge that milk is most likely to be, and usually has been, infected through the occurrence of illness among the persons engaged in handling it. The danger of cesspits in relation to milk, therefore, lies not only in nearness of the pit to the premises, but in close relation of the pit to the people on the premises, who, in their turn, are in close relation to the milk they subsequently sell to the public. To place the pit at a great distance from the premises is a prudent and good thing as far as it goes, but, since the people on the premises go to the pit, it is not so effective a precaution as might be supposed at first sight.

4. Now it is clear that so offensive and dangerous a material should be destroyed from time to time at short intervals, and should not be allowed to accumulate in large heaps, and to remain at hand month after month. This seems a difficult thing to do; but nature has provided a way, and it is really very easy. All that is necessary (on premises which are not within reach of a scavenger) is to provide a small receptacle, which shall stand above the soil and not be sunk in it, to empty it once a week at least, and to thoroughly dig the contents into the surface soil, to a depth of not more than nine or ten inches. This done—a matter of ten minutes' work once a week—natural processes at once begin to act on the deposit, and to convert it into quite harmless matters which, moreover, are very useful to plant life. It does not remain for ever, nor for very long, in the earth where it has been put. In about five weeks it has entirely disappeared, provided it were thoroughly spaded in to begin with. An economical manager would thus manure his vegetable patch, and would reap a benefit. Is that not better than accumulating a filthy and offensive mass near the family, and being exposed year after year to the danger of it?

5. It is sometimes objected that the pail-closet here recommended is in itself offensive, and that it attracts flies. But there need be no offensiveness; that matter it is entirely within the power of the householder to prevent. It is only necessary to keep in the privy a box full of dry earth, or of ashes, and a scoop, and to direct every person who uses the pail to put in a scoopful or two of earth or ashes. If this is done regularly there need be neither offensiveness nor slop, and the task of digging it into the ground is made easy. As to flies, they can be prevented by properly constructing the privy; and in the extract from one of the Board's publications which is given below, will be found a description of the proper way to construct one so as to prevent flies. Flies like the light: then keep the pail dark.

6. It is also sometimes thought that there would be difficulty in digging the contents of the pail into the soil in wet weather. Except during or immediately after heavy storms nothing which can properly be called a difficulty is met with, when the quantity to be dealt with is small, such as a single pail commonly yields. But it is worth while to mention that when the pail is properly served during the week with dry earth or ashes, the resulting mass is a compost which, at need, can be stacked without offence on a slab of stone or the like, under some slight shelter sufficient to keep it dry. It can be taken thence to the garden when the weather is fair again.

7. There is everything to be said against cesspits in relation to the general health of a community, and something special to be said against them when they are found on dairy premises. On the other hand there is nothing to be said for them, except that they are found convenient by the lazy, the short-sighted, and the penny-wise. This is the result of experience. In places where nearly all premises are furnished with pails a few cesspits may remain, but at all events all premises have some decent privy accommodation; whereas in places where nearly all premises have cesspits there are sure to be some which have no decent accommodation at all. The presence of cesspits is evidence either of ignorance or of indifference, or of both together.

J. ASHBURTON THOMPSON,
Chief Medical Officer, President.

Extract

* Metropolitan or Hunter River.

Extract from : "Papers relating to the Collection and Disposal of Nightsoil in Unsewered Districts."

"Method of constructing pail-closets. All privies to hold pails should comprise the following features :—The riser and seat should be well fitted to walls and floor ; the seat should be furnished with a hinged cover, to open against a stop in the back wall of of the privy, so placed that the cover will not remain open except when held, but the stop not to project further than necessary for this purpose, nor far enough to interfere with convenient use of the privy ; at a point immediately above the floor level insert, either in one wall or in the riser, a 6 in. x 4 in. grid, for admission of fresh air to the enclosed space under the seat ; perforate the seat in either of the back angles with a 4-inch circular opening to furnish an exit for the air admitted through the grid ; adapt to this circular opening a 4-inch ventilating shaft, carry it up through the roof, and cover it with a mushroom hood to keep the rain out. By this arrangement the space under the seat containing the pail will be kept dark, so that flies will not congregate there, and at the same time it will be constantly swept out by a current of fresh air. The floor should be fitted with a fillet, so placed that the pan must occupy the proper position without special attention by the scavenger who removes and replaces it. The top of the pail itself should stand not more than two inches below the underside of the seat.

Office of the Board of Health, Sydney, October 8th, 1898.

PUBLIC HEALTH ACT, 60 VIC. NO. 38. PART VIII.

Sir,

I am directed to inform you that arrangements have been made for the cold-storage of the third sample of milk collected by your authority, in pursuance of its duty under the above Act (Section 54).

2. The store is that belonging to the Board for Exports, Government Meat Markets, Pyrmont, and the mode of procedure to be followed in depositing samples is as follows :—

- (a) The sample is to be taken to the store on the day it is collected ;
- (b) If the vessel is of tin the risk of breakage will be avoided. It is to be securely sealed ;
- (c) A receipt, prepared beforehand, clearly describing the distinguishing mark on the vessel, is to be given to the officer in charge of the store to sign, and is then to be retained by the depositor until he reclaims the sample. (Receipt forms can be obtained from the clerk in charge of the store).

I have, &c.,
C. A. SIMMS,
Secretary.

APPENDIX L.

Department of Public Health, New South Wales.

Form 194.

Sydney, October, 1898.

DAIRIES SUPERVISION ACT (1886).

Sir,

I have the honour to inform you that the first of the two paragraphs printed within is to be read by you as though it formed a part of the Board's Manual (No. 2, Form 150) for the information and guidance of Dairymen and Milk-vendors registered by you under the Dairies Supervision Act (1886), and the Public Health Act (1896); and that paragraph 44 of the Manual is cancelled, the second paragraph being now substituted for it.

By order,
C. A. SIMMS,
Secretary.

To the Local Authority,
District of

14A. Floors of Cowsheds, Dairies, Bails, &c.

The flooring of bails, cowsheds, dairies, &c., must be such as can be kept clean and sweet with little trouble, and therefore must be made of smooth, impervious material, such as (a) stone, brick, concrete, mineral asphalt, or the like ; (b) the foregoing materials are to be preferred in every situation, but in bails wood may be used. Whenever the materials mentioned under (a) are employed the floor must be laid on a good bottom, and all joints and cracks must be filled with impervious material so that no liquid can leak into them ; it must be slightly inclined so as to throw off water or stalings, and it must be constantly maintained free from faults and clean. (b) When wood is used for flooring bails, it must be of the hardest sort available, in squared planks not less than three inches thick ; the planks must be accurately fitted to each other, solidly held together, and laid on a good bottom ; the joints must be so caulked that no liquid can leak into them ; the whole must be slightly inclined so as to throw off water and stalings, and must be constantly maintained free from faults, thoroughly dry, and clean.

44. *When infectious sickness occurs in human beings.*

The several diseases mentioned in Schedule A hereto must be reported by the dairy-farmer when they occur in persons living on his premises or engaged in his business. Greatest danger exists when the infectious disease is typhoid fever, scarlet fever (or scarlatina), or diphtheria; while, therefore, all the diseases in the list must still be reported as provided by law, the following special rules are made for dealing with any of those three of them:

A.—When either Diphtheria, Typhoid Fever, or Scarlet Fever (sometimes called Scarlatina) occurs on dairy premises, it is the duty of the Local Authority to take care that communication between all persons belonging to the infected household and the milk business, in all its details, is strictly prevented. This may be effected in one of the two following ways:—

- (1.) The business may be entirely suspended until the patient has been removed and the premises disinfected; or
- (2.) Arrangements may be made for milking and for carrying the milk to the factory, railway, or customer, by persons who neither belong to nor enter the infected premises. This strict separation between the milk business in all its details (from the milking herd to the factory, &c.) and all members of the infected premises must be strictly maintained as long as the illness lasts, and until the premises have been disinfected after it.

B.—It is the duty of the Local Authority to carry out this most important part of the law, and to consider the circumstances of each case as it arises, with a view to deciding whether the precautions proposed to be taken by the dairy farmer are such as may be relied upon to safeguard the cattle and the milk-consuming public. The Local Authority derives its power to order whatever steps may in its opinion be necessary, and is charged with the duty of ordering them to be taken by the dairy farmer, under the Dairies Supervision Act (1886), Sections 4 (IV), 9, 10, and 11. The Local Authority must always act so as to effectually guard the public health; but if, in any case, a dairy farmer should see fit to consult a medical practitioner, the Local Authority may take the latter's opinion into consideration (provided it is communicated in writing) before exercising the peremptory and final powers conferred upon it by the Dairies Supervision Act (1886), Section 4 (IV).

SCHEDULE.

New South Wales To Wit (L.S.) Carrington, Governor.	Proclamation by His Excellency the Right Honourable Charles Robert, Baron Carrington, a Member of Her Majesty's Most Honourable Privy Council, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales, and its Dependencies.
---	--

WHEREAS the Board of Health has recommended that the diseases hereinafter mentioned be declared infectious diseases for the purposes of the "Dairies Supervision Act": Now, therefore, I, CHARLES ROBERT, BARON CARRINGTON, the Governor of the Colony of New South Wales, in pursuance of the provisions of the above cited Act, and with the advice of the Executive Council, do, by this my Proclamation, declare the diseases named hereunder to be infectious diseases, viz:—

A.—In human beings.

Cholera
Enteric (or Typhoid) Fever
Smallpox
Scarlet Fever
Diphtheria
Measles
Syphilis

B.—In animals.

Aphthae
Cancer
Pleuro-pneumonia
Splenic Fever
Tuberculosis
Udder—inflammations, eruptions,
or warts of.

Given under my Hand and Seal, at Government House, Sydney, this twenty-fourth day of November, in the year of Our Lord one thousand eight hundred and eighty-six, and in the fiftieth year of Her Majesty's reign.

By His Excellency's command,

GEORGE R. DIBBS.

(From Government Gazette of 28th November, 1890.)

New South Wales, To Wit. (L.S.) Alfred Stephen, Lieutenant-Governor, Administering the Government.	Proclamation by His Excellency, Sir Alfred Stephen, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, a Companion of the Most Honourable Order of the Bath, Lieutenant-Governor of the colony of New South Wales and its dependencies.
---	--

WHEREAS the Board of Health has recommended that the disease hereinafter mentioned be declared an infectious disease in animals for the purposes of the "Dairies Supervision Act." Now, therefore, I, SIR ALFRED STEPHEN, the Lieutenant-Governor of the colony of New South Wales, in pursuance of the provisions of the above cited Act, and with the advice of the Executive Council, do, by this, my proclamation, declare the disease named hereinunder to be an infectious disease in animals, viz:—

ACTINOMYCOSIS.

Given under my Hand and Seal, at Government House, Sydney, this twenty-sixth day of November, in the year of Our Lord one thousand eight hundred and ninety, and in the fifty-fourth year of Her Majesty's reign.

By His Excellency's Command,

HENRY PARKES.

APPENDIX M.

Department of Public Health, New South Wales, 11th October, 1898.

REPORT ON THE MANUFACTURE AND SALE OF MARGARINE.

DURING the year 1888 margarine was manufactured and sold under the name of butterine by a company styled "The Butterine Company of Sydney." It had a depôt at 163 King-street. Its manufacturing premises were at Alexandria, and were visited by the Chief Medical Inspector to the Board of Health. The product, though coloured and flavoured to resemble butter, was fully described in the company's advertisements, together with the materials from which it was prepared, and the method of making it. There was no attempt at deception; it was offered to the public for what it was. After a short time this company ceased to trade in Sydney.

Oleo-margarine, margarine, or butterine, is a perfectly wholesome article of food. It is made from the kidney and caul fat of beeves, which is minced while quite fresh, washed and heated. The liquid fat thus produced is then deprived of the greater part of one of its constituents (tristearine) either by cooling, or, after cooling, by hydraulic pressure. The separated fat is known as oleo-margarine; it is churned up with water, skim-milk, and butter-colour; it is then salted and worked in an ordinary butter worker. There is thus nothing objectionable about it; it is an animal fat, perfectly adapted to food purposes. The worst that can be said of it is that it may be somewhat less digestible than butter-fat; but this difference, if it exist, is so slight as to be of no importance.

The flavouring and colouring of margarine to resemble genuine butter do not necessarily betoken fraud; but they open an easy way to it. Margarine is said to be producible at a cost of about 3d. a pound. This price is so greatly below that of butter that margarine could be loaded with a heavy profit, and still be sold by a retailer at a price to which genuine butter never falls. Consequently, the temptation to do this when the means are available must sometimes be strongly

strongly felt. However, the fraud, if committed, is a fraud upon the pocket, and entails no more serious result. But if margarine, disguised to resemble butter should be exported from this country, and be sold as New South Wales butter—still more, if this should be done with assistance of the further and distinct fraud which consists in packing margarine in packages identical with those used by reputable butter factories, and bearing their brands—then it would be necessary to take prompt steps to regulate its manufacture and sale, so that it could not by any possibility be mistaken for butter. It is easy to see that unless this were done the reputation of New South Wales in the butter market might easily be destroyed; and if the remedy were not promptly applied, that that reputation might in the meantime sustain an injury from which it would scarcely recover in many years.

During July last it came to the Board's knowledge that margarine was being again manufactured in Sydney in rather large quantity. The Sanitary Inspector to the Board was directed to make full inquiry, and he subsequently presented the reports which are attached hereto. The result of the inquiry was as follows:—In the first place, three margarine factories were discovered, which, between them, could put out probably not less—possibly more—than 12 tons weekly of the finished article between them. Secondly, the finished product was so coloured and flavoured as to resemble butter closely. Thirdly, at each of the three factories, many butter-boxes were found which bore the brands of no less than twenty-four different butter-factories of high repute. Further inquiry revealed the destination of the comparatively small quantity of margarine mentioned above, which alone is produced for the present. It appears that a considerable proportion is used up by pastry-cooks, who are said to prefer it to butter, both on account of its higher melting-point, and its better keeping qualities. Another considerable proportion is supplied to shipping, and in that case is invoiced as "butterine"; a considerable quantity is consumed at cheap restaurants, whose customers are said to know what it is, and to prefer it to the stale butter which proprietors can afford to supply at the low price they charge for meals. Lastly, two retail shops were discovered at which margarine was sold as cheap butter—one situated at Newcastle, the other at Sydney.

On receiving this information, the Board directed the only steps to be taken which, for the present, lie open to it. It directed that the two retail traders last mentioned above should be prosecuted under the adulteration part of the Public Health Act, and this was successfully done, a conviction being obtained in each case. [See Appendix B.] It further directed that all existing makers of margarine should be licensed, after inspection of their premises, under Part I of the Noxious Trades and Cattle Slaughtering Act, 1894, since they clearly fell within the proclaimed class of fat-extractors; and that any who might commence business in the future without first obtaining a license should be prosecuted.

Such proceedings under the Public Health Act, if watchfully and steadily taken by Local Authorities in their several districts, would amply suffice to protect the public against any fraudulent substitution of margarine for genuine butter, and the Board's requirement that all factories shall be licensed will enable supervision to be kept up, which in its turn will afford some information as to the development of this trade, and the destination of its products; but, for obvious reasons, these measures cannot protect the dairying industry from the serious dangers by which, as has already been pointed out, it is threatened from this source.

While the proceedings which have just been briefly described were in progress, an important deputation which well represented the butter trade, was introduced to the President of the Board by Messrs. Kidd and Perry, M's.L.A. The speakers pointed out the immediate damage they suffered from the substitution of margarine for butter, though they admitted that for the present this was not a very important matter; but they earnestly urged the Board to assist them in taking steps to prevent the injury to the butter export trade, which they apprehended would be done to it. They mentioned the damage which had actually been done to that trade both in Great Britain and the United States, and the legislation which had been deemed necessary in both of those, as well as in other countries, to protect it; and they made the important remark that it would be difficult to regulate the manufacture of margarine if the attempt to do so were deferred until that business should have attained much larger proportions than it has at present. They mentioned the value of the reputation of New South Wales for high-class butter, which had been gradually built up with great labour by improving the conditions under which dairy-farming was carried on (in which the Board itself had taken its important share), and at great expense, and pressed that steps should be speedily taken to prevent margarine from being sent out in a form in which it could be represented as, and might be mistaken for, genuine butter.

With these views and wishes the Board finds itself, on the whole, in sympathy. The manufacture of margarine is a legitimate industry; margarine itself is a wholesome food. That it should be flavoured like butter, or in any other way, is unobjectionable, and perhaps might be fairly said to be necessary; but that it should also be coloured so as to resemble butter is not necessary, and should be forbidden.

J. ASHBURTON THOMPSON,
Chief Medical Officer of the Government,
President of the Board of Health.

APPENDIX N.

Board of Health, New South Wales.

RULES TO BE OBSERVED IN APPLYING THE TUBERCULIN TEST.

NOTE.—Although this form is designed primarily for use by the Veterinary Inspectors of the Board of Health, it is desired that it may be employed by all who apply the tuberculin test to animals. The following directions, which it is very important to follow carefully, are therefore printed here. Forms will be supplied gratis on application to the Secretary, on condition that a copy of the record made is subsequently forwarded to the Health Department.

1. Animals should be confined during testing, and the natural temperature should not be taken until they have become cool and quiet after being first confined.
2. Animals under test should be allowed to drink only immediately after taking their temperature, and not within one hour at least before taking it.
3. The temperature must be taken in the rectum; a string should be attached to the thermometer, and held; the thermometer, being about six inches long, should be introduced until its extremity is only just visible; it should remain in for five minutes by the watch; it should be withdrawn horizontally, and read while still in that position; the reading should be written down at the same time; lastly, the thermometer should be cleaned, and the mercury shaken down until it stands below 98°, before replacing it in its case.
4. The natural temperature of the animal to be tested must be taken during the day-time before the injection is made at night. It should be taken three times, at 9 a.m., at 12, and at 5 p.m.
5. It is convenient to inject the tuberculin late in the evening, or between nine and ten o'clock, so that observation of the reaction temperature may be begun early next day.
6. No attempt need be made to ascertain the reaction temperature before the 9th hour after injection, and no such observation, if made, is to be recorded on this form.
7. The highest natural temperature observed before injection is to be taken as the *datum* for comparison with the reaction temperature.
8. No reaction temperature is to be regarded as DECISIVE of tuberculosis which does not exceed the *datum* temperature by two and a half degrees Fahrenheit, at least.
9. Animals suffering from advanced tuberculosis are liable not to give a marked temperature reaction, or, if they are already feverish, the reaction may not be noticeable; consequently, when the disease can be diagnosed with reasonable certainty by ordinary inspection, the tuberculin test should not be applied.
10. Animals, suffering very slightly from tuberculosis, sometimes give a marked reaction temperature. In cases in which a marked reaction temperature has been observed, and no diseased place is detected when the animal is first examined after slaughter, further and more careful search must be made. If the spot of disease is at last found which yet cannot be identified as tuberculous by its appearance, it should be cut out, placed in spirit, and transmitted to the Board Laboratory for microscopical examination, together with the details required in the form.
11. Every Veterinary Inspector of the Board who tests animals for tuberculosis will do his best to explain proceedings to, and to instruct, both the owner and his neighbours.

APPENDIX P.

PUBLIC ABATTOIR, GLEBE ISLAND.

Offices of the Board of Health, Sydney, 22nd November, 1898.

The following amended "Orders and Regulations," under the Act 14 Vic. No. 36, for the control of the Public Abattoir and its Appurtenances, Glebe Island, having been made by the Board of Health, under the authority contained in the sixteenth section of the "Noxious Trades and Cattle-slaughtering Act, 1894," it is hereby notified, for public information, that such "Orders and Regulations" shall take effect as on and from 1st January, 1899 :—

ORDERS AND REGULATIONS.

1. The Abattoir shall, during the period from 1st October to 31st March inclusive, be open daily for business (Sundays excepted) from the hours of 5 a.m. to 6 p.m. (except on Mondays, on which day the Abattoir will be open directly after midnight on Sunday to 6 p.m. on Monday), and on Saturdays from 2 a.m. to 3 p.m., and during the period from the 1st April to the 30th September, from 6 a.m. to 6 p.m. (excepting on Fridays, when the hours will be from 5 a.m. to 6 p.m., and on Saturdays from 5 a.m. to 2 p.m.); and no slaughtering of cattle will be permitted, and no person will be allowed to enter or remain within the Abattoir, during other than the hours and days above mentioned, unless the permission of the Inspector is obtained.

2. The hours during which cattle may be driven in to the Abattoir and yarded shall be from 5 o'clock a.m. to 8 o'clock a.m. between 1st November and 28th February, and from 6 a.m. to 8 a.m. between 1st March and the 31st October (Sundays excepted). Milch cows may be driven in during any business hour, provided prior notice is given to the Inspector.

3. The hours during which sheep may be driven into the pens of the reserved mutton houses shall be from 6 o'clock a.m. to 6 o'clock p.m., Sundays excepted, between the 1st of October and the 31st of March; and between the 1st of April and the 30th of September the hours shall be from 7 o'clock a.m. to 4 o'clock p.m., Sundays excepted.

4. The wheeled traffic and the yarding of cattle shall be under the direction and control of the Inspector, or any officer nominated by him, and all persons shall carry out the directions of such Abattoir officer.

5. Sheep and horned cattle will not be permitted to remain in the Abattoir pen or yards more than forty-eight hours from the time of being brought in, and calves, pigs, and lambs shall remain on the Abattoir for such time only as the Inspector may from time to time direct.

6. Certain slaughter-houses as may be determined by the Board shall be leased by public auction at an upset price to be announced at the time of sale.

7. Certain slaughter-houses shall be retained in the hands of the Board for the use of the public.

8. A fee of threepence for inspecting brands shall be charged upon every head of horned cattle slaughtered in the leased houses.

9. Persons desirous of using the slaughter-houses reserved by the Board shall be permitted to do so on payment of the following fees :—

	s.	d.
For every ox, cow, bull, heifer, or steer (including the inspection fee of 3d.)	1	3
For every calf not exceeding six months old (including the inspection fee)	0	6
For every sheep or lamb	0	1½
For every head of swine	0	6

10. All fees shall be paid at the Abattoir Office to the officer appointed by the Board to receive the same, on demand, and printed receipts shall be given to all parties paying fees.

11. All cattle on which fees are chargeable shall be reported to the Inspector, without delay, and the fees shall be paid forthwith; failing such payment the Inspector may close and lock, or direct to be closed and locked, the doors leading from the pens to the pithing or slaughtering floors until the said fees are paid.

12. The lessees of mutton houses shall severally furnish to the Inspector on or before the fourth day of each month a monthly return of all such sheep as shall have been slaughtered at such houses.

13. No lessee of any beef house or houses shall slaughter or permit to be slaughtered therein, any sheep, lambs, or pigs.

14. Cattle shall in all cases be inspected before being slaughtered, and no person or persons shall yard or slaughter or cause to be yarded or slaughtered, any cattle without the sanction of an Abattoir officer, to whom due notice must be given. And in all cases when carcasses are brought to the Abattoir dressed or to be dressed, notice shall be given to an Abattoir officer on the arrival of the same; but no cattle slaughtered outside the Abattoir and brought there with the heads detached from the bodies may be dressed there. In no case shall the carcass be brought into the slaughter-house until seen by an Abattoir officer.

15. Should any cattle die within the Abattoir, the owner or person in charge of same shall immediately remove the carcass in its entire state from the Abattoir.

16. Any cattle within the Abattoir which appears to an Abattoir officer to be diseased, or in such condition as to be unfit for food, shall be slaughtered at such time, and shall be disposed of in such manner as the Inspector may order. If the owner of the animal, the lessee or occupier shall object to the decision of the Inspector as to the condition of the cattle, the owner, lessee, or occupier may require the cattle to be inspected by an officer of the Board, whose decision shall be final, and the appellant shall pay the cost of such appeal, not to exceed one guinea, if the officer of the Board decides that the cattle is unfit for human food or diseased.

17. (a) The lessee, occupier, dresser, and slaughterman shall point out to an Abattoir officer any suspected disease in any part of the carcass of any animal slaughtered within the Abattoir.

(b) Should any carcass or viscera be tampered with so as to attempt to disguise its condition, or should the pleura be stripped or removed, or the lung be cut from the carcass, or the liver or head removed from the vicinity of the carcass from which it has been severed before examination by the Inspector or his deputy, the owner or person in charge and each slaughterman taking part in the dressing of the carcass shall, unless he can give a reasonable excuse, be held to have committed an offence under the orders and regulations.

18. (a) The Inspector may condemn any meat or the carcass of any cattle which he considers diseased or unfit for human food.

(b) No lessee, occupier, or owner shall expose for sale any carcass or meat which has been condemned.

(c) The lessee, occupier, or owner, on direction of the Inspector, shall forthwith remove any condemned carcass or meat from the Abattoir.

(d) If the lessee, occupier, or owner fails to remove such carcass or meat the Inspector may remove and dispose of same.

(e) Any cattle suffering from anthrax or any other infectious disease, or any carcass (including head, hide, and viscera) infected with any such disease shall be forthwith removed from the Abattoir by any Abattoir officer, and disposed of as such officer may direct.

19. Any meat found blown shall be condemned by the Inspector, and the owner, person in charge, and each slaughterman taking part in the dressing of same shall be held to have committed an offence under these regulations.

20. The lessee or occupier of any slaughter-house shall thoroughly cleanse and wash the slaughter-house, and all places, utensils, and appliances used in connection therewith, immediately after slaughtering has been completed; and with respect to the blood and offal, he may select and immediately remove such portions as the said lessee or occupier may require for disposal for human food; and any blood or offal not so removed shall become the property of the Board. The lessee or occupier shall closely follow the instructions of an Abattoir officer as to the use of water. For the purpose of this regulation, offal shall include any part of the carcass or any animal matter that may be left in the slaughter-house after the time appointed for removal, and in the opinion of an Abattoir officer not intended for human food.

21. No hides or other matter by which a nuisance may be created shall be allowed to remain in any slaughter-house or premises later than 10 a.m. on the day following that of slaughter.

22. Each slaughter-house, together with the implements, vessel, cloths, and water used in dressing carcasses therein, as well as the clothes worn by all persons engaged in such work, shall be kept clean by the lessee or occupier to the satisfaction of an Abattoir officer.

23. All hides, skins, heads, feet, and offal shall be removed from the Abattoir only in such manner and at such times as may be directed by the Inspector.

24. The contents of the paunches and intestines of all cattle slaughtered shall be deposited at such place as the Inspector may appoint.

25. No person shall bring to or deposit at the Abattoir offal or other offensive matter.

26. No person shall bring into the Abattoirs any vehicle intended to be used to convey meat therefrom which is not in a clean or proper condition. Any Abattoir officer shall have the power of preventing the removal of meat from the Abattoir in any vehicle which is not in a clean and proper condition; and all meat conveyed from the Abattoir in open carts must be covered with clean cloths to the satisfaction of an Abattoir officer. If the meat is conveyed in covered waggons, the doors thereof shall be kept closed.

27. All persons engaged in loading meat shall wear clean clothing of suitable material to the satisfaction of an Abattoir officer, and a clean cap covering the head. The driver of each vehicle shall also wear clean clothing of suitable material to the satisfaction of an Abattoir officer.

28. No candles or other lights shall be placed upon or against or affixed to any portion of the walls or woodwork of the slaughter-house, or of any other building or buildings in connection therewith, and no person shall interfere with the gas-light or gas-fittings.

29. If water be negligently allowed to run to waste, the lessee or occupier will be liable for the penalty.

30. Every lessee or occupier shall keep in good condition and repair the premises so leased or occupied as aforesaid, including all houses, erections, and buildings with appurtenances thereunto belonging, during the whole term or period of the said lease or occupancy, and at the end of or sooner determination of the said lease or occupancy shall surrender and yield up the said premises, buildings, and appurtenances in good condition and repair. And if the lessee or occupier shall fail to keep the said premises in proper repair and condition it shall be lawful for the Colonial Treasurer, or an officer appointed by him to enter upon the said premises and make such repairs as he may consider necessary, and the cost of making such repairs shall be borne by the lessee or occupier, and shall be recoverable by the Colonial Treasurer as rent in arrear.

31. The lessees or occupiers are prohibited from using or permitting to be used any instrument for handling or driving cattle other than such as may be approved by the Inspector.

32. No person or persons shall deposit in any place within the Abattoir boundaries, except such place as the Inspector may direct, any hay, straw, reeds, rushes, bushes, or refuse.

33. Gaming with coin, dice, cards, or otherwise is prohibited, and no fermented or spirituous liquors whatsoever shall be brought within the precincts of the Abattoir.

34. The use of blasphemous, obscene, or offensive language, obscene behaviour, fighting, the throwing of missiles or filth of any kind, riotous conduct, disorderly noise, or the committing of any nuisance, is strictly prohibited within the boundaries of the Abattoir.

35. No person shall be permitted to commence or continue to work for any other person at the Abattoir unless his name shall be entered in the Register kept by the Inspector, and he shall have signed an undertaking to observe, comply with, and obey the orders and regulations of the Abattoir, under pain (apart from any other penalty) of having his name expunged from the Register.

36. No boy apparently under the age of 14 years shall be employed at the Abattoir in any capacity whatever. No male person not engaged on necessary business shall be allowed to enter or remain within the boundaries of the Abattoir without permission of the Inspector. Women, female children, and boys apparently under the age of 14 years are strictly prohibited from entering the Abattoir, and every Abattoir officer is authorised and enjoined to exclude them: Provided, nevertheless,

nevertheless, that the Inspector, after inquiry into the circumstances of each case, may recommend to the Board that permission be granted to any adult woman of good character, who is *bona fide* engaged in trade, to enter the Abattoir and to proceed to such part of the premises as he may define for the purposes of business; such permission to remain in force during good behaviour, or until withdrawn by the Inspector.

37. All dogs found within the Abattoir will be destroyed.

38. An Abattoir officer or any other employee connected with the Abattoir may at any time enter any of the slaughter-houses; and no person or persons there or anywhere within the boundaries of the Abattoir and its appurtenances shall obstruct or molest any such officer or employee.

39. If any person or persons be convicted of any breach of any of these orders or regulations, in addition to the penalty imposed therefor it shall be competent for the Board at any time to refuse to allow such person or persons to enter the Abattoir.

40. Any person or persons offending against or failing to comply with any of the Orders and Regulations contained in paragraphs 1, 2, 3, 4, 5, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 31, 32, 33, 34, 35, 36, 38, shall for each and every offence forfeit and pay a sum not exceeding five pounds, recoverable as provided for by the Statute 14 Vic. No. 36, which enacts that if the amount of any penalty and costs be not paid forthwith, the same shall be levied by distress, and the offender may be detained in custody until return can be made to the warrant of distress; but if it shall appear that no sufficient distress can be had the Justice shall cause such offender to be committed to gaol for any term not exceeding three months unless such penalty and costs be sooner paid.

41. All previous Orders and Regulations made under the Act 14 Vic. No. 36 are hereby repealed.

42. In these "Orders and Regulations"—

"Board" shall mean the Board of Health.

"Inspector" shall mean Inspector of the Abattoirs, and in his absence shall include Assistant Inspector.

"Abattoir Officer" shall include the Inspector, Assistant Inspector, and any other person duly authorised by the Board.

"Lessee" shall mean person holding a lease duly issued by the Board.

"Occupier" shall mean person or firm authorised to use an unleased slaughter-house.

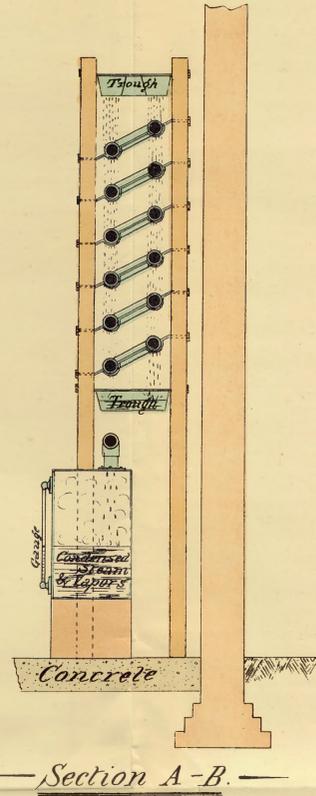

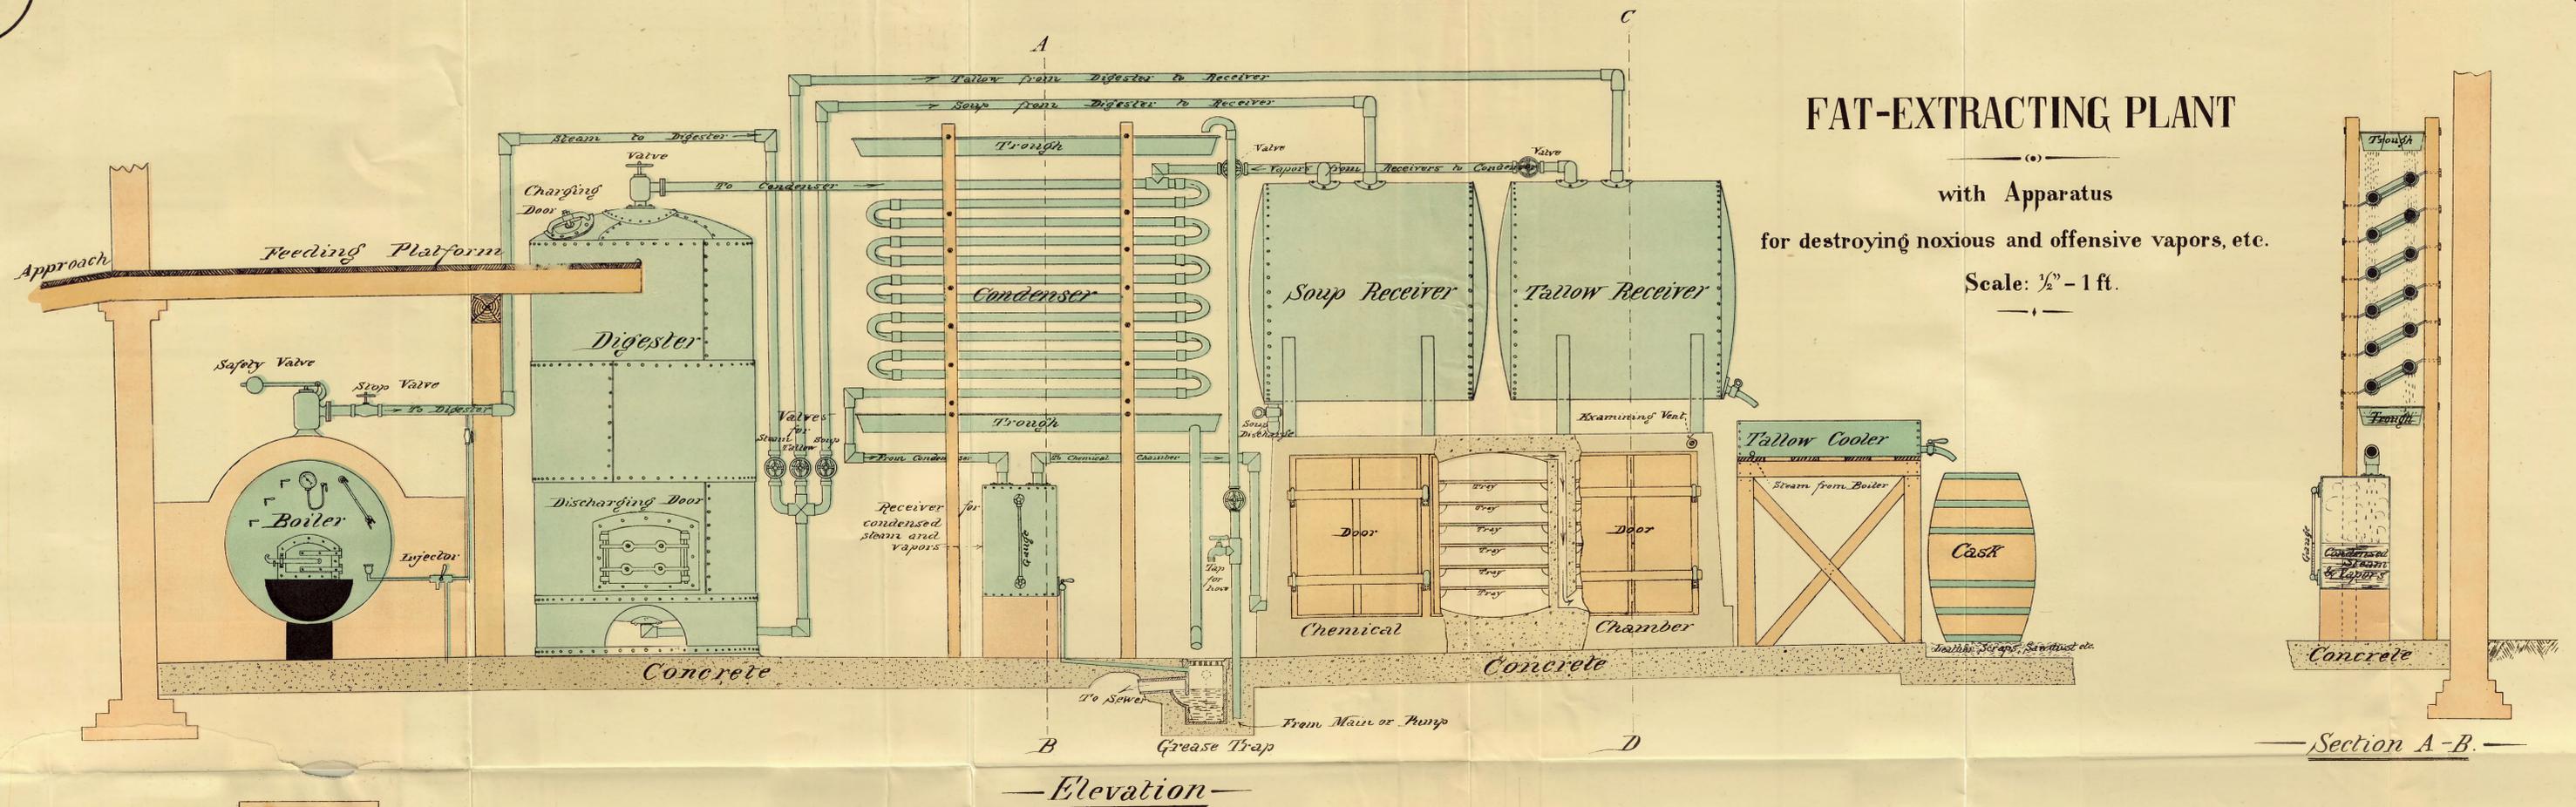

In witness whereof, the Common Seal of the Corporation of the Board of Health was affixed hereto by the President, in the presence of the Secretary, in pursuance of a resolution passed at a duly constituted meeting of the Board, this 22nd day of November, 1898.

CLARENCE A. SIMMS, Secretary.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

OUTBREAK OF PLAGUE AT SYDNEY, 1900.

(REPORT OF THE CHIEF MEDICAL OFFICER ON.)

Ordered by the Legislative Assembly to be printed, 4 December, 1900.

The Chief Medical Officer of the Government and President of the Board of Health to the Hon. The Premier and Colonial Treasurer.

Department of Public Health,

13 November, 1900.

Sir,

The recent epidemic consisted in the attack with plague of 303 persons between January 19th and August 9th, of whom 103 died; in addition to the suffering and the indirect losses which these figures denote, it necessitated a very considerable immediate expenditure and caused much damage to the commerce of this port. The object of the following account is to inquire into its origin and mode of spread, with a view to deducing the measures which are likely to be effectual in preventing a recurrence.

It will be seen at last that steady attention to the more commonplace details of municipal sanitation during absence of the disease alone affords a reasonable prospect of future safety. Simple as this conclusion appears it has the certainty which is attainable only through close consideration of the facts which, however, cannot be successfully observed save in the light of precedent investigations made in many branches of science. Thus it is unlikely that it will be easily accepted; yet not merely because the weight of the reasoning which leads up to it is hard to appreciate, but also because men still despise the humble stream, and vainly imagine the rivers of Damascus. There is no royal road to the prevention of plague.

It is hardly necessary to point out that the data described below were not accumulated without forethought and industry; this opportunity is therefore taken of commending to your favourable notice the zealous services rendered by the permanent and temporary members of the Staff, whose special duties are mentioned with their names. The Principal Assistant Medical Officer of the Government (Dr. Frank Tidswell, M.B., Syd., D.P.H., Camb.) remained in charge of the laboratories; his account of the observations and researches made by him will be found in Appendix A. The Medical Officer of Health for the Metropolitan Combined Districts (Dr. W. G. Armstrong, M.B., Syd., D.P.H., Camb.) took charge of the Visiting Medical Staff, which consisted of Dr. Theodore Barker, M.B., Ch.M., Edin., and Dr. Arthur Grieves, M.R.C.S., L.R.C.P., and of the Disinfecting and Ambulance Corps. The Maritime Quarantine Hospital was placed in charge of Dr. W. F. M. Shells, M.R.C.S., L.R.C.P., from February 24th to March 17th, and from the latter date to the end in that of Dr. A. E. Salter, M.B., Ch.M., Melb. Dr. Salter's analysis of the clinical records constitutes Appendix B. Mr. C. P. B. Clubbe, M.R.C.S., acted as Consulting Medical Officer, and visited the Hospital on alternate days; Dr. Gordon Macleod, M.B., Ch.M., Edin., Ophthalmic Surgeon (see Appendix C), was consulted

consulted on occasion. The ground external to the hospital enclosure was, on April 13th, placed in charge of Dr. Henry Harvey. The general management of the Quarantine Station was, as usual, in charge of the Superintendent of Quarantine (Mr. James Vincent), assisted by the permanent Quarantine Staff and a considerable temporary staff. The Nursing Staff was supplied from the Coast Hospital and from private sources, the whole being under superintendence of Head-nurse Ford, of the Coast Hospital; the Ambulance Staff was also detached from the same Institution. The Inoculation Branch was controlled at first by the Headquarters Staff, but subsequently by Dr. W. F. M. Shells; from time to time many other medical men shared in this work, in which they were assisted by medical students at the University, and occasionally by the laboratory assistants under Mr. Robert Grant. The *post mortem* examinations were made by the Government Pathologist (Dr. George Henry Taylor, L.R.C.P. & S., Edin.), and by the Pathologist to Sydney Hospital (Dr. Sydney Jamieson, M.B., Ch.M., Edin.), whose notes will be found in Appendix D. Sanitary inspections of municipalities and of buildings on infected areas were carried out by a temporarily engaged staff of instructed inspectors under direction of the Board's Sanitary Inspector (Mr. P. E. Getting). About March 25th this staff was increased to 28 and, under the same officer, was turned over to the Department of Public Works to share in the general scavenging operations about that time commenced. The rat-killing staff afloat was managed by the Collector of Customs (Mr. N. Lockyer), and was under supervision of a Superintendent of Fumigation (Captain G. Tait). Others also ultimately bore their share in the multifarious branches of work entailed by the epidemic, but the present object is to draw special attention to those who were immediately connected with the Department; this statement may, therefore, be concluded by mentioning the name of the Secretary (Mr. C. A. Simms), on whom devolved, among many other things, the arduous and responsible task of keeping up communications and daily records, and of attending to visitors, more especially during the hours from 4.30 p.m. to midnight for many weeks together. All of the officers mentioned worked with an intelligence, discretion, and disregard for their own convenience, which are deserving of high commendation and special acknowledgment. For my own part, I beg leave to express here my sense of the obligation under which their generous coöperation and invariable loyalty, in circumstances which were always trying and sometimes difficult, have laid me.

