LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

COAL MINE, BUNDANOON CREEK.

(PETITION—RESIDENTS, BERRIMA DISTRICT.)

Ordered by the Legislative Assembly to be Printed, 30 July, 1867.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the undersigned Residents in the Berrima District, county of Camden, in the Colony of New South Wales.

RESPECTFULLY SHEWETH:—

That a Coal Mine situate at Bundanoon Creek, a few miles from Sutton Forest in the Berrima District, on property taken up on mineral rights by a Mr. Martin Larkin, a sample of which coal has been tested and found to be superior in quality to that of the best coal procurable at Newcastle: and in the event of the said mine being worked, would cause a large amount of labour now unproductive which it would absorb; besides the cities of Sydney and Goulburn, and other townships in the interior, could be supplied, as also the Railway Department, with coal at considerable less cost than at present paid for that commodity.

That the Coal Mine proposed to be worked, is four measured miles in distance from the line of the Great Southern Railway, at the crossing of the Merilla road, at which spot a siding, for a depôt to take up coal by the train, would be a very great advantage and convenience to the public, the Railway being in close proximity.

That your Petitioners are aware that the Honorable James Byrnes, the Minister for public Works, has been applied to as to whether it was the intention of the Government to make a special rate for the conveyance of coal, and the reply received from him was to the effect,—“That it was not in contemplation at present to make a special rate for that article.”

That your Petitioners beg most respectfully to state, that if the Government do not feel disposed to grant a special rate, at a moderate charge, (say) one half-penny per mile per ton, there would be no inducement for the proprietor of the Coal Mine in question to work the same, which would be much deplored by your Petitioners.

Your Petitioners further submit, that their prayer is reasonable, and in as much by the opening of the Coal Mine an addition will be made to the fixed population of the country, and an impetus given to the alienation of the Crown Lands in the neighbourhood, and a consequent increase in their value, whereby all sources of Revenue, including Railway traffic, will be enlarged.

That a special rate for coal, on the Great Southern Railway, being made by the Government, and a siding as a depôt for coal granted, the Coal Mine at Bundanoon Creek would be at once opened and operated upon by experienced miners, who are ready to be engaged for that purpose in the event of a favorable decision being arrived at by your Honorable House.

Your Petitioners therefore humbly pray, that your Honorable House will be pleased to take the foregoing premises into your favorable consideration, and cause such steps to be taken as your Honorable House may deem fit. That a special rate for coal on the Great Southern Railway may be made, and a siding granted for a depôt, thereby conferring a great boon on your Petitioners and the public generally.

And your Petitioners, as in duty bound, will ever pray, &c., &c.

June, 1867.

[Here follow 84 Signatures.]

1867-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

COAL MINE, BUNDANOON CREEK.

(PETITION—INHABITANTS OF GOULBURN AND VICINITY.)

Ordered by the Legislative Assembly to be Printed, 18 March, 1868.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the Inhabitants of Goulburn and its vicinity, in the Colony of New South Wales,—

RESPECTFULLY SHEWETH:—

That there exists a Coal Mine in the locality of Bundanoon Creek, three miles from the line of railway at Sutton Forest, containing an excellent description of coal.

That the proprietor of said mine (Mr. Martin Larkin) has no inducement held out to him to warrant an outlay of capital and give an impetus to labour, owing to the want of a sideling for the conveyance of the coal per railway to Goulburn and Sydney; as also a special rate for that commodity at one half-penny (or less) per ton per mile.

That a Petition has already been presented to your Honorable House, praying that a sideling be granted and a special rate fixed by the Government, which has been signed by influential inhabitants of Sutton Forest and its neighbourhood, but to which no favourable reply has yet been received.

That, considering the vast importance to be derived by a constant supply of coal to the city of Goulburn, the inhabitants of that place will be enabled, if the prayer of your Petitioners be acceded, to have their streets, churches, shops, and other buildings, lighted with gas, fuel will be provided for domestic and manufacturing purposes, no place being able to boast of any manufactories larger than a blacksmith's forge without the valuable commodity of coal.

That in about three months' time it is supposed the line of extension of the railway to Marulan will be completed; when, if your Honorable House should grant a sideling and a special rate, coal can then be delivered in Goulburn by drays from Marulan, as low as fifteen shillings per ton, including all expenses; and, after the train reaches Goulburn, be delivered there at a less rate.

That your Petitioners would point out, also, the advantage that would ensue by supplying coal at a reasonable rate to the engines, and for other railway purposes; besides, its being so conveniently procured would undoubtedly prove advantageous to the Railway Department and the community generally.

And your Petitioners, therefore, humbly pray that your Honorable House will take the foregoing premises into your favourable consideration, and accede to the prayer of your Petitioners, by granting a sideling on the Great Southern Railway and a special rate for conveyance of coal, thereby conferring a boon upon your Petitioners and the public.

And your Petitioners, as in duty bound, will ever pray, &c.

[Here follow 216 Signatures.]

NEW SOUTH WALES.

AUSTRALIAN MUSEUM.

(REPORT FROM TRUSTEES.)

Presented to Parliament, pursuant to Act 17 Vict., No. 2, sec. 9.

REPORT OF THE TRUSTEES OF THE AUSTRALIAN MUSEUM, FOR THE YEAR ENDING 31 DECEMBER, 1866.

To HIS EXCELLENCY THE GOVERNOR-IN-CHIEF.

&c., &c., &c.

1. The Trustees of the Australian Museum have the honor to submit to your Excellency this their Thirteenth Annual Report.

2. The Museum has been open to the public daily (Sundays excepted) during the past year, and has been visited by 79,961 persons.

3. The system of exchanging specimens of natural history with the principal Foreign Museums is still maintained by the Trustees, who have received several valuable collections during the past year, a list of which is appended. (*Appendix No. 2.*)

4. Numerous donations have been received during the year, a list of which is appended. (*Appendix No. 3.*)

5. In Appendix No. 4 will be found a list of the various objects sent in exchange, together with the names of the recipients.

6. Several valuable works, purchased out of the Endowment Fund, have been added to the Museum Library, a list of which is appended. (*Appendix No. 5.*)

7. Three experienced Taxidermists have been occupied during the year in preparing and mounting the following specimens:—

32 mammals,

298 birds,

34 reptiles,

28 skeletons of mammals and birds,—

and in cleaning and preserving from decay the collection already displayed for public inspection.

8. The Trustees have to record the resignation, as a Member of the Board, of Alexander Walker Scott, Esq., M.A.

9. The Trustees have to report that the first edition of their Catalogue is out of print, and that a second enlarged edition is urgently required; and as the Endowment Fund is much encroached upon already for the purchase of the necessary books and periodicals, they are not in a position to proceed with the printing. Under these circumstances, the Trustees recommend that application be made to the Government to have the Catalogue printed at the Government Printing Office.

10. The Trustees have to acknowledge the liberal provision made by the Legislature for the completion of the new wing. The building will be ready within a short period for the reception of specimens, and the Trustees will lose no time in procuring the necessary cabinets, so far as may be practicable with the amount which has been voted for the purpose.

11. Mr. George Masters, the Assistant Curator, has visited Western Australia, and collected a large number of valuable specimens, whereby the fauna of the West Coast is now well represented in the Museum. A list of the collections thus made during the year is appended. (*Appendix No. 6.*)

12. Appendix No. 1 contains an abstract of the receipts and payments of the Trustees on behalf of the Museum, for the year ending 31st December, 1866.

13. Appendix No. 2 contains a list of the specimens received in exchange.

14. Appendix No. 3 contains a list of the various donations during the year, with the names of the donors.

15. Appendix No. 4 contains a list of the specimens sent in exchange to various persons and institutions.

16. Appendix No. 5 contains a list of the books purchased for the Museum Library.

17. Appendix No. 6 contains a list of the specimens collected by Mr. George Masters, Assistant Curator.

18. The Trustees have the honor to submit this their Report for the year 1866; and in testimony thereof, have caused their corporate Seal to be hereunto affixed, this 6th day of June, 1867.

(L.S.)

E. DEAS THOMSON,
Crown Trustee and Chairman.

AUSTRALIAN MUSEUM.

APPENDIX No. 2.

LIST OF SPECIMENS RECEIVED IN EXCHANGE, DURING THE YEAR 1866.

From the Royal Society of Tasmania.

A Thylacine (Thylacinus cynocephalus).

From the Museum d'Histoire Naturelle, at Paris.

- MAMMALS.
- Cynocephalus sphinx
 - Cercopithecus callithrichus
 - Cercocebus fuliginosus
 - Macacus cynomolys
 - Cebus apella
 - Jacchus vulgaris

- BIRDS.
- Trogon surucura
 - Trogon variegatus
 - Trogon personatus
 - Trogon viridis
 - Trogon caligatus
 - Plarpactes malabaricus
 - Plarpactes diordi

From Capt. R. H. Beddome, Official Conservator of Forests, Madras.

INDIAN REPTILES.

- Dipsas trigonatus
- Plectrurus perottetii
- Rhinophis sanguineus
- Dendrophis pictus
- Trimesurus strigatus
- Simotes binotatus
- Trigonocephalus hypnale

- Tropidococcyx perottetii
- Rhinophis palagemis
- Sylibura acellata
- Sylibura elliotii
- Tropidonotus monticula
- Oligodon affinis
- Lygodon aulicus

From Mr. J. Ch. Puls, Gand.

- 7 European Mammals
- 116 European Birds

- 500 European Land and Fresh-water Shells

Australian Museum, Sydney, 6th June, 1867.

GERARD KREFFT, Curator and Secretary.

APPENDIX No. 3.

DONATIONS TO THE AUSTRALIAN MUSEUM, DURING THE YEAR 1866.

MAMMALS.

PRESENTED BY

A Kangaroo (<i>Macropus major</i>)	From the Botanic Gardens, and from the Council of the Acclimatization Society
A Monkey (<i>Cercopithecus</i>)	
A Bettong (<i>Bettongia rufescens</i>)	
A young Deer (<i>Cervus</i>)	
A Water Rat (<i>Hydromys chrysogaster</i>)	
A Flying Squirrel (<i>Petaurista taguanoides</i>)	
A Monkey	
A Water Rat (<i>Hydromys chrysogaster</i>)	
A Tiger (<i>Felis tigris</i>)	
A Phalanger (<i>Phalangista vulpina</i>)	
A Cuscus (<i>Cuscus brevicaudatus</i>)	
A Koala (<i>Phascolarctos cinereus</i>)	
Two Dasyures (<i>Dasyurus viverrinus</i>)	
A Bat (<i>Scotophilus morio</i>)	
A Bandicoot (<i>Perameles nasuta</i>)	
Two Dasyures (<i>Dasyurus viverrinus</i>)	
Four Field Mice	
A Tree-rat (<i>Hapalotis arboricola</i>)	Master Tost Dr. Cox Mr. W. Beaumont Mr. J. D. Stewart Mr. John Buttray Mrs. Stuart Mr. John H. Seymour Mr. William Macleay, M.L.A., F.L.S. Mr. John Seymour Rev. G. E. Turner, B.C.L. Mr. Arthur T. Holroyd Mr. Burnell, junr. Mr. Ed. S. Hill Messrs. Hill and Oatley Mr. R. Stephens Mr. M'Arthur Dr. Cox Mr. H. Barnet Mr. B. P. Rodd Mr. J. H. French Mrs. Neaves Mr. F. Barnett Mr. Albert Cooper
A Flying Squirrel (<i>Petaurista taguanoides</i>)	
A Phalanger (<i>Phalangista vulpina</i>) var. alba	
A Koala and young (<i>Phascolarctos cinereus</i>)	
A large Kangaroo (<i>Macropus major</i>)	
A Koala (<i>Phascolarctos cinereus</i>)	
An Antechinus (<i>Antechinus stuartii</i>)	
A Kangaroo (<i>Macropus major</i>)	
A Flying Squirrel (<i>Petaurista taguanoides</i>)	
A Tree-rat (<i>Hapalotis arboricola</i>)	
A Pouched Mouse (<i>Acrobata pygmaea</i>)	
A Squirrel (<i>Sciurus vulgaris</i>)	
A Spotted Mouse (<i>Mus musculus</i>)	
A Bandicoot (<i>Perameles nasuta</i>)	

BIRDS.

A Finch	Miss Boyd Mr. Sallet
A Crane	
Two Mooruks (<i>Casuarinus Bennetti</i>)	From the Council of the Acclimatization Society, and the Botanic Gardens.
An Albatross (<i>Diomedea exulans</i>)	
A Duck (<i>Anas</i>)	
Two Pigeons (<i>Leucosarcia picata</i>)	
A Pigeon	
A Partridge	
A Pheasant	
A Musk Duck	
A Rose Cockatoo (<i>Cacatua Leadbeateri</i>)	
A Gracle (<i>Gracula religiosa</i>)	
A Partridge	
A Satin Bird (<i>Ptilonorhynchus holosericeus</i>)	

BIRDS—continued.	PRESENTED BY
A Rosella (<i>Platyercus eximius</i>)	From the Council of the Acclimatization Society, and the Botanic Gardens
Two Pheasants	
A Spoonbill (<i>Platalea regia</i>)	
A King Parrot (<i>Aprosmicetus scapulatus</i>)	
A Wedge-tailed Eagle (<i>Aquila fucasa</i>)	
A Swan (<i>Cygnus atratus</i>)	
A Golden Pheasant	
A Silver Pheasant	
Two Cockatoos (<i>Cacatua galerita</i>)	
A Diver (<i>Phalacrocorax</i>)	
A White Hawk and a Sparrow Hawk	Mr. O. West
A Wood Duck (<i>Berniala jubata</i>)	Mr. J. R. Yorke
A Pelican (<i>Pelecanus conspicillatus</i>)	Dr. Cox
A Parrot	Mr. S. Cork
An Owl (<i>Athene boobook</i>)	Mr. A. Boyd
Two Pelicans (<i>Pelecanus conspicillatus</i>)	Mr. Michael Gannon
A Crane (<i>Ardea pacifica</i>)	
A Bittern (<i>Botaurus australis</i>)	Dr. Cox
A Pelican	Mr. Wheeler
A Hawk	Mr. Nichol
A White Owl	Mr. Yeomans
A Pigeon	Mr. Cooper
A Tern	Mr. Ed. Dunn
Three Honeyeaters, and Nests and Eggs of Australian Birds	
A Parrot (<i>Platyercus eximius</i>)	Mr. James Weyet
A Kingfisher (<i>Dacelo gigantea</i>)	Mr. Sallet
A Podargus (<i>Podargus humeralis</i>)	From the Botanic Gardens, and from the Council of the Acclimatization Society
Two Parakeets (<i>Platyercus</i>)	
A Canary	
A Magpie-Goose (<i>Anseranas melanoleuca</i>)	
A Silver Pheasant	
A New Zealand Rail	
A Satin Bird (<i>Ptilonorhynchus holosericeus</i>)	
A Magpie	
A Calcutta Crow	
A Stone Plover (<i>Edicnemus grallarius</i>)	
A Cape Pigeon (<i>Daption capensis</i>)	
A Dove	
An Emu (<i>Dromaius novaehollandiae</i>)	
A Satin Bird	
A Swan	
A Partridge	
A Night Heron (<i>Nycticorax caledonicus</i>)	
A Pheasant	
A Decoy Duck	
A Cockatoo Parrot	
An Apteryx (<i>Apteryx owenii</i>)	Mr. J. B. Bossley.
A Canary	Mr. Sallet.
A Tern (<i>Xema jamesonii</i>)	Mr. T. Patterson.
Femur and fibula of a species of Moa	Mrs. Woolley.
A Collection of Australian Birds	Mr. Eastway.
REPTILES.	
A Tortoise (<i>Chelodina longicollis</i>)	Dr. Rattray, R.N.
A Collection of Reptiles from the Hunter River	Miss Scott.
A Snake (<i>Vermicella annulata</i>)	Mr. F. Allport.
A Cyclodus (<i>Cyclodus gigas</i>)	Mr. W. Macleay, M.L.A., F.L.S.
A Snake (<i>Morelia spilotes</i>)	
A Collection of Australian Snakes	Mr. Edw. S. Hill.
A Lialis (<i>Lialis punctulata</i>)	Mr. H. H. Burton Bradley.
A Snake (<i>Pseudechis porphyriacus</i>)	Mr. James Seymour.
A Snake (<i>Morelia spilotes</i>)	Mr. Paul Coffey.
A Snake (<i>Hoplocephalus</i>)	Mr. Jose G. Hay.
A Lizard (<i>Himulia</i>)	Mr. W. Gorman.
A Tortoise (<i>Chelodina longicollis</i>)	Miss Elliott.
A Snake (<i>Diemenia superciliosa</i>)	Mrs. O'Neil.
A Snake (<i>Morelia spilotes</i>)	Dr. Cox.
A Tortoise (<i>Chelodina longicollis</i>)	Mr. David Wiley.
A Snake (<i>Brachysoma diadema</i>)	Mrs. Pickard.
A Snake (<i>Morelia spilotes</i>)	Mr. James Froeman.
A Lizard (<i>Himulia</i>)	Mr. Inglis.
A Lizard (<i>Phyllurus platurus</i>)	Mr. C. W. Pitt.
A Snake (<i>Hoplocephalus signatus</i>)	Mr. J. W. Webb.
A Lizard (<i>Hydrosaurus varius</i>)	Mr. Clifford.
A Snake (<i>Hoplocephalus signatus</i>)	Mr. Evelyn.
A Lizard (<i>Pygopus lepidopodus</i>)	Mr. Barrrens.
A Python	Mr. James M'Intosh
A Collection of Reptiles from the Hunter	Capt. Welsh.
	Mr. J. J. Robertson.
FISHES.	
A Flying Fish	Mr. John J. Earl.
A Carp	Mr. Sirkitt.
A Shark	Mr. Fitzhardinge.
A Cat Fish (<i>Silurus</i>)	Mr. A. Boyd.
A Balistes	Mr. W. Peacock.
An Eel (<i>Muraenesox bagio</i>)	Mr. W. C. Windeyer, M.L.A.
A Fish	Capt. Archdeacon.
A Shovel-nosed Shark	Mr. Ed. Byers.
Three species of Port Jackson Fishes	Mr. W. Underwood.
A Fish (<i>Cheironectes</i>)	Mr. W. Brown.

FISHES—continued.		PRESENTED BY
A Collection of South Sea Island Fishes	...	Mr. J. A. Buttrey.
A gigantic Pipe Fish (<i>Syngnatus</i>)	...	Messrs. Donald and Clarke.
A Fish (<i>Scorpaena</i>)	...	Mr. Billing.
A Fish (<i>Syngnatus</i>)	...	Mr. Louis Menser.
A Silver Eel (<i>Murænesox bagio</i>), and a Rock Cod (<i>Centropus robustus</i>)	...	Mr. Wm. Edw. Shaw.
A Fish (<i>Pegasus</i>)	...	Mr. George Smith.
A Pilchard (<i>Clupea sagax</i>)	...	{ Hon. E. Deas Thomson, C.B., M.L.C.
A Silver Eel (<i>Murænesox bagio</i>)	...	Mr. Charles Parnell.
A Collection of Fresh-water Fishes (<i>Galaxias, Eleotris, &c.</i>)	...	Mr. W. C. Armstrong.
A Collection of Port Jackson Fishes	...	Hon. T. A. Murray, M.L.C.
A Fish (<i>Thynnus</i>)	...	Mr. Oliver Solomon.
A Fish (<i>Chanos</i>)	...	Mr. Myers Solomon.
A Fish (<i>Cheironectes</i>)	...	Mr. Stacy.
A Fish (<i>Pagrus</i>)	...	Miss Smith.
Skull of a large Schnapper	...	Mr. M'Carthy.
A Port Jackson Shark (<i>Heterodontus phillipi</i>)	...	Mr. David Rutledge.
A Collection of Port Jackson Fishes	...	Mr. Grantley Fitzhardinge.
MOLLUSCS.		
A Collection of Australian Land Shells	...	Miss Scott.
Land Shells from Fiji Islands	...	{ Mr. A. Boyd.
Shells from Port Jackson and the Pacific	...	
Shells from the Pacific	...	Mr. J. A. Buttrey.
Terebratulæ from Port Jackson	...	Mr. J. Brazier.
A Collection of Shells	...	Mr. W. Salting.
A Collection of Land Shells	...	Mr. C. A. Gorrick.
A Shell (<i>Venus</i>)	...	Mr. Frost.
Land Shells from Warro	...	Mr. F. A. Blackman.
CRUSTACEANS.		
A Fresh Water Crustacean	...	Mr. Sirkitt.
A Tree Crab (<i>Birgus latro</i>)	...	Mr. Dalgleish.
Port Jackson Crustaceans	...	Mr. J. Brazier.
A large Tree Crab (<i>Birgus latro</i>)	...	{ Dr. Duncan, R.N., H.M.S. "Esk."
INSECTS.		
A Collection of Australian Lepidoptera	...	Miss Scott.
A Phasma	...	Mr. J. T. Clarke.
Twelve Insects from New South Wales and New Zealand	...	Mr. Alex. Hunter.
A Moth (<i>Antheraea</i>)	...	Mr. Henry Beaver.
A Collection of European Coleoptera	...	Mr. J. W. Edge.
A Collection of Australian Insects	...	Mrs. Forde.
Three Indian Insects	...	Dr. James C. Cox, C.M.Z.S.
A Collection of Lepidoptera, from Cape York	...	Mrs. James Mitchell.
A Wasp-nest	...	Mr. W. J. Martin.
A Collection of Australian Coleoptera	...	Mr. Edward Forde.
A Phasma	...	Hon. J. B. Wilson, M.L.A.
Two Coleopterous Insects	...	Mr. Wm. Hemming.
RADIATED ANIMALS.		
A large piece of Coral	...	Mrs. Brown.
MINERALOGICAL AND PALÆONTOLOGICAL SPECIMENS.		
Stalactites	...	Miss-Johnson.
Copper Ore	...	Mr. Donald M'Donald.
Iron Conglomerate	...	Mr. F. S. E. Holt.
Gold-bearing Quartz	...	Mr. Donald Munroe.
Specimens of various Minerals	...	Mr. W. Salting.
Collection of Minerals	...	Mr. Barker.
Polished Pebbles	...	Mr. Frost.
A large piece of Obsidian	...	{ Commander Freemantle, R.N., H.M.S. "Eclipse."
Columnar Sandstone	...	Professor Smith.
Minerals from Tonga	...	Captain Jones, V.C.
Molar tooth of a Diprotodon	...	Mr. E. H. Acres.
ETHNOGRAPHICAL SPECIMENS.		
A Cannibal Fork from Ovalau	...	Mr. A. Boyd.
A stone Knife from Warro	...	Mr. F. A. Blackman.
COINS.		
Eleven Copper Coins	...	Mrs. Bailiff.
Three Silver Coins	...	Mr. Wm. Pattison.
A Collection of Coins	...	Mr. Henry Cape.
Nine Copper Coins	...	Mr. G. W. Kihlman.
BOOKS.		
Dr. Mueller's "Fragmenta"	...	Mrs. Tozer.
The Annual Report of the Acclimatization Society	...	{ The Council of the Acclima- tization Society.
The 1st volume of the Entomological Society of New South Wales	...	
MISCELLANEOUS.		
Coins, Weapons, and Antiquities, from the Middle Age, collected on the Battle-fields of Great Britain	...	Mr. George Thornton.

1867.

NEW SOUTH WALES.

SEWERAGE AND WATER SUPPLY.

(TENTH YEARLY REPORT OF MUNICIPAL COUNCIL—1866.)

Presented to Parliament, pursuant to Act 20 Vict., No. 36, sec. 75.

THE TOWN CLERK to THE UNDER SECRETARY, COLONIAL SECRETARY'S OFFICE.

Town Clerk's Office,

Sydney, 4 March, 1867.

SIR,

I have the honor, by direction of the Right Worshipful the Mayor, to transmit herewith the Tenth Yearly Report of the Proceedings of the Municipal Council of Sydney under the Water and Sewerage Acts, in order that the same may be submitted for the information of the Parliament of New South Wales, in terms of the "Sydney Corporation Act of 1857."

I have, &c.,

CHA. H. WOOLCOTT,

Town Clerk.

TENTH YEARLY REPORT of the Municipal Council of Sydney, of their Proceedings under the Water and Sewerage Acts.

THE Municipal Council of the City of Sydney have the honor to submit, for the information of the Parliament of New South Wales, the following Report of their Proceedings, under the Water and Sewerage Acts, from the 1st January to the 31st December, 1866, together with Statements of Receipts and Disbursements for the same period.

WATER.

The engines and machinery at Botany have continued at work night and day, Sundays excepted, throughout the year.

The casualties during this period have been—the breaking of one cross-head, one cylinder-cover, one clack-valve box of main pump of the western engine, and one main pump barrel of the eastern engine; all of which were replaced as soon as practicable, and without any interruption to the supply of water to Sydney.

The only casualty on the line of 30-inch main during the year was the bursting of one socket. The pipe was taken out and replaced, with the detention of four hours only.

The quantity of water pumped into the City of Sydney by the Botany engines in 1866, was 958,649,221 gallons, being in excess of the previous year's supply by 83,588,717 gallons. The supply from the Lachlan Swamp, through the old tunnel to the lower level of the city, has been continuous.

During the latter part of the year the effects of the drought were apparent by the diminished depth of water in the store reservoirs; and it was deemed advisable to suspend the watering of the streets for a few weeks, and to shut the supply off from the city and suburbs during the night.

The adoption of the latter precautionary measure has shewn that an enormous quantity of water is allowed to run to waste by consumers, averaging from 750,000 to 1,000,000 gallons per night.

The reservoir at Paddington was completed and brought into successful operation in May last, and the supply of water to the higher levels of the city and suburbs has since been regular and abundant.

After very considerable difficulty and disappointment, a contract has been entered into for the construction of three dams between Lachlan and Botany. The work is now being proceeded with diligently, and when completed will augment the present means for the storage of water to the extent of eighty millions of gallons.

Plans for the formation of three additional reservoirs have been prepared, and the carrying out of these works will effect a further storage of about one hundred and ten millions of gallons. Advantage has been taken of the dry season to resume the cleaning out of the upper mill reservoir at Botany; and the excavation and embankments are now progressing satisfactorily. The completion of this work will provide a reserve of about thirty-eight millions of gallons of water.

The passing of the "Sydney Corporation Powers Extension Act" has placed the Municipal Council in a position to recover water rates from every building upon the lines of streets where mains are laid; and this will have the effect of preventing the surreptitious use of water which has been so generally practised, and will also add considerably to the water revenue.

The various annual contracts for the supply of coal, and for castings and general stores, have been satisfactorily performed.

The quantities of new pipes laid in the city and suburbs during the year (as detailed in Appendix A), are as follows:—

3-inch	480 pipes	1,463 yards.
4	"	1,198	"	3,642 "
6	"	332	"	1,007 "
9	"	17	"	51 "
12	"	76	"	229 "

Street-watering hydrants:—

3-inch 47 pipes.

Old pipes taken up during the year:—

9-inch 63 pipes 189 yards.

SEWERAGE.

The following works in connection with the sewerage of the city have been executed during the year:—

Woolloomooloo Bay.—The whole of the works (enumerated in former Reports) for the drainage of the reclaimed land at the head of Woolloomooloo Bay and its immediate neighbourhood, have been satisfactorily completed.

William-street.—A 6-foot oviform sewer has been constructed from William-street Bridge along the watercourse, in a northerly direction, for a distance of 150 feet.

Cleveland Paddocks.—A 3-foot oviform sewer has been constructed for a distance of 266 feet, from Castlereagh-street to Buckingham-street.

Tank Stream.—A contract has been accepted for constructing a 4-foot oviform sewer along the course of the Tank Stream, from Hunter-street to King-street, but the work was not commenced until the beginning of the present year.

Stoneware Pipe Drains have been laid throughout the city and localities as enumerated in Appendix B, and consist of the following quantities:—

51 yards	9-inch.
1,798	"	12 "
1,644	"	16 "
381	"	18 "
20	"	24 "

The number of houses connected with the main sewer during the year has been 366, making a total number of connections throughout the year of 1,643.

The number of trapped gullies in connection with the new system of sewerage is now 715. They are so constructed as to catch all solid matter passing along the surface gutters, and prevent its passage into the harbour. After rainfall it is usual to remove from each shaft from half a ton to a ton of road drift. There has not been an instance during the last two years in which any one of these gullies has been found inefficient; and the quantity of soil carted away, which would without this means of detention have found its way into the harbour, is incalculable.

It was deemed expedient during the year to examine the condition of the whole of the main sewers constructed since the year 1854, and it was found that the following defects existed:—

The main sewer (6-foot oviform) from Macquarie Place to the outlet of Fort Macquarie was in perfect order, excepting in one spot, between Phillip-street and Macquarie-street junctions, where a few bricks have dropped from the innermost ring of the arch.

The 4-feet 6-inch sewer in Pitt-street, from Bathurst-street to Hunter-street, is in complete order. The portion from Hunter-street to its junction with the main in Bridge-street, was found to be in a somewhat dangerous state, from the fact of the first and second rings of the invert having fallen out two or three bricks in width for more than half the distance. The necessary repairs were immediately undertaken. It was impossible to do this effectually with brickwork, as the opening radiated from a centre, and was consequently

consequently smaller inside the sewer than outside. The cavities, for a distance of 450 feet were thoroughly cleaned out and filled with a concrete of cement, sand, and shingle-ballast, neatly smoothed to the shape of the invert, and is now so hard that nothing but gunpowder will disturb it. There still remains a length of 250 feet to be similarly repaired, and this will be at once undertaken. The sewers in Elizabeth, Phillip, Castle-reagh, Macquarie, and Bridge Streets (all 3-feet, brick, oviform) were sound and in good order, excepting a portion of the Bridge-street sewer, where six bricks have been displaced; and about twenty bricks are wanting in the inner ring of the Phillip-street sewer. That portion of the 4-ft. 6-in. sewer laid in the watercourse in Woolloomooloo in 1856, has been subject to the same action as the northern end of the Pitt-street sewer. The bottom was washed away in several places, and the injuries have been successfully remedied by the use of concrete, as described in connection with the Pitt-street sewer.

The whole of the sewers constructed in Woolloomooloo Bay throughout the reclaimed land are in good order; but in consequence of the streets remaining unformed, and there being no stone gutters and trapped gullies to lead the water into them, the dirt and rubbish from the reclaimed land have accumulated in the sewers, and there are no means at present of effectually flushing them.

The main sewer at the Haymarket, and indeed the whole of the new sewers throughout the city, with the exception of the comparatively trifling defects already referred to, are in good serviceable order, and answer all the purposes for which they were constructed.

FINANCIAL

Statements of the Receipts and Disbursements on account of the Water and Sewerage Works, for the year 1866, duly certified by the City Auditors, are appended hereto.

CHAS. MOORE,
Mayor.

Adopted by the Municipal Council of Sydney, this 4th day of March A.D. 1867.

CHA. H. WOOLCOTT,
Town Clerk.

1867-8.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

SEWERAGE AND WATER SUPPLY.

(ELEVENTH YEARLY REPORT OF MUNICIPAL COUNCIL—1867.)

Ordered by the Legislative Assembly to be Printed, 24 April, 1868.

ELEVENTH ANNUAL REPORT of the Municipal Council of Sydney, of their Proceedings under the Water and Sewerage Acts.

THE Municipal Council of the City of Sydney have the honor to submit, for the information of the Parliament of New South Wales, the following Report of their proceedings under the Water and Sewerage Acts, from the 1st January to the 31st December, 1867, together with Statements of the Receipts and Expenditure for the same period.

WATER.

The engines and machinery at Botany, and the line of 30-inch main between Botany and Sydney, continued to work day and night (Sundays excepted) throughout the year, without any casualty, excepting that mentioned in the last year's Report, which occurred early in 1867.

The quantity of water pumped into Sydney and its suburbs from Botany, during the year 1867, was 955,436,976 gallons.

The usual supply to Woolloomooloo and the lower portions of the city has been obtained through the old tunnel leading from Lachlan Swamp.

The quantity of water which passed through the sluices, and over the weir of the engine pond into the sea at Botany, between the months of February and November, was somewhat over 10,148,000,000 gallons, which quantity, if stored, would, even at the present rate of consumption, supply the city and its neighbourhood for several years.

The arrangement referred to in the last Annual Report, as having been made for shutting off the supply to the inhabitants during the night time, was continued, with great advantage, for some months at the commencement of this year.

The entire absence of rain during the latter portion of the year, caused considerable diminution in the flow of water from the swamps; and although the supply at Botany did not decrease to an extent which prevented the ordinary quantity being sent into Sydney, as a matter of precaution it was deemed advisable to discontinue the use of water upon the streets towards the close of the year.

The several annual contracts for the supply of coals, castings, locks, and general supplies, were carried out satisfactorily.

The contract for the timber works in Dams Nos. 1, 2, and 3, was not satisfactorily completed.

The contract for the construction and filling of Dams Nos. 4, 5, and 6, was, with the exception of some of the timber-work (more especially in No. 4 Dam), properly carried out; and the contractors are now proceeding with the construction of a weir, and the sheet piling to the lower Mill Dam.

The contract for filling and earth-work to Nos. 1, 2, and 3 Dams, proceeded satisfactorily.

A contract was taken, in July last, by Messrs. Willis, Merry, & Lloyd, for the supply of cast-iron pipes from England, in the following quantities, viz. :—300 12-inch, 300 9-inch, 800 6-inch, 2,000 4-inch, 1,000 3-inch, and the first shipment of these pipes has arrived.

Contracts have also been satisfactorily carried out for the repair of two of the boilers at the Botany Works, repairs to the engine-house at Lachlan Swamp, and enclosing with iron palisading the Low Service Reservoir, Crown-street.

The engine-house at Botany has been thoroughly painted inside and outside, under contract by Mr. Yeoman.

The quantities of new mains laid in the city and suburbs during the year are detailed in Appendix A.

SEWERAGE.

The main sewers in the city, constructed under the Sewerage Act, have been found to be in excellent condition, and have completely answered the purpose for which they are intended. The only instance to the contrary has been with regard to the main sewer at the head of Darling Harbour, which has on two or three occasions become choked by the falling in of the soil forming the embankment of the land recently reclaimed by the Government, causing considerable damage to the private properties in the vicinity of the Haymarket.

The following works have been satisfactorily completed, or were in course of completion during the year:—

The Tank Stream, between King and Hunter streets, has been converted into a main sewer, by the construction of 925 feet lineal oviform sewer.

From Elizabeth-street to Goulburn-street, about 400 feet lineal of 6-feet oviform sewer was contracted for, and about three-fourths completed. The work was delayed for a time in consequence of the death of the contractor, but is now being proceeded with.

In Woolloomooloo, about 1,470 feet of 6-feet oviform sewer is being constructed from Palmer-street, along Sir John Young Road to Smedley's-lane.

The quantities of stoneware pipe drains laid in Sydney during the year are detailed in Schedule B.

The number of houses connected with the Sewerage Works during the past year amounts to four hundred and sixty-nine (469), together with 1,643 connections since the Sewerage Works were established, amounts to two thousand one hundred and twelve (2,112).

FINANCIAL.

Statements of the Receipt and Expenditure on account of the Water and Sewerage Works for the year 1867, duly certified by the City Auditors, are appended hereto.

CHAS. MOORE,
Mayor.

Adopted by the Municipal Council of Sydney, this 20th day of April, A.D. 1868.

CHAS. H. WOOLCOTT,
Town Clerk.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MUNICIPALITIES BILL.

(PETITION—MAYOR AND ALDERMEN, MUNICIPALITY OF WOLLONGONG.)

Ordered by the Legislative Assembly to be Printed, 20 November, 1867.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Humble Petition of the Mayor and Aldermen of the Municipality of Wollongong,—

RESPECTFULLY SHEWETH:—

That the Municipality of Wollongong was proclaimed in the year 1859, and ample proof has since been afforded of the benefits derived from local representation.

That those benefits, although great, would have been far greater, had it not been for certain defects in the Municipalities Act of 1858.

That your Petitioners perceive that a new Municipalities Bill has been introduced into your Honorable House.

That your Petitioners, guided by past experience, are afraid that the Bill will not be brought to maturity during the present Session of Parliament.

That your Petitioners feel assured that no measure would be productive of more good to the country than one that would place Municipal Institutions on a sound basis.

Your Petitioners, therefore, humbly pray that the present Session may not be allowed to terminate without a well-considered measure for regulating local self-government, being passed into law.

And your Petitioners, as in duty bound, will ever pray, &c., &c., &c.

WILLIAM ROBSON, Mayor. } (L.S.)
JOHN CURR, Town Clerk. }

Nov. 17, 1867.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MUNICIPALITIES.
(BOROUGH OF BALMAIN—BY-LAWS.)

Ordered by the Legislative Assembly to be Printed, 28 February, 1868.

BY-LAW RESPECTING THE DRAWING AND OBTAINING WATER FROM THE PUBLIC
PUMPS, WATERCOURSES, AND FOUNTAINS WITHIN THE MUNICIPALITY OF
BALMAIN.

No person or persons shall draw, pump, take, or carry away any water from any public pump, watercourse, or fountain, within the Municipality of Balmain, without a written permit from the Council Clerk, under a penalty not exceeding the sum of forty shillings.

JOHN BOOTH,
Chairman.

Passed by the Municipal Council of Balmain,
this 9th day of December, in the year of
our Lord one thousand eight hundred and
sixty-seven.

JAMES M'DONALD,
Council Clerk.

MUNICIPALITIES.
(BOROUGH OF ALBURY.—BY-LAW.)

Ordered by the Legislative Assembly to be Printed, 10 March, 1868.

BY-LAW No. 48, FOR THE BETTER PREVENTION OF FIRES.

1. For the better prevention of fires this Council shall have the power of giving fourteen days' notice to all rate-payers having at any time erected, or being about to erect, stacks of hay, wheat, or other inflammable materials, within (300) three hundred feet of any building in any populous portion of the town, to remove such stacks; and that, in the event of non-compliance with such order, the Council shall have the power to remove such stacks, at the expense of such rate-payer, and to recover the costs at the Small Debts Court.

2. That, from the time of the passing of this By-law, no buildings constructed of or roofed with bark or calico, shall be erected within the populous portion of the Municipality, except by permission of the Council.

I hereby certify that the above By-law has been duly submitted to the Municipal Council of Albury, and duly approved of.

LEWIS JONES,
Mayor.

MUNICIPALITIES.

(BOROUGH OF BATHURST—BY-LAWS.)

Ordered by the Legislative Assembly to be Printed, 11 March, 1868.

BY-LAWS for regulating the right to be enjoyed by the inhabitants of the Bathurst Municipality over the Town Common:—

1. Every inhabitant of the Municipality who shall hold a license to slaughter cattle under any Act now or hereafter to be in force for such slaughtering, shall be licensed or at liberty, on payment of the fees hereinafter provided, to depasture over any land lawfully set apart as a Common, any number of sheep not exceeding two hundred.

2. Every such inhabitant shall, before depasturing such sheep upon such Common, pay to the Treasurer of the Municipality, or to such officer or person as the Corporation may appoint, in respect of such sheep, a fee or charge, at the rate of two pounds sterling per annum for every one hundred sheep, and shall, at all times during such year in respect of which he shall be so licensed, keep registered in a book to be kept for that purpose in the Town Clerk's Office, and to be called the "Register of Brands," an accurate description of all such sheep as may be depasturing upon such Common under this By-law.

3. Every inhabitant of the said Municipality shall be allowed, on payment in advance to the Treasurer, or such officer as appointed, of the fees or charges hereinafter mentioned, to depasture on such Common any number of horses or cattle not exceeding twelve: Provided that this provision shall not extend to entire horses over the age of twelve months, and bulls over the age of six months; and that no fees or charges shall be taken in respect of the progeny of such horses or cattle which may be with their dams and under the age of six months.

4. Every such inhabitant shall, for the depasturing of such horses or cattle, pay yearly to the Treasurer of the Municipality, and previous to such depasturing, the fees and charges hereinafter mentioned:—

For horses or cattle, not exceeding four in number, one shilling and sixpence per head.

For each head of horses or cattle beyond four in number, the sum of five shillings.

5. Every such inhabitant shall, before so depasturing such horses or cattle, cause to be registered in such Register of Brands an accurate description of such horses and cattle, with their brands and distinguishing marks.

6. Nothing hereinbefore contained shall limit or abridge the right of the said Municipality to exercise their powers to impound any cattle, horses, or sheep, in excess of the number which it is hereby provided may be so depastured upon such Common.

The Ranger, or any person authorized by the Council, or any ratepayer or inhabitant of the Municipality, may impound in the Public Pound at Bathurst any cattle, sheep, horses, or other animals which are not authorized in manner hereinbefore mentioned to be depastured upon such Common, or in respect of which the fees hereinbefore mentioned have not been paid.

Passed by the Municipal Council of Bathurst, on the twenty-third day of December, in the year of our Lord one thousand eight hundred and sixty-seven.

FREDK. WM. HOLLAND,
Town Clerk, &c.

EDWARD GELL,
Mayor.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SYDNEY TAXATION LIMITATION AND BOUNDARIES
EXTENSION BILL.

(PETITION—COUNCIL OF BOROUGH OF PADDINGTON.)

Ordered by the Legislative Assembly to be Printed, 3 April, 1868.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the Council of the Borough of Paddington,—

RESPECTFULLY SHEWETH:—

That your Petitioners object to so much of the present Bill, now before your Honorable House, from the Corporation of the City of Sydney, as affects their right as a Corporation to tax all lands not in possession of Her Majesty for Imperial or Colonial purposes, or such other buildings or land specially exempted by the 163rd section of the Municipalities Act of 1867; and also to that particular portion of said Bill which describes the eastern boundary of Cook Ward, the same being indefinite and likely to involve serious loss to your Petitioners.

Your Petitioners humbly pray your Honorable House to take the above premises into your favourable consideration; and, as in duty bound, your Petitioners will ever pray.

(L.S.) JOHN DAVIS, Town Clerk.

Signed for and on behalf of the Council of the Borough of Paddington,—

W. TAYLOR,
Mayor.

April 1st, 1868.

1867-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MR. JOHN MACINTOSH.
(PETITION OF.)

Ordered by the Legislative Assembly to be Printed, 22 April, 1868.

To the Honorable the Members of the Legislative Assembly, in Parliament assembled.

The Petition of John Macintosh, one of the Aldermen for Macquarie Ward,
City of Sydney,—

HUMBLY SHEWETH:—

That your humble Petitioner has been several times prevented from performing his functions as a representative of the Citizens in the Municipal Council by the extraordinary powers used by the Mayor of Sydney while acting as Chairman, in ruling Resolutions as out of order contrary to the letter and spirit of the By-Laws approved of by the Executive Council.

Your Petitioner cites one of those Resolutions, which the Mayor, while acting as Chairman of the Municipal Council on April 20th, ruled as being not in order, after said Resolution had been discussed or spoken to by several Aldermen—(I enclose a Business Paper of that day, and said Resolution is numbered 12, and reads thus) :—“That it is the opinion of this Council, that the officer whose duty it was to collect the rent from Mr. Aaron Wheeler for the Market Wharf be suspended, pending an inquiry into the cause of the amount of arrears of rent being allowed to accumulate to the extent it has done without being reported to the Finance Committee”—whereby, by such ruling, and the prevention of further discussion, and a vote being taken thereon so as to cause an inquiry or otherwise into an alleged negligence of duty by an officer in the employ of the Municipal Council—whereby the citizens hath, and are likely to sustain further and grievous pecuniary loss.

Your Petitioner humbly prays, that your Honorable House will make such inquiry as may seem to you proper to meet the importance of the case, and that such inquiry may tend to prevent Municipal Institutions falling into disorder and disrepute as heretofore.

And your Petitioner, as in duty bound, will ever pray.

JOHN MACINTOSH,

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

SLAUGHTER-HOUSE REGULATION LAWS AMENDMENT BILL.

(PETITION.—CERTAIN BUTCHERS OF ST. LEONARDS.)

Ordered by the Legislative Assembly to be Printed, 17 December, 1867.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the undersigned Butchers, residing in the Municipality of St. Leonards,—

RESPECTFULLY SHEWETH :—

That a Bill to amend the Laws for regulating Slaughter-houses, now before your Honorable House, would, if passed into law, be unjust and oppressive to your Petitioners.

Your Petitioners have severally, within the last month, at the instance of the Municipal Council of St. Leonards, removed from the aforesaid township, and at considerable expense, erected suitable premises for slaughtering cattle, which premises are four (4) miles from Sydney, and one mile further than the distance prescribed by the Act now in force, and in localities which prevent them, or either of them, being a nuisance.

We would likewise state the fact that we are precluded from slaughtering at the Glebe Island Abattoirs, in consequence of there being no constant transit to or from Sydney to the North Shore for wheeled vehicles.

Municipal Councils having the power to pass by-laws for the slaughtering of cattle, we would respectfully request to be allowed to be amenable to the Municipal Council of St. Leonards.

Your Petitioners respectfully pray that their petition may be acceded to, as the Township of St. Leonards is not identical with any other suburb—it being separated from Sydney by water, the crossing of which at times is both dangerous and impracticable.

Your Petitioners, as in duty bound, will ever pray.

[Here follow 3 Signatures.]

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

SLAUGHTER-HOUSE REGULATION LAWS AMENDMENT BILL.

(PETITION—PHILLIP M'CARROLL.)

Ordered by the Legislative Assembly to be Printed, 17 December, 1867.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of Phillip M'Carroll, of Redfern, near the City of Sydney,
wholesale and retail butcher,—

RESPECTFULLY SHEWETH:—

That your Petitioner views with alarm the Bill now before your Honorable House, intituled "A Bill to amend the Laws for regulating Slaughter-houses," by the second section of which it is proposed to extend the limit within which slaughter-houses should not in future be licensed, namely, from three to six miles.

That your Petitioner is the owner of an extensive slaughtering establishment situate at a distance of three miles twenty-four chains from the boundary of the City of Sydney.

That previous to the erection of such slaughter-houses, and the granting of a license to your Petitioner, the site was inspected by Mr. Inspector Oatley, and favourably reported upon as a suitable and proper place for the erection of slaughter-houses.

That your Petitioner thereupon expended a large sum of money, namely, from one thousand six hundred pounds to two thousand pounds, in the erection of suitable buildings, plant, and other necessary works, and a license was granted to your Petitioner, which he has held for upwards of seven years.

