

INQUIRY INTO EMISSIONS FROM THE FOSSIL FUEL SECTOR

Name: Mr Eric Galloway

Date Received: 13 August 2025

I have little faith in the assumption that the extra CO₂ in the Atmosphere has anything to do with climate change which is always changing

Not one extreme weather event bushfires or floods have not happened before

All predictions in the last 30 years have never eventuated

AL Gore might be updating his predictions but they never eventuate

There is an enormous cost to the Australian economy in the transition to net Zero with no change to the climate. Australia is a rich country that became rich on farming and cheap power. Barring the use of fossil fuel will only make the country much poorer

If we continue to push with net Zero agenda farming and mining are the only industries that we can compete with the rest of the world will also be gone

We are still rich thanks to these industries

The destruction of the environment from wind solar and transmission lines is causing more damage than the CO₂ from Coal power stations

In fact my power bill has gone from 19cph in 2012 when I installed solar panels to 63cph

It is very clear to me we are risking the quality of life for future generations by wasting trillions on something that will not change the climate

The best way to help future generations is to scrap all wind and Solar

Use New coal Gas and uranium don't invest another cent on intermittent wind and solar Coal 24/7 is easily the cheapest takes up a very small amount of land