To the Consul-General for France (M. Georges Biard-d'Aunet) and to the Director of the Pasteur Institute at Sydney (Dr. Emile Rougier) warm thanks are owing for the friendly efforts made by these gentlemen to facilitate despatch from the Pasteur Institute of supplies of the anti-plague serum of MM. Yersin and Roux; as well as to the Consul for France (M. L. Vossion), who at a later date presented the Department with a further and welcome quantity brought from Noumea. Unfortunately, neither arrived until the epidemic had begun to show the signs which betoken the period of decline; nevertheless, the public were reassured at hearing that a specific method of treating the disease had become available.

It will be noticed, doubtless, that the advice given by the Department before the plague came (December 26th), while the epidemic was but threatening (January 24th), and at its commencement (February 24th, see Appendix H), practically coincides with the conclusions drawn from the facts of our recent experience. Had it been generally accepted, it would have been well; but it was then impossible to mention reasons fully, nor could many things for which the public themselves clamoured at much later dates have been done at that time. Now, however, reasons can be deduced from facts within our own knowledge. An effort has been made below to express them in the simplest terms (Sections V, VI, and VII), and so that they may be understood by educated readers with little trouble; but if in spite of this attempt they still wear a technical aspect, it must be remembered that after all Preventive Medicine is a branch of science.

I. THE NATURE OF THE DISEASE.

The number of cases which occurred between January 19th and August 9th was 303. The number available for the following clinical description, however, was 262; for in 39 cases death occurred either before notification, or else so soon afterwards that no clinical observation of importance could be made, while two others lay ill at a distance from Sydney and have been omitted from mention.

In very few cases the occurrence of declared symptoms was preceded by feelings of malaise and weariness, which lasted one or two days. This ill-marked and uncommon prodromal stage need not be further referred to, and the observed course of illness may be generally described under the following five heads:—

Onset.—This was a period of from one to about twelve hours, during which the patient passed, very often with alarming suddenness, from a state of apparent health to one of severe illness. It was usually ushered in by a rigor which varied in degree from a feeling of chilliness to a severe shivering fit, and which occasionally lasted for several hours. Acute headache accompanied, or immediately followed, the rigor; it was almost invariably referred to the frontal region, was sometimes felt at the vertex, and was never occipital; it was sometimes accompanied with vertigo. Pain in the back and lower abdomen was common. Vomiting almost constantly occurred; like the headache, it sometimes accompanied the rigor, sometimes followed it after an interval of a few hours, occasionally it was represented by a mere feeling of nausea, sometimes it was severe and long-continued; the contents of the stomach were first rejected, afterwards a greenish or bluish bile was thrown up. The face was usually flushed, and the eyes suffused; the pulse moderately quickened, of good volume, and of apparently increased tension. In all cases which fell under observation during this period there was fever, the temperature ranging between 100° and 102° F. The bowels were constipated, most commonly; diarrhoea occasionally occurred, and even at this early stage warranted a bad prognosis; it was generally accompanied with tympanites. Occasionally at this time, also, superficial lymphatic glands in one or other region—the femoral, inguinal, axillary, subpectoral, cervical, etc.—became spontaneously painful; the pain was described as aching or pricking, and was accompanied with slight swelling and a little tenderness. In five cases out of the whole number, unaccountable swelling and pain in a lymphatic gland were the first signs of illness.

Ingravesence.—This period included a part of the first and the whole of the second day of illness: speaking generally, the symptoms to be shown in individual cases became manifest, and gradually increased in intensity. Often, but by no means always, the patient was now unable to rise from bed. The face was most commonly flushed; the eyes, suffused and congested, were either closed or half-open; not very infrequently the complexion was pallid or livid, and the expression pinched; in a few severe cases it was sallow or yellowish, and a peculiar smell exhaled from the patient. The tongue, very frequently, carried a white coating; this was confined to the dorsum, the tip and edges being either bright red or clean, and it continued moist or, in the severer cases, began to dry. The skin was hot and dry; but when the circulation was extremely feeble, as it was in severe cases almost from the onset, it was bathed in a cold perspiration. The temperature ranged at this time from 101° to 105° F., and occasionally the highest temperature reached during the illness was attained about the end of the second day. The pulse was now much quickened; it continued full, but began to lose tension; in a few cases it had already become weak, very easily compressible, and even dicrotic. Except in very slight cases, appetite was entirely wanting; thirst continued. The bowels remained constipated as a rule. The patient's general expression could rarely be described as anxious, and most often was dazed: sometimes there was mental restlessness, however, and he would exercise his ingenuity to furnish commonplace explanations of his illness, or of the glandular swelling. At this stage affections of speech, and (when the patient was out of bed) of gait, were observed. That of speech varied between slight blurring and almost complete loss of power to pronounce words, while that of gait was manifested merely by staggering; both were clearly due to muscular incoördination, and consequently a stage of alcoholic intoxication was often simulated. Hebetude describes the mental state of the milder cases at this date; but

but in many of the severer kind this had passed into stupor, or even coma, before conclusion of the period. In others, and more commonly, delirium commenced: it was characterised by excitement which not infrequently was furious; the patient constantly struggled to leave his bed, and had to be restrained; he suffered from delusions. In all cases sleeplessness was a marked symptom. The superficial lymphatic gland which had first become painful rather rapidly increased in size, on the average equalling a hazelnut: it was distinct, elastic, and very tender.

State.—The illness having attained the degree of severity above indicated during the first forty-eight hours, became established. The period of maximum intensity was reached; it lasted over the third, fourth, and fifth days, and was sometimes prolonged into the sixth. The temperature now fell, usually ranging between 99° and 102°. The more moderate attacks being excepted, the patient exhibited a state of complete and intense prostration: decubitus was dorsal, the body slipped down in the bed; all excitement abated, and muttering delirium took its place; stupor and coma were likely to supervene. Sometimes diarrhoea set in, and if at all severe was a fatal sign; or external hæmorrhages of grave significance—hæmatemesis, melæna, hæmaturia, or purpura, occurred. The pulse became smaller, weaker, and more rapid, dicrotous, irregular, or running. The tongue continued coated as at first, but now became dry and brown. Albumen was often present in the urine, but always transiently and in small quantity. The bubo increased rapidly in size; the gland often equalled a walnut, while periadenitic effusion increased the swelling to large proportions, and spread over the adjacent glands which were usually very slightly enlarged; although the spontaneous pain which had at first been present in it was almost absent, it continued extremely sensitive; the patient, if not insensible, disposed his limbs so as to avoid pressure upon it, and often its situation could be inferred from the attitude in which he lay. The skin over it also became much reddened. More than half the total deaths occurred on the third, fourth, fifth, or sixth days; they were often due to failure of the heart.

TABLE, I.—Showing the day of illness on which death occurred in 103 fatal cases.

					103

During this stage, cough, due to slight bronchitis, and attended by frothy expectoration, was liable to set in. In a moderate proportion of cases scattered patches of pneumonia were observed; the sputa became less aerated, and contained a little blood, which often stained them uniformly and rather brightly; this expectoration did not at all resemble that of ordinary pneumonia.

Decline.—During the sixth, seventh, or eighth days the disease began to decline in the majority of those cases which terminated favourably. The temperature fell as a rule suddenly, and to about normal; but sometimes it was gradually reduced. All the other symptoms showed a rapid amelioration, and immediately on the fall of temperature sleep returned. The face lost its congested appearance, the tongue began to clean, delirium became mild, intermittent, or was present only for a time after awaking. The bubo continued, and during this stage generally began to soften, if it were going to suppurate; but in a good many cases buboes remained stationary for from six to eight weeks, and yet suppurated at last. The pulse continued small, feeble, and easily compressible, and feelings of great weakness began to be experienced.

Convalescence.—About the ninth or tenth day the stage of convalescence was entered upon in the majority of cases. Almost all the symptoms hitherto mentioned entirely disappeared; only great cardiac weakness and the bubo remained. The temperature

temperature often became subnormal, usually about the ninth day; it sometimes fell below 97° F., and continued subnormal for from one to three days. Suppuration now proceeded rapidly in the bubo, and was usually accompanied by some slight rise of the evening temperature; the abscess was most commonly opened on the thirteenth day. In a less, but considerable proportion of favourable cases, the inflamed gland began to diminish in size, and gradually disappeared by resorption, but this process occupied several, or even many, weeks. The length of the period of convalescence was very irregular; usually it was established thoroughly by the third week, when debility and some discharge from the bubo alone remained. The wound, however, was rarely severe enough to prevent the patient from taking as much exercise as in other respects he was fit for, though occasionally extensive undermining of the skin long delayed his discharge.

If from the foregoing description of the average course of illness in uncomplicated cases, which terminated either in recovery or death, we turn to consideration of individual cases, it appears that the disease exhibited itself in every degree of severity—that is to say, from a slight attack of fever which necessitated confinement to bed for two or three days at most, accompanied by such swelling of a single gland as was a cause rather of discomfort than of pain, to an ill-defined attack of malaise on which death supervened after a few hours—or more often to an apparently moderate illness, which ended with unexpected death in about forty-eight hours from attack. Of the first degree, Case 1 (Appendix L, p. 77) was a good example, while the following are among those which represent the second and third. Case 240, m., *æt.* 45.—It was noticed that the patient's appetite fell off a day or two before attack, but this was not unusual with him, and he made no complaint; he attended to his clerical duties as usual during the morning of May 19th, but at midday was obliged to leave by a fit of colic; he died at 10 p.m. Case 255, m., *æt.* 55.—The patient rose at 6 a.m. and performed his duties as ostler in the usual way, and without having been heard to complain, until 8 a.m.; made a good breakfast, washed and dressed, and sat by the kitchen fire; at 9.30 a.m. he was found dead. Both of these men were intemperate; but this was not so with Case 242, m., *æt.* 17.—The patient rose at 8 o'clock, and complained of slight headache and nausea; he went out, and at 10 a.m. was spoken with by a policeman who afterwards reported that he made no complaint, and did not appear to be ill; at 2.45 p.m. his breathing became laboured, and at 9.45 p.m. he died. The two following patients died unexpectedly, though not so abruptly. Case 142, m., *æt.* 5.—During April 22nd became feverish and vomited several times; during the next thirty-six hours continued feverish, was sleepy or dull, and a tender swelling appeared in the right groin. He died quietly, but suddenly, at about the fifty-first hour of illness, without manifesting any other symptom. Case 84, m., *æt.* 3.—Woke at 3 a.m. on April 5th, feverish, thirsty, and with some slight muscular twitching. Vomiting set in, and continued till midday of April 6th. During the afternoon seemed much better, and played almost as usual. At 6 a.m. on April 7th muscular twitching again appeared; he was sleepy or indifferent, and feverish, and he died suddenly about the fifty-first hour of illness.

Post-mortem Appearances.—These were observed in twenty-four cases (Appendix D, p. 64), among which the five last referred to above were included. From this set of notes it appears that petechiæ of the skin were noted in ten cases; petechiæ of serous membranes, visceral and parietal, or of the mucous coat of the stomach and intestines, in nineteen. They were usually of the size of a pin's head or a little larger, but sometimes as large as a threepenny-piece; and hæmorrhages, or hæmoglobin staining, in the areolar tissue around internal organs were sometimes noticed, apart from enlarged lymphatic ganglions. The spleen was usually enlarged, rounded, softened, and dark in colour on section; it was noticed that the trabeculæ were obscured in six cases; and in only two was this organ reported to be firm and in other respects of normal appearance. Inflamed, swollen, and sometimes necrotic lymphatic glands were noted in twenty-one cases, while in three none were found. They were surrounded with extravasated blood in fourteen cases, and in a less number of the latter there was also oedema of the surrounding areolar tissues. Buboes (sixteen) were—femoral, eight; inguinal, four; axillary, one; and cervical, three. The heart, which often contained soft, pale-yellow gelatinous clots, showed paleness and softening of the myocardium in four cases. The liver was enlarged in fourteen cases, and was fatty

fatty as well in thirteen; this appeared to be a recent change. In two, minute whitish points distributed throughout its substance betokened necrosis; in three cases it was cirrhused from old standing disease. The cortex of the kidneys was swollen and pale in twelve cases, and occasionally was speckled with pin-point hæmorrhages. In Case 84 the former condition was ascertained to be due to catarrhal nephritis at an early stage. The lungs were the seat of old-standing disease in three instances, in five others they were congested, in three others engorged with blood, and in eight others there was a moderate œdema; in one case lobular pneumonia was noted.

Bacteriological Evidence.—Once the presence of plague in epidemic form has been recognised, a large majority of cases can be quite certainly diagnosed by clinical methods alone; and this is fortunate, because rigid bacteriological proof of the nature of this disease can seldom be had before the fifth day from beginning to seek it. Nevertheless, not merely at the beginning, but during the course of every epidemic, bacteriological proof is occasionally demanded. At the beginning it is essential, in view of the consequences which at present follow on the announcement that an indigenous case of plague has arisen among the inhabitants of a large city or an important seaport. So momentous an opinion should not be given but on absolute proof that the disease is plague, and the proof remains incomplete until it has been supported by a bacteriological demonstration. In the course of an epidemic it is also occasionally required in cases of doubt; for accuracy of diagnosis is a first condition of successful management. But in this case the same rigid proof is not necessary as in the former, and a microscopical examination of the juice of an enlarged gland, or (in few and fatal cases) of the blood, will furnish all the corroboration needed to establish a diagnosis already highly probable on clinical grounds.

Bacteriological demonstration of the nature of the disease already described, consisted briefly in detection in the juice of buboes, and in some other tissues, secretions, or excretions of the diseased body, of a micro-organism which had the following morphological, cultural, and pathological characteristics, and a definite reaction to certain stains. The organism was usually present in enormous numbers in smears made from enlarged glands, or from viscera. The individual elements were segregated, though not infrequently two were seen end to end, as though they had been produced by recent fission: they stained with aqueous solutions of fuchsin, methyl blue, and gentian violet, and did not retain the stain when treated by Gram's method. In stained preparations it presented a matured form, which was either that of a typical bacillus, or else it was whetstone or boat shaped; interspersed among these were rounded, oval, or dumb-bell shapes resembling micrococci or diplococci. The greatest mixture of forms was observed in smears from tissues, but there was always a preponderance of the "mature" forms. The bacillary form had an average measurement of 1.8μ , and a breadth of $.8\mu$; the latter showed little variation, the extreme measurements of length were 1.6μ and 2.4μ . The rounded forms had a diameter between $.5\mu$ and 1.0μ . The poles of the bacillary form were often more deeply stained than the centre; in some preparations, practically every bacillus showed more or less deeply stained ends, and a central portion which remained clear and unstained, and which varied in width between a small space and the greater part of the body of the bacillus between the ends. In other preparations only a few elements showed this bi-polar staining, and occasionally it was not at all evident. Cultivation on dry or salted agar produced crops of "involution forms"; some elements became greatly enlarged, so as to measure 5μ . or 6μ . in length by 1μ . in breadth, without losing the shape or staining properties just described; others became otherwise altered, and formed sausage, pear, spindle, circular, or oval shaped bodies, having no resemblance to the bacilli from which they were derived. On nutrient agar, inoculated from buboes or viscera and incubated at 37° C., the first noticeable growth appeared in the form of minute bright specks in from thirty-six to forty-eight hours. In a day or two these colonies become colourless hemispheres from $.5$ to 1.0 mm. in diameter; some of them then enlarged slowly to a diameter of 2 to 3 mm., became flattened, and cloudy towards the centre. The maximum development was reached in two weeks. Individual colonies were hard to pick up, slipping about under the needle; fused colonies were often tenacious, and could be pulled out in strings. In sub-culture the growth appeared earlier than in the original, and developed as a confluent streak, raised and cloudy along the middle,

but

but with thin, colourless, iridescent borders, which were often corrugated. At room temperature on this medium the growth was seldom distinct in less than five or six days, and only reached its maximum development in about three weeks. In beef-broth the growth was usually visible on the second day of incubation, in the form of crumblike spicules attached to the sides, with more or less deposit at the bottom of the tube, the broth itself remaining clear and transparent; but in other cases a moderate uniform turbidity was produced. Growth in broth-flasks containing oil resulted in production of a film, scanty crops of stalactites, and a copious deposit. The stalactites present at any one time never exceeded six or eight, and became detached, and sank to the bottom on the least jar; that more were not found at one time was probably due to unsteadiness of the laboratory shelves. The growth in milk was less abundant than in broth, and the milk remained unchanged. Inoculation of guinea-pigs was usually followed by death in four or five days; the extremes were two to ten days, but six were rarely exceeded. The inoculations were made into the inner side of the knee. *Post-mortem* there was sometimes hæmorrhagic swelling at the site of inoculation, and this extended up the thigh; there was always swelling, and usually periadenitic effusion and hæmorrhage of the corresponding femoral glands, while sometimes the related inguinal, and less often the lumbar, glands showed similar changes. There were petechial hæmorrhages under the skin, the serous membranes, and in the viscera. The lungs were almost always more or less inflamed, the liver enlarged (sometimes to twice its normal size), and the latter usually exhibited a fine mottling caused by appearance of white points or by small hæmorrhages. The spleen was enlarged to two or three times the normal, marked with white spots on its surface, was dark in colour, and had thick or rounded edges. The kidneys were enlarged, pale, and, as a rule, full of small hæmorrhages; the suprarenals were usually congested, and of a deep red colour. Occasionally plague bacilli were limited to the seat of inoculation and the bubo; but usually they were present in all parts of the body, though they were not always recoverable from heart's blood. They were twice recovered from the urine, and were never found in the bile. A bacillus having precisely the same characteristics and the same pathogenicity was recovered from the organs by culture. For a full account of the bacteriological observations made during this epidemic, Appendix A, p. 50, from which the foregoing abstract has been made, should be consulted.

From the foregoing account of the usual course of illness, which has been compiled exclusively from the symptoms recorded of each of the 262 cases which could be clinically observed, from the brief abstract of the *post-mortem* appearances noted in the twenty-four cases which alone were examined in that way, and from the abstract account of the bacteriology of the disease given above, it will be seen clearly that the epidemic illness now under consideration was plague. On comparing it with the published accounts of plague as it appeared in other parts of the world, it will be seen that it might have been compiled from records made in China, in Portugal, in India, in Mongolia, in Mauritius, or, in short, from the records of plague outbreaks in any part of the world from which such records are forthcoming. Nevertheless, certain minor differences between the disease as seen here and as it has been seen in India and China, for instance, are distinguishable. But they are non-essential; they are differences in degree of severity or of fatality, and are doubtless due to the indirect influence of local conditions of life—of feeding, housing, cleanliness, and also of race. And of the three recognised forms under which plague exhibits itself—that is to say, the bubonic, the septicæmic, and the pneumonic, the bubonic form was almost exclusively encountered. The septicæmic form was observed only in 17 cases, of which 15 were fatal; primary plague pneumonia probably not once, although a single case was met with (in a Chinese) which possibly may have been an instance of it, the circumstances having prevented the fact from being ascertained. Bronchitis and secondary pneumonia were not uncommon, carbuncles were seen in two instances, and inflammatory and suppurative affections of the eye six times (Appendix C), but for an analysis of the whole series of cases reference must be made to Appendix B, p. 58.

II.—PROGRESS OF THE EPIDEMIC.

Sydney alone was infected, although several persons first fell ill after leaving for distant places—a matter which will be further mentioned (see p. 32). The total population of the metropolitan area, as defined for registration purposes, was estimated at 438,300 on December 31st, 1899; that of the metropolitan districts as combined for purposes of sanitary administration, was about 456,000. Cases were removed from all parts of the latter area. This population included the small sprinkling of coloured persons usually found at seaports, and a colony of Chinese which numbered less than 4,000 altogether; the latter, for the most part, lived in three separate neighbourhoods. Among the Chinese 10 cases occurred, and 293 among the whites; 226 of the whole number were notified by 87 legally qualified medical practitioners, the remainder (77) having in almost every case been first visited by a Staff Medical Officer.

The weekly notifications showed stages of increase, state, and decline in the epidemic. During the first three weeks only 9 cases occurred, and they were pretty evenly spaced out. During the fourth and fifth weeks, 22 were notified. In the sixth the epidemic became established, and so continued for seven weeks more; two-thirds (208) of the total cases happened during these eight weeks. The period of decline set in with the fourteenth and continued through the nineteenth week; it was marked by great irregularity in the number of cases notified, the series having been 7, 17, 4, 10, 6, and 12. The epidemic then ceased. The twentieth, twenty-first, and twenty-second weeks yielded but 1, 3, and 2 cases, while the last case of all was noted in the course of the twenty-fifth week.

Variation of Virulence.—It is important to remark that the infection had its full virulence from the beginning. The mortality was heavy from February 23rd, when Case 2 died; yet among those which immediately followed it were some which did not exceed Case 1 in severity. The only change observed in it was enfeeblement. This began about May 1st; it was recognised on comparing the state of patients

patients on admission to hospital after May 1st with the state on admission of those received at corresponding dates of illness before May 1st. Nevertheless, among the majority of cases which, as a whole, testified to this, some which appeared to betoken unimpaired virulence were met with to the very end (see Appendix E, Cases 289, 295, and 303). Another point requires notice in this connection. It is that whereas it had taken seven weeks to furnish the first 100 cases, and four weeks to furnish the second, thirteen weeks elapsed before the 303rd case had been recorded.

TABLE III.—Showing the number of attacks and deaths under Sexes and Age Groups.

Age Group.	—5		—10		—15		—20		—25		—35		—45		—55		—65		—75		Total.	
	M.	F.	M.	F.	M.	F.	M.	F.	M.	F.	M.	F.	M.	F.	M.	F.	M.	F.	M.	F.	M.	F.
Attacks	8	7	11	6	20	11	49	6	35	7	45	10	46	6	16	4	5	5	4	2	239	64
Deaths...	4	1	1	3	2	3	18	2	15	1	15	1	14	1	10	1	4	4	2	1	85	18

Sex Incidence.—The disease attacked nearly four times as many males (239) as females (64). The slight information available on this head does not indicate any special liability of males to attack in other countries, and probably this special incidence may be accounted for by the stress of the disease having fallen on business portions of the city, and on that part of the population which daily leaves home for some place of employment. This conjecture is supported by consideration of the incidence on the sexes in two infected areas which were distinct from that just referred to, and in which it was nearly equal: on one area, out of fifteen "indigenous" cases (that is to say, cases in which the infection was in all probability received on the spot where the patients lived), only 7 occurred in males, but 8 in females (Paddington); and in another group of nineteen, 10 males were attacked to 9 females (Redfern). Slighter testimony to the same effect may perhaps be drawn from Table III, which shows that the incidence on males and females below 10 and above 55 was much more nearly equal than at the intervening ages.

Age Incidence.—The observed incidence was on ages from 2 years to 74; but more than half the cases occurred in persons at ages between 15 and 35, while more than two-thirds occurred at ages between 15 and 45.

General Fatality.—The total number of cases having been 303, the deaths were 103; the gross fatality was thus just below 34 per cent. But 10 of the patients were Chinese, a race amongst whom the fatality of plague is usually from 80 per cent. upwards; and, in fact, 8 of the 10 died. If these be deducted, the fatality of the disease amongst the remainder, who were all whites, was 32·4 per cent.

Fatality at Age-groups under Sexes.—Table IV shows the percentage fatality of the disease at four age-groups in the two sexes; the smallness of the figures relating to females (see Table III) should be borne in mind.

TABLE IV.—Comparative statement of the fatality among Males and Females at four Age-groups.

Age-groups.	—15	—35	—55	—75
M.	18 per cent.	37 per cent.	39 per cent.	67 per cent.
F.	29 "	17 "	20 "	71 "

Fatality, at successive periods.—The fatality of the disease was not uniform throughout the whole series of cases. It was absolutely as shown in the following Table, to form which the 303 cases have been divided into three nearly equal parts:—

TABLE V.—Comparing the fatality of the disease among three arbitrary divisions of the whole series.

100 cases (20 January to 12 April)*	Fatality, 38 per cent.
100 cases (12 April to 8 May)*	Fatality, 35 per cent.
103 cases (8 May to 9 August)	Fatality, 30 per cent.

* The cases which occurred on these days have been divided.

But in this Table the Chinese are included who, for reasons already given are a disturbing element in the calculation, and should be separately dealt with. When they have been excepted, the statement concerning the remaining 293 cases among whites only, assumes the following form:—

TABLE VI.—Comparing the fatality of the disease among three arbitrary divisions of the cases which occurred among whites, the ten Chinese having been deducted as shown below.

	Less Chinese.	
	Cases.	Deaths.
100 cases (20 January to 12 April)*—Fatality, 37 per cent. ...	1	1
100 cases (12 April to 9 May)*—Fatality, 37 per cent. ...	5	4
93 cases (9 May to 9 August)—Fatality, 23 per cent. ...	4	3

* See note to Table V.

A few days after commencement of the term during which the latter 87 cases occurred, Yersin-Roux serum became available, and was thenceforward steadily employed; but it must be added that, in opinion of the clinical Staff, the virulence of the disease had already begun to abate about the beginning of May. The evidence which can be adduced in support of this judgment is given in Appendices B and E.

Meteorology.—Appendix M consists of a chart on which are described curves constructed from the daily notifications, the rainfall, the daily mean temperature, and the daily mean tension of atmospheric vapour. The data were furnished by the Government Astronomer (Mr. H. C. Russell, C.M.G., F.R.S.)

Suspected Cases.—From January 25th, when the nature of the first case was made known, down to a date long after that last mentioned in Table II, a total of 221 cases of suspected plague were reported to the Department for diagnosis; 115 of them were referred by 69 medical men, 106 (of which 32 were presented by the patients themselves) through other channels. Many of the latter offered no resemblance to plague in any form, of course; and many of the former were referred from motives of prudence rather than because doubt as to their nature was really felt. But among these were several cases of glandular swelling, with or without other symptoms of illness. In nearly all of these cases the glandular swelling, could be referred to one or other of the usual causes without difficulty; but in two or three of them no such cause could be assigned. However, very careful consideration of the recent occupation, place of residence, and habits of these patients, of the history of the illness and of the swelling, and of the results of a minute and prolonged bacteriological investigation, quite failed to furnish support to the notion which had made an accurate diagnosis necessary.

Ambulant Cases.—The suspected cases came to notice in greater number during earlier weeks, and thereafter with gradually diminishing frequency. The probability that the first case recorded was the first case in fact is supported on grounds which are given in detail in Section VI; and nothing has come to knowledge which would render it probable that either ambulant or pneumonic cases occurred before

before or during the earlier two-thirds of the time covered by the outbreak. But late in the latter third of that time a few ambulant cases were met with: Case 273, came to notice from the patient himself reporting the serious illness of his daughter, and then mentioning that he had had a somewhat similar attack shortly before; and Cases 299 and 300 (unconnected with each other) were detected after their admission to the Coast Hospital for treatment of the results of an illness (suppuration of inguinal glands) from which they had suffered three and six weeks earlier. So that while the question whether the first recorded case were really the first case which occurred can be answered in the affirmative with great confidence, the further question whether the total recorded cases include all which happened cannot be affirmed without reserve. The accidental discovery of the three just mentioned renders it likely that other such cases occurred in which medical advice never became necessary, or else was sought at a date when the true cause of illness was no longer distinguishable. All that can be said with regard to ambulant cases is that in the general opinion they occurred only at the end of the epidemic, and then were few in number.

Removal to Isolation.—It is convenient to mention here the time which elapsed between notification of cases and their removal to isolation at the Maritime Quarantine Station. The account stands as follows:—

TABLE VII.—Showing the time which elapsed between notification of 303 cases of plague and their removal to isolation.

Removed on the day of notification	154
Removed on the day after notification, to avoid transfer at night	99
Removed on the second day after notification, the patients having been too ill on discovery to bear the journey	3
Removed on the fourth day after notification (being the first case, detained at home for investigation)	1
Isolated at country places and not removed to Quarantine	2
First fell ill at Quarantine	7
Died before notification, or immediately after	37
Total	303

253 cases required removal and could be dealt with in the regular way. 154 of them were removed on the day on which they were discovered, while 99 were not removed until the next morning, merely because they had been notified so late in the day that otherwise their transfer must have been effected in darkness.

III.—PROTECTIVE INOCULATION.

Haffkine's prophylactic was alone used. As mentioned below, a small stock had been procured during the latter half of 1899; it was used for protection of those immediately associated with the earlier cases, including the members of the staff. No public inoculation was attempted until a further and large supply came to hand on March 12th. Two considerations governed the manner in which this consignment was expended: First of all persons who lived on, or necessarily frequented areas of known infectivity, had the best right to protection, and the most rational use of the supply was, clearly, inoculation of such persons; secondly, it was impossible (and quite unnecessary) to protect the whole population. But this intention was to a large extent frustrated. Between March 12th and April 2nd, when this supply became exhausted, about 8,000 inoculations were performed, including the small number done before March 12th, which was short of 300. There was then an interval, after which a fresh supply was received, and between May 11th and June 16th, about 2,700 more were done. On this occasion the arrangements made ensured inoculation of a larger proportion of persons considered to be in special danger of infection (see Appendix F., p. 71). Throughout the epidemic inoculation was offered to contacts, either on first being visited, or on arrival at the Maritime Quarantine Station, and the total number segregated having been 1,832, the number then inoculated was 180.

The total number known to have been thus protected was 10,700, all members of the various staffs included; no illness occurred among the latter, except Case 262 (see p. 37), a scavenger at the Quarantine Station who had escaped inoculation,

inoculation, but who was not the only one who was overlooked among the temporary hands employed from time to time. Among the inoculated public, 13 were attacked; particulars are given in the table below. All these patients not merely recovered, but had conspicuously light attacks. The cases occurred almost entirely among the earlier 200, while the virulence of the infection was at its highest, but also among the latter 93 (Chinese being excepted), when it had become feebler.

TABLE VIII.—Showing the dates on which thirteen persons were inoculated, and the dates on which they were subsequently attacked with plague.

No. of Case.	Date Inoculated.	Interval.	Date attacked by Plague.	No. of Case.	Date Inoculated.	Interval.	Date attacked by Plague.
	1900.		1900.		1900.		1900.
36	20 March.	4 days.	24 March.	57	23 March.	3 days.	26 March.
37	21 "	4 "	25 "	66	23 "	6 "	29 "
41	23 "	2 "	25 "	103	26 "	15 "	10 April.
42	23 "	1 "	24 "	115	13 "	1 "	14 March.
44	23 "	4 "	27 "	214	11 May.	0 "	11 May.
47	19 "	5 "	24 "	285	21 March.	93 "	22 June.
51	23 "	7 "	30 "				

There was one other and fatal case (164), which occurred in a boy who was attacked April 29th, and whose relatives insisted that he had been inoculated; they fixed the time, however, at about two months before attack, when none but those who had been in immediate contact with patients were being done. He was certainly not inoculated at that date, nor before commencement of public inoculation, on March 12th. His name could not be found in the register, which was carefully kept, of the names and ages of all persons inoculated by the staff, and inquiry among his fellow-clerks elicited only a vague statement from one of them, that he had been afraid of the plague, and had said something about a sore arm; this permitted the inference that he had been inoculated, but he had not made any direct statement on the subject. On the whole, the question remained undecided, although the statement made by his relatives is entitled to credence.

The immediate effects of inoculation were, in every case, it is believed, such as are commonly described. A few hours afterwards slight malaise and fever began, with swelling about the seat of the puncture; the feverishness increased, and the night was often restless; there was some slight headache and thirst; the temperature rose in observed cases (the night being excluded) from 2 to 3 degrees. The arm became painful, and after 24 hours there was usually a hard lump around the puncture (which was always made at the back of the upper arm), and rather extensive diffuse swelling below it, with much heat and redness. At the same time there was as much general malaise as might cause an unoccupied person to lie up, but not enough to interfere with important engagements. On or before the third day the malaise disappeared; the redness and diffuse swelling continued somewhat longer, and were attended with stiffness and slight tenderness; the hard central lump gradually diminished and could usually be still detected after from two to three weeks, though free from tenderness during the latter part of the term. The inoculations were always performed by medical men under antiseptic precautions; they were assisted by medical students and laboratory assistants. Not more than three or four cases of suppuration came to knowledge.

The inoculations done were hardly numerous enough to interfere with the natural course of the epidemic; but, in point of fact, no interference could be traced. Whole infected households had never been inoculated. If the person attacked had been inoculated it usually turned out that he alone had been done, often having submitted at instance of his employers; and in households where the patient had not been inoculated it was uncommon to find that even one other person among them had been done.

In accordance with the definition of the word "contacts," which will be found at beginning of Section VII, protective inoculation as a preventive measure to be used among a very large city population consisting of white people alone, and during an epidemic of plague which is under management of an efficient sanitary organisation acting under suitable laws, would appear to be practically restricted to

to persons who cannot be removed from premises which are known to be infective; to those who, having evacuated the premises during cleansing, are returned to them while the area on which they stand is still infective; and to those who are obliged to frequent infective neighbourhoods, if they will receive it. It will be noticed that attacks which occurred at, or before the lapse of about ten days from, inoculation were not aggravated by it.

IV.—SERUM-TREATMENT.

Yersin-Roux serum became available on May 13th (Case 217). It was administered only by the Visiting Staff to cases diagnosed by them, and at the Maritime Quarantine Hospital. Its employment did not interfere with the natural course of the epidemic.

Although it was intended to give the serum regularly to all admitted to hospital without exception, so as to avoid selection of cases, it was found that this rule could not be adhered to without introducing an equally objectionable influence. The enfeeblement of the infection, which had begun to be observable by about May 1st, led many patients to defer seeking medical advice, and, consequently, to escape notification until comparatively late dates of illness, when they presented very slight symptoms of constitutional disturbance. Thus a dilemma was caused, out of which no way could be found: if the cases were not selected a false impression of the effects of serum-treatment would certainly be given; on the other hand, if they were selected on principles which necessarily could not be strictly defined, the value of the experience would remain doubtful to all but the observer himself.

Fortunately, averages and percentages are statements quite out of place in such connections as this. As a matter of fact, 22 of the 87 admitted after May 12th were not treated for one reason or other—in 9 cases, because the patients either died before discovery, or were then moribund. On the other hand, to the remaining 65 must be added 6 admitted before May 13th, and on that date lying in a nearly desperate state, of whom 4 afterwards died. Among the 71 were many very slight cases; but some account of all of them will be found in Appendix E, p. 70.

The opinion provisionally formed, and expressed subject to consideration of the day of illness on which the treatment began, the mode of administration, and the general features of each case, is that the serum has antitoxic powers which are manifested in useful recovery of the circulation from the depression which is a constant feature of the natural disease; but that in its present state it can hardly be relied upon as a very active curative agent. Probably the dosage requires revision.

V.—ADMINISTRATIVE MEASURES.

Before the plague came the Board and its permanent staff had been watchful and active.

Appearance of the disease at Hongkong was the beginning of general interest in plague as a modern danger, and the beginning of the special interest of the Department in it as one thenceforward threatening Australia. On four occasions during 1894, and twice in 1895 (when it was thought the disease was dying out at Hongkong and the risk nearly past), as well as in 1896, when plague first appeared in India, this danger was discussed, and was made the subject of resolutions and of special directions by the Board. The steadily progressive spread of the disease in epidemic form to other parts of the world was seen soon afterwards to necessitate further precautionary measures, and additional preparations against it.

Possession and first-hand knowledge of the bacillus was clearly a primary condition of success in attempting to guard against the introduction of cases of plague, or to control spread of the disease after it had gained entrance. Accordingly, cultures of it were procured towards the end of 1897, and during the following twelve months its morphological and cultural characteristics were studied in the laboratories. In October, 1898, the Vienna incident became known; the popular impression it caused was obliquely communicated to the Department through official channels, and it was considered expedient to destroy the enfeebled and harmless specimens which then alone remained in the laboratories. At the same

samé timé, however, the Board caused a communication to be addressed to the Premier, in which it was pointed out that possession of cultures of the microbe was indispensable to due performance of its appointed functions. During the ensuing year, repeated representations to similar effect were made. But it was not until March 12th, 1900 (Case 14), that formal permission to keep, cultivate, and inoculate this microbe into animals was granted to the Board's micro-biologist by the Department of Lands, which administers the Animals' Infectious Diseases Act, 1888. In the meantime, however, verbal permission to keep, cultivate, and inoculate animals with the microbe of plague had been given by the Premier (March, 1899), and was again given by the Premier (December, 1899) to the President; for it was easy to show that if a suspected case of plague were imported, or occurred on shore, the Department would be in a dilemma in which it must either break the law by making cultures and inoculations, or fail in performance of its duty for want of power to use those means of investigation—means which were open to the rest of the world. It was considered that these permissions, although invalid in law, would suffice to protect the Department in a case where an absolute necessity could be shown. They were relied upon when in October, 1899, it became necessary to examine certain cases which had arrived at Newcastle by the British-India Company's S.S. "Ujina," from Calcutta, *viâ* Port Louis, Mauritius (which turned out not to be cases of plague), and again, in January, 1900, when the first case of plague occurred at Sydney. From this latter, indeed, the cultures in use at the laboratories during the epidemic were in part raised.

During the same term now referred to, namely, from September, 1896, plague had been frequently discussed by the Board in relation to maritime traffic, and had also been a subject of communication between the Board and central health authorities in other parts of Australasia. These communications commenced in January, 1897, and were thenceforward continued. At the end of that year the International Convention which had resulted from the Venice Plague Conference was referred to the Board by the Government; after prolonged consideration it felt obliged to advise that the Government should not adhere to it, the law containing no provision under which the plan of medical inspection permitted by the Convention could be carried out (see Section VII, p. 49). In March, 1898, Madagascar, Mauritius, Réunion, and the Seychelles were proclaimed to be places infected with plague, pre-existing proclamations having covered all other places with which New South Wales has communication, and which had so far been attacked. The gradual infection of a greater and greater number of widely-scattered ports and places was carefully noted, and its bearing on the interests of this port considered; and in October, 1899, the Government was advised to intimate its willingness to adhere to those parts of the Convention which provide for international notification of plague.

Even earlier than the last-mentioned date it had become apparent that, in all probability, Sydney would be attacked; and accordingly in January, 1899, the Board suggested that a member of the staff might be sent to Bombay to study the disease.

The danger which threatened was the importation of plague by sea, and no other. The treatment accorded from the beginning to vessels arriving clean from ports infected with plague (that is, from May, 1894, when plague became epidemic at Hongkong) down to December, 1899, was that accorded to such vessels by an earlier International Convention to clean vessels arriving from cholera-infected ports; a treatment which was also accorded by the Venice Convention to vessels arriving under the conditions now contemplated, that is, from plague-infected ports. But when it was announced that plague was epidemic at Noumea, a town which lies but from three and a-half to six days' steam from Sydney according to the class of vessel making the voyage, it became necessary to alter that method; and, while the regulations laid down in the International Convention were adhered to as far as possible, such vessels were compelled to lie at quarantine after arrival (whatever the state of health of those on board might appear to be) until expiration of the twelfth day from the day of sailing. This term was two days in excess of that prescribed by the International Convention, and was adopted merely because the French Colonial Office had issued instructions to Governors of French Colonies to impose it on vessels arriving at their Governments from plague-infected ports. But, in addition, attempts were made to kill any rats which might still remain on these vessels notwithstanding the efforts to
the

the same end which had usually been made at the port of departure; and sometimes these measures yielded a considerable number of dead rats—in one case, as many as 283. Here it is well to note that the Venice Convention contains no reference whatever to rats, and the share they take in disseminating plague.

Lastly, as regards the measures of precaution and of preparation taken by the Board before the plague actually arrived, a supply of prophylactic was sent for about the middle of 1899; and when the infection of Noumea was announced, it turned out that prophylactic was available in this quarter of the world only at Sydney.

The presence of plague at Noumea in epidemic form was admitted towards the end of December, and the information became known in Sydney by cable on the 24th. On December 28th, 1899, the Board resolved that plague should be added to the list of diseases notifiable under the Public Health Act, Part III., and it was proclaimed on February 6th. On February 1st, New Caledonia was declared infected with plague; and the Loyalty Islands, and the New Hebrides were declared likely to become so infected, by proclamation. The treatment already described was applied to vessels arriving from the latter groups. A cable message asking for a further supply of prophylactic was transmitted to Bombay.

It became known on December 30th that plague was epidemic at Honolulu, and it was announced that the same treatment would be accorded to vessels arriving thence as to those which came from New Caledonia, if they had communicated with the shore. It was also made publicly known by the Department that imported cases of plague would certainly be stopped at Quarantine, and that they were little dangerous; and it was pointed out that the first defence against the disease, under the circumstances then obtaining, consisted in killing all rats, the second in general scavenging of urban areas.

On January 15th, it was said that there were cases of plague at Adelaide, South Australia.

On January 25th, occurrence of the first case of plague at Sydney was made known. The Registrar-General was at once requested to refer to the Department every information received since beginning of the year, in which the cause of death was ascribed to blood-poisoning, septicæmia, acute abscess, septic intoxication, &c., &c., in order that further inquiry into such cases might be made if occasion appeared; and, since the notification of infectious diseases is by law required only as soon as the medical practitioner in attendance becomes aware that the patient is suffering from one of them, a circular letter was addressed to the medical profession on February 8th, in which a hope was expressed that the strict letter of the law would be exceeded, and that not merely cases of plague, but also cases reasonably suspected to be plague, would be reported by them to the Department (see Appendix N, p. 80); it was also desired that they might be reported direct—not, as the regulations made under the Act require, to local authorities in the first place. Circumstances attending the occurrence of this first case caused the Board to insert advertisements requesting information from owners and occupiers of wharves, stores and warehouses, masters of vessels, scavengers, and the public in general, as to unusual mortality or unusual movement among the rats at places under their control, and attempts were made in other ways to obtain such information. This case having occurred in the city, the President placed himself in communication with the Local Authority, and advised the Town Clerk on January 26th; it was then mentioned that some special scavenging and house-to-house visitation was already in progress. At the same time it was made known by the Department, through the public press, that there was little risk attending the care of plague-patients by the healthy, and the need to kill all rats was again insisted upon, as being the essential preventive measure then practicable. The patient was removed, together with his household and several contacts, to the Maritime Quarantine Station (see Diagram A); and in the report upon it, dated February 7th, it was pointed out, that if cases began to be met with in series, it would be necessary to evacuate the Coast Hospital. All members of the staff, and all who had been brought into contact with this case were inoculated with the prophylactic. The house was disinfected and painted; the contacts were released on the tenth day, the patient on the twenty-fourth day.

