## **SUSTAINABILITY OF ENERGY SUPPLY AND RESOURCES IN NSW**

**Name:** Mr Richard Bowdler

**Date Received:** 28 August 2019

Coal Mining is Important to Australia and its people.

It provides a multi million dollar income for Australia and keeps entire Communities alive.

Clean coal power generation is entirely possible. In fact the technology was developed right here in Australia.

Renewable energy is all well and good until you start talking baseload power production. Nothing comes close to coal fired power stations for cost per kilowatt.

Considering Australia accounts for less than 1% of the world's greenhouse gas emissions it makes complete financial and moral sense to spend capital on clean coal power production using the world's best thermal coal grades we have right here in our back yard.