That since the formation of such establishment, the premises have been regularly inspected by Mr. Inspector Rolleston, and no complaints have ever been made by him.

That your Petitioner slaughters weekly one hundred and twenty bullocks and eight hundred sheep, taking an average on the whole year.

That your Petitioner has seven retail shops in the City of Sydney and suburbs, and employs upwards of seventy men in the carrying on of his wholesale and retail business.

That the said slaughter-houses stand alone, and are far away from all dwelling-houses.

That the passing of the said second section of the said Bill would bring certain ruin upon your Petitioner, as it would be the means of closing his present slaughter-houses, prevent his carrying on profitably his retail business, and render almost worthless years of toil and industry.

Your Petitioner, therefore, prays that your Honorable House will take the above premises into your consideration, and not pass the second section of the said Bill into law.

And your Petitioner will ever pray, &c., &c.

Dated at Sydney, this twelfth day of December, A.D., 1867.

PHILLIP M'CARROLL.

1867.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SLAUGHTER-HOUSE REGULATION
LAWS AMENDMENT BILL.

(PETITION—ALFRED DAVIS, NEWTOWN.)

Ordered by the Legislative Assembly to be Printed, 18 December, 1867.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of Alfred Davis, of Newtown, near the City of Sydney,
Wholesale Butcher,—

RESPECTFULLY SHEWETH :—

That your Petitioner views with alarm the Bill now before your Honorable House, intituled "A Bill to amend the Laws for regulating Slaughter-houses," by the second clause of which it is proposed to extend the limit within which slaughter-houses should not in future be licensed, namely, from three to six miles.

That your Petitioner is the owner of an extensive slaughtering establishment, situate at Petersham, at a distance of more than three miles from the boundary of the City of Sydney.

That previous to the erection of such slaughter-houses, and the granting of a license to your Petitioner, the site was inspected by the proper Officer, and favourably reported upon as a suitable and proper place for the erection of slaughter-houses.

That your Petitioner has expended a large sum of money, namely, three thousand pounds, in the erection of suitable buildings, plant, and other necessary works, as well as in the purchase of adjoining land; and that your Petitioner has held a license for such slaughtering business for upwards of five years.

That since the formation of such establishment, the premises have been regularly inspected by Mr. Inspector Taylor, and no complaints have ever been made by him.

That your Petitioner slaughters weekly, taking an average on the whole year, about four hundred sheep and eighty bullocks.

That the said slaughter-houses stand alone, and are far away from dwelling houses.

That the passing of the said second clause of the said Bill, would bring certain ruin upon your Petitioner, as it would be the means of closing his present slaughter-houses, breaking up his present business connections, and render almost worthless years of arduous toil and industry.

Your Petitioner, therefore, prays that your Honorable House will take the above premises into your consideration, and not pass the second clause of the said Bill into law.

And your Petitioner will ever pray, &c.

Dated at Newtown, this sixteenth day of December, A.D., 1867.

ALFRED DAVIS.

1867.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

SLAUGHTER-HOUSE REGULATION LAWS AMENDMENT BILL.

(PETITION—WILLIAM PEISLEY AND ALFRED DAVIS, OF SYDNEY.)

Ordered by the Legislative Assembly to be Printed, 18 December, 1867.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of William Peisley and Alfred Davis, of Sydney, Cattle-salesmen,—

HUMBLY SHEWETH:—

1. That your Petitioners are possessed of a large section of land on the Duck River, in the County of Cumberland, upon which land your Petitioners have erected an extensive establishment for the slaughtering of cattle, at a cost of upwards of two thousand pounds, and that such establishment has been duly licensed to your Petitioners, in terms of the Acts of Council fourteenth Victoria number thirty, and fourteenth Victoria number thirty-six.

2. That the said establishment is within half-a-mile of the Parramatta Railway, and your Petitioners have, at great cost, caused a tramway to be made connecting with the said line of railway, for the transit of meat ready for the market in vans to the trains for conveyance to Sydney.

3. That your Petitioners view with alarm the thirteenth and other sections of the Bill to amend the Laws for regulating Slaughter-houses, now before your Honorable House, by which thirteenth section all licenses in force for slaughtering cattle within half-a-mile of any navigable river, or line of railway, or any public highway, are to be cancelled and become void on the thirtieth day of June, one thousand eight hundred and sixty-eight.

4. That if such clause should become law, without indemnification to your Petitioners, they will sustain irredeemable injury by the loss of their business, and rendering the entire plant and machinery of their said establishment valueless, which loss your Petitioners estimate at not less than five thousand pounds.

5. That your Petitioners are the only licensed persons for slaughtering cattle on or near the said line of railway; and your Petitioners are prepared to prove that no public inconvenience, danger, or damage has ever arisen, or is at all likely to arise, from your Petitioners said establishment, but rather, from the isolated position of the slaughter-houses, and the great facility of transit by the aforesaid tramway to the railway, and thence to the terminus at Redfern, is a convenience and advantage to trade and the public.

Your Petitioners therefore humbly pray that your Honorable House will be pleased to take the subject matter of this Petition into consideration, and that your Petitioners' license for their said slaughtering establishment may not be affected by the said Bill.

And your Petitioners will ever pray, &c.

W. PEISLEY.
A. DAVIS.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

**SLAUGHTER-HOUSE REGULATION
LAWS AMENDMENT BILL.**

(PETITION.—CERTAIN BUTCHERS OF SYDNEY AND SUBURBS.)

Ordered by the Legislative Assembly to be Printed, 18 December, 1867.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the undersigned,—

RESPECTFULLY SHEWETH :—

1st. That your Petitioners are Butchers, residing in and carrying on their business in the City of Sydney and its suburbs.

2nd. That your Petitioners have noticed that a Bill to amend the Slaughtering Act has been introduced into your Honorable House, and read a first time on the (12th) twelfth day of the present month (December), and that the said Bill has been ordered to be read a second time on Monday, the (16th) sixteenth instant.

3rd. As your Petitioners are informed that the said Bill is calculated to seriously affect their interests, we humbly submit that it would be a reasonable concession on the part of your Honorable House, should you kindly delay the said second reading of the said Bill until your Petitioners shall have had time and opportunity to peruse and consider the Bill.

4th. Your humble Petitioners, therefore, pray your Honorable House that you will so delay the said second reading of the said Bill.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 72 Signatures.]

1867-8.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

SLAUGHTER-HOUSE REGULATION LAWS AMENDMENT BILL.

(PETITION—J. WARNE, MACLEAY RIVER.)

Ordered by the Legislative Assembly to be Printed, 9 January, 1868.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of John Warne, of Warneton, Macleay River, in the Colony of New South Wales, Grazier, Storekeeper, Farmer, and Proprietor of a Slaughtering Establishment,—

SHEWETH:—

That your Petitioner has observed with surprise, that a Bill, proposed to be intituled The Slaughter-house Act 1867, is now under consideration by your Honorable House, by the 19th section of which it is proposed to enact, that from and after the 13th day of June, 1868, it shall not be lawful to grant to any person any license for the slaughtering of cattle within half-a-mile of any navigable river, used for the water-supply of any city or town, and on such date all licenses then in force for the keeping of slaughter-houses, contrary to the provisions of this section, shall cease and become void, without any provision being made for compensation to the proprietors of existing slaughter-houses.

That your Petitioner has for the last twenty-two years been the proprietor of a cattle slaughtering establishment, situate at Warneton, on the banks of the navigable river Macleay, about six miles above the small townships of East and West Kempsey, which derive their water-supply from the said river.

That such river, opposite the establishment of your Petitioner, is at least two hundred feet wide, with an average depth of six or more feet, and a rise of tide of more than two feet, and is subject to freshes rising as high as forty feet; and therefore even if meat, offal, or manure, were thrown into the river by your Petitioner, they would not pollute or render impure the water of such a noble river; and that in fact your Petitioner obtains his supply of water for the use of himself, family, and servants, from his wharf, situate a few yards lower down the river than his slaughter-house.

That during such twenty-two years no complaint has ever been made, even by the neighbours, of the water of such river being rendered impure by the slaughtering of cattle at your Petitioner's establishment, nor has any complaint ever been made against any other slaughter-houses on the said river, the whole of which are within half-a-mile thereof.

That your Petitioner has lately, at the expense of more than £130, erected a substantial shingled slaughter-house, and is not the proprietor of any freehold land distant more than half-a-mile from such river, suitable for the erection of another slaughter-house.

That the cool breeze prevailing at night on the river tends very much to render beef firm and capable of being salted, whilst the air as far back as half-a-mile is very warm and unsuitable.

That the settlers in this neighbourhood, who with their wives and families are remarkably healthy, principally reside on the banks of the river, and their traffic is entirely carried on in boats which come to your Petitioner's wharf, from whence they take away their meat, and it would occasion them great trouble, inconvenience, and loss of time, if they were obliged to travel more than half-a-mile inland, in all weathers, to obtain it, besides increasing the risk of its spoiling in so warm a climate.

2 SLAUGHTER-HOUSE REGULATION LAWS AMENDMENT BILL.

That the removal of his slaughter-house would entail on your Petitioner the expense of purchasing, if to be had, a piece of ground more than forty feet above the ordinary level of the river, whereon to erect a slaughter-house and the necessary yards, and the sinking of a well deeper than low-water mark of such river; and also the erection of a hut wherein to locate a watchman, to prevent beef being stolen, besides the expense of such watchman, and of killing so far from his other establishments, and the risk of fire; and as the necessities of his part of the river do not require daily killing, but only three or four head on each Friday, the expenses would considerably enhance the price of beef to his customers, already sufficiently impoverished by floods, bad crops, and bad prices.

That your Petitioner believes some proprietors have not the means necessary for removing their establishments, and that at some places swamps extend for miles back, and a suitable piece of ground could not be obtained, at any price, removed half-a-mile from the river.

That your Petitioner humbly submits the licensing of slaughter-houses ought to be left to the local magistrates, who are better enabled than parties residing at a distance to form an opinion as to whether or not their existence on the banks of the river is prejudicial to the health of the inhabitants.

Your Petitioner therefore humbly prays, that the aforesaid 19th section of the proposed Slaughtering Act may not become law.

And your Petitioner shall ever pray, &c.

J. WARNE.

1867-8.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

SLAUGHTER-HOUSE REGULATION LAWS AMENDMENT BILL.

(PETITION—CERTAIN RESIDENTS OF THE MACLEAY RIVER.)

Ordered by the Legislative Assembly to be Printed, 9 January, 1868.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the undersigned residents on the banks of the Macleay River, in the vicinity of Warneton,—

SHEWETH:—

That your Petitioners have heard with surprise that by the proposed Slaughter-house Act of 1867, now under consideration by your Honorable House, section 19 proposes to enact that all slaughter-houses shall be removed more than half-a-mile back from any navigable river supplying with water any city or town.

That your Petitioners reside on the banks of the River Macleay, from whence they derive their supply of water, and their traffic is wholly carried on in boats, and they have for many years been in the habit of obtaining their stores and beef from Warneton, where there is a slaughtering establishment and stores on the bank of the river.

That during all the time your Petitioners have resided on the Macleay, no cause of complaint has ever arisen of the water being polluted, discoloured, impure, or unwholesome, by reason of such slaughtering establishment being so near the river; but, on the contrary, the water in its immediate vicinity is quite as pure as in other places, and the health of the inhabitants is remarkably good.

That if such establishment were removed half-a-mile from the river it would cause your Petitioners great loss of time in procuring their beef, independent of the great risk which would be caused in such a warm climate of its being spoiled by its transit to the river, and of its price being greatly enhanced by the extra trouble and expense to which removal would subject the proprietor.

Your Petitioners therefore humbly pray that such 19th section may not be passed into law.

And your Petitioners shall ever pray, &c.

[Here follow 31 signatures.]

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SLAUGHTER-HOUSE REGULATION
LAWS AMENDMENT BILL.

(CERTAIN BUTCHERS, SYDNEY.)

Ordered by the Legislative Assembly to be Printed, 16 January, 1868.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Humble Petition of the undersigned,—

RESPECTFULLY SHEWETH:—

1st. That your Petitioners are Butchers and others residing in and carrying on their business in the City of Sydney and its Suburbs.

2nd. That a Petition was presented to your Honorable House in the month of December now last past, asking for time for perusal and consideration (in reference to a Bill then before your Honorable House, having for its object the Amendment of the Slaughtering Act), received and ordered to be printed.

3rd. That your Petitioners, having since read and considered the said Bill, are of opinion that the passing of the same would seriously and injuriously affect them in the pursuit of their legitimate calling, and also fail to confer beneficial effects on the public in general.

4th. That your Petitioners humbly submit that Clauses No. 2, No. 3, No. 4, No. 5, No. 6, No. 7, No. 8, No. 9, No. 10, and No. 11 of the said Bill, would, if acted upon, so vex and annoy the generality of those submitting to those proceedings, as to cause them to feel oppressed and to lose their self-respect and sense of freedom.

5th. Your said Petitioners therefore humbly pray your Honorable House not to pass the said Bill. And your Petitioners, as in duty bound, shall ever pray.

CATTLE DISEASE PREVENTION ACT OF 1866.
(REGULATIONS UNDER.)

Ordered by the Legislative Assembly to be Printed, 5 July, 1867.

(Presented to Parliament, in accordance with the provisions of the
16th clause of the Act.)

Department of Lands,
Sydney, 6th November, 1866.

CATTLE DISEASES PREVENTION ACT OF 1866.

THE following Regulations, made by His Excellency the Governor, with the advice of the Executive Council, in accordance with the provisions of the above-named Act, are hereby published, for general information.

J. BOWIE WILSON.

1. Any vessel being ordered by the Minister to be placed in quarantine under the provisions of section 5 of the Cattle Diseases Prevention Act, shall proceed to the usual anchorage at Spring Cove, and shall remain there under the same rules and restrictions as vessels are subject to by the Quarantine Regulations of 19th January, 1855, so far as such Regulations are applicable to the provisions of the above-named Act, until the animals, stall-fittings, fodder, or other articles on such vessel, prohibited by the said Act, are destroyed or transhipped to some port or place out of the Colony, and until the said vessel be duly cleansed and disinfected.

2. All animals, stall-fittings, fodder, or other articles required to be destroyed under the above-named Act, shall be conveyed to Shark Island, and consumed by fire in presence of the Inspector; and the boat, barge, or other vessel conveying such animal or articles shall thereafter be duly cleansed or disinfected before leaving such Island; and no cattle or other animals shall be allowed upon such Island while this Act remains in force, under penalty of being destroyed.

3. The contribution chargeable under section 13 of this Act, may be paid either to the Colonial Treasurer or to the Clerk of Petty Sessions nearest to the run or premises on which the cattle are depastured or kept.

MEMO.

I regret to have to report that pleuro-pneumonia has again broken out among the uninoculated cattle in several of the Northern Districts, through their coming in contact with infected mobs travelling to the southern markets. Those attacked are, of course, chiefly young stock which have grown up within the last two or three years, and a few of the older cattle which were not inoculated during the last outbreak.

2. There is, therefore, every probability of the disease spreading among this class of cattle, unless it be checked by inoculation, or some other preventive; and as there are still, in many instances, very erroneous ideas with regard to pleuro-pneumonia and its proper treatment (inoculation), the accompanying Report on these subjects is submitted, with the suggestion that it may be printed for the information of stock-owners.

ALEXANDER BRUCE.

7 January, 1868.

The Under Secretary for Lands.

PLEURO-PNEUMONIA.

PLEURO-PNEUMONIA, which is sometimes termed "the Lung-disease in Cattle," is known in Italy as *Polmonca dei Bovini*, and is said by the veterinary surgeons of that country to have existed there from time immemorial. It is now common throughout the whole of Europe, with the exception perhaps of Spain and Portugal; and although the majority of the exceedingly destructive outbreaks of cattle disease which are recorded in European history may be attributed to rinderpest, gloss anthrax, and malignant murrain, there is little doubt but that pleuro-pneumonia had also a share in these outbreaks, and that it has existed throughout Europe as long as it is said to have done in Italy.

The first apparently reliable account of pleuro-pneumonia in England is that of the outbreak of 1745, occasioned, as it is said, by the introduction of foreign cattle; and it was not successfully dealt with until 1758, when it was stamped out by the destruction of the infected animals, in the same manner as rinderpest has lately been eradicated there.

From that time the disease was unknown till it was again introduced from the Continent in 1841. It then obtained a firm footing in England, Scotland, and Ireland; and as there has never been any proper legislation for preventing the introduction or spread of infectious or contagious diseases among cattle in the United Kingdom, it is still as prevalent there as ever, and must continue to be so until the necessary measures are taken.

From England the disease was carried to America, where it is now widely disseminated; and it has existed in Cape Colony and Southern Africa for nearly twenty years, where also it is believed it was imported from England.

Pleuro-pneumonia was introduced into Australia by a cow brought from England by Mr. Boadle, of the Plenty District, in Victoria, and landed at Melbourne in the end of 1858. This cow is said to have had an attack of pleuro-pneumonia some time previous to her purchase by Mr. Boadle, and to have been cured, but as it would now seem, only partially, for shortly after she was landed she had a relapse and died. She infected that gentleman's other cattle. These again conveyed the disease to the stock of some of his neighbours who had bullock teams at work on the roads, and through them, directly and indirectly, the infection was spread throughout Victoria.

Thence the disease soon travelled to the neighbouring colonies, and it has now in its progress nearly reached the northern confines of Queensland; the infected store stock from which colony are infecting the young and uninoculated cattle of New South Wales with which they come in contact on their route to market.

NATURE.

It is generally understood that pleuro-pneumonia in cattle, like all other constitutional diseases, has its seat, in the first instance, in the blood, being febrile in its earliest stage, but becoming typhoid in its second and third, or last stages, with a specific termination in disease of the lungs and pleuræ—the changes in which (in the shape of inflammatory exudation) hold the same relation to the true disease that the eruption in small-pox does to the blood state in that disease.

Medical opinion is in favour of not regarding this as a local disease originating in and confined to the lungs and pleuræ. It is, therefore, properly speaking, a misnomer to call it pleuro-pneumonia, for it may never reach the second or third stages, but exhaust itself in the first or febrile stage, and it is upon this fact that the efficacy of inoculation for the disease is founded.

The duration of the incubation of pleuro-pneumonia is most uncertain; the best authorities at home holding that the period may extend from five days to five months; and the experience of both Victoria and New South Wales going to shew that, after receiving the contagion, will not, in ordinary circumstances, when not driven or knocked about, shew any signs of the disease, even to a close and practised observer, under two to four months,* and then only in perhaps some two or three cases in a mob of 200 head. This is fully borne out by the results of the experiments which were made in 1864 in the neighbourhood of Melbourne, by bringing sound cattle from Tasmania into contact with diseased animals.

The course of this disease is generally, both in the individual animal and in the herd, insidious and lingering. An animal may be attacked and show very little symptoms for months, beyond a staring coat and an occasional cough; and in a herd it does not make a quick and clean sweep and quit the cattle, but it seems occasionally to die away, and then on the first change in the weather, it breaks out again with perhaps greater virulence than ever, till it has in many instances, when unchecked by inoculation, carried off 50 per cent. of the cattle attacked; and even this high percentage of deaths has been increased by the exposure of the infected herd to any of the more trying secondary causes, such as droving, tailing, or confinement in cold, wet yards. From the most reliable accounts of the losses sustained by cattle-owners throughout the Colony during the last outbreak of the disease, it would appear that they cannot be put down at a less average than 25 per cent. of the whole stock.

Taking into account the number which die of the disease with that of those which shew

* In England, the best authorities place the date of the appearance of the disease in an animal which has come in contact with the contagion, at a period of from six to eight weeks thereafter.

shew unmistakable symptoms of being affected, and of those which exhibit like symptoms when slaughtered for meat, while the disease exists in the herd, it may be safely said that no more than $\frac{1}{3}$ (if so many) of the herd entirely escape the infection. This is fully borne out by the report of the state of the cattle slaughtered for pleuro-pneumonia in 1861-2, referred to hereafter.

Of all seasons of the year the disease has proved most deadly in the spring; next, during the dry weather in the height of summer; and next perhaps, in the end of autumn and beginning of winter.

The disease runs its course in three forms, which may be termed—the dry form, the wet form, and a combination of the wet and dry forms. The dry form is that in which pneumonia is the more prevalent affection, and death arises from hepatization (the conversion into liver-like substance) of the lungs. The wet is that where pleurisy prevails, and hydrothorax (water in the chest) carries off the animal. The combined form (which is the most common) kills of course both by pneumonia and pleurisy. There is also what is termed by some a fourth form of the disease—a poisoning of the blood; but it is believed that this arises rather from a relapse than a new attack, and that the deaths occur from blood-poisoning properly so called, in the manner afterwards explained when treating of relapses.

Under favourable circumstances many cattle recover from the first stage of the disease, and a considerable number from the second stage, without any special treatment, and if not much disturbed afterwards, and on good feed, they may become fat and fit for market; but those that do recover after being badly affected are not unfrequently subject to a relapse, which always carries them off.

On the deaths ceasing in an infected herd, it might be supposed that the cattle which escaped would for the future possess an immunity from the disease; and so it is believed all those in which it has only reached its first or febrile stage do, as well as those which have suffered from the second stage, so far as infection from without is concerned; but still not a few of those in which the disease has reached the second stage are carried off *apparently* by fresh attacks of pleuro-pneumonia, at the end of six, eight, or ten months or even longer after their recovery, and when they had perhaps become nearly fat and fit for the butcher, although quite poor when the disease seemed to leave them.

This feature of the disease is to be accounted for by the mode in which a cure takes place. Thus, when pleuro-pneumonia reaches its second stage, some portion of the animal's lungs is hepatized; and if a cure occurs it is effected by a separation taking place between the sound and unsound portions, and the unsound portion being enclosed in a membranous covering or sac, termed a cyst or capsule. If the cure turns out to be a permanent one, this covering remains intact till the diseased portion of the lung which it contains is carried off by a process of absorption, when the animal is quite sound, *minus* the portion of the lung which was diseased, and which is thus lost. But if it be subjected to any hardship; in the shape of overdriving, exposure to cold, or the like, or if any ailment affecting the lungs or pleura supervene before the absorption is complete, this covering or sac frequently breaks, and its contents seem to spread over the lungs, pleura, and diaphragm, involving them in utter destruction. For not only does an animal thus suffering from a relapse, or rather from the sequel of the disease, suddenly sink and die, but the stench of the diseased lung, and sometimes of the carcass, and even of the blood of the animal in such cases, is quite unbearable. These facts have been overlooked by some of the writers on pleuro-pneumonia, and the symptoms of a relapse having been mistaken for those of a first attack, a great deal of confusion has arisen, and many conflicting descriptions have been given of the nature of the disease. There is little doubt, also, but that what has been termed the fourth form of the disease—the blood-poisoning—is a relapse, and not an original attack.

It has been said that pleuro-pneumonia in cattle is identical with the measles in the human subject; but these diseases differ in their course and symptoms in many material respects. And supposing they were identical, little or nothing would be gained by knowing that they were so, seeing that fact would not prove that their treatment ought to be the same; for in the case of small-pox in sheep, which is more identical with small-pox in the human subject than any other disease to which the lower animals are subject, we see that vaccination, which is a comparatively effectual preventive in the case of the human subject, is useless in the case of sheep. Further, supposing that pleuro-pneumonia were identical with measles, the same treatment could never be carried out in cattle.

Some stock-owners are of opinion that pleuro-pneumonia will gradually die out, and in the course of a few years entirely disappear. This is completely at variance with the experience of every other country, which goes to shew that time in no way mitigates the virulence of the disease, and that so long as the contagion can reach fresh subjects, the results are, under similar circumstances, always the same. Even so late as 1862, pleuro-pneumonia existed in 35 out of 40 counties in England, and in 17 out of 33 in Scotland; and the losses through the disease for the six years ending with 1860, amounted to £12,000,000, or at the rate of £2,000,000 a year. Here the disease only decreased when there were no fresh cattle to be attacked; and the fact that the young stock, which have grown up since the last outbreak passed over the colony, are now being infected by diseased cattle brought from Queensland, ought to dispel the illusion that the disease will finally disappear unless the contagion be eradicated, and the introduction of diseased cattle prohibited.

THE CAUSE.

The cause of pleuro-pneumonia in cattle is infection or contagion, conveyed either directly or indirectly from the diseased animal to the sound one. This is the opinion of Professors Simmons and Gangee, as well as of all the veterinary surgeons of standing in Great Britain; while among the highest authorities on these subjects on the Continent, such as Haller, Majendie, Layard, Hertwig, Gerlach, Wagenfel, Spinola, and Delafound, the same opinion is held. Then, as to facts in support of this opinion. It is well known that the outbreaks of the disease in Victoria, in America, and in Sweden, as well as in several other parts of the world, can be clearly traced to animals which proved to have been diseased when introduced into these countries. It is also an established fact that, with very few exceptions, every outbreak of pleuro-pneumonia which has taken place throughout the Colonies can be traced to diseased cattle coming into districts which were previously clean. In this way the first fifty cases which were investigated in Victoria could all be traced to contagion, propagated directly or indirectly by the cow, already referred to, imported in 1858. In like manner, the introduction of the disease into New South Wales was at first, in almost every instance, traced to cattle brought from Victoria.

It is true that the Victorian Commissioners who conducted a course of experiments in 1864, with sound cattle brought from Tasmania, and placed in contact with diseased animals, reported that Pleuro-pneumonia was neither infectious nor contagious; that it was gradually dying out, and that inoculation was worthless as a preventive. But, unfortunately for these gentlemen, as well as for the stockowners in Australia, their report was scarcely in circulation, till the cattle upon which they had experimented began to die of decided pleuro-pneumonia, thus proving their experiments to be worthless, and their conclusions incorrect. The Commissioners seem not only to have ignored the opinion of practical men in Australia, but to have carried out their experiments and formed their opinions without regard to what had been done in England and on the Continent to settle the question, whether pleuro-pneumonia was infectious or contagious; and being deceived by the lengthened incubation of the disease, they were led to imagine the cattle to be free from infection, when they were actually diseased, and thus reported erroneously.

It would appear that the disease is propagated by positive contact rather than atmospherically, both from its spread being most irregular and apparently capricious (not regular and general, as infection would make it); and from the fact that cattle in paddocks have, in most cases, escaped the disease two, three, and four months longer than cattle on open runs, where they would of course be far more liable to come in contact with diseased straggling cattle. Thus it would seem that a certain degree of either direct or indirect contact is necessary; for if the disease were infectious, and not contagious, it would have been speedily wafted through the fences to those in the paddocks, if not from the diseased animal which brought the disease into the neighbourhood in the first instance, at any rate from some of those depasturing around the paddock on the open run, which were first infected by that animal.

Although there cannot now be a doubt as to the *primary* cause of pleuro-pneumonia being a specific poison, conveyed either by infection or contagion, and without which the *secondary* or predisposing causes,—to which its origin has been so often erroneously attributed,—fail to be active, yet there are many of these secondary causes which tend to render this poison more or less active and certain in its effects. The principal of these are, variable weather, hot, crowded, foul, and ill-ventilated cow-houses, cold, moist, foggy atmospheres, exhalations from marshes, over-driving, bad tailing or herding, and exposure in wet, dirty yards, as well as any other cause which has a tendency to lower or depress the vital system.

As to the stages of the disease at which one animal conveys the contagion to another, it was clearly proved, in the examination of the 6,000 or 7,000 head of cattle destroyed by the Government of New South Wales, in the Albury district, in 1861 and 1862, that pleuro-pneumonia is contagious in a very early stage; for if it were not, the disease could not have been so widely disseminated within the comparatively short period it had existed among these cattle as it was found to be when they were destroyed. Every animal slaughtered as diseased was opened and examined, and an exact account taken of the symptoms which the chest and its organs displayed; and the return made to Parliament shows that, out of some 7,000 head of cattle destroyed, mostly within three or four months after the disease was detected, about 2,400 appeared to be slightly affected, 3,000 distinctly, about 1,500 badly, 300 very badly, and 94 in the last stage of the disease.

SYMPTOMS AND POST-MORTEM APPEARANCES.

The course of the disease in an animal is generally divided into three stages.

First stage.

In bush cattle, the first noticeable symptoms of pleuro-pneumonia, which may be only temporary, are either an unusual amount of coughing in a mob when on camp, especially at night; drooping of the head or ears, an apparent sadness and loss of strength; a lagging behind the mob; a disinclination to feed; a staring of the coat; a feverish eye; pale and slimy nostrils and inside of mouth; or generally the appearance that tells a person accustomed to stock that an animal is not altogether right. In dairy cows, again, along with any of the above symptoms, in a more apparent degree may also be

be observed a decided and unaccountable deficiency in the yield of milk ; tenderness of the teats, a restlessness, a refusal of food, or any change in their customary habits and behaviour.

In this stage, generally speaking, beyond the symptoms of fever, no decided post-mortem appearances are discernible ; but in some few instances there will be found congestion and inflammation of portions (generally the points) of the lungs, or of either of them, inflammation of the pleura, with effusion of lymph on the inside of the ribs and diaphragm.

Second stage.

The symptoms here, in addition to those of the first stage in an aggravated form, may be all or any of the following, viz. :—A stiffness in the foreparts ; a disinclination to move ; a drawn-up and cramped appearance when standing, especially noticeable to the practised eye at a distance ; a sudden and almost instantaneous stopping, on being allowed to do so, in driving ; the cough hard, sharp, and frequent, when moved out of a slow walk, and sometimes even when standing, with frequently a discharge of frothy phlegm from the mouth ; a heaving of the sides and a decided affection of the lungs ; the nostrils inflamed and filled with slime, and the muzzle covered with drops of clear moisture ; the eye protruded, feverish, and watery ; a rapid falling off in condition ; or a disinclination in the animal to lie down, and when it does, it rests on the affected side.

In milch cows the more noticeable symptoms of the second stage of the disease, in addition to those given, are sometimes a sudden purging ; a falling-off and a yellowish tinge in the milk ; want of appetite, especially for green food, difficulty in swallowing ; apparent thirst ; grunting when being turned in the stall, or tenderness under pressure along the back and loins.

A *post mortem* examination of an animal in the second stage of the disease will, in most cases, shew a quantity of fluid of a bloody tinge in the cavity of the chest, effusions of lymph on the inside of the ribs, pleura and the diaphragm ; great inflammation of the pleura, and sometimes attachment of the lung to the ribs. But the chief and unmistakable symptom of pleuro-pneumonia is to be found in the lungs.

At this stage of the disease, a portion of each of the lungs, or what is more frequently the case, from a third to three-fourths of one lung—generally the right—is hepatized or (what is commonly called) “marbled,” while the rest of the lung is partially hepatized, and the whole of the other is comparatively sound, exhibiting only some traces of inflammation. The hepatization will be found to have changed the healthy consistency of the lung to a heavy liver-like substance, which when cut into, exactly resembles a brown marble with white or greyish streaks running through it in all directions. The hepatization increases the weight of a lung twenty-fold, and sometimes even forty-fold.

Third stage.

In the third or last stage, the disease assumes a more typhoid form, and the animal appears to suffer less pain, so much so that persons unacquainted with the deadly leaden hue which the eye now assumes, imagine that a recovery has commenced. In this stage the animal will generally stand up under a tree, emitting when moved a low sound, between a grunt and a moan ; and it will frequently charge when stirred. The back will be raised, the head protruded, and the eye which is sunk will assume a deadly appearance ; the droppings will be black and scanty ; the cough which is now comparatively soft and faint, will be frequent, with expectorations of bloody mucus ; the tongue swells and protrudes, and there will sometimes be a thick ropy discharge from the nose and eyes ; hoven will not unfrequently occur, respiration will become impeded and difficult, and the animal will speedily sink and die.

In milch cows, besides these symptoms, the grunt will be increased, the breath will stink, they will frequently grind their teeth, great restlessness will often be observed as death approaches, the skin and horns will be cold, and the pulse will be accelerated to twice its natural speed.

The *post mortem* appearances here are the same as those described in stage No. 2, but in an aggravated form. Thus, in the dry form, where pneumonia prevails, the whole of one lung and a portion of the other will be found to be hepatized. In the more badly diseased lung, the hepatization where it has first commenced will be darker and more gangrenous in appearance. Around the outside of this lung, and attaching it to the ribs, there will be a coating of coagulable lymph (a straw-coloured, fatty looking substance) which sometimes extends to the pleuræ ; while in the cavity of the chest there will be a considerable quantity of serum—a fluid of a bloody tinge. In the wet form, where pleurisy prevails, a much greater quantity of serum will be found in the chest—sometimes nearly a bucketful ; and floating in this serum there will be shreds of coagulable lymph frequently covering the pleuræ, which when exposed are found to be highly inflamed. One of the lungs will also be found to be more or less diseased, and covered with lymph. In the combined form of the disease again, where pneumonia and pleurisy equally prevail, along with considerable hepatization of one of the lungs, and sometimes (though rarely) of both, a large quantity of serum will be found in the cavity of the chest ; while a sort of adhesive inflammation will be set up, and portions of the lungs, pleura and diaphragm, are found attached in one diseased mass to the ribs.

AUSCULTATION.

Although the changes caused in the chest and its organs by pleuro-pneumonia exist before any marked symptoms shew themselves in the living animal they are generally indicated by certain sounds, which to the practised ear, disclose the true state of the lungs and other organs affected.

One or other, and sometimes all, of the following indications will present themselves on applying the ear to the side of the animal's chest. (1st.) The healthy breath murmur. (2nd.) The crepitus. (3rd.) The absence of sound. (4th.) The sawing, rubbing or friction sound. (5th.) The deep gurgling and irregular sound.

- (1.) The natural sound which meets the ear applied to the side of the chest of a healthy animal, well conveys the idea of that which is actually taking place,—of air entering a vast number of minute cells, and is what may be termed a smooth, soft, bellows-like murmur.
- (2.) When again, one of the lungs is affected, and the disease is confined to that organ, the breath sound in it is louder and coarser than usual, and conveys the idea of the lung becoming impermeable to the air. This is the case, for, as inflammation of the substance of the lung progresses, the air enters the cells with difficulty, owing to the lymph being poured into them and also into the spaces between them. The air forcing its way into the cells, under these circumstances, gives rise to the peculiar rushing and crackling sound termed *crepitus*, which is very distinct, but only heard during inspiration.
- (3.) As the disease progresses, some portions of the lung emit no sound whatever—neither the healthy murmur nor the crepitus; and this arises through the effusion of lymph involving the air-cells and substance of the lung—in the silent portions of it—in general destruction. By this time a peculiar blowing or rushing sound will be detected in other parts of the chest.
- (4.) If the course of the disease be towards pleurisy, after the crepitus is noticed, other sounds conveying the idea of sawing are emitted. This arises through the pleuræ becoming inflamed and covered with lymph, which dries on their surface; and their coats being thus rough, uneven, and dry, emit this sound on coming in contact, instead of gliding smoothly and noiselessly over each other, as they do when they are free from disease. These sounds differ from the crepitus in another respect:—They are heard during both inspiration and expiration.
- (5.) As the disease advances towards termination, the sounds become very equivocal, resolving themselves into a deep gurgling and irregular noise, caused by the cavity of the chest becoming filled with serum.

PERCUSSION.

This is another mode of ascertaining whether or not an animal which exhibits no outward symptom of being so, is diseased, *i.e.*, by striking the side of the chest with the knuckles or any other hard substance of similar weight.

On striking the chest in this way, when the lung has become solidified, and only when it is so, the sound emitted is dull and flat, and not sonorous and booming, as it is when the chest and its organs are free from disease.

The same dull dead sound is elicited when the animal is affected with pleurisy; and the extent of the gathering of water in the chest can be traced by the extent to which the chest fails to emit the healthy sounds when tested in this way.

THE BEST MEANS OF TREATMENT.

In dealing with this branch of the subject, the state and value of the cattle, and the mode in which they are managed, must be taken into consideration; and if this is done, it will be obvious, in the first place, that, as the herds intermix more or less from one end of the four Colonies to the other, it is impossible to adopt any system of perfect segregation; and in the second, that the cattle are, generally speaking, both too wild and of too little value to allow of their owners putting them under the comparatively tedious and costly course of treatment and high feeding which is still generally followed at home.

It will also be evident, that the only remedy which need be proposed in these Colonies must be one which, if it is to be effectual, will require but a single application, and that too, of a simple and inexpensive description. These requirements, it is believed, are all fully met by inoculation with virus, taken from the lung of a beast which has been slaughtered in the second stage of the disease, and performed in the manner afterwards described.

To inoculation, therefore, which has so far evidently proved a preventive against the spread of pleuro-pneumonia, should stock-owners (in Australia, at least) look, as the best means yet discovered of protecting their cattle stock from the ravages of this deadly disease; and although it is not possible to preserve sufficient virus to inoculate the calves as they are weaned, yet every owner could obtain a supply for his young stock and for the old, if they have not been inoculated, on the disease coming within a day's ride of his station.

INOCULATION.

Inoculation, as a means of staying the spread of pleuro-pneumonia in cattle, was first successfully tried about the year 1852, in Holland; and the practice has since been extensively followed in that country, in Belgium, Germany, and Prussia.

In Saxony, we learn that inoculation has been practised for years with so very great success that the average number of deaths there among cattle from this disease has been reduced by inoculation from 25 and 50 per cent. to as low as 10, and in some cases to 2, and even 1 per cent.

In France, on the other hand, a Commission appointed some twelve years ago, for the purpose of testing the efficacy of inoculation, declared against it.

In Great Britain nearly all the best authorities were at one time opposed to inoculation, although they allowed that in certain cases it was attended with a certain degree of success. With the English veterinary surgeons, however, as well as with the French, the question was then, and must still be a comparative one, that is, whether it is better to inoculate cattle for pleuro-pneumonia, or to treat them as they still generally do? For there, operations such as blistering, setoning, and the like, can be performed on cattle, and medicines administered to them, while their fattening can at the same time be pushed so rapidly on with artificial food that they will be fit for market before the disease has reached a very deadly stage; but here, as has been already explained, their medical or surgical treatment, or high feeding (if we except a few small herds of thoroughbred cattle), is out of the question.

Now, however, the tide of opinion seems, even in England, to be turning in favour of inoculation for pleuro-pneumonia; and we learn by late accounts from that quarter, that Professor Gaingee, in his examination before a Select Committee of the House of Commons, strongly advocates the practice; and many other veterinaries in both Scotland and England are now said to be practising inoculation with decided success. Among others, it has been tried by the Professors of the new Veterinary Colleges of Newcastle, Edinburgh, and Glasgow, and also by many of the veterinary surgeons in Perth and Fifeshires.

From Holland the knowledge of inoculation was carried to the Cape of Good Hope, where its practice in a great measure stopped the ravages of the disease, which, before inoculation was tried, was carrying off the cattle stock there, in some instances, at the rate of 70 or 80 per cent.

In December, 1861, a letter from Mr. Cloete, of Zandoliet, Cape Town, was published in the Sydney and Melbourne papers, describing inoculation, and advising its practice.

Upon this information, Mr. Thomas Mitchell, Little River, Victoria, acted, and was thus the first to commence the practice in Australia. Shortly afterwards (about the 12th of January, 1862), the Messrs. M'Laurin, of Yarra Yarra, New South Wales, also tried the experiment, and the success of these gentlemen speedily induced other stock-owners in both Colonies to follow their example, till inoculation as a preventive against the spread of pleuro-pneumonia in cattle has been practised with decided success in almost every portion of New South Wales and Victoria, as well as in Queensland and South Australia.

There are now innumerable instances where inoculated cattle have, for a period of upwards of five years frequently mixed and been in contact with infected animals with almost complete immunity from the disease, while uninoculated cattle were dying on the same ground in considerable numbers; and there are also numberless cases where, although a considerable number of cattle were dying in the herd when the operation was performed, the disease disappeared shortly afterwards, and the cattle have since continued to be healthy, and free from pleuro-pneumonia.

There have certainly been frequent instances of the apparent failure of inoculation; but where these occurred, the parties operating have almost always attributed such failures not to a want of efficacy in the operation, but (as they were no doubt right in doing so) to one or more of the following causes, viz. :—

1st. The animal being badly diseased before being operated upon. In scarcely a single instance did the owner inoculate his cattle till he had lost some 12, 15, or even 20 per cent. of his cattle, and by that time three fourths of the others were diseased.

2nd. The use of improper virus, and a wrong mode of operating. Not only was improper virus used, and both proper and improper wrongly applied by those who were anxious to perform the operation correctly, but many who knew nothing of inoculation and who were quite regardless of the results, so long as they could make from £5 to £10 a day, went from station to station inoculating; and it is not to be wondered at that the operation was in many instances unattended with success. Of these inoculators, the worst were those who pretended to inoculate with preserved virus, for as they made a mystery of procuring and preserving it, they could use any sort of rubbish.

3rd. The system of the animal inoculated being, in some exceptional cases, in such a state as to prevent the virus from affecting it.

On the other hand, some apparently well authenticated cases have been brought forward where animals which had been carefully inoculated, and on which the operation seemed to take the proper effect, were afterwards attacked with the disease and died. It is believed, however, that even in the herds in which they occurred, these cases were exceptional; and if so, they might be accounted for—

1st. By the animals which were carried off in this way having had an attack and recovered, although not perfectly, previous to their being inoculated; and, being subjected to some of the more trying of the secondary causes of the disease, suffered a relapse before the process of absorption was completed.

2nd. By the inoculation not being properly performed, although it appeared to be so; or

3rd. By the protective effect of the inoculation—like that of vaccination in some cases—dying out.

It is also another strong argument in favour of the practice of inoculation, that, with one or two exceptions, the veterinary surgeons, both in New South Wales and in Victoria, have most disinterestedly declared themselves advocates for its adoption.

When

When properly and carefully performed, the average deaths from inoculation, even in bush cattle, where the animals are comparatively speaking beyond the reach of assistance, should excessive swellings occur, do not exceed 2 per cent. ; and in quiet paddock cattle, which can be watched and attended to, the percentage is even less, while the cost of the operation is but trifling—five or six hands, with proper convenience, being able to inoculate from 300 to 500 head of cattle in a day.

As this is the case, even supposing for a moment that the beneficial effects of inoculation are greatly overrated by the supporters of that remedy, and taking its advantages at the low value put upon them by its opponents, who admit that some slight benefit is gained by inoculating, but that it would equally follow the insertion of a seton without virus in any part of the animal's body, it must certainly be better to try inoculation for pleuro-pneumonia than any other remedy or specific yet proposed ; for even at that very low estimate of its value, it is the cheapest and most effectual available means for staying the spread of the disease yet made known in these Colonies.

It is not here attempted to explain how inoculation acts as a preventive against the spread of pleuro-pneumonia ; but the bulk of our experience goes to prove that, when properly performed, it does so with apparently nearly as much certainty and to as great an extent as vaccination is a preventive against small-pox in the human subject and inoculation against small-pox in sheep—the effects of which all wear out in a certain number of years ; and, if not renewed, leave the system open to another attack. This, it is believed, is even the case with persons who have suffered from small-pox.

It may, however, perhaps be said that pleuro-pneumonia in cattle is of a different nature from the diseases the spread of which is said to be arrested by vaccination and inoculation ; and that, therefore, the spread of pleuro-pneumonia cannot possibly be affected by inoculation.

If it should be so contended, it may be answered that, in the first place, it has not been proved that the process of inoculation would not be an effectual preventive in many cases where it has not yet been tried ; and in the second, although now ascertained to be at first a blood disease, it is not yet settled as to what class of blood diseases pleuro-pneumonia, in its early stage, actually belongs.

Taking these grounds, therefore, we are thrown back on the result of experience to determine the efficacy or non-efficacy of inoculation ; and in this respect there is a vast array of evidence in favour of that treatment :—

- 1st. We have the general admission by a very large majority of stock-owners that inoculation is a decided preventive.
- 2nd. Reports by the cattle inspectors, shortly after inoculation was tried, corroborative of this opinion :
- 3rd. Reports of the Inspectors of Stock in July and August last, conveying the views of the stockowners in their several districts on the subject, when they were found to be all but unanimous in its favour, *there being only six unfavourable reports out of thirty-four, and of these only one decidedly against the efficacy of inoculation.*
- 4th. The opinion of Mr. Cloete, of Cape Town, as expressed in a letter of the 12th August last, where he says, "The mode of inoculation described by you is still very generally practised in the Colony, and with success."

There are some, however, like Professor Simmons, of London, who aver that these good results are overstated, and that where they do occur they are brought about by the insertion of the seton in the tail ; which that gentleman, and those who entertain similar views, affirm would have just as much effect although no virus whatever was introduced with it. They, in fact, deny that pleuro-pneumonia can in any form be conveyed to a sound animal by bringing virus from a diseased lung in contact with its blood ; or, in other words, that cattle can in any case be inoculated for pleuro-pneumonia in the proper sense of the term.

This was the opinion of the Victorian Commissioners. Strange to say, however, although they reported against inoculation, they in no case adopted the usual mode of inoculating with the virus from a diseased lung, but used secretions from the nostrils, without any apparent effect. It is very unfortunate that these gentlemen followed such a course, as they thus lost the best opportunity there will ever be of testing the efficacy of inoculation. If, instead of devoting their time in attempting to solve in Australia what was a settled question in Europe with respect to the nature of the disease,—they had inoculated some of the cattle from Tasmania with virus from a diseased lung, in different portions of the animal and in different ways ; and afterwards subjected the cattle which had been inoculated to infection,—their experiments would have gone far to settle the question, and would have conferred an incalculable benefit on the stock-owners in Australia.

Others again, like the late Professor Dick, of Edinburgh, one of the highest authorities of his day, take a middle course ; and while they refuse to admit that pleuro-pneumonia can be conveyed from one animal to another by inoculation, they allow that greater results than can be attributed to a bare seton follow the operation. These views, as expressed by Professor Dick in his letter to a writer in the *Sydney Morning Herald*, signing himself, "An Amateur Vet.," are as follows :—"The opinion of Mr. Gamgee, the popular lecturer on the diseases of the lower animals, is that inoculation is a panacea as a preventive. I cannot agree with such ; but, in the face of its general success, I can only account in this way for its arresting and preventing the disease,—that by the operation we introduce a mild morbid action or disease, by which, upon the principle that two such actions could not exist at one time in the constitution, we prevent the introduction of the malignant disease called pleuro-pneumonia, and thus tide over the dangerous time during which the epizootic or cattle disease was prevailing."