When the second case was discovered (February 24th), it was perceived that the fears which the circumstances alluded to above had caused the Department to express a month earlier were about to be realised. The same course was taken in
isolating

isolating the family as before, but the Board now directed establishment of an ambulance service and of a disinfecting staff at the Quarantine Depot, Woolloomooloo Bay (see Diagrams); and that temporary equipment of the Quarantine Hospital should be commenced, with a view to transmitting all patients and contacts thither until it should be possible to judge of probabilities in the near future. For it was evident to the Board that if a large number of cases should occur, not merely would the task of fully equipping this hospital for a purpose for which it was never intended, enormously increase the labours of the executive staff, but that it might easily happen that there would not be room enough in the enclosure for all the patients who must accumulate there, and for the nursing and serving staffs as well; while the need to transport all patients to it by sea from a point at the margin of the inhabited area would not merely entail very long journeys on many of them, but would also require organisation of land and water ambulance-services of considerable magnitude.

The infection of Sydney with plague was now officially announced. Once more the Department publicly stated that epidemics of plague were not kept going by communication of the disease from person to person, and again urged a crusade against rats; and it now suggested that a capitation fee should be paid for every dead rat delivered by all except the members of a special rat-catching staff, which should be at once appointed and paid regular wages.

On March 1st, a poster containing advice and instructions to householders was prepared, and subsequently exhibited very freely in conspicuous places all over the metropolitan area; and, notwithstanding the smallness of the Chinese colony, the apparent susceptibility of this race to the disease made it prudent to issue an edition printed in the Chinese language. At a later date (March 29th, case 48) this notice was reprinted in pamphlet form and posted to every householder in the metropolitan area (Appendix H, p. 75).

On March 2nd, the Department announced that for the future it would remove to isolation only actual sufferers from plague, and would quarantine houses and contacts only when the former were overcrowded and filthy, and presumably a source of infection. The plan was disapproved by the Government, which directed strict isolation of all people who had been in contact with plague-patients, and closure of the houses from which they had been removed. This decision subsequently appeared to be in accordance with popular feeling.

In the meantime, local authorities, both in Sydney and elsewhere, had begun to bestir themselves. As regards the City, it was mentioned that special inspection and scavenging had been begun as soon as the rumoured presence of plague at Adelaide became known, and that £2,000 had been thus spent down to February 26th. A house-to-house inspection of the city of Newcastle was carried out at the instance of the Medical Officer of Health for the Hunter River combined Sanitary Districts (Dr. Robert Dick); it had been begun about January 9th, and was reported complete about January 30th. Many metropolitan municipalities also announced the steps they were taking to put their districts in order. The Board gathered together a staff of instructed sanitary inspectors and caused them to visit all municipalities in the metropolitan district, and report (*a*) on the special measures alleged to have been taken or which were being taken; and then (*b*) on the effect produced, as judged after a perambulation of each district, and general inspection of dwellings. About March 2nd, it was stated that the local authority for the City had undertaken the systematic destruction of rats; and on the 9th, it was said, at a meeting of this authority, that 9,000 had already been destroyed. Doubtless, also, there was some private activity in this direction, the Sydney Meat Preserving Company having offered a reward to its workmen for every rat caught on their very extensive premises, as early as February 27th.

Fumigation of coastal vessels, with a view to destruction of rats, had been begun by the several companies at an early date; but a staff to carry out this work on all vessels loading at Sydney, trading between Sydney and other ports and places in New South Wales, or leaving Sydney for other parts of Australia or of the world, was organised and set to work by March 16th. It was placed under a temporary Superintendent of Fumigation, had its headquarters at the Custom House, and was generally supervised by the Collector of Customs (Mr. N. Lockyer). As regards vessels trading within New South Wales, it was ordered that, after leaving Sydney, they must not be allowed to communicate with the shore until they produced a certificate

certificate issued to them by the Department stating that the prescribed fumigation had been done while the holds were empty. These regulations worked without causing any serious interruption to traffic (see Appendix I, p. 76).

On March 22nd, regulations prescribing the mooring of vessels at wharves so as to impede the entry of rats to, and the landing of rats from them, were drawn up and recommended to the Attorney-General for gazettal (Appendix K, p. 77); this was done, but it was found that such regulations could be made only under the Wharfage and Tonnage Rates Act, 1850, so that they could be enforced only in the case of vessels mooring at public wharves.

On March 21st (Case 28), the President suggested to the Government that steps should be taken to call a Special Plague Committee into existence. Popular excitement had gradually increased until it had reached a pitch which threatened further serious interference with the Department's practical management of the epidemic. It was thought that such a Committee, if it included the leading members of the community, might steady the popular mind and afford the Department the kind of support in execution of its difficult and anxious duties which seemed about to become indispensable. Nothing resulted from the proposal at that time. But citizens presently began to move in the direction indicated; and on March 28th, the first meeting of a local Sanitary Committee was held in the municipality of Woollahra at instance, and at the house, of the Hon. Edward Pulsford, M.L.C., Mr. John Garland, M.L.A., in the chair. This example soon bore fruit, a similar Committee being called together at the Glebe, by Mr. J. A. Hogue, M.L.A., and a third at Paddington, on April 2nd. On April 11th, the Attorney-General (the Hon. B. R. Wise, Q.C., M.L.A.), attended a public meeting summoned by the Woollahra Committee, and, after explaining the Public Health Act and other sanitary enactments, took occasion to deliver some timely remarks on the indifference theretofore shown by the people in general to their civic duties, and on the tendency, which was universally evident, to rely on the Government not merely for administrative, but for executive, help in every kind of municipal work and responsibility.

The potential usefulness of such Committees was immediately perceived; and on April 11th, a general Committee, to be called the Citizens' Vigilance Committee, was instituted, which was to have a central office and sub-committees in every municipality. Alderman James Graham, M.D., M.L.A., became Chairman, and Messrs. John Garland, M.L.A., and J. J. Cohen, M.L.A., Hon. Secretaries. This Committee which, under its able managers, flourished greatly, and which still continues at work, did an incalculable amount of good in two main directions. In the first place, it laboured for and secured that coöperation of individual householders in the rat-killing business, without which it was plain the best efforts of the Government, and even of municipal councils, could yield but inadequate results; and, secondly, it set about systematically carrying out in every district the recommendation made by the Department on March 1st, in the poster and pamphlet then issued—namely, that every ratepayer should make it a rule to report to the local authority of his district every matter, or premises, which appeared to him to constitute a nuisance and a danger to health. Neglect to faithfully execute the sanitary powers entrusted to them had been a too common rule with many besides the City Council, though within the City its effects were exemplified on the greatest scale; and in the course of a few weeks the result of this scheme began to be evident, not merely in an improved public opinion, but in the changed attitude of all but one of the local authorities referred to. It seems likely that these results, which have flowed almost entirely from the public-spirited and wise exertions of the members and executive of the Citizens' Vigilance Committee, will in important measure prove to be permanent.

From the beginning, it had been gradually becoming clearer and clearer that the origin of the epidemic, as a local event, lay with certain wharves on Darling Harbour. (See Diagrams A, B, and C.) On February 15th (Case 1) and following days these places had been visited in detail by the Medical Officer of Health for the Metropolitan combined Sanitary Districts (Dr. W. G. Armstrong), and owners had been desired by him to take steps to cleanse them, and to destroy the rats about them. On March 11th, the President inspected them in company with the Collector of Customs (Mr. N. Lockyer), and ascertained that very little had been done in the desired direction; he thereupon communicated with occupiers, and threatened that

that unless large gangs of men were at once put on, and certain specified things done, he would quarantine these wharves. Already it had been perceived that if possible this portion of the city should be evacuated—the first object to be sought under such circumstances being removal of the inhabitants and daily visitors from the apparent focus of infection. But it was the headquarters of a very important branch of trade, and it was thought that this step could not be effectively taken without inflicting a blow on the prosperity of the country (for the welfare of every town would have been affected) which it was little likely to suffer from the epidemic—alarming as the situation was beginning to appear to the public who misconceived of plague as a highly infectious disease, liable at any moment to begin to spread like wildfire. And now two conditions became known, which made some further step than had hitherto been taken imperative. In the first place, while on the one hand it was soon ascertained that wharf-owners in general were not taking the measures which have just been referred to with anything like the requisite energy, it appeared on the other hand that their best efforts could hardly produce the desired results unless business were first stopped, because of the serious structural faults these old wharves exhibited. And then, secondly, the house-to-house inspection of this infected quarter, which was being carried out by the Board's staff of temporary sanitary inspectors, showed that it had fallen into a deplorable state from long-continued omission of the local authority to execute the ample powers to preserve the public health within its district which it enjoyed under its own Act of Incorporation, 1879, and under the Public Health Act, 1896. The result of this maladministration—now for the first time revealed to the general public, though well enough known in several quarters—was precisely that which sanitarians are aware must supervene in every large city, where, though there are good laws, there is an executive authority over a part of it which is at once uninstructed, indifferent, unguided by the routine of an efficient organisation, and ungoverned by strict principles of action.

As soon as these facts were apprehended the Government, after consideration, decided on March 23rd that the parts of the city and the line of wharves referred to, should be mapped out in convenient sub-divisions which should be consecutively closed, and given over to gangs of workmen under its own control. These gangs were to cleanse and disinfect streets, lanes, yards, and the houses inside and out; and, as regards the latter, note was to be made of all which had fallen into disrepair, or were so constructed that they should have been dealt with by the local authority under Part V. of the Public Health Act, with a view to making application for closing orders. The Board, therefore, increased its staff of temporary sanitary inspectors to twenty-eight, placed it under its sanitary inspector (Mr. P. E. Getting), and after furnishing it with a scheme of house-to-house inspection to be filled in and recorded, turned the whole over to the Department of Public Works. Successive portions of the city, which are indicated by dark shading on the three diagrams attached hereto, were closed to traffic and cleansed between March 23rd and July 17th.

Down to about March 23rd (Case 31), the Department had not succeeded—notwithstanding the increasing public alarm—in causing it to be perceived that it was beyond the bounds of possibility that it should not only advise and plan, but also actually supervise unaided all the varied proceedings which on such occasions become necessary. So far it had, by incessant and extraordinary exertions on the part of every member of its permanent and temporary staffs, not only succeeded in the tasks properly arising out of its acknowledged functions, but also in others which did not so arise and which had been silently imposed upon it. But when at this date it appeared to be tacitly assumed that it should supervise the collection, organisation, employment, direction and feeding of a scavenging staff which at the beginning was designed to consist of 1,000 men, and which soon came to number 3,000 men at work at one time, it became necessary to point out not only that this work ought to be intrusted to persons competent in it, but that other subdivisions must be shared out among other public departments which, down to this date (with exception of the Customs, and, as regards the quarantining of individual houses, the Police) had shown little comprehension of the mere physical necessities of the case. From that time forth each took its part. The various branches of the increasing business continued to be smoothly and efficiently worked. The Department was able to turn more attention to its proper occupations, which
from

from the beginning had been sufficient to engross the best energies of every member of the professional staff, weighted as they were with the thousand-and-one interruptions due to popular excitement.

The original supply of prophylactic had been reserved for use in the cases of those persons who had been closely exposed to infection, from their having occupied or frequented the same premises from which cases of plague had been removed; no general public inoculation had, so far, been possible. But on March 12th a fresh supply arrived. Systematic inoculation was begun in the building occupied by the Department. In the morning, ladies and a few other people who came in small numbers, were dealt with upstairs; that part of the general public which lived on, or was employed throughout the day in, the then infected area, was inoculated during the afternoon in the basement. On March 21st, however, the public, without any warning, suddenly arrived in very great numbers, and practically took possession of the building; they invaded the upper part of it, packing the staircases almost beyond possibility of movement, and at imminent risk of a disastrous accident. The building itself was, moreover, unapproachable through the large crowd outside it, which desperately resisted displacement from positions of advantage they had gained near the entrances. The next day, use of the Exhibition Building was granted by the City Council for inoculation purposes. Strenuous efforts were made to restrict public inoculation to those persons who either inhabited the infected area or were obliged to pass the day in it. The medical profession naturally desired that supplies of prophylactic should be placed at its disposal, but, of course, acquiesced in the necessity for restricting its application in the way just mentioned, as soon as it was pointed out; but a portion of the general public were determined to be inoculated at all hazards, though they stood in no known danger of contracting the disease, and very much of this first consignment consequently was wasted. When, at a later date still, a further supply had arrived and the method of inoculation had been organised (Appendix F, p. 71)—being done on this occasion in the basement of the city Town Hall—so entirely had all panic, or even lively interest, in the continued prevalence of the disease died out of the public mind, that between May 11th (Case 215) and June 16th (Case 278) only 2,700 persons presented themselves at the inoculation station, which, consequently, was then closed.

About March 28th it was suggested by the Government that if a new plague hospital were really necessary it should be put up somewhere between the Coast Hospital and Botany North Head, the minimum distance from Sydney thus indicated being 10 miles by road. On March 31st the Board reduced the term of detention of contacts from ten days, at which it had so far stood, to five days; and this was done because it was generally perceived that the former term was unnecessarily long. It was done at this time, however, in order to afford the Quarantine Ground a relief which the accumulation of contacts had made necessary. At the same date the Board once more recommended evacuation of the Coast Hospital; but after deliberation the Government decided that it would be dangerous to remove the patients then in occupation, and, besides, feared it might be necessary to destroy it afterwards if it were used to house plague cases. Not only was the contact camp at Quarantine overcrowded at this date, but the hospital itself was nearly full, being in considerable measure occupied by convalescents. On April 3rd, therefore, a part of the contact-ground and some buildings were transformed as well as possible into a convalescent hospital. This arrangement in turn trenchanted on the accommodation required for contacts, even after their numbers had been reduced by lessening the term of detention, to an extent which necessitated erection of some fresh buildings; and consequently the Board recommended on April 5th that such new buildings should be at once commenced. This was done. By this time the labour of equipping the hospital, which turned out to be greater even than had been foreseen, had been nearly completed, and as well as circumstances allowed; but only by the hearty and, indeed, self-sacrificing efforts of every member of the staff—medical, nursing, and lay. Quarantine hospitals afford little more than shelter; the buildings in this case happened to be more than usually extensive, but it is not expected—and practically it rarely happens—that more than half-a-dozen persons landed from an infected ship have to be provided for. Its equipment, consequently, and the staff quarters attached to it, little more than suffice to deal with some such small number of persons. There is a vast difference between such an establishment and a hospital which receives a constant stream of patients suffering from an acute fever, and liable

to

to all kinds of serious complications ; and which, as a matter of fact, came to house for a long term more than 100 persons at a time. Accommodation for the nursing and serving staffs had to be improvised ; they were moreover for months strictly confined to an enclosed area of, perhaps, a couple of acres to a large extent covered with buildings. The only relief which could be afforded the nursing staff was on their journeys to Sydney to attend to the removal of fresh cases, and a rare excursion on the water in one of the launches. It is due entirely to the energy and loyalty not merely of the staffs just mentioned, but of the Superintendent of Quarantine (Mr. James Vincent), and the permanent and temporary staffs under him, that the very great difficulties just adverted to were overcome ; and the best evidence of their willing aid is the statement, which can be made without reserve, that whoever else may have suffered, at all events every patient was as comfortably lodged and as carefully tended as could have been the case in the best appointed permanent hospital. The conditions just indicated had been foreseen, and evacuation of the Coast Hospital was recommended in view of them ; for by that plan an establishment completely equipped, in going order, and possessing its own ambulance service, would have been rendered available. As it was, the staff of the Coast Hospital had to be very freely drawn upon, in addition to private sources ; 18 nurses under Head-nurse Ford were transferred from it to plague duty, whose places had to be hurriedly filled as they best might. Thus the Matron of that Hospital (Miss MacMaster) bore her share in the labours arising out of the epidemic, and succeeded in carrying on the institution very much as usual in spite of the loss of many of the leading members of the staff under her.

On April 17th arrangements were made by which the free distribution of disinfectants to local authorities, which had been going on since March 12th, was supplemented by the free distribution of rat-poison ; the Premier also directed that every metropolitan local authority should be empowered to hire at least one man whose duty would be to distribute the poison, to instruct and stimulate householders in its use, to extricate poisoned rats from under floors and other situations in which they had died and become a nuisance, and to destroy the bodies of rats which he himself caught or received. Additionally, a deputation of Members of Parliament urged the Government, on April 11th, to offer a reward for the body of every dead rat delivered to appointed persons ; and subsequently a capitation sum of 2d. was so paid. On April 27th, the capitation payment was increased to 6d., and with very satisfactory results as regards the number of rats brought in.

In addition to the measures already described several others were taken, to which but brief reference is necessary. Thus, the powers and duties of local authorities under the Public Health Act, 1896, were explained by the Honourable the Attorney-General, and on March 27th, a circular letter was issued from his Department to all those bodies ; and when the deplorable state of some dwelling-houses, and the filthy state of parts of some neighbourhoods, became known in connection with inefficient administration of health laws by some local authorities, he directed that reports upon them should be referred directly to his officers, with a view to taking criminal proceedings against the responsible parties—owners or occupiers as the case might be—in a Court of Quarter Sessions. No such proceedings ever became necessary, but a great amount of cleansing and repairing was speedily effected as soon as they were threatened. So, also, a permanent hospital was erected at Newcastle, on the Stockton Quarantine Reserve, with the probable infection of that port (which is next in importance to Sydney itself) in view.

Local authorities in country districts were requested to secure refusal of a suitable cottage which might be got ready for use in case any person suffering from plague should be imported.

Attempts were made to impart to the public information concerning plague. Dr. Frank Tidswell, M.B. (Syd.), D.P.H. (Camb.), found time to prepare a paper describing the principal epidemiological, clinical, and pathological facts concerning the disease, which was read to a large meeting of the profession at the Royal Society's House on April 27th, and which was reprinted by the Government and suitably distributed. Professor T. P. Anderson Stuart, M.D., LL.D. (Edin.), delivered a popular lecture on plague on April 28th and on May 5th, which was subsequently printed by the Government, and widely distributed ; and Dr. Camac Wilkinson, M.D., M.R.C.P. (Lond.), discoursed to the Ladies' Sanitary Association on the same subject on June 5th.

The policy of indiscriminate removal of both patients and contacts was adhered to till the end of the epidemic; patients were strictly isolated from contacts; contacts after bathing and changing to clean clothes were housed in common—that is, without reference to dates of exposure; inoculation was offered to them on arrival at quarantine, but was rarely accepted, and the term of their detention was five days, except quite at the beginning, when it was ten. Convalescents were discharged as soon as (*a*) they had had a normal temperature for ten days, (*b*) provided they had no unhealed sore, and (*c*) were in general respects fit for discharge. The three clergymen who resided at Quarantine and acted as chaplains (Rev. Father le Mesurier from March 22nd; the Rev. J. F. Moran from April 7th; the Rev. Alan McDougal from April 3rd), the medical staff, the consulting medical officer (Mr. C. P. B. Clubbe), and medical men who desired to study the disease, were allowed to enter and leave the hospital enclosure, the former to return to their quarters on the contact ground, the latter to the city, on condition that they had been inoculated, wore a special suit of clothes during the visit, and bathed before resuming their own clothes. The bodies of persons who had died of plague before removal were confined by a specially engaged undertaker; the joints of the coffin were rendered watertight; the bodies were wrapped in a sheet wet with sublimate solution 1-1,000, the lid was screwed down, the coffin was then enveloped in a coarse cloth wet with sublimate solution, and delivered at the Quarantine Depot. It was thence transferred to the Maritime Quarantine Station, and there buried without further precaution in sandy soil, on a steep slope falling to cliffs above the Pacific, and at a part of the grounds far removed from that in common use.

VI.—ORIGIN AND MODE OF SPREAD.

All those conditions by which the natural course of the epidemic might have been interfered with or modified having now been mentioned, the epidemiology of the outbreak can be studied.

Five or six localities in different parts of the world are known to be endemic seats of plague; the disease has reappeared in them at short intervals during a long series of years, but it has remained confined to them. From one of these endemic seats, situated in the southern province of China called Yun Nan, plague was carried during 1893 along a caravan route to the town of Liao Tchou in the adjoining province of Kwang Si. From Liao Tchou it was transported by two routes. By one, which followed the Canton River, it reached the city of Canton, and became epidemic there in February, 1894; by the other it was carried to the seaport of Pakhoi, on the gulf of Tonquin. Either from Canton or from Pakhoi it reached Hongkong, where it was officially declared to be epidemic in May, 1894. It has been present at Hongkong ever since; in 1895 only forty-five cases were notified, but in 1896 it again became prevalent. During the latter year it reached India, and was officially declared to be epidemic at Bombay in September; subsequently it spread very widely thence, but Calcutta escaped until the Spring of 1898, or, probably, somewhat earlier. The best opinion is that the disease was carried from Hongkong to Bombay by sea.

Trade between Sydney and the ports of Hongkong and Calcutta has been great for many years past. As regards Hongkong two lines of steam vessels both make monthly voyages thither all the year round; the cargo steamers of some other lines sail between the two ports more or less regularly and frequently according to season; while there are in addition many irregular or casual vessels which arrive from China after touching at many places, including Hongkong. So that Sydney has been in danger of importing plague at all events ever since May, 1894; and the invasion of Calcutta, with which communication is frequent, greatly added to that risk. In Mauritius plague was first officially reported on February 27th, 1899, but cases had been observed as early as the previous December which subsequently came to be looked upon as plague; and this island has a steady though small trade with Sydney, which is carried on both by steam and sailing vessels. Kobe, Japan, became infected some time in December, 1899; Honolulu, H.I., on December 12th; and Noumea, the capital of New Caledonia, was officially declared to be infected on December 24th, 1899, when the news reached Sydney by cable. These are the infected places with
which

which Sydney has the most frequent and regular communication, and from which it was consequently most seriously threatened. Lastly it was announced on January 15th, 1900, that certain cases had occurred at Adelaide, South Australia, which were considered to be plague. The detailed accounts, when they came to hand, hardly portrayed plague under its clinical or its epidemiological aspects; they lacked adequate bacteriological data, and they contained statements which were unexpected and strange in connection with plague. The rumour, which from the first had been regarded with doubt, was ultimately discredited; and the matter is mentioned here only in order to direct attention to the effect it had in stimulating that professional alertness and public alarm which had already been aroused by news of the infection of Noumea.

Beyond pointing out the several ports from which plague might have been introduced into Sydney, and the great number of vessels which arrive from those ports during each year, nothing can be said as to the way in which the disease actually was introduced. Since 1894 no vessel has arrived which carried, or (as far as very careful examination and questioning on arrival revealed) which had carried, a case of plague in man. Theoretically the infection might be introduced in goods from infected ports; but the lengthy immunity from attack enjoyed by many cities into which goods drawn from infected centres have been daily poured during several years shows that in practice it is at worst very little likely to happen. All that can be said on this point, consequently, is that the first patient was a carman, who was regularly employed by the Central Wharf Co., who was chiefly occupied in carrying exports from city warehouses to Central Wharf [See Diagrams A, B, and C], and who occasionally visited other wharves to fetch packages in course of transshipment. It was ascertained from his employers' books that during 25 days before his attack (January 19th) he had had business at only one other wharf 10 days before attack, that of the Australasian United S. N. Co., Darling Harbour; but between October 21st, 1899, and January 20th, 1900, four vessels which had touched at Hongkong lay at Central Wharf—one of them from January 9th to January 20th. (For a full account of this case, see Appendix L, p. 77.)

TABLE IX.—Showing the Wharves on Darling Harbour only at which Steamships and Sailing Vessels, which arrived from Plague-infected Ports, lay between October 21st, 1899, and January 20th, 1900. (See Diagrams.)

The case presented a feature, however, which was taken to show that in all probability the infection had been received neither from an earlier case of plague in man, nor from any infected article. The patient suffered from the disease in the
bubonic

bubonic form, and the bubo appeared in the lowest gland of the vertical chain in the left thigh. In the external retromalleolar hollow of the same extremity was a circular spot, about 3 mm. in diameter; the cutis was purplish red; the cuticle which had been raised was then adherent to it, and at one point only of its circumference it was ragged. This observation (which I made on the third day of illness) suggested that the infection had been communicated by puncture at this spot, and that the inoculation was most likely to have been effected there—at a part of the foot which was well covered by the boot the patient wore—by an insect, namely, by a flea. The inference drawn was that rats were already dead or dying of plague in Sydney, and this formed the motive of the advertisement requesting information regarding disease among, or emigration of, rats which the Board caused to be inserted in the daily papers as soon as the nature of this case had been established, as well as of the prediction then uttered by the Department—namely, that although no cases would arise by communication from Case 1, yet other cases would probably be met with.

The full justification which this view subsequently received, supports an opinion that the disease was not introduced either by some unobserved imported case in man, or by importation of infected articles, but by infected rats; from which it spread to the local rats which, in turn, communicated it first to Case 1, and, as will subsequently appear, to other persons afterwards. But by what vessel, or from which infected port, such rats were landed at Sydney, there is no evidence. It may be pointed out, however, that communication with the remoter infected places had been extensive, and steadily maintained for long previously without introduction of the infection; and that the latter gained a footing only after the disease had appeared at Noumea, a port which lay close at hand. No official account of the epidemic in New Caledonia has yet been published; the following remarks must therefore be regarded as conjectural to some extent. The first case in man must have happened in New Caledonia some time before the presence of plague was acknowledged on December 24th; and it may have happened considerably before that date. But appearance of the disease among rats, not among the inhabitants, has most interest in relation to risk of importing the infection. Now, it was reported that the rats at Noumea suffered heavily during the epidemic; but the important question whether the epizootic preceded the epidemic, cannot at present be positively answered, no authoritative information on this point having become available. A frequent experience, however, is that the rats suffer first, and usually several weeks before appearance of the first case in man. If this happened at Noumea there was nothing to prevent importation thence at any time prior to December 24th, for no special precautions were or could be taken at Sydney until after that date, when the disease was first officially admitted to be present there in man.

No information concerning mortality among rats was furnished in response to the advertisement mentioned above nor to other inquiries until February 14th, when an officer in the Customs Department drew attention through the Collector to unusually frequent deaths among them at Huddart, Parker, & Co.'s Wharf, on the eastern side of Darling Harbour (see Diagrams). The wharf being within the city, the President caused the local authority to be informed and advised, and in the course of the afternoon four live rats and three carcasses were brought to the laboratories by the Chief Inspector of Nuisances for the city, who said it had taken him two hours to find them. At a later date an inspector of fruit in the Department of Mines and Agriculture reported that he had noticed an unusual mortality among the rats at Huddart, Parker, & Co.'s Wharf about the first week in January. Nothing further on this head has been discovered; and it is important to note that no suggestion that rats were suffering from an epizootic at any other part of Sydney about or before the dates referred to has ever been made. The beginning of an epizootic among rats occurred at wharves on the eastern side of Darling Harbour, and it first became manifest at Huddart, Parker, & Co.'s Wharf.

The seven rats above mentioned were at once utilised for the usual bacteriological and inoculation tests, and were shown conclusively to have been suffering from plague. At the same time, glands which had been removed from the body of a man who had died the previous day were brought to the laboratories, and on examination showed with sufficient certainty under the known circumstances that the cause of death had been plague. The beginnings of an epidemic are so important that

that an account of Case 2, as well as of a few others of the earlier cases, is necessary. The patient had been attacked about February 17th. In the course of his brief illness he had been attended by three medical men, of whom two were called in consultation, not because of the apparent gravity of his case, but for reasons which can be inferred from what follows. A clear history of injury to the lower abdomen received three or four days before attack, and caused by a fall against a plank, was given. The disease was recognised as having the form of septic fever; but no peritonitis or other occasional consequence of such an injury could be made out and, in fact, there was none. The illness was well marked, though as it seemed, not immediately dangerous to life. Death occurred unexpectedly. It was then that plague was judiciously suspected, and that inguinal glands which had become enlarged and painful in the neighbourhood of the seat of injury were removed, and brought to the laboratories for examination at about 3.30 p.m. This patient, who died at his house in a suburb, was a sailmaker. His business is said to have been exclusively among locally-owned craft, and all connection with vessels coming foreign was denied for him by his survivors. He occupied a sail-loft on the water side of Sussex-street, not above 200 yards south of Huddart, Parker, & Co.'s Wharf, where he employed about forty workpeople, men and women. He had also a large household, part of which, at all events, had for some time lived at the workshop with him. As soon as the examination of the glands had been carried sufficiently far, the workshop was placed in quarantine at about 4.45 in the afternoon and, of course, without warning. On being questioned at that time as to the presence of rats there, the inmates said that deceased had removed five dead rats from a water-closet on the same floor two or three days before his attack. This closet was connected in a primitive fashion with a short pipe-drain which discharged under a wharf at the back of the house. No illness occurred either among the members of the family who had been as much associated with these premises as the deceased, nor among the many workpeople who were regularly employed there. No illness occurred, either, among the frequenters of the three premises above which the sail-loft ran, two of which were occupied by a produce salesman, and the other as a merchant's office; however, they were entirely cut off from the sail-loft, which had a separate entrance from the street.

Case 3 was notified by the medical man in attendance the next day (February 24th.) The patient lived on the western side of Darling Harbour, at Pymont, but he was a wharf labourer employed at Huddart, Parker, & Co.'s wharf. There was no history of dead rats at his dwelling, nor anywhere in the neighbourhood of it. This patient had a household of six persons, among whom no illness occurred.

Case 4 was notified on February 28th. The patient was a labourer in employment of a produce dealer who lived at the Glebe. He had not been anywhere near Darling Harbour for at least a fortnight before attack; but the supplies for the shop at which he worked all day were in large measure drawn either from Huddart, Parker, & Co.'s wharf, or from another close to it, at the back of the house occupied by Case 2, where the bales of hay, sacks of potatoes, &c., &c., often lay for several days before being delivered. In this case the disease could not be attributed to rats seen; and it may be suggested that the infection was conveyed adherent to some of the articles mentioned. The patient himself was too ill when first visited to speak as to presence or absence of rats, dead or alive, from the bales and sacks which he unpacked. No illness occurred either among his employer's family, or at the house (in a street a mile away) where he lived, and whence ten persons were transferred to observation.

Case 5, notified on March 2nd, occurred in a publican whose house was immediately opposite Huddart, Parker, & Co.'s wharf, and was overrun with rats. No case occurred among the other sixteen members of the household, who were removed to observation.

Case 6 occurred in a boy aged 8, who lived with his uncle and aunt and two other children in a house in Kippax-street, Belmore Park, and was notified on March 7th. No other case occurred in this street until eight weeks later (Case 180); it then seemed probable that the neighbourhood had become infected by extension from the focus to be mentioned in connection with the next case, though at the time of notification Case 6 could not be in any way connected with a probable source of infection. The house was not used for any business. The patient's uncle
(who

(who was not attacked) was employed by a butcher whose shop lay not very far away, but in a neighbourhood which yielded no indigenous cases until long afterwards. It seemed that the child himself did not go far from home except to school. There had been rats on the premises, but they had been killed off about four months before by dogs obtained for the purpose, and there was no history of dead rats having been seen.

Case 7, which is the last which need be here mentioned in detail, occurred on March 8th, in a boy about 2 years old. His parents lived in a cottage which is indicated on the three diagrams by a cluster of five dots which represent the five cases which occurred in this family. The cottage stood in the neighbourhood of the City Corporation tip at Moore Park, a place where all the garbage and street-sweepings of the city are still dumped. To this spot refuse from the neighbourhood of the infected as well as other wharves was carried for some time after the fact of infection became known. There is no difficulty in showing clearly enough that the part of Sydney in this neighbourhood became subsequently a focus of infection which yielded many indigenous cases, of which the present was the first. The circumstances attending this case were the following:—The family consisted of the parents and six children. The cottage had had a good many rats about it; and in an outhouse in which the younger children used to play, one or two dead rats were discovered when, after attack of Case 7, it was cleaned out by the father. On these premises, also, the disinfecting staff found quite an extraordinary number of fleas; the bodies of the younger children were almost literally covered with their punctures. The only persons attacked were four young children who habitually played in the outhouse, and the father who cleaned it; they had none of them visited the garbage tip. All but the youngest child recovered.

The progress of the epidemic in point of time has already been described in Section II; its progress in place may be gathered from the diagrams lettered A, B, and C, which are appended. These diagrams have been constructed as follows:—In all three each case noted is represented by a dot; the dots are printed in four colours, each of which is appropriated to a period of time; thus black indicates the cases which occurred between January 20th and March 24th (Case 32); green, those which occurred between March 25th and April 21st (Case 129); red, those which occurred between April 22nd and May 19th (Case 239); and blue, those which occurred between May 20th and August 9th (Case 303), the end of the epidemic. On Diagram A the spots are so placed as to indicate the houses from which patients *were removed*, or, if they were actually removed from a general hospital, those they had occupied before admission to such hospital. On Diagram B they indicate the places at which the patients *were employed* during the time which covered the date of their infection; a working limit to latency—probably correct also—of five days being assumed, although of course the duration of employment at the place before attack had usually been lengthy. On Diagram C they indicate the probable *place of infection*, which was sometimes the residence, and sometimes the place of employment. The manner in which this place was fixed upon requires describing.

If Diagram A be examined, and if for the sake of clearness attention be confined to the black dots on it, which represent the places from which those cases which occurred between January 20th and March 24th were removed, it will be seen at once that the components of the series were not related by neighbourhood; for although one household afforded five cases, and although at another point six separate households appear close together, speaking generally the black spots are distant, and in several instances very distant, from each other. Secondly, it was ascertained that the members of these infected households were in all cases unacquainted with each other. Thirdly, the patients themselves were unacquainted with each other, except in certain instances in which they were associated at their place of employment or at home (Case 7). Hence it appeared that neither locality of habitation, nor personal communication, was the essential factor in infection. But the observed association of certain cases at their place of employment made it necessary to rearrange the diagram so as to show place of employment instead of the place of residence (see Diagram B); and this having been done, it appeared at once that the black spots were drawn much closer together, and were largely concentrated about Huddart, Parker & Co.'s wharf, and the eastern shore of Darling Harbour, although several of them still remained outlying.

It must be remembered that the time represented by the colour black was considerable (thirty days exclusive of Case 1) and that elucidation of the place of infection lay in reality with the circumstances surrounding the earlier cases of this period; and then, secondly, that the nature of our possible source of local infection had been established at an early date. It did not consist in an infection of the soil; no other reason in support of that supposition could be given than an assumed automatic commencement of specific infectivity of it, which, of course, is absurd. On the other hand it was already known to be present in the rats of the locality. Now rats are not confined in place, but can wander, and in accordance with their known habits were sure to occupy a wider area, or to migrate to different areas as time went on; and hence the black spots on Diagram B are concentrated about the original focus of infection only as regards the earlier numbers of the series, and even then with exception of Cases 4, 6, and 7. In fact, towards the end of the series indigenous cases began to appear at points rather far removed from the original focus (Case 20 at Rowe-street, City, 22 at Windmill-street, City, 23 at Walker-street, on the Redfern focus); and then, as time went on, cases began to be met with in which, although in some instances the patient was employed in or close to the original focus of infection, his case could not reasonably be referred to his place of employment on account of cessation of the neighbourhood it indicated to furnish a succession of fresh cases—because, in short, that focus had ceased to be dangerous. Also, other cases in persons who never had been near the original focus, and who had not been away from their place of residence, began to be met with in appreciable proportion (women and children especially), and with the neighbourhoods in which these occurred some of the cases just before referred to were associated. It became apparent, after careful study of all the circumstances, that fresh foci of infection had become established, and that it was no longer possible (as at first it had been) to assert *a priori* that wherever a patient might be found it would probably be ascertained on inquiry that he was in some way associated with the eastern side of Darling Harbour. The dissociation of these later cases both in place of residence and in personal communication continued to be as conspicuous as at first; if they lived in the same neighbourhood still their houses were more or less distant from each other, and although they might all possibly have encountered each other in the streets, by far the most often they were unacquainted. Consequently these neighbourhoods gradually became distinguishable, and entitled to be designated fresh foci; and as soon as this conclusion presented itself the same relation between them and the presence of diseased rats in them was observed, as had been first observed at the original focus. In many cases the evidence consisted merely in the reported observation of an unusual number of rats, and of dead rats, or of the death of rats in unusual places—under floors, in cupboards, or outhouses, &c.; but in some cases, elsewhere mentioned more particularly, it consisted in actual detection of plague in sick or dead rats, or (in one case) in a cat. Thus Diagram C, which represents the probable place of infection, was constructed from the whole of the facts concerning each case, after they had been weighed. It is in reality, therefore, an expression of opinion—very carefully formed, it is true, but not to be taken in all respects as a representation of ascertained fact; and that is the reason why Diagrams A and B (which state ascertained facts only) are presented along with Diagram C.

On Diagram C the black dots are shown almost entirely gathered together on the eastern side of Darling Harbour, and at the northern end of that shore. Cases 4 and 7 still occupy the positions originally assigned them—in other words have still to be regarded as indigenous to those places, or, at least, as having no personal connection with the original focus; and now Case 23 appears at Walker-street, Redfern, due west of the five dots indicating Case 7. It is the first in immediate relation to Case 7, and the garbage tip at Moore Park, and is seen to have belonged to a considerable collection of cases which occurred thereabouts at later dates. And thus, perhaps, a hint of a possible source of the infection received by Case 6 (Diagram A) is indicated; far as he lived from any area known at the date of his attack to be infected, he attended Bullanaming-street School, and to reach it crossed the area on which Case 23 occurred. To later extension from that area are also ascribed the cases to the north which are marked about the words “Surry Hills,” east from Redfern terminus. These patients had no concern with Darling Harbour, nor even with any neighbouring part of the City.

To further illustrate the course taken by the infection in spreading to various neighbourhoods, it can be pointed out in relation to the black spot which indicates Case 4 that a green and two blue spots appear near it on Diagram C; not in very close contiguity to it, considering that the locality is closely covered with streets and houses, but still near it. These two colours respectively indicate the period which followed on that indicated by black, and the last period of all. A similar sequence of events might be described in relation to two or three other congeries of spots of different colours which appear on Diagram C. It might be suggested, therefore, that wherever one case of plague occurs there, or thereabouts, other cases may be expected. But the black spot attached to Case 4 indicates the place where the patient was employed; he did not lie ill there, and being attacked suddenly at midnight at his own house a mile away, which he did not leave thereafter except for isolation, he was not even on the premises while suffering, and therefore he could not have been the source of infection for the cases indicated by the green and blue spots, however indirectly. And, in fact, those cases belong to an extension of the infected area at the head of Darling Harbour.

From the head of Darling Harbour the infection spread to the neighbourhood of Redfern terminus, and thence in a south-westerly direction; a rat brought from the house indicated by a green dot towards the western end of Cleveland street and just above the words "Vine-street," as early as March 26th (Case 35) was ascertained to have died of plague. It did not cross the terminus, nor the railway lines to the south, nor the open spaces to the north of it. It proceeded from the terminus along George-street West, to be revealed in part by the cases referred to above as standing near the place at which Case 4 was employed; but it is possible, although, considering the lie of the country not so likely, that it reached this latter neighbourhood on a south-westerly course from the head of Darling Harbour; whence also at a much later date the indigenous cases shown on the promontory marked Pyrmont in all probability derived their infection. The green spots show that the above extensions occurred at all events before April 21st (Case 129).

Reverting now to the original focus, no less than 115 cases, or 38 per cent. of the total number are ascribed on diagram C to the area enclosed by Liverpool-street (running east from near the head of Darling Harbour), Elizabeth-street which intersects it, and a line drawn at right angles to a line produced from the northern end of that street in a northerly direction, so as to run westerly through the words "Bridge-street" and "Charlotte Place" to Darling Harbour again. Black spots (first period) are there seen only near the water; green spots (second period) are in a majority, and are present at the water's edge, but they also appear to the east of the black spot area; there are only two red spots (third period) close to the water, and to the east they far outnumber the green spots; there are but few blue spots (fourth and concluding period), and they chiefly appear at points far removed from any part of this area. As these four colours represent four divisions of the time over which the whole outbreak lasted, they indicate the direction in which the infection extended on this the most heavily stricken area of all, and indicate it very accurately. It appeared at the water's edge; it travelled easterly thence up the ridge which runs north and south parallel with Darling Harbour, and which culminates on the line of York-street; down the other side of this ridge to George-street; and up the ridge on the eastern side of George-street, as far as Elizabeth-street. There it was abruptly stayed; on the easterly side of Elizabeth-street, beginning at the intersection of Liverpool-street, are the uninhabited spaces marked on the diagrams. They are parks, or spaces on the margin of the parks occupied only with public buildings, and they stretch quite to the water at Bennelong Point, the northerly point of their westerly boundary being indicated by the line of Macquarie-street.

At a later date the infection did travel east of Elizabeth-street; perhaps closely round the southern end of the continuous open spaces just mentioned, but more probably from about Campbell and Hay streets (north of Redfern terminus). There was a distinct sub-centre of infection at that neighbourhood, to the south of Oxford-street, through which "Napier-street" runs; the building at the corner of Oxford and Dowling streets, marked by a red dot, being a brewery.

A quite separate focus which requires description became established at Manly. This place is a village situated on a neck of land at the northern end of the harbour, so that it has frontages both to the harbour and to the Pacific (see diagram A);

A); it contains about 3,000 inhabitants, many of whom travel daily to Sydney, and it is a favourite holiday resort which is visited by several thousand persons from Sydney every Saturday afternoon and Sunday. It can be reached by crossing from Circular Quay to Milson's Point, and following a road for thirteen miles, in the course of which the water must be crossed once more. This route is little used as a means of reaching Manly, although—a point of some importance—it is taken occasionally by waggons carrying heavy goods such, for instance, as furniture. The usual route is by ferry from Circular Quay; the distance being then seven miles, and the time occupied about half-an-hour. These ferry-boats convey considerable quantities of stores, including butcher's meat, every day. They lie at the wharves at either end between journeys and at night. From a misunderstanding, it happened that fumigation of these vessels to destroy rats on them, was not begun at the same time as on the ferries which plied from wharves on Darling Harbour.

The ferry runs to a single pier at Manly, on which are the usual shelter-sheds, and at the end nearest the shore a refreshment-room. The lessee had been allowed to convert a part of the structure into a dwelling, for which it was quite unsuited.

