## INQUIRY INTO 'ENERGY FROM WASTE' TECHNOLOGY

**Organisation:** Blacktown and District Environment Group

**Date received:** 25 May 2017

---

The incinerator would be in very close proximity to a high density population area and the use of a hot technology would permanently destroy resources, rather than recycle them.

This would also release toxic air pollutants, and generate toxic ash containing toxic heavy metals and dioxins.

Burning waste produces more carbon dioxide than coal or gas, and is a deterrent to recycling efforts, undermines real renewable energy, and also costs jobs