In support of the opinion that the disease is actually conveyed to the sound animal when the operation is properly performed, we have the following facts, namely :—

1st. Cattle after being several days inoculated (say from seven to fifteen) in almost all cases shew decided symptoms of sickness and fever, similar to those exhibited by animals in the first noticeable stage of the disease—their eyes appearing humid and bloodshot, and their coats staring; while in their gait and movements they display decided symptoms of low spirits and feverishness.

Milch cows, again, under the effects of inoculation, besides the symptoms now detailed, frequently exhibit another unmistakeable proof that, in their case, the disease has been set up; for there is, during that period, a decided falling off both in the quantity and quality of their milk, it being considerably less in quantity, and the cream which arises on it is of a very poor description, and of an unhealthy, skinny, yellowish appearance.

2nd. The fact that inoculated cattle convey the contagion to those which are not inoculated. This has been proved by the disease breaking out among cattle where it had not previously shewn itself, after their coming in contact with some inoculated animals which were free from the disease when inoculated. Cases of this sort, and even of cattle being inoculated before the disease had broken out among them, are so few that decisive evidence in this way is far from plentiful, but it is sufficient to establish the general fact.

Further, it has frequently been the case, where all the others were inoculated that a few head have been missed and the percentage of deaths among those which were not operated upon was always excessive; thereby shewing that the inoculation of the disease on every side of them not only rendered their escape from the contagion impossible, but seemed to increase the virulence of the disease.

3rd. In cases of mal-inoculation, again, the gatherings of lymph or serum were of a similar nature to those found in the diseased lung, having, when cut into, the marbled or streaky appearance peculiar to the hepatized lung in its second and third stages, allowing, of course, for the difference in the structure of the portions affected.

4th. The result of an experience of over five years, that where cattle have been properly inoculated, they afterwards possess an immunity from the disease; and this is what must eventually (if it has not done so already) settle the question.

5th. The fact that inoculation with the serum of the blood from an animal affected with the Rinderpest conveys that disease to the animal inoculated.

If this point—that pleuro-pneumonia can be conveyed to an animal by inoculation—be established, then the efficacy of the operation is also established; for although we are not entitled to argue that its effects would be exactly the same as those of vaccination or inoculation for small-pox in the human subject, or of inoculation for small-pox in sheep we know that an infectious or contagious disease seldom or never occurs a second time in the same subject, within a given period at least, and that therefore, cattle inoculated for pleuro-pneumonia would to the same extent be protected from that disease.

Although there is thus evidence in favour of inoculation for pleuro-pneumonia of the strongest description, it is not so thoroughly conclusive as to form the basis for legislation; not because the operation when properly performed on sound cattle fails to prove a preventive, but because sufficient evidence of the proper class has not been gathered.

To have given inoculation a fair trial, the cattle ought to have been inoculated previous to their coming into contact with the disease; and scarcely any were so. Indeed, with a very few exceptions, owners did not inoculate till they were alarmed at the great losses they were sustaining; and by that time, it may be safely said, that at least three-fourths of their cattle were actually affected, although they might not have appeared to be so. It is plain, therefore, that in almost every herd in which inoculation was practised, large numbers of the cattle were diseased when operated upon, and that inoculation must be a cure as well as a preventive to have been efficacious under such circumstances.

This was more especially the case with regard to the larger herds, very few of which are depastured on fenced runs; and as the result of the inoculation of the cattle on these runs was naturally brought more prominently before the public than that of the smaller herds in fenced paddocks, which were in many cases inoculated before they shewed any symptoms of the disease, erroneous opinions have in consequence been formed with respect to inoculation.

Where cattle kept in secure paddocks were inoculated prior to pleuro-pneumonia shewing itself among them, there is every reason to believe that they have remained up to this time free from the disease, although brought into contact with infected animals. In some cases of this description, diseased cattle have been actually placed in the same paddock with the inoculated animals, and died there without any of the inoculated cattle being infected.

It is plain, therefore, that further and exact inquiry as to the efficacy of inoculation is called for; and to carry this out effectually, Parliament should appoint a Commission to sift the matter thoroughly. To do so, the Commissioners would, of course, examine such witnesses as could throw any light on the subject; but prior to this, the House should order sworn returns to be made by all owners possessed of more than twenty head of cattle, giving, among others, such particulars as the following :—

I.—Return of inoculated cattle.

1. Date of inoculation.
2. Name of owner.
3. Name of run.
4. Number of cattle inoculated.
5. State of cattle when inoculated; if diseased, state percentage.
6. How long diseased previous to inoculation.
7. Description of lung used, and of animal from which it was taken.
8. Mode of preparing virus, and of keeping it.
9. How long was virus kept.
10. Mode of operation.
11. How and to what extent were effects of inoculation visible.
12. Number of deaths from excessive swelling.
13. Result of inoculation up to this date.
14. General remarks.

II.—Return of uninoculated cattle.

1. Date of infection.
2. Name of owner.
3. Name of station.
4. Number of cattle.
5. State of cattle when infected.
6. How long disease existed in the herd.
7. Percentage of cattle affected.
8. Number of deaths.
9. When disease finally left herd.
10. Present state of cattle.
11. General remarks.

The names of the owners making these returns would, of course, be held strictly private, and only the result of the examination of the returns (as in the case of the statistics) would be made known to the public.

COMPULSORY INOCULATION.

Should the Commissioners, from the information afforded by these returns, and the evidence of the witnesses they examine, come to the conclusion that inoculation is the most efficacious treatment which can be applied to cattle for the prevention of the spread of pleuro-pneumonia, a law should be passed by which owners whose stock came into direct or indirect contact with the disease should be compelled to inoculate them; and persons inoculating should be required to pass an examination, and obtain a certificate that they were properly qualified.

It may, perhaps, be said that owners will of their own accord inoculate their cattle when necessary. They will, no doubt, generally do so; but there are many careless and prejudiced persons who, unless they be compelled by law, would be years (if ever they would do so at all) before they adopted this or any other remedy; so that diseased cattle will still continue to travel, and year after year infect the young stock, and the disease will thus be perpetuated in the Colony.

Such a law might not be so necessary were it always possible to preserve a supply of virus for inoculating the calves as they were branded, but it is not; and if the necessity for such a course can be obviated by passing a law compelling every owner to inoculate his cattle on their coming within reach of the infection, it ought to be passed, if the question of the efficacy of inoculation is settled in the affirmative.

DIRECTIONS FOR INOCULATION.

Yards and Pen for inoculating.

ON a station where the number of cattle does not exceed 2,000 or 3,000, and where a spaying bail and forcing yards are already erected, the herd might be inoculated in them, although only half the number could be got through in a day that would be done were proper bail and yards erected. The cost of erecting proper bail and yards would be soon repaid by the saving of time in inoculating, and the convenience the bail would afterwards be, when branding store stock brought upon the run, as well as in many other ways in working in the herd.

Where the herd is large, it would save time and expense to erect a small forcing yard, with a five-railed six-foot high pen of eight or ten panels in length, and two feet six inches wide inside. The posts should be round, mortised through and through, with the mortises worked close to the inner side of the post, so as that when put up, the sides of the post may not project further into the pen than the rails; and they should be three feet in and eight feet out of the ground, with caps on each pair across the pen. A pen made of round rails will be found more convenient and safe to work at, than if they were split, less liable to injure the cattle, and less costly in erection. The pen should of course be logged, and have the proper gates and fastenings at each end. In such a yard and pen, five or six hands could inoculate from 500 to 600 head a day.

In whatever way the operation is performed, or whatever sort of pen is used in inoculating, the tail ought to be kept steady; and where cattle (especially small beasts and calves) do not pack so closely in the pen that they cannot move, their heads should be roped to a rail of the pen.

The

The Virus.

The virus is to be taken from a lung of a young beast in the second stage of the disease; and the animal selected is to be slaughtered and bled as if killed for meat, every care being taken that the lungs are as free as possible from blood, since blood in the virus renders it unsafe and comparatively useless. Between the more firmly and earlier hepatized portion of the lung, and that which has only reached the inflamed or congested stage of the disease, will be found a soft, jelly-like part, which has quite recently become hepatized, and is plainly charged with quantities of lymph. It will be known also by the comparatively bright light colour and fleshy appearance of the brown portion of the marbling. This is the portion to be used, and the lymph, when extracted, should have but a very slight tinge of blood. The part thus selected is then to be placed in an earthenware vessel, and to be cut up in small pieces, when the greater part of the virus will flow from the lung, and can be poured off. The pieces of lung may then be put into a cloth of open texture, and the virus still remaining in them pressed out. The whole virus thus obtained should be filtered through a piece of fine muslin into a clean bottle, which is to be made quite air-tight and to be kept in a cool place, the virus being taken out in small quantities as required. If, after being allowed to stand, it coagulates, it will again become liquid by shaking. The virus must be perfectly inodorous, and if it becomes foetid it is useless: for we know that medical students in dissecting bodies, such as those in which death has resulted from erysipelas, may do so with impunity—although their hands are very unsound—after putridity has begun, while a short time after death inoculation from such bodies of the slightest scratch would be most dangerous, if not certain death. The lymph or matter taken from the inoculated wound of an animal which has been operated upon not later than the twentieth day after the date of the inoculation, has been found to be as effective and fully as active as the virus taken from the diseased lung; but the quantity of lymph procurable in this way is comparatively small, and only sufficient to operate on a few head, even where some thousands have been inoculated. At any rate, virus or lymph could never be procured in this way to inoculate a herd of cattle. Virus from the newly hepatized portion of the lung of an animal, in the third stage of the disease, has also been used with success, but it should only be used when virus cannot be procured from one in the second stage; for it is doubtful if it be equally efficacious, even when the lung is apparently of the right description, and selected free from the least portion of the earlier hepatized part; and it would seem, at any rate, that excessive swellings and mal-inoculation were much more frequent where the virus used had been taken from an animal in the third than in the second stage.

Some, again, have inoculated with the serous fluid found in the cavity of the chest in cases of hydrothorax—the wet form of the disease. As, however, hydrothorax is more properly a sequence than a stage of pleuro-pneumonia, and as hydrothorax may arise from other causes, this fluid can contain little or none of the proper virus, and must be comparatively useless for the purpose of inoculation.

There is certainly in the dry form of the disease, a small quantity, and only a small quantity, of virus to be obtained near the lung; but unless the inoculator has had considerable experience in selecting virus, it would be safer to use only what can be procured from the lung in the state already described.

Preservation of Virus.

As virus when in the least exposed to the air becomes putrid and useless in less than twenty-four hours in hot weather, and in two or three days when carefully corked and kept in a cool place, many attempts have been made to preserve it, but with indifferent success; and it appears very questionable whether the articles sold as preserved virus or lymph, or under some other more high-flown appellation, be not worse than worthless. It might, perhaps, be possible, by using comparatively large glass tubes, to preserve virus in the same manner as vaccine lymph is saved—by filling the glass tubes and hermetically sealing them. But this mode has not yet been adopted, and, practically speaking, it is not necessary; for any stock-owner wishing to inoculate his cattle before the disease has shown itself among them, can always obtain a supply of virus on its coming within a day's ride of his station. A good practicable mode of keeping virus sound for a time is, to fill the bottle (which should be perfectly clean) in which the virus is to be put, with the fumes of sulphur, and then to pour the virus into the bottle, carefully corking and sealing it before the whole of the fumes of sulphur are expelled. By adopting this plan, and keeping the bottle in a cool place, virus can be preserved for, at any rate, several days longer than it would otherwise be, which is a great advantage in inoculating a herd. Another and perhaps a better mode is, to pour some oil on the top of the virus, which excludes the air and keeps the virus fresh till required again, when the oil can be poured off. Some of the advocates for the preservation of virus also modify or weaken it; indeed, it is believed they cannot accomplish their so-called preservation without doing this. But it will be seen that this modification or weakening of the virus is very absurd, when it is considered that the chief object to be aimed at, in carrying out the operation of inoculation, is the certainty of its taking effect. For, if it fails in only a few cattle, the disease is kept alive in the herd, and the effects of the inoculation are to a great extent lost. Since it is all but impossible to say, from the appearance of the cattle after inoculation, whether or not it has taken a proper effect, it is much better rather to over-do than under-do the operation, and make the matter a certainty, even at the expense of a few losses from excessive swellings. The losses from inoculation, where unmodified lung-virus is used, need never, when properly performed, exceed 2 per cent. They are generally less, and it is believed that, with the modified article,

article, the percentage is fully as great; while the operation must undoubtedly fail in innumerable instances. Glycerine is the ingredient used for modifying and preserving virus in the proportion of one to one; and there is no doubt but that the preservation is complete, whatever the effect on the efficacy of the virus may be.

Mode of inoculating.

Where the disease has broken out in a herd the cattle should be disturbed as little as possible; and if they are to be inoculated, they should be quietly mustered, and yarded in small mobs, and they should on no account be rushed or knocked about in the yards or pen.

The safest and most efficacious mode of inoculating is, to use what may be termed an enlarged spaying needle, from 5 to 6 inches in length, with the point of it ground narrow and fine, and to draw a soft thread of twine or of worsted, of two thicknesses, well saturated with virus, twice through the upper or outer side of the tail and about one and a half inch from the tip; and having done so, without drawing the stitch tight, to cut off the thread, leaving about two inches out of the incision at each end like a seton, twice inserted and left untied. The double insertion renders the effects of the inoculation, much more certain—a material matter, since it is so difficult to discover whether or not the virus has taken effect, while experience proves that this mode does not increase the risk of evil effect from the operation. The tail should be closely clipped with a sheep-shears around the proper spot; and in operating, the needle should be carefully inserted just deep enough to reach the blood, and no further. It will be obvious that the tail of the animal is the proper seat for the inoculation, not only from being the portion of the body with which it can most easily dispense in case of any evil effects following the operation, but chiefly because it is the most remote from the more vital organs of the animal.

The operation should, like spaying, be steadily and carefully performed, and not bustled or hurried over, as cutting and branding generally are.

To economize virus, only about three or four inches of the thread should be saturated at a time, and it should be so for every head of cattle.

A spaying needle may be used when a setoning one cannot be obtained,* but the larger is the better, both on account of its being held more firmly in the hand, and from its making a larger opening, whereby a healthy discharge is more likely to occur.

Making a slight incision in the tail, and placing a drop of virus in the wound, or using a grooved inoculating knife, is a more expeditious mode than the needle and saturated thread, but it is not nearly so certain, as the blood from the wound is apt to carry off the virus before it has done its work. Nor is it so safe, for as clean wounds in cattle are apt to close, the comparative clean wounds thus made in inoculating with the knife, sometimes do so, and the discharge stopping, dangerous consequences ensue. This, the thread, by acting as a seton, in a great measure prevents.

Apparent Effects of Inoculation.

On some of the cattle in a herd, swelling in the tail begins to be observable about the fifth day; and in the majority of them, about the fifteenth. On some, again, the swelling is not perceptible till the twenty-fifth, or thirtieth, or even the fortieth day; while in some there will be scarcely any perceptible swelling at all.

The extent of swelling in those cattle on which no dangerous or fatal effects follow, will range from an apparent stiffness in the tail, with a barely perceptible increase in its thickness, to an enlargement of half its natural girth. This swelling, however, most frequently amounts to an increase of barely a fourth of its ordinary thickness; and the seat is generally immediately above the inoculation wound, for two, three, and sometimes four inches upwards, growing gradually as it ascends. Shortly after these swellings are observable, scabs begin to be formed around the inoculation wound; and where the swelling is at all considerable, the scabs sometimes quite encircle the tail, while in other cases they are only of small extent.

Under these scabs are collections of matter, greater or less, according to the size of the scab. Where the swelling has been barely perceptible, the scab is small, and little or no matter is to be seen under it.

A considerable number of the cattle (perhaps a fourth) will lose a portion of their tails; generally from the first joint above the inoculation wound.

Where no dangerous or fatal effects follow the swelling, its subsiding, like its rising, takes place at irregular intervals of from twenty to thirty-five days from the date of inoculation.

In the case of those, again, that are dangerously or fatally affected, the swelling first appears at the root or butt of the tail, and very quickly afterwards begins to extend to other parts of the animal, spreading under and around the root of the tail, and in some cases, up to the rump. As this swelling increases, the external openings of the fœcal and urinal passages become more or less choked up.

So long, generally, as these swellings are confined to the butt of the tail and the portions of the rump about the mouth of the rectum, no fatal effects follow, and the animals, though apparently sick for four or five days, keep feeding a little, and are relieved as soon as the swelling breaks and suppuration takes place.

In those cases, on the other hand, in which the swelling spreads from the root of the tail downwards, till it apparently chokes up the urethra, extending, as it does in some cases, down between the hips and the thighs to the belly, the effects are always fatal.

Remedy

* Mr. Jennings, cutler, Sydney, supplies needles of the proper description.

Remedy for excessive Swelling.

As the effects of the most mild and careful inoculation are sometimes dangerous, through causing excessive swellings and gatherings in the tail and hind quarters of some of the cattle inoculated, it is necessary to consider how these may be best counteracted. Experience shews that it is better not to cut off any portion of the tail, at least not close to the rump; although blood-letting by making a longitudinal incision in the under side of the tail not nearer than five or six inches to the butt has a beneficial effect, when the tail is much swollen or inflamed.

When taken at an early stage, while small and soft, these gatherings may generally be removed by inserting a pledget of tow, well saturated with an equal part of butyr of antimony and Venice turpentine, in an incision made with a good-sized pocket-knife in the swelling, right through the centre, till the sound flesh be reached at the back. The mouth of the incision should be downwards, so that the discharge will run readily off. This dressing should be renewed three or four times at intervals of two days.

Where the cattle are worth the trouble, they might be cured even after the swelling had reached a dangerous extent, by ripping open the skin and cutting away the callous flesh; when the proper dressing could be applied, and the skin sewed up; or, what is nearly as effectual and much less troublesome, these gatherings may be well opened and scarified to a good depth, so as to allow the flies to get into the incisions, and work in there for six or seven days, when it will be found that the greater portion of the gathering can be removed through the action of maggots which separate the core from the sound flesh. When they have done so they may be expelled with turpentine, and a dressing is then to be put on to keep the flies off till the wound is healed.

It would not be expedient to inoculate cattle which are fit for the butcher. They would of course be better sent to market at once, as they would get bruised and knocked about in the operation; neither should cows in season or near calving be operated upon; nor should calves on being cut; nor cattle with swellings or sores in the hind-quarters.

N.B.—In inoculating, care should be taken that none of the virus gets into wounds or scratches in operator's arms or hands, as threatening and rather dangerous results have sometimes followed, where the virus was allowed to remain on wounds for any length of time without washing.

MEDICAL TREATMENT.

Although it will be gathered from what has been said, that inoculation is considered (in Australia, at least) to be the only generally practicable means of staying the spread of pleuro-pneumonia, yet it may be useful to give the best modes of medical treatment as practised in England, both for the purpose of shewing how very little it is adapted for general use in these Colonies, and also to allow owners of quiet or valuable stock to put those that are actually diseased under a course of medical treatment, while they inoculate the general herd to prevent the further spread of the disease. With these objects in view, the following short directions have been compiled from the best English allopathic and homœopathic authorities:—

ALLOPATHY.

Bleeding (Blaine, p. 317).

“If the beast be excited, let a vein be opened and blood taken till a change is produced. The pulse here is no guide. The animal itself must tell us when to stop. When its excitability is lost,—when from being furious it has become tame,—when there is a marked alteration from that which was to something else,—then enough has been abstracted; pin up immediately. The animal cannot bear the loss of much of the vital fluid; she is in no condition to stand a drain upon the system, and the less blood that produces the effect we desire, the better. Let the veterinary surgeon, therefore, keep his eye on the beast, while any bungler may strike a vein, which, if the abstraction of blood be warranted at all, will swell up as large as a cart-rop. It is of a size, then, rather to throw stones at than to poke at with a fleam.”

Blistering.

This is neither forbidden nor prescribed by Blaine; but it is prescribed by others, and at an early stage of the treatment, next to bleeding. It is to be performed in the following manner:—The hair is to be cut closely off the side of the chest over the affected lung, and either of the following mixtures is to be well rubbed on the portion denuded of hair:—

$\frac{1}{4}$ oz. terebinthinate solution of croton,

$\frac{1}{2}$ oz. solution of ammonia,

4 ozs. olive oil,

or, with an ointment composed of—

The ointment of the iodide of mercury,

The ointment of tartar emetic,

The ointment of Spanish blistering fly,

Of each $\frac{1}{2}$ oz.; and $\frac{1}{4}$ oz. croton oil.

Where neither these nor any other blister can be obtained in the bush, a rough and ready mode, said to be still followed in Italy, might be tried,—of applying a firing iron, shaped like a small gridiron, and of the proper size, heated to a firing heat, to the chest, over the seat of the affected lung.

Medicines

Medicines (Blaine).

With regard to medicinal measures, these must be very gentle. Every caution is necessary to husband the strength, and active measures will not always check the disorder. During the first stage the symptoms merely denote general irritability, and the treatment required is such as will check that which the symptoms suggest. Shake a drachm of calomel, blended with two drachms of opium, upon the tongue of the animal and leave it to be licked down at leisure, as the beast has no power to spit it out again. Three hours after this, give the following drink:—

Epsom salts	$\frac{1}{2}$ lb.
Sulphuric ether	1 oz.
Liquor ammonia acetatis	6 ozs.
Aconite (in powder)	1 scruple.
Cold water	1 pint.

If this has not operated in six hours, repeat the physic; and after the lapse of another six hours, give another dose,—only this last time administer but half the quantity of Epsom salts, and add 1 oz. of powdered gentian root. In another six hours, once more repeat this last drink.

Let nothing more but repeated drinks—composed of sulphuric ether 1 oz., laudanum 1 oz., cold water 1 pint—be given till the pulse becomes stronger, till the cough appears, and the entire symptoms change. With the earliest indication of this alteration, new medicine must be administered; then exhibit the following mixture thrice a day, which must be persevered with during the continuance of the active stage:—

Extract of belladonna	$\frac{1}{2}$ drachm.
Aconite (in powder)	1 scruple.
Emetic tartar	1 scruple.
Nitre	1 drachm.
Sulphuric ether	1 ounce.
Cold water	1 pint.

Rub down belladonna with a little of the water; dissolve the emetic tartar in a little more of the same liquid; then mix, add the other ingredients, and give.

Should the disease continue, and the pulse grow weak, with the other signs of the third stage having supervened, withdraw the nitre and tartar emetic. A pint of good ale, blended with half an ounce of extract of gentian may now be added to the other components, instead of the former weakening agents. The ale, it is true, we would rather dispense with; but everything now depends upon keeping up the strength, which we must endeavor to accomplish even at some risk. Should the bowels continue costive, continued half-pints of linseed oil, with each of which half a drachm of chloroform is blended, and in each of which a scruple of camphor must also be dissolved, should be administered at intervals.

Everything depends now upon cleanliness, careful nursing, and quiet * * *

The better appearance of the creature, her altered and even cheerful aspect, her readiness for exertion, which, on narrowly watching, will demonstrate her greater weakness; the entire absence of anything like pulse at the jaw; the strange smells that are perceptible about the beast; the cessation of cough, and a bloody foul, exudation from the nostrils, with a partial inclination for food, will bespeak the gradual starting up of the fourth and last stage of the disorder. Solids probably would not be retained within the rumen, therefore fluids alone are worthy of reliance. Now withdraw the belladonna and the aconite, as well as the tartar emetic and the nitre, from the drink; to which add one quart, instead of one pint, of sound ale; half an ounce of laudanum, and six ounces of liquor ammonia acetatis, and give the whole as a drink. Let there be no hay or straw near or under the animal; notwithstanding her weak state and desire to feed, she must lie even on the bare stones. Were there any substance she could attempt to eat, she would seize it, perhaps, with avidity, masticate it with eagerness, but on her attempt to swallow it, her strength would suddenly fail, the morsel would probably stick in the gullet, produce hoven, occasion confusion, frighten the cow, and do all the injury we are careful to avoid. She may be anxious to get loose, but keep her tied up; her efforts to free herself will soon subside. Should she become hoven in this disorder, you must pass the probang, and, down the tube, when it has entered the stomach, pour a dose ($\frac{1}{2}$ oz.) of chlorate of potash dissolved in water. If the fætor prove offensive, give a scruple of the chloride of zinc dissolved in a pint of water, which may be repeated as often as it is required. Double the quantity may also be mixed with some flour and water to be used as injections if any stinking diarrhoea accompany the latter stage, and cloths saturated with the solution of the chloride should be hung about in various parts of the house. The same liquid may be of service to sprinkle any part of the cow's body upon which any soil may have fallen, the dirt being first cleanly washed off.

The return of the cough—the reappearance of pain, as denoting a return to consciousness—the revival of the pulse—in short, the restoration of the symptoms of the third stage, though in a softened form,—will denote amendment. After this, every thing will depend upon the farmer himself. For a short period, the last drink, with the addition of $\frac{1}{2}$ an ounce of the extract of gentian, must be continued, and then mineral tonics gradually substituted. Nothing must be done suddenly; nor, if the symptoms that are recorded are properly observed, will any violent change be necessary, however much so these directions (compressed for the sake of brevity) may seem to direct. Of the mineral tonics, the sulphate of iron in two-drachm doses, is the best. It may be dissolved in water with which $\frac{1}{2}$ an ounce of the extract of gentian has been rubbed

down, and thus compose a drink. No ginger, though that stimulant is justly a favourite, must be given, for fear of recalling the inflammation, which we have too much reason to dread has not been entirely subdued. The food must not be too large in quantity, but of the most digestible kind.

HOMŒOPATHIC TREATMENT.

Medicines prescribed.

Acid Phosphor. (3); Antmo. Tart. (6); Armea Mont. (3); Arsenicum Alb. (6); Bryonia Alb. (3); China Off. (3); Rhus. Tox. (3); Sulph. (6).

The above are the remedies and potencies recommended, whether tinctures or globules. The dose in all cases may be as follows:—If tinctures are used, three drops; if globules, thirty in number dissolved in a small quantity of water, care being taken that the horn is perfectly clean, and well rinsed and dried before used for a second medicine. Those who adopt the homœopathic treatment should have two small horns for that purpose only.

Treatment.

If taken in the first stage of the disease, give byronia and rhus every eight hours for a week; the following week, the same medicines every twelve hours, and this is generally sufficient to effect a cure,—when a few doses of sulphur should be given for two or three days twice a day.

Should the animal have been neglected in the first stage, give bryonia alone every two hours the first day, after which, bryonia and rhus every four hours, wrapping the animal up in a blanket, and continuing the use of these two medicines throughout the week, unless any of the following symptoms present themselves:—If accompanied with diarrhœa, bryonia and arsenicum must be given every four hours in alternation. It sometimes occurs that, when laid down, the beast will rest its head on its side. In that case, bryonia and armea should be given alternately every four hours. It often happens that, when the fever has left the animal, it is followed by a diarrhœa, characterized as follows:—A frequent passage of undigested food, in appearance like hay that has passed through a chaff machine. For this, give early in the morning a dose of bryonia; six hours afterwards, china, repeating the latter medicine every six hours until it ceases. Grinding of the teeth is an indication that arsenicum and bryonia alternately are required.

Regimen.

The animal must be kept from all food until the violence of the disease is over, when it ought to be given very sparingly. Bran mashes, with or without linseed, carrots, or mangel-wurzel, may be given if the animal will eat them; a little good hay, if all goes on favourably, in three or four days. Cold, soft water should be kept within the animal's reach, and changed frequently.

Preventive.

Bryonia and rhus every twelve hours; and, for those living in the country, bryonia, rhus, and arsenicum; and where the land is undrained or subject to fogs, the latter is to be used every twelve hours.

PREVENTIVE MEASURES.

Among the innumerable other advantages which would accrue from a comprehensive Fencing Act, that of stopping, to a very great extent, the spread of disease among stock would also follow; and this consideration should tend to hasten the passing of a Fencing Act.

In the meantime, while the cattle, with the exception of those on the few runs already described, may be said to intermix from one end of Australia to the other very little benefit can be expected from the adoption of purely preventive measures for staying the spread of pleuro-pneumonia; but still it would be well for stock-owners to attend as far as possible to the few following points, viz. :—

1. To make themselves well acquainted with the external and internal symptoms of the disease.
2. To keep a constant watch on their own and their neighbours' stock, in order that they may detect the earliest approach of the disease. The best mode of examining cattle is to drive them smartly along for a short distance, keeping a watch for suspicious symptoms, as the cattle proceed; and then to run out at a gallop for forty or fifty yards, any that exhibit symptoms of disease. The test of auscultation might, where practicable, be also employed.
3. To endeavour to retard its advance, by changing or travelling stock as little as possible; by discouraging the carriage of stores by bullock teams; by keeping their own bullocks at home; by preventing stray cattle, as far as possible, from mixing with their own; by closely watching and examining all travelling cattle; by being most particular to burn all carcasses of dead cattle on their own or their neighbours' runs; and, in the case where cattle are crawling about in the last stage of the disease, to kill and burn them.

1867.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SHEEP DISEASE PREVENTION ACT OF 1866.
(REGULATION UNDER.)

Ordered by the Legislative Assembly to be Printed, 23 July, 1867.

(Presented to Parliament, in accordance with the provisions of the
77th clause of the Act.)

Department of Lands,
Sydney, 12th July, 1867.

DISEASES IN SHEEP ACT OF 1866.

THE following Regulation by His Excellency the Governor, with the advice of the Executive Council, for carrying into effect the above-named Act, is hereby published for general information.

“The owners of travelling sheep, in giving the notice required by section 41 of the said Act, of their intention to drive sheep across or along the boundary of any run, shall do so within a period of not more than 48 nor less than 12 hours of the time of their driving such sheep over or along any part of such run.”

SCAB IN SHEEP.

(REPORT OF CHIEF INSPECTOR.)

Ordered by the Legislative Assembly to be Printed, 10 July, 1867.

HALF-YEARLY REPORT of the state of the Sheep in the Colony of New South Wales, submitted by the Chief Inspector of Sheep for the information of the Minister for Lands.

Department of Lands,
Sydney, 1st July, 1867.

SIR,

In submitting my Report for the six months ending the 30th ultimo, I have the honor to state, that the sheep throughout the Colony are now free from scab.

2. The two small flocks which were in quarantine, in the neighbourhood of Scone, in the beginning of the year, were examined by the Directors and Inspector on the 15th of March last, and declared clean; and they have since shewn no symptoms of the disease.

3. In the month of February last, a re-outbreak unfortunately occurred among some sheep running at large on Mr. Holt's estate of Sutherland, near Sydney, but they were destroyed under the provisions of the Act now in force; and the precaution was taken to put the rest of the sheep on the estate through a regular course of dressing, although they were not known to have come in contact with those which were destroyed.

4. My attention will now be chiefly directed to guarding against the re-introduction of the disease into the Colony, by sheep brought over the border, or imported by sea.

5. This, so far as imported sheep are concerned, has been well provided for by the sections of the Act relating to Imported and Coast District Sheep; and Inspectors have been stationed at all the ports where sheep are likely to be landed, and Directors appointed along the coast to see that the provisions of these sections are strictly observed.

6. With regard again to sheep brought over the border from the adjoining Colonies, there is no danger to be apprehended from Queensland, and little or none from South Australia; but the risk of infection from Victoria is still great, as the disease is very prevalent there, and as the sheep are running at large on the banks of the Murray, they not unfrequently cross into this Colony. It is hoped, however, that the large staff of Inspectors and boundary riders now employed on the Murray, destroying straggling sheep which cross the river, will prevent the introduction of the disease from that Colony, until the sheep there are cleansed and the danger removed.

7. I anticipated, that, with the eradication of the disease, it would be practicable to reduce the present staff of Inspectors in the inland districts; but as the Directors in these districts, to whom the subject was referred, have, with a single exception, decided against a reduction, I do not consider that I would be justified in submitting any such proposal.

8. I may add, that all the Inspectors report that the season has latterly been most favorable, and that the sheep are looking remarkably well.

I have, &c.,

ALEX. BRUCE,

Chief Inspector of Sheep.

The Under Secretary for Lands.

VACCINATION.

(REPORT FROM MEDICAL ADVISER TO THE GOVERNMENT, FOR THE YEAR 1866.)

Ordered by the Legislative Assembly to be Printed, 28 August, 1867.

THE MEDICAL ADVISER TO THE GOVERNMENT to THE COLONIAL SECRETARY.

Medical Adviser's Office,

Tarban, 10 July, 1867.

SIR,

The Medical Adviser to the Government has the honor to furnish you with a Report of the State of the Vaccination Department for the year 1866.

He has made strenuous efforts to collect all the necessary facts relating to this important branch of the Service, in order to render it complete and instructive, as a concern of the highest social and hygienic interest; but he regrets that the quality and quantity of information it conveys will tend to impress you rather with the conviction of retrogression than the assurance of progress. The returns of successful vaccinations for the whole year are far from satisfactory. In answering his circular lately issued from this office to public Vaccinators, requesting them to furnish him with duplicates of their returns, or memoranda to that effect, of their successful cases during the latter half of the year 1866,—from some the reply is “nil,” and from others something tantamount to it, in the paucity of their successful cases. One gentleman candidly states that “the Government fee is so small for country districts, that there is no inducement to medical men in the country to carry out the system very widely.” So that the number of successful vaccinations for the year 1866 amounts only to 7,606, whereas the returns of 1865 present a total of 8,367, shewing a decrease of 761.

The chief cause of this falling off appears to him to consist mainly in the absence of a stringent law to compel parents, or those whom it may concern, to have their children vaccinated as early after six months of age as their conditions of health and vigour will permit.

The Medical Adviser hopes it may not be considered forward in him to mention here, in passing, that the indescribable suffering he endured in his own person in childhood, from the worst or confluent form of small-pox, and a long sequel of constitutional derangement and impaired health, with many years of after experience in the treatment of it in others, justify him, he believes, in giving full expression to his convictions on a subject which so deeply concerns the whole family of mankind. He, therefore, proposes that no time should be lost, no moral influence untried, and no reasonable expense withheld, to make vaccination as common in every family as a “household word”—held as sacred as the hearth, and observed with the devotion and force of the innate law of self-preservation. What a scourge it would be in this semi-tropical country may be conjectured from its remorseless ravages, under similar climatic conditions

conditions, in every land where it seems passively welcomed by a fatalism which prevails equally in these Colonies, but for the truth of which, if the logic of our prejudices were analyzed, we would blush while we could not but acknowledge it.

It behoves all men; therefore, of all parties, all opinions, and all creeds, to combine in the humane, or more truly, the selfish resolution—for it is a question of positive self-interest, after all—to carry a Bill through both Houses of Parliament, with as little delay as possible, to render vaccination compulsory. It is only a postulate for time to resolve, and the resolution of it may, be very near at hand—that, as commerce with all quarters of the globe and immigration from all countries increase, so will the probability of the introduction of small-pox increase in proportion. Let this noisome pestilence once get a footing on our shores, and it will laugh to scorn all subsequent efforts to erase it from the catalogue of your epichorival diseases.

The dismal chasms made in families by the devastations of the small-pox, the frequent impairment of the constitution, and the sad transformations effected by it in the most beautiful of all God's handiwork—the human countenance, which many British practitioners still living must have witnessed in the early part of this century, will bear him out in his strong expressions on this subject. Next to the absence of a compulsory law, the deplorable apathy generally evinced in these Colonies towards the heaven-inspired prophylactic of vaccination against the ravages of a disease so loathsome, seems to have two very manifest minor sources—the blameable confidence, or rather, perhaps, temporizing confidence of parents, and the inadequate remuneration of public Vaccinators, particularly those residing in country districts.

On this account, he submits that the allowance of Vaccinators, especially to country district practitioners, should be increased. And he at once especially recommends the addition of one shilling for every successful case, which he has no doubt will be followed by good fruits next year. The number of Vaccinators paid by the Government during 1866 was thirty-six, of whom seven reside in Sydney and the suburbs, and twenty-nine in the country. The expense of this staff for mere vaccination, including the pay of the central Superintendent, only amounted to the sum of £1,190 15s. The extraneous expenses incurred by this useful institution are not taken into account.

For this small public outlay during the twelve months, 7,606 children of both sexes and various ages have been protected from the fatal and disfiguring effects of small-pox. For, even if persons who had been carefully vaccinated in infancy should in after life become infected with *variola*, it has been most generally observed that it always appeared in a modified and mild form.

Under all circumstances, then, the Medical Adviser repeats his firm belief that vaccination should be enforced as a social obligation of the utmost importance to the State and to humanity.

To lengthen out this Report by analyzing the appended tables would answer no useful end; they are sufficiently lucid and intelligible for all the purposes that may be required of them.

FRANCIS CAMPBELL, M.D., A.M., F.A.S.L.

Medical Adviser's Office,
Tarban, 9 July, 1867.

F. CAMPBELL, M.D., F.A.S.L.,
Medical Adviser to the Government.

1867-8.

NEW SOUTH WALES.

VACCINATION.

(REPORT FROM MEDICAL ADVISER TO THE GOVERNMENT, FOR THE YEAR 1867.)

Presented to both Houses of Parliament, by Command.

THE MEDICAL ADVISER TO THE GOVERNMENT to THE COLONIAL SECRETARY.

THERE were thirty-seven public vaccination districts in the Colony at the end of the year 1867—twenty in the country and eight in Sydney. This partition of the metropolis into vaccinating stations is purely arbitrary. In the absence of some authorized subdivisions of this kind, I have considered it desirable to distribute the city into as many vaccinating localities as there were public vaccinators in it at the end of last year; so that the whole staff of this Government establishment is now exhibited in one view.

The returns from the several vaccinating stations in town and country display very unequal degrees of success in extending the protecting powers of vaccination; yet I am confident the officers engaged in this beneficent work discharge their duties with zeal and fidelity, as far as lies in the compass of their individual activities. There is, however, an opposing moral force, against which all professional energy and all ordinary reasoning operate without effect; and it were to be wished that the existence of this force was only a simple postulate; but the reports of those who are the best qualified to decide, shew clearly that the obstructive apathy or prejudices of parents are settled theses, confirmed every year by the decreasing number of vaccinations.

One gentleman writes that "vaccination, to become general, must be compulsory. Many of the native-born who are married and have never been vaccinated, do not see any necessity in having their children vaccinated."

The total vaccinations performed in the year 1864 were	11,067.
"	1865 .. 8,367.
"	1866 .. 7,600.
"	1867 .. 7,110.

The returns shew also, that there was one public vaccinator to every 11,000, and one child successfully vaccinated in every fifty-seven individuals of the whole population, at the end of the year 1867. The names of the public vaccinators, and their respective stations, are seen in the subjoined "Statistics of the Government Vaccine Establishment."

I have said apathy. But whatever be the sentiment in the minds of parents which prompts them to oppose the employment of so potent, so sure, and so innocuous a defence against the inroads of small-pox, it is only an effect. The root of the baneful prejudice luxuriates in a richer soil; where, in truth, many another moral pestilence is propagated. The legitimate cause is ignorance—primordially the ignorance of *mothers*; a truism, by the way, which, as a little reflection will shew, goes far to resolve the problem of compulsory general education.

VACCINATION.

Speaking parenthetically, I would ask—Whence arises that unsightly brood of moral cankers—the biased judgments of mankind, the moody bigotries, the opiniatrics, the ineradicable prejudices, the sophistries, the selfish intolerance, the oily falsehoods winding mischievously through all the business of life? They spring from the want of knowledge; they are the exuberant outgrowth of *maternal* ignorance; and it is such cacodæmons of the intelligence as these, progenerating still, that become the most deadly and efficient impediments to human progress, that frustrate the full expansion and the free exercise of the young plastic intellect, and render it incompetent in the years of maturity to exert its noblest faculty—the power to discriminate between the true and the false of the things of life. Minds thus hemmed in are little qualified to correct faults in their own judgments, or to deduce sound conclusions from the propositions of the worldly ethics reduced to practice everywhere around them.

The essential object of all education is to instruct the young mind in what is true. As times go, deception mingles with and tarnishes all the pursuits of man; and it is to enable the young mind to discover the elements of truth, and separate them from what is untrue of things, that a higher order of instruction than public schools now, or at least lately, were capable of imparting. Error in the youthful processes of thought, whether resulting from absolute ignorance or from *mis*-instruction left to grow up and ripen into convictions, become in the course of time habits of the mind; and consequently, through the adapting contrivance of nature, they are transmitted, like physical blemishes, from mother to child, till at last they grow into positive idiosyncrasies of the mental constitution, reproducing in their turn corresponding intellectual obliquities, acting more or less injuriously on the issues of life.

And it is these conditions of ignorance, or a jejune culture of the mother's understanding, which stimulates the moral sentiments of all classes of society, the rich as well the poor, to revolt—as exemplified in the question of vaccination—against some of their dearest interests. It is ignorance—not the baser impulses of the human heart—which is the true cause of that otherwise unaccountable antagonism which the uneducated mostly, but not a few of the educated also, so frequently set up against the progress of those scientific improvements whose chief tendencies are towards their own happiness and the amelioration of their condition; and until the fogs which hang so dense and heavy over the mental vision of the benighted classes shall have been dissipated by the brightening rays of accurate knowledge operating on the female mind, philanthropy may shed her tears in vain. If the daughters of the working classes were taught at public schools something more practical, deep, and lasting than a routine of flimsy coaching to exaggerate their ordinary surface-painting, and render it splendid and fascinating at examinations;—if they were taught some lessons in logic, or the principles of common sense methodized, and their reasoning powers thereby expanded, and their thoughts trained to habits of order in their examination of any disputable points in the realities of life coming under their scrutiny, as well as in giving accurate expression to them in language;—if they were led on, by easy gradations, to investigate without restriction any of the established popular theories, opinions, beliefs, prejudgments, &c., which interest, perplex, or inform the understanding;—nay, if they were subjected to an elementary course of mathematics, including algebra, but without ascending to the higher abstractions of the science,—and I see neither anything startling in the suggestion, nor why this might not be substituted for some of the less important or necessary branches of female study, as it would only take the place and time of Latin and Greek with boys, and would both sharpen and habituate their understandings more than anything they can learn, in the accurate discrimination of right and wrong in whatever concerned their moral or physical interests;—in short, to be practical and domestic, if they were enabled, by suitable instruction, to reason out to first principles the *why* and the *wherefore* of all things that are likely in any way to influence the concerns of their future sphere of action in this “jumble of sighs and tears” which constitutes the volume of human life;—then, and only then, would they be fitted to become both worthy mothers and indefatigable propagators of the soundest form of utilitarian knowledge to succeeding generations. These, with a general view of natural philosophy, would suffice.

Maidens thus trained would find no difficulty, when they become mothers, in comprehending why gloomy prejudices and misconceptions of every name, quality, and degree of

VACCINATION.

H

of power over the affairs of the world, are inimical to social happiness, and the source of inconceivable mischiefs; and by the same light, they would learn the reasons why the salutary and protective effects of vaccination are urged so earnestly and persistently upon them, as embracing one of the most momentous interests of the human family.

There is nothing so precious in life as the proper culture of a girl's understanding; and no consideration on earth should weigh the value of a feather against the full and accurate measure of education being meted out to her, I trust, the future regenerator of the human race. It is only by instructing mothers, that the seeds of sound and useful knowledge and a pure morality can ever be disseminated and made to take permanent root. Enlighten thoroughly the maternal mind, and the husband and the children will not remain long in darkness. The reason is as obvious as the writing on the wall.

The promotion and success of vaccination concern all alike, from the peasant to the peer. It excites all our softer emotions, it pleads in burning accents to every heart and every conscience; for the young, the innocent, the tender, and the beautiful, are its surest victims. It appeals, I repeat, to the affections, and especially to the common sense of every man and woman of the community, to exert their best endeavours in extending this great boon to the utmost limits both of civil and savage life.

Governments may well call for annual reports of the progress of vaccination; few interests in our social condition are more deserving of serious thought. Certainly it is not a matter of true political economy, for it ceases to be productive under the unrestricted *laissez faire* system; on the contrary, it only thrives in the ruder embraces of legislative protection. Without compulsion for its foster-mother, it is to be feared that this best and only defence against the deforming and fatal ravages of small-pox will at last fall into ruin from excess of liberty. I respectfully submit, therefore, that this missionary of protection against a great evil ought not to be sent to hibernate from year to year on the meagre fare of an annual report, or at the expense of a few half-crowns.

Compulsory vaccination ought to be taken into consideration, and treated as a necessity, like all other state obligations which bind society to particular useful courses.

FRANCIS CAMPBELL, M.D., F.A.S.L.,
Medical Adviser to the Government.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

PORT MACQUARIE ASYLUM FOR INFIRM AND
DESTITUTE.

(REPORT OF INSPECTION OF.)

Ordered by the Legislative Assembly to be Printed, 10 July, 1867.

THE SECRETARY OF THE GOVERNMENT ASYLUMS BOARD to THE PRINCIPAL UNDER
SECRETARY.

The Government Asylum,
Sydney, 20 June, 1867.

SIR,

I have the honor to enclose, for the information of the Honorable the Colonial Secretary, a report of my visit of inspection to the Port Macquarie Asylum.

I am directed to call your attention to paragraph No. 7, wherein the necessity for some addition to the enclosures in front of the Asylum, to enable the old people to obtain more exercise, is brought under the Board's notice, and to request that you will be good enough to solicit the Colonial Secretary's sanction to move the Minister for Lands to approve of the fencing in of that portion of the Crown Lands situate between the Asylum and the Harbour (*vide* the accompanying sketch).

I have, &c.,

FREDERIC KING,
Secretary.

REPORT of the Secretary's Visit of Inspection to the Port Macquarie Asylum.

The Government Asylum,
Sydney, 12 June, 1867.

SIR,

I have the honor to report that I left Sydney on the 20th May, and proceeded on a visit of inspection to the Port Macquarie Asylum. I returned to Sydney on the 11th instant.

2. I found the Asylum in good order, and the inmates contented and well-behaved. The Master and Matron appear to pay great attention to the comfort of the inmates and the good order of the institution.

3. Dr. Neild's daily visits to the Asylum enable the Master and Matron to feel that they have some one who is authorized to act and relieve them of responsibility in all cases of difficulty. It is also satisfactory for the Board to know that a gentleman of such matured experience exercises a constant supervision over the interests of the institution. The inmates are very warm in their expressions of gratitude to Dr. Neild for his kindness and attention.