On May 1st, the case (163) of a man who kept a tobacconist's shop about 150 yards from the pier was notified. He had visited two warehouses in the immediate neighbourhood of the original focus five days before attack. This shop was subsequently demolished, and then many dead rats were found under the floor. On May 2nd the case (175) of a rouseabout at a public-house about six doors from the foregoing shop was notified. He slept in a shed at the rear of the hotel, getting his meals in return for his casual services, and hung about the pier when he was not wanted at the hotel. This person had not been away from Manly for many days before. On April 28th he removed several dead rats from the cellar of the hotel, on which premises no poison had been laid. On May 11th the case (213) of a vanman who lived in a street within a short distance of the pier, and who plied almost entirely at it, was notified; and the next day that of a girl (217) who was employed at the refreshment-room on the pier. This place was lined with matched-board and had a false floor; from this cover about thirty dead rats were removed during disinfection. On the 20th a boy who was practically unemployed, and who was always to be found at the pier if he were wanted to carry a message, was attacked with and died of plague (242). On May 29th the first of two cases in children (253), which occurred at livery stables just across the road from the pier, was notified; the house was emptied and disinfected May 30th, the family returned June 5th, and on June 25th the second case (288) occurred, the first being still in hospital; and between these two, on June 5th, the case of an ostler at another public-house opposite the pier was reported (257). The infected area was closed for general cleansing; and on July 12th, while this was still in progress, the case (298) of a man employed on the scavenging staff was notified. His place of residence was at Manly, but a mile and a quarter away from the neighbourhood of the pier.

Association of most of these cases with the pier is evident; but the first patient (163) had no other communication with it than consisted in frequently walking across it to the ferry-boat; while 175, 253 and 288, and 257 did not frequent it, although in the case of the two children it is likely they were often there. But 298 certainly had no particular communication with it, and, in fact, was infected only long after all the others (seventeen days), and only in the course of scavenging the area on which other cases had resided and (possibly, though not probably, with exception of 163) had been infected. Apparently, then, the infection, although communicated to persons who either frequented the pier or visited it casually more or less often, was not confined to it. On the other hand, it extended only to a short distance from it, and was markedly associated with presence of dead rats. Some of them, however, may have died of poison.

As soon as the first case was notified rats were sought at the pier and in its neighbourhood; nineteen were delivered at the laboratories, and all of them showed signs of disease. In eighteen of them, however, this could not be identified with plague (the bodies were very often more or less putrid), the signs consisting mainly in enlargement of the liver and spleen, and it seemed possible that these changes might have been the effect of poison (phosphorus for the most part), which had several weeks before been supplied to the local authority. Nevertheless, experience
having

having already shown that where plague occurred in man there plague in rats existed and could usually be discovered, the tedious bacteriological search was continued until in the nineteenth rat (and in two others afterwards) plague was demonstrated.

This localised outbreak has many attractive features. Although in constant and unusually free communication with Sydney, the place escaped infection until the eleventh week of the epidemic. The occurrence of cases, and therefore the distribution of the infection, was limited to a very small area; an extremely small proportion of the persons living on and passing through that area was attacked, so that it seems that in addition to presence of infection some accidental, and not commonly existing condition was necessary to enable its communication to man. The pier seemed to be the gate by which the infection entered the place, and the special connection of several of the patients with it indicated that it was perhaps the centre of infection, or the most dangerous point of the small area. Lastly, so long as seventeen days after the last case occurred, and the area had therefore begun to be regarded as clean, it was discovered on sufficient search, namely in the course of scavenging operations, that infection still lurked in it. The discovery of plague-rats, and of a large number of dead rats at the pier refreshment-room and elsewhere, showed that plague infection was present on the area in rats, if nowhere else; and consideration of the points summarised above, together with the evidence which is later given that the disease was not communicated directly or (with a single exception) mediately from man, shows that a hypothesis on which the infection is assumed to have been introduced, and to have been spread, by rats comports so well with them that no other source of infection for man need be conjectured.

North Sydney is considered never to have become infected, although six households, shown only on Diagram A yielded cases. These, from which there was no extension of the disease were ascribed, with one exception, to infection received on the chief area in Sydney, where the patients were employed. The exception was the case of a baker's man, whose movements outside North Sydney could not be ascertained, and the source of whose infection was left undetermined.

The apparent spread of infection in Sydney itself need hardly be further traced. It will be seen from Diagram C that indigenous cases are set down far along the course of Oxford-street, the important thoroughfare which runs easterly from the city; along Parramatta-road, the main thoroughfare which runs westerly from the city; and along Botany-road, the main, but much less frequented, thoroughfare which runs southerly from the city. At some of these more distant places plague rats were identified or, as in one case, a plague-stricken cat (see diagram B); while at others there was often a history of dead rats, verified in 70 cases by the disinfecting staff. But it must be noted here that a spot map does not show details; and some of these distant cases are set down as indigenous with hesitation, in as far as the epithet implies—as, in its present use, it is intended to imply—local presence of the infection in rats, and therefore in an automatically transportable form. In a few of them it was clearly possible, as far as ordinary surrounding circumstances went, that the infection might have been introduced together with goods derived from the central infected area; but whether such goods carried deposited infection, or whether they merely harboured infected rats, dead or alive, is a question for the present reserved.

The general outcome of the foregoing examination of the manner in which the 303 cases of plague were situated and successively occurred on the whole area, is to suggest that the infection was in some way or other connected with place. Frequent references have been made to the ascertained presence of dead and of plague rats in this or that neighbourhood; but this has been almost unavoidable, and has not been intended to prejudice the case for other modes of infection, which are known to have operated elsewhere, and one of which, at all events, was seen in operation (in a single instance, Case 262, p. 37) at the Maritime Quarantine Station. And therefore the mode in which the disease actually did spread will now be examined from other points of view.

If the three diagrams be examined in general, it will be apparent on a little reflection that the conditions represented could be produced only by three causes, apart from infection of locality: These are infected water, infected food, and infected persons.

The

The two former can be certainly excluded without difficulty. The bacillus of plague can survive in water for short terms, which vary with the kind of water used (sterilised, distilled, main, or sea water); this knowledge, however, has been gained experimentally (except one observation on sea water), and it has not yet been noted whether plague can be communicated to animals from water carrying plague-bacilli. What is more to the purpose is that while the epidemic spread of plague by town water supplies has never been suggested, the accounts returned from several different parts of the world do not furnish the least ground for suspecting that it may have happened. As regards Sydney, it is enough to point out (*a*) that a very much larger area than that included in Diagram A is supplied from one primary source; (*b*) that while the water from this single source is pumped to, and distributed from, subsidiary reservoirs, more than one such reservoir must have been contaminated to account for the observed distribution of cases; and (*c*) that Manly has its own source of supply, entirely distinct from the former. Secondly, as regards distribution of the infection by food in any form, it is now generally admitted that the disease is rarely communicated to man by feeding; there is no reason for suspecting that this mode can have been a factor in any epidemic prevalence of the disease hitherto observed.

Remains, then, only habitual communication from person to person as a possible cause of the Sydney epidemic. This might be brought about directly or by mediate channels: the infection might pass directly from the sick to the well; or it might be communicated from the sick person to some place or object, whence the second patient could receive the disease without having seen, or even become aware of the existence of, the primary case. These are ways in which epidemics are known to be sometimes caused (of small-pox or scarlet fever, for instance). Whether they had any important share in contributing to cause the Sydney outbreak of plague is the question now to be examined. But, first, the difference there is between the possible communication of disease by one or other means realised only from time to time and rarely, and such a usual communication of it as alone can cause epidemic prevalences, must be referred to. All preventible disease should be prevented; and, therefore, if special dangers exist they should be guarded against by precautions specially taken against them. The first object, however, is to prevent epidemic prevalences; afterwards, the occasional causes of exceptional occurrences of the disease can be considered and steps taken to prevent even them.

In the first place, it may be inquired whether the facts furnish any reason for suspecting that infection mediately communicated from man was the cause, or an important contributory cause, of the epidemic.

How could such mediate infection operate effectively? Only by habitual diffusion of household goods. Only in this way could articles which had been in contact with, and which had received the infection from, the sick, be brought sufficiently often into contact with healthy persons; and such contact to have been a factor in the epidemic must have taken effect on persons outside the house occupied by the primary patient. Firstly, then, the infected households were much the most often those of respectable working-people who carried on no business at home, but who left home every day for some place of employment. These are not the people whose household belongings are commonly liable to wide diffusion; but if they were, the suddenness with which this disease usually attacks must be remembered, and that it would be singular if the first few days of an illness which was almost always alarming from the first, were chosen for such diffusion. Secondly, although in order to cause an epidemic spread of disease such communication must be between the primary household and others, yet, if it could take effect on the latter, much more should it take effect within the primary household itself; but it will be seen directly that only 10 altogether out of 276 households yielded secondary cases, and those occurred under circumstances so different that they cannot be classed together. If, then, mediate infection played so small a part (if any) within households, it could not have played a larger part outside them. One other possibility remains open, namely, unconscious diffusion of the infection by means of articles of commerce handled by the sick. Here, again, the suddenness of attack must be referred to. Persons did not, and, for the most part, could not, remain at work a moment after onset of the disease, and until then they were

were incapable of communicating the infection. However, in the following table the occupations of the 303 patients are classified and presented :—

TABLE X.—Occupations of persons attacked.

Occupation.	Male.	Female.	Total.

Total	303

Mediate infection as a cause of the epidemic may be excluded then, and without hesitation; the question of possible spread from man to man by intermediate animate objects being for the present reserved. The possibility that direct communication of the infection from the sick to the healthy was the cause of the epidemic spread of the disease now alone remains; it must be examined with care.

Two sets of facts furnish the requisite evidence. In the first place, those which concern the total cases will show whether the persons who did contract the disease got it from preceding cases; and secondly, the fate of those who were in contact (usually household contact) with the sick will show in what degree (if any) it was communicated to them.

The first statement is as follows:—There were 303 cases altogether; but thirteen were secondary cases which occurred in ten households; so 290 households yielded 303 cases. Four of the 303, however, occurred in members of scavenging gangs while

while they were at work on the area to be scavenged; these, though actually in contact with large numbers of people, cannot be reckoned as belonging to households. Four cases and four households must be deducted, therefore; and the statement then is, that 286 households yielded 299 cases (it is true, also, that several of the 299 had no fixed place of abode—but they had usually been in known contact subsequent to attack with more or fewer persons among whom no illness occurred, so that it is not worth while to complicate this statement by excepting them). But a further deduction must be made of ten Chinese who occupied ten different dwellings, because too little (and that untrustworthy) could be learned concerning them. So the nett statement, which applies to whites only, is that it took 276 households to furnish 289 cases. This by itself is sufficient to show that direct communication of the infection from the sick to the well could have occurred but rarely, and even exceptionally.

Among the cases just mentioned were some persons who, after receiving the infection at Sydney, travelled to more or less remote towns and there fell ill, from none of whom was there any extension of the disease. Particulars of these cases are given in the table below:—

TABLE XI.—Showing the number of persons who left Sydney and were attacked at distant places within five days thereafter.

No. of Case.	Residence in Sydney.	Left Sydney.	Arrived at.	On.	Distance from Sydney.	Was attacked.	No. of Contacts.

* Reported from these ports, where the vessels were held in Quarantine.

But it will already have been perceived that several other cases, which are precisely similar to those in Table XI, except in the comparative shortness of the distance to which they travelled from the centre, occurred within the metropolitan district (see Diagram A).

These particulars, which have been cited as evidence that the disease never within our experience was set going by the arrival at uninfected places of persons who fell ill shortly after, introduce the second set of witnesses which consists of those who lived for a time in contact with others who had the disease. Attention is here drawn to the statement already made that although inoculation was offered to contacts it was seldom accepted by them; to which it may now be added, that the total persons among the contacts (total 1,832) who were inoculated, either before being sent to isolation or on arrival there, was so small (180) that they may be left out of account in this connection. Further, it has already appeared from Table VII, that isolation followed very speedily on notification, and it may now be asked whether the contacts had remained in communication with the primary patient sufficiently long to contract the disease from him, if so it might be contracted. But the duration of exposure to the infection was the interval which elapsed not between notification

notification and removal, but between attack and notification; and what this was is shown for each of the 289 cases in the following table:—

TABLE XII.—Showing the day of illness on which 289 patients and households were removed to isolation. Also the number of secondary cases which occurred after isolation in four households.

Day of Illness.	No. of Cases.	No. of Con'tacts.	No. of Cases among Con'tacts attacked in Isolation.

Uncertain date	1	21
	282	1,752	7

This table may be read in the following way:—458 persons were exposed to risk of infection from 77 cases during the first two to three days of illness, and one was attacked after separation from them and from the houses at which they lay ill; or, 240 persons were exposed to 31 patients during the first five to six days of illness, and none of them fell ill, &c., &c.

Plague as seen at Sydney during the outbreak under notice was not “catching.”

Under certain circumstances, however, plague can be communicated from the sick to the healthy; and although Table XII shows only 7 secondary cases (because seven only occurred after separation from the primary patient and from the infected premises), the fact is that 10 households altogether yielded 13 secondary cases. The circumstances under which plague is known to be communicable from the sick consist either in the form assumed by the disease, or in inoculation of diseased products of the sick body. Thus, primary plague pneumonia is very easily communicated to others (but compare the statement contained in Dr. Lorans' report on the epidemic in Mauritius, p. 17), while several of the secretions, excretions, and tissues of the diseased body carry the bacillus which is the cause of the disease. Inoculation of these products can be effected in two ways: a wound may have been made first, and the diseased matter may have been subsequently brought into contact with it; or the wound may have been made with an instrument already carrying infectious matter. This latter mode is scarcely likely to be witnessed except in the case of post-mortem examinations of the bodies of persons who have died of plague; but probably it does happen, and much more frequently than is generally supposed, when a suctorial insect first punctures the skin of a person suffering from plague, and soon afterwards punctures the skin of a healthy person. But this way can be effectual only when the blood of the plague-patient carries bacilli into the circulatory vessels of the skin; and this it does only when the patient has either suffered from the septicæmic (or blood-poisoning) form of the disease from the beginning, or else is about to die and is within 24 hours of death. The septicæmic form is seen in a minority of cases in man (in 17 out of 303 at Sydney); on the other hand, it is the commonest form of the disease in rats. It is therefore necessary to ascertain if possible, exactly how the secondary cases in the 10 households acquired their disease, before concluding that they did not get it from the primary patient.

Nine of these households yielded two cases each, one of them yielded five cases. But the secondary cases occurred under very different circumstances, according to which the 10 households will be divided into three classes: (a) four in which the secondary cases occurred after separation from the primary patient and the house in which he had lain ill; (b) three in which the secondary cases occurred before removal to isolation; and (c) three in which the secondary cases occurred after return of the family to the house after the latter had been cleansed and disinfected, and before release of the primary patient in two of them. The following are the requisite and available details concerning the first group:—

Case 7, m., *æt.* 2; attacked March 8th; transferred to Sydney Hospital the same day; died early on the 10th. The family of two adults and five children was removed to isolation on the 10th. On March 11th, f., *æt.* 9, and m., *æt.* 5, were attacked; on the 13th, m., *æt.* 7, and during the night of the 13th to 14th, m., *æt.* 45; form, bubonic in all. All were indigenous.

Case 15, m., *æt.* 20; attacked March 11th; notified and removed to isolation, together with 18 on the 13th. Case 18, m., *æt.* 18, was attacked March 14th. These patients were brothers who lived together; they also worked at the same warehouse; form, bubonic in both.

Case 159, f., *æt.* 24; attacked April 23rd; died May 1st before removal. Case 177, f., *æt.* 4; attacked April 29th; form, bubonic in both. The house stood on the area indicated by a cluster of dots west of the five dots representing Case 7, and the cases were indigenous to it.

Case 161, m., *æt.* 15, was attacked April 28th; removed to isolation, together with 170, May 1st. Case 170, f., *æt.* 11, was attacked May 2nd; form, both bubonic. These two patients were brother and sister; they lived on the area last-mentioned above, and the cases were indigenous to it.

Case 7 could not have infected the other four, because the patient was taken to a public hospital as soon as he was attacked and left there; and notwithstanding the plague of fleas in the cottage (see p. 25), the latter could not have derived from him any infection they may have carried, because his case was bubonic, and because he was not near death at the time he was removed from their reach. Case 15 had all those opportunities of infecting 18, which their relationship and occupation of the same dwelling imply, and the interval between the attacks was just sufficiently long for communication to have taken place, but 15 was a bubonic case, and he recovered; on the other hand, both of these patients had been occupied immediately before and down to the attack of 15 in collecting dead rats, and in destroying live ones at the warehouse at which both were employed, and which had suddenly become overrun. 177 having been closely exposed to 159 during six days of the latter's illness, and having been attacked only a little more than 24 hours before 159's death, it is possible, and even likely, that the infection was communicated from 159 to 177. 161 had opportunity of infecting 170, and in this instance no source of infection was actually discovered; but the house they occupied stood on the Redfern secondary focus, and in accordance with the views already expressed hardly requires special explanation. While the details, then, do not positively exclude communication of the infection from the primary to the secondary cases, they do not conclusively point to it either; the first two instances, indeed, strongly indicate that the infection was received from a source common to primary and secondary cases alike.

If this interpretation be correct, then among so large a total number of households it is probable that there would be some in which the primary and secondary cases were either simultaneously attacked, or were attacked successively, but at a very short interval. There were three such occurrences, of which the requisite particulars are given below.

Case 84, m., *æt.* 3; attacked April 5th; died before removal April 7th. Case 85, f., *æt.* 30; attacked April 5th; form, bubonic in both. Mother and child; lived on the original focus.

Case 101, f., *æt.* 42; attacked April 8th; removed April 12th. Case 102, f., *æt.* 32; attacked April 7th; removed April 12th; form, bubonic in both.

Case 272, f., *æt.* 13; attacked June 8th. Case 273, m., *æt.* 41; attacked June 6th; form, bubonic in both. Father and daughter; both were removed June 13th. The house is represented by two contiguous blue spots on the Botany-road.

The first pair were simultaneously attacked, the second within twenty-four hours of each other; in neither could the infection have been communicated. There must have been a common source from which both took it. In fact, 84 and 85 lived at a public-house on the infected area, close to the waters of Darling Harbour; while 101 and 102 were fellow-servants at an hotel overrun with rats, of which many had died shortly before the dates mentioned. In the third pair communication was hardly possible; it cannot have been effected by inoculation (see p. 33) from 273, whose case was bubonic and ambulant; and if not so (but still communicated in some other way), attack of 272 could scarcely have followed within,

or

or just beyond, forty-eight hours of the attack of 273. And on the other hand, 273 was a cow-keeper, who had a large stock of fodder, in which a great number of dead rats was found by the disinfecting corps when they turned it over.

A still further test can be applied to the correctness of the interpretation put upon the facts recorded above. If, in those instances, primary and secondary cases alike owed their illness to a common source of infection, which consisted neither in infected human beings nor in infected goods, it must have inhaled in some way in the premises; and, consequently, there should be instances in which the disease occurred among men who frequented premises on which no plague patient had ever lain ill, nor even had ever been while suffering. In the following Table several such instances are mentioned; the premises are places of business which were not places of residence, and which were frequented by the patients during the daytime only:—

TABLE XIII.—Showing places of business at which more than one case occurred among the workmen, and distinguishing those workmen who lived on uninfected areas.

Only 17 such places yielded multiple cases, but to a total number of 43. 10 yielded 2, 5 yielded 3, and 2 yielded 4 cases each. As will be seen from the last column of the Table, the workmen who were attacked sometimes had their homes on areas regarded as infected in accordance with the method of judgment already described; they must be excepted, therefore, as owning (in the present relation) a doubtful place of infection. But at 12 of these premises, 3 patients in a total of 3, 2 in 3,

2 in 3; 2 in 4, and 2 in 4; 2 in 2, 1 in 2, 1 in 2; 1 in 2, and 1 in 2; 1 in 3; and 1 in 3, lived on areas to which no suspicion of infectivity ever attached. It seems by far the most probable that these cases were infected on the premises at which they worked during the day; and that being so, it is on the whole likely that the remainder were infected there also, though on this it is not necessary to lay stress. The only objection which can be raised to these examples when they are relied upon to show that infection was present on premises quite apart from man is this—they all stood on the area of severe infection defined above (see par. 3, p. 27); so that these workmen ran some daily risk in crossing it, and perhaps some more definite and greater risk during the dinner hour. But, as to the former, the whole outbreak negatives liability to contract the infection by merely passing along the streets, &c.; while as to the second, it is evident that if the infection had not habitually spread on erratic courses (as judged by occurrence of cases on individual premises) an infinitely larger number of such premises should have yielded cases than actually did so, for the 17 stood precisely on that part of the city which is given up to such establishments. Yet this argument must not be incautiously pressed; for these very cases show clearly that mere presence of the infection is not enough to ensure attack. Something further, and something not commonly existent, seems necessary to enable communication of the infection from the source to man; for when buildings, which daily receive from one hundred to several hundred workpeople are judged (on the evidence just mentioned) to be seats of infection, only an exceedingly small proportion of the latter are likely to contract the disease. This has already been pointed out in another connection (see p. 29); but, indeed, the experience of ordinary houses supports the same view, since the occurrence of single cases in them was the common rule.

Even yet the evidence which points to the conclusion that the infection was erratically diffused, and which can be drawn from this epidemic, is not quite complete. Usually disinfection of premises appeared to be thoroughly effective; as a rule no cases occurred on premises which had once been evacuated, disinfected, and cleansed and which were re-occupied after five days. But in the very small minority of 3 households out of 276 further cases did occur; and this is exactly what might be expected to happen if the infection did not (as it has hitherto been expressed) inhere in the house itself, but was present in a form which allowed of its withdrawal and return.

Case 50, f., *æt.* 15; attacked March 27th, removed March 30th, together with 186. The house and contents were disinfected, and the family resumed occupation April 6th. Case 50 was released April 21th, and returned home. Case 186, m., *æt.* 5, attacked May 3rd, removed May 5th. Form, bubonic in both. The house stood on the Redfern secondary focus, not far from case 7; 186 had not been away from the house and the street in which it stood since April 6th. There was no history of rats about the house.

Case 253, m., *æt.* 6; attacked May 23rd, removed May 30th, with 288; was released June 28th; the family returned June 5th. Case 288, f., *æt.* 5, attacked June 26th; form, bubonic in both; brother and sister; lived on the Manly focus.

Case 270, m., *æt.* 5, attacked June 4th, removed June 11th, released August 24th; the family returned June 16th. Case 296, f., *æt.* 12, attacked June 26th; form, bubonic in both; brother and sister; the house stood at Surry Hills, a neighbourhood infected by extension from the Redfern focus; the cases were indigenous to it. Case 270 had found a dead rat in the kitchen two or three days before attack, and the disinfecting corps discovered several others after raising the kitchen floor.

These three instances are not cited to show that the several houses did become reinfected from the outside after they had been cleansed and disinfected; for it is quite possible that the secondary cases acquired their infection at some neighbour's house to which they may have gone. They are mentioned merely as being consistent with the supposition that the source of infection was automatically transportable, and had reintroduced itself. It can be objected that if this were the true explanation such cases should have occurred much more frequently, whereas the fact is that the disease recurred on premises after they had been cleansed only 3 times in 276; but this is conjectural, and may be met by the reply that even when the infection certainly was present it by no means followed that it would be communicated to the inhabitants.

It appears then, from the foregoing considerations, that the infection attached to neighbourhoods; that it was encountered on premises, and usually in houses; that, as judged by the occurrence of cases in man, it fell erratically on the houses in any infected district; and that even when it was known to be present on premises
its

its communication to man was also erratic—or, at least, was effected much less commonly than might be expected in the case of this disease against which none of the population was protected. It is true that between March 12th (Case 14) and April 2nd (Case 67) 7,700 persons, and between May 11th (Case 215) and June 15th (Case 278) 2,700 more were inoculated, and that great efforts were made to restrict inoculation to those who lived on infected areas; but while this latter attempt largely failed, the total number of inoculations done in proportion to the number of persons living on or frequenting infected neighbourhoods, was far too small to account for the erratic incidence of the infection on the inhabitants or frequenters of infected premises; and, as a matter of fact, it was ascertained either not to have been received by any of the persons now referred to, or else to have been received by one here and there only. The observed behaviour of the infection, then, seems to require scrutiny with two points specially in view: the mode of its distribution in place, and the mode of its communication to man.

As to the mode of its distribution in place, it has already been remarked more than once that the only situation in which it was found (out of connection with the bodies of the sick) was in the bodies of sick and of dead rats. But that is hardly a fair statement which leaves the supposition open that it may have been present in a dozen other situations as well, but was merely not detected in them. The fact has been shown more or less fully (as regards man) that it did not exist effectively in soil, water, food, or fomites. Hence the known presence of the infection in rats points to these animals as the source from which man derived the disease. How the rats became infected is, doubtless, a question in relation to which possible infectivity of soil is of importance. But if it should be contended that the local rats received their infection thence, it must be shown first how into this virgin soil the infection came to be implanted; secondly, that having been implanted it could rest and even grow there. Now, if no case of plague in man preceded our Case 1, and if the soil became infected (if it were at all infected) otherwise than through ingress of sick rats, apparently this must have happened from communication of infection deposited on merchandise and thence transferred to the soil. Yet, while it has never been suggested that an intermediate stage of growth in soil is necessary, and while all pathological experience shows that it certainly is unnecessary (whether or not it be possible), it has been pointed out above that introduction of merchandise from infected into clean countries has never satisfactorily been shown to have communicated the infection to man, who is as susceptible to it as are rats. So it must be supposed that the infection in merchandise which did not communicate itself to rats on board ship, nor to man after it was landed, did communicate itself to rats on shore after an unnecessary, and in all probability hindering residence in soil. The merely practical consideration how the infection could probably be transferred from merchandise to soil under the usual conditions of packing, handling, and warehousing, need only be mentioned. It is manifestly most likely that the infection, if communicated to the soil at all, was so communicated by sick rats landed from a ship; but then, why should the soil-stage be imagined? Plague spreads from rat to rat in part, at all events, and with certainty, by the healthy feeding on the bodies of the dead. This is the way in which Loeffler's mouse-typhoid, and the disease of rats caused by Danysz' organism are spread, and in those cases is, perhaps, the only way—both being diseases caused by organisms which belong to the same group as *B. Pestis*. In short, the introduction of sick rats would seem to be an adequate and highly probable cause of the direct infection of local rats, while suggestion of the soil as a link seems unnecessary, and besides almost entirely lacks the requisite basis in observed facts.

The question whether Case 1 were the first case which occurred has little importance in relation to the epidemic (because this was not due either to direct or mediate infection from the sick), but may have some in relation to the epizootic. Exceptionally in our experience, though certainly if suitable measures are employed, the infection is communicable from man to man by mediate means, and therefore may be communicated from man to rat: the following is the only instance which we met with, and it concerns man alone:

Case 262, m., *æt.* 22, engaged March 8th as scavenger at the Maritime Quarantine Station.

May 30th, at 6:30 p.m., went to lie down as usual before beginning his night duty, and afterwards had shivering, nausea, and headache; slept.

May 31st.—Awoke feeling well, but had slight diarrhœa; continued well all day; in the evening headache came on again; it lasted an hour only. Did his work during the night,

June

June 1st.—Was thirsty all day ; went to his work at night.

June 2nd.—Was obliged to give up work at 4:30 a.m. Reported himself sick at 11:30 a.m. ; was admitted to hospital at 2 p.m. On examination, temperature 98°·8, face flushed, eyes suffused, but not markedly ; pulse slightly quickened, and of normal tension. A swollen gland the size of a large almond, and very tender, in right axilla ; less enlargement of three or four cervical glands behind the sterno-cleido-mastoid muscle, which were not tender. 40/c.c. Yersin-Roux serum subcutaneously.

June 28.—Returned to duty.

The progress of the case calls for no special remark. The patient began to recover soon after admission. Liquid was withdrawn from the axillary gland (probably on June 5th) and microscopically examined on June 7th, with a negative result as regards *B. Pestis*, but streptococci were present. None of the enlarged glands suppurred. In the opinion of three experienced medical men who examined the case on or shortly after admission, there was no doubt the illness was plague.

On May 22nd the patient had received at the gate of the hospital enclosure the confined bodies of two plague patients. These bodies had, as usual, been wrapped in a sheet wet with sublimate solution, and placed in a coffin having water-tight joints, by wardsmen ; the coffins were then screwed down, wrapped in a cloth wet with sublimate solution, and handed to the patient, who helped the sexton to wheel them to the burying-ground. His other duties consisted in scavenging refuse and night-soil from all parts of the Station, except the hospital enclosure, but including the convalescent quarters ; this he did during the night, and he never came into personal contact with the convalescent patients. He had on his right hand six grazes which were scabbed over, and which seemed not to have healed as quickly as such slight injuries should ; he had also several horizontal cracks in the skin of the right fore-finger.

On the whole, the above account cannot be accepted as proof of mediate infection (inoculation of infectious material, perhaps from dressings discarded by convalescents) ; but the case was diagnosed as plague by gentlemen who at that date had had very considerable experience, and apparently inoculation could have come about only in some such way.

At this date, then—namely, more than nine months after the recognition of Case 1—it is still the general opinion that no other case in man preceded it. A comparison of the rates of death under causes in corresponding months of previous years disclosed rather smaller rates than usual. A stronger argument (because there is no reason whatever for suspecting that unobserved plague caused such fatality as would impress the returns with unusual features) can be deduced from the general proficiency and public spirit of the medical profession of Sydney ; from the population being either of immediate European descent, or at the older ages actually of European birth in considerable proportion, and almost entirely British ; from the ease with which medical advice can be obtained, and the universal habit of seeking it on occasion ; from the number of friendly or provident societies ; from the number, size, and accessibility of the public hospitals, as well as of other institutions where gratuitous medical advice is either available or whence applicants are directed to other places where it is furnished. Under these circumstances the presence of plague in New Caledonia became known, and placed the medical profession on its guard a month before Case 1 occurred (and effectually, as the instant report of Case 1 itself shows) ; while after the published identification of that case a whole month elapsed before the occurrence of Case 2, though in the interval suspected cases were referred for diagnosis. It is, nevertheless, possible, of course, that one or more unrecognised cases did occur ; but to assume this seems as unnecessary as does the assumption that the epizootic sprang, not directly from infected rats, but in a roundabout way from some unidentified source through the soil. At the same time, the possibility that the epizootic arose from communication of the infection to rats (perhaps in sewers) through the infected excreta of an unknown case in man cannot be excluded, for no demonstration is or can be possible. It is perfectly clear, however, that Case 1 followed, and did not precede, the epizootic ; while reason has been shown for asserting that Case 1 actually did receive his infection from a rat. That reason will appear the stronger to those who are well acquainted with the investigations of Dr. P. L. G. Simond, *Médecin Principal des Colonies Françaises*, and who have observed that they explain and bring into accord many apparently dissociated or even opposed facts recorded of plague.

Admitting, then, that the source of infection for the local rats cannot be demonstrated to have been infected foreign rats, but asserting on ætiological and general grounds that this origin is almost infinitely probable, it must be enquired whether the observed distribution of plague rats in Sydney was sufficiently wide to account for the epidemic. It has been subsumed throughout the foregoing pages that man was usually infected by rats ; whether it actually were so or not, was it possible ?

On diagram B certain dates are inserted in red ink, some of which are underlined. They indicate some of the neighbourhoods in which diseased or dead rats were discovered. The under-score means that plague was demonstrated in the rats indicated by microscopical, cultural, and inoculation tests conducted in the laboratories. Where there is no under-score the note means that dead rats in numbers had been seen by some member of the staff, under circumstances which denoted death by disease, not by poison; very often (in 70 infected houses) the report was received from the disinfecting corps by which the bodies had been (and often had first been) discovered. It was rather commonly the case that the members of infected households had nothing to report concerning presence of rats alive or dead on the premises where these animals and their bodies were found on proper search. In one case (Queen-street, Woollahra) the infected animal was a cat; it was forwarded by Dr. W. H. Quaife, and was the only one of 5 received at the laboratory which had plague. No case of illness occurred in the house whence it came, which stood, however, on an infected area. Of 6 house-mice received, 2 had plague. The total number of rats examined at the laboratories was 167, of which 50 were alive; 10 of these were sick, and 4 of the sick rats had plague; of the 117 dead rats, many of which were putrid, 19 were shown to have had plague (see Appendix A, p. 53). The infected animals came from widely-separated localities within the city of Sydney where 41·5 per cent. of the total cases occurred; and two of them from the distant suburbs, Manly and Woollahra. These 23 are all the instances in which plague was rigidly demonstrated in animals; but very many rats were examined which there was no reason to doubt had also died of plague.

The above is the recorded evidence that rats over a considerable area of Sydney, which was the area on which cases of plague in man occurred, suffered from an epizootic; and that this epizootic (which began before plague in man occurred, and ceased, as far as can be learnt, about the same time as the epidemic ceased) was plague. In practice, however, many reports of dead rats, and of the sudden invasion of premises by rats where none had been before, which were commonly made during continuance of the epidemic were taken as supplementing the evidence already given; and it would be erroneous to suppose that the recorded and rigidly proved instances were the only ones which were credible. This was far from being the case; and if it be desirable that many more well-established observations should have been recorded—as, undoubtedly, it is—it is also the case that our resources were not adequate to furnish a separate staff to watch over the epidemiological features of this outbreak. What was possible was done.

In short, that the infection was disseminated by rats appears tolerably certain, and it may not be too much to surmise that plague is primarily a disease of the rat which is communicable to some other animals, among which man happens to be included. The real difficulty is encountered when an explanation of the way in which it was communicated from rats to man is sought. It must be remembered that the prevalent opinion now is that, generally speaking, man contracts plague by inoculation. A rat might well disseminate the infection on the air by sneezing, since it is found on the nasal mucous membrane of rats; but this, perhaps, would produce the primary pneumonic form in man—not a common form in any epidemic, and, with a single doubtful exception, not seen during the Sydney epidemic. A rat might also disseminate it with its excreta; but, if this should suffice to bring it within striking distance of man sufficiently often to cause epidemic prevalence of a practically non-infectious disease (in the common bubonic and the less common septicæmic forms), it must operate usually by contamination of food or of articles other than food. As to food man rarely (if ever), as a matter of fact, gets the disease by ingestion. Many an article might be soiled with the infection without causing inoculation or, rather, few articles so soiled are capable of inflicting a wound, and still less often are likely to enter into the circumstances which would afford the necessary opportunity; but there is certainly one exception. If hay became the medium for deposited infection any person handling it would be very likely to receive the slight wound which alone is necessary to inoculation; but hay is just as likely to carry the rats themselves, dead or alive. After all, however, this accident could not occur often enough to be of importance in causation of an epidemic, and the opportunity is taken to mention it merely because it affords a possible explanation of Cases 4 and 272-3 as well, perhaps, as of some others of those which are classed in Table X as employed at produce stores. But case 273, p. 35, hints another and simpler interpretation.

The

The means of inoculation must be one commonly in operation in order to be an efficient cause of epidemics. Hence the observed preponderance of bubonic enlargement of the glands of the groin, which indicates entry of the infection at some part of the lower extremity, and which has been observed in the barefooted populations of the East, is often ascribed to the wounds which unprotected feet receive. It may even be surmised that the notion of spread of the infection mediately through the soil has received some unacknowledged support from this theory. But the facts do not at all warrant it. The preponderance of groin buboes at Sydney was as striking as in any other part of the world. Among the total 303 cases there were 17 which had no bubo; in the remaining 286 cases the bubo occupied the right inguino-femoral region in 99, the left in 101, and it was bilateral in 9; making altogether 209 in which the bubo occurred in the inguino-femoral region and no where else, or 73 per cent. of all those which showed buboes at all. Yet the inhabitants of Sydney, and those among them who were attacked, no more go barefoot than do the inhabitants of London. They live in a sub-tropical climate, but their habits in all matters of dress are still entirely those of the people of northern Europe.

Needless, however, to beat about the bush. Granting that plague in man is usually the result of inoculation, the manner in which this can be brought about on a sufficient scale to account for an epidemic would remain hidden but for the observations of Dr. P. L. G. Simond, already referred to. A sufficient account of the leading points in his teaching appears in Appendix A, p. 56, and need not be repeated here; but to appreciate the weight of his observations his original paper must of course be studied. He considers that plague is most often communicated to man by fleas which, after feeding on plague rats, become transferred to man whom they inoculate. Thus also, he thinks, is the disease sometimes conveyed from rat to rat and to other susceptible animals. The minute puncture usually leaves no mark, but in a small proportion of cases it produces a phlyctenule or a bleb. Such a lesion was observed in seven of our cases; excepting Case 1 it appeared as a small papule, surmounted with a minute vesicle; from two of these in two different cases smears were made; in one of the smears bacilli morphologically resembling *B. Pestis* were demonstrated. It is not to be supposed that all our cases were searched with this object in view; many were, and the six formed but a small proportion of the total examined, but a quite systematic and quite thorough search could not be carried out in all cases. Several fleas taken from infected rats were examined; in one a bacillus resembling *B. Pestis* was demonstrated, and it was identified by the result of inoculation into a guinea-pig.

Nine fleas taken from rats received at the laboratories were referred to the Government Entomologist (Mr. Walter. W. Froggatt) for classification. Mr. Froggatt reported upon them as follows:—

Slide No. 2 Dog-flea (*Pulex Serraticeps*, Germ). This is our common cat and dog flea, and has been described under the name *P. Canis* and *P. Felis*. These specimens do not exactly agree with my typical form (which was caught in the office), as the teeth-like spines on the lower edge of the head are absent, but this may be a variation in the sexes. The dog flea is the common house-flea in the United States, *P. Irritans* being a rare species with them, and seldom found. "Examination of many specimens of fleas sent to the Department in recent years shows that the species which commonly overruns houses during damp summers in our eastern cities at least, is not, as many have supposed, the human flea, but the common cosmopolitan flea of the dog and cat." (L. O. Howard, in Bulletin No. 4, division of Entomology, U.S. Department of Agriculture, 1896, p. 24).

Slide No. 3. This slide contains 3 specimens; one, the largest, is another specimen of *P. Serraticeps*; the 2 small ones are rat-fleas (*P. Fasciatus*, Bosc.)

Slide No. 4. Rat-flea (*P. Fasciatus*, Bosc.) Slide No. 5. Three specimens of the same.

P. Fasciatus was of the most usual brown colour. *P. Serraticeps* is said by Neumann not to bite man; but this is not in accord with general experience, and would seem from the reference furnished by Mr. Froggatt not to be the case in the United States. Whether *P. Fasciatus* will bite man is not known here; no experiments to test this point were tried during the epidemic. As Dr. Frank Tidswell has suggested, it is likely enough that varieties which will not, or do not, commonly infest houses and man, may yet bite once when they find themselves on the human body. *P. Serraticeps*, however, which certainly does bite man, was found on two of the small number of rats thus examined.

The teaching of the foregoing study of plague as it appeared at Sydney, seems to be as follows:—

1. The disease was not directly communicated from the sick to the well—in other words was not “catching.”

2. It was not communicated in any important degree, at all events, from the sick to the well by mediate channels (clothes, household goods, merchandise, excreta).

3. The infection attached to localities, and spread to others adjoining and continuous with that in which it was first manifested.

4. It also spread in a fashion which betokens the possibility of its being transported mechanically from an existent focus to a considerable distance (Moore Park garbage-tip and Manly), and there initiating an independent focus.

5. In the buildings on any infected locality cases occurred irregularly, and showed no special proneness to occur in adjoining houses.

6. When the occurrence of one case among the inhabitants of a building showed that the infection was present in it, secondary cases rarely followed. Irregularity of incidence on houses was accompanied with irregularity of incidence on the inmates.

7. An epizootic disease among rats preceded the first case which occurred in man.

8. This epizootic disease was plague.

9. The area over which the epizootic extended was practically co-extensive with that on which cases of plague in man were observed.

10. The epizootic died out as far as can be learned at the same time as the epidemic ceased.

11. The epidemic was caused by communication of the infection from rats to man.

VII.—PREVENTION.

It will appear ultimately that the best protection against epidemic plague lies in sufficient sanitary laws, persistently and faithfully executed by Local Authorities during absence of the disease, and that no other general scheme of defence is practicable.

Successful prevention of epidemic diseases depends entirely on knowledge of their nature, of their causes, and of the means by which the latter are diffused. On these points our experience has shed useful light, though many details remain to be worked out—some in the laboratory, some in the field; while others still require, and now urgently demand, assistance from those who profess correlated branches of science. In such circumstances practical management of a present epidemic cannot proceed unless certain assumptions are made; and it is worth while to point out here that rational assumptions which coördinate and explain accurately observed facts have nothing in common with guesses. Accordingly, the following remarks are made in view of the facts and inferences recorded above, and with reference to epidemic plague in the bubonic form.

The prevention of epidemic plague might be discussed under the three heads importation, local diffusion, and exportation. Under importation fall international notification, arrest of infected persons and things, and destruction of rats afloat. Under local diffusion fall care of the sick, care of contacts, protective inoculation, exclusion of rats from dwellings and the immediate neighbourhood of man, destruction of rats, destruction of human parasites, cleansing and disinfection. Under exportation fall the steps which can practically be taken with hope of preventing diffusion of the disease from infected spots (*a*) to clean places within the same country, and (*b*) to clean places beyond its borders. It will not be convenient to take these subjects exactly in the above order. It will be best to inquire first who may properly be designated “contacts,” and how these persons should be treated.

The term is much in use; it has a certain convenience, but unfortunately no defined meaning. Probably it was devised to indicate those who had recently been in close association with the sick; and were it so employed in connection with smallpox, for instance (which is maintained and diffused exclusively by communication of the infection from the sick to the healthy), it would be not merely useful, but sufficiently exact. But in the present connection it is inaccurate. As we have now learned, bubonic plague and smallpox do not become epidemic by the same means; our epidemic was not caused or maintained by communication of the infection from the sick to healthy human beings, either mediately or directly. As long, then, as the word "contact" is used with reference to preventive measures, of which one is obviously indicated by it, it does not necessarily apply to those who have been recently associated with persons who are actually suffering from plague. On the other hand, our experience has shown that infectiveness attaches to localities; so that "contact" might properly be used to designate a person who had lived on, or who had been exposed to the influence of, an infective locality; and he would deserve this distinctive epithet for five days after he had been completely separated from that place, because the infection (if it has been taken) reveals itself within that period in occurrence of the disease. But our experience has further taught that local infectivity is not due to any inherent peculiarity (attaching, for example, to the soil), but merely to the casual presence of plague-rats. So a "contact" is one who has been more or less closely associated with plague-rats.

The other persons living in any house which contains a plague-stricken human being, then, may or may not be "contacts." The presence of the patient is evidence merely that he has at some time been a "contact" himself within the meaning of the definition, but it predicates nothing of the rest of the household. Effective exposure to the infection (inoculation) must necessarily be little more than momentary; so that no person who moved about up to the time of his attack can be assumed to have received the infection either at that place where he lives and is found or at those other places which he frequented. In point of fact it has been shown that the place of infection was sometimes not the dwelling, but the workshop; and, on the other hand, that it was sometimes not the workshop, but precisely the place of residence. In short, the first hint that infection is somewhere to be encountered usually consists in occurrence of the disease; and this only furnishes occasion for inquiring where it was encountered. The search will naturally begin with the patient's immediate surroundings, but often these furnish no clue; it must be continued to distant places frequented by him, and there the source may be found.

