The Hon. ROSE JACKSON: To be clear, as you say, it is clear that there is massive demand in regional New South Wales. So it is not the case right now that banks are not offering finance to developers who are looking to build stock in regional New South Wales because, in fact, there is so much demand that there would be no concern that there would not be able to be purchasers at the end for that product.

**TOM FORREST:** That is true, but that is not a sustainable long-term position. But what I would say is—and this goes back to the point that Ms Faehrmann raised—at the moment sometimes the specificity of the requirement for biodiversity offsets is so great that it simply slows down or even stops the process. While it might be affordable—and that creates a problem for another day should interest rates go up, but let us put that to one side, as you say—what you get then is a delay or a non-delivery of the housing stock, which exacerbates the very problem of rising prices in the first place. So we have sort of got dual problems which, in some respects, compete against each other.

**The Hon. ROSE JACKSON:** It is easy to say that in theory that development is not occurring because they cannot find a like-for-like offset, but can you give us specific examples? Where has that happened? Where has that occurred?

**TOM FORREST**: I would have to take the question on notice.

Further information in response to the question asked, see my further answer below along with Figure 1 and two spreadsheets attached. The information in the spreadsheet has been taken from the portal (a link to the portal is included in the answer). This information is accurate at the time of writing.

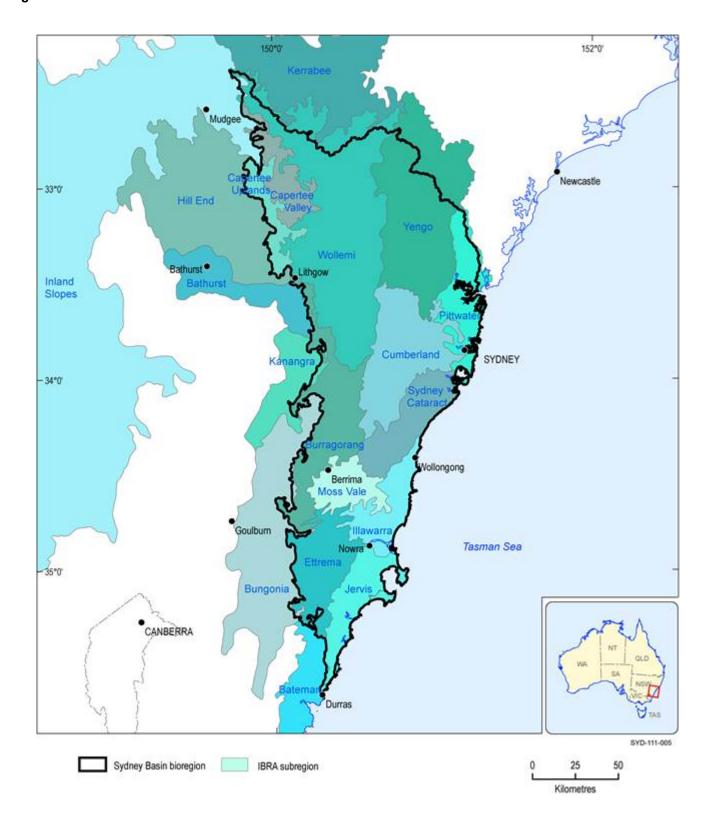

DPE's credit demand register includes one entry for 'credits wanted', being 250 ecosystem credits in the South Eastern Highlands IBRA region. However, the BCT's credits wanted list (available via the link <a href="here">here</a>) shows a high demand of credits across various IBRA subregions. The BCT's credit wanted list identifies the credits required by the BCT to satisfy offset obligations received from developers who have paid into the Biodiversity Conservation Fund. There is a shortage of credits available and a surplus of those wanting credits. This is representative of a system that is not working.

As an example, you can see there is a high demand for ecosystem credits in the Cumberland IBRA subregion (which appears to cover most of the Western Sydney growth area – see **Figure 1** with 295 requests for ecosystem credits (details are available in the **attached** spreadsheet). However, demand for credits is still high outside of Sydney. For example, the Bathurst IBRA subregion also has 295 requests for ecosystem credits (again – see **attached** spreadsheet). The total number of credits wanted across both regions is also similar (8,270 for the Cumberland IBRA subregion and 8,249 for the Bathurst IBRA subregion).

Examination of the attached Spreadsheet shows that there are a number of types of ecosystem credits in high demand in column D of each of the spreadsheets. These are the credits that are particularly difficult to replace on a like for like basis, thus adding costs, limiting housing supply and adding to the housing affordability crisis, even though the development community, generally, is doing its best to comply with all the rules and regulations.

Urban Taskforce notes that there already exists a tiered system for biodiversity conservation, with retirement of "like for like" credits being the preference, but then there are variation rules which can apply in some circumstances and the ancillary rules which set out actions that can be undertaken as biodiversity conservation actions. This change should be promoted, expanded, and simplified.