4. Several matters connected with the working of the Asylum require attention, and some of the most urgent I sanctioned, pending the Board's approval.

5. With a view to carrying out the Board's wishes with reference to a garden to be worked by the inmates, I have rented a piece of land, about $\frac{2}{3}$ of an acre, fenced in, close to the principal entrance to the Asylum, at the rate of £3 per annum, which I hope may, in a short time, be found to be remunerative, and enable the Master to dispense with the present expenditure of 1s. 6d. per diem for soup herbs. As it will be some weeks before the garden will be productive, I have directed Mr. Armstrong to purchase, as soon as possible, a few hundred pounds of pumpkins and onions (these being the only soup vegetables supplied by the contractor), in lieu of the above daily supply. This arrangement will give the inmates a larger quantity in their soup, and at a cheaper rate than under the present system. Green herbs, such as parsley, thyme, sage, and eschalots, are quite unattainable in the district.

6. The number of inmates has been increased to 125 men and 47 women; but I am of opinion, and I am supported in it by Dr. Neild and Mr. Armstrong, that though the men's quarters are full with 125 men, the number of women may (provided the western

2 PORT MACQUARIE ASYLUM FOR INFIRM AND DESTITUTE.

end of the large dining-hall is partitioned off, so as to form a dormitory) with safety be augmented to sixty-six. This new dormitory would thus form a convenient hospital ward, and be a great comfort to paralyzed patients, who could get on to the verandah and enjoy the fresh air without running the risk of falling down the stairs.

7. The enclosures for both men and women are very confined, and there appears to be no possibility of increasing them without incurring great expense. At the Gaol a large space of land has been enclosed by a high paling fence. If this were done at the Asylum (and there are numbers of acres of unoccupied Crown land round the walls), it would not only promote the health, but materially increase the comfort of the inmates.

8. The provisions supplied by the contractors are, generally, of a wholesome and proper quality. I have, however, seen it necessary to complain of the tea and potatoes. I have informed Messrs. M'Donald & Co., the contractors, that the conditions of their contract will be strictly enforced; and the Master has been directed to inspect the supplies, and to use authorized measures for replacing them if they are of inferior quality. The bread and meat are very good.

9. The clothing and bedding are kept in good order, and the people appear clean and tidy. It is evident that, from the proximity of the Asylum to the sea, the inmates require quite as warm articles of clothing as those used at the Sydney Asylums. The easterly winds, during the winter months, are very keen and piercing. Mrs. Armstrong wishes to allow the women an extra petticoat. The Asylum being only recently established, is not so well provided with second-hand dresses, which are used for warm petticoats, as the Hyde Park Asylum. Each woman is, at present, provided with 1 dress, 1 shawl, 1 apron, 1 flannel petticoat, 1 chemise, 1 cap, 1 pair shoes, and 1 pair woollen stockings. Should the Board approve of Mrs. Armstrong's proposal, a cheap material might be sent to her immediately.

10. I held a muster of the inmates on the 4th instant; it appeared to be quite correct.

11. The dispensary shelving, which has been so repeatedly asked for, has not been erected by the Colonial Architect's Department. On Dr. Neild's representation that it was much required, and that much risk to the drugs and bottles was incurred by their being placed on loose boards, I anticipated the Board's approval, and agreed with Mr. Butler, who had formerly been employed by Mr. Flue, at the Asylum, for the erection of the necessary shelving and table for the sum of £3 15s.

12. The water-closets and drains are in good order, with the exception of one set of pipes, which are too small to carry off the water from the roof; this, however, is of very trifling inconvenience, and does not involve any risk to the building or the health of the inmates.

13. A lavatory is much required for the use of the men; at present they wash with loose basins on the verandah, or on the grass. It has a messy appearance either way, and in rainy weather is very inconvenient. The men are bathed in a small room outside the walls of the institution, but it is a very awkward arrangement for the very infirm and paralyzed inmates. The arrangements for bathing and washing the women are very good.

14. Mrs. Armstrong has brought under my notice the necessity for an increased staff of washerwomen. It is evident that the most economical way of having the washing of the whole Asylum done is to manage it in the women's laundry. It has been done in this way hitherto by two women at 3d. per diem, with occasional help from the other women; but since the number of men has been increased, and the washing thereby become very onerous, Mrs. Armstrong finds it very difficult to get the work done, and wishes to be allowed one woman at 4d., and three women at 3d. each, per diem. Even at this increased rate, the washing will be done far more cheaply than by allowing the men to wash their own clothes and bedding.

15. Mrs. Armstrong applies to have an extra boiler erected in the women's kitchen. It appears to be necessary, as the large saucepan which was supplied to provide for this want is too heavy for the old women to lift about. The boiler, if supplied by the Board, could be built in by one of the inmates.

16. Mr. Armstrong applies for some additional allowances for the working inmates, and urges his request in consequence of the increased numbers. They are as follows:—

- 1s. per diem instead of 6d. to the head wardman, who will then be on a par with the Parramatta and Liverpool head wardmen.
- 3d. per diem to the assistant cook in the men's kitchen. The head cook receives 6d. per diem.
- 3d. per diem for an additional wardman who has the care of two new wards.
- 3d. per diem to the dispensary assistant clerk and librarian.
- 3d. per diem to the gardener.
- 3d. per diem to the messenger and funeral conductor.

17. A few seats placed round the enclosures would add much to the comfort of the inmates, and prevent their carrying the dining-room forms into the green, and thereby exposing them to the sun.

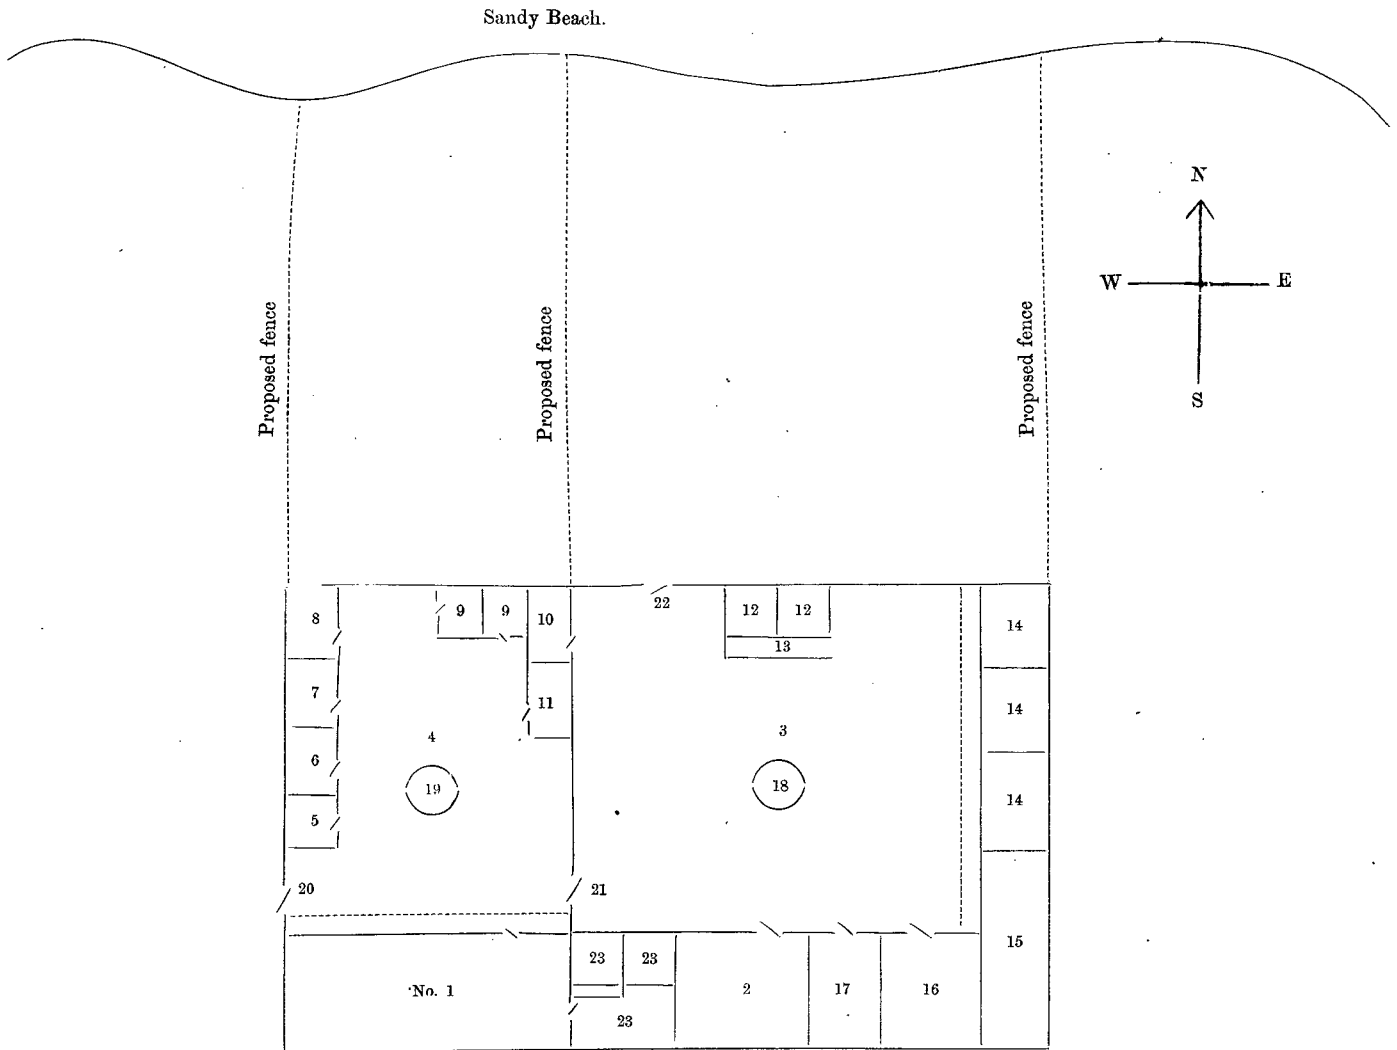

18. The contractor for burials has applied to be allowed to continue his agreement for another year, that is, to the end of 1868. He states that it will be then worth his while to procure a small hearse, and make other arrangements which will enable him to carry out his contract more satisfactorily than at present. He appears a good man, and is anxious to attend to the requirements of the Asylum.

19. Mrs. Armstrong wishes to be allowed a few pounds of knitting cotton and a few needles for the use of the blind women; the expense would be trifling, and the work would amuse the old people.

I have, &c.,
 FREDERIC KING,
 Secretary.

I CERTIFY the above to be a true and correct List of the Directors of the Society for the Relief of Destitute Children, for the year 1868.

ALFRED H. STEPHEN,
Honorary Secretary.

The following Alterations have been made in the By-Laws of the Society :—

In Rule 7, the word "four" has been substituted for the word "three."

In Rule 11, the word "fifty" has been substituted for the word "ten."

In Rule 12, the words "one hundred" have been substituted for the word "fifty."

In Rule 16, after the words "not less than sixteen", the words have been added, "nor more than twenty-three"; the word "eight" has been substituted for the word "six"; and after the words "eligible for election" the following words have been added, "but no person whose subscription for the past year has not been paid shall be qualified to be nominated for a Director."

In Rule 24, after the words "*not less than nine members*", have been inserted the words "*nor more than twelve, exclusive of the Treasurer and Secretary, who, ex officio, shall be members of the House Committee.*"

In Rule 27, after the word "*Matron*" the following words have been inserted, "*and Accountant, the appointment and dismissal of all other officers and servants being vested in the House Committee.*"

In Rule 37, all the words following the words "*they shall*" have been omitted, and the following words have been inserted, "*do all that in them lies, both by precept and example, to foster and encourage religion and morality among the children committed to their care.*"

In Rule 38, the words "*shall preside at all meals of the children*" have been omitted.

In Rule 43, all the words following the words "*there shall be*" have been omitted, and the following words have been inserted, "*two Medical Officers, one Honorary and one Visiting, both of whom shall be appointed by the Board of Directors after its first meeting after each Annual General Meeting of the Society.*"

ALFRED H. STEPHEN.

[Price, 3d.]

Hyde Park Asylum,
Sydney, 20th May, 1867.

FREDERIC KING,
Secretary.

1867.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

LUNATIC ASYLUM, TARBAN.

(RETURN RESPECTING PATIENTS ADMITTED, &c.)

Ordered by the Legislative Assembly to be Printed, 8 October, 1867.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 17 September, 1867, That there be laid upon the Table of this House,—

“ A Return shewing the number of patients admitted to the Lunatic Asylum, Tarban Creek, within the last two years. Also, a Return, shewing the number of such persons who would be ineligible for admission to such Asylum, on the ground of possessing sufficient means for medical aid, if private establishments were authorized by law.”

(Mr. Burdekin.)

THE SUPERINTENDENT OF TARBAN LUNATIC ASYLUM to THE PRINCIPAL UNDER SECRETARY.

Tarban Lunatic Asylum,
21 September, 1867.

SIR,

In accordance with the request expressed in your letter of 18th September, 1867 (130), that I should prepare and forward, with the least convenient delay, a Return shewing the number of patients admitted to the Lunatic Asylum, Tarban Creek, within the last two years; also, a Return, shewing the number of those who would be ineligible for admission to such Asylum, on the grounds of possessing sufficient means for medical aid, if private asylums were authorized by law, I have the honor to report:—

1. That from the 1st of September, 1865, to the 1st of August, 1867, there were admitted to this Asylum 267 males, and 132 females, making a sum total of 399 admissions.

2. I am so little acquainted with the circumstances of the lunatics placed under my superintendence, that, with a single exception, I am quite unable to form an opinion as to their “ineligibility for admission into this Asylum, on the grounds of possessing sufficient means for medical aid, if private establishments were authorized by law.”

It appears to me, in my present state of knowledge on the matter, that one or two small struggling farmers, tradesmen, and helpless widows, with a large majority of the so called labouring classes, make up the sum of the insane population of this Asylum; that those who can pay at all for their maintenance, do so to their utmost ability, at the rate of two shillings and twopence a day; and that no keeper of a private asylum could supply even pauper patients with food and clothing at this price, without doing grievous injustice either to himself or his charge. Even double the amount would yield but sorry profits for the common run of lunatics enjoying, as they ought, their full freedom; and that amount, I conjecture, is more than any patient in this establishment could afford.

I have, &c.,

F. CAMPBELL, M.D.,
Superintendent.

1867-8.

LEGISLATIVE ASSEMBLY.

LUNATIC ASYLUMS.

No. 1.

DR. MANNING to THE COLONIAL SECRETARY.

H.M.S. "Esk,"
Sydney, New South Wales,
8 June, 1867.

SIR,

On thinking over our short conversation of yesterday, several points have occurred to me which I think it right to submit to you.

In appointing a Medical Superintendent to your Asylums, you require that he should have, firstly, a high professional and moral character, and secondly, a special acquaintance with the treatment of the insane. The first I hope my papers certify that I possess; the second I am able to offer only in a partial degree, and I completely concur in what seems to be your opinion,—that such knowledge should be gained at my own expense. In visiting the Asylums of England, the Continent, and America; however, I have a strong desire not only to acquaint myself fully with the modes of treatment of the insane, but to collect such complete information concerning the plans, statistics, and general arrangements of Home and Foreign Asylums, as is possessed by few (if any) medical men in England, and which would be of great value to any Colony or public body proposing a remodelling of its institutions for the insane.

Such information, collected at my own expense, would be my personal property; and should circumstances arise, during or after the preparation of my reports, which would prevent me seeking further the appointment which is in your gift, I should feel that I was not doing wrong in publishing such report or disposing of it as seemed most to my advantage. I would venture, therefore, to suggest for your favorable consideration, that the Government of New South Wales should give directions to their Agent in England to appoint me an officer in their service, under whatever title may suggest itself to you, immediately on reporting myself to him as ready for work; that such appointment should have attached to it a salary equal in amount to about half the permanent appointment, and should be accompanied by a letter of instructions from you. In this case, I should travel as the accredited Agent of the Government of New South Wales; and such official position would procure for me an immediate *entrée* to all Home and Foreign Government Asylums, and assure me a much more favorable reception and greater opportunities for collecting information from all public bodies having charge of similar institutions, than I could hope for as a private individual. All reports, plans, &c., so collected would be absolutely the property of the Government of New South Wales; and as I do not propose to occupy much more than six months in pursuing my inquiries, the Government would thus obtain, at a cost of something under £300, a mass of information which will be of great use. The future appointment of Superintendent of your Asylums could be given to me when my reports were examined and found to be to the satisfaction of your Agent, or such other persons as you may be pleased to appoint.

In conclusion, I should be glad to learn if you propose to fix the salary of Superintendent permanently at £800 per annum, or whether it will rise gradually to a larger sum.

I have, &c.,

FREDC. NORTON MANNING, M.D.,
M.R.C.S., England.

No. 2.

MINUTE PAPER FOR THE EXECUTIVE COUNCIL.

Colonial Secretary's Office,
Sydney, 13 June, 1867.

WITH a view to the more perfect organization and control of the Lunatic Asylums of this Colony, I recommend that Frederic Norton Manning, Esq., M.D., should be appointed a Commissioner to visit and inquire into the condition and management of the principal Lunatic Asylums of Great Britain and Ireland, the Continent of Europe, and the United States of America; to obtain for this Government full particulars of the systems of maintenance, rules and regulations in force therein, plans of construction of buildings, modes of treatment of patients, copies of laws, public reports, and papers pertaining to the object of his Commission; and further, that the Commission should come in force on the 1st November, 1867, and remain in operation for six months; and that a salary, to be provided for by vote on Estimate, should be allowed to Dr. Manning during such period, at the rate of £600 per annum.

HENRY PARKES.

MINUTE.

MINUTE.

THE Executive Council, having carefully considered the subject herein set forth, with reference to obtaining full information as to the management and general working of Lunatic Asylums in Great Britain and Ireland, the Continent of Europe, and the United States of America, are of opinion that the course proposed by the Honorable the Colonial Secretary will meet the end contemplated; and accordingly advise that Frederic Norton Manning, Esq., M.D., be appointed a Commissioner, under the Great Seal of the Colony, for the purpose of carrying out the said inquiry, and reporting thereupon.

The Council further advise that the Commission should remain in force for the period of six months from the 1st November next, and that Dr. Manning be allowed salary during such period, at the rate of £600 per annum.

ALEX. C. BUDGE,
Clerk of the Council.

Abstract of Minute 67/25.—Advised, 13th June, 1867.—Confirmed, 20th June, 1867.
22 June, /67.—Approved—J.Y.

No. 3.

COMMISSION.

BY His Excellency the Right Honorable SIR JOHN YOUNG, Baronet, Knight Commander of the Most Honorable Order of the Bath, Knight Grand Cross of the Most Distinguished Order of St. Michael and St. George, Captain General and Governor-in-Chief of the Colony of New South Wales, and Vice-Admiral of the same.

To FREDERIC NORTON MANNING, Esquire, M.D., M.R.C.S., England,—

Greeting :

WHEREAS it being deemed expedient, with a view to the more perfect organization and control of the Lunatic Asylums in the Colony of New South Wales, to appoint a Commissioner to visit and inquire into the condition and management of the principal Lunatic Asylums of Great Britain and Ireland, the Continent of Europe, and the United States of America, in order to obtain for the Government of the said Colony full particulars of the systems of maintenance, rules and regulations in force therein, plans of construction of buildings, modes of treatment of patients, and also copies of all laws, public reports, and papers relating thereto: Now, therefore, I, Sir John Young, the Governor aforesaid, do, with the advice of the Executive Council, by this Instrument, appoint you, the said Frederic Norton Manning, to be such Commissioner accordingly; and I do hereby invite and request all officers and other persons whomsoever in charge of such Asylums to be assistant to you in the execution of these presents.

Given under my hand and the Seal of the Colony, at Government House, Sydney, in New South Wales aforesaid, this fourteenth day of June, in the year of our Lord one thousand eight hundred and sixty-seven, and in the thirtieth year of Her Majesty's reign.

JOHN YOUNG. (L.S.)

By His Excellency's Command,

HENRY PARKES.

Entered on record by me, this fourteenth }
day of June, 1867. }

HENRY HALLORAN,
Under Secretary.

No. 4.

THE PRINCIPAL UNDER SECRETARY to DR. MANNING.

Colonial Secretary's Office,
Sydney, 14 June, 1867.

SIR,

I am directed by the Colonial Secretary to enclose a Commission under the Great Seal of the Colony, appointing you to visit and inquire into the condition and management of the principal Lunatic Asylums of Great Britain and Ireland, the Continent of Europe, and the United States of America, with the object therein more fully stated; and to request that, as early as practicable after your arrival in England, you will enter upon the duties therein confided to you, and endeavour to bring them to a conclusion within the period of six months.

I am to add, that a further communication, containing full instructions, will be forwarded to you through Captain Mayne, the Government Agent, No. 118, Cannon-street, London, to reach you immediately after your arrival.

I have, &c.,
HENRY HALLORAN.

No. 5.

No. 5.

THE PRINCIPAL UNDER SECRETARY to W. C. MAYNE, Esq.

Colonial Secretary's Office,
Sydney, New South Wales,
24 August, 1867.

SIR,

In June last, Fredc. Norton Manning, Esquire, M.D., was appointed, by this Government, Commissioner to visit the principal Lunatic Asylums in Europe and America, to obtain the latest and most accurate information of the plans of construction, systems of management, and the general treatment in such institutions. Dr. Manning was attached to H.M.S.S. "Esk," which vessel was ordered home at the time of his appointment.

2. It is very probable that the "Esk" will arrive in England by the time you receive this letter.

3. On his arrival in London, Dr. Manning will call on you, and present his Commission; and Mr. Parkes is anxious that every assistance should be afforded to him by you in the prosecution of his duties. By the Panama mail leaving on the 1st proximo, full instructions on this subject will be transmitted to you.

I have, &c.,

WILLIAM GOODMAN.
(For the Under Secretary.)

No. 6.

THE COLONIAL SECRETARY to DR. MANNING.

Colonial Secretary's Office,
Sydney, New South Wales,
31 August, 1867.

SIR,

Referring to my letter of June 14th, enclosing a Commission under the Great Seal of the Colony, appointing you to the duty of visiting the principal Asylums for insane and idiotic persons in Europe and America,—I have now the honor to state more in detail the objects which the Colonial Secretary desires to be kept in view in your inquiries.

2. As was fully explained to you before you left Sydney, this Government is desirous of making such changes in the management of the Lunatic Asylums here as will bring their organization more into harmony with the best managed institutions in the mother country. By personal inspection you made yourself acquainted with our Asylums, and you are, therefore, aware of the want of adaptation in the character of the buildings, and the obstacles that stand in the way of effecting satisfactory improvements. Still, it is believed that much may be done by a reorganization of these establishments, on the basis of a correct knowledge of the improvements carried out, under more favorable circumstances, in other parts of the world. The principal object of your mission is, to obtain the information which is considered to be necessary for the guidance of the Government in these important changes.

3. In accordance with the proposal made by yourself in Sydney, you will visit the chief Asylums in the United Kingdom, on the Continent, and in the United States. You will direct your inquiries, in these visits, to the principles on which the buildings have been erected, and the sanitary precautions adopted in their construction. You will carefully observe the different methods of treatment, and obtain statistical evidence of the results in separate cases, so far as is practicable. You will examine the working of different systems of management and discipline, and endeavour to ascertain the effects of the different forms of administrative organization on the condition of the patients, and in relation to efficient supervision and economy of expenditure. In all cases, it will be desirable to obtain plans, as well as accurate descriptions of the buildings, particulars of the number of inmates allotted to rooms of a given size, and the quantity of pure air considered as indispensable to a given space.

4. You will obtain from the institutions you visit, copies of all regulations, dietary scales, and reports. It will also be within the compass of your duties to procure for the Government, copies of all recent and important statutes, state papers, and departmental reports, relating to the treatment of lunatics.

5. You will report to this Government, by every mail, the more important particulars in the progress of your inquiries.

6. Before leaving England for any foreign country, you will present yourself to the Right Honorable the Secretary of State for the Colonies, and explain the object of your mission. It is believed that Her Majesty's Government will not be unwilling to render you assistance in prosecuting investigations which must be regarded with much interest,

I have, &c.,

HENRY HALLORAN.

No. 7.

THE COLONIAL AGENT to THE PRINCIPAL UNDER SECRETARY.

(No. 61.)

New South Wales Agency,
118, Cannon-street, London, E.C.,
24 October, 1867.

SIR,

I have the honor to acknowledge receipt (on the 14th instant) of your letter C.S. 193, dated 24th August, 1867; and, in reply, to inform you that I have had an interview with Dr. Manning, who called on me here, and with whom I arranged to communicate as early as possible after receiving the instructions referred to in the concluding words of your letter.

I have, &c.,
W. C. MAYNE,
Agent for the Colony of New South Wales.

No. 8.

DR. MANNING to THE COLONIAL SECRETARY.

Milton Ham, near Northampton,
21 November, 1867.

SIR,

I beg to acknowledge the receipt of full instructions for my guidance in visiting the Asylums of Great Britain, the Continent of Europe, and the United States of America, and have the honor to report to you, that, with a view to carry out the same, I have waited on the English Lunacy Commissioners, and obtained such advice as they can give me concerning the Asylums best worth visiting at home and abroad. I purpose now to spend about two months in the United Kingdom, in examining fully, and in detail—according to a tabular view which I have drawn up, and which I have the honor to transmit to you by this mail—a limited number of the best English Asylums, making myself thoroughly acquainted with their working, and collecting all reports, plans, and printed regulations. At the same time, I shall lose no opportunity of visiting and inspecting in a more cursory manner any Asylums which are in my route. After completing the English report, I purpose calling on the Right Honorable the Principal Secretary of State for the Colonies, according to your directions, and, making full use of the assistance he is able to furnish me, spend about two months in closely inspecting a limited number of Continental Asylums. The American Asylums I shall subsequently visit in the same manner.

I shall, in accordance with your directions, report to you by each mail what Asylums I have visited, with any particulars that may seem of immediate interest; but I conceive that I shall be best carrying out your wishes if I have all the facts I can collect before me, before making a full report to you. This report I hope to bring to a conclusion in six months from this date, and shall lose no time in forwarding it to you.

In conclusion, I have the honor to request that I may be considered as engaged in the service of the New South Wales Government from November 16th, 1867, and shall be glad to learn how and at what periods I may draw the salary attached to my office as Commissioner.

I have, &c.,
FREDC. NORTON MANNING.

No. 9.

DR. MANNING to THE COLONIAL SECRETARY.

Milton Ham, near Northampton,
23 December, 1867.

SIR,

I have the honor to report to you that, in accordance with the instructions which I have received from the Government of New South Wales, I have visited and inspected the following Institutions for the Insane:—

Middlesex County Asylum	Colney Hatch
Essex	do.	...	Brentwood
Sussex	do.	...	Hayward's Heath
Surrey	do.	...	Burntwood
Three Counties	do.	...	Hitchin
(Bed. Bucks. Hants.)			
Gloucester	do.	...	Gloucester
Worcester	do.	...	Powick
Stafford	do.	...	Stafford
New Stafford	do.	...	Lichfield
Lancashire	do.	...	Prestwick
Derby	do.	...	Mickleover

Bristol Borough Asylum	Stapleton
Coton Hill Lunatic Hospital	Stafford
Bethlehem do.	Southwark
Camberwell House Private Asylum	Camberwell
Brislington House do.	Near Bristol
Broadmoor State Asylum	Near Woking
Earlswood Idiot Asylum	Reigate.

I have also visited the Herbert Hospital, Woolwich, and the Pauper Hospital at Chorlton on Medlock, near Manchester,—two of the most recently finished buildings erected on the pavilion principle, so strongly advocated by Miss Nightingale.

I have, &c.,

FREDC. NORTON MANNING, M.D.

1867-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

LUNATIC ASYLUMS.

INQUIRY INTO THE CONDITION AND MANAGEMENT OF, IN GREAT BRITAIN, ETC.—FURTHER REPORT.)

Ordered by the Legislative Assembly to be Printed, 1 April, 1868.

FREDERIC NORTON MANNING, Esq., to THE COLONIAL SECRETARY.

Milton Ham, near Northampton,
17 January, 1868.

SIR,

I have the honor to report to you, that since the date of my last letter, I have visited the following Lunatic Asylums:—

Northampton Lunatic Asylum, Northampton.
Leicester Lunatic Asylum, Leicester.
Fife District Asylum, near Cupar.
Morningside Asylum, near Edingburgh.
Dundee Royal Asylum, Dundee.
Montrose Royal Asylum, Montrose.
Perth Royal Asylum, Perth.
Perth District Asylum, Murkilty.
Perth Criminal Asylum, Perth.
Glasgow Royal Asylum, Gartnavel.
Glasgow Parochial Asylum, Glasgow.
Haddington District Asylum, Haddington.

I have also visited the Lunatic Wards in the Leicester, Edinburgh, Dundee, and Perth Poorhouses.

This list almost completes the number of English and Scotch Asylums which I propose visiting. I have made arrangements to see Lincoln County Asylum—an Institution much commended by the Lunacy Commissioners; and the difficulties which surround the question of accommodation for, and treatment of Criminal Lunatics has made me desirous of paying another visit to the State Asylum at Broadmoor, before proceeding abroad.

The very limited time at my disposal will, I am afraid, prevent me paying a visit to any of the Irish Asylums.

I have already met with difficulties in procuring plans of Asylum Buildings. In many cases, and some of the newest and most interesting among the number, the architects themselves are very jealous of supplying copies for use or reference abroad, and such copies are not possessed by the Commissioners. I hope, however, to obtain several which will be very useful.

The Right Honorable the Secretary of State for the Colonies has given me all necessary introductions, and taken marked interest in the work in which I am engaged; and I think it right to report to you the interest which is taken in the object of my mission by physicians of eminence in this country. Among others, Sir James Clark, Bt., Physician in Ordinary to Her Majesty, has written to beg me to pay a visit to his country-house, and confer with him on the subject—the state of his health not permitting him at present to visit town. I propose spending a day or two with him, and doubt not to receive some valuable suggestions.

I have, &c.,
FREDC. NORTON MANNING.

1867.

NEW SOUTH WALES.

UNIVERSITY OF SYDNEY.

(REPORT FOR 1866.)

Presented to Parliament, pursuant to Act 14 Vict., No. 32.

THE REGISTRAR, UNIVERSITY, to THE COLONIAL SECRETARY.

University of Sydney,
1 May, 1867.

SIR,

I do myself the honor to transmit herewith the Annual Report of the University for the year 1866, together with an account of the Receipts and Disbursements during the same period.

I have, &c.,
HUGH KENNEDY,
Registrar.

REPORT of the University of Sydney, for the Year ended 31st December, 1866.

1. The Senate of the University, in accordance with the provisions of the 22nd clause of the Act of Incorporation, have the honor to submit, for the consideration of His Excellency the Governor and the Executive Council, the following Report of their proceedings during the year 1866.

2. Eleven students were admitted to matriculation after having passed the statutory examination.

3. Messrs. John Hunter and Alfred Davis, having proved to the satisfaction of the Senate, that they had kept terms in British Universities, and having otherwise complied with the regulations, were admitted to a corresponding status in the University, with a view to the completion of the curriculum for the degree of B.A.

4. Dispensations were granted to Mr. John Hunter and the Reverend James White, of Singleton, exempting them from attendance on the Lectures for one year.

5. The Degree of Doctor of Laws was conferred on Mr. James Stuart Paterson, M.A., LL.B., and the Reverend George Heap Stanley, M.A., LL.B., who duly complied with the requirements of the By-laws.

6. The Degree of Master of Arts was conferred on Mr. Arthur Mansfield Allen, B.A., who passed the examination in the School of Mathematics and Natural Philosophy.

7. The Degree of Bachelor of Medicine was conferred on Mr. Charles Field Goldsbro', Member of the Royal College of Surgeons, England, who passed the examination in the Faculty of Medicine.

8. The Degree of Bachelor of Arts was conferred on the following students who passed the examination in the Faculty of Arts:—

- | | |
|------------------|------------------|
| A. Browne. | D. M. Myers. |
| W. P. Faithfull. | F. O'Brien. |
| E. Fitzgerald. | E. A. L. Sharpe. |
| J. R. Gorman. | J. D. Sly. |
| A. Horniman. | G. Deas Thomson. |
| G. Knox. | W. Watson. |
| F. M'Culloch. | |

9. The following undergraduates passed the examination for B.A., in Michaelmas Term, viz:—

- | | |
|---------------------|----------------|
| N. Emanuel. | John Hunter. |
| G. Faithfull. | Joseph Maher. |
| G. H. Fitzhardinge. | A. Richardson. |
| A. Gilchrist. | W. Sullivan. |

10. The following Honors were awarded :—

B.A. Mathematical Examination.

1st Class :—G. Knox.

2nd Class :—J. D. Sly.

B.A. Prize for Physics.

N. Emanuel.

SCHOLARSHIPS.

For General Proficiency.

First year :— { J. Alston.
T. Roseby.
J. Coutts ("Levey").

Second year :— { E. Barton ("Lithgow").
P. Cooper.
W. Purves.

Special.

"Deas Thomson" (*for Physics*) :—

A. Gilchrist.

"Professor Pell's" Medal (*for Mathematics*) :—

G. Knox.

"Professor Smith's" Prize (*for Physics*) :—

A. Gilchrist. } *æq.*
D. Cooper. }

"Wentworth" Medal (*for English Essay*) :—

G. Knox.

"Honorable George Allen's" Medal (*for Greek Iambics*) :—

J. D. Sly.

11. Mr. William Charles Windeyer was, at a Convocation duly held in the Great Hall of the University, elected a Fellow of the Senate, in the room of the late Henry Grattan Douglass, Esquire, M.D.

12. Alexander Morrison Thomson, Doctor of Science in the University of London, was appointed, on the nomination of Sir Roderick Murchison, to fill the office of Reader in Geology and Mineralogy, and Assistant in the Laboratory, and has arrived in the Colony. Arrangements have been made for a Course of Lectures in Geology, Mineralogy, and Palæontology, and a Class in Practical Chemistry, to commence in Lent Term.

13. In reporting the death of the Reverend John Woolley, D.C.L., Principal and First Professor of Classics and Logic in the University, the Senate desire to record their high sense and appreciation of his valuable services, and of the unwearied zeal which he manifested in all matters connected with the progress of the Institution. Called on to assist in the work of initiating a scheme of superior education in the Colony, he gave his best energies to that object; and his voyage to Europe, which had so deplorable an issue, was in furtherance of the cause to which he had devoted the best years of his life. By reason of this lamented event a vacancy was created in the Chairs of Classics and Logic. With a view to obtain a perfectly qualified successor, the Senate appointed, as a Committee, the following gentlemen in England, who, from their long connection with the University, and knowledge of the requirements of the Colony, would be competent to fulfil the important trust confided to them, viz. :—

Archbishop Polding.

Sir Charles Nicholson, Bart., D.C.L., LL.D.

Edward Hamilton, Esq., M.A., M.P.

W. C. Wentworth, Esq.

F. L. S. Merewether, Esq., B.A.

J. B. Darvall, Esq., M.A.

Alfred Denison, Esq., B.A.

Pending the arrival of the new Professor, the Assistant Professor of Classics and Dr. Paterson have been appointed to conduct the classes in the Department of Classics.

14. The Senate have to report, with much regret, the death, by the hand of a lunatic, of Richard Greenup, Esq., M.D., one of the Examiners in the Faculty of Arts, and also in the Faculty of Medicine, and would record their sense of the valuable services rendered by him during the long period of his connection with the University in the several capacities of Registrar and Examiner.

15. John Foulis, Esq., M.D., was appointed Examiner in the Faculty of Arts; and Edward Bedford, Esq., and Haynes Gibbes Alleyne, Esq., M.D., Examiners in the Faculty of Medicine; the several vacancies having been caused by the deaths of Dr. Greenup and Dr. West.

16.

16. Negotiations were entered into with the Directors of the Sydney Infirmary, with a view to make that Institution available for a course of study in connection with the University, for the Medical Profession. Steps were accordingly taken by the Senate, and application was made to the Medical Council of England, for the recognition of such of the University Examinations and Lectures as would form part of the curriculum for a Medical Degree. Application was simultaneously made by the Medical Council for the recognition of their Institution by the Medical Council. A scheme of Medical Instruction, to extend over the first two years of the course of study prescribed for intending Practitioners, has been prepared, which, if it can be carried out, will do away with the necessity for a lengthened sojourn in England, in the case of persons desirous of qualifying themselves for the Medical Profession.

17. The Reverend Wazir Beg, M.D., having placed at the disposal of the Senate his gratuitous services, in the capacity of Lecturer in Oriental Languages and Literature, has been appointed Reader in those subjects. Facility will thus be afforded for study in that branch of learning, to persons wishing to compete for appointments in the Civil Service of India.

18. A contract was entered into for completing the rooms in the south end of the building, for the purposes of a Museum of Geology and Mineralogy and a Laboratory. The institution of a class of Practical Chemistry, and the arrival of a large collection of typical rocks, fossils, &c., rendered this work necessary.

19. Appended is an account of the Receipts and Expenditure of the University, for the year 1866.

RETURN of the RECEIPTS and DISBURSEMENTS of the UNIVERSITY of SYDNEY, in the Year 1866.

31st December, 1866.

1867.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

UNIVERSITY OF SYDNEY.

(RETURN IN REFERENCE TO.)

Ordered by the Legislative Assembly to be Printed, 4 July, 1867.

RETURN to an *Address* of the Honorable the Legislative Assembly of New South Wales, dated 18 December, 1866, praying that His Excellency the Governor would be pleased to cause to be laid upon the Table of this House,—

“ A Return shewing, respectively :—

“ (1.) The amount of money expended on the Sydney
“ University, including the cost of buildings, alterations,
“ repairs, architect’s fees, salaries, wages, and all charges
“ of whatever nature, which have been paid out of the
“ public funds on account of that Institution, from its
“ foundation to the present date.

“ (2.) The number of acres, and the estimated value (when
“ dedicated) of the land granted to the University, with
“ interest at the rate of 5 per cent. per annum on such
“ value, from the time of dedication to this date.

“ (3.) The total amount received for fees for or from
“ students to this date, and how such fees have been
“ appropriated.

“ (4.) The maximum and minimum number of students
“ attending the University each year since its foundation.

“ (5.) A nominal Return of all students who have attended
“ the University, with the period of attendance in each case.

“ (6.) A nominal Return of all students who have taken
“ degrees or honors in the said University.

“ (7.) A nominal Return of all persons (not students) of
“ the University, on whom that Institution has conferred
“ honors or degrees.

“ (8.) A nominal Return of all officers (either paid or
“ honorary) connected with the University.

“ (9.) Information of a like nature (so far as applicable),
“ with reference to the Affiliated Colleges connected with
“ the University, and also with reference to the Sydney
“ Grammar School.”

(Mr. Lucas.)

UNIVERSITY OF SYDNEY.

No. 1.

RETURN shewing the Amount of Money expended on the Sydney University, which has been paid out of the Public Funds, from its foundation to 31st December, 1866.

1st.—Annual payment of the Endowment of £5,000 per annum	£80,000
Amount received for a special purpose, viz.:—Repairs to the	
Bank	150
2nd.—Amount received from Government for building purposes ..	65,000
3rd.—Amount received, being nett proceeds of sale of the Sydney	
College, after paying off the shareholders	5,584
	£150,734

31st December, 1866.

WILLIAM CLARK,
Accountant.

HUGH KENNEDY,
Registrar.

No. 2.

THE Number of Acres, and the Estimated Value (when dedicated) of the land granted to the University, with Interest at the rate of 5 per cent. per annum on such Value, from the time of dedication to this date.

The land at Grose Farm, (*48) forty-eight acres, granted to the University in 1852, can hardly be said to have any value, as one of the conditions of the grant was, that it should never be appropriated to building purposes—the only basis of value in such a locality. Mr. F. O'Brien received some land on the Grose Farm Estate in lieu of a similar quantity surrendered by him at Randwick, at a time when Randwick land was worth about £50 an acre.

Bearing in mind that the University grounds cannot be alienated or otherwise made use of, I cannot set a higher value upon them than £50 per acre.

E. T. BLACKET,
Architect.

Interest on £2,400, for 14 years, at 5 per cent.—£1,960.

HUGH KENNEDY,
Registrar.

* The total grant of land was 120 acres, of which 72 acres have been appropriated for the Affiliated Colleges.

No. 3.

RETURN shewing the Amount of Fees received from Students from the foundation of the University, and how such Fees have been appropriated.

RECEIVED :—

Gross amount of Fees from foundation to 31 Dec., 1866

£10,129 19 7

PAID :—

To Professors

£7,388 10 0

To the general revenue of the University

2,741 9 7

£10,129 19 7

31st December, 1866.

WILLIAM CLARK,
Accountant.

HUGH KENNEDY,
Registrar.

UNIVERSITY OF SYDNEY.

NEW SOUTH WALES.

ST. JOHN'S COLLEGE.

(BY-LAWS.)

Presented to Parliament, pursuant to Act 21 Vict., sec. 11.

ST. JOHN'S COLLEGE WITHIN THE UNIVERSITY OF SYDNEY.

In pursuance of the power vested in us by the Act passed in the twenty-first year of the reign of Her present Majesty, entitled, "*An Act to incorporate Saint John's College as a College within the University of Sydney*," we, the Rector and Fellows of St. John's College, for the purpose of carrying into effect the provisions and objects of the said Act, do hereby revoke the several By-Laws heretofore made by us, and do, instead thereof, establish the several By-Laws which are contained in the Schedule hereto, signed at the end thereof by the present Rector of the said College.

In witness whereof, we hereunto affix our corporate seal, this third day of December, in the year of our Lord one thousand eight hundred and sixty-six.

By order of the Council,

(L.S.) JOHN FORREST, D.D.,

Rector.

BY-LAWS OF ST. JOHN'S COLLEGE.

MEMBERSHIP.

1. The ordinary members of St. John's College, in addition to the Rector, Vice-Rector, and Fellows, shall be the Tutors, Masters, and students of the College, together with those who, having been students thereof, shall keep their names on its books as hereinafter provided.

2. Other persons may be admitted to membership from time to time, upon such terms and conditions as the Council may determine.

ADMISSION OF STUDENTS.

3. Persons desirous of becoming students of the College shall, if required so to do, produce letters as to character from a clergyman, and from the Principal of the College or school where the applicant has studied.

4. The name of every student admitted into the College shall be registered in a book provided for that purpose.

5. All students residing in the College shall either have matriculated, or be preparing for matriculation at the next ensuing examination for that purpose.

6. The names of resident students shall not be entered in the College register until they shall have matriculated.

7. Any student failing to pass the matriculation examination shall cease to reside in the College, but may be re-admitted prior to the next matriculation examination, if he shall intend again to present himself for examination.

8. Every student, on being entered on the College register, shall sign a declaration that he will conform to the Statutes of the College.

9. Non-resident students, being undergraduates, shall, on signing the usual declaration, be admissible to the College lectures.

TERMS AND VACATIONS.

10. The Collegiate terms and vacations shall be the same as those of the University. The Easter recess shall not be considered a vacation.

11. Resident students wishing to remain in the College during vacation, may do so with the consent of the Rector, and under such regulations as the Council may establish.

RELIGIOUS EXERCISES.

12. All resident students shall attend morning and evening prayers, mass, and all public services in the College chapel.

13. They shall approach the Holy Communion at least once in each term, and also at the festivals of Christmas and Easter.

RELIGIOUS INSTRUCTION.

14. All students, whether resident or non-resident, shall receive gratuitous and systematic instruction in the doctrines and practice of the Catholic Church.

15. The Rector, with the sanction of the Visitor, shall determine the text-books for such instruction; and every student must provide himself therewith, and attend all lectures on these subjects.

GENERAL INSTRUCTION.

16. The course of philosophy commonly distributed into logic, metaphysics, and ethics, shall be taught within the three years of the ordinary University curriculum; and all students, whether resident or not, shall attend the lectures on these subjects.

17. Modern history, dating from the beginning of the Christian Era, shall be taught in the College; and the lectures thereon shall be so arranged as to comprise the entire course within the period of the University curriculum. Attendance at these lectures shall be obligatory on all students.

18. It shall be competent for the Council to provide for the teaching, in the College, of any other subject as deemed advisable.

19. An examination shall be held annually, at a time to be appointed, on the subjects of College instruction other than those taught at the University lectures; and the result of such examination shall be reported at a meeting of the Council.

TUTORIAL INSTRUCTION.

20. Lectures (as well as individual instruction, when deemed necessary,) shall be given on the subjects of the University course.

21. Stated hours shall be set apart for private study; and during the hours so assigned silence shall be observed by all students.

LIBRARY.

22. The Council shall form a library for the use of the College, and shall make regulations for the due management thereof.

MEALS.

23. Resident students shall take their meals together in the College hall, or public dining room, at stated hours, due notice whereof shall be given.

24. These hours shall be such as to suit the convenience of the students, and meet the requirements of the horarium of the University.

25. Non-resident members of the College and visitors may be admitted to the public table, upon such conditions as shall be imposed by the Council.

FEES.

26. The ordinary fees from members shall consist of an admission fee and of Annual fees.

27. The admission fee shall be the same for all students, whether resident or not.

28. The annual fee for resident students must cover the expenses of room, board, service, lectures, and tuition.

29. The annual fee for non-resident students must cover the charges for lectures, tuition, and any other College privileges for which the Council may require a fee.

30. An annual fee shall be payable by all other members (except Fellows and Officers), to entitle them to keep their names on the College books.

31. The amounts of all College fees shall be fixed by the Council, and paid to the officer appointed to receive them.

32. All fees are to be paid in advance; and a schedule thereof shall be exhibited in the public hall.

ROOMS.

33. Any student intending to reside in the College may, upon payment of the necessary fees, select his room from those vacant; priority of choice of rooms being, as between different students, determined by the order of their respective applications for admission.

34. The furniture of his room shall be provided by the student at his own cost.

DISCIPLINE.

DISCIPLINE.

35. The College gates shall be closed at a stated hour every evening, after which hour no resident student shall leave the College without the permission of the Rector.

36. Every resident student shall be within the College grounds before the gates are closed; in default thereof he shall be liable to such penalty as the Council may determine.