It is plain, therefore, that no general rule according to which all those who are found in contact with a plague patient shall be dealt with can be laid down, and that the attempt to enforce such a rule will not only lead to injustice in a majority of the cases submitted to it, but must unnecessarily embarrass the central health authority; more than that, it would be found practically impossible to adhere to it in the case of many business establishments, such as banks, public Departments, and the like. Each case must be treated according to the known facts of the place or places concerned, and the general features of the epidemic. What these are is always much better known to the central health authority than to any other party, for it has (and, if it be properly organised, it alone can have) possession of the information on which a prudent judgment can be based; it is, additionally, the most competent interpreter of the facts within its knowledge. The central health authority will be most wisely left absolutely free to take such measures to control the epidemic as to it seem best; much more, therefore, should it be left absolutely free to deal as it thinks most prudent with individual premises and the persons associated with the patient. It is also obviously necessary that its decisions be accepted as final and unquestionable. Every other course must result in increase of public agitation, in unnecessary expenditure, and in great risk of prolonging the visitation.

Secondly, it is convenient to inquire how the sick themselves should be dealt with. It has now been said many times that the epidemic was not maintained either by direct or mediate communication of the infection from man, and it has doubtless seemed—and very naturally seemed—that no better reason for leaving the sick where they are found could be given. But true though the statement be, this inference would be false. Plague is a disease common to man and to rats; whether it be primarily a disease of rats or not is of little immediate importance.

It

It can be communicated from rats to men, and from men to rats by suitable means—the word “suitable” in this connection meaning “by inoculation,” though as regards rats only it includes also feeding on plague-rats. Those are the facts of such communication experimentally ascertained; it is probable also, but not ascertained, that the disease can be communicated from man to rat in other ways—namely, through the infective matters cast off from the diseased human body. Indian records are not devoid of instances which suggest that this may occasionally have been the true sequence of events in a few localities; and therefore, although they scarcely amount to proof, and although (it is believed) communication of the disease to rats by such means has not been demonstrated to be an experimental possibility, yet there is ample reason for collecting everything which proceeds from the infected human body and for destroying it, or at least for rendering it non-infectious by one or other of those means which are known to be efficacious. Now, a central health authority, charged with the heavy responsibilities which attach to management of an epidemic of plague, would be imprudent which left the precautions just mentioned to be taken by the members of individual households, whatever their resources might be. All of the sick should be removed at the earliest possible moment to an isolation hospital strictly managed under immediate direction of the central health authority; but cases occur in which no isolation hospital exists within reach, and some others in which ample means and the isolated situation of the houses in which they occur render it not absolutely necessary to remove the patient. In all such cases the central health authority may leave him at home, but only on condition that he is nursed by nurses in its employment and under direction (in all matters relating to prevention of spread of the infection) of a member of its own medical staff. On the whole, though extreme care is in every case necessary, greater care, if possible, would appear to be requisite with houses connected to a sewerage system than with others.

Thus, for the present at all events, every actual case of plague must be regarded as a danger to the whole community; and therefore, in connection with the question whether the sick must be isolated, attention should be drawn to the fact that plague is communicable from man to man both by direct and mediate channels, although our epidemic was not maintained by such communication. Primary plague pneumonia is directly communicable to man; and further, whatever the form of plague may be in which a case of the disease begins, secondary plague pneumonia is liable to supervene. The patient's expectorations then carry the bacillus, and therefore are probably dangerous. Additionally, the excreta, both solid and liquid, sometimes (with unascertained frequency) also carry the bacillus; this happens at all events when the minute hæmorrhages into the submucous coats escape into hollow organs, and possibly under other circumstances; while the discharge from bubonic abscesses always carries the bacillus in profusion at first, and on very good authority is said to continue to carry it in viable (though not necessarily in virulent) form for many days. Lastly, in almost all septicæmic cases, and in many others of whatever form when death impends, bacilli are easily found in profusion in the general blood-stream, even in the capillary vessels of the skin, and from the latter the infection can be abstracted by suctorial insects (fleas and bugs), and may be inoculated by them into the healthy, or into rats. So that for the sake of preventing as much as possible occasional communication of the disease from the sick to others associated with them, and largely for the sake of diminishing the risk of infection of rats from cases in human beings, and of rendering control of those risks more easy and certain, all plague-cases in man must be isolated under immediate direction of the central health authority; and in the vast majority of cases it will be not only expedient, but necessary, to effect this by transfer to hospital. In view of the rare exceptions which will be met with, the central health authority must be left absolutely free to decide what shall be done in each case on its merits, and, again, its decisions must be accepted as final, and must be unquestionable. The fears and fancies which preoccupy the mind of the general public on such occasions, and the dicta of those among them who rely for guidance on common sense, cause confusion, sap confidence, favour panic, and pave the way for disaster.

International notification of plague has its uses, although the information thus communicated comes too late to set in motion those preventive measures which would prevent importation—if they ever could be thoroughly effectual. It is not customary to notify the presence of plague unless there is good reason to consider it epidemic

epidemic. But, which is of more importance, the notification regards exclusively manifestation of the disease in man. This, we have learned, is a matter of secondary importance. It has been preceded by the epizootic; and the real danger to the importing country lies with plague-rats, not with plague-stricken men. Evidently notification, as at present understood and practised, cannot much help in preventing importation of plague.

It is hardly possible to conceive how a measure taken to prevent the risk of importing plague-rats could be made dependent on notification of disease among rats at the port of departure; besides which the defences of that country which relies on other countries for aid in raising them are likely to be inefficient. Were the fullest information always available in time, which it never could be, the object would be to kill all the rats—not a majority, but all of them must be destroyed—on every incoming vessel; and this could be done in practice only by landing cargo on a small island, overhauling it, treating the hull, and reloading the vessel before allowing it to approach the quays. But there can be little doubt that this is impracticable. It is possible to kill many rats on laden vessels; though at the best it must always remain doubtful whether all have been killed, and a difficulty arises in connection with damage to cargo. Experience has led us to rely on sulphur fumes.

Rats will not venture where there is the least smell of sulphur dioxide, and they are easily killed by respiring air which contains a moderate proportion of it. The practical use which has been made of these facts, is the following:—Small quantities of sulphur are burned on upper decks, &c., being only enough to taint the air rather strongly; this not merely causes rats to retire to the lower parts, but seems sufficient to prevent them from returning even when the next stage of the process is in full swing. This consists in closing holds, bunkers, &c., &c., by the usual means, and in then burning sulphur in the estimated proportion of about 2 lb. to every 1,000 cubic feet of unoccupied space. The exposure should last not less than six hours. This plan is effectual, though there is reason to think it is not always completely so. It is easily managed, and the only objection to it is damage to some kinds of cargo by taint of sulphurous acid. It has already been mentioned that as many as 287 dead rats were gathered from a small steamer after fumigating it in the above-mentioned manner; and at Newcastle where vessels generally arrive in ballast to load coal, or else carrying a moderate load (say up to 1,000 tons) of general cargo for the most part cased, the number thus destroyed has varied from a few to a "tubful". As a matter of fact, no serious complaint of damage to cargo has been made; but vessels from New Caledonia ceased to bring coffee during continuance of these precautions which, it was thought, would be unmerchantable after fumigation with sulphur. The alternatives to sulphur appear to be formaldehyde and carbon dioxide, both of which were suggested at an early date. As to the former, its practical use requires more careful management than available fumigators can be relied upon for; errors and omissions can seldom be made good by a second operation, for although shipowners submit willingly enough to a detention of known duration, they expect the time to be utilised in a businesslike way. Formaldehyde is, moreover, expensive. Carbon dioxide appears a more promising agent, but it has serious drawbacks. In the first place it does not favour collection of living rats in holds and bilges where alone this gas would in all probability collect in sufficient proportions to kill, and if perceived by the rats it would be easily evaded by them. As to disengaging it in the required quantity and with the requisite promptitude, this could only be effected with cylinders of the compressed gas; but those who have used them are aware of the practical difficulties which are encountered. The gas might be disengaged from chalk and muriatic acid; but it happens that the Department has had some practical experience of this method in connection with the killing of stray dogs by the police, and the result of the experiments conducted by the Government Analyst (Mr. W. M. Hamlet, F.I.C., F.C.S.) precluded all thought of attempting to employ this plan on shipboard. On the whole, our experience has shown us that sulphur dioxide is the only agent practically useful for the present purpose, notwithstanding some drawbacks.

But we have learned more than this, which leaves the cargo difficulty (in practice not important with us) untouched. It would be much better not to have rats on board ship, than to attempt to kill them off on laden vessels; and there is not much difficulty in keeping them away. The method is to fumigate the vessels with sulphur while empty, or nearly empty, at the beginning and end of voyages. According to the reports furnished by the Superintendent of Fumigation (Captain G. Tait) it appears that if vessels which engage in coasting voyages lasting about three weeks, or from that to a month, are fumigated at the port of departure before loading, and at the ultimate port touched on the voyage (when they usually have some cargo on board), few and often no rats are discovered after the next fumigation done on return to the port of departure before commencing a fresh voyage. This statement applies to steam-vessels of various tonnages up to about 4,000. The method has been practically carried out under intercolonial agreement, which requires that such vessels shall produce a certificate of fumigation while empty at the port of departure, and at the ultimate port of the voyage, without which they are not allowed to communicate with the shore except after a prohibitory detention at quarantine.

In conjunction with this precaution, which might well be adopted under an international agreement, others, designed to prevent intercommunication between shore and ship rats while lying at quays, should be adopted. These consist essentially
in

in the use of shields on springs and lawwers, in fending off vessels from quays, or in hauling off at nightfall, in closing openings in the sides, and in hauling up gangways at night unless in actual use, in illuminating the quay and the ship's side, and in providing watchmen.

Lastly, quays must be properly constructed—that is to say, they must terminate in a solid sea-wall of masonry or concrete at a point below low-water mark, so that wharves built out always have water beneath them. The wharves at Darling Harbour, which were the starting-point of the epidemic, are very old, and everything which wharves should not be. They consist of staging carried out over the foreshores, the quay wall being sometimes barely within reach of high water, and constructed either of seriously defective rubblework, or else of sheet-piling in bad order and filled in behind with large stones. Both afford ample harbour for rats, which were found to exist there in great numbers, while the mudbanks which are exposed at low tide and the piles which support the wharf-deckings collected and retained the dead animals and heaps of organic wastes, which insufficient scavenging and defective supervision caused to be thrown into the water. These faults will now be remedied in course of time under the Darling Harbour Resumption Act, and the Harbour Trust established by it, and this part of Darling Harbour will be reconstructed to resemble other parts which are already built in the manner recommended above.

While very much can be done to impede entry of plague-rats by the means described, which, therefore, should be adopted and steadily used, it is evidently unlikely that they can prevent such entry, or, in other words, be at all times completely effectual. Failure in connection with a single vessel, even though partial only, the entry of a single plague-rat to the rat community ashore is all that is necessary to originate an epizootic of plague: and this is likely to occur, first, because all the described precautions can hardly be continuously taken; secondly, because information of the occasion for taking them is usually received after the risk has been run; and, thirdly, because of the unavoidable uncertainty of their effect when they have been taken. We pass on, then, to consider what should be done to control a present epidemic, and what should be done ashore to render recurrence of it as difficult as possible.

During an epidemic the only proceeding of much value is destruction of rats and of their nests, burrows, and habitual haunts, and those others which are calculated to prevent access of surviving rats to proximity with human beings—in other words, to expel them from occupied premises, and to keep them outside. This measure was given a first place in the precautions recommended to householders in the pamphlet issued from the Department on March 1st (Appendix H, p. 75), and, on the whole, subsequent experience may be said to have established its usefulness. It is true, no doubt, that several people were infected at wharves, and four others in the course of scavenging infected areas (though whether within or outside dwellings does not appear) but the great majority were infected on premises. On premises where indigenous cases had occurred, moreover, the presence of freshly-deceased rats was discovered quite often enough to support the general proposition that the danger of contracting plague stood in relation to the presence of rats in dwellings or enclosed premises. A general slaughter of rats would answer the purpose, if it could be carried out quickly, and with tolerable completeness; but that is practically impossible.

Slaughter of rats was attempted by us, and doubtless should always be attempted. The following steps were taken:—The City Council, within whose district the epidemic commenced and fell most heavily, early instituted a special rat-catching staff, and ultimately reported that it had destroyed 38,600; the business was then taken over by the Government. A considerable staff of rat-catchers was employed, who worked according to indications furnished by the Department, or else from observation; a capitation fee of 2d., subsequently raised as already described to 6d., was paid for the body of every rat brought in by the public; depôts at which rats were received, paid for and burned, were established at various points in the suburbs; municipal councils were gratuitously supplied with rat-poison for distribution among their ratepayers, and with a man to distribute it, and to exhort the people to lay it; the Board of Water Supply and Sewerage, fumigated the sewers with sulphur in a systematic way; officers in charge of public buildings were instructed to take similar measures; and many private firms, including owners of wharves and steamships, as well as private householders, dealt with their own property. There was delay in commencing the destruction of rats on a scale likely to be at all useful. It was only seriously attempted after the public attention had been aroused by a last appeal made by the Department on April 9th, when the 96th case had already occurred. It is difficult to estimate the effect on the rat population which was produced. The total recorded number of rats killed by the Government staff between April 18th and

October

October 31st was, in the city, 56,136; in the suburbs, 13,572; total, 69,708. To this must be added the number claimed to have been killed by the local authority for the city, namely, 38,600, making a recorded grand total of 108,308. Private persons probably killed a considerable additional number; and many were killed by the scavenging staff in the course of its operations.

On April 3rd the Water and Sewerage Board commenced fumigating the sewers. Within the city of Sydney, though many intercepting sewers have been constructed by the Board which are in all respects in good order, the greater part of the district is still served by very old and ill-constructed sewers; and the house-connections are, in the case of about 20–21,000 houses out of 22,000, improper, imperfect, and dangerous. Outside the city all sewers have been constructed by the Board; these in themselves and in their connections are what they should be. In the first place, then, the general statement may be made that probably very few rats existed in the new sewers, but great numbers in the old ones. While the new sewers afford them no lodgement, the outfalls discharge either into deep water or on well-tended filtration areas or sewage farms; while the old city sewers are too often accessible from harbour foreshores. The method adopted was either to blow the fumes of sulphur into them, or to burn sulphur in trays suspended beneath manholes; afterwards they were flushed with water to wash down the dead rats. The result, gathered from the reports regularly issued by the Board, cannot be expressed in numbers. From the new sewers very few carcasses were got; from the old sewers large numbers were washed down (at all events at commencement of these operations), and it is believed that many must have been killed which never were seen. As a matter of fact only between 300 and 400 were actually gathered by the workmen employed, but, as just mentioned, this does not bear any definite relation to the numbers actually killed and seen, though not collected. In the city an incidental and useful effect of the fumigation was to fix the position of many faults in the old system, through which the fumes escaped so as to be strongly perceived within houses, and even in the open.

Employment of the organism used by Professor Loeffler to destroy mice had at an early date been recommended in letters to the daily papers for the destruction of rats. The Department, however, had investigated this matter at great length two years earlier in relation to its proposed use for destroying flying-foxes (see Annual Report of the Board of Health for the year 1898), and had subsequently extended the inquiry to ascertain its powers and usefulness for the destruction of rats both in the laboratory and in the field. The results showed that while the scattering of bait impregnated with broth cultures of Loeffler's *B. Typhi Murium* often resulted in disappearance of rats from their old haunts, very few sick rats were ever seen and no dead bodies were ever found; while in one locality unmistakable evidence was got that the infection of a few animals was immediately followed by retirement of the whole horde to some neighbouring spot not far distant, where it lived in good health.

Cultures of Danysz' organism, recommended by the discoverer for destruction of both rats and mice, had been cabled for at beginning of the year, in consequence of an account of its apparent effects which had been communicated to the President by a *confrère* in New Caledonia. As soon as they arrived (May 3rd) this organism also was examined in the laboratory and tested in the field, without any useful result being attained. At a later date Danysz' own account of the organism was published, from which it appeared that the disease caused by it spread only to rats which fed on the bodies of rats killed by eating the original bait, and that it was not alleged to cause a disease freely communicable in other ways, such as seems to be requisite to its effectiveness in the desired direction.

Nevertheless, it is likely enough that an impression was produced on rats in certain districts, and in as far as such districts were infected that impression was useful. It can have been useful, however, only to the inhabitants; for rats flee as soon as they are persistently disturbed, and partly (only) for this reason the infected rats spread beyond that area on which the epizootic first appeared. This danger was recognised by the public, which desired that before attempts at destroying rats in an infected district were made the locality should be surrounded by a fence to prevent their dispersion. This, as well as many another suggestion of a different kind, was made at a comparatively late stage of the epidemic—at a time, at all events, when alarm had rendered it possible to secure public approval for almost any proceeding, however inconvenient, expensive, or oppressive it might be; and it is necessary to point this out because, even at the date when it might have been tried, it would no longer have been useful. Without discussing the question whether any fence which could be erected in a large city would have the desired effect, the fact was that before they were disturbed by efforts made to destroy them, infected rats had spread far beyond any such restricted area as could be fenced. This had happened in accordance with the instinct which causes rats to desert places where disease attacks them, or where poison is effectually laid for them. Case 7 (March 8th), it has been shown above, was infected where the patient was found, at a distance of about 2 miles from Darling Harbour; while the occurrence of Case 15 showed that plague-rats had already invaded premises as far away from the shore line as York-street by March 13th. Other instances could be mentioned; but, in short, while it was sufficiently difficult to watch the progress of the epidemic in man, it was quite impossible to observe extension of the disease among rats. The conclusion as to rat-fencing is that it is one of those measures which would be useful if only they were practicable, while the conclusion as to rat-killing is that it may be useful and should be persevered with, but that it can never be more than an assistant means, and never can be a preventive. A better defence must be looked for in other directions.

What

What this is has already been mentioned. Importation of plague-rats may be impeded if good fortune accompany care, but in the long run it cannot be prevented. Rats ashore may be killed in large numbers, but it is hardly possible to suppose that they might be exterminated; besides, the epizootic will usually have made considerable headway before the disease has been communicated to man, and, therefore, before it has been noticed. In the meantime, the rats will have scattered widely, not in consequence of attempts to destroy them, but of their own motion, and in accordance with those habits which are commonly known to cause them to leave any place where they find their companions dying. Under these apparently hopeless circumstances, examination of the facts of the late epidemic show that the infection was practically always taken on premises. This was only learned from careful observation, record, and consideration of all the facts of the outbreak; but, having been pointed out, the deduction from it is obvious. It is that the important practical protection against epidemic plague consists in removal of all those conditions which favour the harbourage, feeding, and breeding of rats in the immediate neighbourhood of occupied premises, and in excluding rats from dwellings.

This mode of defence is no sooner mentioned than it is seen to be practicable; and not merely so, but to be attainable by the steady and faithful execution of the elementary details of municipal sanitation. The places in which rats live and breed are the dark and intricate recesses which exist about ill-constructed or decaying structures; heaps of household refuse, which afford warmth, and in which they burrow; ill-made basements, cellars, and store-rooms, where defective flooring is supported above the natural soil; stables and dungheaps. The conditions which attract and retain them are the presence or near neighbourhood of food; if (as is usually the case) they are to be met with in hardware and soft goods stores which have been ill-constructed or which have fallen into disrepair, they are more constantly found in butchers' shops, produce stores, grocers' shops, public houses, hotels, and kitchens; and are always to be seen at night in lanes and rights-of-way, however well paved these may be, hunting for food in garbage boxes or dustholes. Access to buildings and to dwellings from the outside is furnished to them sometimes by defects of structure which may even be such as in every other relation are unimportant; at others through doors left open at night; but largely through the more serious gaps which occur in the course of decay of dwellings in which, also, there are sure to be many nooks in which they can permanently establish themselves. And, again, they are attracted to the neighbourhood of such dwellings especially by the lumber and organic refuse which too often are allowed by local authorities to accumulate in back yards and on waste land, and which furnish food and cover for them. The conditions adverted to are often accompanied by permanent infestation of premises with parasitical insects, among which fleas and bugs are of most importance in the present connection; for dirt, decay, darkness, and filth favour them at least as much as they favour the presence of rats. Lastly, as with other matters which fall under the general heading of care of the public health—and which comprise, it should be remembered, all matters relating to communal health or disease, from the most abstruse down to the simplest item of municipal scavenging—the dangers just indicated as conducive to epidemic plague carry others with them which are of even greater importance. Darkness, dampness, filth, and bad construction of dwellings are causes of the prevalence of consumption (for example) which annually kills more people than, it may be safely said, plague ever will destroy here during the epidemics which may occur at intervals of years. And these dangers of fostering plague, and plague especially and singularly, are by no means confined to the houses on which they actually exist. Rat-infested premises threaten the inhabitants of every dwelling in average good order which stands within a few hundred yards of them. Numbers of cases of plague occurred, no doubt, on premises which conspicuously presented some or all of the faults just mentioned; but a larger proportion occurred in the dwellings of artisans which were sometimes in good order, at others in an ordinary and fair state, and which laboured under the disadvantage of entirely insanitary methods of connection with sewers, or of the neighbourhood of ancient and dangerous sewers or drains, only within the city of Sydney.

Thus the best, and the only attainable, defence against epidemic plague lies in removal of dangerous conditions which for the most part could not occur under good municipal management, even of the elementary processes of inspection, record, and scavenging.

The

The epidemic, and the efforts to abate it by cleansing a part of the infected area, revealed to the general public the inefficiency of the work to that time done by some local authorities which, consequently, were loudly accused of neglect. Neglect there had been, no doubt; but, except in the city of Sydney, where large revenues and powers under special Acts of Parliament render excuse difficult, it has been largely unavoidable. There seems to be little ground for hope of important improvement in municipal sanitary administration until local authorities are granted power to strike a sanitary rate, from which the expenses of business-like supervision and improvement of their districts may be defrayed by them.

But funds are not all that is requisite. Knowledge and guidance are also necessary. The Public Health Act provides for appointment of Medical Officers of Health to districts, and to groups of districts. The Board carried out this instruction of the Legislature by combining the populous municipalities in the Metropolitan and Hunter River Districts, and by appointing to each combined district a Medical Officer of Health whose whole time should be devoted to his duties, the opinion having been formed by it that such officers can act efficiently only when they have no other interests. Thus the local authorities administering districts which carry rather more than a third of the total population, were furnished with competent advisers on all matters relating to the public health; for the officers referred to are officers of the combined local authorities, and are not (as they are often taken to be) officers of the central authority. But in the metropolitan district, the local authority for the city of Sydney has power, under its Act of Incorporation (1879), to appoint its own Health Officer. Without reflection on the manner in which the present and past holders of this post have done their duty, it may be pointed out that every incumbent has laboured under those very disadvantages which the Board has striven to remove in the cases just mentioned, namely, of being embarrassed by the cares of private practice, and of being entirely under direction of the Council. It is necessary that the sections of the Act of Incorporation which granted this power should be repealed, and that the city, like other metropolitan municipalities, should be transferred to the care of a medical officer the terms of whose appointment not merely ensure that he shall be skilled in the work which he undertakes, but shall also save him from all those influences which, if they came into play, would seriously impede him in doing it.

The Board, by its use of the opportunity afforded by the Public Health Act, took an important step towards establishment of a public health service on the only basis which renders sound progress possible. It is to be feared that its bearing has, so far, hardly been generally appreciated. And perhaps one reason is that, while providing for the appointment of specially-educated directorial officers, the Act stopped there, and made no provision either for giving sanitary inspectors a similar security of tenure, nor for making sure that they have had reasonable instruction in their special business before they are allowed to undertake it; nor did it co-ordinate them with the Medical Officer of Health, whose assistants and executants, under the local authority, they are. This omission should now be rectified; probably no better plan can be mentioned than that of paying half the salaries of sanitary inspectors in populous districts on condition that they are neither appointed nor discharged except with approval of the Board, which latter would have power gradually to require that every such inspector should produce some certificate or voucher for his having been through a course of instruction in the subjects of which his occupation requires knowledge. There is no doubt that local authorities would gladly accept such an arrangement, which would, besides, relieve them of some local difficulties in executing the law which they now occasionally meet with.

As soon as they are mentioned it will be perceived, doubtless, that these proposals, which were submitted on July 3rd in the form of amendments to the Public Health Act, are of a fundamental character. No efficient execution of health laws need be expected until they have been adopted; and especially no such improvement in scavenging and in buildings as can be a useful defence against incursions of rats is at all likely to be effected until, by means of the organisation sketched above, there is at least a possibility of steadily carrying out the regular inspections, keeping the registers, and causing the improvements which are required.

In special connection with the present subject certain detail amendments of the Public Health Act must be mentioned. The spread of disease by rats is a fact new to practical hygiene; but, for the future, cognisance must be taken

of

of it, and special powers must be given to meet the newly recognised danger. In the first place, premises which on inspection by the proper authority furnish evidence of infestation with rats should be declared to be a nuisance liable to be dealt with summarily by addition of a definition to that effect to those which stand at commencement of the Public Health Act, Part VI. This would give magistrates power to require the owner or occupier to remove wooden floors (if any) in basements and to substitute concrete, to repair walls and effectually stop holes, to guard entrances with wire-netting, to cause doors to close thoroughly, to shield the lower parts of doors with iron plates, to remove accumulations of useless lumber from yards, and to do all other things which might seem necessary in order to prevent a recurrence of the nuisance. Secondly, power should be given to the Board to order vessels lying at wharves and quays to moor with such precautions as are best calculated to prevent free interchange between ship and shore rats, the law at present only permitting such regulations to be made under an Act which applies to public wharves alone. Thirdly, a general building Act not being in force, something of the kind should be substituted without any delay; and in the proposed amendments, already referred to, a way has been suggested by which this might probably be effected without serious difficulty. Fourthly, the law relating to management of epidemics of dangerous diseases should be so altered as to permit medical inspection or surveillance of suspected persons to be used as an alternative to detention at quarantine—namely, so as to make it possible to order persons to live at any address chosen by them, and to present themselves for examination either there or at prescribed times and places. Fifthly, local authorities should be supreme in all health matters not directly undertaken by the central health authority under the Government; their ratepayers should not be subject to the annoyance and confusion caused by liability to receive notices touching the same subject from different authorities as at present they are; but all such notices, from whomsoever emanating, should be given and enforced by the local authority alone. All of these points were also included in the amendments proposed on July 3rd, and, together with those mentioned before, have been approved by you.

It is clear that the beneficial effect of the foregoing provisions, if they were already law, could not be speedily realised. But notwithstanding the singular way in which plague is diffused, it much resembles all other epidemical diseases in this: That there is no royal road to prevention, and that safety can be attained only by steady and long-continued effort. On the other hand, the result of such efforts would tell largely towards prevention of many other diseases which afflict the dwellers in cities. The best internal defence against plague consists in good construction of dwellings and in household and municipal cleanliness, together with the slighter special precautions mentioned above. The origin of this defence lies solely in knowledge of the disease and the mode of diffusion peculiar to it; the possibility of raising it lies with the Legislature; the execution of it lies with local authorities under the Public Health Act, and can lie with no others.

I have the honor to be,

Sir,

Your obedient Servant,

J. ASHBURTON THOMPSON.

APPENDIX A.

Bacteriological Report.

By FRANK TIDSWELL, M.B., Ch.M. (Syd.), D.P.H. (Camb.), Principal Assistant Medical Officer of the Government, Microbiologist to the Board of Health.

SYNOPSIS.

1. Initiation of observations.
2. *Bacillus pestis bubonicæ*.
 - (a) Morphological characters.
 - (b) Cultural characters.
 - (c) Pathogenic characters.
3. Observations on the Mode of Infection in Plague.
 - (a) Inoculation.
 - (i.) Significance of injuries of the skin.
 - (ii.) Significance of phlyctenules.
 - (b) Ingestion.
 - (c) Inhalation.

1. INITIATION OF OBSERVATIONS.

The bacteriological observations were initiated with sanious lymph obtained from the femoral gland of the first case of the series (A.P.), on January 20th, 1900, the third day of illness. The immediate microscopical examination gave every support to the suspicion of plague roused by the clinical aspects of the case, but in view of the importance of the question at issue, a final pronouncement was deferred pending the completion of the cultural and inoculation tests. The positive results obtained in both of these directions permitted the report of a definite diagnosis of plague on January 23rd, 1900, and the decision thus given received ample confirmation by subsequent observations.

The next point of evidence was secured on February 14th, when, in response to an appeal by the Department, evidence was obtained of excessive mortality amongst rats at one of the wharves in an important business section of the city. On the date mentioned seven rats, three dead and four living, were forwarded for examination, and the microscopical, cultural, and inoculation tests clearly and decisively demonstrated the existence of plague amongst the rats.

On February 24th, femoral and inguinal buboes obtained after the death of the second case in a human being (Case 2) were forwarded, and the series of tests again yielded positive results in all particulars.

From this date onwards throughout the epidemic, a period of four and a half months, practically all the time of the laboratory staff, other than that occupied in the ordinary routine of the laboratory, was taken up by plague work. The demands in this respect comprised examination of specimens from cases in human beings in which the clinical evidence admitted of doubt, or the *post-mortem* appearances were indecisive, or from hospital patients either for information with regard to some particular lesion or symptom, or as to their freedom from infection and safe discharge; examination of rats and other animals taken dead or alive at various parts of the city and suburbs; and observations on the morphology, biology, and pathogenicity of the bacilli isolated from these various sources. The data obtained in these different ways, collected and classified, form the basis of the following descriptions of the more important aspects of the bacteriology of plague.

2. BACILLUS PESTIS BUBONICÆ.—(Figures 1–10.)

(a) *Morphological Characters.*

In smear preparations of material from buboes or viscera the micro-organisms were usually present in enormous numbers (v. Figs. 1, 8, 9, 10). As a general rule, the first glance revealed a field teeming with bacilli, and it was very seldom that any lengthy search was required for their detection. The individual elements were isolated, save that here and there two short bacilli were commonly seen end to end in such a position as to suggest recently-accomplished fission, whilst in preparations made from broth-cultures there were sometimes short chains of four to ten bacilli (Fig. 4). In certain specimens, especially those obtained from cases in which the severity of the illness was mild, or in which the acute stage had passed, the bacilli appeared to be enclosed within leucocytes.

Hanging-drop preparations usually showed Brownian motion. Here and there an individual element was seen to be vigorously wriggling, but no movement of translation was ever observed. No essential differences in this respect were noted between specimens taken direct from infected tissues, from young or old cultures, from liquid or solid media, or whether examined at the room temperature, or at 37 degrees C. in the Nuttall incubator. It may here be mentioned that staining methods failed to reveal the spiral flagellum described by Gordon, but it is possible that the few wriggling bacilli which may have possessed one might escape detection.

The application of Widal's method was unsuccessful with specimens taken during the early stages of illness, and blood from convalescents, whilst producing imperfect agglutination in one or two instances, was neither constant nor complete in its effect.

The bacilli stained readily with ordinary aqueous solutions of fuchsine, gentian violet, or methylene blue. They did not retain the colour when treated by Gram's method.

In stained preparations the micro-organisms usually had the appearance of a short straight bacillus, but, as a rule, there was considerable variation in the forms presented by the different elements in the same preparation (Figs. 1, 8, 9). In what may be regarded as the mature form, the outline was either that of a typical bacillus, the sides being parallel for the greater part of their length (Fig. 1), or it was whetstone

or

or boat-shaped, the sides being convex outwards (Figs. 6, 10). Interspersed amongst these were rounded, oval, or dumb-bell shaped elements resembling micrococci or diplococci (Figs. 1, 6, 9). The greatest mixture of forms was observed in smear preparations from infected tissues, but there was always a predominance of those above referred to as mature. In young cultures (24–48 hours) the elements were sometimes very minute, and rounded or oval in outline (Fig. 2); but the later growth was usually made up entirely of bacillary forms. As a general rule, the ends were smoothly rounded-off, but in certain preparations were more abrupt, and even irregular.

An occasional element was surrounded by a halo, which could not be demonstrated as a capsule by staining. This appearance was noted only in specimens taken directly from infected tissues. The "stickiness" of many agar-cultures was suggestive of some glutinous envelope or matrix, but nothing of the kind was to be seen in preparations from cultures, even when mounted without previous suspension of water. Spores were not detected.

The average of a number of measurements gave the bacillary forms a length of 1.8μ , with a variation between 1.6μ and 2.4μ . Rarely longer forms were seen. The breadth averaged $.8 \mu$, and showed little variation, this feature being much more constant than the length.

In young cultures (24–36 hours) the rapidly-multiplying bacilli were sometimes smaller, but after the second or third day they attained the dimensions given above. The rounded forms had a diameter varying between $.5$ and 1.0μ .

The appearance of the unstained specimen indicated aggregation of the protoplasm at the ends of the rods. The deeper colouration of the poles after staining would thus appear to be accounted for by the structure of living bacilli, and not to result from any plasmolytic effect of the processes of drying and staining. But whilst it may be said that the majority of the specimens contained bacilli showing bipolar staining, this feature was far from being a constant character of individual elements. In some specimens it was exhibited by practically every bacillus (Figs. 6, 8, 10); in others a few elements showing it were only found after some search; in others, again, it was no more than suggested, whilst occasionally it was not at all evident. In general, bipolar staining was much more distinct in bacilli obtained directly from infected tissues than in those from cultures. The degree of colouration varied. There was rarely only a comparatively thin band at the poles with the rest of the bacillus clear; more frequently only a small clear space in the middle of the rod, which was otherwise deeply tinted throughout; but most usually the bacilli presented some intermediate condition.

As mentioned below, cultivation upon dry or salted agar readily produced crops of "involution forms" (Fig. 3). In undergoing this process some elements became greatly enlarged, reaching a length of 5μ or 6μ and a breadth of 1μ , but without loss of the shape and staining properties of the original bacillus. They thus represented, so to speak, giant plague bacilli. But other elements became laterally distended as well as enlarged, forming large sausage-shaped, pear-shaped, spindle-shaped, oval, biscuit-like, circular or irregular bodies, staining with a pale uniform colour, and having no resemblance to the bacilli from which they were derived. Many of these metamorphosed bacilli contained clear round spaces (vacuoles), and if these happened to be at the edge the appearance produced was as if a bite had been taken out of them. The more characteristic involution forms have not been met with in the tissues, but the smaller circular bodies, sometimes found in considerable numbers, may, perhaps, represent them. The production of one or other of the forms above mentioned did not appear to depend upon any particular rule. The bizarre shapes were only found in young cultures; as the growth became older, the elements assumed rounded outlines, but sometimes only the latter were present from the first. The ultimate change appeared to be disintegration.

(b) Cultural Characters.

The initial cultures with material from infected tissues were usually obtained by inoculation of nutrient agar, coagulated serum, or beef bouillon. Subcultures were grown on other ordinary media (gelatine, milk, potato, &c.)

On agar tubes, inoculated with material from buboes or viscera, and incubated at 37°C ., the first noticeable growth usually appeared in 36 to 48 hours, in the form of minute bright specks, very slightly raised above the surface of the medium. In the course of a day or two, the colonies became small colourless hemispheres, ranging from $.5$ to 1 millimetre in diameter, then having the appearance of tiny drops of dew. Many colonies never developed beyond this stage; others extended to more or less circular patches having a diameter of 2 or 3 millimetres. When so extending, the slightly raised patch became flat on the surface, and acquired a cloudy opacity, the edges remaining thin and colourless. The cloudiness was also developed when a number of colonies became confluent. Rarely it was present from the first appearance of the colonies. A degree of opacity beyond cloudiness was not seen in growths upon agar. The maximum amount of development appeared to be reached during two weeks incubation; after that time no obvious extension of the growths was observed. When the medium was moist the colonies were apt to fuse into an expansion of irregular contour. Individual colonies were sometimes difficult to pick up, slipping about over the surface of the medium when touched by the needle. The confluent growths were often tenacious and sticky, pulling out into strings. In many instances smaller colourless and large cloudy colonies grew up side by side. The bacilli appeared to be morphologically the same in both, and although no observations were made as to their relative pathogenicity, they probably correspond to the two varieties mentioned by Yersin. In subculture the growth appeared earlier than in the original (24–48 hours), and developed as a confluent streak, raised and cloudy along the middle, but with thin, colourless, iridescent borders often having a fine corrugated appearance. The extreme border was wavy. Sometimes a row of isolated colonies formed along both sides of the streak. The breadth of the streak rarely exceeded 2 or 3 millimetres, except at the lower end, where there was often an expansion 6 or 8 millimetres wide. By rubbing or spreading out a streak, a thin, slightly-cloudy growth was obtained, which gave a ground-glass appearance when looked at through the thickness of the agar. With age the growth became more transparent, and often developed a mother-of-pearl iridescence.

Anaërobic cultures gave scanty growths. On agar at the room temperature, the growth was much slower, being seldom distinct in less than five or six days from the time of incubation, and reaching its maximum development in about three weeks. The appearances were very much the same, but the ultimate amount of growth less, than in cultures developing in the incubator. On perfectly dry or salted agar the growth

growth developed in very much the same way as on ordinary agar, resulting in a few days in the production of the involution forms already described. The addition of glycerine or glucose was not found to have any advantage over the simple medium. No redness was produced on slightly alkaline litmus agar, whilst the culture itself often acquired a pale-blue colour from the litmus.

On nutrient (17 per cent.) gelatine, at the room temperature the growth appeared in 3-4 days, and reached its maximum development in the course of the succeeding fortnight. In gelatine tubes, kept in the warmer atmosphere of the incubating room (16-20° C.), the colonies sometimes appeared in 24-36 hours. The general appearance of the surface culture was similar to that upon agar, but often had a white colour. In stab-cultures the growth appeared first in the form of a row of closely-placed, fine granules, which later became more or less confluent, and appeared as a well-marked whitish streak. There was a slowly-growing white expansion on the surface. No liquefaction of the gelatine occurred.

On ordinary serum tubes, inoculated with material from buboes or viscera, and incubated at 37° C., growth usually appeared in 36 to 48 hours after inoculation in the form of small, rounded, cloudy colonies. In their development the colonies reached a diameter of 2 or 3 millimetres, and acquired a creamy colour. In general, the growth was more opaque and more abundant on serum than on agar. Occasionally the serum appeared to be depressed in the neighbourhood of the growth, but there was never any observable liquefaction. In subculture the growth on serum was often visible in 24 hours.

In ordinary beef-bouillon tubes, incubated at 37° C., the growth was usually visible on the second day after incubation. As a general rule, it appeared in the form of fine crumb-like spicules attached to the sides, with more or less deposit at the bottom of the tube, the broth remaining clear and transparent. In other cases a moderate uniform turbidity was produced. No change of colour was observed in neutral litmus agar. No reaction for nitrites nor for indol was obtained, except in a few instances of growths several weeks old, in which, however, the culture appeared to be pure bacilli pestis. Growth in bouillon flasks containing oil resulted in the production of a film, scanty crops of stalactites, and a copious deposit. The number of stalactites present at any one time never exceeded six or eight; they were very fragile, and were noticed to become detached from the film and sink to the bottom of the flask with a worm-like motion. The paucity of growth of stalactites is probably attributable to the fact that the laboratory is subject to a considerable amount of vibration, sometimes marked enough to be distinctly felt, and always such as to prevent micro-photographic work in the daytime. The use of the pepto-gelatine medium of Yersin did not give results obviously better than those obtained with ordinary bouillon.

In milk the growth was much less abundant than in bouillon, and development was effected without change in the appearance of the medium.

On ordinary potato, and also on alkalinised potato, a scanty creamy growth, limited to the lower end of the line of inoculation, developed on only a few of the many tubes inoculated.

(c) Pathogenic Characters.

The reports of numerous investigators indicate that plague not only affects man, but is liable to attack several different species of lower animals. Rats, mice, pigs, monkeys, cats, marmots, bandicoots, and pigeons are mentioned as having acquired the disease in a natural way, whilst guinea-pigs and rabbits are the most important items of a long list of animals susceptible of infection by artificial means. In Sydney plague has been found in specimens from human beings, rats, mice, and cats forwarded for examination, and in the laboratory experimental observations have been made upon rats, mice, cats, and guinea-pigs.

The specimens from human subjects of plague comprised materials from buboes, carbuncles, blood, sputum, urine, fæces, and from the viscera in *post-mortem* cases.

The material was obtained sometimes at the initial examination by means of a sterilised syringe; and sometimes from patients in the hospital by the same procedure, or after incision when the gland had suppurated. In a few instances sloughs from buboes were examined. The results of the examinations as regards the detection of plague bacilli are shown by the following statement:—

Material taken.	Number examined.	Result positive.	Result negative.
On 2nd day of illness	1	1	...
" 3rd "	5	5	...
" 4th "	1	1	...
" 6th "	3	3	...
" 7th "	4	4	...
" 8th "	4	3	1
" 9th "	4	4	...
" 10th "	3	1	2
" 13th "	1	...	1
" 14th "	3	...	3
" 15th "	1	1	...
" 16th "	1	1	...
" 18th "	1	...	1
" 19th "	1	...	1
" 20th "	2	...	2
" 21st "	1	1	...
" 23rd "	1	...	1
" 24th "	1	...	1
" 25th "	2	1	1
" 29th "	3	1	2
" 32nd "	2	2	...
Between 38th and 94th day of illness	13	...	13
Total	58	29	29

It will be seen that plague bacilli were forthcoming in 50 per cent. of the specimens; that material taken during the first week yielded uniformly positive results, that bacilli were discoverable up to the thirty-second

thirty-second day of illness; but that at later stages, up to the ninety-fourth day, the results were uniformly negative. It may be added that pus from suppurating buboes nearly always gave negative results as regards plague bacilli; it was generally sterile, but sometimes contained micrococci.

Material from carbuncles was examined in three cases, and all gave positive results.

Material from phlyctenules was examined on two occasions, with a positive result in one case.

Blood was taken during life from thirty-two patients either from the finger or from the lobe of the ear. The results were positive in four cases, all of which ended fatally within twenty-four hours after the examination. The negative results were obtained with specimens taken at periods ranging from the second to the seventeenth day of illness.

The sputum was examined in five cases having clinical indications of pneumonia, perhaps primary in one, and secondary in four cases. Plague bacilli were detected in sputum from the possibly primary case, in which they were extremely numerous and practically pure, and in two of the secondary cases in which they were mixed with various other micro-organisms.

