**INQUIRY INTO FEASIBILITY OF UNDERGROUNDING  
THE TRANSMISSION INFRASTRUCTURE FOR  
RENEWABLE ENERGY PROJECTS**

Subject: Objection to trans-grid transmission lines.

Hello,

We adamantly objected to trans-grid transmission lines coming through our area the Murray River council.

They will to decimate the rice industry at Moulamein. We will have up to a 3rd loss of production in the area.

personally the route they are proposing to put them through all of our Rice layouts, so we will lose a considerable amount of our productive rice farming land, which is also followed by cereals, and then followed by grazing.

Transcrete have coming to our community like a wrecking ball. The 7th July !!

They come with their divide, and conquer attitude. All they want, is your name your number and a meeting in the next couple of days at your house, it's disgraceful behaviour. They have been using the term mandatory acquisition as a bullying tool, coating that they bank has been given the right by the Federal government.

They think that we are a literate country, Hicks and that is how they treated us.

The people that came from trans-grid to our community should be embarrassed with the way they behave towards country people.

At the drop in sessions which I attended 3 no one took minutes. No one wrote down who walked through the door. No one had nametags, or from what area of trans-grid they were from. They said they were taking questions on notice and they get back to us, but no one wrote those questions down. We do not want to negotiate with transgrid for the best outcome.

We do not want Transgrid in our area.

I do not give transgrid permission to come onto my land now or ever.

I do not agree to Transgrid subject me to high voltage transmission line,EMR's

There is a Plan B put up by a professor that every house in every city should have solar panels on it, and there would be no need for the VNI west, it would be a white elephant.

I don't completely understand the capacity of a powerline, but my understanding it is like a channel. You can only get so much water up a channel. You can only get so much power up a power line. The information that has been share for others is that the VNI W. can only have one more windfarm Connected into it through a substation and that's it. What is the point.

This is devastation By state and federal government of a highly productive producing area, devastation of farm businesses, who have been living under all the restrictions of water, government, the basin plan. Now they want to wipe us out with high transmission powerlines.

High transmission lines is Something that the country won't even use.

I think it's about time the government lifted the ban on nuclear and seriously looked at that because this green energy superhighway is just turning into a major debacle, devastating, businesses, lives, and communities.

Having neighbours who have live together all their lives never speak to each other again and end up in court viciously fighting each other.

The fire risk of these monstrosities is enormous. And the fire fighters will not go near them because smoke is a conductor, and they conduct the ground so then it becomes a personal hazard for the firefighters. I believe they are told to stay on the nearest road and just watch it. That means they could be a ferocious fire and no one can combat it.

I read an article where America a tribute to all of their wildfires there late last summer to being started by high transmission powerlines.

The Australian inquiry to the black Saturday fires also said fires were started by high transmission lines. The point being they can't be fought. They just have to be left alone to burn if they're near high transmission powerlines .

The high transmission powerlines that the government wants to criss-cross the eastern Australian states, Victoria, New South Wales and Queensland. The food producing states of our nation .

No one will be able to fight the fire because they'll always be a transmission line in the way.

This seems to me to be electricity, security versus food security. What do people think they are going to eat if Australia reduces its food production by a third?

Some wind turbine info, for you,

With the wind turbines in their 3rd-4th year, of their leading edge of the turbine fins degrades, and then spewing blue asbestos powdery dust over everything that they are around people, animals, land. And then the rain comes and it washes into our waterways.

Where are the green monsters on this issue?

There are issues with it right across the the food producing area f Australia.

Farmers are under threat.

. The wind turbines with blue asbestos dust every year after the four year for the rest of the time, they are standing, the transmission lines with fire risk and no one can fight them, the solar panels they are weathered they Leach heavy metals into the waterways.

This line cannot be allowed to go ahead.

I will be fighting it the first year, the 2nd year, the 3rd year, the 4th year, the 5th year, the 6th and onwards

Not one landholder in the proposed route in New South Wales from Murrabit to theDinwilly substation, which incidentally doesn't exist it's not even there.

That's another lie that Transgrid told us. They told us that the Dinwilly substation was under construction. A neighbour of mine went for a drive and there's nothing there.

Not even a sod turned over. Lying deceitful trans-grid strikes again.

Sincerely  
Ann Hare