37. Every student shall be held responsible for the conduct of his visitors while within the College grounds, and no visitor shall be allowed into the College after the gates are closed.

38. Leave of absence from the College, for a portion or for the whole of the night, may be granted to any student by the Rector, or, in his absence, by the Vice Rector; but, in either case, only for very urgent reasons.

39. The academic dress shall invariably be worn by all students and Officers of the College in chapel, hall, and at lectures, and likewise within the precincts of the College or University, except during recreation.

40. Habitual breach of discipline, or any other serious offence on the part of any student, shall subject him to a reprimand in the presence of the Council; and, in extreme cases, the Council may suspend him for a limited period from his ordinary rights and privileges, or, if necessary, expel him from the College.

SCHOLARSHIPS.

41. Persons desirous of founding scholarships or free places within the College for any special purpose, may do so upon any conditions not repugnant to the objects for which the College is established.

42. Where the founder shall not have directed the special application of any such scholarship, the Council shall have the right to do so.

43. Candidates for scholarships who shall be admissible to the College under By-law No. 3, shall be examined by at least three Examiners, of whom the Rector shall be Chairman, the others being nominated from time to time by the Council.

44. The Examiners shall vote for the candidate who shall exhibit the greatest proficiency in the subject or subjects of examination; and the Rector shall report, in writing, at the next meeting of the Council, the result of such examination, and the Council shall award the scholarship accordingly.

45. Due notice shall be given of all such scholarships, and of the time and place of examination.

THE COUNCIL.

46. The meetings of the Council shall be held at the College, or at some place in Sydney, at such times as shall be appointed for that purpose.

47. A special meeting of the Council shall be convened by the Rector upon the written requisition of one Clerical and two Lay Fellows.

48. Of ordinary meetings, every Fellow resident in Sydney, or within 50 miles thereof, shall receive at least two day's written notice, and, of special meetings, at least one day's written notice.

49. At all meetings, the Rector, or, in his absence, the Vice-Rector, shall preside.

50. All the proceedings of the Council shall be entered in a journal, and at the opening of each meeting the minutes of the previous meeting shall be read, and (unless the then meeting shall be an adjourned meeting) confirmed. In the case of meetings adjourned, the confirmation of the minutes shall be deferred until the next ordinary meeting.

51. No motion (other than of a merely formal character) shall be made at any meeting, unless notice of such motion shall have been given at a previous meeting; but this requirement may be dispensed with in any case where the meeting shall unanimously consent thereto.

52. Whenever any question shall be submitted by the Chairman for the vote of the meeting, every Fellow present shall vote thereon.

53. If any Fellow shall, without leave of the Council, be absent from three consecutive ordinary meetings thereof, his office of Fellow shall thereupon become vacant; provided that, for the purpose of this Rule, every adjourned meeting shall be reckoned as part of the original or principal meeting, and not as distinct therefrom.

54. Upon any vacancy occurring amongst the Fellows, candidates for the vacant office shall be nominated at the next meeting of the Council; and, whether opposed or not at such meeting, they shall be submitted for election at the next ensuing meeting, and their election shall depend upon the result of the votes taken in reference thereto.

55. The annual certificate required by the "Colleges Endowment Act," 18 Victoria, No. 37, section 5, shall be under the hands of any two Fellows.

THE SEAL.

56. The seal of the College shall be in the custody of the Rector, and shall not be affixed to any document except by order of the Council.

JOHN FORREST, D.D.,
Rector.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

EVIDENCE TAKEN BY THE TRUSTEES

OF THE

SYDNEY GRAMMAR SCHOOL,

RESPECTING THE

CHARGES BROUGHT AGAINST MR. PRATT.

ORDERED BY THE LEGISLATIVE ASSEMBLY TO BE PRINTED,
10 *July*, 1867.

SYDNEY: THOMAS RICHARDS, GOVERNMENT PRINTER.

1867.

[*Price, 9d.*]

57—A

EVIDENCE

TAKEN BY THE

TRUSTEES OF THE SYDNEY GRAMMAR SCHOOL,

RESPECTING THE CHARGES BROUGHT AGAINST MR. PRATT.

At a Meeting of the Trustees of the Sydney Grammar School, held on Monday, the 7th of January, the following letter was read from Mr. Edward Pratt:—

Sydney Grammar School,
5 January, 1867.

Gentlemen,

I have the honor to ask your attention to certain statements made in the Legislative Assembly, on Thursday, 20th ultimo, by Mr. William Macleay, seriously affecting my character as a Master in this institution, and tending very much to injure the Sydney Grammar School in the eyes of the public.

His charges are briefly these:—

- (1.) That I entered in an unworthy and disgraceful conspiracy with two members of your Board, against the late Head Master, Mr. Stephens.
- (2.) That I am the "most blasphemous infidel that ever came into the Colony," and that I expressed, in the common room, an opinion that if Christ was not an impostor and a swindler, the evidence in favour of that view is very strong.

I have ascertained that these statements have been industriously circulated, publicly and privately, in an exaggerated form; and I feel assured that, if they are allowed to pass unnoticed by the Trustees, they will be productive of serious, and perhaps lasting injury to the school.

I venture, therefore, respectfully to suggest that an inquiry be at once made into the truth of Mr. Macleay's charges, and that that gentleman be requested either to come forward and substantiate them, or state upon what authority they were made.

I have, &c.,

The Trustees of the
Sydney Grammar School.

EDWARD PRATT.

In consequence of the receipt of the above letter, the following letter was addressed to Mr. Wm. Macleay:—

Sydney Grammar School,
9 January, 1867.

Sir,

I am directed by the Board of Trustees of the Sydney Grammar School to enclose a copy of a letter which they have received from Mr. Pratt. In consequence of that letter the Trustees adopted the following resolution, viz.:—"That a copy of Mr. Pratt's letter be forwarded to Mr. Wm. Macleay, and that he be requested to state the grounds upon which he made the charge referred to in the paragraph numbered (2.) in Mr. Pratt's letter."

I am also directed to inform you, that I am instructed to call a Meeting of the Board upon the receipt of your reply, when the Trustees intend to institute an inquiry, if there seems any possibility of the charge referred to in the above resolution being substantiated.

I have, &c.,

Wm. Macleay, Esq., M.P.

W. H. CATLETT,
Secretary.

The

The following reply was received on the 13th January :—

Currajong, 12th January, 1867.

Sir,

In reply to your letter of the 9th instant, enclosing a copy of a letter from Mr. Pratt, to the Trustees of the Grammar School, I beg that you will inform the Trustees that Mr. Edwards, one of the Masters of the school, can give them full information as to the particular charge of blasphemy referred to.

As regards the general charge of blasphemy, I would suggest inquiry among the former and present Masters of the school.

I have, &c.,

WILLIAM MACLEAY.

W. H. Catlett, Esq.,
Secretary, Sydney Grammar School.

Sydney Grammar School,
Thursday, 17 January, 1867.

At a Special Meeting of the Trustees, held this day at 4 p.m., for the purpose of receiving Mr. Wm. Macleay's reply to the Secretary's letter of the 9th instant, and to inquire further into the charge against Mr. Pratt—

Present :

PROFESSOR PELL, Chairman.
N. D. STENHOUSE, Esq.
ARTHUR A'BECKETT, Esq.
R. A. A. MOREHEAD, Esq.
W. C. WINDEYER, Esq.
THE HONORABLE GEORGE ALLEN, Esq.

Mr. John Edwards, Class Master, was called in and examined.

Mr. Macleay's letter of the 12th instant was read to the witness, and he was requested to give what information he possessed on the subject referred to.

The witness stated that he had put in writing the information required.

The Trustees requested the witness to read the writing, and which was as follows,

viz :—

To the Trustees of the Sydney Grammar School,
&c., &c., &c.

Paddington, 17 January, 1867.

Gentlemen,

At the request of your Secretary, Mr. Catlett, I reduce to writing the evidence I have "to give in reference to the charge Mr. Wm. Macleay has made against Mr. Pratt."

And first, I beg leave to say that from the day I joined the Sydney Grammar School to the present period, I have always been in amity with Mr. Pratt, and that I have always met, at his hands, with the greatest consideration and attention, and that, therefore, in what I am about to write, I am not instigated by unkind feeling, but that I deeply regret having unadvisedly repeated in a private conversation to Mr. Stephens any words I have heard from Mr. Pratt.

If I had thought that an advantage would have been taken of what I was communicating to Mr. Stephens, I should have studiously kept silence; and I have Mr. Stephens' assurance that Mr. Macleay's "charge" in the Legislative Assembly was made without his expressed consent.

It is of far greater regret to me, that Mr. Pratt's public repudiation of his words—those quoted by Mr. Macleay—*obliges* me, that in support of my own truthfulness, to mention what I would infinitely prefer not to notice.

A few days after my introduction to the Sydney Grammar School, Mr. Stephens told me of a matter in dispute between himself and Mr. Pratt, that was under investigation by the Trustees; and he begged me, for my own sake and for his, to take no part whatever in the controversy. This advice I scrupulously followed; and until the decision of the Trustees was made known, I had no communication with Mr. Stephens of which Mr. Pratt or the matter under investigation formed the subject. The facts of the case are as follows :—

About a month prior to the Christmas vacation, it happened that I said, in conversation with Mr. Pratt, that though a member of the Church of England, I sometimes heard the Rev. Mr. John Graham preach at the Theatre, and I expressed my admiration of that gentleman's eloquence, ability, and liberality of thought.

This elicited other remarks on the many forms of religion in the present day, and Mr. Pratt asked me if I knew Mr. Newman's "Phases of Faith," I said "No." (I am told that this work is of much ability, but that it casts infinite discredit on the Founder of Christianity, and is of infidel, if not atheistic tendency.) Mr. Pratt spoke in the highest terms of praise of the talent, argument, and evident honesty of the author; and on my asking him to what conclusion Mr. Newman came, said "Oh! he proves Jesus Christ to be an impostor and a swindler." This startled me somewhat; and Mr. Pratt observing, I suppose, that I looked astonished, said—"I do not go so far as that—I do not say that Jesus Christ is an impostor or a swindler, but that the evidence in favour of that view is very strong indeed."

On the evening of that day, speaking in my family of the inquiry then pending, I mentioned that Mr. Pratt held peculiar opinions on Christianity, and I repeated the words he had that day used to me, and quoted since by Mr. Macleay. My wife was shocked, and said

said it was a duty I owed to my own sons and to the other pupils in the school, to report Mr. Pratt's opinions to Mr. Stephens, the Head Master. I thought differently—it was not for me to judge the opinions of other men. Mr. Pratt did not teach his opinions to the boys. And moreover, I could not, in fairness to Mr. Pratt, make any statement to Mr. Stephens that might possibly tell against Mr. Pratt in the investigation not then completed. More was said, but only relevant to this subject, inasmuch as this family difference has kept fresh in my memory what otherwise I might have forgotten.

On the Saturday following the day on which the decision of the Trustees was made known, I called on Mr. Stephens at his private residence, to inquire what my future position in the school would be, as I had been appointed to do what had been Mr. Blackmore's work, but other forms had been assigned me. I held a long conversation with him. Among other topics, Mr. Pratt and his theological opinions was then first mentioned between us; and I told Mr. Stephens what Mr. Pratt had said to me, and the strong feeling of my family on the subject. The words fell from me in common conversation, after the decision of the Trustees had been published, and I never imagined they could in any way be used to Mr. Pratt's disadvantage.

A few days after this, Mr. Pratt told me Mr. Windeyer was to bring before the Assembly His Excellency's speech delivered in the schoolroom. I was present on that occasion, and to my great astonishment, and I must add disgust, heard Mr. Macleay use the identical words I had reported to Mr. Stephens.

My first impression was to tell Mr. Pratt at once, that Mr. Macleay had indirectly derived his information from me; but on consulting my friends, I was advised to take no step in the matter until it should be brought directly before me. Some one else might have given the information, and if so, why embroil myself? The next day I saw Mr. Stephens. He told me the words had been used without his expressed consent; he had mentioned them to Sir William Manning, but was not then sure that he had mentioned them in the first instance to Mr. Macleay, although he had conversed with him upon the subject. He has since found, on inquiry, that he had mentioned them to Mr. Macleay.

On Saturday last, 12th January, I met Mr. Pratt in George-street; he broached the subject to me, and I then told him unreservedly, and as nearly as I can remember, in the same words as I have now used to you, all the circumstances as they actually happened.

I come now most reluctantly to a very painful part of my duty, but Mr. Pratt's published repudiation of his words makes it imperative on me to shew that he has the habit of speaking in a reckless and inconsiderate way of what the majority of people in a christian country hold sacred. The matter of this inquiry is narrowed to an assertion on my part, and a denial on Mr. Pratt's. It is necessary, then, that I shew that Mr. Pratt has a habit of speaking unadvisedly on matters relative to Christianity; and that, in the absence of positive confirmatory evidence of his having used the words I affirm he *did* use, there is at the least very strong presumptive evidence that, from habit, the occasion presenting itself, he would use them.

And first I say, that I had not been a frequenter of the common room one month before I was fully satisfied that, in his theological opinions, Mr. Pratt was what is generally understood by the word infidel, and this from sentiments and opinions uttered casually by him. On very many occasions I have heard him sneer at and speak with biting sarcasm of the Founder of Christianity, and of the doctrines and opinions of the various christian sects and communities. I am unable to detail all, for they have passed from my memory, but I will mention one as a sample of his habit. In conversation I had been saying that I had been greatly wronged by a certain person, a carpenter by trade, and that on going to expostulate with him I found him reading his Bible. "Ah!" said Mr. Pratt, with a sneer, "but Jesus Christ was a carpenter."

Take an instance of his reckless way of speaking. I had been criticizing a picture painted by Martens—I think it is called "The last Judgment." In this picture the Great Judge is represented sitting on a globe; before him is a gulf or chasm; on his left are figures clad in scarlet and the ensigns of power; on his right is a mixed multitude rising from the ground. John Wesley is depicted in a black coat and white handkerchief, in juxtaposition with Alfred the Great, Washington, the former robed in ermine and crowned. I was ridiculing the composition of this picture, when Mr. Pratt said "I don't believe in either Heaven or Hell. If there be a Hell, I would rather go there in company of such intellects as Byron, Shelley, and Voltaire, than go to the other place with black coats and white chokers."

On Saturday last, when I met Mr. Pratt, in course of our conversation I recalled this observation of his to his memory; he admitted it, and said, "Oh, the words mean nothing, and anyone might have used them."

It is quite true the words *may* have no value, but they evidence a reckless and inconsiderate habit of speaking of matters of serious import. Mr. Mein had joined us, and was standing by at the time on the same occasion, speaking of Newman's "Phases of Faith." Mr. Pratt again spoke in admiration of the work, and again said that Mr. Newman came to the conclusion that Jesus Christ was a swindler and an impostor—the words he had used before, only changing the position of the epithets.

I called his attention to his having then uttered as a quotation the very words he had repudiated before. He did not seem to be aware that he had used them at all.

This is a confirmation that I was right in the early impression his words and opinions had made on me. He said, of his own accord—"If you ask me if I believe in the Christianity of the nineteenth century, I unhesitatingly say I do not"; and afterwards he added that he would suffer the rack rather than give his adhesion to the historical portions of the early chapters in Matthew and Luke—

. Mr.

Mr. Pratt has an absolute right to the enjoyment of his opinions, unquestioned and unquestionable; but the above instances are enough to shew that, on matters connected with Christianity, he does speak unadvisedly; and in the present case, the assumption is that, having in his mind the conclusion to which Mr. Newman's reasonings had led him, he would naturally express himself in terms the same or akin to those used by Mr. Newman himself. I ought not to omit to mention that Mr. Pratt emphatically denied having used the word "swindler." It is of no great importance—the two epithets are nearly synonymous. I have, however, a very distinct recollection that both words were used.

At the risk of being tedious I have written thus at large, because I am desirous that all the circumstances connected with Mr. Macleay's "charge" should be before you; and I again repeat that nothing short of the necessity of proving my own truthfulness could have induced me to write what I have done.

I have, &c.,
JOHN EDWARDS.

By Mr. Windeyer: The words underlined were heard by Mr. Mein.

By the Chairman: The words attributed to Mr. Pratt, by Mr. Macleay, were said about a month ago in the common room? Mr. Whitfeld heard the observations about Heaven and Hell attributed by me to Mr. Pratt. I did not make a habit of repeating what was said in the common room to the Head Master. I think that Mr. Pratt made use of the blasphemous expressions attributed to him, without attaching any serious meaning to them. I feel that whatever is said in the common room is confidential. I went to Mr. Stephens to ask some questions respecting my position in the school. We conversed on various subjects. Introduced the subject of Mr. Pratt's blasphemous remarks. This was a private conversation, and not official. Mr. Stephens was not then in reality Head Master. I mentioned Mr. Pratt's remarks to him quite inadvertently.

Cross-examined by Mr. Pratt: I was educated at Westminster, and at Trinity College, Cambridge. I took the degree of Master of Arts there. I never migrated to any other college. I took my degree in 1832. I was on Peacock's side.

Mr. Pratt: Do you not think that, if I had obtained my present situation by representing that I had taken a degree at Cambridge when I had not, that I might fairly be termed a swindler and an impostor? *Mr. Edwards:* Yes, I suppose so.

Mr. Pratt: In such case, then, do you not think that my word would be of very little value—do you think that much weight should be attached to the testimony of a swindler and an impostor? *Mr. Edwards (after some hesitation):* No, I suppose not.

Mr. Pratt: In obtaining your present office, did you not represent yourself to be a M.A. of Cambridge? *Mr. Edwards:* Yes.

Mr. Pratt: Now, did you take a degree at Cambridge? *Mr. Edwards:* Yes, I did.

Mr. Pratt: Have you any papers to shew this? *Mr. Edwards:* No, they were destroyed by a fire in Brisbane.

Mr. Pratt: Your name should appear in the Cambridge Calendar for 1829, 1830? *Mr. Edwards:* Yes.

Mr. Pratt: Have you any such Calendar? *Mr. Edwards:* No.

Mr. Pratt produced Cambridge Calendars for 1828, 1829, 1830. Mr. Edwards, having examined the Calendar for 1829, stated that he could not find his name in it, nor could he account for its absence. On being examined by the Chairman, the witness could not tell the name of the Master of Trinity in his time. On being asked, was inclined to think that Dr. Whewell was Master, and Mr. Thomson, Tutor. Did not know where St. Mary's at Cambridge is, nor what it is. Did not know that it is the church where the members of the University hear sermons every Sunday. Could not tell what College stands next to Trinity. The Chairman here remarked that it was quite obvious that witness had never been a member of the University of Cambridge. Dr. Whewell was not appointed Master of Trinity until 1841. The witness was rising to depart, when the Chairman addressed him as follows:—The impression left upon the minds of the Trustees by this examination is that you are an impostor. Have you anything to say which can remove that impression, or anything further to say? The witness withdrew without any further remark, except that he persisted in the truth of his statements concerning Mr. Pratt.

Mr. Chas. S. Mein, Class Master, was called in and examined:—

By the Chairman: I am acquainted with the charges against Mr. Pratt. I never heard him use expressions such as those attributed to him by Mr. Macleay. According to what I know of Mr. Pratt's opinions about Christ, I do not think that he would have used the expressions swindler and impostor as applied to Christ—never heard him use the words in such conversation. I heard part of a conversation between Mr. Pratt and Mr. Edwards on Saturday last. I did not hear Mr. Pratt say anything about Heaven or Hell. I do not remember hearing Mr. Pratt use the words (underlined words in Mr. Edwards' statement).

By Mr. Pratt: I have been intimate with you for years, and have never seen anything in your religious views to prevent my associating with you. I resided with you for about a month, and did not hear you use any objectionable language concerning religious matters.

Mr. Edwin Whitfeld, Class Master, was called in and examined:—

By the Chairman : Never heard Mr. Pratt use the words attributed to him by Mr. Macleay, or anything to the same effect. I do not think that Mr. Pratt would use such words, knowing as I do his religious opinions. Never heard Mr. Pratt use the words "swindler and impostor" in connection with the name of Christ. Have heard him quote such words from Newman, but stating that he differed from that writer. Never heard him say that the evidence in favour of Newman's view is strong.

By Mr. Pratt : I am generally in the common room more than any other Master. Have never heard you speak sneeringly of Christ.*

Mr. Pratt then read the following letters which he had received from the Masters and ex-Masters of the school:—

(A.)

William-street,
14 January, 1867.

My dear Pratt,

I sympathized very strongly with you when I read the extraordinary attack made on you by Mr. Macleay.

I certainly never, in all my intercourse with you, heard you utter such sentiments, and your conversations with myself entirely prevented me from believing that you held them.

I see that the term "common room" has been misunderstood.

I feel quite certain that, even if you held the opinions attributed to you, you would not enunciate them in the schoolroom.

Very sincerely yours,
JOHN KINLOCH.

Ed. Pratt, Esq.

(B.)

10 January, 1867.

My dear Pratt,

In reply to your note of to-day, I have much pleasure in stating that I have never heard you utter, in the common room or elsewhere, any sentiments at all calculated to shock the mind of a Christian.

Yours truly,
FRANK HUTCHINSON.

Edward Pratt, Esq.

(C.)

211, Macquarie-street,
15 January, 1867.

My dear Sir,

I have read with very great regret the attacks which have been made upon your character, in the Assembly and the *Morning Herald*, in which you are said to have attributed to Jesus Christ the epithets of "swindler and impostor." I have frequently heard you discuss religious questions; and I can state without the least hesitation that I never heard you, either in the "common room" or elsewhere, use the expressions imputed to you, or which could possibly be so interpreted; on the contrary, I have, if I mistake not, heard you condemn those who deny the divine mission of our Saviour.

I sincerely hope that you will be able to refute completely the wanton and cruel attack which has been made upon your character.

Believe me, my dear Sir,
Your sincere friend,
A. BATES.

Ed. Pratt, Esq.

(D.)

134, Forbes-street, Woolloomooloo,
15 January, 1867.

My dear Sir,

I have read, with great surprise, that charges of blasphemy have been brought against you in a most public manner, and in particular of your having used some highly offensive expression regarding Christ. I can only say that I never heard you use such expressions, and, from the general tone of your conversation, I have reason to believe that the charges against you are totally false and unfounded.

I am, dear Sir,
Yours respectfully,

FERDINAND JOSEPH LANDER,
German Master.

E. Pratt, Esq.

(E.)

* The question whether Mr. Whitfeld had ever heard Mr. Pratt say that he did not believe either in Heaven or Hell was accidentally omitted to be put to Mr. Whitfeld on the 17th January, but at a subsequent meeting Mr. Whitfeld was examined on the subject, and he stated that he had never heard Mr. Pratt say that he did not believe in either Heaven or Hell, nor had he expressed sentiments to that effect.

(E.)

Redfern, 12 January, 1867.

Dear Sir,

In compliance with your request, I beg to state, for the information of all whom it may concern, that I never heard you, either in the common room of the school or any other place, make use of the expressions attributed to you by Mr. Macleay; and furthermore, as a simple act of justice towards yourself, truth compels me to add, that the only occasion within my memory on which you, in my presence, made any personal allusions to the great Founder of Christianity, was in terms of admiration of his noble character.

I remain, &c.,

E. Pratt, Esq.

C. J. NELSON.

(F.)

Sydney, 16 January, 1867.

My dear Sir,

In reply to your note of the 9th, inquiring whether or not I have ever heard you impute swindling or imposture to Jesus Christ, I beg to state that I do not remember having heard you make use of such a statement.

Yours truly,

E. Pratt, Esq.,
Grammar School.

E. BLACKMORE.

Sydney, 10 January, 1867.

I hereby certify that I have never heard Mr. Pratt give utterance to any opinions on religious matters in the common room.

P. A. DUTRUC.

Mr. Pratt also read the following letters from the parents of pupils who had resided with Mr. Pratt at the school:—

Newcastle, 3 January, 1867.

Dear Sir,

Had I been present in the Legislative Assembly when Mr. Macleay characterized you as a "blasphemous infidel," I should have felt it to have been my duty to have defended your character from what I conscientiously believe to be a most unwarrantable aspersion.

I am truly glad that you intend to ask the Trustees for a full inquiry into the whole case; and, as one who has had some opportunity of forming an opinion of your qualifications as a guardian of youth, I beg leave to state, for the information of the Trustees, that my son was under your care and control, as a boarder at the Sydney Grammar School, for about two years, and that during that period you behaved towards him in such a way as to deserve my entire approval; and from what has passed between myself and son during my occasional visits to the school, I am fully persuaded that you were ever ready to check what seemed to you to have even the slightest tendency towards an improper course. Most assuredly, his conduct, since he has left the school, affords me no reason whatever to suspect that you taught him to think lightly of what all Christians love and admire.

I have read this note to Mrs. Hannell, who desires me to say that she fully agrees with every word in it.

I entertain no manner of doubt of your being able triumphantly to refute the charges brought against you, and to thoroughly satisfy the Trustees that you are, in every respect, a proper person to be intrusted with the charge of youth.

I am,

Very truly yours,

Edward Pratt, Esq.

JAMES HANNELL.

Blackdown, Bathurst,
2 January, 1867.

My dear Sir,

I have much pleasure in stating that I have enjoyed your acquaintance these past four years, during which period two of my sons, who were pupils at the Sydney Grammar School, boarded with you, and were under your special charge. I have questioned my sons closely—and they are both old enough to judge of such matters—and from their answers, I find there has been nothing in your conduct towards them to lead them to suppose you held any extraordinary opinions upon religion. They have both now altogether left school, and they speak of you most highly, both in regard to your attention to their school duties and their general conduct. I have read the report in the *Herald*, of Mr. W. Macleay's speech in the Assembly, wherein you are characterized as "the most blasphemous infidel that ever came into the Colony." I can only say that, from my own knowledge of you, I don't believe the statement, or that Mr. W. Macleay would venture to make the same statement outside the privileges of "*the House*." If my good opinion of you is held in the least estimation, I beg to assure you, that what Mr. W. Macleay has said of you has not in the least affected it, nor will it cause any alteration in my feelings towards you, which are now as before, those of your sincere friend.

HENRY ROTTON.

E. Pratt, Esq.,
Sydney Grammar School.

My

My dear Mr. Pratt,

I have observed, with surprise and indignation, the attempts which have been made to excite distrust in you as a Teacher; and should you in any way be called upon to notice them, I hope you will give me an opportunity of offering my testimony in your favour. I have known you so long and so intimately, that I am entitled to speak with perfect confidence, and I am certain that a better or more competent guardian and instructor of youth is not to be found in the Colony. And during the years my eldest son has been in your charge, I have always considered him as safe as if he were at home, while his progress in his studies has exceeded my most sanguine expectations. Should circumstances enable me to obtain the same advantages for my second son, I shall gladly avail myself of them, quite regardless of opinions expressed by men who speak in ignorance or malice.

I remain,

My dear Mr. Pratt,

always yours,

JOHN STEWART.

Wollongong,
12th Jan., 1867.

Kurrajong, 28 December, 1866.

My dear Pratt,

I am truly sorry to hear of the false and mischievous attack that has been made on your character, and hope you will be enabled to discover and punish the author of the calumny.

Mr. Macleay, we may presume, only said what he had heard and believed, though I am surprised at his taking advantage of his privileged position, to make such an attack. I have known you intimately for the last eight years, and during that period have very often heard you express your opinions on various religious questions, but in no single instance have I heard you say anything that need shock the most devout Christian, or speak irreverently of the Lord Jesus Christ. I cannot indeed remember any direct statement of your views regarding the nature and teaching of Christ; yet, from the general character of your remarks, I am perfectly convinced that you would not have expressed yourself as you are reported to have done. You are at liberty to make any use you please of this letter, if you think it can be of service to you.

Trusting that you will receive no serious injury from the undeserved attack that has been made on you,—

I remain,

Yours very truly,

W. SCOTT.

E. Pratt, Esq.

Sydney Grammar School,

Friday, 18th January, 1867.

At the adjourned Special Meeting of the Trustees, held this day at 4 p.m., for the purpose of inquiring further into the charges against Mr. Pratt:

Present:

PROFESSOR PELL, Chairman.

ARTHUR A'BECKETT, Esq.

N. D. STENHOUSE, Esq.

THE HONORABLE GEORGE ALLEN, Esq.

R. A. A. MOREHEAD, Esq.

W. C. WINDEYER, Esq.

Mr. John Kinloch, formerly Assistant Mathematical Master in the school, was examined:—

By the Chairman: I am aware of certain blasphemous language attributed to Mr. Pratt; never heard him make use of such expressions, or anything like them; from what I know of Mr. Pratt, I do not think that he would utter such sentiments.

Mr. Kinloch identified his letter addressed to Mr. Pratt, marked (A.) Never heard Mr. Pratt make use of any language respecting Heaven or Hell such as that attributed to him by Mr. Edwards; I have reason to think, from Mr. Pratt's conversation with me, that he holds opinions such as those conveyed by the words attributed to him in abhorrence.

By Mr. Pratt: If I had heard it stated that you had spoken sneeringly of Christ I should not believe it, but would rather think that you had been misunderstood; I would believe you in preference to Mr. Edwards.

Mr. Hutchinson, formerly an Assistant Classical Master in the school, was examined:—

By the Chairman: I left the school about twelve months ago; I am aware of certain blasphemous language attributed to Mr. Pratt; I have never heard him use such expressions, or any like them; I know nothing of Mr. Pratt's religious opinions; never heard him say that he did not believe in Heaven or Hell.

Mr. Hutchinson identified his letter, marked (B).

Mr. Bates, formerly an Assistant Classical Master in the school, was called in and examined :—
I left about six months ago ; I was six months in the school ; I am aware of certain blasphemous language attributed to Mr. Pratt ; I never heard Mr. Pratt use such words, or any like them ; from what little I know of Mr. Pratt's opinions, I should think it very unlikely that he should use such expressions ; I never heard him say that he did not believe in Heaven or Hell ; I have conversed with Mr. Pratt on religious subjects.

Mr. Bates identified his letter, marked (C).

Mr. Lander, German Master in the school, was examined :—

I came to the school in August, 1864 ; I am aware of certain blasphemous language attributed to Mr. Pratt ; I never heard Mr. Pratt use any such expression, and I do not think him capable of using such language ; I never heard Mr. Pratt say that he did not believe in Heaven or Hell ; I never had any conversation with Mr. Pratt on religious matters.

Mr. Lander identified his letter, marked (D).

Mr. Nelson, Writing Master since 1860, was examined :—

I am aware of certain blasphemous language attributed to Mr. Pratt ; I never heard Mr. Pratt use such expressions, or anything like them ; from what I know of Mr. Pratt's opinions, I do not think he would be likely to use such expressions ; I have not had much conversation with Mr. Pratt on religious subjects ; he never said anything derogatory to the Christian religion ; I never heard Mr. Pratt say that he did not believe in Heaven or Hell ; I have been frequently in the common room, and never heard any such language from Mr. Pratt ; I am positive that Mr. Pratt holds sentiments such as those attributed to him in abhorrence, because I have heard him express views directly opposite.

Mr. Nelson identified his letter, marked (E).

M. Dutruc was absent through illness.

Mr. Blackmore, formerly an Assistant Classical Master in the school, was examined :—

I was eight years in the school ; I am aware of certain blasphemous language attributed to Mr. Pratt ; I never heard Mr. Pratt use such language, or any expression that would convey that idea ; I do not think, from what I know of him, that he ever made use of such expressions ; I have conversed with Mr. Pratt on religious subjects ; I never heard him speak sneeringly of Christ ; I never heard him say that he believed there was neither Heaven or Hell.

Mr. Blackmore identified his letter, marked (F).

Mr. Pratt then read the following letter :—

Sydney Grammar School,
18 January, 1867.

Gentlemen,

I have the honor herewith to return you Mr. Edwards' letter, and to inform you that I give a distinct and emphatic denial to each and every charge against me which is therein contained.

Some of Mr. Edwards' statements I solemnly declare to be absolute fabrications, and the rest, even if founded in fact, involve such gross misrepresentations of any sentiments which I may have uttered, that I feel justified in asserting that the whole letter consists of a tissue of falsehoods:

I do not think that it would be consistent with self-respect that I should of my own accord comment upon Mr. Edwards' statements in detail. If, however, you wish to examine me any further in the matter, I shall be glad to give you any information which you may require.

I have, &c.,
EDWARD PRATT.

The Trustees of the Sydney Grammar School.

Mr. Pratt examined by Mr. Allen :—

I never used expressions about Heaven and Hell attributed to me by Mr. Edwards ; I never sneered at, and spoke with bitter sarcasm of the Founder of Christianity ; I never sneeringly remarked that Jesus Christ was a carpenter ; I never had any such conversation as that related by Mr. Edwards on this subject ; I do not hold that Jesus Christ was a swindler and impostor ; I believe in a future state of rewards and punishments ; I hold in abhorrence the opinions attributed to me by Mr. Macleay. Mr. Fowles, the Drawing Master, is not here ; he was summoned ; I never remember seeing him in the common room.

The Trustees having duly considered the above evidence,—

It was moved by Mr. Stenhouse, seconded by Mr. Morehead, and carried unanimously:—

“That the special charge brought against Mr. Pratt by Mr. Macleay rests entirely upon Mr. Edwards’ testimony, which the Trustees consider unworthy of credit, and that the other charges have been disproved, as far as the nature of the case admits.”

Resolved—That a Report of the whole of the proceedings connected with the inquiry be immediately forwarded to the Government.

Elizabeth-street, Paddington,
4 February, 1867.

Gentlemen,

The following is a copy of a credential given me by Mr. Stephens:—

“18 January, 1867.

“I hereby testify that Mr. J. Edwards held office as Assistant Master in the Sydney Grammar School, from July, 1866, to December in the same year, and that during that period, his assiduity, skill, and success in teaching, were in the very highest degree satisfactory. In Mr. Edwards I have found large experience united with abundant energy, and could not have desired a more efficient assistant. I have no doubt that he is thoroughly well qualified to direct and carry out any system of high education.

“I have also had opportunities of observing Mr. Edwards’ success with private pupils, and although I have no particular acquaintance with his method, have seen most satisfactory results from his tuition.

“It may be to the purpose to add that Mr. Edwards was recommended to me as a singularly well qualified Teacher, by my friend and former Master, the Rev. M. Wilkenson, D.D., late Fellow of Clare College, Cambridge, and Head Master of Marlborough College.

“W. J. STEPHENS, M.A.,

“Late Fellow and Tutor of Queen’s College, Oxon., and Head Master of the Sydney Grammar School.”

170, Alberto-terrace, Darlinghurst,
Sydney, New South Wales.

I RECITE this letter to shew that, although I assumed a little to which I had no claim,—in the capabilities I brought to my office, and in the manner I performed its duties, I gave full value for the stipend I received. As a rule, and with very few exceptions, I gave up all my time daily from 12-30 to 2 p.m. to my forms; and, as a result, I brought them to a state of perfect discipline, and got from them nearly twice the amount of work assigned by the Head Master.

I was to receive a salary at the rate of £300 per annum; but although I did all the work for the last half-year, instead of receiving £150 I was paid £137 10s. only, £12 10s. having been held back from my first month’s stipend.

At the close of the year I inquired of your Secretary as to whether my services would be required any longer. He could give me no positive assurance, but said he supposed I should be on the same footing as the other Masters, my appointment being subject to three months’ notice.

On the faith of this I sought no other employment, and when, on the 17th ultimo, I was told I should not be further employed, it was too late, from the nature of scholastic engagements, to seek a post elsewhere.

I therefore submit to your consideration, that it is only justice that I be paid the £12 10s. held back from my first month’s stipend, together with such compensation as you deem just by my loss of employment, consequent on your summary dismissal of me on the 17th ultimo.

It is true that, under the pressure of extreme poverty, and from the belief that no one would be appointed to the office I solicited unless he had a degree, I assumed that to which I had no right. For my culpability in this respect I offer no other excuse; but it went no further—no one could have done the work more efficiently or more assiduously than I did it.

I have only now to refer to what took place at a meeting on the 17th ultimo, to say that, when questioned by Mr. Pratt, I was so confused by the consciousness of my false position that I lost all self-command, and that I do not now know what I then said or did.

The Trustees of the
Sydney Grammar School,
Sydney.

I have, &c.,
JNO. EDWARDS.

1867.

NEW SOUTH WALES.

SYDNEY GRAMMAR SCHOOL.

(REPORT FOR 1866.)

Presented to Parliament, pursuant to Act 18th Victoria.

THE SECRETARY TO THE TRUSTEES, SYDNEY GRAMMAR SCHOOL, to THE
COLONIAL SECRETARY.Sydney Grammar School,
1 July, 1867.

SIR,

I have the honor, by direction of the Trustees of the Sydney Grammar School, to transmit to you, for the purpose of being laid before the Legislative Assembly, the following Report of their proceedings, and of the progress of the School, during the year 1866.

In the early part of the year, the Trustees instituted an inquiry, which extended over many months, into the state of the School. A full Report of the evidence and proceedings relating to this enquiry has been already laid before the Government.

At a Meeting of the Trustees, held on the 12th of April, Mr. Richard Jones was elected a Trustee, in the place of Mr. Thomas Barker, who resigned his seat at the Board. At the same Meeting, Mr. W. C. Windeyer was elected a Trustee, in the place of the Honorable James Martin, whose seat became vacant by his acceptance of office under the Government.

The Trustees having been advised by the Attorney General that Mr. George Wigram Allen and Mr. Richard Jones were disqualified from having seats at the Board, in consequence of their holding office under the Government and the University respectively, the vacancies so occasioned were, at a Meeting held on the 1st May, filled up by the election of the Honorable George Allen and Mr. A. M. A'Beckett.

Mr. Arthur T. Holroyd having resigned his seat at the Board, Mr. M. H. Stephen was elected in his place.

At a Meeting held on the 7th May, the Trustees resolved to recommend to the Senate of the University, that the "Salting Exhibition," then vacant, be conferred upon Mr. J. W. Alston, Scholar of the University, and late Captain of the Grammar School. Upon this recommendation, Mr. Alston was appointed to that Exhibition.

At a Meeting held on the 2nd July, Professor Pell was elected Chairman for the current year. At the same Meeting, a letter having been read from Mr. E. Blackmore, Assistant Classical Master, resigning his office, Mr. John Edwards was subsequently temporarily appointed in his place, and held office until the end of the year.

The office of Head Master having become vacant by the retirement of Mr. Stephens, the Trustees, at a Meeting held on the 17th December, appointed Mr. A. B. Weigall to that office.

SYDNEY GRAMMAR SCHOOL.

Mr. Weigall took high classical honors at Oxford, and was highly recommended to the Trustees by the Authorities of Brasenose College, Oxford, where he was educated, and also by Professor Irving of the University of Melbourne.

The Trustees are happy in being able to report that the utmost harmony prevails amongst the Masters, and that they have every reason to be satisfied with the state of discipline and efficiency of the School under the present management.

Mr. Edward Knox having resigned his seat at the Board, the Trustees, on the 17th December, elected Mr. N. D. Stenhouse in his place.

Since the date of the last Report, the Trustees have not found it necessary to make any further regulations for the government and discipline of the School.

The Account of the whole income and expenditure of the School, and the number of pupils who attended during the year, will be found in the annexed Appendix.

I have the honor to be,

Sir,

Your most obedient Servant,

W. H. CATLETT,

Secretary.

NEW SOUTH WALES.

PUBLIC SCHOOLS ACT OF 1866.

(REGULATIONS ADOPTED BY THE COUNCIL OF EDUCATION, ON 27 FEBRUARY, 1867.)

Presented to both Houses of Parliament, by Command.

Council of Education Office,
Sydney, 1st March, 1867.

THE following Regulations, adopted by the Council of Education on 27th February, 1867, are published in accordance with Section 7 of the Public Schools Act of 1866.

HENRY PARKES,
Chairman.

COUNCIL OF EDUCATION.

Regulations under the Public Schools Act of 1866, adopted by the Council, 27th February, 1867.

I.—PROCEEDINGS OF COUNCIL.

I.—CONDUCT OF BUSINESS.

1. The Council shall meet for the transaction of business, unless otherwise ordered, every Monday, at 3 o'clock.
2. At each meeting, the Secretary shall enter in the Minute Book an accurate record of every proceeding of the Council; and the Minutes so recorded shall be read over as the first business of the next subsequent meeting, and, after such corrections as may be found necessary to ensure complete accuracy, shall be signed by the President or Member acting in his stead.
3. The President or any two other Members may cause to be convened an extraordinary meeting of the Council, by a letter addressed to the Secretary, stating the time and object of such meeting.
4. If any meeting of the Council shall lapse for want of a quorum, it shall be so recorded in the Minute Book, with the names of the Members present.
5. The order of business shall be arranged by the Secretary, subject to the direction of the President, and shall be clearly stated on a Business Paper for the use of each Member.
6. Acts of misconduct or irregularities on the part of the servants of the Council shall, on becoming known to the Secretary, be reported to the President, who shall have power to take any steps that may be considered necessary in cases of importance, submitting the whole matter for the consideration of the Council at its next meeting.
7. The President shall attend at the offices of the Council at least once in every week, to hear complaints or explanations arising out of the conduct of general business.
8. The President shall be entitled to vote on all questions as a Member of the Council, and, in cases of an equality of votes, shall be entitled to give a casting vote as President.

9. No Member shall absent himself from four consecutive weekly meetings of the Council without leave.

10. All meetings of the Council shall be convened by circular signed by the Secretary.

11. In case of his inability to attend any meeting, the President shall explain the cause of his absence by letter addressed to the Council before the hour of such meeting, unless circumstances render communication of the kind impossible; and another Member shall be elected to the chair for that occasion only.

II.—ELECTION OF PRESIDENT.

12. At the first meeting of the Council in January, in each year, one Member of the Council shall be elected President, who shall hold office until the thirty-first day of December of the same year, but who shall not vacate the chair until his successor has been elected.

13. The President for the year 1867 shall be elected in the month of March, and shall hold office in the same manner until the thirty-first day of December.

14. The President shall be elected by ballot, in the following manner:—

The names of the Members shall be printed on five cards all alike, which, after being initialled by the Secretary, shall be by him enclosed in five blank envelopes, all alike, unsealed, and shall be so distributed to the Members of the Council, either by hand or letter.

Each Member shall erase four of the names, leaving the name for which he votes, and shall return the card in the blank envelope, sealed, either by hand or letter, to the Secretary.

The Secretary shall produce, on the day of election, the cards in the original blank envelopes, sealed; and they shall be opened by the President or other Member occupying the chair, and the Member having the largest number of votes shall be duly elected.

Provided always, that in the event of a tie between any two Members, the election between such two Members shall be decided by ballot confined to the Members then present.

II.—SCHOOL ADMINISTRATION.

I.—ESTABLISHMENT OF SCHOOLS.

1.—Classes of Schools.

The Council of Education will establish, maintain, or assist, four classes of schools, viz. :—

Public Schools—Section 8, Public Schools Act.

Provisional Schools—Section 13.

Half-time Schools—Section 12.

Certified Denominational Schools—Sections 9 and 28.

2.—Assistance to Public Schools.

In the case of Public Schools, the Council will contribute, in such proportion as they may deem expedient—but as a rule not more than two-thirds—to the cost of erecting and furnishing school buildings, subject to the provisions of Section 23. The assistance to the other classes of schools will, as a rule, be limited to payment of Teachers' salaries and supply of school books and apparatus.

3.—Conditions of Grant for Buildings.

Appendix A.

Applications for the establishment of Public Schools are to be made upon forms provided for that purpose; and applicants must state the amount that will be locally contributed towards the cost of the necessary buildings, and the names of the persons by whom payment of that sum is guaranteed.

4.—Duration of Pledge.

A pecuniary pledge made by the Council in any year will hold good for that year only; if not taken up within that time, a fresh application will be necessary.

5.—Assistance to Public School on leased land.

When applicants for the establishment of a Public School are themselves willing to provide the requisite buildings, they must be prepared to execute a lease of the premises to the Council for a term of at least five years, at a nominal rent. Before accepting such lease, the Council will satisfy itself, through its officers, that the proposed school buildings are in good repair, sufficient for the purpose, and suitably furnished.

6.—Deposit of Local Contributions.

All local contributions should be deposited in the Union Bank of Australia, Sydney, to the credit of the "Council of Education Building Fund," and all such payments should be notified to the Secretary at the time they are made.

7.—*Plans and Dimensions.*

Plans for the erection of Public Schools will be supplied by the Council; but plans locally provided may be adopted, if first submitted to the Council and approved. No schoolroom should be less than 16 feet in width, and 10 feet in height; and at least 8 square feet of floor should be allowed for each child in ordinary attendance.

8.—*Provisional Schools.*

In applying for aid to Provisional Schools, the promoters must adopt the form Appendix B. provided, and must satisfy the Council that the Teachers employed are competent to perform the duties required of them, and that they are persons of good moral character.

9.—*Half-time Schools.*

Half-time Schools under Itinerant Teachers may be established wherever twenty children of the school age are residing within an estimated radius of ten miles from a central point, and can be collected in groups of not less than ten children in each.

10.—*Certified Denominational Schools.*

Applicants for a Certificate to a Denominational School must provide a school-house, sufficient in all respects for the purpose, and suitably furnished; and they may Appendix C. nominate a competent Teacher or Teachers, for appointment by the Council. Appendix D.

11.—*Conditions on which Certificate may be withdrawn.*

Certificates will be withdrawn from Denominational Schools, should—

1. The required number of pupils not be maintained.
2. The building become dilapidated, or otherwise unsuitable.
3. The supply of furniture and apparatus become inadequate.
4. The Regulations of the Council be infringed.

12.—*Inscription.*

In the case of every Public School building, whether the property be vested in the Council of Education or not, the inscription—PUBLIC SCHOOL—and no other, shall be conspicuously put up on the outside.

13.—*Uses of Public School Buildings.*

No use shall be made of Public School Buildings tending to cause contention—such as the holding of political meetings, or bringing into them political petitions or documents of any kind for signature; and they shall not at any time be converted into places of public worship, unless they shall have been built and kept in repair without aid from public funds.

II.—ORGANIZATION OF SCHOOLS.

14.—*Grants of School Books.*

Grants of school books and apparatus will be made from time to time, as may be deemed expedient, to all schools under the supervision of the Council, in proportion to the average number of pupils in daily attendance; and a full supply will be granted as a first stock to all schools newly established.

15.—*Character of School Books.*

Such books only as are supplied or sanctioned by the Council are to be used for ordinary instruction.