The urine from twenty-nine patients was received into sterilised bottles, conveyed to the laboratory, centrifuged, and the sediment examined. Micro-organisms morphologically resembling bacilli pestis were observed in ten of the twenty-nine specimens, but in no instance were they obtained by cultivation or the inoculation of guinea-pigs. In this connection it may be mentioned that no growth was observed in tubes of human urine inoculated from cultures, although other media (agar, serum, &c.) inoculated with the same material, at the same time, showed abundant development. The results were equally negative whether the urine used was sterilised by heat or by passage through the Pasteur-Chamberland filter; and whether left acid or neutralised. As well as the visible evidence, the results were tested by sub-cultivations from the urine tubes on agar or serum, which always remained sterile. But on two occasions growths were obtained from the (alkaline) urine of guinea-pigs dead after inoculation with plague bacilli.

The faeces were examined in twenty cases, microscopically and by plate cultivation, but plague bacilli were neither isolated nor seen.

Plague bacilli have been detected in specimens from various lymphatic glands, spleen, liver, lungs, and blood taken at *post-mortem* examinations on fatal cases. These specimens were submitted for examination as a matter of diagnosis, so that the results are not representative of the intra-corporeal distribution of the bacilli.

The rats forwarded for examination from various parts of the city and suburbs numbered 167. The general results are stated in the following table:—

Condition.	No.	Sick.	Putrid.	Injured.	Result positive.	Result negative.
Living	50	10	3	4	46
Dead.....	117	30	22	19	46
Totals	167	10	30	25	23	92

It will be seen that of the 167 rats, plague bacilli were detected in twenty-three, equal to about 12 per cent. In fifty instances the rats were alive, and 117 were dead. Of the fifty live rats, ten were sick and three injured. They were all killed and examined, with the result that plague bacilli were detected in four, all of which were sick on receipt. Of the 117 dead rats, thirty were too putrid for reliable examination, and twenty-two had injuries of such severity and character as to account for their deaths. Plague bacilli were detected in nineteen of the remaining sixty-five rats.

The pathological appearance presented by the tissues of naturally infected rats (Fig. 15 and 16) was briefly as follows:—There was usually general congestion, œdema, occasional excess of fluid in the serous cavities, and minute hæmorrhages under the skin and into various viscera. Enlargement of the lymphatic glands was a common, but not a constant feature, and when present was usually exhibited in several different situations—femoral, inguinal, brachial, lumbar. On two occasions cervical glands and on one occasion a mesenteric gland were found swollen to the size of a pea, but in all three there was great enlargement of glands elsewhere. The swollen glands were not generally discoloured, and though there were sometimes small hæmorrhages under the capsule, the periadenitic swelling and hæmorrhage characteristic of a bubo were never observed. Generally, but not always, the lungs showed patchy pneumonia, and occasionally a few hæmorrhages. The liver was usually enlarged, sometimes to as much as two or three times its normal bulk (Fig. 15), was of a lighter colour than normal, and on a few occasions was mottled with small white points. The spleen was usually swollen (Fig. 15 and 16), in some specimens it was 2 inches long and correspondingly thickened, but occasionally it was not in excess of the normal limits. The suprarenal bodies were frequently of a dark colour, and in a few instances there were small hæmorrhages under the capsule of the kidney. No definite lesions of the gastro-intestinal tract were noted. With the exception of petechial hæmorrhages under the parietal pleura and peritoneum, the remaining parts of the body presented no pathological appearances meriting special mention.

Preparations, cultures, and inoculations with material from the different viscera indicated that the plague bacilli were generally distributed throughout the bodies of the rats, but they were not always detected in the blood, nor in the lungs.

Experimental inoculation of rats was invariably successful; the animals dying after three to four days. The resulting lesions resembled those after natural infection, except that a bubo was produced in the glands corresponding to the site of inoculation.

The mice taken in different parts of the city and suburbs and forwarded for examination numbered six, and plague bacilli were detected in two of them. The pathological lesions were similar to those observed in the rat, but the small size of the organs prevented accurate observations of the finer changes. Experimental inoculation was performed on eight mice. It proved fatal in five, the deaths occurring in two and a half, two and a half, two and a half, three, four and a half days respectively. A bubo was formed.

formed in all cases. The mice surviving after inoculation were observed to be very quiet, and ate sparingly between the third and sixth days after injection, but after that rapidly recovered, and became quite lively in the course of the second week. In all three instances the material used, culture or infected organs, killed guinea-pigs inoculated at the same time. In a series of three mice, the first inoculated with material from a bubo in a human patient, and the others with material from the spleen of the preceding mouse of the series, the animals died in two and a half, three, and four and a half days respectively.

Five cats were forwarded, all living, but two were sick. They were killed with chloroform. In the three apparently healthy cats no abnormalities were found on *post-mortem* examination. One of the sick cats had an angry-looking, discharging ulcer at the right angle of mouth, with inflammation of the adjacent mucous membrane extending back as far as the pillars of the fauces. The autopsy revealed general congestion of the tissues, but no œdema, nor hæmorrhages. The lymphatic glands were not enlarged. Pneumonic consolidation of lower part of right lung; other thoracic viscera normal. Spleen slightly swollen and showing numerous grey nodules; liver enlarged and mottled, section had a vague nutmeg appearance, small intestine congested, stomach and large intestine unaffected. Other viscera presented no departure from normal, except as regards congestion. Smear preparations from the ulcer showed a variety of micro-organisms, but none resembling bacilli pestis; those from the spleen contained a minute bacillus, whilst blood, lung, liver, and mesenteric gland were negative. The culture tubes remained sterile, except those inoculated from the ulcer, which gave mixed growths. A guinea-pig inoculated with a portion of the spleen remained unaffected. There was thus no evidence that this animal suffered from plague. The second sick cat was practically moribund on receipt. There was a subpectoral swelling on the left side, near the axilla, about 2 inches in diameter. This was found to have a nucleus of thin pus, surrounded by œdema, but no hæmorrhage, and involved all structures down to the ribs. In the internal organs there was general congestion, slight œdema, but no general hæmorrhages. The pleura adjacent to the pectoral abscess was intensely inflamed. Both lungs showed numerous broncho-pneumonic areas generally about the size of peas, with hæmorrhagic exudation, and sometimes necrotic central points. The bronchial glands were not visibly abnormal. The spleen was very dark in colour, but not obviously altered in other respects. No special lesions were detected in other parts of the body. Smear preparations from the subpectoral pus and œdema contained innumerable plague bacilli (Fig. 9); and preparations from the pneumonic areas were also positive; but liver, spleen, and blood were examined with negative results. Cultures from the subpectoral œdema gave abundant growths, which at subsequent dates produced fatal plague on inoculation into six guinea-pigs and two rats. No differences were observed as regards morphological, cultural, and pathogenic characters between the bacilli obtained from the cat and those derived from man or other animals.

A healthy cat was experimentally inoculated in the thigh with an emulsion of serum-culture in distilled water. Local swelling appeared in two days, with some apparent malaise. The animal was definitely ill on the fifth day, grew steadily worse during the sixth day, was comatose on the evening of the seventh day, and was found dead on the morning of the eighth day after inoculation. *Post-mortem* examination revealed hæmorrhagic exudation at the site of inoculation extending upwards to the femoral region, where a bubo existed. The corresponding inguinal and, to a less extent, the lumbar glands were congested and enlarged. There were no enlarged glands elsewhere. Beyond congestion and slight enlargement of the liver and spleen the organs showed no obvious departure from the normal. Smear preparations from the local exudation, femoral, inguinal, and lumbar glands showed innumerable plague bacilli, and though less numerous, bacilli were also plentiful in the spleen and liver. The lungs and blood gave negative results. Cultures gave vigorous growths.

Guinea-pigs inoculated in the laboratory usually died within four to five days. The exact times ranged from two to ten days, but was rarely longer than six days. No definite differences were obtained in this respect as regards the effect of material from different sources. The inoculations were generally made into the inner side of the knee. The *post-mortem* examinations (Figs. 11, 12, and 13) sometimes revealed hæmorrhagic swelling at the site of inoculation, extending up the leg, but generally there was no such local reaction. In every case there was swelling of the corresponding femoral glands, and usually also periadenitic exudation and hæmorrhage. The related inguinal were frequently, and the lumbar glands sometimes, swollen, and occasionally showed periadenitic hæmorrhage (Fig. 13). In some instances other glands were involved, *e.g.*, the deep abdominal, brachial, and cervical groups, and might even show petechial hæmorrhage, but never the appearances observed at the primary bubo. The mesenteric glands were always free from visible alteration. The tissues were generally congested, dusky, œdematous, and very commonly there were petechial hæmorrhages under the skin, serous membranes, as well as in the viscera. The lungs were rarely normal; usually they showed degrees of alteration varying from limited areas of congestion to inflammation of the greater part on both sides (Fig. 11), and petechial hæmorrhages were commonly observed in them. In some cases they were studded with miliary points (Fig. 12). The pericardium and heart rarely showed any changes beyond congestion, and sometimes hæmorrhages. The liver was usually enlarged, sometimes to twice its normal size (Fig. 11). The surface often showed discoloured areas, fine mottling of white points or numerous small hæmorrhages. The spleen was almost invariably enlarged to two or three times its normal size (Figs. 11 and 12), occasionally it was much larger. The surface was usually marked by a variable number of white spots (Figs. 11 and 12), irregularly distributed, and sometimes very numerous. The general colour was much darker than normal, either uniformly or in patches. The edges were thick and rounded. The kidneys were sometimes larger than normal, as a rule pale and marked by hæmorrhages (Fig. 13). The suprarenal bodies were generally swollen and congested, and sometimes of a deep red colour (Fig. 13). The stomach and intestines were usually unaltered in appearance, but occasionally the small intestine was congested. No definite changes were observed in the urinary organs.

The bacteriological examinations showed that occasionally the plague bacilli were practically limited to the site of inoculation and bubo, but that usually they were present in all parts of the body. They were often very abundant in the bubo, in other lymphatic glands, in the spleen, and in the liver. They were not always discoverable in the blood of the heart, even when numerous in the viscera. On two occasions they were recovered from the urine, but were not found in the bile. Micro organisms, morphologically resembling plague bacilli, were detected in the nasal mucus on three occasions, in all of which there was marked pneumonia.

3. EXPERIMENTAL OBSERVATIONS ON THE MODE OF INFECTION IN PLAGUE.

As opportunity offered, experimental observations were made with the object of instituting comparisons with the reports of other investigators on certain epidemiological aspects of the bacteriology of plague. The work in this respect had to do with various assertions as to the manner in which plague is acquired, and more especially with regard to inoculation, ingestion, and inhalation. The results here reported represent the first fruits of a plan of investigation not yet completed in detail.

(a) Inoculation.

The experiments described in the foregoing section afford abundant testimony of the susceptibility of various animals to plague bacilli inoculated under the skin, and are in accord with the reports of authorities. It is generally believed that inoculation at some point on the external surface of the body is also the principal mode of infection in man. The significance attached to the occurrence of a bubo is that the inoculation took place through the skin of the region from which lymph is collected to pass through the affected gland. The validity of this inference is vouched for by both clinical and experimental evidence. It has occasionally happened that medical men engaged in investigations on plague have become accidentally inoculated in some particular place, and the resulting bubo has always developed in the glands associated with the part known to be the site of inoculation. Thus Dr. Sticker, a member of the German Commission sent to India to study the plague, received a scratch on the hand whilst performing an autopsy on a plague subject. This small wound was followed by enlargement and tenderness of the glands in the corresponding axilla. A similar sequence of events occurred in the cases of Drs. Aoyama and Ishigami, of the Japanese Commission, who were infected in the same way during their work at Hong Kong. Experimental inoculation of animals always results in a bubo affecting the nearest-related group of lymphatic glands. In the observations made in this laboratory, inoculation in the thigh was followed by a femoral bubo, and inoculation in the fore-leg by an axillary bubo. Hence when a bubo is present the entry of infection occurred in the corresponding part of the body, and observers have very generally endeavoured to find indications of it in the patients coming under their notice. As a matter of fact, any such evidence of the exact site of infection is rarely forthcoming. In the great majority of cases searches for such prove futile; no lesions are to be discovered. They had either disappeared by the time the examination was made, or had never existed. This has also been our experience in human beings; and in most of the inoculations on lower animals performed in the laboratory there was no local reaction at the actual point at which the bacilli were injected, all traces of the tiny wounds made being obliterated in the course of a day or two. But in many instances scratches, abrasions, or wounds of the skin have been credited with affording the means of ingress; whilst Simond and some other observers have described the occasional presence of a special local lesion, a phlyctenule, as indicative of the point of entry. Observations on both have been made in this laboratory.

(i) The Significance of Wounds of the Skin.

In a few of our cases in human beings scratches or abrasions were found which might have sufficed to admit the infection, but in all cases, when discharges or scrapings from them were examined, no plague bacilli were detected. The contamination of such wounds with plague microbes involves contact with a plague subject or with some infected inanimate material. The acquisition of plague by direct contagion has been asserted in a few instances, but the conditions under which it is said to have occurred have never been such as to place the matter beyond question. On the other hand, there is abundant evidence that even close association with the plague-stricken, as in hospitals and in most households, does not involve infection. Experimental verification of this fact has also been obtained by many investigators, and was the outcome of the following observations made upon the point in this laboratory:—

1. A healthy mouse was placed in the same jar with another mouse inoculated with material from a bubo. They remained in association during two and a half days, when the inoculated mouse died, and on *post-mortem* examination was found to be generally infected with plague. The other mouse remained perfectly healthy for a period of three weeks, and on being then killed was found to be free from disease.
2. A healthy rat was placed in the same cage with a rat inoculated from a culture. They remained in association during three days, when the inoculated rat died, and was found to be generally infected with plague. The other rat remained perfectly healthy for a fortnight, when it was inoculated from a culture of plague bacilli. It died of plague in three days.

It will be seen that in both instances animals intimately associated with others fatally sick with plague escaped infection, although in one case at least there was no insusceptibility to the disease.

In connection with this aspect of the question some experiments may be mentioned, which were designed to investigate the liability of infection being derived from the surroundings of the sick. On one occasion a mouse, on another a guinea-pig, and on six occasions rats were placed in the uncleaned jars in which animals had died of plague. In no instance did the animal so exposed become infected, although the conditions may be regarded as eminently favourable for mediate contagion. The failure to acquire the disease was not due to insusceptibility, for most of the animals subsequently succumbed to inoculation with plague-cultures or infected organs.

These experiments upon the acquisition of plague from inanimate objects raises the question of the extra-corporeal existence of *Bacillus pestis*. The many experiments which have been performed to ascertain the behaviour of the bacilli under conditions as nearly as possible similar to those in Nature are in general accord in the conclusion that *Bacillus pestis* is not capable of prolonged saprophytic life. As the possibility of the contamination of wounds is most likely to occur from clothing, or from dirt, some experiments on the viability of plague bacilli in such materials were made in this laboratory. The series of experiments is not yet complete, the articles hitherto used comprising only (a) silk and (b) garden soil.

(a.) Small pieces of old soft silk, 1 centimetre square, were placed in a glass double dish, sterilised, allowed to cool, and then soaked in a bouillon-culture. In the first series the excess was removed and the squares placed in the incubator at 37° for about twenty-four hours. They were then removed and kept at the room temperature; pieces being taken at intervals of a few days, and inoculated into bouillon tubes. Growths were obtained up to, but not after, the fourteenth day from the date of infection. In a second series the sojourn

sojourn in the incubator was omitted, but otherwise the observations were made exactly as before. Again, no growth was obtained in bouillon receiving the squares of silk after the lapse of more than fourteen days from the date of infection. Thus the bacilli on the silk retained their vitality for about a fortnight only.

(b.) In the other experiments bacilli were inoculated from an agar-culture into sterilised garden mould. In some cases the dry culture was mixed with the dry mould, in others the culture was made into an emulsion with sterilised distilled water, and this added in a quantity such as to render the soil merely moist. Samples removed from the dry tubes after six and thirteen days gave no growths in bouillon. Samples removed from the moist tubes continued to give growths up to the twenty-first day. After this the soil had become drier and the subcultures showed no growths.

The two kinds of observations just described are not in themselves adequate proof of brief survival of plague bacilli in natural materials. But taken in conjunction with the results of other investigators, they suggest that the assumption of the derivation of infection from inanimate objects through wounds and abrasions can only be regarded as valid when the contact has clearly been with quite recently-infected articles.

(ii) The Significance of Phlyctenules.

The second kind of local lesion, the phlyctenule, found in plague patients, is ascribed by Simond to inoculation of plague bacilli by fleas—a conclusion at which he arrived as the result of a series of interesting observations which may here be briefly summarised. As the outcome of close inquiry into the circumstances attendant upon the well-known liability to plague infection as a consequence of handling rats dead of the disease, Simond states that a plague rat is dangerous or not, in accordance with the time that has elapsed since it died. If handled soon after death, plague may follow; but if not touched for some hours, it may then be handled without risk. It was, says Simond, just as if the infection completely evaporated within a few hours after death. He also states that perfectly healthy rats harbour very few fleas, and are very expert in removing them; but as they become sick they neglect their toilet, and fleas become more and more abundant upon them, so that they sometimes swarm upon moribund rats. After death, on cessation of the circulation, and as the body becomes cold, the fleas leave it and seek another host.

By associating the "evaporation" of the infection with the departure of the fleas, Simond inferred that these parasites were implicated in the transport of the infection. This inference was further supported by clinical observations of two kinds, viz., the site of the bubo, and the existence of a phlyctenule. Simond noticed that persons becoming plague-stricken after handling a dead rat did not necessarily develop their bubo in the axilla. As often as not in such cases the bubo was femoral. Hence the infection was not due to direct contact with the rat, but to some associated circumstance, such as invasion by fleas from the rat. It is obvious that such fleas might inflict a bite and inoculate the bacilli not on the hand or the arm, but on the leg or trunk, and thus produce a bubo elsewhere than in the axilla. He also observed that occasionally a small papule or vesicle—phlyctenule—was present on the area corresponding to the bubo; and more especially on a part where the skin was thin, e.g., the dorsum of the foot. The occurrence of such a phlyctenule is vouched for by several other investigators, though not all concur in Simond's interpretation of it. This local lesion is not always apparent, and, in fact, in the majority of cases it is not to be found; but this frequent absence, Simond contends, is due to the fact that it would only be produced when the inoculated bacilli were of comparatively mild virulence or in small quantity. Under such conditions there would ensue positive chemotaxis, local leucocytosis and reaction; whereas, if the bacilli were very virulent, the chemotaxis would be negative, and no such local reaction occur. Following up these observations, Simond succeeded in detecting plague bacilli in some of the phlyctenules and in fleas from plague rats, and with the latter he produced plague by inoculation of animals. He therefore concluded that if the fleas from the dead plague rat reach another rat or a human being, they may inoculate the bacilli they acquired by ingesting the blood of their former host, and so produce plague; the site of inoculation being occasionally indicated by a phlyctenule. By way of complete demonstration of his hypothesis, he showed that plague could be conveyed in the way suggested. He placed in a large glass jar a sick rat, and also a healthy animal (rat or mouse), the latter being enclosed in a small cage so as to prevent contact with the sick rat. If he left or placed fleas upon the sick rat, and allowed its body to remain lying in the jar for some hours after death, the healthy animal sometimes developed plague and died; but if he previously removed all the fleas from the rat and repeated the experiment otherwise precisely as before, the healthy animal did not die, but remained perfectly well.

Simond's observations and experiments were repeated in this laboratory as opportunity offered. As already mentioned, phlyctenules were found in six patients, and smear preparations were obtained from two of them. The examination of the preparations from one proved negative, but those from the other showed a small number of micro-organisms having the morphological characters of plague bacilli. As no further tests were possible, the exact nature of the bacilli remained unascertained. It may here be mentioned that a lesion resembling a phlyctenule was artificially produced in one of the experimental animals. A guinea-pig was inoculated in a small, shaved, sterilised area on the fore-leg, by being pricked with a needle previously sterilised, cooled, and then dipped in a plague-culture. On the following day a small inflamed papule had developed at the site of inoculation, and on the third day, when the animal died, this papule showed a whitish spot at its apex as though about to undergo vesiculation. *Post-mortem* examination revealed the general appearances of plague, including an axillary bubo, and plague bacilli were found in the papule, bubo, liver, and spleen. The production of the phlyctenule in this case corresponds with Simond's hypothesis, inasmuch as the number of bacilli inserted by the process adopted was very much less than in inoculation performed in the usual way, which is not followed by any such lesion.

Examinations were made of fleas from healthy human beings, from a plague patient, from mice, from rats, and from cats. The microscopical examinations all prove negative except in the case of fleas obtained from a rat actually sick with plague. This rat was taken in a house from which a case of plague had been removed five days previously, and in the vicinity of which many persons were attacked. The animal was killed with chloroform, and about a dozen apparently stupefied fleas were obtained from its body. The fleas were crushed up in a few drops of sterilised distilled water, and as preparations from the emulsion so obtained showed micro-organisms resembling plague bacilli (Fig. 5), the remainder of it was inoculated into a guinea-pig. The animal became sick, and died on the seventh day. The *post-mortem* appearances were those of plague, and micro-organisms resembling bacilli pestis were found in the bubo, in the blood of the heart, in the spleen, and in the liver. In

In the experiments performed with living fleas, the conditions described by Simond were slightly modified. A rat, selected because of its having many fleas upon it, was inoculated with plague bacilli from a culture and placed in a small wire cage. A second healthy rat was placed in a similar wire cage. The two cages containing the rats were both placed in the same (sheet iron) larger cage, the interval between them being about 2 inches. The inoculated rat died in three days, and its dead body was allowed to remain in the cage for twenty-four hours. It was then removed, and on examination was found to be generally infected with plague. The other rat remained perfectly well for a period of four weeks. The experiment was repeated under exactly the same conditions, except that numerous fleas, obtained by the chance discovery of a mouse's nest, were thrown into the cage, and upon the inoculated rat. This animal also died in three days, its body left twenty-four hours in the cage, and when examined found to be generally infected with plague. A third rat was placed in the uncleaned cage. Neither the first nor the third rat became infected.

It will be seen that the observations we had the opportunity of making in this laboratory gave support to Simond's assertions, as regards the presence of plague bacilli in phlyctenules and in fleas from plague rats, and, whilst the results in the experiments with living fleas were negative, it has to be noted that such tests are obviously liable to miscarry owing to the several uncontrollable factors involved in their performance.

(b) *Ingestion.*

Authorities are not agreed upon the question of the acquisition of plague by ingestion of infected diet. In the epidemic at Hong Kong in 1894, plague was said to sometimes take a special form indicating that the infection had entered through the stomach or intestines. This form is said not to have been observed in India, and *post-mortem* examinations have generally failed to reveal evidence of gastro-intestinal infection. No sign of intestinal plague was observed in our own cases. Experimentalists are also at variance—some having succeeded, others having failed, to infect animals by feeding. In this laboratory ingestion experiments were performed by feeding animals with bread, or biscuit, sopped in a bouillon-culture, or in an emulsion of agar-culture; and by the contamination of carrots or bread with, or, in the case of rats, actual feeding upon infected organs. The result of the eleven experiments of this series are shown in the following tabular statement:—

No.	Animal.	Experiment.	Result.
1	Guinea-pig	Fed with bread; infected from agar-culture	Unaffected.
2	"	" " bouillon-culture	"
3	"	" infected liver	Died in 5½ days.
4	"	" " "	Unaffected.
5	Mouse	" biscuit, sopped in bouillon-culture	"
6	Rat	" bread infected from agar-culture	"
7	"	" biscuit infected from bouillon-culture	"
8	"	" liver and sternum of infected rat	Died in 6½ days.
9	"	" " "	" 10½ "
10	"	" spleen	" 4½ "
11	"	" " "	" 4½ "

The various animals received the infected food on one occasion only, and in all cases a control animal, inoculated with the same material, died in the usual time. It will be seen that whilst feeding with cultures was always unsuccessful, a diet of infected organs proved fatal in one of two guinea-pigs, and in all from rats fed upon it. In the fatal cases there were no signs of external injury such as might result from scratching with infected claws, and no bubo indicating that inoculation had occurred in any such way. Further, in most instances the animals were kept in cages by themselves, so as to prevent fighting, &c., by which inoculation might also be effected. The fact of plague infection was verified by *post-mortem* and bacteriological examinations. The guinea-pig and two of the rats which died showed no gastro-intestinal lesion beyond congestion of the iliac portion of the small intestine, and even this was absent in a third rat. The mesenteric glands were not enlarged in these cases. But in the fourth rat there were well-marked indications of the passage of the infection through the walls of the digestive tract. The stomach and intestines showed fine hæmorrhages, and the ilium and first part of the large intestine were intensely inflamed. Connected with the stomach there was a large deeply-congested lymphatic gland. The blood-vessels in the mesentery were engorged with blood, and the mesenteric lymphatic glands were swollen and fused into a sausage-shaped mass. The cæcal end of the large intestine was involved in hæmorrhagic fibrinous exudation, causing adhesions, and extending into the swollen mesenteric glands. These various changes are shown in Figure 14.

From the results of these experiments, the provisional conclusion is drawn that animals may become infected by ingestion of infected materials. The susceptibility would appear to vary in different animals, rats being more liable to acquire infection in this way than the other species tested. It would seem also that something depends on the exact condition (virulence?) of the plague bacilli with which the food is contaminated.

(c) *Inhalation.*

Infection by inhalation is stated to be responsible for plague pneumonia, a fatal form of the disease of which we have fortunately had practically no experience. As in the case of ingestion, so with inhalation experiments, observers have sometimes succeeded, sometimes failed, to infect animals. In this laboratory the only experiments made in connection with this aspect of plague-infection were repetitions of those of Batzaroff, who produced pest-pneumonia by deposition of culture material on the uninjured nasal mucous membrane of rabbits and guinea-pigs, and by smearing the nostrils of rats and mice. The material used by us included culture material, and fresh plague-infected organs, but in five experiments performed the results were always negative.

APPENDIX B.

The Clinical Aspects of Bubonic Plague, as observed in the outbreak of the disease in Sydney during the period commencing 20th January and ending 9th August.

BY A. E. SALTER, M.B., Ch.M., Melb., in charge of the Isolation Hospital.

DURING that time, as the subject matter of the report which precedes this has shown, there were 303 cases of this disease reported at the office of the Department of Public Health for New South Wales.

Of these 303 cases, 10 were among persons of the Chinese race, and the remaining 293 among persons of European descent; of the 293 Europeans, 13 had become affected with the disease at some time subsequent to their inoculation with Haffkine's serum.

In order that a comparison may be instituted between persons of the same race only, these 10 Chinese have been kept in a separate group by themselves.

The 293 Europeans have been divided into four groups—the first three according to centuries—the first of these contains the first 100 Europeans reported suffering from Bubonic Plague, the second group contains the second 100 reported, the third contains the 93 remaining after the first 200 have been dealt with, the fourth being made from Haffkine's inoculated cases, which have been picked out from the different groups in which they are scattered and placed in Table 2, in order that the prodromal symptoms with which they were attacked may be compared with the prodromal symptoms of the complete group. Thus we have a total of five groups, which for convenience of reference have been called by the letters A for the first 100 European cases, B for the second 100, C for the remaining 93 Europeans, D for the inoculated persons, and E for the 10 Chinese.

Comparing the first three Groups A, B, C, of the series, to learn when they came under the notice of this Department, it is found that Group A was reported between the 20th January and the 12th April, in fact that these 100 cases developed in a period of 82 days. Group B came to light in 28 days, so that the second 100 cases were produced in slightly more than one-third the time that it took to produce the first 100. The cases of Group C were discovered between 9th May and 9th August, that is in 93 days, or in a period more than three times as long as it took to produce the cases comprising Group B.

As there is this difference between the periods of time taken to produce these three groups, it might be inferred that the virulence of the infection accrued during the first period, reached its zenith in the second, and declined during the third. Yet the death rate among the cases in Group A was 37 per cent., while it was 37 per cent. among the cases in Group B, and 22·6 per cent. among the cases in Group C, which seem to point, if not to a greater virulence in the first portion, to at least an equal virulence, and a study of the incidence of nervous symptoms tends to strengthen the latter inference. Taking a mean of all the temperatures recorded, when the case has been seen for the first time, the mean for Group A is 103·2, the mean for Group B is 102·8, and for Group C it is 102·1, showing that there was a gradual ebb in the temperature wave. Whatever be its cause, the first 100 cases of Bubonic Plague occurred at the rate of 1·2 per day, the second 100 at the rate of 3·5, and the third at the rate of 1 per day. The premonitory symptoms most frequently complained of in each group have been taken out and put into Table 1, and the number of deaths in each set of symptoms has been put down with the object of showing what mode of attack may be regarded most gravely, and therefrom to form a basis for prognosis in the earlier stages from the initial symptoms.

GROUP A.

From Table 1 it appears that pains in the body, back, and chest were complained of as initial symptoms in 23 cases; of these 23 eleven died giving a mortality of 47·8 per cent. Vomiting, not the commonest premonitory symptom, had the second greatest percentage of deaths among those who suffered from it. It was a premonitory symptom in 55 cases, and of the 37 persons who made up the total number of deaths in Group A 26 suffered from this initial symptom so that 47·3 per cent. of the persons affected with vomiting died. Headache was complained of in 72 cases, of them 26 died, giving a percentage of 36, while symptoms referable to the lymphatic glandular system were complained of at the very onset of the attack in 29 cases with 11 deaths. The percentage of deaths among cases presenting this symptom was 37·9.

For purposes of prognosis in Group A pains in the body, back, and chest were most important, vomiting being almost equal. The mean average of all the first recorded temperatures was 103·2.

Buboes.—The lymphatic glandular system was affected in the cases of this group 97 times, while in the remaining 3 no abnormalities were discovered nor referred to by the patient.

From Table 4 it appears that the most frequently affected glands were the right femorals, the next in order being the left femorals, while those next in order were the inguinals, but far behind the two first. The femoro-inguinal regions were responsible for a total of 83 cases, leaving 14 to be divided among all the others when the mortality among these cases is considered it is found that in the 3 cases with no glands there were 3 deaths, and among the 30 cases of right femoral, that there were 10 deaths, among the 25 cases of left femoral that there were 7 deaths. The femoro-inguinal regions with 83 cases were responsible for 25 deaths, while among the remaining glandular regions there were 9 deaths; so that the 14 cases of Bubonic Plague in which the sub-pectoral, axillary, or cervical glands were affected were responsible for 9 deaths showing a percentage of 64·2. The preponderance of mortality was much greater in cases with glandular troubles of the cervico-axillary regions. In 46 cases the buboes were incised. Of these 46 there were 3 operated upon which died subsequently, therefore, 43 of the incised cases recovered and 34 of the deaths took place prior to the suppurative stage being reached, leaving 20 cases in which recovery took place and the buboes resolved, so that of the 63 persons altogether who survived, 68 per cent. suffered from suppuration of their enlarged glands and 30 per cent. recovered with resolution of their glandular affections. Pain or tenderness of the glands at some period of the illness, not necessarily at first—was complained of 57 times altogether.

Secondary Buboes.—These occurred 7 times, but by the expression secondary buboes is meant those buboes occurring after a well-defined term had elapsed between the appearance of the first bubo or chain of buboes, because it was not always easy to determine the order of precedence where several buboes arose in the illness.

Nervous Symptoms (see Table 3.)—Symptoms referable to derangement of the nervous system, such as trismus, delirium, coma, semi-coma, staggering gait, thickness of speech, convulsions, screaming, occurred either singly or in combination with each other in 72 cases. Of these 72, there died 28, or a percentage

percentage of 38.9 Taking these symptoms separately, coma was seen 4 times, semi-coma 25 times, delirium (ordinary) 33 times, delirium (furious) 17 times, getting out of bed 9 times, hebetude 12 times, speech was affected 23 times, staggering gait is recorded as occurring twice, screaming of a wild and furious nature twice, convulsions 6 times, trismus twice, insomnia 7 times. Spitting: This curious habit occurred in 5 cases; it consisted of a desire to expectorate, though there was no mucous which could be regarded as obnoxious, as far as its appearance afforded opportunity for judgment. The cases which exhibited this symptom would sometimes expectorate right across a ward. If addressed upon the subject they continued their habit, taking no notice of remonstrances, and not trying to avoid any object which might be in the line of fire. Among these 5 there were 3 deaths. It was always regarded as a grave symptom, and in the 2 cases in this group which exhibited it, yet recovered, the train of the symptoms was as follows:—In the first, temperature 104.6, with furious delirium, clammy perspiration, pains in the muscles, irregular pulse, respirations with a frequency of 30 and in the second temperature 103.8, ordinary delirium, pulse very soft 124, respirations 38 and insomnia.

Organs of Vision.—The conjunctivæ were deeply injected in 7 cases; the ultimate result of this injection was as follows:—In two cases considerable mischief to the eyeball took place, the sight of the right eye being quite lost in the one, and considerable corneal impairment supervening in the other. In 3 cases it gradually dispersed, no lesion of the eye taking place; in the other two, though iritis and ulceration of the cornea took place, both recovered and left the Quarantine hospital without any apparent mischief being left behind.

Eruptions of the Skin.—Ecchymotic patches were seen in 6 cases, Erythematous eruptions 3 times, Petechial eruptions twice, Miliary eruptions 3 times, Scarlatiniform once, Eczematous once.

Tongue.—This organ presented the character of being covered with a creamy white fur on the dorsum, and having the tip and edges bright pink and clean in 43 cases.

Septicæmic Cases.—Those 3 cases, with no glandular lesions discoverable during life, died and were not admitted to hospital. The course of their illness in two cases was 30 hours; the third had been ill several days at notification. These may be regarded as Septicæmic cases.

GROUP B.

The premonitory symptoms of this group are found by reference to table 1 to have been, as in the former group, headache, vomiting, rigours, symptoms referable to the lymphatic glandular system, pain in the back, body, and chest, in the order named as far as frequency is concerned. When the mortality in each set of symptoms is considered, the cases of vomiting are accredited with 40.4 per cent. of deaths, the cases of pains in the body, back, &c., with 36.6 per cent., headache with 31.2 per cent., rigors with 34 per cent., and symptoms referable to the glandular system with 25.6 per cent. For purposes of prognosis in these cases, the vomiting stands the highest in the rate of mortality, pains in the back or body coming next. The mean average of all the temperatures first recorded is 102.8.

Buboes.—The lymphatic glands in this group were affected in 93 cases, and in 7 cases no glandular troubles could be discovered. The left femoral glands were affected alone 21 times, the right femoral alone 16 times. The right inguinal were affected 10 times, and the left inguinal 5 times. Taking inguinal and femoral for both sides together, we find the right groin affected 32 times, and the left groin affected 31 times. To get the femoro-inguinal chain complete there should be added the 4 cases in which both groins were affected in the one individual, and the one case in which the right femoral and left popliteal were affected. The total in this chain for Group B is, therefore, 68. It appears from these observations, and from the observations in Group A, that the femoro-inguinal chains on both sides had about equal chances of infection, and were very much more often affected than the other regions. It must be remembered that the glands of the groin were also frequently affected at the same time as were those of the region next to be considered.

The Axillary Region.—The axillary glands were affected unilaterally once for each side—the cervical glands of the right side once, and of the left side 3 times, in each case unilaterally; but axillary and cervical glands (not considering those just mentioned) were, in combination with some other of the lymphatics, affected 17 times. There were also 1 right and 1 left subpectoral, which are included in the axillary chain. On adding all these together, it appears that the cervico-axillary chain was affected 25 times. The mortality in these two divisions was 19 for the femoro-inguinal chain and 12 for the cervico-axillary chain, being a percentage of 26.4 in the first case and 48 in the second. The most fatal kind were the cervical, as in the 4 cases where the cervical alone were affected 3 died, or 75 per cent. Incision was necessary in the glands of this group in 41 cases. Of the 41 buboes incised there were 2 among them in which death supervened, leaving 39 cases operated upon with recovery, and 34 cases of death without the stage for operation being reached, and 25 in which there was recovery without incision. Taking the cases, therefore, of recovery, viz., 63 in all, it appears that the percentage of them which needed operation was 62, or somewhat less than the percentage needing operation in Group A, while the percentage of cases recovering in which the glandular structures did not break down at all was 39.

Secondary buboes occurred in 17 cases.

Nervous symptoms (see Table 3). Symptoms indicating derangement of the nervous system occurred either singly or in combination with each other in 62 cases; of these 26 died, giving a percentage of 42 deaths. Separately they occurred as follows:—Coma, 9 times; semi-coma (not counting it when it went on to coma), 8 times; delirium of an ordinary kind (not counting it when it became furious), 33 times; furious delirium, 15 times; getting out of bed, 18 times; mental hebetude, 6 times; wild delirious screaming, once; convulsions, twice; affection of the speech was noted in 15 cases; insomnia was complained of 5 times; and staggering gait noticed 5 times; spitting occurred in 4 cases, with 3 deaths.

The Organs of Vision.—In this group 4 persons suffered from a deep injection of the conjunctivæ, with the final result that in the case of 1 bilateral iritis, hypopyon and panophthalmitis supervened, with complete blindness. One case cleared up when in hospital, but on returning to work the left eye was found to be weak, and to have a tendency to a recurrence of the injection. The third cleared up completely, and the eyes were strong and well when last heard of. The last of these 4 died before the eyeball became affected.

Eruptions of the Skin.—Erythema occurred 4 times, ecchymoses 4 times, and petechiæ 4 times. In 1 case the body became purple all over sometime before death; in another varicella was just disappearing as bubonic plague came on. Epistaxis occurred in 1 case in this group important enough to require special notice (Case 183).

Septicæmic Cases.—There were 7 cases without glandular symptoms. Of these, 2 were admitted to hospital, the other 5 died too soon in their progress of their illness to admit of removal; of those 2 who were admitted, 1 recovered; the other, after lingering some days, finally succumbed.

GROUP C.

GROUP C.

As in the previous groups, the same premonitory symptoms were recorded. Forty-nine cases complained of vomiting, and 14 died; 49 also complained of headache, of them 10 died. Pains in the back, etc., were complained of only 13 times, with 3 deaths; rigors occurred in 62 cases, with 14 deaths. Symptoms referable to the glandular system are noted in 34 cases, with 5 deaths. Even when allowance is made for the fact that in this group only 93 cases are under consideration as against 100 in the two previous groups, it would appear that the number of persons complaining of pains in the back and bones had very markedly decreased. The mean average of the first noted temperatures was found to be 102.1.

Buboes.—The inguino-femoral chain in this group produced 58 of the total of 89 cases in which buboes were found, the remaining 31 being divided thus: Axillary and subpectoral regions furnished 16, cervical 4, and the cervico-axillary region combined with some other region, or with each other, furnished 11. There were 4 cases without any buboes, which brings the total up to 93. The mortality as shown in Table 4 points to the same preponderance in the same regions as was noticed in the other groups, the axillary and subpectoral chain being most fatal, with 50 per cent.; the cervical being the next in order, with 25 per cent., until the inguino-femoral chain is reached with 12 per cent. Thirty buboes were incised. Of these 30 incised cases 1 died, and 43 recovered without incision, the buboes resolving. Thus 40 per cent. of the cases recovering needed operation. There were 20 deaths in which no incision was justified. The percentage of cases recovering with resolution was 59.7.

Nervous Symptoms.—Symptoms referable to derangements of the nervous system: Coma occurred in 3 cases, with 3 deaths; semi-coma (not going into coma) in 3 cases, with 2 deaths; delirium (ordinary) in 18 cases, with 7 deaths; delirium (furious) in 6 cases, with 3 deaths; getting out of bed in 7 cases, with 2 deaths; hebetude is noted once, with no deaths; affection of speech in 12 cases, with 2 deaths; insomnia in 3 cases, with 2 deaths; loud screaming in 3 cases, with 1 death; convulsions in 1 case, with 1 death; staggering gait in 2 cases, with 2 deaths. One or more of the foregoing occurred either singly or in combination with each other in 39 cases, or in 42 per cent. of the total admissions. Of these 39 there died 16, being 41 per cent. of deaths. Spitting was observed in 1 case, which was fatal.

Organs of Vision.—The conjunctivæ were deeply injected in 5 cases with following result:—That in 1 case there was some iritis going on to hypopyon, which cleared up the eye, recovering finally, though very weak. Of the other 4 cases, 1 died too early in his illness to show what the future held in store for his eyes, while the remaining 3 never became more than merely conjunctiva injection; finally they cleared up altogether. Eruptions of the skin in this group were: Eczema, once; urticaria, several times; erythema, once; petechia, once; large ecchymosed patches came out in 1 case a short time before death.

Septicæmic Cases.—There were 4 cases in which no glandular symptoms were distinguishable during life. Of these, 2 were admitted to hospital, and 2 were overcome before it was possible to remove them. Of the 2 who were removed to hospital, 1 recovered; the other, after an illness of 9 days, died.

GROUP D.

This group comprises the cases inoculated with Haffkine's prophylactic. They are placed in Table 2 to show how their premonitory symptoms compare with those of the cases in Table 1, where the whole list of cases in each group is dealt with. It is worthy of note that on comparing these two tables it appears that the inoculated cases had milder prodromal symptoms. These persons suffered from vomiting as an initial symptom only 4 times out of the 13, and from pains in the back and body only once. Their glandular regions were affected as follows:—

Swelling of the right femoral occurred 4 times, of them 1 was incised; left femoral 4 times, of them 3 were incised; right inguinal once it was incised; left inguinal twice, 1 was incised; right inguinal and femoral once it was incised; right and left femoral once, and was not incised; right cervical once, and was not incised. Thus of these 14 buboes, 7 were incised, the remainder resolved. As strengthening this comparison, it is to be borne in mind that Table 1 has the advantage of having the inoculated cases included in it, so that it gets the benefit of their less-marked symptoms.

GROUP E.

Chinese.—There is not much to be said of this group, because of the 10 persons who were attacked 7 were discovered in extremis. Those whose faculties were not completely clouded by the intoxication of their disease were unable to speak English well, and could not give much information. Two out of 10 recovered, and of them 1 suffered the loss of an eye as a result of the injection of the conjunctivæ followed by iritis and panophthalmitis. Both eyes were affected with iritis, but in the 1 case it cleared away, and good vision has remained in this eye, while total loss of vision resulted in the other. The buboes recorded were 1 right inguinal, 1 right inguinal and femoral, 1 right and left inguinal, 1 left axillary, 1 left cervical, 1 right and left cervical, 1 right femoral. Three had no buboes, as far as can be ascertained. That case with the right inguinal and femoral gland affected, and that case with the right femoral affected, are the 2 which recovered. In both cases the buboes were incised. In 1 of the Chinese a carbuncle formed on the right hip. He recovered. Of the 10 who were attacked, 5 were admitted to hospital, the other 5 died before they could be removed. Of the 5 admitted to hospital, 2 recovered, the remainder died.

Taking all the cases together, reference must be made to a symptom exhibited by a few cases, and not referred to in the detailed account, viz., swelling of the legs, especially of the thigh. The swelling was not oedematous. No glands were perceptible to the touch, and there was no tenderness in any of the glandular regions.

