**INQUIRY INTO URANIUM MINING AND NUCLEAR
FACILITIES (PROHIBITIONS) REPEAL BILL 2019**

Name: Mrs Beryl Ford

Date Received: 14 August 2019

Many finite minerals and resources are at a stage where they will be depleted either now or in the near future. They have become difficult or impossible to mine due to the excessive use of a growing world population. Where ever possible the use of an infinite source of energy has to be a better choice than a finite source. Uranium is a finite source that has many challenges in its use due to the lethal nature of its composition. It has many uses in medicine that give it a validation but using it for energy when infinite, resources such as wind, water, solar, can be used is reckless. Also renewable energy can be gathered on site in homes, businesses or common areas giving individuals control of their needs without having to rely on large companies whose commitment is to their own financial benefit.

Future generations will need uranium for medicinal reasons and may even find uses for it that we do not know of. We can not go ahead using resources just because they are there when we have alternatives.

Also the cost of uranium energy will always be high both financially and on the welfare environment of the planet. The market is not the answer ensuring human beings and the environment remain healthy is.