16.—*Apparatus.*

Apparatus will include maps, diagrams, pictures, black-boards, easels, and ball-frames.

17.—*Registers and Instructional Documents.*

The undermentioned Registers and Forms are to be kept by the Teacher in every school, according to directions supplied with each:—

- Admission Register.
- Class Roll.
- Daily Report Book.
- School Fee Account Book.
- Lesson Register.
- Time-table.
- Programme of Lessons for each Class.

18.—*Returns.*

Quarterly and Annual Returns are to be furnished from every school. The Quarterly Returns, neatly and correctly made out, are to be forwarded to the Inspector of the District, immediately after the close of every quarter. They are to be made out in duplicate; one copy to be furnished to the Inspector, and the other to be retained by the

the Teacher as a record of the school. No salary due or accruing at the end of any quarter will be paid, until the Return, properly completed, has been received, and certified by the Inspector to be correct. The Annual Return must be forwarded, with the Quarterly Return, immediately after the close of the December quarter. Negligence in compiling Returns or in keeping School Registers will render a Teacher liable to a fine, or if repeated to a loss of classification. Teachers found guilty of wilful falsification of Registers or Returns will be instantly dismissed.

19.—*Training of Teachers.*

The Council have established a Training School for Teachers, in connection with the Model Public School at Fort-street, Sydney.

20.—*Classes of Candidates.*

The Council will receive into the Training School three classes of candidates, viz. :—

First Class—Pupil Teachers whose term of service has expired, and Teachers who have already been trained elsewhere.

Second Class—Untrained Teachers who may have been in charge of schools.

Third Class—Persons entering the teaching profession for the first time.

21.—*Qualifications of Candidates.*

Appendix E.

Candidates must apply for admission to the Training School in the form annexed. They must, except in the case of pupil teachers, be at least 18 years of age, but not more than 40; they must be free from any bodily infirmity likely to impair their usefulness as Teachers; they must be persons of active habits, energy of character, and unblemished reputation; they must satisfy the Council as to their previous history, and must undergo an examination in the following subjects at least:—

Reading—Fourth Book of Lessons of the Board of National Education (Ireland), or some equivalent book, with fluency and expression, and answer on the subject matter in detail.

Writing—From dictation, in a neat and legible hand, with correct spelling and punctuation, a passage from the Fourth Book.

Arithmetic—Questions as far as Proportion and Practice.

Grammar—Parsing a passage from the Fourth Book, and elementary Analysis of Sentences.

Geography—The elementary portions of Geography.

22.—*Conditions of Admission.*

Prior to admission, candidates must make a declaration that they intend *bonâ fide* to adopt and follow the profession of Teacher in the public schools of the Colony, and that they will accept a situation in any locality, as the Council may see fit; and they must procure a guarantee from two responsible persons that the whole expense of their training shall be refunded, if from any cause whatever—death excepted—they should quit the service of the Council within three years from the date of their first appointment or admission to the Training School.

23.—*Term of Training.*

Entrance examinations will be held quarterly, in the last weeks of March, June, September, and December; and the periods of training will be, one month, three months, or six months, as may be found necessary.

24.—*Allowances during Training.*

The following allowances will be made to candidates who satisfy the above-mentioned conditions:—

To married couples £7 per month.

To unmarried persons £5 per month.

When the Training School is ready to receive candidates into residence, these allowances may be withdrawn, and board and lodging provided instead.

25.—*Course of Studies.*

The course of studies will include—

1. Ordinary Subjects. (For the whole term of training.)

Reading and Elocution.

Writing—Plain and Ornamental.

Arithmetic—Theory and practice.

Grammar and Composition.

Geography—Physical and Descriptive.

School Management.

School Books.

Drill and Gymnastics.

Elements of Singing.

Linear Drawing.

Exposition of the Public Schools Act and Regulations made thereunder.

2. Alternative Subjects. (For second Quarter only.)

Algebra; as far as Quadratic Equations.

Geometry; the first four Books of Euclid.

Science of Common Things.

Domestic Economy.

English Literature.

26.—*Practical Training of Candidates.*

Candidates will also be trained in the practical management of schools; and it is intended to add certain industrial occupations as soon as arrangements can be made for that purpose.

27.—*Examinations.*

Oral examinations of the students in the Training School will be held monthly, with a view to test their attention and progress; and written examinations will take place quarterly, in the first weeks of January, April, July, and October, when classifications will be awarded to the students, according to their attainments and skill in teaching. The Council will not award to students in training a higher certificate than Class II, and no certificate will be issued until the Inspector's Report upon the school shews that the Teacher is successful in his management.

28.—*Classification.*

Teachers will be classified according to their attainments and practical skill in one of the following grades:—

Class I.....	{	Section A.
		„ B.
Class II	{	Section A.
		„ B.
Class III.....	{	Section A.
		„ B.
		„ C.

29.—*Exhibitions.*

The Council will award exhibitions (not exceeding ten yearly) to Pupil Teachers who exhibit the highest degree of practical skill and the greatest advance in their attainments at the termination of their engagement in that capacity, with a view to enable them to undergo a six months' course of training free of expense.

30.—*Appointment of Teachers.*

The appointment and dismissal of Teachers, in all Schools other than Provisional Schools, rest solely with the Council, subject to the provision contained in Section 10 of the Public Schools Act.

31.—*General qualifications of Teachers.*

As a general rule, no Teacher will be appointed to a Public School or to a Certified Denominational School, unless he has undergone a course of training in the Council's Training School or some other recognized Training Establishment; and although in some cases a Teacher may be appointed provisionally who has not undergone such training, his appointment will not be ratified until his competency has been tested by examination.

32.—*Qualifications as to attainments and practical skill.*

The attainments of Teachers will be tested by oral and written examinations, and their skill in teaching by inspection of their schools.

33.—*Board of Examiners.*

The Council will appoint a Board of Examiners, to whom will be entrusted the duty of setting examination questions and revising the answers.

34.—*Subjects of Examination.*

The subjects on which Teachers will be examined are divided into two classes—Ordinary and Alternative. The former embraces those elementary branches with which it is necessary for every Teacher to be acquainted, inasmuch as they form the staple of daily instruction in school. Reading, Writing, Arithmetic, Grammar, Geography, and the knowledge of the School Books are of this kind; to which must be added, as being equally requisite, acquaintance with the Principles of School Management, and if possible, rudiments of Music and Linear Drawing. All other subjects are styled Alternative, because it is optional with the Teacher to undergo an examination in any of them with which he may be familiar.

35.—*Alternative Subjects.*

The following is the list of Alternative Subjects on which Teachers may be examined:—

Latin.—Virgil. Grammar.
 Mathematics.—Algebra to Quadratic Equations, including Surds, and
 Euclid, Book I—VI. Trigonometry.
 Chemistry.
 French.
 German.
 Geology, }
 Botany, } With especial reference to Australia.
 Zoology, }

36.—*Syllabus of Subjects for each Class.*

THE following is a Syllabus of Subjects in which Teachers will be examined for each grade of Classification.

For a *Third Class Certificate*, Teachers must be examined in—

Grammar: Including Punctuation, Paraphrasing, Parsing, and Analysis of Simple and Combined Sentences.

Geography: General and Descriptive.

Arithmetic: As far as Decimal Fractions. *Female Teachers*, as far as Proportion.

School Management: Including the Organization, Discipline, and Instruction of Schools.

School Books: The Reading Books from the First to the Third inclusive.

Reading: Prose and Poetry, from the Lesson Books.

Writing: Specimens of copy-setting, in text, round, and small hands.

Vocal Music.*

Linear Drawing.*

Female Teachers: Needlework. Domestic Economy.

* Failure in these subjects will not necessarily prevent a Teacher from gaining a classification.

For Second Class Certificate.

Grammar: Including Punctuation, Paraphrasing, Composition, Parsing, Derivation, and Analysis of Sentences.

Geography: Physical and Descriptive.

Arithmetic: As far as Cube Root and Duodecimals and Elementary Mensuration.

Female Teachers as far as Decimals.

Art of Teaching: The Organization, Discipline, and Instruction of Schools, in greater detail.

School Books: The series of Reading Books.

Reading: Prose and Poetry, from the Literary Class Book.

Writing: Specimens of copy-setting in three hands, and of letter-writing.

Vocal Music.

Linear Drawing.

Female Teachers: Needlework. Domestic Economy.

Algebra: As far as, and inclusive of, Quadratic Equations, but omitting Surds.

Geometry: The First Book of Euclid's Elements.

Latin: Cæsar (De Bello Gallico). Grammar. (In lieu of the two preceding subjects.)

For First Class Certificate.

Grammar: Punctuation, Paraphrasing, Parsing, Analysis of Sentences, Composition, Style, Derivation, and Prosody.

Geography: Physical, Political, and Commercial, with Popular Astronomy and Mathematical Geography.

Arithmetic: The whole Theory and Practice as laid down in Text Books in common use.

School Books: The whole of the Reading Series.

Reading: Prose and Poetry.

Writing: Specimens of copy-setting and letter-writing.

Vocal Music.

Linear Drawing.

Female Teachers: Needlework. Domestic Economy.

Principles of Teaching: Including a knowledge of the nature of the human mind.

English Literature: And one Alternative Subject at least.

37.—*Annual Examinations.*

All Teachers holding a lower classification than Class III, Section A, will be required to undergo examination annually. Success in the examination will not necessarily entitle a Teacher to a higher classification, but failure will lead to a loss of classification, unless a very satisfactory reason can be assigned for the decrease of attainments. Teachers who desire to be examined with a view to obtain a higher certificate must apprise the Inspector of the District of their wish, and at the same time furnish to him a list of the Alternative Subjects upon which they are prepared for examination.

38.—*Condition of Promotion.*

In order to obtain a First or Second Class Certificate, Teachers must submit to examination in one or more alternative subjects; and it is recommended that they should confine their attention to one group of subjects. Teachers who undergo examination for a higher certificate, will be expected at every successive grade to show increased acquaintance with the ordinary branches. No higher classification will be awarded, even if an examination be passed successfully by a Teacher, unless the Inspector's Reports upon his school speak in favourable terms of his ability, industry, and efficiency.

39.—*Promotion for Good Service.*

A revision of classification will be made at the end of three years; and should it appear that, during the three years, a school had increased in numbers and efficiency—that the Inspector's opinion was uniformly favourable—and that the Local Board had reported well of his conduct—the Teacher would then be entitled to one grade of promotion, without being required to undergo an examination. The promotion in such cases would be equivalent to a reward for patient, sustained, and skilful exertion in the actual work of the school. A Teacher must, however, serve for *five* years in Class II, Section A, before he can be promoted to Class I, Section B, without examination.

40.—*Promotion by Removal.*

Teachers who are desirous of being promoted to larger or more important schools, are to intimate their wishes in this respect to the Inspector of the District, in writing. A list of such Teachers will be kept in the Council's Office; and, except in special cases, promotions will be made in accordance with the principle of classification and seniority.

41.—*Notification of Commencement of Duty.*

When Teachers have been appointed to schools, they are required to report to the Inspector for the District the fact of their arrival at their post, and of their having commenced their duties.

42.—*Duties of Teachers.*

The duties of Teachers are,—

- To observe faithfully the Regulations of the Council.
- To carry out the suggestions of Inspectors to the best of their abilities.
- To teach according to the Course of Secular Instruction.
- To maintain the Discipline prescribed in the Regulations.
- To keep the School Records and to furnish Returns neatly and punctually.
- To see that the undermentioned documents are constantly posted in a conspicuous place in the schoolroom, viz.:—
 - Regulations of the Council.
 - Notice to Visitors.
 - Course of Secular Instruction.
 - Time-table.
 - Programme of Lessons.
 - Names of Local Board.
 - Scale of Fees.

- To take charge of the Public School Buildings and all other property belonging to the Council, and to be responsible for keeping the school premises in repair at their own cost, allowance being made for reasonable wear and tear.
- To consult the Local Board and receive their instructions on matters not relating to the internal management of the school.

It is the duty of the Teachers' wives to be present at the assembling and dismissal of the pupils, in order that they may take charge of the discipline of the female children; and they are required to teach needlework to the girls during at least one hour every school day. In forming an estimate of the efficiency of schools, the competency and usefulness of Teachers' wives and the amount of time they devote to school duties will be taken into account.

43.—*Remuneration of Teachers—Salary.*

The remuneration of Teachers in charge of Schools will consist of—(1) salary, (2) school fees, and (3) residence. The salaries will be according to the following scale:—

Class I.	{	Section A.....	£150	per annum
		„ B.....	138	do.
Class II.	{	Section A.....	120	do.
		„ B.....	108	do.
Class III.	{	Section A.....	96	do.
		„ B.....	84	do.
		„ C.....	72	do.
Probationers		60	do.	

These will be joint salaries for husband and wife. To single persons, the salary will be £12 per annum less.

44.—*Residence.*

In Public Schools when no residence is provided, an allowance for rent will be made to the Teachers in charge; but in all other schools the Teachers' residences must be provided by the local promoters, or an equivalent in rent.

45.—*Fees.*

If there be more than one Teacher employed in a school, the fees shall be distributed among them in the ratio of their respective salaries, but Pupil Teachers are not entitled to participate in the fees.

46.—*Reduction for small Attendance.*

The foregoing rates apply only to Teachers in whose schools a minimum of thirty scholars is maintained. If in any case the attendance falls below that number, a reduction may be made in the amount of salary awarded, as the Council may see fit.

47.—*Model Schools.*

In Model Schools special salaries may be awarded to the Teachers, at the discretion of the Council.

48.—*Mistresses.*

Mistresses in charge of separate departments will be paid two-thirds of the salaries allotted to the classification they hold.

49.—*Assistant Teachers.*

Assistant Teachers may be appointed to schools in which the average daily attendance exceeds seventy. They will be entitled to receive a proportion of the school fees, and such salary as may be determined by the Council. Assistants may be—(1) persons who have served for three years at least as Pupil Teachers; or, (2) persons who have been regularly trained in a Training Institution; but no person will be appointed as an Assistant Teacher unless examined and classified.

50.—*Pupil Teachers.*

Pupil Teachers may be engaged for a term of not less than three years, for service in schools in which the average daily attendance has not been less than fifty for the six months preceding the date of appointment, provided the Teacher hold a certificate of classification not lower than Class II, Section B, and that the school is well furnished and well provided with books and apparatus.

51.—*Conditions of Appointment.*

Candidates for the office of Pupil Teacher must be at least 13 years of age, and free from any bodily infirmity likely to impair their usefulness. Their remuneration will consist partly of instruction given by the Teacher, and partly in a fixed yearly salary which is paid by the Council, provided the Teacher certify as to their efficiency and good moral character, and they pass their annual examination in a satisfactory manner.

52.—*Course of Study for Pupil Teachers.*

The subjects to be studied during each year are the following:—

Before Appointment.—Candidates.

Reading: To read the "Third Book of Lessons" of the Board of National Education (Ireland) with ease, fluency, and expression; to spell well, and to understand the meaning of the passage read.

Writing: To write from dictation, in a neat hand, a simple prose narrative, with correct spelling and punctuation.

Arithmetic: To know the arithmetical tables, and to work the rules as far as Reduction.

Grammar: To parse and analyze correctly a Simple Sentence taken from the Third Book.

Geography: To understand the Geographical Terms, and have a knowledge of the Geography of Australia.

Skill in Teaching: To teach a junior class in the presence of an Inspector.

First Year of Appointment.—Class IV.

Reading: To read the "Fourth Book" of the Board of National Education (Ireland) with fluency and expression, give synonymous words and phrases, and answer upon the subject matter.

Writing: To write neatly and correctly from dictation, or from memory, a passage from the Fourth Book.

Arithmetic: To work questions in Proportion and Practice.

Grammar: To parse and analyze Combined Sentences taken from the Fourth Book.

Geography: The Geography of New South Wales in detail, and Europe in outline.

Skill in Teaching: To discipline one of the lower classes, and give a reading lesson.

Second Year of Appointment.—Class III.

Reading: To read the Fourth Book with improved intonation and expression; to paraphrase the sentences, and give the derivation of prominent words.

Writing: To write, in a neat and flowing hand, an abstract of an object lesson. Subject to be chosen by the Inspector.

Arithmetic: To Interest and Vulgar Fractions.

Grammar: Parsing of difficult sentences; with a good knowledge of Syntax, and the Analysis of Complex Sentences.

Geography: Australia, Great Britain and Ireland in detail; Asia in outline.

Skill in Teaching: Management of the Second Class, and giving a lesson on Elementary Geography or Grammar.

Third Year of Appointment.—Class II.

Reading: The "Literary Class Book," with correct intonation and emphasis, paraphrasing and derivation.

Writing: To write an account of the organization of the School, or of the methods of teaching adopted.

Arithmetic: To understand the nature and uses of Decimals.

Grammar: Increased skill in Parsing, and in the Analysis of Simple and Complex Sentences.

Geography: Palestine, in detail; America, in outline.

Skill in Teaching: Ability to discipline the Third Class, and give an Object Lesson.

Fourth

Fourth Year of Appointment.—Class I.

Reading: To read with ease and expression the "Literary Class Book," and reproduce, either in word, or writing, the passage read.

Writing: To write an essay on some subject connected with the art of Teaching.

Arithmetic: Extraction of Roots.

Grammar: Prosody; Analysis of Compound Sentences.

Geography: Physical Geography in detail; the World generally.

Skill in Teaching: Increased skill in the management of Classes, and in giving of Object Lessons.

53.—*Resignation of Teachers.*

Teachers are required to give one month's notice of their intention to quit their situations, such notice to be dated on the first day of any month. As a condition to the payment of the salary for the last month of their tenure of office, they are to hand over to the Local Board all the school property belonging to the Council, and are to make out, in duplicate, an inventory of the same; one copy, signed by two of the Local Board in testimony of its correctness, to be forwarded to the Council, the other to be retained by the Local Board.

54.—*Teachers' Occupations.*

Teachers in the service of the Council of Education are prohibited from engaging in any occupation not having a distinctly educational character, unless the sanction of the Council has been applied for and obtained.

III.—DISCIPLINE OF SCHOOLS.

55.—*Punctuality and Regularity.*

With a view to the proper training of their pupils, Teachers are to conduct the operations of their schools with punctuality and regularity.

56.—*Cleanliness.*

Habits of personal neatness and cleanliness are to be encouraged among the scholars, by precept and personal example of the Teacher; and, if necessary, may be enforced by his authority.

57.—*Order.*

Proper measures are to be taken by Teachers to instil into the minds of their pupils the necessity for acquiring habits of orderly behaviour, obedience to Teachers and to the rules of the School, and for maintaining a cheerful and modest demeanour. Pupils should also be trained to exhibit due respect for the property of others, whether public or private; to regard the feelings of their fellows; to be honest and truthful, attentive and diligent while under instruction, and conscientious in the discharge of every duty. Every moral virtue, in short, which the Teachers can inculcate by direct instruction, by influence, or by example, should be sedulously cultivated as they may find occasion.

58.—*Government of Pupils.*

In the government of the pupils, all degrading and injurious punishments are to be avoided. The Teacher's discipline must be mild but firm, his manner kindly, his demeanour cheerful and calculated to gain the confidence of his pupils, and his language marked by strict propriety. While he should overlook no offence, his aim should be to prevent the necessity for punishment by the improvement of the offender.

59.—*Corporal Punishment.*

Corporal punishment should be inflicted in extreme cases only, and then as a last resource; and the Teacher must keep a record of the time and place at which pupils were corporally chastised, the amount of such punishment, and the nature of the offence.

60.—*Expulsion of Pupils.*

No pupil is to be dismissed from any school under the superintendence of the Council, unless with the express concurrence of the Local Board.

61.—*Playground Supervision.*

The conduct of pupils in the playground must be carefully supervised; and Teachers must take steps to see that, in proceeding to school and returning therefrom, the behaviour of the scholars is well-regulated.

IV.—INSTRUCTION OF SCHOOLS.

62.—*Course of Secular Instruction.*

The Course of Secular Instruction for each Class shall be as follows:—

First Class.

Reading: The "First Book" of the Board of National Education (Ireland), or some reading book equivalent to it.

Writing: On slates from copies and monosyllables from dictation.

Arithmetic : Notation to three places of figures ; Simple Addition on slates ;
Mental operations involving results not higher than 60.
Object Lessons : Domestic Animals and Common Objects.
Singing : Simple Melodies by ear or by Tonic Sol-fa Method.

Second Class.

Reading : The "Second Book" and the "First Sequel Book" of the Board of
National Education (Ireland), or some reading book or books equivalent.
Writing : On slates from memory and dictation ; in books, from copies.
Arithmetic : Notation ; Simple Rules ; Tables.
Grammar : The Parts of Speech.
Geography : Local Geography ; Uses of a Map ; Definitions.
Object Lessons : Domestic Animals ; Common Objects.
Singing : Simple Melodies by ear or by Tonic Sol-fa Method.
Drawing : Simple rectilinear figures on slates.

Third Class.

Reading : The "Second Sequel Book" and the "Third Book" of the Board of
National Education (Ireland), or some reading book or books equivalent.
Writing : On paper, from copies ; and on slates, from dictation.
Arithmetic : Compound Rules and Reduction ; the easier Rules of Mental
Arithmetic ; Tables.
Grammar : Parsing, Syntax, Analysis of Simple Sentences, and Elementary
Composition.
Geography : Australia and New Zealand in detail, outlines of Europe.
Object Lessons : Common Minerals, Vegetables, and Animals ; the simpler
Manufacturing processes.
Singing : Part Singing, Tonic Sol-fa Method.
Drawing : Fowles' Elementary Drawing Books, Nos. I II and III, or some
equivalent books.
Scripture Lessons : Scripture Lessons, Old and New Testaments No. 1 of the
Board of National Education (Ireland).

Fourth Class.

Reading : The "Fourth Book" of the Board of National Education (Ireland),
or some equivalent book.
Writing : On paper, from copies and dictation.
Arithmetic : Proportion and Practice ; Fractions ; Mental Arithmetic.
Grammar : Etymology and Syntax, with Analysis of Sentences ; Composition.
Geography : Europe and Asia in detail ; America in outline ; Elements of
Physical Geography.
Object Lessons : Natural History, Manufactures, Elementary Mechanics, Science
of Common Things.
Singing : Tonic Sol-fa Method.
Drawing : Fowles' Drawing Books IV V and VI, on paper.
Geometry : Definitions and Axioms.
Scripture Lessons : No. 2 Old and New Testaments, Board of National Educa-
tion (Ireland.)

Fifth Class.

Reading : The "Supplement to the Fourth Book" of the Board of National
Education (Ireland), or an equivalent.
Writing : On paper—plain and ornamental.
Arithmetic : Decimals ; Roots ; Mensuration.
Grammar : Syntax ; Prosody ; Analysis of Sentences ; and Composition.
Geography : The World, Physical and Descriptive.
Object Lessons : Arts and Manufactures ; Laws of Health ; Social Economy ;
Duties of a Citizen ; The Laws.
Singing : Tonic Sol-fa Method ; Established Notation.
Drawing : Perspective ; Drawing from models.
Geometry : Euclid, Book I.
Algebra : To Simple Equations of two unknown quantities.
Latin : Smith's Inductive Latin Course ; or, Arnold's Henry's First and Second
Books.
Scripture Lessons : As in Fourth Class.

63.—*Religious Instruction.*

During an hour of each day (designated in the Time-table) children whose
parents desire that they should receive special religious instruction from the pastors or
other approved religious teachers of their respective communions, are to be allowed to
receive such instruction, so far as the school buildings will admit of distinct classes
being formed. Every Public School is to be so arranged as to admit of the formation of
one such denominational class at least ; and if the simultaneous teaching of more than
one be impracticable, it will be necessary to arrange that classes of the different denomi-
nations be formed on distinct days of the week. Such arrangements must however
be left in a great measure to the good feelings and convenience of the parties concerned,
as

as circumstances will necessarily vary too much to admit of uniform regulations being applicable in all cases. In case no religious instructor should attend during this hour in any Public School, it is to be employed in the ordinary instruction.

64.—*Denominational Books.*

The Teacher is to take care that the religious books employed in the denominational classes be strictly confined to the time and place of denominational instruction, and that they be not left in the way of the children whose parents may object to them.

65.—*Methods of Teaching.*

Every Teacher is required to make himself acquainted with improved methods of teaching, and to practise them in his own school, in order that his instruction may be productive of the greatest results.

66.—*Results of Teaching.*

As the efficiency of Teachers will be judged by the attainments of their pupils and their mental and moral advancement, the results as well as the methods of instruction should constantly be kept in view.

67.—*Teaching power to be justly distributed.*

Teachers are to provide for the equitable distribution of their time through all the classes, so that no pupils may be neglected.

68.—*Denominational predilections to be respected.*

Nothing must be said or done to offend the religious views of any pupil during the period devoted to ordinary instruction.

V.—GOVERNMENT OF SCHOOLS.

69.—*Public School Boards.*

The power to decide upon a Teacher's competency for his office is vested in the Council alone; and it also reserves to itself the power of controlling, through its officers, the internal management of schools. But the Council, for other purposes, will avail itself of the assistance of Public Schools Boards, wherever suitable persons can be found to fill the office. Members of such Boards are appointed by the Governor and Executive Council, on the recommendation of the Council of Education. The Council will not submit for appointment the names of any persons whose habits are intemperate, or whose moral character is not unexceptionable.

70.—*Duties of Public School Boards.*

In addition to the power to visit, inspect, and report, conferred on Public School Boards by the Public Schools Act (section 22), the Council will entrust to them the following duties:—

- To make due provision for keeping the school buildings in constant repair.
- To take care that they are not used for any improper purposes.
- To cause a sufficient quantity of suitable furniture and apparatus to be provided.
- To take precautions for excluding from the school, during its ordinary business, all books not sanctioned by the Council.
- To inspect periodically the School Registers and Records, and to countersign the Returns made to the Council.
- To use their influence with parents to induce them to send their children regularly to school.
- To see that the school is open on all the usual school days, and that the Teacher is present at his work.
- To observe whether the Teacher regularly and punctually discharges his duties; to report his conduct to the Council when he is in fault; and to protect him from frivolous and vexatious complaints.
- To suspend a teacher from office, pending the decision of the Council, should there appear to be *primâ facie* evidence of gross irregularity or immoral conduct.
- To sign the Teacher's monthly Abstract of Salary, provided they are of opinion that his duties have been regularly and punctually performed.
- To be the medium of communication with the Council on behalf of the School.
- To inquire into and report upon all applications for gratuitous instruction, under Section 17 of the Public Schools Act.

71.—*Local Boards of Denominational Schools.*

The Council will recognise and correspond with the Local Boards of Certified Denominational Schools, Provisional Schools, and Half-time Schools. It is hoped that the Local Boards of these Schools will perform the same duties as the Public School Boards. In every case in which a Local Board is sufficiently numerous, a Chairman, a Treasurer, and a Secretary, should be chosen; but when it consists of three persons only, a Secretary or Chairman should be appointed to conduct the correspondence with the Council.

VI. CONDUCT OF SCHOOLS.

72.—*Daily Routine.*

The following daily routine shall be observed in all Schools aided or maintained by the Council of Education :—

8 $\frac{3}{4}$ or 9 $\frac{1}{4}$	}	Pupils to assemble in the play-ground, all school materials to be prepared for lessons.
8:55 or 9:25		
9 or 9 $\frac{1}{2}$	}	Pupils to be arranged in ranks, inspected as to personal cleanliness, and marched into school.
10 $\frac{1}{2}$ or 10 $\frac{3}{4}$		
10 $\frac{3}{4}$ or 11 11:55 or 12:25	}	Lessons to commence as noted in the Time-table.
12 or 12 $\frac{1}{2}$		
	}	Recess for ten minutes, to be spent in the play-ground by Pupils and Teachers.
	}	Lessons to be resumed according to the Time-table.
	}	Class Rolls to be called and marked.
	}	School to be dismissed.

Afternoon.

12 to 1 or 2, or 12 $\frac{1}{2}$ to 2	}	Recess for dinner and recreation, under the superintendence of the Teachers.
12 $\frac{3}{4}$ or 1 $\frac{3}{4}$		
12:55 or 1:55 1 or 2	}	Pupils to re-assemble in the play-ground ; materials to be prepared for lessons.
2:55 or 3:55 3 or 4		
	}	Pupils to be arranged, inspected, and marched into school. Lessons to commence as noted in the Time-table.
	}	Roll to be called and marked.
	}	School to be dismissed.

73.—*General Time-table.*

The Time-table mentioned in the foregoing Daily Routine is the following :—

9 to 10, or 9 $\frac{1}{2}$ to 10 $\frac{1}{2}$	}	Special Religious Instruction, or, in Public Schools, Ordinary Instruction.
10 to 12, or 10 $\frac{1}{2}$ to 12 $\frac{1}{2}$		
12 to 1 or 2 or 12 $\frac{1}{2}$ to 2.	}	Ordinary Instruction.
1 to 3, or 2 to 4		
	}	Recess.
	}	Ordinary Instruction.

74.—*Vacations.*

The Vacations sanctioned by the Council are—a fortnight at Christmas, a week at Easter, and a week at Mid-winter.

75.—*Holidays.*

The specified Holidays are—Anniversary of the Colony, Good Friday, Queen's Birthday, and Christmas Day.

76.—*Notification of Holidays and Vacations.*

Teachers are required to state on their Time Tables the ordinary Vacations and specified Holidays of the school.

77.—*Closing School at unusual time.*

Schools are never to be closed upon any of the usual school days, without the written consent of the Local Board ; and if closed for more than three days, the circumstances should be reported to the Inspector of the District.

VII.—INSPECTION OF SCHOOLS.

78.—*Credentials of Inspectors.*

Inspectors and other persons deputed by the Council to visit schools will be furnished with credentials under the Corporate Seal.

79.—*Duty of Teachers to Inspectors.*

Teachers are required to treat Inspectors, as the representatives of the Council, with deference, to carry out their suggestions for the improvement of schools, and to obey their instructions in all matters relating to the Public Schools Act and the Regulations of the Council.

80.—*Duty of Local Boards to Inspectors.*

Local Boards are required to afford every facility to Inspectors in the execution of their duty.

81.—*Powers and Duties of Inspectors.*

Inspectors are authorized to enforce the observance of the provisions of the Public Schools Act and of the Regulations ; but their decisions are subject to appeal to the Council. They are further empowered to examine into the condition of schools, and to inquire into all matters which it may be expedient to report to the Council. They are authorized

authorized to determine all questions of school management, and are empowered to take the teaching of a class or of the whole school into their own hands for a time, to show the teacher how defective methods may be improved.

82.—*Conduct of Inspectors.*

In their intercourse with Teachers, Inspectors will be guided by a feeling of respect for their office and of sympathy with their labours. They will manifest towards Teachers a spirit of truest courtesy, treating them at all times with the kindness which the difficulties of their position render proper.

83.—*Observation Book.*

The Inspectors' remarks upon the state of a school visited by him, will be entered in the "Observation Book" of the school, which, as a School Record, should be carefully preserved. Entries therein are not to be erased or altered.

84.—*Visitors.*

The public may have free access to every school maintained or aided by the Council during the hours of secular instruction, not to take part in the business, or to interrupt it, but as visitors, to observe how it is conducted.

85.—*Duty of Teachers to Visitors.*

Every Teacher of a school under the supervision of the Council is required to receive courteously visitors who purpose to inspect it, to afford them free access to the schoolroom, and full liberty to observe what books are in the hands of the children or upon the desks, what tablets are hung up on the walls, and what is the method of teaching; but Teachers are by no means to permit any person to interrupt the business of the school, by asking questions of the children, examining classes, calling for papers of any kind, or in any way diverting their own attention or that of their scholars from the usual business. This restriction is of course not intended to interfere with the provision made in Section 19 of the Public Schools Act, whereby access is afforded to Clergymen and Religious Teachers, for the purpose of communicating special religious instruction, nor is it intended to apply to official visits of Local Boards, or to visits of Members of the Council of Education. Should visitors wish for information which they cannot obtain by such inspection, it will be the duty of the Teacher to refer them to the Local Board.

86.—*Visitors' Book.*

Every Teacher is required to have the "Visitors' Book" lying upon his desk, in which visitors may enter their names, and, if they think proper, any remarks. Such remarks the Teachers are by no means to erase or alter.

APPENDIX.

A.

Application for the establishment of a Public School at

Post Town

Date

To the Council of Education.

Gentlemen,

We, the undersigned residents at _____, request that you will be pleased to establish a Public School at that place, under the provisions of the Public Schools Act of 1866; and we hereby engage to raise, by local subscriptions, the sum of £ _____ for the erection of schoolhouse, teacher's residence, outbuildings and fences, for providing furniture and apparatus, and for other necessary purposes, the total cost of which we estimate to be £ _____. We further submit the following as the names of persons by whom payment of the sum of £ _____ will be guaranteed, viz. :—

We have the honor to be, Gentlemen,
Your most obedient Servants,

Local Committee, }

We, the undersigned, in consideration of the establishment by the Council of Education of a Public School in accordance with the above request, hereby guarantee the payment to the said Council of the above-mentioned sum of £ _____ within six months from this date.

Dated this

day of

A.D. 186 .

Information

14 PUBLIC SCHOOLS ACT OF 1866.—REGULATIONS.

Information to be supplied by Local Committee.

1. Describe the position of the proposed school.
 2. What other schools, maintained or aided by the Council of Education, are within two miles of the site of the proposed school?
 3. If none are within two miles, what is the distance of the nearest school.
 4. Are there any primary schools not aided by the Council of Education, within two miles of the proposed school? If so, of what character, and how attended?
 5. State the number of children, from four to fourteen years of age, living within a radius of two miles of the site of the proposed school, *e. g.* :—

Boys
Girls
Total			
- Religious Denominations—
- | | | | | |
|----------------------|-----|-----|-----|--------|
| Church of England... | ... | ... | ... | |
| Roman Catholics | ... | ... | ... | |
| Presbyterians | ... | ... | ... | |
| Wesleyans | ... | ... | ... | |
| Others | ... | ... | ... | |
| Total | | | | |
6. Give a technical description of the proposed site, according to the dimensions and bearings of its boundaries by survey. If possible, annex a plan of the ground.
 7. By whom is the site granted, and on what terms?
 8. Is a right of way to the site secured?
 9. Is the ground level or otherwise?
 10. What is the nature of the ground upon which the building is to rest? Is it of a rocky, clayey, or sandy character? How drained? How affected by floods?
 11. Of what materials are the proposed buildings to be constructed?
 12. Are these materials suitable in all respects?
 13. Of what materials are the public or best buildings in the neighbourhood constructed?
 14. What is the cost of building-stone? Of bricks, per 1,000; of lime, per bushel?
 15. State the price of hardwood, cedar, and pine, per 100 feet, and of shingles per 1,000.
 16. Do the rates mentioned include carriage to the school site? If not, state cost of carriage.
 17. What is the current rate of wages paid in the district, to workmen employed in building?
 18. How is a supply of water to be obtained?
 19. Add any other circumstances deemed desirable for the information of the Council.

Annex to Application for establishment of a Public School at

We, the undersigned, Parents (or Guardians) of children residing within the undermentioned distances from the site of the proposed Public School at _____ hereby undertake that our children, whose names are inserted below, shall attend the said school.

Name of Parent or Guardian. (To be written by himself.*)	Distance from School.	Name of Child.	Age.	Religious Denomination.

* If the Parent or Guardian be unable to write, his mark must be witnessed by a Member of the Local Committee.

B.

Application for the establishment of a Provisional School at

Post Town

Date.

Gentlemen,
 I beg to request that you will grant assistance to the Provisional School established at _____ in accordance with the 13th section of the Public Schools Act. I submit the name of _____ as Teacher of the school, knowing _____ to be a person of good moral character, and believing _____ to be competent to perform the required duties.

I have the honor to be,
 Gentlemen,
 Your most obedient Servant ,

The Council of Education.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

PUBLIC SCHOOLS ACT OF 1866.

(MODIFICATION OF 62ND REGULATION UNDER.)

Ordered by the Legislative Assembly to be Printed, 17 July, 1867.

Council of Education Office,
Sydney, 16 July, 1867.

THE following Regulation was adopted by the Council of Education on the 15th July instant.

HENRY PARKES,
President.

The 62nd Regulation adopted by the Council of Education on the 27th February, 1867, under the head of "School Administration," shall be so far modified that, in Denominational Schools, it shall not be necessary to use the Scripture Lessons published under the sanction of the Board of National Education in Ireland.

PROGRESS REPORT

OF THE

COUNCIL OF EDUCATION

TO

31 AUGUST, 1867.

Presented to both Houses of Parliament, by Command.

By Authority :

SYDNEY: THOMAS RICHARDS, GOVERNMENT PRINTER.

1867.

[Price, 1s. 8d.]

9—A

THE COUNCIL OF EDUCATION to HIS EXCELLENCY THE GOVERNOR,

SUBMITTING

PROGRESS REPORT TO 31st AUGUST, 1867.

To His Excellency the Right Honorable SIR JOHN YOUNG, Bart., Governor-in-Chief of
New South Wales, &c., &c.

MAY IT PLEASE YOUR EXCELLENCY,—

We, the Council of Education appointed under the provisions of the Act 30 Victoria, No. 22, entitled the "Public Schools Act of 1866," beg to submit to your Excellency this Report of our proceedings for the portion of the current year preceding 31st August, 1867. Although not required by the terms of the Act to report until next year, we have considered it desirable to furnish, for the information of Parliament, an account of the measures adopted, during our tenure of office, for accomplishing the objects contemplated by the Public Schools Act.

I.—APPOINTMENT OF COUNCIL.

Notification of our appointment was published in the *Government Gazette* of the 1st January, 1867, in the following terms, viz. :—

"His Excellency the Governor, with the advice of the Executive Council, has been pleased to appoint the undermentioned gentlemen to be the Council of Education under the Public Schools Act of 1866, viz. :—

The Honorable GEORGE ALLEN, Esquire, Member of the Legislative Council;

The Honorable WILLIAM MUNNINGS ARNOLD, Esquire, Speaker of the Legislative Assembly;

The Honorable JAMES MARTIN, Esquire, Member of the Legislative Assembly;

The Honorable HENRY PARKES, Esquire, Member of the Legislative Assembly; and

JOHN SMITH, Esquire, M.D., Professor of Chemistry and Experimental Physics in the University of Sydney."

II.—INITIATORY PROCEEDINGS.

On the 5th of that month the first meeting of the Council was held, and the Council at once commenced its duties. The attention of the Council was first directed to those provisions of the Public Schools Act that required immediate action. Having appointed a Secretary and such temporary officers as were necessary for the conduct of business, the Council adopted a Common Seal, and made provisional arrangements for the regulation

regulation of its proceedings. One of the most important duties devolving upon the Council at this time was that of receiving into its charge the National and Denominational Schools, the oversight of which was committed to the Council by the Public Schools Act. The Board of National Education and Denominational School Board having furnished lists of the schools under their control on 31st December, 1866, the Council, in accordance with the provisions of the 28th section of the Act, adopted the National Schools as Public Schools, and, by circular addressed to the Teachers, gave instructions that the latter title should be exclusively used to designate them in all official documents. The necessary steps were also taken to enable the Council to certify existing Denominational Schools. In the first place, application was made to the Heads of Denominations for lists of the Denominational Schools eligible for certification under the 28th section of the Act, which they desired to have continued under the Council's superintendence. This information having been obtained, the Council appointed Inspectors for the purpose of visiting Denominational Schools, in order to ascertain in what cases the requisite conditions were fulfilled. The Inspectors were accordingly instructed to report (1) Whether the schools visited were in existence when the Public Schools Act came into operation; (2) Whether the number of pupils attending was in any case less than the number required by any Regulation of the Denominational School Board; and (3) Whether the Teachers exhibited *prima facie* evidence of competency. The last-mentioned direction was necessary, inasmuch as the 21st section of the Act required the Council to determine whether it was expedient to continue the Teachers in charge of their schools. This inquiry, besides fulfilling its primary object, was the means of eliciting much valuable information respecting the condition of the schools. Reference to this point will be made in a subsequent paragraph. It will suffice for the present to remark, that to visit all the Denominational Schools was a work requiring much time and labour, the distances to be travelled and the frequent interruptions caused by continued wet weather and floods having rendered it impossible to complete the examination in six months. The Council, on receipt of the Inspectors' Reports, certified all the schools mentioned in the Denominational School Board's list, with the exception of—

1. Bungowannah.
2. Baulkham Hills.
3. Eden.
4. Moorwatha.
5. Grubbenbong.
6. Urana, and
7. Mundoonen.

The first mentioned of these had been closed by the Denominational School Board at the end of 1866; the second had not been in operation for more than a year; the third and fourth had not been properly established as Denominational Schools; and the remainder were found not to have been in existence at all. Copies of various forms of certificates for Denominational Schools, required by the 28th and 9th sections of the Act, are appended to this Report. The certificates awarded under the 28th section have now been issued.

III.—REGULATIONS.

The necessity for framing Regulations in accordance with the powers conferred upon us by the 6th section of the Act, was apparent at a very early stage of our proceedings, inasmuch as the re-organization of the Public and Denominational Schools could not be proceeded with until the various matters embraced in that section had been determined. The Council therefore endeavoured to bestow attention upon this subject commensurate with its urgency; and, after careful consideration, adopted Regulations on the 27th February, 1867. At a subsequent date, a supplementary Regulation was framed to define the extent to which the operation of Article 62 was limited. These Regulations having been laid before Parliament within one month after the commencement of the present Session, and not having been disallowed by express Resolution of both Houses, have now the force of law, as provided in section 7 of the Act. Immediately after the framing of the Regulations, the Council proceeded to the election of a President in the manner prescribed in Articles 13 and 14, Section I. The result of the ballot was in favour of the Honorable H. Parkes, Esq., M.P., who was accordingly declared to be duly elected President for the current year.

IV.—

IV.—SCHOOLS.

The Public Schools received by the Council from the late Board of National Education were 259 in number. To these must be added two others, viz., Freeman's Reach and Moulamein, in course of formation in 1866. It was found necessary, however, to close two of the existing schools,—one on account of small attendance, and another because of the superabundance of the means of education in the district. As it was not necessary to visit the Public Schools for any special purpose, it has not been practicable up to the present time to ascertain their condition as a whole, but the regular course of inspection will supply ample means of arriving at a just estimate of their efficiency during the current year.

Three hundred and ten Denominational Schools have been certified under the 28th section of the Act. As before intimated, the inspection of these schools prior to their certification, although cursory, was sufficiently searching to disclose facts calculated to excite grave dissatisfaction with their condition and lack of efficiency. In general terms, it may be stated that those Denominational Schools which during previous years had been subjected to regular inspection and careful oversight were for the most part in a creditable condition. In this class, the Church of England Schools in the Sydney District deserve favourable mention. But where proper supervision had been omitted or neglected, the schools as a whole were found to be badly disciplined and most inefficiently taught. Even competent trained Teachers, owing to the want of professional guidance and the absence of any inducement to improve their own skill or the condition of their schools, failed to manifest ordinary ability or interest in the discharge of their duties. Many men who, under a regular system of inspection, would have gained creditable positions as Teachers and benefited the community by their labours, seemed to have lost the power to manage their schools or to bring their abilities to bear upon their work. The Denominational Schools in the Hunter River District were, as a whole, the worst managed of any in the Colony. It may perhaps be desirable to mention the principal faults observed in the schools visited. The defects of *Organization* were,—general absence of Time-tables and Programmes, and neglect of Registers; of *Discipline*,—unpunctual and irregular attendance, disorderly conduct of pupils, and ineffective control on the part of Teachers; and of *Instruction*,—want of systematic arrangement, obsolete or unsuitable methods, and absence of appreciable results.

The attendance of pupils at the schools in operation may be seen from the subjoined tables.

Various

6 PROGRESS REPORT OF THE COUNCIL OF EDUCATION.

Various causes have conspired to render the number of pupils in average daily attendance less than would have been the case under ordinary circumstances. The continuous wet weather, with its concomitants of floods and impassable roads, acted as a serious preventive to regular attendance, during many months, in large portions of the Colony; and the prevalence of an epidemic specially affecting children served to aggravate the evil, and diminish the number of pupils in other districts. There is now reason to believe, however, that with fair weather and improved sanitary condition, the attendance will be largely increased.

The general poverty of the people in many parts of the Colony, caused by unfavourable seasons and the loss of crops, together with the total destitution resulting from floods in some districts, has rendered many parents unable to pay school fees. This fact will account for an apparent diminution in the amount of fees paid during the first six months of the current year.

From the 1st January to the present date, the Council has received and entertained applications for new schools as follows:—

Public Schools	43
Provisional Schools	30
Half-time Schools	8
	— 81

It is calculated that these schools will furnish the means of education to upwards of 3,500 children who would otherwise be for the most part entirely destitute. Judging from past experience, it seems probable that a similar rate of increase will be maintained during the remainder of the year, and that notwithstanding the obstacles to progress incidental to the organization of a new system, the means of instruction will be largely extended throughout the country, and at the same time considerably improved. In connection with the latter statement, it is desirable to mention that the attention of the Council has been forcibly directed to the need which exists in the larger towns of the Colony for schools of a somewhat superior class to the ordinary Public or Certified Denominational Schools. It is found that schools in which the ordinary course of instruction could be extended by the addition of elementary classics and mathematics would be regarded as a great boon by large numbers of people. The Council has therefore decided to assist in the formation of superior Public Schools of this description, wherever the people contribute in the usual proportion towards the extra expense which the establishment of such schools would entail.

V.—BOOKS.

In deciding upon the course of secular instruction prescribed in section 6 of the Public Schools Act, the Council found it necessary to determine upon the books to be employed in the ordinary teaching of Public and Certified Denominational Schools. It was considered that these books should be of such a character as to admit of their use in all schools alike, without offence to the religious convictions of any denomination. This condition was fully met in one available series of books only—that published under the sanction of the Commissioners of National Education in Ireland. That series was accordingly adopted by the Council, although in some respects defective in proper gradation, and literary merit. On this account, a second series was added, viz.:—Constable's Series, published by T. Laurie of Edinburgh. But a series properly adapted to the circumstances of the Australian Colonies, and to the exigencies of the Public School System would be more fitting than either of the sets above named, if it could be obtained; and the Council accordingly sanctioned the use of some elementary Reading Books designed to meet these conditions, and known as the "Australian Class Books." The books sanctioned by the Council appear to have met with general acceptance from all parties and all denominations, excepting some portions of the Roman Catholic community. On this subject, we beg to refer to the annexed correspondence between the Very Rev. S. J. A. Sheehy, Vicar General, and the Council.