This occurred only occasionally during the acute febrile stage of the disease, and in some cases death supervened, in others recovery.

That swollen condition frequently seen during and after convalescence is not the swelling now referred to. This last was fairly frequent, and was doubtless caused by the impediment to the return circulation resulting from a healing bubo.

The first took place when there had been no apparent bubo.

Hæmorrhages.—Those hæmorrhagic effusions occurring under the skin in cases of bubonic plague have been dealt with in the various groups under the heading of eruptions of the skin.

Under the present heading the symptom referred to is an unnatural discharge of blood, sufficient in quantity either to threaten the life of the patient, or being poured into some important organ to cause the destruction of that organ. Although

Although hæmorrhage from the lungs, in the form of hæmoptysis, occurred in about half of the cases in which the secondary cause of death is set down as apnoea, that form of hæmorrhage is not meant here. It never occurred in sufficient quantity to endanger life.

Epistaxis.—This was not at all frequent, even in a mild form, although it was seen occasionally. I had no bearing on the cases, and did not happen in the earlier course of the fever, excepting in one case. This was one of those cases in which the hæmorrhage was excessive enough to be a source of danger to the patient. It was stopped only with difficulty, and later on death supervened, and appeared to have been accelerated by the loss of blood. Hæmorrhage from the stomach occurred twice in such large volume that it caused the collapse of the patient. It came on suddenly, and lasted for but a few minutes, very large quantities of dark red blood being ejected.

The patients admitted to Quarantine hospital were suffering from an acute febrile disease, having prevailing characteristics distinguishing them from the ordinary run of febrile diseases met with in general practise.

Those characteristics were most commonly some affection of the lymphatic glands, such as swelling, pain, or tenderness referable to one or more of the glandular regions. Considerable mental disturbance usually appearing in the form of drowsiness and a general appearance of being very ill without any cause being found. These indications were accompanied by marked disturbance in the circulation, concerning which nothing has been said in the detailed report of the symptoms. The pulse, in all cases where it was evident from other indications that the person under consideration was very ill, had characters which were in sympathy with the general condition; it was usually accelerated and compressible; sometimes dicrotic, sometimes intermittent; and was always watched with the greatest care.

In cases where the illness was prolonged past the stage of acute plague, the pulse would often be found accelerated, and as many as 120 or 130 beats to the minute without any marked rise in temperature. This acceleration was not reduced by the exhibition of such drugs as digitalis and strophanthus, although given in large continuous doses. It seemed that where the disease left the pulse with those characteristics it gradually returned to its natural condition of its own accord. The respirations were accelerated not, however, on account of any mischief being present in the structure of the lung itself, but irrespective of lung complications, and in cases that were about to end fatally that increase would gradually continue until as many as fifty per minute would be recorded. During the month of May and thereafter the character of the symptoms, as shown by the cases on their admission to the Quarantine hospital, changed. It was conjectured from the alteration in the type of the cases received that the outbreak was coming to a conclusion. Cases were admitted but seldom in which unconsciousness was present. Usually the cases showed very little indications of being very ill. Either some fever or glandular trouble was present, generally there were both, but other constitutional symptoms were less frequent. Not only was the mean average temperature lower, but there was a diminution in frequency in the derangement of the nervous system. This is evidenced by the fact that the records of the cases show that the frequency of certain nervous symptoms, either alone or combined, was in Group A, 72 per cent.; in Group B, 62 per cent.; but was in the cases of the last ninety-three only 42 per cent. (see Table 3). This marked alteration was not due to any particular method of treatment adopted; it was due to the difference in the type of the cases. The 72 or 62 or 42 per cent. of the persons who suffered from the nervous symptoms detailed did so from the time of their admission to Quarantine; patients were, in the early part of the outbreak, for the most part in a drowsy or semi-conscious state when admitted. In the latter part of the outbreak these symptoms were conspicuously absent in the patients when admitted. Indeed, no such thing as a case entering Quarantine with mild symptoms, and getting worse or dying, ever happened. The first 200 cases were, with some exceptions, either delirious or drowsy or in a comatose state when they were received, but more than half the latter cases were quite conscious, mentally clear, and not inclined to believe that they were seriously ill, nor did they turn out to be so. Probably the source whence the infection was being received was no longer producing such virulent material, but whatever be the reason it is certain that the type of the disease was becoming modified.

Cause of Death.—In considering the secondary cause of death, only those cases which were admitted to Quarantine and died there are referred to.

The number of these is 64, leaving 39 who died elsewhere, the end having come either too quickly to permit of their removal, or else, as no doubt happened in the case of some of the Chinese, the fact of the individual's illness did not become known until he was in a moribund condition, or perhaps actually dead.

The secondary cause of death is as follows:—

Cardiac failure.—Failure of the central organ of circulation was the secondary cause of death in 26 cases—that is to say, the heart gradually grew weaker and weaker until death supervened.

Apnoea.—In 24 cases the patients were really asphyxiated. There was a collection of thin mucous in the trachea and bronchi; sometimes there was hæmoptysis. Abnormal chest sounds were not always discernible.

The condition seemed to be as if the mucous membrane of the bronchi was affected similarly to the mucous membrane of the eye, and by the same irritant. (The same irritant no doubt was at work on the mucous membrane of the fauces in the cases where spitting was a prominent symptom.)

Exhaustion.—In 5 cases the patients, having got through the acute stage of plague, seemed unable to recover their vitality. The digestive organs did not act, or there was continuous vomiting, or the rate of the pulse, as has already been stated, became very high, and did not respond to the drugs which were exhibited. The nervous system seemed to have received permanent injury, and they died ultimately of exhaustion, after an illness of from thirteen to ninety-eight days.

Convulsions.—These were the secondary cause of death in 6 cases, and of them there was a previous history of convulsions in one case only; but, probably, if the facts could have been traced, it would have been found that a family history of convulsions existed in the majority.

Hæmorrhage.—Hæmorrhage from the stomach (already mentioned among the hæmorrhages) was so profuse as to terminate life suddenly in 2 cases.

Coma.—In 1 case the patient was in a profound coma, and continued so until death, being in that condition a little over two days.

TABLE 1 showing the number of times the symptoms mentioned occurred as the earliest observed symptoms of illness in 293 whites, divided into three arbitrary groups containing—in Group A, 100 cases, 20th January to 12th April; in Group B, 100 cases, 12th April to 9th May; and in Group C, 93 cases, 9th May to 9th August;—together with the number of Deaths which occurred among patients having the symptoms as specified.

The cases in Group D are those of inoculated persons, and have been reckoned in the previous columns of this Table.

APPENDIX C.

Notes on some Lesions of the Eye ; by C. Gordon McLeod, M.B., Ch.M.

On April 14th I visited the Quarantine Hospital at North Head, and examined four patients suffering from eye trouble. They were as follows:—

Case 10.—Right eye ; large superficial corneal ulcer of dendritic type ; little photophobia ; moderate ciliary congestion ; no hypopyon.

Case 17.—Right eye ; extensive exudation of pure lymph in anterior chamber ; subsiding iritis, with closed pupil. No keratitis.

Case 86.—Both eyes ; slight attack of simple iritis.

Case 40.—Left eye ; small central corneal ulcer, with considerable iritis.

In case 17, the eye lesion appears to be specific to the general disease from which the patient is suffering. The entire absence of outside causes points to a septic embolus setting up a disastrous intra-ocular suppuration.

As to the other cases, there is nothing in the appearances to distinguish them from similar trouble occurring under many other circumstances ; but as keratitis and iritis have been frequently noted in the course of plague, their presence here is probably more incidental than accidental.

APPENDIX D.

Post-mortem notes made on twenty-four cases of plague by the Government Pathologist (Dr. G. H. Taylor), by the Pathologist to Sydney Hospital (Dr. Sydney Jamieson), and by Dr. F. P. Sandes, Resident Medical Officer, Prince Alfred Hospital.

Case 22. March 17. F., æt. 14. Duration of illness, 30 hours.

Body well nourished. Skin pale. No enlarged glands. Hæmorrhage around the femoral glands, but no œdema. Arachnoid and pia mater much congested. Small hæmorrhages scattered over pulmonary pleura, upper surface of diaphragm, costal pleura, surface of heart, interior of heart and pericardium, the capsule of kidneys, and surface of intestines. Several of these hæmorrhages appeared to have a slightly necrotic centre. Hæmorrhage into the mucous coat of stomach. The hæmorrhages varied in size from a pin's head to a three-penny piece. The lungs were congested and œdematous. The liver slightly fatty. The spleen normal in size and firm. Colour of splenic pulp a dark red. Dr. Armstrong removed a piece of the spleen. G.H.T.

Case 58. April 1. M., æt. 43. Duration of illness, 7 days.

External appearances.—Fairly well nourished. Body pale. Rigor mortis universally present. *Post-mortem* lividity very marked over dependent parts of body. A few small livid petechiæ, about size of pin-heads, were found in the anterior aspects of both legs.

Lymphatic Glands.—The axillary, brachial, and inguino-femoral glands were dissected out. In the case of the latter groups some of the glands were slightly enlarged, and on section were softened and somewhat mottled, but no hæmorrhagic extravasation was found around them.

Thorax.—Cavities : Contained no subserous hæmorrhages and no excess of fluid.

Lungs.—Both were somewhat congested and slightly œdematous, but were otherwise normal. The glands at the roots of the lungs were normal in appearance. No petechial hæmorrhages were found in the pleuræ.

Heart (weight 10 $\frac{3}{4}$ oz.).—Both ventricles were filled by pale yellow gelatinous clot, which was tightly adherent to the meshes of the columnæ carneæ. Otherwise the organ was healthy looking.

Abdomen.—Peritoneum healthy. No petechial hæmorrhages.

Liver.—Enlarged (weight, 5 lb. 8 $\frac{3}{4}$ oz.). It was of a uniform yellow colour, and of soft consistence. This was found microscopically to be due to an extensive fatty degeneration of the liver.

The gall-bladder and its contents appeared normal.

Stomach and Intestines.—In the stomach were numerous submucous extravasations of blood, especially towards its cardiac end. The mucous membrane was corrugated and covered by a thick, glairy, tenacious mucus.

The mucous membrane of the intestines was slightly congested, but otherwise normal.

Genito-urinary System.—Right kidney (6 $\frac{3}{4}$ oz.) : Organ swollen, and of soft consistence. Its cortex was pale and swollen. On section the kidney substance overlapped the divided capsule. The capsule was thin, translucent, and non-coherent.

Left Kidney (7 $\frac{1}{4}$ oz.).—Similar to its fellow.

Microscopically the kidneys showed proliferation and desquamation, with cloudy swelling of the tubular epithelium, and also of the epithelial lining of the Bowman's capsules.

The bladder and ureters showed nothing abnormal.

Hæmopoietic System.—The spleen was enlarged ; somewhat softer than normal. On section the pulp had a brownish-red colour, and the trabeculæ were obscured by the swelling of the pulp.

The

The mediastinal and mesenteric glands were unaffected, but chains of vessels running along both iliac vessels were somewhat enlarged and redder than normal.

Nervous System.—The brain showed nothing abnormal save some slight excess of fluid beneath the lepto-meninges.

Films from the spleen pulp and the blood of the right median basilic vein were made and stained by dilute aqueous solution of fuchsin, and showed numerous short oval-shaped bacilli, many of which showed characteristic bipolar staining.

Films were also stained by Gram's method, and showed the bacilli to be decolourised. S.J.

Case 78. April 6. M., æt. 18. Duration of illness, 72 hours.

Body pale, but cyanosed. Numerous small excoriations in both forearms, the result of scratching—resulting from the irritation of mosquito bites. Some abrasions on lower parts of both legs. No petechiæ. The inguino-femoral glands and the glands above Poupart's ligament on the right side were enlarged.

Thorax.—Cavities: Nil.

Lungs.—Nothing abnormal, except a few small petechial hæmorrhages. Heart.—Muscle apparently healthy. All its cavities were completely filled by pale yellow gelatinous clot, firmly adherent to columnæ carneæ. Valves and aorta healthy.

Abdomen.—Liver: Enlarged and mottled. Gall, bladder, and bile apparently normal. Stomach and intestines.—Mucosa of stomach swollen and mamillated, and covered with ropy mucus. Numerous petechiæ in the submucous coat. In some parts of the large intestine there were many submucous hæmorrhages, some as large as a three-penny piece.

The mesenteric glands were enlarged, but not hæmorrhagic.

Genito-urinary System.—Kidneys enlarged, and softer than normal. Cortex swollen and pale. No hæmorrhages in substance or capsule. Capsule stripped readily.

Bladder and Ureters.—Healthy.

Hæmopoietic System.—Spleen: Slightly enlarged, and somewhat soft. On section of a dark reddish-brown colour.

Nervous System.—Brain healthy. The iliac and inguino-femoral glands on the right side were enlarged and softened. On section they were dark and mottled, and there was a considerable amount of peri-capsular hæmorrhage. There was also marked œdema (inflammatory) of the retro-peritoneal tissue in both iliac regions.

The blood, spleen, and enlarged glands all showed numerous plague bacilli. S.J.

Case 79. April 6. F., æt. 61. Duration of illness, 7 days.

Heart and lungs not examined. Axillary glands enlarged. Femoral glands not increased in size. Liver normal in appearance. No superficial hæmorrhage. Spleen enlarged somewhat, soft, darker colour than normal; no superficial hæmorrhages. Intestines normal. Mesenteric glands firm and rather prominent. Kidneys healthy. F.P.S.

Case 84. April 7th. M., æt. 3. Duration of illness, 51 hours.

External appearances.—Rigor mortis universally present. *Post-mortem* lividity well marked. Numerous petechiæ on chest, abdomen, and legs. No definite bubo to be made out.

Thorax.—Cavities: Empty. No petechial hæmorrhages.

Lungs.—Somewhat congested. There were a few petechial sub-pleural hæmorrhages, otherwise nothing abnormal found.

Heart.—Showed nothing abnormal except some pallor of its muscular walls.

Abdomen.—Peritoneum: No petechiæ; no abnormality observed.

Liver.—Somewhat enlarged and softened. It was very much mottled in appearance, and was found to be the seat of an extensive fatty degeneration.

The gall bladder and its contents showed nothing unusual.

Stomach and Intestines.—The stomach showed a few submucous hæmorrhages. The small intestine showed some swelling and infiltration of the solitary glands and Peyer's patches. Throughout the whole length of the intestines were found numerous small submucous hæmorrhages.

The pancreas was the seat of a somewhat extensive hæmorrhagic extravasation, both into its substance and beneath its serous coat.

Genito-urinary System.—Right kidney was enlarged and softer than normal. The capsule was tightly stretched over the organ. It stripped readily. No hæmorrhagic extravasations were found either in the substance of the organ or beneath its capsule.

The cortex was pale and swollen, and found to be the seat of an early catarrhal nephritis (microscopically).

Left kidney similar to its fellow.

Bladder and ureters.—Healthy.

Hæmopoietic System.—The spleen was enlarged and of subnormal consistence. Its pulp was of a light brownish-red colour, and its trabeculæ were obscured.

The lymphatic glands along the course of the iliac and femoral vessels were slightly enlarged and of a dark-red colour. On section they were found to be of soft consistence and to be markedly mottled. Around these enlarged glands was an area of subserous hæmorrhages.

The brain showed no abnormality.

Microscopic examination of the spleen pulp and blood was made, and enormous numbers of typical plague bacilli were found.

The blood, in addition, was found to show a very extensive leucocytosis and there were present also numerous myelocytes and nucleated red corpuscles. S.J.

Case 93. April 9. M., æt. 22. Duration of illness, 36 hours.

Died 8th April. Body, face, and neck cyanosed. No petechiæ. Femoral, inguinal, and iliac glands, red in colour and mottled in section, not enlarged: surrounded by hæmorrhage. Lungs œdematous and congested with numerous small sub-pleural hæmorrhages. Hæmorrhage in pericardium and surface of heart. Heart contained dark clots. Liver mottled with patches of fatty degeneration. Spleen slightly enlarged and softer than normal. A few hæmorrhages on surface of intestines. A few submucous hæmorrhages in stomach. Large sub-capsular hæmorrhages in kidney.

Death reported to coroner as due to plague. Spleen and blood afterwards examined by Dr. Bowker, who confirmed the opinion, which was quite clear from the *post-mortem*. G.H.T.

Case 111. April 13. M., æt. 36. Duration of illness, 36 hours.

The body was that of a well-nourished and fairly muscular man; skin pale, and face placid. Hæmorrhage around the inguinal bubo, and œdema; hæmorrhage around the femoral, iliac up to the lumbar glands. A few petechiæ in the pulmonary pleura. Lungs œdematous. Dark soft clots on both sides of heart, with soft pale clot in right ventricle. Muscle and valves normal. Scattered hæmorrhage in posterior mediastinum. Hæmorrhage around round ligament of liver. Scattered petechiæ on surface of liver. Subserous and submucous hæmorrhages in gall-bladder. Hæmorrhages into pancreas and into retro-peritoneum and surface of kidneys. Spleen normal in size and consistence, dark red in colour. Many small areas of congestion in arachnoid, which, from simple inspection, resembled hæmorrhages (small). G.H.T.

Case 114. April 15. M., æt. 62. Duration of illness, 48 hours.

Body fairly nourished. Numerous petechiæ all over the body. No wounds or abrasions of any sort. Double inguinal hernia. Decomposition signs showing in legs and lower abdomen.

Thorax.—Lungs: Both were markedly congested. A few small sub-pleural hæmorrhages.

Heart.—A few sub-epicardial hæmorrhages. Marked *post-mortem* staining of the endo-cardium. Heart muscle soft and flabby. Badly formed pale clots on both sides.

Abdomen.—Liver: A few small sub-capsular hæmorrhages. Organ slightly pale, but no marked fatty change. Consistence soft.

Stomach.—Showed some small hæmorrhages near the pyloric end.

Kidneys.—Very soft, and somewhat swollen. Cortex swollen, especially the inter-pyramidal portion.

Bladder and Ureters.—Showed some sub-peritoneal hæmorrhages over the fundus of the bladder.

Spleen.—Much enlarged and very soft in consistence.

Brain.—Nothing abnormal.

Lymphatic Glands.—The left inguinal and iliac glands were slightly enlarged and discrete. There were some hæmorrhages around the iliac glands.

Films from the blood and spleen pulp showed a few plague bacilli and numerous streptococci. Films from the enlarged gland showed numerous plague bacilli.

S.J.

Case 129. April 21. F., æt. 68. Duration of illness, 24 hours.

All the organs were very much congested and in a decomposing state; they were also, especially the liver, full of air cavities. Heart showed old mitral disease. Liver not enlarged. Spleen not enlarged. Numerous hæmorrhages in the capsule. Hæmorrhage along the line of iliac vessels. Brain, like other organs, soft and congested. Smear preparations from blood in iliac vein, and also from spleen, showed numbers of bacilli corresponding to those of *pestitis bubonica* with bi-polar staining, also *proteus vulgaris*.

S.J.

Case 132. April 22nd. F., æt. 17. Duration of illness, 96 hours.

Body well nourished. A few petechiæ about the legs. Large swellings on both sides behind and below the angles of the lower jaw.

Thorax.—Cavities: No gland or adhesions.

Lungs.—Over both pleural surfaces were a few subserous hæmorrhages. Both were slightly congested, but otherwise healthy.

Heart.—Muscle firm and pale. The right ventricle was filled by mixed clot. Valves and endocardium healthy.

Abdomen.—Peritoneum: Several small hæmorrhages seen beneath the peritoneum covering the lumbar portion of spine.

Liver.—Numerous small hæmorrhages on anterior surface of liver and over the fundus of the gall-bladder. Scattered through the substance of the liver were numerous small pin-point white masses closely resembling miliary tubercles. Some of these were surrounded by hæmorrhage.

Stomach and Intestines.—A few submucous hæmorrhages in the stomach.

Genito-urinary System.—Both kidneys were slightly enlarged and showed a few sub-capsular hæmorrhages. Cortex swollen and pale in both. Bladder and Ureters: Nil.

Uterus: Small. Tubes and ovaries congested, but no hæmorrhages around them.

Hæmopoietic System.—Spleen: Enlarged and softer than normal. On section of a dark reddish-brown colour.

Tonsils.—On the surfaces of both were sloughy patches, and on squeezing them a puriform fluid exuded from the crypts.

The lymphatic glands at the root of the mesentery below the pancreas were enlarged and softened and had hæmorrhage around them.

The glands on either side of the neck near the angle of the jaw were somewhat enlarged, softened, and mottled in appearance. They were absolutely embedded in a tissue composed of extravasated blood and inflamed cellular tissue. This appearance was visible along the entire course of both sterno-mastoid muscles.

Brain.

Brain.—Somewhat hyperæmic, but otherwise normal.

Microscopic examination of the blood, spleen pulp, and the juice of the enlarged cervical glands showed numerous plague bacilli.

The puriform fluid from the faucial tonsils was inoculated upon some sloped serum (solidified). In eighteen hours a copious growth took place, which was found to consist of rod-shaped organisms closely resembling the *Bacillus Coli Communis*. No Klebs Loeffler bacilli were found.

S.J.

Case 140. April 24. M., æt. 59. Duration of illness, 5 days.

Body rather obese. Small bruise over left eye. Numerous petechiæ on trunk and limbs. Rigor mortis and lividity well marked.

Thorax.—Lungs: Showed nothing unusual.

Heart.—Apparently healthy; full of pale yellow gelatinous clot on both sides.

Abdomen.—Peritoneum: Showed no petechiæ.

Liver.—Enlarged. Very fatty, and in an advanced stage of cirrhosis.

There were numerous hæmorrhagic points in the mucous coat of the gall-bladder.

Spleen.—Very large (about twice its normal size). On section it was found to be very soft and of a dark reddish-brown colour. Its trabeculæ were obscured.

Kidneys.—Both were enlarged; softer than normal. Numerous small sub-capsular hæmorrhages. Capsule was thin and non-adherent. The cortex was pale, swollen, and slightly mottled.

Lymphatic System.—No enlargement or sign of disease was found in any of the lymphatic glands.

A microscopic examination of the spleen pulp showed numerous typical plague bacilli present.

S.J.

Case 142. April 25. M., æt. 5. Duration of illness, 51 hours.

Body well nourished; skin pale, excepting slight *post-mortem* lividity on back. No enlarged glands. Hæmorrhage around the femoral, inguinal, and iliac glands on left side. Glands slightly inflamed. Lungs slightly œdematous, with a few petechiæ in pulmonary pleura. Liver slightly enlarged. Hæmorrhage into pancreas. Spleen normal in size and firmness. Splenic pulp dark red in colour. Heart contained dark and pale clots.

Piece of the spleen afterwards handed to Dr. Tidswell.

G.H.T.

Case 143. April 25. M., æt. 49. Died in a Public-house bar. No information.

A few petechiæ were present on the arms and legs. *Post-mortem* lividity and rigidity were both well marked.

Thorax.—The lungs showed nothing abnormal.

The heart showed nothing abnormal, except a few petechiæ on the visceral pericardium. It contained dark fluid blood.

Abdomen.—Peritoneum: There were numerous petechiæ upon the serous coats of the intestines.

Liver.—Somewhat enlarged and fatty.

Spleen.—Slightly enlarged; of firm consistence. On section of a dark reddish-brown colour.

The kidneys were swollen and pale. The cortices were somewhat swollen.

There was no evidence of enlargement of the lymphatic glands in any part of the body.

Microscopic films of the splenic pulp showed enormous numbers of plague bacilli.

S.J.

Case 173. May 3. F., æt. 56. Duration of illness, 9 days.

Body very obese. Face and neck much swollen, livid, and congested. *P.M.* lividity very marked.

Thorax.—Cavities: No hæmorrhages or fluid. Lungs: Engorged, but otherwise normal. Heart (13½ oz.): Muscle pale; both ventricles and auricles contained a small amount of mixed clot.

Abdomen.—Peritoneum: Nil.

Liver.—Slightly enlarged, of soft consistence. Had a mottled appearance. No sub-capsular hæmorrhage. Liver evidently fatty.

Stomach and Intestines.—A few small submucous petechiæ in the stomach. Intestines were in places somewhat congested looking.

Genito-urinary System.—Both were enlarged and of rather soft consistence. On section they were dark and cyanotic. Cortex swollen. Capsule healthy.

Hæmopoietic System.—Spleen: Slightly enlarged; darker than normal; on section it was of about normal consistence and of a mahogany colour. Brain: Nil. Lymphatic Glands: In the right femoral region was an enlarged gland, about the size of a small hen's egg. The inguinal glands were also enlarged. The glands along the iliac vessels were also enlarged. All these glands were softened and somewhat mottled, and were surrounded by areas of extravasated blood.

Microscopic examination of the blood, spleen pulp, and the juice of the enlarged glands showed numerous plague bacilli.

S.J.

Case 184. May 2. M., æt. 59. Duration of illness, 75 hours.

Body well nourished. Rigor mortis universally present. *Post-mortem* lividity well marked. A few small petechiæ on legs and flanks. An enlarged gland could be felt in the left groin.

Thorax.—Lungs: Somewhat congested, but otherwise normal. Heart: Showed nothing abnormal. No ecchymoses in pleural or pericardial serous sacs.

Abdomen.—Liver: Slightly enlarged and mottled. A few petechial hæmorrhages found beneath the capsule of Glisson.

Spleen.—Enlarged; somewhat subnormal in consistence. On section the pulp was found to be softened and of a dark reddish-brown colour.

Kidneys.—Enlarged; capsule stripped readily; cortex pale and swollen.

Bladder

Bladder and Ureter.—Healthy.

Stomach and Intestines.—Showed nothing abnormal, except that there were a few petechiæ in the mucous membrane of the stomach near its cardiac end.

Pancreas.—Nil.

The femoral group of glands in the left groin were enlarged, softened, and surrounded by hæmorrhage. On section they were mottled.

Microscopic films from the spleen and enlarged glands showed numerous plague bacilli.

S.J.

Case 197. May 6. F., æt. 5. Duration of illness, 48 hours.

Body was well nourished. A few petechiæ about the neck. On left side of neck, a little below the ear, I found a bubo about the size of a pigeon's egg. On cutting into this I found the gland surrounded by hæmorrhage, with œdema of the adjoining tissues. Slight œdema of the lungs, with numerous petechiæ in pulmonary pleura. Heart contained dark and soft pale clots. Liver soft and fatty. Hæmorrhage into pancreas. Small hæmorrhages on surface of liver, intestines, and kidneys. Spleen normal in size, not softened. Splenic pulp red in colour.

Death due to plague. This was afterwards confirmed by an examination of the spleen made by Dr. Tidswell.

G.H.T.

Case 198. May 7. F., æt. 65. Duration of illness, 6 days.

The body was that of a stout, well-nourished woman; skin was pale, excepting slight *post-mortem* lividity over the back; the face was placid. No enlarged glands. Lungs œdematous. Heart soft and fatty; dark and soft pale clots on both sides. Liver enlarged and fatty. Spleen much enlarged and soft. Splenic pulp very dark in colour. Kidneys cirrhotic. The femoral glands on right side were deeply congested, but not enlarged, and the tissues around them appeared to be normal. I dissected out the inguinal, axillary, and cervical glands, and found nothing abnormal. No trace of hæmorrhage, excepting a small patch, close to right ovary, which was bound down by old adhesions to the peritoneum; the hæmorrhage was beneath the peritoneum, and very dark in colour.

G.H.T.

Case 226. May 15. M., æt. 28. Duration of illness, 24 hours.

Well-nourished, muscular Chinaman. Body and face livid; hands clenched. Numerous petechiæ in neck and chest. Bubo about size of a hen's egg, a little behind and below the left ear. On cutting into this I found hæmorrhage surrounding the gland with œdema of the adjoining tissues. Lungs congested, and slightly œdematous. Small scattered hæmorrhages in pulmonary pleura, and pericardium; also on surface of heart. In the centre of several of these hæmorrhages there appeared to be a necrotic spot. The heart contained a quantity of imperfectly clotted dark blood. Numerous hæmorrhages on surface of liver and kidneys. Liver enlarged and fatty. Spleen slightly enlarged and soft, of a dark red colour.

G.H.T.

Case 234. May 18. M., æt. 20. Duration of illness, 7 days.

Body spare. Rigor mortis present, but not yet complete. Body still warm. Lividity marked. No petechiæ. Enlarged gland felt in left groin.

Thorax.—Lungs: Deeply engorged, but otherwise normal. Heart: Somewhat flabby, but otherwise not abnormal. Both sides filled with whitish-yellow gelatinous clot.

Abdomen.—Liver: Not enlarged. Numerous subcapsular hæmorrhages. Organ very soft and extensively fatty.

Spleen.—Very large (about twice normal size), of subnormal consistence. On section of a dark red colour. Pulp very soft. Trabeculæ obscured.

Kidneys.—Softer than normal. Cortex swollen and pale and speckled with numerous pin-point hæmorrhages. Capsule thin and non-adherent.

Lymphatic Glands.—One of the femoral glands on the left side was enlarged slightly and surrounded by sub-capsular hæmorrhage. On section it had a mottled appearance.

Films were made both of the spleen pulp and of the juice of the enlarged gland. In the former no plague bacilli were found, whereas the latter contained typical plague bacilli in great abundance.

S.J.

Case 238. May 19. M., æt. 70. Duration of illness, 48 hours.

Body well nourished. Rigor mortis and lividity both present, the latter excessive. A few small petechiæ about the size of pin-heads were scattered over the trunk and limbs.

Thorax.—Both lungs were the seat of a chronic interstitial pneumonia, the result of irritation from inhaled coal pigment. There were no petechiæ on the pleura. The bronchial mucous membrane was swollen and reddened, and the tubes contained a quantity of frothy muco-purulent matter.

The heart showed nothing abnormal, except that its right side was distended by pale yellowish gelatinous firmly adherent clot.

Abdomen.—Peritoneum healthy. Liver enlarged and mottled in patches. There were numerous hæmorrhages of small size into its capsule. Spleen enlarged, somewhat softer than usual. Its pulp was of a dark reddish-brown colour. The trabeculæ were obscured owing to the swelling of the pulp.

The kidneys were swollen and of soft consistence. These capsules stripped readily. Cortices were pale, somewhat mottled and swollen. On division of the capsule the kidney substance "lipped" over the divided capsule. The other organs in the abdomen showed nothing abnormal.

Lymphatic Glands.—One of the glands in the left femoral region was swollen, enlarged, and surrounded by a zone of hæmorrhage. On section it was soft and had a mottled appearance. The other glands showed nothing abnormal.

Microscopic examination was made of films from the spleen and enlarged gland, and large numbers of plague bacilli were found.

S.J.

Case 240.

Case 240. May 20. M., et 45. Duration of illness, 12 hours.

Body very obese. A few petechiæ were found on the trunk and limbs.

Thorax.—Lungs somewhat engorged. Heart.—The walls of the heart, especially the left ventricle, were of soft consistence, and mottled from early fatty degeneration. The cavities of the organ contained a small quantity of dark fluid blood. Valves were healthy.

Abdomen.—Liver markedly enlarged, and the seat of extensive fatty degeneration. Spleen enlarged, of normal consistence. On section of a dark red colour. Trabeculæ obscured.

Kidneys somewhat enlarged and of soft consistence. On section the capsule stripped readily. The cortex was paler than usual and mottled throughout with numerous pin-point hæmorrhages. Stomach showed evidence of chronic gastric catarrh, and also numerous recent submucous hæmorrhages.

Lymphatic Glands.—In the right femoral region one of the glands was found to be swollen slightly, and to be surrounded by a small hæmorrhagic zone. On section it had a mottled appearance.

Microscopic examination of the spleen and lymphatic gland pulps showed numerous plague bacilli.

S.J.

Case 242. May 21. M., et 17. Duration of illness, 12 hours.

External appearances.—A few petechiæ on sides of chest and on back. Rigor mortis present. Lividity marked. The glands in both inguino-femoral regions were felt to be enlarged and "shotty."

Thorax.—Lungs somewhat engorged. No sub-pleural hæmorrhages. Heart apparently healthy. A parti-coloured clot filled the right auricle and ventricle.

Abdomen.—Liver enlarged and slightly mottled. A few petechial hæmorrhages beneath the capsule of Glisson. In one small area in the substance of and on the surface of the organ was a group of small pin-point yellowish-white bodies closely resembling miliary tubercles. Spleen enlarged and almost semi-diffuent. On section it was of a dark reddish-brown colour.

Kidneys beyond being somewhat congested showed no abnormality.

Stomach.—The mucous membrane was swollen, red, mammillated, and at the cardiac end were numerous small submucous hæmorrhages.

Lymphatic Glands.—The glands in both inguino-femoral regions were found to be somewhat enlarged. In consistence they were harder than normal (resembling the condition seen in syphilitics). One of the femoral glands on the right side was somewhat redder than the rest, and on section were somewhat mottled.

Microscopic Examination.—Films were made, both of the spleen pulp and of the pulp of the gland described above. No organisms resembling the plague bacillus were found in the spleen, but the film taken from the gland contained innumerable plague bacilli.

S.J.

Case 255. May 31. M., et 55. Duration of illness, 15 hours.

The body was that of a muscular and well-nourished man; the face and neck deeply cyanosed; the mouth contained some semi-digested food. No enlarged glands. Old pleuritic adhesions in both sides of chest, the large bronchi inflamed, and the lungs somewhat congested. Heart large. Left ventricle hypertrophied; heart much diseased. Coronary vessels slightly atheromatous. Dark clots in both sides. Liver in an advanced stage of cirrhosis. Kidneys granular. Stomach contained a quantity of food; its mucous coat in a condition of chronic inflammation. Spleen enlarged; softer than normal. This appeared to be a recent change, and was a little suggestive of plague.

In the brain the arachnoid was thickened and opaque, with some atrophy of the convolutions.

A piece of the spleen was removed and handed to Dr. Tidswell, and, after examination, the case was reported as one of plague.

G.H.T.

Case 295. June 29. M., et 55. Duration of illness, 70 hours.

Body very emaciated. A swelling about the size of a hen's egg in the right groin. Numerous petechiæ on the trunk and limbs. On the right leg were two small vesicular papulæ, which looked as though they had had their heads scratched off.

Thorax.—Both pleural sacs were entirely obliterated by old, tough, fibrous adhesions, the result of previous repeated attacks of pleurisy.

Lungs.—At the apices of both lungs were old deposits of chronic fibroid tubercle, and in the upper lobe of the right lung was a somewhat more recent spread of miliary tubercle. The bronchi showed signs of chronic catarrhal inflammation.

Heart.—There was considerable hypertrophy of the right ventricle. Both ventricles were distended by blood clot; that on the right side was for the most part of a yellowish-white colour, and slightly adherent to the columnæ carneæ. On the left side the clot was dark-coloured and very "crumbly." At the root of the aorta was some evidence of advanced atheroma; otherwise the heart showed no abnormality.

Abdomen.—There were no ecchymoses on the peritoneal covering of the intestines.

Liver.—Very soft and flabby, and of a pale yellow colour. On its surface were numerous small hæmorrhages beneath the capsule.

Spleen.—Enlarged; fairly firm in consistence, and of a dark reddish-brown colour.

Kidneys.—Both were enlarged and obviously congested. The cortex was swollen, and paler than normal.

Brain.—Nothing abnormal found.

The femoral and inguinal glands on the right side were enlarged and somewhat softened. They were surrounded by a small amount of hæmorrhagic extravasation. On section they were mottled in appearance. The glands along the line of the external and common iliac arteries on both sides were somewhat enlarged, and of a dark red colour.

Films of the blood, spleen, and enlarged lymphatic glands contained enormous numbers of plague bacilli.

S.J.

APPENDIX E

Cases treated with Yersin-Roux Serum.

TABLE showing particulars of all cases admitted on and after May 13th (Case 217), when Serum first became available, and distinguishing those (22) which did not receive it. The first 6 were admitted before May 13th, and were treated merely because their cases were almost desperate. From Dr Salter's clinical notes.

Consec No	Sex	Age	Day of illness on which admitted	(1) Days of illness on which Serum was injected (2) Quantity in Cub Cents (3) Place of injection (S = Subcutaneously, V = Intravenously)	Day after attack on which Patient—		Remarks
					Was discharged	Died	
201	F	10	3rd	5/20 V		6th	Left cervical bubo; slight enlargement and tenderness of glands in both axillæ, and femoral gland on one side
202	M	30	7th	9/20 V, 11/40 S, 12/20 S 13/40 S, 15/20 V		16th	Chinese; right inguinal bubo, steadily declined from attack
204	M	19	4th	7/40 S, 8/20 V, 9/20 V		11th	Septicæmic form; on 7th day right cervical gland became slightly enlarged, and others at later dates
205	M	28	3rd	7/40 S		8th	No buboes; right femoral gland and right axillary became slightly enlarged on 3rd day
208	F	16	3rd	8/20 V	42nd		Bubo, subpectoral on right side, and left cervical; afterwards right femoral also
216	F	29	3rd	3/20 S	97th		Bubo, left femoral, extreme lethargy on admission
217	F	14	3rd		32nd		No serum, left femoral bubo; had a vesicular eruption considered to be chickenpox (which others in the family had lately had); hæmorrhage occurred into each vesicle
218	M	15	2nd	2/40 S, 3/20 V, 7/20 S, 8/20 V.	75th		Left femoral bubo; no other enlargement
219	M	45	4th		56th		No serum, right femoral bubo, did not appear very ill on admission; T 101, P 92, T fell to normal next day and never rose again
220	F	23	4th	5/40 S	76th		Admitted 4th day, moderate attack
221	F	15	5th	4/30 S	76th		Left femoral bubo only
222	M	38	5th	5/40 S	76th		Some tenderness and indistinct swelling in both axillæ; T. 100, P 80, on admission
223	M	15	5th		41st		No serum, admitted 5th day, left inguinal bubo; T 98 4, P 68, on admission; was never worse
224	F	14	6th	6/40 S	53rd		Left femoral bubo, T 99, P 92, on admission; was never worse
225	M	16	2nd	2/40 S, 3/20 V, 4/20 S, 5/20 S.	42nd		On first day (evening) T 103; P dicrotic and very rapid, lethargic; face pallid. On admission 2nd day, almost comatose; T 99 2
226	M	28					Died before reception, Chinese
227	M	26	2nd	1/40 S, 2/40 S, 6 20 V, 7/30 S		7th	Right axillary bubo; other glands slightly enlarged; delirium and stupor at end of 1st day of illness, serum temporarily exhausted
228	M	11	7th	7 20 S	35th		Notified 7th day; small right femoral bubo, a slight case
229	M	43	1st	1/40 S	29th		Left femoral, did not appear to be very ill on admission
230	M	20		3/40 S		3rd	Right inguinal, on discovery patient too ill to remove; died same day
231	F	40	4th	3/30 S		80th	Left femoral only; a moderately severe case
232	M	38					Died before reception
233	F	35	5th	5/40 S		31st	Left femoral; a mild case
234	M	20					Died before reception
235	M	46	6th	6/40 S		100th	A diabetic
236	M	24	5th			52nd	No serum, supply threatened to run short temporarily; patient hardly exhibited any constitutional symptoms on admission
237	F	44	9th			34th	No serum, admitted 9th day, and showed no constitutional symptoms
238	M	70					Died before reception
239	M	41	2nd			33rd	No serum, although the bubo was axillary, and patient admitted on 2nd day of illness, he offered very slight symptoms of constitutional illness, he was said to have been very delirious during the night which followed attack
240	M	45					Died before reception.
241	M	4					Died before reception
242	M	17					Died before reception
243	M	28	8th	8/40 S, 9/20 V, 11/40 S		98th	Left cervical bubo; left sublingual gland enlarged and tender.
244	M	26	5th	5/40 S		6th	23 hours in hospital, hopeless at admission Chinese
245	M	18	7th			42nd	No serum, right femoral; slight case; did well from admission.
246	M	46	7th	7/40 S		8th	Right cervical; cough, and bright red sputum at first examination, 6th day of illness, bubo not observed till 6th day; declined steadily from admission
247	M	28	6th			32nd	No serum, right inguinal
248	M	17	4th	4/40 S, 6/40 S, 7/40 S, 8/120 S		10th	Septicæmic case
249	M	38	3rd			42nd	No serum, supply short, showed no constitutional symptoms except slight feverishness, other severe cases under treatment
250	F	13	3rd	3/75 S, 4/40 S		68th	A severe case
251	M	23	4th	4/40 S, 5/80 S		5th	Right axillary, left axillary slightly enlarged and tender; patient moribund, veins could not be entered
252	M	74	12th			45th	No serum, left femoral, practically convalescent on reception
253	M	6	6th			36th	No serum, right inguinal, P 112 the only sign of illness on reception, when appetite very good
254	F	26	2nd	2/30 S, 3/20 S, 5/20 S		30th	Left femoral, a mild case
255	M	55					Died before reception
256	M	44	15th	1/40 S		89th	Semi-conscious on reception, left femoral, inguinal; left axillary, right and left cervical also enlarged, Chinese.

Consec No	Sex	Age	Day of illness on which admitted	(1) Days of illness on which Serum was injected (2) Quantity in Cub Cents (3) Place of injection (S = Subcutaneously, V = Intra-venously)	Day after attack on which Patient—		Remarks

289	M	29	2nd	2/20 S		4th	Right femoral; in hospital 11 hours, hopeless when notified.
290	M	18	2nd	2/40 S	38th		Left femoral
291	M	7	8th	8/37 S	38th		On reception, both inguinals
292	M	38	5th	5/40 S, 7/40 S	46th		Left femoral, at time of reception stock of serum had become temporarily exhausted
293	F	38	5th	5/80 S	45th		Right femoral.
294	F	2	2nd	1/30 S, 4/20 S	31th		Left axillary
295	M	55					Died before reception.
296	F	12	4th	4/20 S, 6/40 S	36th		Right cervical
297	M	42	2nd	2/40 S, 3/40 S	40th		Right femoral
298	M	22	6th	6/40 S and 40 V	33rd		Right axillary
299	M	41	45th	45/60 S	78th		Right inguinal; convalescent on reception.
300	M	45	21st	21/60 S, 27/40 S	60th		" "
301	M	2	6th	6/20 S	36th		Right subpectoral.
302	M	56	5th	5/40 S		37th	Right axillary
303	M	36	7th	7/40 S	58th		Left femoral, this case was quite well marked, and approached the severe.

APPENDIX F.

Form 258.

Inoculation against Plague.—Second Series.

Department of Public Health, New South Wales, Sydney, 10 May, 1900

In view of the expected arrival of a further consignment of plague prophylactic, the Honorable the Premier and Colonial Treasurer has been pleased to approve of the following regulations for its distribution.

J. ASHBURTON THOMPSON,
President of the Board of Health.

Regulations.

- 1 Preference will be given to persons resident or employed within the infected area.
- 2 Application must be made by persons desiring to be inoculated at the Town Hall (Druitt street entrance), between 9 a.m. and midday, on and after a day which will be announced.
- 3 Applicants will be furnished with a dated ticket entitling them to be inoculated on the date specified thereon.
- 4 Inoculations will be performed at the Town Hall (Druitt-street entrance) every day except Sunday from 1.30 p.m., until the supply of prophylactic has been exhausted. Two afternoons a week will be reserved for inoculation of women and children.

5. No person unprovided with a ticket will be inoculated. No person provided with a ticket will be inoculated on any but the date specified thereon. Should any holder of a dated ticket allow the appointed day to pass without appearing, a new ticket must be procured before inoculation will be done.

6. Managers of business establishments may furnish lists of their employees by letter, addressed to the Secretary, Department of Public Health, and endorsed "Inoculation." Dated tickets will then be posted to them in return. Employees may be divided by managers into batches, and request made that the different batches may be inoculated on different days.

7. Inoculation is gratuitous and voluntary.

Circular Letter to the Public.

Form No. 256.

Sir, Department of Public Health, N.S.W., Sydney, 1 May, 1900.

A further consignment of plague prophylactic being expected to arrive shortly, I have the honor to inform you that the following arrangement has been made for convenience of those managers of business establishments who may desire inoculation for themselves and their staffs.

2. On receipt of this letter a list of the persons employed at your establishment may be made out by you, and may be forwarded by post to me at the above address. As soon as the prophylactic has arrived you will then receive by post a ticket for each person named in your list, entitling him to inoculation on a date stamped thereon. You may find it convenient to divide your list, so as to avoid absence of your whole staff on one day, and if you do so it will be understood that you desire a different date to be appointed for inoculation of each division.

3. No inoculations will be done at this Department, and the place chosen will be duly announced in the newspapers.

I have, &c.,

C. A. SIMMS,
Secretary.

Letter to Heads of Departments of the Public Service.

Form No. 257.

Sir, Department of Public Health, N.S.W., Sydney, 1 May, 1900.

A fresh consignment of plague prophylactic being expected to arrive shortly, I have the honor, by direction of the President of the Board of Health, to inform you of the arrangements which have been made for inoculation of Civil Servants employed in Sydney.

2. Three methods will be available, and in accordance with regulations which the Premier and Colonial Treasurer has been pleased to make, the number inoculated on any one day will be strictly limited.

(a) If you have the goodness to furnish me with a list of the names of officers in your Department who desire to be inoculated, a portion of prophylactic will be forwarded to you sufficient for the number. You may then provide a medical man to make the inoculations, a room in which he can operate, and a clerk to record the names of those operated on, together with the date of operation. This list to be forwarded to me for record with reference to possible occurrence of cases of plague among the persons inoculated at some future date—a matter of great practical importance at this time.

(b) You may send a list of the names of members of your staff who desire inoculation to me, when you will receive tickets entitling the holder to be inoculated on a day specified thereon. The names may be divided into batches to be inoculated on different days (so as not to interfere with business unduly). The holders will then present themselves at the place of public inoculation on the appointed day, and will take their turn with the general public.

(c) Individuals may make personal application at the place which will be appointed for the issue of tickets, when they will receive dated tickets as last mentioned.

3. Should you decide to adopt either of the methods (a) or (b), I am to ask you to be good enough to communicate with me at the earliest possible date. It is particularly requested that the names of gentlemen who are habitually employed in Sydney may alone be mentioned, others being in no known danger, and the supply of prophylactic being limited. The place at which tickets will be issued, and the place of public inoculation, will be announced in due course in the newspapers.

I have, &c.,

C. A. SIMMS,
Secretary.

Form No. 268

Department of Public Health, N.S.W.

Sir, Sydney,

In answer to your recent request, I have the honor, by direction of the Chief Medical Officer of the Government, to forward you herewith doses of Haffkine's plague prophylactic, and to call your attention to the instructions and conditions mentioned hereunder.

As a matter of convenience the form referred to, which will be found overleaf, is perforated, so that it may, when filled up with the particulars, be torn off and returned to me.

I have, &c.,

C. A. SIMMS,
Secretary.

To Dr,

Haffkine's

Haffkine's Prophylactic.

The prophylactic is issued to medical practitioners on condition that they forward to the Secretary of this Department, as soon as possible, particulars concerning ages, addresses, and doses administered, &c, by them, in accordance with subjoined form :—

Dosage.					
For a male aged 25 years or over	5cc.
" " " 20 " "	4cc.
" " " 15 " "	3cc.
" " " 10 " "	2cc.
" " " 5 " "	1cc.

Intermediate ages, intermediate doses. Females to receive one-fifth less than males of same age.

NOTE.—It is not safe to use the prophylactic save within an hour or two after the bottle has been opened. Arrangements should be made for the attendance at the same time of a sufficient number of people to use up the whole bottle.

Schedule.

PARTICULARS of Persons inoculated with Haffkine's Prophylactic.

Date of Inoculation. ¹	Name.	Age.	Address.	Dose.

(Signed)

(Address)

The Secretary, Department of Public Health, Sydney.

APPENDIX G.

Cleansed Areas.

TABLE showing the dates on which Cases were infected within the several Areas which were specially cleansed, before, during, and after completion of cleansing: together with the dates on which each area was closed for cleansing. The dates of release are often merely formal; areas seldom remained closed more than seven or eight days, and often less. (*See* Diagrams A, B, and C.)

APPENDIX H.

Text of the Poster and Pamphlet issued on March 1st, 1900.

Department of Public Health, New South Wales.

Prevention of Plague.

PLAGUE is present in Sydney. It has been introduced by diseased rats, and there is great danger of its spreading still further.

Great efforts must therefore be at once made by Municipal Councils and by individual householders to kill all rats. This war must be persistently and steadily carried on. It must extend to every neighbourhood, as well as to those where the rats are known to be infected, for the following reason:—As soon as rats find they are dying in numbers, or are being trapped and killed, in any place they inhabit, they leave that place and go to some other. If there are already rats at the latter place, these become infected by the immigrants, and then disperse in their turn, thus carrying the disease still further. All rats, therefore, must be exterminated as far possible, and the attack upon them should be simultaneous in the healthy and infected neighbourhoods.

The following hints should be carefully read:—

1. It is most necessary that rats should be kept out of dwellings. Take care that doors are not broken near the ground, and close them at night; see that all gullies are effectually trapped; see that every house connected with the sewers is so connected according to the Regulations of the Board of Water Supply and Sewerage, and that the traps are in good order, so that rats cannot get past them.

2. Gather up with scrupulous care all fragments of food, bones, vegetables, potato-peelings, corn, &c., &c., and either burn them at once behind the kitchen fire, or place them in a securely covered dirtbox; as far as possible also leave no water about where rats can get at it. Rats are always looking for food, and will not stay where none is to be found.

3. Lastly, take measures to kill any rats which happen to reach the premises. Poison is the best means, and nothing is better than arsenic, which is sold as "Rough on Rats," and under other names. It should never be spread on bread and butter, which might attract children, nor on any similar food. It should be mixed with a little meal and water. Oil of aniseed and an oil called oil of rhodium are said to be specially attractive to rats, and a little may be mixed with the meal, or smeared on traps. Set traps also. Use dogs too; dogs very rarely indeed have suffered from plague, and, at all events, it is not only diseased rats which are to be destroyed, but also healthy ones.

Dead rats found about premises should not be touched until they have first been scalded with boiling-water where they lie; they should then not be taken up in the hands but with tongs; they should be burnt.

Extermination of rats is the most important thing to be attempted at this time. Very good reason has been shown for thinking that the plague spread in Indian cities not so much in proportion to overcrowding nor to filth as in proportion to the facilities which houses afforded by their construction for entrance of rats to dwelling-rooms.

Still, it must be remembered that, although rats may begin an epidemic of plague in man, they are by no means the only carriers of the contagion. Plague is a fever; like other fevers, it is aided in its attacks by filthy surroundings, and probably its infection is fostered by filthy heaps of neglected and putrefying material, and by filthy earth.

Very great and special pains must therefore be taken by householders to thoroughly cleanse their houses internally, their yards, their gutters, and their drains. Municipal authorities should increase their staff of scavengers, and take care that all the minor nuisances (which at present are subject of daily complaint to this Department) are abated forthwith, and prevented from recurring; they should also regularly collect and destroy filth, sweep and flush road and other gutters under their control, and take care that sewers within their jurisdiction are often flushed. Municipal authorities are seldom provided with large staffs, and nuisances sometimes exist for long before they are detected and dealt with. Every ratepayer should make a point, therefore, of reporting every nuisance which he observes in his district to the Council Clerk, who represents the Council, which latter is the Local Authority under the Public Health Act for the district it serves. It has full legal power to deal with and prevent all nuisances, either by its own action or through the Police Courts. Such complaints should not be addressed to this Department, which cannot execute detail work over the whole Colony. Detail work is the duty of Local Authorities within their several districts or municipalities.

Directions for Special Cleansing and Disinfecting.

Limewash all ceilings and whitened walls afresh; limewash all cellar, basement, and outhouse walls. Swab all woodwork thoroughly with carbolic water—include sash frames, window cases, &c.

Remove all floor coverings; have carpets beaten; oilcloth, &c., to be washed with carbolic water on both sides. Scrub the floors if of boards, and swab with carbolic water. Water stone, brick, and earth floorings with carbolic water three times a week.

All lumber and the like not in actual use must be removed from the premises and not returned to them. All wastes, garbage, ashes, dung, stable bedding, &c., &c., must be removed, and stable bedding renewed with clean stuff.

Stable floors, if of wood, or likely to be foul beneath, must be torn up, the surface below thoroughly cleansed as described, and replaced with good floors properly close-jointed and caulked, well-bedded on a sound bottom, and graded to a gutter. The gutter must be placed in communication with a gulley leading to the sewer.

All drains, gullies, sinks, water-closets must first be flushed with hot water. They must then be flushed with carbolic water, and afterwards be kept dressed with chloride of lime.

Furniture must be moved so as to give access to walls for cleansing, &c., and to the floor on which it has been standing.

All

All makeshift buildings and sheds in bad repair must be pulled down and removed before the premises can be considered clean.

Solid disinfectant—Chloride of lime.

Liquid disinfectants—Carbolic water—Miscible carbolic, $\frac{3}{4}$ pint; water, 1 gallon.

Carbolic limewhite—Miscible carbolic, $\frac{1}{2}$ pint to the gallon.

For household use, chloride of lime, mixed with water in the proportion of half a pound to the gallon, may be used for all purposes within and outside; or carbolic acid and the well-known tarry disinfectants, suitably diluted according to instructions with which they are sold. The poorer inhabitants should be supplied by the Local Authority for the district (the Municipal Council) free of cost, and Sanitary Inspectors should see that the disinfectant is properly applied.

The fullest information as to disinfection and disinfectants has been printed in a pamphlet, containing Suggestions for the prevention of the Infectious Diseases proclaimed under the Public Health Act, of which large numbers of copies have been sent to each Local Authority over the whole country. This was done more than a year ago. Any ratepayer can get one by application at the Council Chambers in his district.

By order,
C. A. SIMMS,
Secretary.

Sydney, 1st March, 1900.

* * Local Authorities will be supplied gratis with the disinfectants called miscible carbolic acid, cresylene, and chloride of lime, on application to the Chief Inspector of Stores, Young-street, Sydney; but of the two first named one only will be furnished.

APPENDIX I.

Form No. 251.

Department of Public Health, New South Wales.

Prevention of Plague.

Notice to Shipmasters, Agents, and Owners touching fumigation and destruction of rats.

ALL vessels trading between Sydney and every other port or place in New South Wales having to be fumigated under the Proclamation No. 286 of Friday, 30th March, 1900, in accordance with the requirements of the Board of Health, and having to produce a certificate that such fumigation has been so done to the Customs Officer at the ports or places at which they touch before communication with the shore will be permitted them, the following suggestions are published with a view to prevent loss of time in performing fumigation:—

1. Masters are expected to assist the officers of the Board in every way.
2. Preparation for fumigation should be made by the Masters as follows:—Compartments to be carefully examined and all openings closed, except one for access, as well as all cracks and crevices, A bucket of paste and a bundle of old newspapers are all that is required besides the usual closings, hatches, &c., &c.
3. As soon as these preparations are complete or well under way, notice must be given to Captain Tait, Superintendent of Fumigation, at the Customs House, Circular Quay, stating where the vessel is lying, and when she will be ready for fumigation to begin. The Superintendent will supply forms on application.
4. The actual fumigation must be done by or under immediate superintendence of the appointed officers of the Board.
5. After completion of fumigation to the satisfaction of the Superintendent, a certificate will be given in the appointed form, stating that fumigation has been done, and that the certificate is good until the date mentioned therein, when it will expire, and when fumigation must be repeated.

By Order,
C. A. SIMMS,
Secretary.

Sydney, 30 March, 1900.

Form 243.

Certificate of Fumigation delivered to Master by Superintendent.

Department of Public Health, New South Wales.

THIS is to certify that the vessel _____ Master, _____ tons register, was fumigated at this port for the purpose of destroying rats on board, under supervision of an officer of this Department, on this _____ day of _____ 1900.

C. A. SIMMS,
Secretary.

Signed, _____ Superintendent.

1900.

NOTE.—This certificate is incomplete and of no avail unless countersigned by the Superintending Officer

APPENDIX K.

Governor's Regulations under the "Wharfage and Tonnage Rates Act of 1880."

1. Every vessel lying at a public wharf at any port or place in New South Wales must be maintained by fenders at a distance of not less than 4 feet from the wharf.
2. The fenders used, as required by the last preceding Regulation, together with any ropes attached to them must be freshly tarred each time before use, and daily if continuously used for more than twenty-four hours.
3. To each hawser and rope by which the vessel is made fast for 6 feet of length from the shore end, and for 6 feet in length from the ship end, and to fore and aft springs throughout their whole length, tar must be applied so that the said parts and springs are thoroughly covered, freshly before each time of use and daily if continuously used for more than twenty-four hours. The tar may be applied by means of bagging securely fastened around the hawser, rope, or spring.
4. All gangways must be drawn up, except when in actual use, for reception of cargo, except a single passenger gangway, and the said passenger gangway while in use must be constantly maintained freshly tarred on its upper surface for a distance of 3 feet at least from its shore end, and for a distance of 3 feet at least from its ship end.
5. Between sunset and sunrise, lamps of the best available sort must be suspended over the side sufficient to keep the wharf fore and aft brightly lighted.
6. All port and other holes in the ship's side next the wharf must be kept closed, unless in actual use for reception of cargo, when they must be brightly lighted as long as the vessel lies at the wharf.
7. No net must be used between the ship and the wharf.
8. No lighter must be allowed alongside except by special written permission of the Manager of Public Wharves.
9. Every master of a vessel who contravenes any of these Regulations shall be liable to a penalty not exceeding £20, and not less than £5, which may be recovered in a summary way before a Police or Stipendiary Magistrate, or any two Justices of the Peace, in accordance with the Acts relating to proceedings before Justices of the Peace, adopted by the Act 14 Vic. No. 43, and any Acts amending the same.

APPENDIX L.

Report of the Board of Health upon the Case of A.P.

The Chief Medical Officer of the Government and President of the Board of Health to The Honorable the Premier and Colonial Treasurer.

February 7, 1900.

* * * * *

I.—CLINICAL ACCOUNT.

A.P., aged 33, married, a rather slight but muscular man, fair, and of nervous temperament; had had no illness for several years past. On *January 19th* he was driving a lorry through the city about 12 o'clock, on a very hot day, when he was suddenly seized with giddiness, headache at the vertex, and pain in the region of the stomach; he was obliged to lie down for a time when he reached the warehouse to which he was then going, but afterwards finished his day's work, though still suffering. About four hours after attack he began to feel pain in the left thigh near the groin, and discovered a small lump which had not been there before. He left work at 6 o'clock and went to bed; he took some castor oil, and had free action of the bowels; he also vomited, the vomit being of natural appearance. He was very ill all night with headache, thirst, fever, and continued pain in the gastric region; the lump in the thigh ached continuously. *January 20th*, at 2.15 p.m., he was found dozing, but was easily roused to attention; his face was flushed, and a little puffy or heavy-looking; his eyes were slightly suffused; the skin felt burning hot, the axillary temperature was 104.9° F., and the pulse was rapid and bounding. Examination of the lungs discovered no sign of disease; he was able to move about the bed freely, and to show various parts of his body readily; he answered questions promptly and clearly; there was no delirium, nor anxiety, nor interference with speech; the spleen could not be felt. The left lower extremity showed the lowest gland of the femoral chain enlarged; it was just visible, was about the size of an unshelled almond, indurated, and but slightly tender on pressure; the swelling was well defined, and limited to the gland itself, there being no infiltration of the surrounding tissues; two other glands, which seemed not to be enlarged, could be distinguished just above it. There was no inguinal enlargement, and careful examination of the rest of the body failed to discover any other swollen ganglion, except one in the right submaxillary region; this was hard, was not tender, and, though the patient was unaware of it, was probably old. The genital organs were perfectly free from lesions of any kind, and there were no signs of venereal disease present or past. The leg was examined for injuries which might have given rise to swelling of the gland, but none were found. A further examination, made two days later, disclosed the following:— Behind the left external malleolus, and just anterior to the edge of the achilles tendon, was a circular spot, about 3 mm. in diameter; the cutis was purplish red; the cuticle which had been detached was then adherent to the skin; at one point of the circumference it was slightly ragged. It seemed probable that this had been a bleb; its circular form and protected position suggested that it had not been produced by abrasion; and, while the feet showed no evidence of chafing at any other point, the patient said he had been wearing the same boots for three or four months past, and that they had never hurt him. Three days afterwards the cutis had lost its reddish-purple colour, and new cuticle had been formed. Earlier observers felt unable to say that this lesion had not been present at the first examination.

On *January 21st* his temperature had fallen to 102.2° F.; the pulse was no longer bounding, and was occasionally intermittent (imperfect systole); he still had some headache at the vertex, but he had slept tolerably well, and was better. The gland formed a visible lump of the size of a walnut; the skin
over

over it was slightly red, but it had been continuously fomented with hot boracic lotion; there was commencing peri-adenitic effusion, but no matting with the smaller glands immediately above could be made out. On *January 22nd* his temperature about midday had fallen to 99.2° F.; he was cheerful and alert, but pale and rather tremulous; the headache was less; he felt weak, but not exhausted; the gland had markedly increased in superficialities, but was not much thickened, and though still quite tender was not at all acutely sensitive. He had slept well. On *January 23rd* the patient was in a similar state, but decidedly thinner and paler than at first; his temperature had risen again to 102.4° F.; the pulse was weak and easily compressed, but not intermittent. The femoral swelling had increased, and was nearly circular, about 2 inches in diameter. On *January 24th* his temperature was still 102.4° F., and his general state about the same; the femoral gland was of the size of a mandarin orange; it was still hard, surrounded with effusion, only moderately tender, and free from fluctuation.

2.—BACTERIOLOGICAL INVESTIGATION.

The bacteriology of this case was described by Dr. Frank Tidswell in the following report:—

On *January 21st* a puncture of the gland was made with instruments just previously sterilised by exposure to steam for half an hour in the Koch steriliser. The cotton-wool wrappings were retained till the time of operation, and the instruments were still warm when used. The part had been continuously treated with boracic acid fomentations for the previous twenty-four hours. Just prior to the operation the skin was shaved, well washed with 5 per cent. carbolic lotion, then with recently boiled and still warm distilled water, and finally dried with sterilised cotton wool. Through the single opening in the skin by partial withdrawal the syringe needle was passed in six different directions through the gland. The piston was raised on each occasion, but no fluid entered the barrel of the syringe. On its final removal the channel of the needle was found to contain a minute quantity of blood. This was ejected over the surface of a serum culture tube brought for the purpose, and a second serum culture tube was inoculated from the first in the ordinary way by means of the platinum needle. Both of these tubes incubated at 37° C. remained sterile for a period of ten days, when their further observation was abandoned.

On *January 22nd*, whilst palpating the gland, a drop of pus-like fluid was expressed through the puncture hole of the previous day. On the 23rd and 24th also similar fluid was obtained in the same way. On each occasion the single drop issuing was used to make smear preparations, and cultivations on serum and agar; and that obtained on the 22nd was also used to inoculate a mouse. As the microscopical and cultural characters of the three samples of fluid were identical, one description will serve for all.

The fluid expressed was of a dark greyish colour, showing a little red (blood), but no yellow. A small portion set aside was found to have clotted firmly when examined half an hour afterwards. The amount of blood present was far too small to account for this clotting, and, moreover, the clot was pale in colour. It is evident, therefore, that the fluid contained a large admixture of lymph. Under the microscope the fluid was seen to contain numerous lymph cells. A few were normal in character, but most of them showed fragmented nuclei, and more or less granular cytoplasm, *i.e.*, resembled "pus cells." Lying in groups and singly amongst the cells were numerous bacilli, varying, but commonly ovoid or cylindrical in form, ranging between 1 μ and 3 μ in length and about .5 μ broad; ends tapering and finally rounded off; staining well with gentian violet, fuchsine, or methylene blue, and more densely at the poles than in the middle of the rods. The majority did not retain the stain when treated by Gram's method, although here and there an individual bacillus remained coloured. No spores were seen. Rounded bacterial elements were not uncommon, and the results of cultivation subsequently showed them to be micrococci, and not merely coccobacilli.

The cultivations were upon ordinary serum and upon nutrient agar, the inoculations being made at the bedside with the platinum needle sterilised in the flame of a spirit-lamp. The tubes, inoculated about noon, showed definite growth on the second morning afterwards, *i.e.*, in about forty-five hours, having been incubated at 37° C. in the interval. The growths were of two kinds, one composed of micrococci, the other of bacilli.

The micrococcal growth upon serum developed in the form of rounded colonies, attaining a diameter of .5 mm. in forty-eight hours, and extending to 2 or 3 mm. in three or four days. Thick, opaque, flat, slightly irregular margins, smooth surface, creamy white in colour. In subculture the growth was more rapid at first, a 1 mm. wide creamy streak developing in twenty-four hours. After this the growth extended slowly, reaching a width of about 3 mm. after five days at 37° C. No alteration in colour was observed. There was a thick deposit and turbidity in the condensation water. Upon nutrient agar the growth was similar to that on serum, but whiter. On glucose agar the growth was more abundant than on nutrient agar, and was well up in twenty-four hours. In bouillon there was uniform turbidity already apparent in twenty-four hours.

The cocci stained readily with gentian violet, fuchsine or methylene blue, and retained the colour when treated by Gram's method. Under the microscope they were seen to be regular in outline, and to lie singly or in groups (staphylococci). There were no chains. Individual cocci measured .5 to .8 μ . in diameter. The transverse line commonly seen in the pyogenic cocci was not detected in any of the specimens examined.

The bacillary growth upon serum at 37° C. was scanty. It appeared in forty-eight hours in the form of small, round, slightly raised translucent colonies, of a little less than .5 mm. in diameter. The growth had not extended much by the third day, after which, in the original tubes, it became overgrown by more rapidly developing micrococci. In subculture upon serum the growth was visible as a thin colourless streak, in forty-eight hours it increased to a band about a millimetre wide. After five days it formed a thin translucent streak still limited to the neighbourhood of the inoculation line, slightly thicker at the margins with outlying colonies, and showing granular raised specks at irregular intervals. Upon nutrient agar and glucose the growth was very similar, and when looked at from the back had a ground-glass appearance. In broth it formed abundant spicular or crumb-like particles attached to the side of the tube, with an obvious deposit of same character as that in Haffkine's prophylactic, the broth itself remaining perfectly clear and transparent. A filmy appearance on the surface disappeared on shaking, and was not reformed after four days at 37° C. In flasks with oil a film and a few pendent growths 2 to 6 mm. long were formed, as well as a copious deposit.

The bacillus stained readily with violet, fuchsine, or methylene blue. Is decolourised by Gram's method, although here and there individual bacilli or small groups of them retain the colour. Non-mobile, at least as regards obvious movements of translation. The bacillus shows very distinct bipolar staining, more marked in some specimens than in others, but clearly recognisable in all. This characteristic may amount to the colouration of only a polar granule, or to colouration of most of the bacillus, leaving only the middle of the rod unstained. Intermediate gradations are common. The bacillus varies very much in form, regularly cylindrical, boat-shaped, club-shaped, dumb-bell, and oval elements are the commonest forms. The length varies between 1 μ and 3 μ , and the breadth is usually about .5 μ . The ends are rounded off. No spores were observed.

Some of the material obtained from the femoral swelling on 22nd *January* was inoculated at 4.30 p.m. into a mouse—into the back at the root of the tail. The animal was lively during all the next day. There was no visible swelling at the site of inoculation; but the mouse was not handled. Next day it was much less lively in the morning, and got very sick during the afternoon. At 6 p.m. it was huddled up, coat rough, respiration hurried, refusing food, but started up when the glass of its jar was flicked. It was found dead and stiff next morning at 9 a.m., having thus become definitely sick within forty-eight hours, and died within sixty-four hours after inoculation.

The principal *post-mortem* features were as follows: *Hæmorrhagic* œdema at site of inoculation; enlargement of the inguino-femoral glands on the right side; no enlargement of glands detected elsewhere; pericardium dusky, but no hæmorrhages seen; both ventricles of the heart distended with feebly clotted blood; lungs bright red in colour, patchy pneumonia (?); liver definitely but not very much swollen, mottled white and pink on surface; deep red on section; gall bladder empty, or nearly so; spleen not much, if at all, longer than normal, but thicker, swollen in such a way as to lose its normal sharp edges and assume a sausage-shaped form, section deep red, trabeculæ could not be seen with a hand lens; stomach normal, small intestine congested, large intestines not obviously affected, but contain fluid fæces; kidneys mottled, section pale, internal structure obscure; bladder distended with urine of normal colour. Smear preparations and cultures made from various organs gave the bacilli showing bipolar staining.

A second mouse, inoculated with a small piece of the spleen of mouse 1 on 25th January, at 10:30 p.m., was lively on the following day (26th). On the 27th it became sick, exhibiting the same symptoms as the first mouse. On the 28th, at 9 a.m., it was lying partly upon its left side—the hind quarters being in a normal position; but the forelegs were tucked away, the left shoulder touching the wire-gauge floor of the cage, and the head stretched out. It remained quiescent in this position till it died at 11 o'clock. The second mouse thus became sick in about forty-eight hours, and died in seventy-two and a half hours after inoculation.

The principal *post-mortem* features were as follows, the animal being examined ten minutes after death: Hæmorrhagic œdema at the site of inoculation; enlargement of hæmorrhagic infiltration round the right inguino-femoral glands; enlargement of the left inguino-femoral, and right and left axillary glands, but no hæmorrhage. Pericardium dusky, but no hæmorrhages; right ventricle of heart contains fluid blood, left ventricle contracted and empty; lungs redder than normal, but not so much affected as in first mouse; liver slightly swollen, mottled pink and white on surface, section deep red; gall bladder distended with clear yellow bile; spleen not visibly altered internally, but section a little thicker than normal, and of a deep red colour; trabeculæ faintly discernible with lens; stomach normal, small intestines markedly congested, large intestine contains fluid fæces; kidneys normal on surface; section pale; structure obscure; bladder empty. Smear preparations and cultures were made from various organs gave bacilli as in first mouse.

A third mouse, inoculated on 28th instant with a small piece of the spleen of mouse No. 2, became sick on the 30th instant. During 31st January and 2nd February it had a series of seizures, characterised by very hurried and laboured breathing and prostration, and on each occasion appeared about to die. In the intervals it sat quietly huddled up, rarely moving, and taking very little food. It was found dead at 9 a.m. on the morning of 2nd February, having thus become sick on the second day, and died in about four and a half days. The *post-mortem* appearances were very similar to those shown by the other mice; in particular, the left inguino-femoral glands were swollen and surrounded by hæmorrhagic œdema, and the spleen enlarged to twice its normal size.

A guinea-pig, inoculated in left thigh on 25th January with a small piece of the spleen of mouse 1, showed no sign of illness till the 27th, but upon that day became quiet and drowsy, and took food sparingly. On the 28th it became very obviously sick, sitting huddled up with the back arched, eyes partly closed, and rarely moving. On the 29th and 30th it remained in very much the same condition, and was found dead at 9 a.m. on the 31st instant. The principal *post-mortem* features were as follow:—Hæmorrhagic infiltration at site of inoculation and in left inguino-femoral region; right groin normal; enlargement of and hæmorrhage round left axillary glands; right axillary glands enlarged; heart shows subpericardial hæmorrhages along auriculo-ventricular and interventricular grooves, and also along the edge of the right ventricle; lungs dark in colour, especially upper and middle right lobes, in which there is broncho-pneumonic consolidation; subpleural hæmorrhages in various places in all lobes; liver enlarged to about twice normal size, mottled red and white on surface, numerous small subcapsular hæmorrhages; spleen about three times larger than normal, deep violet in colour, showing very numerous white areas on both sides resembling miliary tubercle in appearance, edges rounded, no hæmorrhages; kidneys not enlarged, dusky in colour, hæmorrhages under capsule; suprarenals, especially left, enlarged and hæmorrhagic; bladder distended with clear urine giving albumin ring with nitric acid. No definitely abnormal appearances were detected in stomach or intestines. The blood-vessels found on reflecting the skin were markedly injected, and the blood fluid. The viscera were not sliced as it was desired to preserve the specimen with the organs *in situ*, for microscopical and cultivation purposes small pieces were obtained through areas on the under parts of the organs, previously seared in the usual way with a hot knife-blade. The smear preparations and cultures showed the bacilli already described.

A second guinea-pig, inoculated on 30th January with a small piece of the spleen of guinea-pig No. 1, became sick on 29th January, was very sick during 31st January and 2nd February, and died at 1:30 p.m. on 2nd February, having thus become sick in two days, and died in about four days. The *post-mortem* appearances were similar to those of guinea-pig No. 1, except that the spleen, though twice the normal size, did not show the miliary-tubercle-like appearance.

From the foregoing description of the bacteriological examination of material obtained from the enlarged femoral gland of A.P., it will be seen that two microbes were isolated—(a) a micrococcus still undetermined, but most likely one of the varieties of staphylococcus pyogenes albus; and (b) a bacillus answering positively to all the immediately applicable tests for *Bacillus Pestis Bubonica*.

FRANK TIDSWELL.

3.—EPIDEMIOLOGICAL RELATIONS.

A.P. was a lorry-driver, employed by the Central Wharf Company. His chief occupation was carting exports from city warehouses to the wharf, and delivering them either at his employer's warehouse or at the ship's side. For several months past he had been thus engaged in carting wool almost exclusively. Occasionally he used a truck to run goods from the warehouse across the wharf. He had not handled goods discharged from any ship since the previous August. He had no business on board ships, though he may occasionally have carried a message to the mates; and he had not been below on any ship for three months past at all events. Since Christmas he had only visited one other wharf, that of the A.U.S.N. Co., on January 9th, when he removed green hides imported from Queensland to a city warehouse. Both steam and sailing vessels from plague-infected ports must by this time (namely, near the end of the sixth year from the date of declaration of the epidemic at Hongkong) have discharged or loaded at every suitable wharf in the harbour; and, as regards Central Wharf alone, between November 1st and January 20th four steamships, which all carried Chinese crews, and which had all touched at Hongkong, had lain there—one of them from January 9th to 20th.

4.—LOCAL CONDITIONS.

A.P. had lived in the house where he was found for eight years (see illustration). It was built of brick, on a sandstone ridge, which sloped rather steeply to a branch of the harbour, within the city limits, and in a neighbourhood containing many large warehouses. It had two stories, four rooms, a small attic, and an unused basement, of which the natural rock formed the floor. It was in average general repair, but the sewerage was seriously defective.* There were no inside fittings, but there was a yard gulley halfway down the small walled yard, and a water-closet at the end of it. These were drained by 6-inch glazed E.W.P., which ran forward under the house in a chase cut in the rock floor of the basement. The drain was in aerial connection with the sewer, and the last length of piping against the front wall of the house had had a considerable hole knocked in it; the interior of the dwelling was thus brought into direct connection with the interior of the sewer. On the other hand, however, the basement had a large opening at pavement level in its front wall, and a door at the back, both of which were said to be kept constantly open. The drain junctioned with a very old oviform rubble sewer, which discharged on the foreshore at Dalton's Wharf, about 50 feet below the house and about 150 yards away, next to the Central, and which was unprovided with any tide-flap. Very few houses were connected with it, and its chief use seemed to be discharge of storm-waters. In every domestic respect the house was tidy, clean, and well-kept.

J. ASHBURTON THOMPSON.

* This is too generally the case within the city of Sydney, which in this respect is very sharply distinguished from the rest of the Metropolitan area. In the latter sewerage is under exclusive control of the Metropolitan Board of Water Supply and Sewerage; and the 38,000 houses, containing 182,000 persons, to which the Board's service had been extended down to December 31st, 1899, are in every case connected on the most approved principles.

APPENDIX N.

Circular.

Form No. 236.

Department of Public Health, New South Wales, Sydney, 8 February, 1900.

Bubonic Plague.

Sir,

I do myself the honor to draw your attention to the enclosed copy of *Supplementary Government Gazette* of the 6th instant, No. 108, in which Plague is proclaimed to be a notifiable disease under the Public Health Act, Part III, in accordance with Section 20 thereof.

2. In connection with this proclamation, I would point out that, whereas notification of the commoner infectious diseases is properly not required until the diagnosis has become clear [see Public Health Act, Section 21 (b)], it is desirable in the general public interest that a somewhat different course should be taken with Plague. Success in the prevention of this disease depends so largely on early knowledge of all cases which occur that, although it is not the law, I venture to urge upon you the desirability of notifying not only declared cases, but also those in which the clinical symptoms, the patient's occupations, his recent movements, &c., &c., furnish ground for reasonable suspicion of plague.

I have, &c.,

J. ASHBURTON THOMPSON,

Chief Medical Officer of the Government.

APPENDIX O.

Department of Public Health, N.S.W.

Form 247.

Directions for Special Cleansing and Disinfecting, issued to the Staff of Sanitary Inspectors, Scavengers, &c.

LIMEWASH ceilings whenever dirty, and in all small property; spare good ceilings in good condition or decorated, &c., &c.

Limewash all whitened walls afresh; limewash all cellar, basement, and outhouse walls.

Swab all woodwork thoroughly with carbolic water—include sash frames, window cases, &c.

Remove all floor coverings; have carpets beaten; oilcloth, &c., to be washed with carbolic water on both sides. Scrub the floors if of boards, and swab with carbolic water. Thoroughly saturate inside stone and brick floorings with carbolic water.

Saturate all outside pavements and soil with sulphuric acid water.

All lumber and the like not in actual use must be removed from the premises and not returned to them. All wastes, garbage, ashes, dung, stable bedding, &c., &c., must be removed, and stable bedding renewed with clean stuff.

Stable floors, if of wood, or likely to be foul beneath, must be torn up, the surface below thoroughly cleansed as described, and replaced with good floors properly close-jointed and caulked, well-bedded on a sound bottom, and graded to a gutter. The gutter must be placed in communication with a gulley leading to the sewer.

All drains, gullies, sinks, water-closets must be first flushed with hot water. They must then be flushed with carbolic water, and afterwards be kept dressed with chloride of lime.

In warehouses, &c., merchandise (except heavy machinery) must be moved so as to give access to walls for cleansing, &c., and to the floor on which it has been standing.

All makeshift buildings and sheds in bad repair will be condemned, and must be pulled down and removed before the premises can be passed as clean.

Occupants of premises which have been passed as clean will be furnished with a small placard, which they may affix in a conspicuous position, stating that the premises have been cleansed in accordance with the requirements of the Board.

Solid Disinfectant.—Chloride of lime.

Liquid Disinfectants.—Carbolic water—Miscible carbolic, $\frac{3}{4}$ pint. Water, 1 gallon.

Sulphuric acid water.—Sulphuric acid, $\frac{1}{2}$ pint. Water, 1 gallon.

Carbolic limewhite.—Miscible carbolic, $\frac{1}{2}$ pint to the gallon.

By Order,

C. A. SIMMS,

Secretary.

Department of Public Health, New South Wales.

Form No. 246.

THESE premises have been cleansed and disinfected, in accordance with the requirements of the Board.

C. A. SIMMS,

Secretary.

Address of premises,

Signed,

Date,
Sanitary Inspector in Charge.

No.

Department of Public Health.

Form 250.

Notice to Cleanse and Disinfect, under the Public Health Act.

To occupier of situated at No. street.

THE Board of Health, being of opinion that it is necessary that the premises occupied by you should be cleansed and disinfected, and that the drains of the said premises should also be cleansed and disinfected, and that certain articles should be destroyed, notice is hereby given that unless within twenty-four hours from the receipt of this notice you inform the Board of Health, in writing, that within a further period of hours you will carry out the cleansing and disinfecting operations, and the destruction of certain articles hereinafter mentioned, the Board of Health will enter on the said premises and carry out the said cleansing and disinfecting operations and the destruction of the said articles at your expense, in pursuance of the powers vested in them by the provisions of the Public Health Act.

Particulars of cleansing and disinfecting operations required

List of articles to be destroyed

NOTE.—All such cleansing and disinfecting operations, and the destruction of such articles, must be done to the satisfaction of a legally-qualified medical practitioner.

Date of Service

Hour of Service

Inspector.

Under this notice you may elect to take any of the following courses:—

“A” To cleanse and disinfect the premises yourself within the period mentioned in the notice.

“B” To request the Board of Health to undertake the cleansing and disinfecting of the premises.

Penalties for Non-compliance.

If, having elected to carry out the required operations, you fail to do so within the time mentioned, a breach of the Act will have been committed.

NOTE.—In addition to the penalties incurred under the Public Health Act, you will be liable to have your premises placed in quarantine and isolated.

C. A. SIMMS,
Secretary.

The total cases were 303; in 30 cases the place of employment remained unascertained or the patient was unemployed at the date of attack, and 14 cases at distant points. (Manly, Quarantine Station, North Sydney, Hurstville, Sans Souci and Glenfield) have been omitted so as to reduce the size of Map.
The place of residence has been reckoned as the place of employment for house-wives, children etc.
The dates shown in red on this map indicate neighbourhoods in which diseased or dead rats were observed by Officers of the Department and the time when they were observed. When the date is underlined the rats (or cat) referred to were rigidly proved in the Laboratories to be infected with plague.
The Areas which were quarantined and cleansed are shown thus:

Scale 4 Inches = 1 Mile

NEW SOUTH WALES.

COMPENSATION IN CONNECTION WITH PLAGUE OUTBREAK.

(RETURN RESPECTING)

Printed under No. 8 Report from Printing Committee, 9 August, 1900.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 5th July, 1900, That there be laid upon the Table of this House,—

“A Return showing what compensation has been paid in connection with the plague outbreak,—(1) for damage to property; (2) for interruption to business; (3) to person quarantined as contacts.”

(Mr. Ashton.)

(1) No money has been paid for destruction to buildings. The payments made for bedding, carpets, and other articles destroyed during cleansing operations in the interests of public health amount to £315 17s 9d, as per statement attached.

(2) No payments have been made for interruption to business.

(3.) No payments have been made to persons quarantined as contacts.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MR. PETER BEHRENDT.

(PETITION OF.)

Received by the Legislative Assembly, 24 July, 1900.

To the Legislative Assembly of New South Wales.

The humble Petition of Peter Behrendt, Civil Engineer and Architect, "Bracklyn," Edgecliff-road, Woollahra,—

HUMBLY SHOWETH:—

1. That, on the 14th of June last, the Prime Minister communicated to your Honorable House the contents of a minute said to have been furnished to him by Mr. George McCredie, in charge of the disinfecting operations carried on by the Government in connection with the plague, in which the following statement was made in reference to your Petitioner, namely:—"Mr. Berrend, an inspector, was found incapable of carrying out his duties the first day he was appointed, and was then placed in charge of the disinfectants, where he also proved incapable, and was consequently dismissed."

2. That the allegation that your Petitioner, having been appointed to the position of inspector on the said works, was removed from that position for incompetency is a false and libellous aspersion upon your Petitioner.

3. That the allegation to the effect that your Petitioner was then placed in charge of the disinfectants, but was removed for incompetency from that position, is also a false and libellous aspersion on the character of your Petitioner.

4. That your Petitioner has studied at the University of Konigsberg for one year, and at the Technical University of Berlin for three years, and has passed the examination in architecture, civil engineering, and other technical sciences, as required for positions in the Public Service in Germany.

5. That your Petitioner has lived in the Australian Colonies, a naturalised citizen, for the past twenty years, and has during that period practised his profession as a consulting architect and civil engineer.

6. That the professional labours and qualifications of your Petitioner fitted him, he believes, to render valuable service to the public in connection with the sanitary operations conducted under the said George McCredie.

7. That on the 3rd day of April last your Petitioner was sent for by the President of the Board of Health, and by him introduced to Mr. Getting, who engaged your Petitioner as superintendent of the disinfectants on the 4th day of April last.

8. That before entering upon that work your Petitioner did one day's work as inspector in charge of a gang.

9. That observing reckless waste in the use of disinfectants during the operations in Sussex-street, and that many of the inspectors were ignorant of the use of such materials, your Petitioner offered, without additional pay, to give the inspectors the necessary instructions, and that this offer was refused.

10. That some six weeks after his appointment your Petitioner found his position taken from him, without any notice to your Petitioner that his services were unsatisfactory, and without any complaint of any sort from first to last, the Paymaster simply stating when paying your Petitioner his week's salary that his services were dispensed with.

11. That the said Paymaster gave your Petitioner no reason for his abrupt dismissal.

12. That your Petitioner applied to the said George McCredie for an explanation, and the said George McCredie replied as follows:—"I have agreed with my friends appointing somebody else, as complaints have been made that you are too economical."

13. That, excepting in the above paragraph set forth, the Petitioner never received any explanation of his dismissal.

14. That no knowledge, either direct or indirect, was ever conveyed to your Petitioner that there was any charge of incompetency against him until he heard of the appearance in *Hansard* of the report of Mr. McCredie, before referred to.

15. That your Petitioner can bring abundant evidence to show that the charges of incompetency against him are entirely without foundation, and that the reasons given to him for his removal were creditable to your Petitioner, who fearlessly tried to do his duty to the public, and if discreditable to any were discreditable to those who removed him.

For all these reasons, your Petitioner humbly prays that your Honorable House will take such steps as may seem fit to inquire into the premises, and to enable him to clear his professional reputation from the charges aforesaid.

And your Petitioner, as in duty bound, will ever pray.

PETER BEHRENDT.

1900.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

ADULTERATION OF FOOD AND LIQUOR.

(RETURN RESPECTING ARTICLES SUBMITTED TO THE GOVERNMENT ANALYTICAL CHEMIST FOR ANALYSIS DURING LAST TWELVE MONTHS.)