VI.—BUILDINGS.

During the period covered by this Report, the Council has expended upon buildings the undermentioned sums :—

For Public Schools	£3,428	5	3
For Certified Denominational Schools	1,374	7	5
Total	£4,802	12	8

In explanation of the latter item, it may be stated that the sums paid to the Denominational Schools had been pledged to them by the late Denominational School Board. These pledges the Council considered itself bound to meet from the balance transferred by that Board to the Council.

VII.—SALARIES OF TEACHERS.

Pending the settlement of a permanent scale of salaries, the Council determined to pay all Teachers at the rates received by them in 1866. The rates mentioned in Article 43, Section II of the Regulations are based upon a classification to be awarded to Teachers according to their attainments and practical skill. In consequence of the adoption of this principle, it became necessary to take measures for ascertaining the qualification of the Teachers by examination. The Council has not yet been able to carry out the provisions of the 16th section of the Act, which requires the Council to authorize a scale of fees to be paid for pupils alike in Public Schools and in Certified Denominational Schools. Before attempting to lay down such a scale, the Council desired to obtain more extensive and more detailed information respecting the rates commonly paid hitherto in the different districts; and the necessary inquiries have been instituted with this view. In the meantime, the rates formerly charged have been allowed to continue.

VIII.—EXAMINATION AND CLASSIFICATION.

In consequence of the large amount of time unavoidably consumed in making arrangements for the conduct of examinations and the appointment of Examiners, it became evident to the Council that little could be effected towards a general classification of Teachers during the current year. The inability of the Inspectors to superintend examinations, in consequence of the complete absorption of their time in the performance of their ordinary duties, rendered this conclusion still more obvious. The Council therefore adopted the following resolutions :—

- “ 1. That Teachers who were examined and classified under the late Board of National Education shall be confirmed in their several classifications, and shall enjoy the salaries attached thereto, unless the want of success in teaching render re-classification necessary. This resolution to take effect from 1st August, 1867.
- “ 2. That Teachers who were employed under the late Denominational Board shall receive provisional classifications, with salaries attached thereto, but without issue of certificates, and that the classifications will be liable to reduction or withdrawal in the event of want of success in teaching. This resolution to take effect so soon as the necessary information can be obtained on which to found the classifications.
- “ 3. That Teachers classified under the preceding resolutions shall be subject to the operation of the 37th Regulation, in the same manner as other Teachers.”

The requisite instructions were accordingly issued to the Inspectors who are now actively engaged in furnishing the information necessary to award the classifications deserved by the various Teachers.

Another subject of considerable importance in connection with this matter was the position of Pupil Teachers. In the case of Public Schools, a systematic course of instruction, a regular system of examinations, and a graduated scale of payment corresponding with increased experience and efficiency in school work, had been in force under the

the late Board of National Education, and had been continued under the Council; but no such arrangements had prevailed among the Denominational Schools, in which (the Church of England Schools in the Diocese of Sydney excepted) there was a total absence of system, as regards instruction, examination, or payment of Pupil Teachers. The real object of appointing Pupil Teachers and the nature of their position appear to have been generally misunderstood, and hence arose numerous incongruities in the arrangements concerning them. Persons in some instances ten years beyond the proper age were appointed; their instruction was generally irregular and unsystematic, while in frequent cases it was altogether omitted. Some of the Pupil Teachers have never been examined as to their attainments, no inquiry had been made as to their practical efficiency, and their salaries appeared to have been fixed on no discernible principle. In order to reduce these irregularities to order, the Council determined to subject the Pupil Teachers in Denominational Schools to the same rules as obtain in Public Schools. Examinations have accordingly been held for this purpose, hitherto with little result but to shew the necessity for the proposed arrangements.

Appendix F. Copy of a circular addressed to Teachers respecting their duties is appended hereto.

IX.—TRAINING SCHOOL.

The obligation to establish a Training School imposed upon the Council by the 15th section of the Public Schools Act, has formed the subject of careful deliberation. Up to the present time, however, the Council has been able to make only provisional arrangements for this purpose. The deep importance of the subject and the consequent necessity for proceeding in a cautious spirit have seemed to the Council to require some delay before adopting permanent arrangements which are likely to affect in no small degree the future course of education. The provisional arrangements referred to were those in force under the late Board of National Education. Up to the present time, thirty-one persons have completed a course of instruction in the Training School, have passed the required examinations, and have obtained certificates accordingly. Although forty-four candidates are now in attendance, much difficulty has hitherto been experienced in providing a sufficient number of properly qualified Teachers to supply vacancies caused by resignations and removals.

X.—INSPECTION.

Having, through the public Press, invited applications for the office of Inspector of Schools, we received letters from forty-one persons desirous of obtaining the appointment. After inquiring into the merits of the respective applicants, the undermentioned were appointed, and stationed in the Districts set opposite their names:—

J. Gardiner }	Sydney
E. Johnson }	
J. M'Credie	Albury
W. M'Intyre	Armidale
J. Coburn	Bathurst
J. Huffer	Camden
A. L. Forbes	Cumberland
T. Harris	Goulburn
W. Dwyer	Maitland
J. W. Allpass	Newcastle.

As before remarked, most of the Inspectors were engaged for several months in visiting Denominational Schools, in order to report whether they were entitled to be certified under the 28th section of the Public Schools Act. A short time was also occupied in a Conference of Inspectors, convened for the purpose of discussing various matters of school organization and management, and with a view to arrange a systematic course of inspection. Experience has shewn that Conferences of this kind have proved fruitful in useful results; and, on this ground, the Royal Commission appointed to inquire into the educational arrangements of the Colony of Victoria, in their Report recommend "that the practice commenced by the Board, of convening the Inspectors in periodical Conferences, be continued." Appended hereto is a Report of the Proceedings of the Conference of our Inspectors. The recommendations contained in this Report are still under consideration, but the Council has not yet arrived at any determination respecting some of the questions raised.

Appendix A.

Notwithstanding

Notwithstanding the amount of time consumed in the performance of special duties, and the further period devoted to inquiry and report upon applications for new schools, it has been arranged that all the schools in the Colony under the Council's superintendence shall be formally inspected once at least during the present year. By this arrangement the Council hopes, at the end of the year, to be in possession of the requisite information to furnish Reports upon the condition of the Public Schools and Certified Denominational Schools, in accordance with the provisions of Section 27 of the Public Schools Act.

XI.—LOCAL SUPERVISION.

The selection of suitable persons to be recommended for appointment as Public School Boards, under the 22nd section of the Act, occupied a large portion of the Council's attention. Considering the difficulty of this task, and the importance of the interests involved, the Council would have preferred to allow this duty to remain in abeyance until a fuller knowledge of the circumstances of the different schools had been attained; but the necessity for immediate action compelled the Council to proceed in the matter without delay.

The Local Boards of Denominational Schools are appointed by the Heads of Denominations, to whom application was made for information as to the persons holding office in that capacity. Lists of the Local Boards having been furnished by most of the Heads of Denominations, the persons enumerated have been duly recognized by the Council.

Council of Education Office,
 Sydney, 2nd September, 1867.

APPENDIX.

A.

REPORT upon matters submitted for consideration at the Conference of Inspectors held on the 25th March, 1867.

CONFORMABLY to instructions received from the Council of Education, the Inspectors met in Conference on the 25th ultimo, and terminated the discussion of the various matters submitted to them for deliberation on the 10th instant. The subjects to which their attention was directed included upwards of forty topics, which may be classified as follows:—Course of Inspection; Organization, Discipline, and Instruction of Schools; Examination and Training of Teachers and Pupil Teachers; the establishment of Model Schools; and, in general, the best means of raising the character and efficiency of the Schools, and of extending primary education to its utmost limits in the Colony.

2. With the view of economising time, and of facilitating the business of the Conference, the Inspectors resolved themselves into three committees, to each of which was entrusted a portion of the matters to be considered. Upon the reports of these committees being submitted to the full Conference, the various matters treated of were condensed and arranged as presented in the accompanying Report.

3. To decide upon a course of Inspection, and prepare the forms to be used therein; to draw up for an extended period a uniform Standard of Proficiency, by which the progress of the pupils might be measured; and to arrange a Syllabus of Study for Teachers;—a considerable amount of time had to be devoted. It is hoped, however, that the results of the Inspectors' labors, herewith submitted, may be found in some measure commensurate with the time bestowed upon them, and that they may meet the approval of the Council. The Inspectors are fully aware that any attempt at perfect arrangement is, at all events for the present, impracticable; they require a personal and intimate acquaintance with the circumstances brought about by the new order of things in regard to education, before venturing to pronounce confidently upon matters, or strongly advising the Council as to a particular course; but they are of opinion that the conclusions at which they have arrived may reasonably be expected to provide for present difficulties, to meet contingencies for some time to come, and to infuse into the conduct and management of the schools a degree of vitality which it is hoped will increase their energy, and give a successful impetus to their operations and tendencies.

Before concluding this Report, the Conference desires to place before the Council its unanimous opinion that, apart from the more palpable and immediate result of its meeting, the interchange of ideas among Inspectors upon matters of professional experience is in itself an object of such importance as to affect very sensibly their acquaintance with, and performance of, the manifold and onerous duties entrusted to them. By this contact, they are subjected to a healthy mental refreshment, encouraged in what is laudable, warned against undesirable or injudicious courses of action, and prepared to resume the exercise of their ordinary functions with renewed energy and perseverance.

Inspector's Office, Fort-street,
Sydney, 10th April, 1867.

J. GARDINER,
Chairman.

COURSE OF INSPECTION.

By Section 81 of the Council's Regulations, "Inspectors are empowered to examine into the condition of Schools, and to inquire into all matters which it may be expedient to report to the Council."

It is the opinion of the Conference that every School should be inspected at least twice in each year. In discharging this duty it will be necessary, in the case of each school, to make inquiries upon the following subjects:—

1. The material appliances.
2. The means employed in conducting the school.
3. The results obtained.
4. The influences that affect the welfare of the school.

An inquiry which embraces the whole of these particulars may be termed a *General* Inspection. One that is mainly directed to the third, that is, that consists of an examination of the pupils to test their progress in the subjects of instruction, and of the moral condition of the school, may be called a *Regular* Inspection. When the Inspector's visit is for the purpose of observing the school in its ordinary state, and not with the view of examining the pupils, it may be designated an *Ordinary* Inspection. A casual visit to a school by an Inspector, when in the neighbourhood for the discharge of other duties, may be regarded as an *Incidental* Inspection.

In forming a judgment upon the schoolroom, out-offices, furniture, and apparatus, the Model Public School in Sydney, or some provincial school similarly equipped, should be regarded as a standard. The course of inquiry into the means in operation in the school, and the subjects and range of examination, are shewn in the forms E and F for reporting

reporting upon schools, the "Course of Secular Instruction," and the "Standards of Proficiency." In order that a just estimate may be formed of the actual work done in a school under the head of attainments, the Teacher should be required to furnish the Inspector with the following data :—

1. The age, temperament, and mental capacity of each pupil.
2. The names of pupils in each class, who have been promoted since the date of last inspection.
3. The average period for which each class has been enrolled.

The business of examination may be facilitated by the Inspector grouping the subjects under the heads of oral and written. Under the first, would be included Reading, and Grammar, Arithmetic (in part), Geography, Vocal Music, Scripture Lessons, and Geometry; under the second, Arithmetic (in part), Penmanship, Object Lessons, Drawing, Algebra, and Latin. The Conference is strongly of opinion that the Inspector should so conduct the examination as to ascertain, as nearly as possible, the attainments of each pupil. To this end, it should to a large extent be individual. The success of an examination will, in a great measure, depend upon the manner in which it is carried on. The Conference thinks that the Inspector, by a cheerful and becoming demeanour, should endeavour to secure the confidence of the children, so as to get from them the full results of the instruction they have received; that his style of questioning should be direct—neither suggestive, misleading, nor puzzling; that he should insist upon particular and sustained attention from each class, and expect all the pupils to manifest a readiness to answer, as well as to exhibit a cheerful and self-reliant disposition.

It may not be out of place briefly to detail the nature of a Regular Inspection.

In inquiring into the material state of Schools, due attention will be given to the qualities of the situation, playground, school buildings, furniture, apparatus, books, requisites, and the general condition of the school property. Such an inquiry will afford to the Inspector one aspect of the physical as well as moral training to which the pupils are subjected. He will observe whether the outdoor recreation is of a healthful and rational character, whether an attempt is made, as by the cultivation of flower gardens, to implant in the minds of the pupils a taste for the beautiful, and whether they are taught to be mindful of the preservation of public property; defects will be pointed out to the local boards or Teachers, as the case may demand; obedience, to the action recommended as the most suitable will be required, and every effort used to remedy the case before invoking the interference of the Council.

In examining into the condition of the Discipline, a full investigation will be made into the habits of the pupils both in and out of school. Their demeanour under instruction will be carefully noted. It will be observed whether they are taught to avoid waste of time, and to recognise the laws of health, and whether the teaching is calculated to render them industrious, orderly, peace-loving, and virtuous citizens.

The judiciousness of the Classification, and the suitability of the Occupation provided for the pupils, will next be considered and estimated.

Reading.—In ascertaining the progress of the pupils, the first subject examined will usually be Reading. This will first be examined and valued as an art. The inner details—as Word Meanings, Synonyms, Derivation, Equivalent Expressions, and the framing of Sentences shewing the uses of words—will be separately entered upon and estimated apart from the mere retention of the narrative, for it may be seen that a pupil who is utterly incapable of changing the terms used in the construction of narrative may understand its scope, and have no difficulty in answering passably upon the leading features of the lesson.

Spelling.—Generally this will be tested by Dictation, but also orally by requiring the children to spell words, entire phrases, or short sentences.

Writing.—The quality of the Writing will be determined by the examination of slate work, copy-books, the character of the head-lines, reproduction of lessons, and sometimes, as in the case of an advanced class, by oral examination upon principles.

Arithmetic.—In this subject, the Inspector will be careful to see that the principles of each rule are thoroughly understood. With this view, he will commonly propound original questions, care being taken to prevent copying or collusion among the pupils. Only one trial will be permitted in each exercise, and all who fail in the first instance, will be noted. Regard will be had to the circumstances of the class in estimating the value of the work done.

Grammar.—The Grammar will generally be taken in connection with the Reading, and will be tested by detailed Etymological and Syntactical Parsing, Analysis, and Composition. The attention and mental power of the pupils will be carefully noted.

Geography.—For a young class a map or black-board sketch will occasionally be employed, but for upper classes neither will be used except to clear up a doubtful point.

Object Lessons.—This subject will admit of considerable variety of treatment, and as it is sometimes desirable to have a specimen of the Teacher's mode of presenting an Object Lesson, he might be required to recapitulate while the Inspector observed. Should the Inspector however examine, it would be well to scrutinize the Teacher's notes. Very frequently, and especially in the upper classes, the examination in Object Lessons might be conducted in writing, and dealt with as an exercise in composition.

Scripture.—In dealing with Scripture, great prominence will be given to the New Testament.

Drawing.—

Drawing.—This will be examined on slates and books from the black-board, from copies, and from models.

In every school the Examiner will expect to find the faculties of the pupils in three stages of development: in the lower classes, he will look for the full exercise of the perceptive faculties; in the middle division, for the faculties of comparison and classification; and in the upper division, for the reasoning faculties and general power of judgment. In all the stages, due importance will be attached to the cultivation of memory.

Among the circumstances that affect the welfare of a school, the foremost will be the Teacher's influence in the neighbourhood. The Conference is of opinion that charges against him should in all cases be preferred in writing, and that an Inspector should decline to receive a complaint except with the distinct understanding that it may be dealt with officially. Where, in the same locality, there are more than one school under the Council's supervision, the Inspector should discourage unseemly rivalries, and endeavour to promote friendly intercourse between them, especially for mutual professional benefit.

STANDARDS OF PROFICIENCY.

THE following scale of marks is proposed as a standard for estimating the proficiency of pupils examined:—

- $\frac{5}{5}$ Excellent.
- $\frac{4}{5}$ Very good.
- $\frac{3}{5}$ Good or up to standard.
- $\frac{2}{5}$ Very fair approach to standard.
- $\frac{1}{5}$ Fair approach to standard.
- $\frac{3}{8}$ Tolerable approach to standard.
- $\frac{2}{8}$ Moderate approach to the standard.
- $\frac{1}{8}$ Failure.

STANDARD OF PROFICIENCY.—FIRST CLASS.

First Quarter.

Children enrolled one quarter, and being 5 years old, will be expected—

Reading.—To read the First Book, section I, Board of National Education, Ireland; or, Australian Class Book No. 1, part I, to page 15 inclusive; or, Constable's E. R. B. No. 1, part I, to page 13 inclusive.

Writing.—To write on Slates the following letters, with combinations of at least two letters:—*i, u, n, m, o, a, c, e, v, w, r.* Slates used for writing by the first class should be indelibly ruled, and the distance between the lines not less than half an inch.

Arithmetic.—To read and count any number as far as 12, write the same from the Black-Board, and add mentally concrete quantities as far as 12.

Singing.—Tonic Sol-Fa Method—The Scale from the Modulator: Exercises on the Strong Tones: Simple Melodies by ear.

Second Quarter.

Reading.—To read the First Book, I. N. B., section II; or, Australian Class Book No. 1, part I. to page 36; or, Constable's E. R. B. No. 1, part I, to the end.

Writing.—To write on Slates from the Black Board the following letters, with their combinations in words, using also the letters given in the first quarter:—*t, l, d, b, h, j, y, g, q, p.*

Arithmetic.—To count and read any number as far as 20; to add, in single columns, numbers not involving a higher result than 20; to notate as far as 20; to add and subtract mentally numbers not involving results higher than 20.

Singing.—Easy Scale Exercises on Modulator: Strong and Weak Tones: Simple Melodies by ear.

Third Quarter.

Reading.—To read the First Book, I. N. B., section III; or, Australian Class Book No. 1, part II, to section IV, lesson IV; or, Constable's E. R. Book, No. 1, part II, to page 30.

Writing.—To write on Slates from Black Board the letters *k, s, x, z,* and from Dictation, easy words embodying the letters already learned.

Arithmetic.—To count, read, and notate, any number as far as 40. Simple Addition on Slates, involving results not higher than 40. Mental operations with numbers as far as 30.

Singing.—Easy Scale Exercises on Modulator, with upper and lower Replicates: Simple Melodies by ear.

NOTE 1.—Object lessons on Domestic Animals and Common Objects should be given to this class at least twice a week.

NOTE 2.—Simple melodies by ear are required to be taught once a week, and practised daily.

NOTE 3.—It is expected that, during the second year of enrolment, the children will be well grounded in Simple Addition, and able to work easy questions in Simple Subtraction.

Fourth

Fourth Quarter.

Reading.—To read First Book, I. N. B.; or, Australian Class Book No. 1, part II, to end; or, Constable's E. R. B., No. 1, part II, to end.

Writing.—To write on Slates, from Copies and Dictation, Monosyllables and Sentences consisting of Monosyllables.

Arithmetic.—To count, read, and notate any number up to 100. Simple Addition involving the process of "carrying." Mental operations to results not higher than 40.

Singing.—Scale Exercises on Modulator: Simple Melodies by ear, or from Teacher's pointing on Modulator.

STANDARD OF PROFICIENCY.—SECOND CLASS.

First Quarter.

Children enrolled one quarter, and being 7 years old, will be expected—

Reading.—To read the Second Book I. N. B., sections I and II; Australian Class Book, No. 1, Part 3; or, Constable's E. R. Book No. 2, to page 41.

Writing.—*On Slates*—from Copy and Dictation of the lessons read, using capitals; *in books*—simple words in text.

Arithmetic.—To write from Dictation easy numbers as far as 5 places, and to work sums in Addition and Subtraction to at least 5 places; to know the Multiplication Table as far as 6 times. *Mental Arithmetic*—Easy Addition and Subtraction.

Grammar.—To give simple definitions of Noun, Adjective, and Article, and to distinguish them in the Reading Lessons.

Geography.—The Schoolroom and Vicinity; Cardinal Points.

Drawing.—Fowles' Drawing Book, No. I, page 1.

Singing.—Notation of Tune and Time (two-pulse measure): Exercises on Modulator: Simple Melodies by ear.

Second Quarter.

Reading.—To read the Second Book, I. N. B., section III; or, Constable's E. R. Book No. 2, to page 79.

Writing.—*On Slates*—from Copy and Dictation of lessons read, including the use of capitals; *in books*—text, with capitals.

Arithmetic.—Notation as far as 7 places; questions in Subtraction; Multiplication by one digit. *Mental Arithmetic*—More difficult operations in Addition and Subtraction; Multiplication table as far as 9 times.

Grammar.—To give Simple Definitions of the Pronoun, Verb, and Adverb, and distinguish them in the Reading Lesson.

Geography.—Uses of a Map; Definitions of Continent and Ocean, with examples.

Drawing.—Drawing Book No. I, pages 1 and 2.

Singing.—Time (four and three pulse measure): Simple Melodies from Modulator.

Third Quarter.

Reading.—To read the Second Book, I. N. B., section IV; or, Constable's E. R. Book No. 2, to the end.

Writing.—*On Slates*—from Copy and Dictation, passages from the Reading Lessons; *in books*—text hand.

Arithmetic.—Notation as far as 9 places; Multiplication, with frequent recapitulation of previous rules; Multiplication Table. *Mental arithmetic*—As previously given, with exercises in Multiplication.

Grammar.—To define all the parts of speech, and distinguish them in the Reading Lesson.

Geography.—Definitions of Land and Water, with examples.

Drawing.—Drawing Book No. 1.

Singing.—Time—division of pulse into halves: Simple Melodies in Sol-Fa Notation.

Fourth Quarter.

Reading.—To read Sequel, No. 1 to II Bk., I. N. B., lessons 1 to 12; or, Constable's E. R. Book No. 3, to page 56 inclusive.

Writing.—*On Slates*—from Copy, Dictation, and Memory, passages from the Reading Lessons; *in books*—text hand.

Arithmetic.—Notation; Simple Division; exercises in Four Simple Rules. *Mental Arithmetic*—Exercises in Simple Rules.

Grammar.—To distinguish parts of speech in Reading Lesson, and frame Simple Sentences; to be able to distinguish the Kinds of Noun, and to have an acquaintance with Number and Gender.

Geography.—Recapitulation of previous quarter's work, with special reference to Australia.

Drawing.—Drawing Book No. 1, and No. 2, page 1.

Singing.—Tune—Notes of transition, Fe and Ta; Tune—Division of pulse into Fourths and Thirds; Simple Two-part Songs.

NOTE 1.—Object lessons on Domestic Animals and Common Objects should be given to this class at least twice a week.

NOTE 2.—Simple melodies by ear are required to be taught once a week, and practised daily.

NOTE 3.—It is expected that, during the second year of enrolment, the children will be well exercised in Multiplication and simple Long Division.

STANDARD

STANDARD OF PROFICIENCY.—THIRD CLASS.

First Quarter.

Reading.—To read fluently and with expression the 2nd Sequel to 2nd Book, I. N. B., to page 82 ; or, Constable's Reading Book No. 3, to page 61.

Writing.—*On Slates*—passages dictated from the Reading Lessons, marking capitals ; *in Copy-books*—Text and Round hands.

Arithmetic.—Addition of money, with frequent exercises on previous rules, and to know the Money, Troy, and Avoirdupois Tables. *Mental Arithmetic*—Prices of dozens.

Grammar.—To distinguish readily all the parts of speech ; to know the Accidence of the Noun ; to construct Simple Sentences ; and to be able to point out the Subject and Predicate.

Geography.—To know the Outlines of the Geography of Australia.

Object Lessons.—On common Minerals, Vegetables, and Animals.

Drawing.—Fowles' Drawing Book No. 2, Pages 1 and 2.

Singing.—Tune—Sharpened Tones : Time—Six-pulse measure : Two-part Songs, and Rounds in three or four parts.

Scripture Lessons.—Old Testament, No. 1, I. N. B., to Lesson 17 inclusive.

Second Quarter.

Reading.—To read with fluency and expression the 2nd Sequel to 2nd Book, to the end of book ; or, Constable's Reading Book No. 3, to end.

Writing.—*On Slates*—passages dictated from the Reading Lessons ; *in Copy-books*—text and round hands.

Arithmetic.—Addition of weights and measures, with frequent exercises on previous work ; Tables—all the more useful kind. *Mental Arithmetic*—Cost of articles by the score and gross.

Grammar.—To parse the Noun and Simple Verb fully ; Analysis of Simple Sentences ; the Enlargement of the Subject by single words.

Geography.—Physical Geography of New South Wales in detail.

Object Lessons.—On common Minerals, Vegetables, and Animals.

Drawing.—Drawing Book No. 2.

Singing.—Tune—Flattened Tones : Time—Notes and Rests of various lengths : Songs, &c., as in previous Quarter.

Scripture Lessons.—Old Testament, No. 1, Lessons 18 to 23 ; New Testament, No. 1, Lessons 1 to 12.

Third Quarter.

Reading.—To read with fluency and expression the 3rd Book, I. N. B., to page 73 ; or, Constable's Reading Book No. 4, to page 49.

Writing.—*On Slates*—passages dictated from the Reading Lessons, marking periods ; *in Copy-books*—three hands.

Arithmetic.—Subtraction of Money, Weights, and Measures, with exercises on previous work. *Mental Arithmetic*—As before, with exercises on the Arithmetical Tables.

Grammar.—Parsing of Simple Sentences, including a knowledge of the easier rules of Syntax ; Analysis of Sentences ; the Enlargement of the Subject in detail.

Geography.—New South Wales (political), with the general outlines of the other Australian Colonies.

Object Lessons.—On common Minerals, Vegetables, and Animals.

Drawing.—Drawing Book No. 3, Pages 1 and 2.

Singing.—Tune—Various marks of Expression : Time—Sycopation : Three part Songs.

Scripture Lessons.—Old Testament, No. 1, Lessons 24 to 28 inclusive ; New Testament, No 1, Lessons 13 to 18 inclusive.

Fourth Quarter.

Reading.—To read with fluency and expression the 3rd Book, I. N. B., to page 156 ; or, Constable's Reading Book No. 4, to end of section 2.

Writing.—*On Slates*—passages dictated from the Reading Lessons with proper Punctuation ; *in Copy-books*—three hands.

Arithmetic.—Compound Multiplication, using multipliers as far as thousands. *Mental Arithmetic*—A full acquaintance with the easier rules.

Grammar.—Increased skill in Parsing, and Analysis of Sentences, with a further knowledge of the rules of Syntax.

Geography.—New Zealand in detail, and revision of the previous quarter's work.

Object Lessons.—On Manufactured articles.

Drawing.—Drawing Book No. 3.

Singing.—Tune—Transition to Soh and Fah Keys : Modulator and Time Exercises : Three-part Songs.

Scripture Lessons.—Old Testament, No. 1, to the end ; New Testament, No. 1, Lessons 19 to 24.

STANDARD OF PROFICIENCY.—FOURTH CLASS.

First Quarter.

Reading.—To read I. N. B. 4th Book, sec. 1; or, Constable's Eng. Reading No. 5, section 1. (Synonyms—Meanings—Paraphrasing.)

Writing.—*On Paper*—Reproduction of Lessons—Dictation with correct Spelling and Punctuation; *in Copy-books*—three hands.

Arithmetic.—Simple Proportion. *Mental Arithmetic*—Proportion, by "First Principles."

Grammar.—Accidence, fully; Prefixes and Affixes; Parsing passages from Reading Lesson; Analysis of Simple and Combined Sentences; Composition—Constructing Similar Sentences.

Geography.—Europe in detail; Mapping.

Object Lessons.—As in Course of Secular Instruction.

Singing.—Tune—Transition and the Minor Mode: Modulator and Time Exercises: Three-part Songs.

Drawing.—Drawing Book, No. 4, pages 1, 2, and 3.

Geometry.—Euclid's Definitions, 1 to 12 inclusive.

Scripture Lessons.—Old Testament, No. 2, Lessons 21 to 27; New Testament, No. 2, Lessons 1 to 9.

Second Quarter.

Reading.—I. N. B. 4th Book, section. 2, part 1; or Constable's E. R. Book. No. 5, section. 2.

Writing.—Same as previous quarter, with increased excellence.

Arithmetic.—Simple and Compound Proportion. *Mental Arithmetic*—As in previous quarter.

Grammar.—*Syntactical Rules*; Parsing, as before; *Derivation*—Principal Latin Roots, A to C, in the "Spelling Book Superseded"; *Analysis of Complex Sentences*, using only Adjectival and Adverbial Clauses; *Composition* of simple Combined, and Complex Sentences.

Geography.—Asia, in Outline.

Object Lessons.—As in the previous quarter, and Course of Secular Instruction.

Singing.—Tune—Expression: Modulator and Time Exercises: Three-part Songs.

Drawing.—Drawing Book No. 4, and pages 1 and 2 of No. 5.

Geometry.—Euclid's Definitions, 13 to 19 inclusive.

Scripture Lessons.—No. 2, Old Testament, lessons 28 to 40; No. 2, New Testament, Lessons 10 to 15.

Third Quarter.

Reading.—I. N. B. 4th Book, sec. 2, part 2; or, Constable's E. R. B. No. 5, to page 190.

Writing.—The same as in previous quarters, with exercises, *from memory*, added.

Arithmetic.—Reduction and Addition of Fractions; Practice. *Mental Arithmetic*—easy operations in Fractions and Practice.

Grammar.—Parsing (fully) Sentences from Reading Lesson; Analysis of Complex Sentences; Constructing Similar Sentences—Easy Exercises in Letter-writing; Derivation, D to F, inclusive.

Geography.—Asia, in detail; Mapping.

Object Lessons.—As in the previous quarter, higher excellence being expected.

Singing.—Tune—Intonation, Enunciation, and Expression; Modulator and Time Exercises; Part Songs.

Drawing.—Drawing Book No. 5, and pages 1 and 2 of No. 6.

Geometry.—Euclid's Definitions, 20 to 29 inclusive.

Scripture Lessons.—No. 2, Old Testament, lessons 14 to 18; New Testament, No. 2, Lessons 16 to 20.

Fourth Quarter.

Reading.—I. N. B. 4th Book, sec. 3; or, Constable's E. R. Book No. 5, to the end of sec. 3.

Writing.—*On Paper*—Reproduction of Oral lessons, in addition to the work of previous quarters.

Arithmetic.—Practice; Interest; Fractions (fully). *Mental Arithmetic*—Miscellaneous Exercises in the work of the three previous quarters.

Grammar.—Parsing Exercises, in Prose and Verse; Analysis of Compound Sentences; Composition of different kinds of Sentences, and Exercises in Letter-writing; Derivation, G to L inclusive.

Geography.—Elements of Physical Geography; Mapping.

Object Lessons.—As in the Course of Secular Instruction.

Singing.—The whole system of Tonic Sol-Fa Notation: Part Songs.

Drawing.—Drawing Book No. 6.

Geometry.—Euclid's Definitions (complete).

Scripture Lessons.—No. 2 Old Testament, Lesson 49 to the end; New Testament, No. 2, Lesson 21 to the end.

STANDARD OF PROFICIENCY.—FIFTH CLASS.

First Quarter.

Reading.—I. N. B. Supplement to 4th Book, to page 111 ; or, Constable's E. R. Book, to page 76.

Writing.—*On Paper*—Passages in Prose and Verse.

Arithmetic.—Decimals. *Mental Arithmetic*—Advanced Exercises.

Grammar.—Parsing ; General Analysis ; Principal Figures of Speech ; Paraphrasing ; Derivation, M to O inclusive. (Spelling Book Superseded.)

Geography.—Europe (Physical) ; detailed description of countries, particularly of Great Britain and Ireland ; Winds ; Mapping.

Object Lessons.—As prescribed in Course of Secular Instruction.

Singing.—Established Notation—the Staff and positions of notes thereon : Tune—simple divisions of the measure : Part Songs in Sol-Fa Notation.

Drawing.—Ornaments or Scrolls, shaded.

Geometry.—Euclid's 1st Book, prop. 1 to 12 inclusive.

Algebra.—Definitions ; Addition and Subtraction.

Latin.—Henry's (Arnold's) 1st Book, to page 32, Exercises 1 to 20 ; or, Smith's Inductive Course, Exercises 1 to 30.

Second Quarter.

Reading.—I. N. B. Supplement to 4th Book, to page 221 ; or, Constable's E. R. Book, to page 166.

Writing.—As in previous quarter, with Exercises in Invoices and other Commercial Forms.

Arithmetic.—Decimals—Application to other Rules. *Mental Arithmetic*—Advanced Exercises.

Grammar.—Parsing ; Scanning ; General Analysis of Sentences with their relations to one another ; Composition—Original Descriptive Sketches ; Paraphrasing ; Derivation, P to R. (Spelling Book Superseded.)

Geography.—Asia, Physical and Descriptive ; Tides and Currents ; Mapping.

Object Lessons.—As prescribed in Course of Secular Instruction.

Singing.—Established Notation—Clefs, Sharp, Flat, and Natural : Time—Notes, Rests, and Time Signatures : Part Songs.

Drawing.—Figures, Animals, or Landscapes, from copies.

Geometry.—1st Book, prop. 13 to 26 inclusive.

Algebra.—Multiplication and Easy Division.

Latin.—Arnold's 1st Book, to exercise 40 ; or, Smith's I. C., to exercise 50.

Scripture.—As in 4th class.

Third Quarter.

Reading.—I. N. B. Supplement 4th Book, to page 330 ; or, Constable's E. R. Book No. 6, to page 255.

Writing.—As before, with Ornamental Writing added.

Arithmetic.—Square and Cube Roots. *Mensuration*—Rectangular Figures. *Mental Arithmetic*—as before.

Grammar.—Parsing, Scanning, Paraphrasing, and General Analysis ; Composition, Themes ; Derivation, S and T. (Spelling Book Superseded.)

Geography.—America—Physical and Descriptive ; Mapping. The more Simple Astronomical Phenomena.

Object Lessons.—As prescribed in the Course of Secular Instruction.

Singing.—Established Notation—Keys and their Signatures, Marks of Expression : Part Songs.

Drawing.—From solid models.

Geometry.—1st Book, propositions 27 to 42.

Algebra.—1st four rules ; Greatest Common Measure ; Least Common Multiple ; Easy Simple Equations.

Latin.—Arnold's 1st Book to Exercise 62 ; Smith's I. C., to Exercise 72.

Scripture Lessons.—As in 4th class.

Fourth Quarter.

Reading.—I. N. B. Supplement, 4th Book, to end ; or, Constable's No. 6, to end.

Writing.—As in the previous quarter.

Arithmetic.—General Exercises upon previous Lessons. *Mensuration*—of Surfaces (fully). *Mental Arithmetic*—as before.

Grammar.—As before ; Derivation, U to V. (Spelling Book Superseded.)

Geography.—Africa and Oceanica ; Mapping ; Physical Geography ; Meteorology.

Object Lessons.—As prescribed in the Course of Secular Instruction.

Singing.—Established Notation—The whole System : Part Songs.

Drawing.—Simple objects in perspective.

Geometry.—Book 1, proposition 43 to end of Book, with Exercises.

Algebra.—Simple Equations.

Latin.—Arnold's 1st Book, to end ; Smith's Inductive Course, to Exercise 90.

NOTE.—The foregoing Standards are not intended to prevent Teachers from realising, if possible, higher results.

INSTRUCTIONAL DOCUMENTS.

The Conference begs to submit specimens of Forms for a *General Time Table*, a *Programme of Lessons*, and a *Lesson Register*.

It is considered that every Time Table should provide for the following matters:—

- 1st The constant and profitable employment of all the classes.
- 2nd The allotment of portions of time to the various subjects, according to their relative importance. As a rule, each pupil should read and write in some form twice a day: and two-thirds of the time for instruction should be devoted to Reading, Writing, and Arithmetic.
- 3rd. The alternation of Oral and Silent lessons to adjoining classes.

UNIFORMITY IN TREATMENT OF GRAMMAR.

The Circular here submitted embodies the views of the Conference on this subject:—

WITH a view to avoid the difficulties and inconveniences caused by the adoption of many different modes of Parsing and Analysis, the Council of Education recommends that the subjoined method should be employed by all Teachers in its service.

The advantages sought to be secured by the introduction of a uniform method may be thus enumerated:—

1. The Examination Papers of Teachers and Candidates may be more easily compared and revised, and their respective merits more accurately estimated.
2. The Inspection of Schools and Examination of Pupils would be greatly facilitated, and the means of forming a just comparison of schools by reference to a fixed standard would be largely increased, while the Inspectors would not be obliged to acquaint themselves with the peculiarities obtaining in each school.
3. Pupils on removing from one school to another would not require to commence the study of Grammar anew, in order to acquaint themselves with the peculiar terms in use.
4. A change of Teachers would not subject a school to a possible alteration in the technical language employed in teaching Grammar.

MODE OF PARSING.

<i>Article</i> —		Kind.	Prefixed to the Noun			
	Definite					
	Indefinite					
<i>Noun</i> —		Kind.	Number.	Gender.	Case.

APPENDIX.

FORM OF ANALYSIS.

I.—For Simple Sentences.

Subject.		Predicate.				
Enlargement of the Subject.	Simple Subject.	Simple Predicate.	Enlargement of the Predicate.			
			Completion.		Extension.	Kind of Extension.
			Object.	Attribute.		

II.—For Combined, Complex, and Compound Sentences.

Order of Clauses denoted by letters, thus— A ... b ... c ... d ... E ... f ... g ... h ...	Clauses.	Names of Clauses and their relation to each other.	Connectives.	Subject.		Predicate.			Remarks.	
				Enlargement of the Subject.	Simple Subject.	Simple Predicate.	Completion.	Extension.	Kind of Extension.	
							Object.	Attribute.		

NOTE.—Capital Letters may be used to denote Principal Clauses; Small Letters, Subordinate Clauses.

CLASSIFICATION OF PUPILS.

ON this subject the opinion of the Conference is as follows :—

- 1st. That there should be one classification for all subjects.
- 2nd. That, as a rule, there should not be more than three classes in a school that is conducted by one teacher.
- 3rd. That the pupils composing any class should be, as nearly as possible, of similar attainments in Reading, Arithmetic, and Grammar.
- 4th. That pupils should be removed from one class to another, *only* at the beginning of a school quarter.
- 5th. That it is important that children should not be placed in classes for which their attainments render them unfit, nor detained therein when eligible for promotion.
- 6th. That the representations of parents as to the classes into which their children are to be placed, should not be allowed to influence the teacher so as to lead him to disregard the foregoing provisions.

MAXIMUM PERIOD FOR EACH CLASS.

THE Conference desires to state, that the following is based on the supposition of children attending school regularly.

First Class.—Pupils in the First Class, admitted at four years of age, may be expected to clear the First Book I. N. B., or Australian Class Book No. 1, parts 1 and

2, or Constable's English Reading Book No. 1, parts 1 and 2, at 6 years of age; at 7 years old, to have mastered the Australian Class Book No. 1, part 3, or Constable's No. 1, part 3. Pupils should therefore clear the First Class at 7 years.

Second Class.—Pupils passing from the First to the Second Class will be expected to clear the Second Book and First Sequel I. N. B., or Constable's Reading Book No. 2, at 9 years of age.

Third Class.—Pupils will be expected to clear the Second Sequel, and Third Book I. N. B., or Constable's Third Book, and sections 1 and 2 of Fourth Book, at 11 years of age.

Fourth Class.—Pupils will be expected to clear the Fourth Book I. N. B., or Constable's Fourth Book, sections 3 and 4, and Fifth Book, at 13 years of age.

Fifth Class.—Pupils will be expected to clear the Supplement to the Fourth Book I. N. B., or Constable's Sixth Book, at 14 years of age.

THE BEST MEANS OF SECURING THE REGULAR ATTENDANCE OF PUPILS.

In the absence of a compulsory system of Education, the Conference is of opinion, that all other means to secure regularity of attendance, must, at the best, be but weak and partial in character. It has had several under consideration, but doubts whether much good would result from the adoption of any, unless it be monthly or quarterly payments of school fees in advance.

HOME LESSONS.

It is the unanimous opinion of the Conference, that such lessons should be given systematically to the more advanced pupils. It believes, that, in this way, the general work of the school may be facilitated, and parents led to take more interest in school business than they at present exhibit. It is to be observed, however, that, while teachers ought to be encouraged to foster the habit of home study in their pupils, they should be careful not to allow such lessons to degenerate into mere rote learning, or attention to them to interfere with the more immediate duties of the school. Where the hearing of home lessons is permitted to usurp the place of oral instruction, the result cannot but be hurtful.

Home lessons may be classified under two heads :—

1. To prepare for school work.
2. To test the result of the instruction given.

The following are recommended as suitable subjects for home lessons, which may always be given in connection with the ordinary school work :—

1. Spelling.
2. Committing to memory passages of poetry and prose for recitation.
3. Arithmetic—Tables and Exercises.
4. Grammar—Parsing and Analysis; Composition.
5. Geography—Reproduction of lesson; Mapping.
6. Latin.
7. Geometry.
8. Drawing.

REWARDS AND PUNISHMENTS.

It is not the mind of the Conference, that, as a rule, the giving of rewards should be encouraged.

As regards punishment, the Conference considers that it should be inflicted for persistent inattention and for moral offences. For trivial breaches of discipline, it is of opinion that a reprimand or an imposition will be found sufficient; but for grave offences, where the surrounding circumstances are of a special or aggravated character, it believes that nothing short of the cane will be found effective. It would, however, limit the use of this to the head teacher, and place the following restrictions upon its application—that it shall on no account be applied to the head of a child; and that, as a rule, the punishment shall be inflicted after an interval from the time the offence has been committed.

THE SUPPLY OF SCHOOL REQUISITES.

For a *first* supply, the Conference begs to recommend an allowance at the rate of *five shillings* for each pupil in actual attendance, or who will probably attend.

In the case of *subsequent* grants, it is the opinion of the Conference that *two shillings* per head per annum should not be exceeded, but that each application should be considered on its merits.

It is further suggested that the pupils in the schools be encouraged to purchase the books required for their home studies.

REQUISITION

 REQUISITION FOR BOOKS, MAPS, &c., FOR THE SCHOOL AT

Scripture Lessons (Old Testament), No. 1.
 Do. do. No. 2.
 Do. (New Testament), No. 1.
 Do. do. No. 2.

Reading Books (I. N. B. Series) :—

 Pencil cases.
 Pencils.
 Ink.
 Ink-wells.
 Chalk.

THE FORMATION OF DEPOTS IN THE COUNTRY, FOR THE SALE OF APPROVED SCHOOL MATERIALS.

The Conference regards *Sydney* as the most suitable place from which to forward supplies of school requisites to the various schools throughout the Colony.

At the same time it is thought of importance that the Council's Agent in *Sydney* should be instructed to establish *branch depôts* in the various parts of the Colony, wherever such a course may be expedient or practicable.

SCHOOL

SCHOOL LIBRARIES.

In schools under the Council's supervision, the establishment of libraries for the use of the pupils would, in the judgment of the Conference, prove very beneficial.

In order to reach this desirable result, it is thought that the Council of Education might be requested to contribute a portion of the cost of the books, and of the cases in which they are kept, whilst the remaining portion should be raised in the school and neighbourhood.

For the judicious use, and profitable benefit of these libraries, and for their safe custody, the teachers ought to be held responsible.

NIGHT SCHOOLS.

It is the opinion of the Conference that, wherever the establishment of night schools will clearly advance the interests of education, they ought to be encouraged; but, at the same time, it is considered necessary that they should be subjected to the following restrictions:—

- 1st. Pupils of the ordinary school age should not be admitted to them.
- 2nd. They should not be open for more than three evenings a week, nor kept open beyond an hour and a half each evening.
- 3rd. They should in no case be mixed schools, but contain one sex only.

THE PROPRIETY OF ESTABLISHING MODEL SCHOOLS.

It is often assumed that the mere possession of knowledge is sufficient to qualify a person for the office of Schoolmaster—in other words, that literary attainments and practical skill to educate are identical; this, however, is a great mistake. A person may be well-informed in a subject, and yet possess little or no power of explaining it; he may even be able to explain it in such a manner as to make himself understood by an adult, and yet his language may be such as to render the explanation quite unintelligible to a child. To be a teacher, principles must be studied, and practical skill in their application must be acquired. A teacher should be energetic, persevering, and enthusiastic in his work; he should have the power of disciplining the mind of his pupils, of inculcating right principles, of forming correct habits, and of cultivating refined tastes. Teachers such as these are wanted for the Colony; and, if education is to be promoted, it is necessary that means should be at once adopted to obtain such. The Conference is of opinion that nothing will be more effective in promoting this object than the establishment of Model Schools throughout the Colony. A Model School may be described “as being one established on such principles, organized on such plans, regulated by such a course of discipline, and conducted on such a method of instruction, as to be a model or pattern for teachers or school managers to copy or imitate. The model or pattern may refer to various and very different phases of a school: sometimes to the architecture or construction of the building; sometimes to the arrangement of the furniture; sometimes to method, to order, to system, to the course of education—it may refer to all or any of these, so far as they can be copied or imitated by others, and, in this regard, every well-conducted school may, in some measure, be said to be a model; but, in the strict sense of the term, as Educationists define it, a Model School is one in which there is a reasonable excellence in all these respects, and which, in addition, is either attached to an institution for the training of young teachers, or is itself, along with being an Elementary school, a seminary for the same purpose.”

The Conference, therefore, recommends as follows:—

- 1st.—That there should be a principal Model School in Sydney in connection with a Normal Institution or Training Establishment. This institution would, in time, furnish a supply of thoroughly-trained teachers, sufficient for all the wants of the Colony.
- 2nd.—That one Model School, at least, should be established in each Inspectoral district. This would not only serve as a pattern or model for the imitation of the other schools in the district, but candidates and inexperienced and untrained teachers might be sent to the school for a practical training in their work. Thus the expense of bringing such persons to the principal Model School in Sydney would be saved to the Council.
- 3rd.—That in outlying parts of each district, minor Model Schools should be established. The untrained teachers and others in such parts would thus have a model for imitation, and means of improvement brought within their reach.

Model Schools may be of *one, two, or three* departments, according as circumstances may render it desirable.

The entire outlay for the erection and equipment of Model Schools, will have to be incurred by the Council of Education. Considering, however, the scope and object of these institutions, namely—that they are intended not merely to confer the advantages of Education of the most approved kind upon the localities in which they may be established, but also to afford a complete exposition of the principles and practice of improved modern teaching; to present to the surrounding schools a constant standard of efficiency; to elevate the character of the instruction; to direct and concentrate the tone of thought among teachers; and, in a word, to diffuse as widely as possible the germs of perfection

in the educational machinery of the Colony—these are among the more prominent results which Model Schools are intended to effect—and considering their incalculable value, as means to a most desirable end—the Conference begs to submit that the mere money expenditure is a matter of secondary importance, and not to be regarded as paramount when placed in juxtaposition with the benefits which the establishment of such schools is likely to realize.

CLASSIFICATION OF SCHOOLS, PARALLEL TO THAT OF TEACHERS.

SUCH a classification of schools as is above indicated is deemed desirable, and the Conference advises that they be divided into Special and Ordinary, in the following manner:—

1st. *Special*:—All Model Schools.

2nd. *Ordinary*:—

(a) *First Class*:—Schools of three departments, viz., boys, girls, and infants.

(b) *Second Class*:—Schools of two departments, and others held in approved buildings, thoroughly organized, and having an average attendance of 100 pupils.

(c) *Third Class*:—All other schools.

NOTE.—As a rule first-class teachers should be appointed to Model or Ordinary First-class Schools; second-class teachers to Ordinary Second-class Schools; and third-class teachers to Ordinary Third-class Schools.

CAN THE PUPIL TEACHER SYSTEM BE IMPROVED OR EXTENDED?

THE Conference, taking into consideration the fact that young persons apprenticed to trades have generally allowances equivalent to board, lodging, and partial clothing, considers that the position of pupil teachers ought to be at least somewhat in advance of theirs; and, to this end, it advises that the money remuneration be as follows:—

For Males, £36 1st year, £42 2nd year, £48 3rd year, £54, 4th year.
 „ Females, £24 „ £30 „ £36 „ £42 „

Further, with a view to encourage teaching talent, and to promote efficiency in preparatory training for the teaching profession, it is suggested that scholarships for at least one year, in the Training Department, be granted by the Council; and that for every forty of an increase in the daily average attendance at any school, an additional pupil teacher be appointed.

COURSE OF STUDIES FOR TEACHERS.

THE following is a List of Subjects in which Teachers will be examined for the various Classifications:—

THIRD CLASS.

(The maximum number of marks for each subject in this class is 500.)

Grammar.—Including Spelling, Punctuation, Paraphrasing, Etymological and Syntactical Parsing, Analysis of Simple and Combined Sentences.

Text Books.—M'Leod's Grammar, National School Grammar, Morell's Analysis of Sentences.

Geography.—Geographical Terms and their application, General Geography of the World—Europe and Australia in detail.

Text Books.—Sullivan's Introduction to Geography, W. Hughes' General Geography (Gleig's Series), Geography of New South Wales (Moore).

Arithmetic.—Simple and Compound rules, Reduction, Proportion, Practice, Interest, &c., Vulgar Fractions, Terminate Decimals. Female Teachers—to Compound Proportion only.

Text Books.—Colenso's Arithmetic, National School Arithmetic, Tate's Arithmetic.

School Management.—Organization, Discipline, and Instruction of schools in outline.

Text Books.—Regulations of the Council of Education, Robinson's School Management, Currie's Infant School Management.

School Books.—Reading Books as prescribed for First, Second, and Third Classes in Standards of Proficiency.

Reading.—Prose and Poetry from the Lesson Books.

Writing.—Specimens of Copy lines in Text, Round, and Small hands, knowledge of the Principles of Writing.

Vocal Music.—Subjects required for Elementary Tonic Sol-fa Certificate.

Text Books.—Manual of Tonic Sol-fa Method, Curwen's Standard Course, Tonic Sol-fa Reporter, Vols. V and VIII.

Linear Drawing.—On paper and on the Black Board.

Text Books.—Fowles' Drawing Books, Nos. 1, 2, and 3.

Domestic Economy.—Female Teachers only—Plain Needlework, Food, Clothing, Household Management.

Text Books.—The Finchley Manuals.

SECOND CLASS.

(The maximum number of marks assigned to each subject in this class is 800.)

Grammar.—Including Spelling, Punctuation, Paraphrasing, Parsing in full detail, Derivation, and Analysis.

Text Books.—Latham's English Grammar, Hunter's English Grammar, Morell's Grammar and Analysis of Sentences, Sullivan's Dictionary of Derivations.

Geography.—

- Geography*.—Descriptive Geography of the Four Continents, Australasia, and Polynesia, Physical Geography.
Text Books.—W. Hughes' Physical Geography, W. Hughes' Manual of Geography.
Arithmetic.—As far as and inclusive of the Cube Root, Duodecimals, and Elementary Mensuration. Female teachers—to Decimals only.
Text Books.—Tate's Mensuration, Book-keeping in the National School Series, Cornwell and Fitch's Arithmetic.
Art of Teaching.—Organization, Discipline, Method, and Instruction of schools in full detail.
Text Books.—Gill's School Management, Morrison's School Management.
School Books.—The Authorized Series of Reading Books.
Reading.—Prose and Poetry, Reading books in ordinary use, Literary Class Book, Biographical Sketches.
Writing.—Specimens of Copy lines, Letter writing, Principles of teaching Writing.
Vocal Music.—Subjects for Intermediate Tonic Sol-fa Certificate.
Text Books.—As before.
Drawing.—On Paper and Black Board; and conduct a class properly.
Text Book.—Fowles' Drawing Books, Nos. 1 to 6.
Needlework.—For Female Teachers—Plain and Ornamental.
Text Books.—Finchley Manuals.
Domestic Economy.—For Female Teachers—Food, Clothing, simpler Laws of Health.
Text Book.—The Laws of Health—Gleig's Series.
Algebra.—As far as and inclusive of Quadratic Equations, omitting Surds.
Text Book.—Colenso's Algebra, Part 1.
Geometry.—Euclid's Elements—First Book.
Text Book.—Pott's Euclid.
Latin.—Cæsar (De Bello Gallico), Grammar.
Text Books.—Anthon's Cæsar, Edwards' Eton Latin Grammar.

FIRST CLASS.

- (The maximum number of marks assigned to each subject in this class is 1,000.)
Grammar.—Including Orthography, Punctuation, Parsing in full detail, Paraphrasing, Analysis of Sentences, Composition, Style, Derivation, and Prosody.
Text Books.—Latham's Grammar, Hunter's Grammar, Morell's Analysis of Sentences.
Geography.—Physical Geography of the Globe, Political and Commercial Geography with special reference to Australia, Popular Astronomy, Mathematical Geography.
Text Books.—W. Hughes' Manual, W. Hughes' Physical Geography, W. Hughes' Mathematical Geography, Sullivan's Geography Generalized, Tate's Popular Astronomy, Lardner's Popular Astronomy.
Arithmetic.—The whole Theory and Practice.
Text Books.—Thomson's, De Morgan's, and Cornwell's Arithmetics.
School Books.—The Authorized Reading Series in full.
Reading.—Prose and Poetry.
Writing.—Specimens of Copy Setting, Letter Writing.
Vocal Music.—The whole System of Tonic Sol-fa Notation, ability to sing at sight easy music in the Established Notation, Elementary Knowledge of Harmony.
Text Books.—As before.
Drawing.—Animals, figures, and landscapes; perspective; sketching on the Black Board.
Text Book.—Dicksee's Perspective, Butler William's Manual of Model Drawing and Perspective.
Needlework.—For Female Teachers—Plain and ornamental needlework.
Domestic Economy.—For Female Teachers—Food, Clothing, Health, Sickness.
Principles of Teaching.—Method, including a knowledge of the nature of the Human Mind.
Text Books.—Tate's Philosophy of Education, Currie's Common School Education, Morell's Mental Philosophy.
English Literature.—From the time of Chaucer to the present period.
Text Books.—Chambers' English Literature, Craik's English Literature.
 (One Alternative subject at least must be taken.)

NOTE.—Whilst no marks can be assigned for Spelling considered as such, failure in this subject will deprive a Teacher of all claim to a Certificate.

TRAINING OF TEACHERS.

THE Conference is of opinion, that the training of teachers will not be satisfactorily dealt with until provision has been made for the board, lodging, and systematic instruction of candidates and teachers who may attend the Training School. The objects of the instruction should be:—

- 1st. To impart information on subjects which are taught in the Schools under the Council's direction.
- 2nd. To furnish professional knowledge.
- 3rd. To exhibit good methods.

1st. It is thought desirable that the principles of teaching inculcated in the Training School, should be systematically illustrated by lessons to a class of children, in the presence of the candidates.

2nd.

2nd. That the candidates ought to be employed, at stated periods, in the actual business of teaching.

3rd. That, if practicable, each candidate should be required to take full charge of a *small* school, in the presence of a responsible person, in order that his practical skill may be ascertained, and errors of management corrected.

EXAMINATION AND CLASSIFICATION OF TEACHERS.

ON this subject, the Conference is of opinion :—

1st. That the questions in Examination papers, as well as the papers for the different Classifications, should be carefully graduated.

2nd. That no questions should appear in an Examination paper, except those that the Examinee is expected to answer—that is, that groups of questions should not be given.

3rd. That a specified time be allowed for completing each paper, and that it be strictly adhered to.

4th. That new sets of Examination papers be issued monthly, if required.

5th. That Examinations be regulated by the printed rules. These should be read to the Teachers before the Examination begins, and a copy suspended in the room during the Examination.

6th. That special prominence be given to the subject of School-Management.

7th. That Style, as well as Matter, be taken into account in estimating the value of Examination papers.

8th. That Examinations in Reading and Practical Skill, be dealt with by Inspectors.

9th. That in attaching a value to these subjects, the maximum number of "Marks" for "Reading" be the same as for any other Ordinary subject, and that the number for "Practical Skill" be the same as those attainable for the Ordinary subjects for a First-class Certificate.

10th. That Teachers, upon whom it is compulsory to attend the Annual Examination, but who cannot do so without incurring personal expense, should receive allowances from the Council.

11th. That at the triennial revision of a Teacher's Classification, his promotion should not necessarily depend upon the receipt of a good report upon his conduct from the Local Board, inasmuch as, in some cases, Local prejudices might render such a report untrustworthy.

12th. That, inasmuch as the meaning of words used in communicating to teachers the results of Examinations, is liable to misinterpretation, numbers should be employed for this purpose.

THE NECESSITY FOR DIAGRAMS OF FURNITURE AND APPARATUS.

THESE diagrams are considered to be necessary—

1st. To prevent the use of unsuitable furniture.

2nd. To promote uniformity of Organization.

These diagrams should be *working plans*, to enable any ordinary tradesman to construct the furniture.

Diagrams of the following kind are recommended :—*Black-board* and *easel* ; *desks*—shewing grooves, ink-wells, and standards ; *book-presses* ; *forms* ; and *map-stand*.

TEACHERS WEST OF THE DIVIDING RANGE TO BE GRANTED AN ALLOWANCE ON ACCOUNT OF SITUATION.

THE Conference is of opinion, that on account of the dearness of provisions, an allowance, at the rate of *eighteen pounds* (£18) per annum, should be made to teachers located west of the Dividing Range, and in other Localities in which the Council may consider it necessary.

SUPPLY AND ARRANGEMENT OF SCHOOL FURNITURE.

THE desks should, in the judgment of the Conference, be sufficient to accommodate at least two-thirds of the pupils in daily average attendance. They ought to be arranged in parallel groups, lengthwise, and placed on graduated platforms, leaving sufficient space in front for the necessary school operations.

E.

GENERAL INSPECTION.

INSPECTOR'S Report upon the	School, at	in the	District.
Visited on the	day of	18 . Teacher	Class Section

I.—ORGANIZATION.

1. SITUATION.
 - Is it central ?
 - Is it healthy ?
 - Is it pleasant ?
 - Is it accessible ?
 - Is it otherwise suitable ?
2. SCHOOLROOM.
 - What is its form ?
 - What are its dimensions ?
 - In what state of repair is it ?
 - Is it suitable ?
 - What is its condition as to cleanliness ?
3. PLAYGROUND.
 - Give its extent ?
 - Is it enclosed ?
 - Are the closets in good condition, suitably placed, and properly arranged ?
 - Is there a shed to protect the pupils from the weather ?
 - Are there trees for shade ?
 - Are there flower borders ?
 - Has the Master a garden—its condition ?
4. FURNITURE.
 - Is it sufficient ?
 - Is it suitable ?
 - In what condition ?
 - Is it properly arranged ?
5. APPARATUS.
 - Is it sufficient ?
 - Is it suitable ?
 - In what condition ?
 - Is it properly arranged ?
6. BOOKS.
 - Is the stock sufficient ?
 - In what condition ?
 - Are any in use not sanctioned by the Council ; if so, give their titles ?
7. CLASSIFICATION.
 - How many classes are there ?
 - Is the classification judicious ?
 - Is it adapted to the "Course of Secular Instruction" ?
8. OCCUPATION.
 - Time Table :—Does it agree with the "Act," "Course of Secular Instruction," and "Regulations" ?
 - Does it provide for the constant and profitable occupation of all the pupils ?
 - Is it duly observed by the Teacher ?
 - Are there any vacations and holidays other than those sanctioned by the Council ?
- PROGRAMMES OF LESSONS :—
 - Are they suitable ?
 - Are they acted upon ?
9. SCHOOL RECORDS.
 - Admission Register
 - Class Roll
 - Daily Report Book
 - Quarterly Return
 - School Fee Account Book
 - Lesson Registers
 - Remarks

II.—DISCIPLINE.

10. PUNCTUALITY.
 - At what hour does the School business commence ?
 - Is the Teacher punctual ?
 - Are the Pupils punctual ?
 - If not, what means have been employed to secure punctuality ?
11. REGULARITY.
 - What proportion of the Pupils attends regularly ?
 - What means are adopted to secure regular attendance ?
 - Are they successful ?
 - If not, why ?
12. CLEANLINESS.
 - Of Premises ?
 - Furniture ?
 - Apparatus ?
 - Teacher ?
 - Pupils ?
 - What is the character of the inspection before entering School ?
13. ORDER.
 - Are the School operations conducted with order and decorum ?
 - What is the character of the behaviour of the Pupils ?

APPENDIX.

14. GOVERNMENT.

- Is the Teacher's demeanour in the presence of his Pupils becoming?
- Is his moral influence beneficial or otherwise?
- Are the principles of virtue inculcated?
- What is the character of the Government?
- What is the moral tone of the School?

III.—INSTRUCTION.

15. SUBJECTS.

- What are the subjects taught?
- Do they accord with the "Course of Secular Instruction"?

16. METHODS.

- What are the methods employed?
- Are they suitable?
- Are they effective?

IV.—SCHOOL BOARD.

- Name the Members and state the number of Visits paid to the School, by each, since the last inspection, as recorded in the Visitors' Book?
- How often are Board Meetings held?
- Is a record kept of the business of each meeting?

RETURN OF ATTENDANCE.

(Circular No. 1.)

Council of Education Office,
Fort-street, Sydney,
7 January, 1867.

Sir,

I have the honor, by direction of the Council of Education, to acquaint you that, by the Public Schools Act of 1866, all National Schools, whether Vested or Non-vested, are declared to be Public Schools within the meaning of the Act.

2. I am, therefore, to request that in all books, records; and returns, you will designate the School under your charge as a Public School, and that the inscription, "National School," required by the regulations of the late National Board, may be immediately removed, and the words, "Public School," substituted.

3. Two copies of the Public Schools Act are forwarded herewith for your information; and I am to intimate that all communications to the Council respecting Public Schools should be addressed to me as above.

I have, &c.,

W. WILKINS,
Secretary.

To
Teacher of the Public School,

D.

(Certificate A, 30 Vic., 22, sec. 9.)

To all to whom these Presents shall come,—

The Council of Education, the Corporation created under the Public Schools Act of 1866, sends greeting:—

WHEREAS the school at _____ in the Colony of New South Wales, known as _____ is situated within five miles but not within two miles of a public school established under the said Act, and which has in attendance not less than seventy children: And whereas the Council is satisfied, after due inquiry, that there are at least thirty children in regular attendance at such first mentioned school: Now these presents witness, that the Council of Education doth hereby certify and declare the said School at _____ to be a certified Denominational School within the intent and meaning of the Public Schools Act of 1866.

In witness whereof, the Council of Education hath caused its Common Seal to be hereto affixed, at Sydney, in the said Colony, this
day of _____ in the year of our Lord one thousand eight
hundred and _____

(Certificate B, 30 Vic., 22, sec. 9.)

To all to whom these Presents shall come,—

The Council of Education, the Corporation created under the Public Schools Act of 1866, sends greeting:—

WHEREAS the school at _____ in the Colony of New South Wales, known as _____ is situated within two miles by the shortest highway of the Public School at _____ and the said Public School at _____ together not less than one hundred and twenty children: And whereas the Council is satisfied, after due inquiry, that there are at least thirty children in regular attendance at such first mentioned school: Now these Presents witness, that the Council of Education doth hereby certify and declare the said school at _____ to be a certified Denominational School within the intent and meaning of the Public Schools Act of 1866.

In witness thereof, the Council of Education hath caused its Common Seal to be hereto affixed, at Sydney, in the said Colony, this
day of _____ in the year of our Lord one thousand eight
hundred and _____

(Certificate C, 30 Vic., 22, sec. 28.)

Know all men by these Presents, that the Council of Education, the Corporation created by the Public Schools Act of 1866, doth hereby certify and declare that the Denominational School situated at _____ in the Colony of New South Wales, called or known as _____, was an existing Denominational School at the time when the said Act came into operation, and that the said school is entitled to be, and is hereby to be, a certified Denominational School under the said Act.

In witness whereof, the Council hath caused its Common Seal to be hereto affixed, at Sydney, in the said Colony, this _____ day of _____
in the year of our Lord one thousand eight hundred and _____

E.

E.

The Very Rev. S. J. A. Sheehy, V.G., to The Council of Education.

Vicar General's Office,
Sydney, 13 June, 1867.

Gentlemen,

The Roman Catholic Clergy of this Diocese, being assembled in Conference, have adopted certain resolutions, of which I have the honor to enclose a copy, inasmuch as the third resolution contains their respectful request to the Council of Education.

2. They hope most earnestly that you will be able to gratify them and their people, by acceding to the request therein expressed for a supply of acceptable books.

3. They are acting in this matter from no desire to embarrass or complicate; rather their intention is to indicate at the outset a difficulty which is insuperable, because it is founded on motives which no inducements or discouragements can ever suffice to render inactive in the minds of Catholics.

I have, &c.,
S. J. A. SHEEHY, V.G.

Copy of Resolutions passed at a Conference of the Roman Catholic Clergy of the Archdiocese of Sydney, on the 13th June, 1867.

RESOLVED—1. That we, the Catholic Clergy of the Diocese of Sydney, can not and will not accept any series of books for use in our primary schools which shall not have received the sanction of our Archbishop.

2. That the series of school books published by the Christian Brothers, and also the series at present used in the Roman Catholic Schools of England, under the Privy Council System of Education, having been sanctioned by His Grace the Archbishop, either of these series will be accepted for use in our schools.

3. That the Council of Education be respectfully requested to supply our schools with books of either of the series mentioned in the foregoing resolution.

The Secretary to the Council of Education to The Very Rev. S. J. A. Sheehy, V.G.

Council of Education Office,
Sydney, 22 June, 1867.

Very Reverend Sir,

I have the honor, by direction of the Council of Education, to acknowledge the receipt of your letter, dated 13th June instant, enclosing copy of resolutions passed at a Conference of the Roman Catholic Clergy of the Archdiocese of Sydney, on the 13th June, 1867.

2. In reply, I am instructed to acquaint you that the resolutions will be considered at a special meeting of the Council.

I have, &c.,
W. WILKINS,
Secretary.

The Very Rev. S. J. A. Sheehy, V.G., to The Council of Education.

Vicar-General's Office,
27 June, 1867.

Gentlemen,

Referring to my letter of the 13th instant, on the subject of certain resolutions which the Roman Catholic Clergy of this Diocese felt themselves compelled to adopt in the matter of primary education, I have the honor to forward with this, copies of books from the two series mentioned in the second resolution as sanctioned by their Archbishop, and which they now submit to the Council, with their earnest and respectful request that a supply of them may be by the Council authorized, and furnished to the Catholic Schools.

I have, &c.,
S. J. A. SHEEHY, V.G.

The Secretary to the Council of Education to The Very Rev. S. J. A. Sheehy, V.G.

Council of Education Office,
Sydney, 29 June, 1867.

Very Reverend Sir,

I have the honor, by direction of the Council of Education, to acknowledge the receipt of your letter, dated 27th June instant, forwarding copies of books sanctioned by the Archbishop from the two series mentioned in the second resolution of the Roman Catholic Clergy of the Archdiocese of Sydney, transmitted in your letter of the 13th instant, and requesting that a supply of them may be authorized by the Council and furnished to the Catholic Schools.

I have, &c.,
W. WILKINS,
Secretary.

The

The Secretary to the Council of Education to The Very Rev. S. J. A. Sheehy, V.G.
Council of Education Office,
Sydney, 7 August, 1867.

Very Reverend Sir,

Adverting to my letter, dated 22nd June last, in which it was stated that the Council of Education would, at a special meeting, take into consideration the resolutions of the Roman Catholic Clergy of the Archdiocese of Sydney, transmitted with your letter of the 13th of that month, I have now the honor, by direction of the Council, to acquaint you that the question raised by your communication has formed the subject of lengthened and careful deliberation. Your letter of the 27th June and the school reading books which accompanied it, have also occupied the Council's attention.

2. In reply to these communications, I am instructed by the Council to remark that, both in your letter and the resolutions, it was implied, though not expressly stated, that the two series of reading books which the Council was requested to authorize and to furnish, viz., "Reading Lessons, by the Christian Brothers," and "Reading Books," published by Burns, Lambert, and Oates, were intended for use in the ordinary secular instruction of Certified Roman Catholic Denominational Schools, and that such use would not be limited to the hour set apart for special religious instruction, under Article 73, Section II, of the Regulations of 27th February, 1867.

3. The Council therefore deemed it necessary to minutely examine the books thus proposed for adoption, in order to ascertain if they possessed the characteristics required to admit of their use in the course of secular instruction, prescribed in Section 6 of the Public Schools Act of 1866, and contained in Article 62, section II, of the Regulations. That course was drawn up with a view to its adoption in all schools under the Council's supervision, without offence to the religious convictions of any pupils; and as, by the 9th section of the Act, all Certified Denominational Schools are to be subject to the same course of secular instruction as may be prescribed in reference to Public Schools, regard was had to this provision in selecting the reading books for the purpose since sanctioned by the Council. A course of secular instruction would fail to satisfy the necessary conditions, if books were used which inculcated the special doctrines or religious observances of any particular Church. That any other arrangement would be objectionable is evident from the 20th section of the Act, which provides that "no applicant shall be refused admission into any Public or Certified Denominational School on account of the religious persuasion of such applicant, or of either of his parents." The necessity for constructing the course of secular instruction on the principles before mentioned is further shewn by the fact that a large proportion of the Certified Denominational Schools are attended by children whose parents belong to different religious persuasions.

4. The Council found, on inspection, that both series of the reading books submitted for sanction contained lessons inculcating the special doctrines and religious observances of the Roman Catholic Church.

5. It follows, therefore, that to authorize the introduction of such books for use in the ordinary teaching would be to abolish the course of secular instruction in Certified Roman Catholic Denominational Schools; to extend the period of religious instruction to the whole of the school day; and, the religious instruction in all Certified Denominational Schools being, by Section 11 of the Act, left entirely under the control of the Heads of the Denominations to which such schools may belong, to deprive the Council of all right to interfere in the instruction. Further, the provisions of the 20th section of the Act would be rendered entirely nugatory, and proselytism would receive the Council's official sanction.

6. Such a course being in direct contravention of the letter and spirit of the Public Schools Act, the Council has no alternative but to decline to supply or sanction the reading books under consideration.

7. Should the Council be in error as to the wishes of the Clergy by whom the resolutions were passed, and have wrongly supposed that the reading books were intended for use during the hours of secular instruction, I am to point out that the Council's sanction is not required to the books to be employed during the period devoted to religious instruction, that matter being entirely under the control of the Head of the Denomination.

8. I am, moreover, instructed to observe, that any objections to the books already sanctioned by the Council for use in the secular instruction of Public or Certified Denominational Schools will, on being made known to the Council, receive full and reasonable consideration.

9. A proviso in Section 9 of the Public Schools Act empowers the Council, in the case of Certified Denominational Schools, to introduce into the course of secular instruction such modifications, not being inconsistent with any express provision of the Act, as may be judged to be expedient. As the Council is prepared to interpret this clause as liberally as is consistent with the leading principles of the Act, any proposal for a modification in the Daily Routine or Time-table prescribed in Articles 72 and 73, Section II of the Regulations, that may be desired to enable the pupils of the same denomination to receive instruction in the doctrines and observances of their Church, will be favourably considered by the Council, provided the arrangements proposed do not break the continuity of the secular teaching, and admit of the convenient absence of any children whose parents may object to their attendance.

I have, &c.,
W. WILKINS,
Secretary.

F.

Council of Education Office,
Sydney, 27 March, 1867.

Sir,

In compliance with the 7th section of the Public Schools Act, two copies of the Regulations, published in the *Government Gazette* of the 1st instant, have been forwarded to you, and I am now instructed by the Council of Education to furnish, for your guidance, a brief exposition of the objects which the Public Schools Act was designed to accomplish, and an explanation of the general scope and operation of the Regulations founded thereon.

The Public Schools Act was intended, in the first place, to extend the means of instruction throughout the Colony, so that by the various agencies which the Council will establish or support, every locality, however remote, and every family, however humble, may have the ameliorating influences of education brought within their reach. While the Public and Denominational Schools already existing will provide for the teaching of the great body of the population, the Provisional Schools will confer the same advantages upon newly settled or thinly inhabited localities; and the Half-time Schools, under itinerant teachers, will carry the benefits of instruction into remote and neglected districts which could not be reached by the more regular agencies.

But, concurrently with this extension of the means of instruction, the Council of Education further contemplates improvement in its character by its more systematic communication, and by its closer adaptation to the special needs of the pupils. Thus, while it is desired that every scholar on quitting school should be able to read and comprehend ordinary English prose, to write in a flowing and legible hand, to be acquainted with the grammatical construction of his mother tongue, the more useful arithmetical processes, and the physical conformation, natural resources, and industrial products of the Colony, it is further deemed necessary that some instruction should be given upon subjects of a less technical, though not less important, description. For example, the laws of health in individuals and communities; the principles which regulate family and social economy; such general notions respecting property, capital, and labour, and their relations, as may be rendered comprehensible to boys at school; and other questions of a similar kind, which have an important bearing upon the condition and prosperity of the industrial classes;—should be included in the programme of a good elementary school. It is of equal moment that some knowledge of the laws by which the community is governed should be widely diffused, in order that none may err through ignorance, but that all may feel equally interested in obeying their requirements, and in supporting the authorities to whom the duty of enforcing their provisions is intrusted.

Of even greater importance than effective and enlarged instruction, is the moral training of the youth of the Colony. The formation of habits of regularity, cleanliness, and orderly behaviour,—the inculcation of regard for the rights of property, public and private,—the growth of a spirit of obedience to the law, and respect for duly constituted authority,—the correct practical appreciation of the value of time as an element of worldly success,—the implanting of a love for patient and sustained exertion in some industrial pursuit,—and the development of a character for energy and self-reliance,—are all points of the highest value both to individual children and to the community at large. Honesty, truthfulness, temperance, and other virtues, may be cultivated by school discipline; reverence for sacred things may be fostered; and, without any violation of the strict neutrality required between conflicting creeds, a religious spirit may be educed by a teacher who exhibits in the performance of his own duty the promptings of religious influences.

A cursory glance at the course of secular instruction laid down in the Regulations will show that the teaching in schools supervised by the Council is designed to be systematic and progressive. It is probable, indeed, that in many schools the whole of this programme can never be fully carried out. For this, among other reasons, everything taught should be taught thoroughly, and in such a manner as to give the utmost cultivation to the pupils' reflective faculties that the nature of the subjects will admit of. If, in your teaching, these objects be constantly borne in mind,—if you steadfastly work with a view to produce such results,—and if you are unceasingly solicitous about what your pupils are becoming, as well as about what they know,—the expectations of the Legislature in passing the Public Schools Act will, in time, it is hoped, be realized.

The results of such teaching would speedily become manifest in the character of the individuals thus educated. Along with thoughtful intelligence, and, for their years, a mind well stored with information, they will have received such a moral and religious training as will prepare them for the easier and more cheerful performance of the duties incumbent upon them in their various relations as members of a family, of society, and of a state. The national character will thus be elevated and improved, while the concomitant advance in national prosperity will place New South Wales in a position of honor and respect. Such results the teacher should labour to secure; they are such as will most certainly earn for the teaching profession in New South Wales the thanks and confidence of the Legislature and people.

The various practical measures devised by the Council for the attainment of these objects may be ascertained by a careful perusal of the Regulations. The matters relating to Teachers merit your special consideration.

The elevation of the teaching profession to its proper rank in a civilized community has been regarded by the Council as one of the most effective means of improving the character of public instruction. To this end, the Regulations have been framed in such a manner as to afford to intelligent and faithful teachers opportunities of extending their acquirements, of improving their professional qualifications, and of raising their social position—thus widening and strengthening their influence for good.

To accomplish the aims shadowed forth in the preceding remarks, teachers are required whose personal attainments are high, whose moral character is above question, and whose religious principles may be discerned in every act of their lives. A high authority has pronounced that a teacher requires to know more than he is called upon to teach, in order that he may teach with intelligence and with taste; and this view has led the Council to arrange for the successive examination of teachers until they have gained a respectable rank in the profession. They must at the same time possess such moral qualities as will secure for them the respect of the community in general, and such professional skill as will place them above depreciatory remark. But, to be fully successful, other qualifications are necessary. The best teacher is liable to failure unless possessed of a calm temper, courteous manner, and sound judgment. Tact and discretion are not less necessary than sound principle, for the accomplishment of the objects which he will constantly have in view.

The multiform relations sustained by teachers in regard to their pupils, to parents, to Local Boards, and to the Council and its officers, impose upon them a variety of duties which, though not absolutely conflicting, are sometimes difficult to adjust in such a manner as to avoid risk of disagreement. Their duties to their pupils will have been gathered in general terms from the foregoing observations, and it is only necessary now to remind teachers of the deep responsibility they incur for the influence they exert upon the character and habits of those placed in their charge. To parents, teachers are responsible for the safe custody and proper training and instruction of their children. In their intercourse with parents, teachers should exhibit a becoming demeanour, patient attention to the communications made respecting pupils, a considerate regard for their wishes, and a desire to meet such wishes as far as is compatible with their duty to the Council. Towards the members of Local Boards their conduct should be characterized by politeness and respect, and by a desire to co-operate cordially with them in promoting the welfare of the school—maintaining, at the same time, a modest independence of manner, equally removed from servility on one hand, and from insolent assumption on the other. It will be seen from the Regulations that Inspectors are charged to treat teachers with the utmost courtesy. This conduct should be reciprocated by teachers, who will find in the Council's officers, friends ready and willing to assist them with advice and direction on all points connected with the management of their schools. But in cases of neglect, disregard of regulation, or manifest inefficiency, the Inspectors are required to enforce attention to duty and observance of rule, or to recommend the removal of teachers whose services are unproductive of useful results.

The inducements held out by the Council to every competent and assiduous teacher will, it is hoped, assist in rendering the performance of these duties not an irksome task, but an occupation in which he can engage with zeal and pleasure. With emoluments sufficient to maintain him in comfort and respectability,—with a position honorable and useful in itself, and secured to him as long as he may desire to retain it, unless lost by his own fault,—and with opportunities of benefiting the community to an incalculable extent,—the teacher's career, notwithstanding its acknowledged difficulties and trials, may be found to possess most of the characteristics which render other pursuits attractive to men of cultivated minds. But, in addition to motives of personal interest, the pleasure you will doubtless share in contributing to the better recognition of the dignity of your profession will not be without its influence; nor will the claims of your native or adopted country upon your earnest exertions in her behalf be disregarded. And finally, when it is remembered that you will be to the children around you the most prominent living exemplar of the idea of duty, the Council will confidently rely upon your efforts to fulfil every obligation with the strictest care.

I have the honor to be,

Sir,

Your most obedient servant,

W. WILKINS,

Secretary.

To School at

1867-8.

NEW SOUTH WALES.

REPORT

OF THE

COUNCIL OF EDUCATION

UPON THE CONDITION

OF THE

PUBLIC SCHOOLS

FOR

1867.

Presented to both Houses of Parliament, by Command.

By Authority:

SYDNEY: THOMAS RICHARDS, GOVERNMENT PRINTER.

1868.

[Price, 3s. 1d.]

423—A

THE COUNCIL OF EDUCATION to HIS EXCELLENCY THE GOVERNOR,

SUBMITTING

REPORT UPON THE CONDITION OF THE PUBLIC SCHOOLS FOR 1867.

To His Excellency the Right Honorable SOMERSET RICHARD, Earl of Belmore, a Member of Her Majesty's Most Honorable Privy Council in Ireland, Governor and Commander-in-Chief of the Colony of New South Wales, and Vice-Admiral of the same.

MAY IT PLEASE YOUR EXCELLENCY,

In conformity with the provisions of the Public Schools Act of 1866, Section 27, we, the Council of Education, beg to submit to your Excellency this Report upon the condition of the Public Schools under our superintendence during the year 1867.

A Progress Report which we had the honor to lay before His Excellency Sir John Young, in the month of August last, and which was submitted to Parliament, describes the steps taken to re-organize the educational system of the Colony. It is only necessary to add that the Council continued to devote its attention to this subject during the remainder of the year, and that the organization of the system is now tolerably complete, some few points of importance being yet under consideration. In carrying out the duties entrusted to the Council by the Public Schools Act, it has been found necessary to hold seventy-five meetings in the course of the year. The President has further attended at the Council's Office for the purposes indicated in Article 7, Section I, of the Regulations of 27th February, 1867.

The total number of schools in operation under the Council's superintendence in 1867 was 642, and the aggregate number of pupils in attendance was 64,655. The following Table exhibits the number of schools of each kind, and the number of pupils that attended at any time during the year:—

	Schools.	Pupils.
Public	288	28,434
Provisional	31	733
Half-time... ..	6	267
Denominational	317	35,306
Total	642	64,740

The total amount of school fees paid was £30,719 8s. 9d., and 8,603 children were instructed gratuitously.

PUBLIC SCHOOLS.

A Return shewing the number of Pupils on the Rolls and the number in Average Attendance at the 288 Public Schools is appended to this Report. Similar Returns respecting the Provisional and Half-time Schools are given in Appendices B and C, and some further general statistical information is comprised in Appendix D.

Reference

Appendix E.

Reference to the accompanying Schedule will shew that, during 1867, seventy-six applications were received for the establishment of Public Schools. This fact appears to the Council to furnish strong evidence of a wide-spread desire on the part of parents to take advantage of the increased facilities afforded by the Public Schools Act for the diffusion of education throughout the Country. The number of children for whom the schools applied for would provide the means of instruction is estimated at 6,000; the number of those whose attendance was actually promised was 4,202; and the number of persons who, as parents or guardians, signed the applications and undertook that their children should attend was 1,288. The proportion of each Denomination may be seen from the subjoined Table:—

Church of England	639
Roman Catholic	287
Presbyterian	175
Wesleyans	130
Others	57
Total	1,288

It is clear from this statement that, if left to their own unbiassed judgment, the laity of all Denominations would join in making applications for the establishment of Public Schools. If the members of any Denomination have hitherto appeared to give a less cordial support to the Public Schools Act than the general public, the fact is to be attributed to the exercise of special influences, the nature of which may be inferred from the correspondence appended to this Report respecting the establishment of a Public School at Nimitybelle.

Appendix F.

A Schedule of applications for aid to Provisional Schools instituted under the provisions of Section 13 of the Public Schools Act, will be found in Appendix G. In many of these cases, it is anticipated that, as the population increases or becomes more settled, the schools will be regularly organized as Public Schools.

The appointment of Itinerant Teachers in sparsely populated districts, as contemplated by the 12th Section of the Act, has received much consideration; and, by the close of the year, Half-time Schools had been established in twelve localities. The Council has now under consideration a code of regulations for the more systematic organization and conduct of schools of this class which, it is believed, may be usefully extended to large portions of the Colony in which other modes of education would not be practicable.

Appendix H.

The general condition of the Schools may be ascertained from the Inspectors' Reports appended. The Council is desirous to regard the Inspectors' estimate rather as a point from which future improvement may be measured, than as an absolute judgment of the efficiency of the Schools. During a period of transition, many irregularities occur and mistakes are committed, which a more settled state of things and a more intimate knowledge of rule would enable Teachers to avoid. For these and other reasons, the Council anticipates with confidence that marked improvement in the condition of Schools will be observed in future Reports.

The condition and efficiency of the Half-time Schools already in operation have not been reported upon by any of the Inspectors during the past year; and, believing that information on this important department of the Council's operations would be much valued, the Council invites attention to the following extract from the Report of Mr. E. Johnson, an Inspector who was specially instructed to visit these Schools since the commencement of the current year:—

“The teachers in charge of Half-time Schools are, with one or two exceptions, energetic and painstaking, and imbued with a proper enthusiasm for the work. Although not specially instructed to do so, I examined the attainments of the pupils in several of the Schools, and it afforded me much satisfaction to find that substantial work had been done. Even in the case of those Schools which receive but one day's instruction in the week, appreciable results had been produced. Had I been required to report in detail of each Teacher's labour, I do not hesitate to say that, having regard to the difficulties

difficulties under which the Half-time System has hitherto been carried on, that Report would have disclosed results of a gratifying kind. I have reason to believe that if the Half-time Schools be conducted upon the principles embodied in this Report, they will prove a success, and form no unimportant part of the educational machinery of the Colony."

BUILDINGS.

The amount paid by the Council towards the erection and repair of school buildings, the property of the public, was £6,941 12s. 1d. A further sum of £1,348 2s. 3d. was expended for similar purposes upon school buildings belonging to various Denominations, in fulfilment of pledges made by the late Denominational School Board.

It has been the aim of the Council, in providing plans of new school buildings, to secure designs as tasteful and appropriate as is consistent with judicious economy of the public funds. The question as to the best form and arrangement of a schoolhouse is still unsettled, and cannot, indeed, be determined without reference to local circumstances.

The dilapidated condition of the Public School buildings at Cleveland Street, their unsuitable material, and the insufficient accommodation they afforded, having been brought under the Council's notice, it was decided to erect new schoolrooms according to improved designs furnished by the Council's Architect, Mr. G. A. Mansfield. The foundation stone of this building was laid on 14th November, 1867, by His Excellency Sir John Young, and we anticipate that it will prove to be a model for imitation in all large city schools.

Besides the school buildings required for the new schools for which application was made in 1867, others were erected during the year for old established schools which had either been conducted in temporary premises, or which had increased beyond the accommodation afforded by the original schoolrooms. It is hoped that considerable improvement has thus been effected in the organization of some of the schools, and that a similar course will be followed in future years in the case of other schools.

As a rule, contributions to the extent of one-third of the total cost of new school buildings have been required from the residents in the locality. The principle has not been rigidly adhered to in all cases, the exceptions being chiefly those in which, from accidental causes, the people were in a state of great poverty.

BOOKS AND SCHOOL REQUISITES.

Under existing arrangements, the Council grants supplies of books and other requisites to an amount not exceeding, in any one year, the sum of 2s. for each child in daily average attendance; but, in the case of newly established schools, this rate is augmented so as to provide sufficient materials for the ordinary work. All books and other requisites supplied by the Council remain the property of the public, and are placed in charge of the respective Teachers.

Hitherto the supply of books has been entrusted to an agent who undertakes to forward them to all parts of the Colony. The defective means of communication with some districts, and other accidental circumstances, have caused considerable delay in furnishing some Schools with their supplies, but there is reason to believe that in very few instances is any inconvenience now felt on this ground. Requisitions for the books sanctioned by the Council have now been received from all the Schools under the Council's superintendence in which those books were not already in use.

The amount actually disbursed for books and school requisites in 1867, was £958 0s. 5d.; but as many accounts have not been received, this sum does not represent the whole charge under this head.

TEACHERS.

Considerable difficulty has been experienced in properly adjusting the teaching staff to the requirement of the several schools. In some instances, the number of Teachers was found to greatly exceed the proportion necessary for the efficient instruction of the pupils, while in other cases the staff was insufficient. It was, therefore, obviously desirable that

that some general rule should be established for regulating the number and kind of Teachers to be appointed in different Schools, according to the daily average attendance of pupils, and for defining their relations to each other. After considerable inquiry had been made, and the question had been fully discussed, the Council adopted the following Rules :—

- “ 1. In every School consisting of more than one department and conducted in the same premises, the Master shall be regarded as the *head*, having power to interfere for the better discipline and instruction of each of the departments into which the School may be divided, subject, however, in cases of doubt or dispute, to an appeal to the Inspector of the District.
- “ 2. This power of general supervision, however, shall not be accorded to a Master who may not possess the necessary ability or skill to exercise it for the general well-being of the departments concerned.
- “ 3. This exceptional rule shall also apply to any School consisting of more than one department, whether conducted in separate premises or not, where the Teachers in one of the departments are members of a religious order.
- “ 4. In any School consisting of more than one department, but conducted in separate premises, the Teacher in charge of each department shall be regarded as directly responsible to the Inspector alone for the proper and efficient management of that department.
- “ 5. In any School consisting of one department, in which two or more Teachers are employed, the Master shall be regarded as head of the School, and shall have control over the other members of the teaching staff whilst in the performance of school-duty.
- “ 6. In every separate Boys', Girls', or Mixed School, the proportion of Teachers to pupils shall be—

For an average attendance of at least—

50 pupils	Teacher and a Pupil-Teacher.
80 pupils	Teacher and 2 Pupil-Teachers.
100 pupils	Teacher, Assistant, and Pupil-Teacher.
140 pupils	Teacher, Assistant, and 2 Pupil-Teachers.
180 pupils	Teacher, Assistant, and 3 Pupil-Teachers.
240 pupils	Teacher, 2 Assistants, and 2 Pupil-Teachers.
300 pupils	Teacher, 2 Assistants, and 3 Pupil-Teachers.

- “ 7. In every Infant School having an average attendance of at least—

60 pupils	Teacher and Pupil-Teacher.
100 pupils	Teacher and 2 Pupil-Teachers.
150 pupils	Teacher, Assistant, and 2 Pupil-Teachers.
200 pupils	Teacher, 2 Assistants, and 2 Pupil-Teachers.”

In carrying out these Rules, the Council has been desirous to proceed cautiously so as to avoid injuring, by sudden removals, the Schools which have hitherto been accustomed to the services of a certain staff of Teachers.

At the close of 1867, there were in the service of the Council—

659	Principal Teachers or Heads of Departments.
155	Assistant Teachers.
157	Pupil Teachers.

Total.....971

The organization of the Training School is still less complete than could be desired, and the existing arrangements for its conduct must still be regarded as provisional. The whole question as to the training of Teachers requires careful deliberation; and, before any permanent system is adopted, it seems to the Council that further experience should be gained. In the mean time, the arrangements in force appear to work with reasonable efficiency.

While

While applicants for admission to the Training School are sufficiently numerous, it is to be regretted that they are not as a body better prepared for the course of instruction upon which they are required to enter. The whole number of persons who made application in 1867, was 181, of whom 112 were received. Of the remaining 69, 10 failed to appear at the entrance examination, 3 were disqualified on the ground of age, 2 withdrew their applications, and 5 who had some previous experience in teaching were at once appointed to schools which would otherwise have been closed for a lengthened period. Forty failed to pass the entrance examination, being somewhat more than 22 per cent. of the whole number of applicants. Of the 112 admitted, 65 were males and were females.

The numbers of each Denomination were,—

Church of England	42
Roman Catholics	30
Presbyterians	11
Wesleyans	17
Others	12
			112

The subjects of instruction were those prescribed in Article 25, Section II, of the Regulations, excluding however those specified for the second quarter. In addition to the instruction imparted on these subjects, the candidates received some practical training while attending the Model School. As regards conduct and attention while under instruction, the candidates were, in general, favourably reported of by the Training Master and other persons charged with their supervision.

At the expiration of the usual period the candidates were again examined with a view to determine the classification to which they were respectively entitled. The subjoined Table exhibits the number that obtained each grade of classification :—

	CLASS III.		
	Section A.	Section B.	Section C.
Males	12	18	26
Females	8	11	22
	20	29	48

Four of the candidates were appointed to Schools before their term of training had expired ; two retired on account of bad health ; one died before his examination was completed ; one was expelled ; one absented herself from examination ; four failed to pass ; and two were retained to undergo further instruction.

In consequence of the occupation of the Inspectors' time, no examinations of Teachers were held during the year. The provisional certificates granted under the Minute of 29 July, 1867, cited in our Progress Report, are consequently still in force. As the steps taken by the Council in this matter appear to have been misunderstood, it may be desirable to explain the grounds on which the certificates awarded by authorities beyond the Colony were not recognized. In the first place, it may be remarked that the Council was called upon to decide the classification of Teachers or Applicants holding certificates obtained in New South Wales, Victoria, Queensland, England, Ireland, Scotland, and Canada. As the requirements for the different grades vary greatly in all these countries, to adopt all the certificates indiscriminately would be eminently unjust to superior Teachers, inasmuch as it would place men of widely differing qualifications upon the same footing. Such a step would be calculated to defeat the object contemplated by the award of certificates—the encouragement of superior attainments and practical skill. Again, the certificates granted in some countries vary according to the period at which they were issued. In England, for instance, the value of a certificate has greatly declined of late years, and a First-class Certificate obtained in 1865 by no means implies equal ability with that indicated by one of the same grade awarded in 1855. An opposite process has taken place in Ireland, where the late certificates are of more value than the earlier

earlier. In every one of the countries above enumerated, a change of some kind has occurred in the value of certificates. Further, it is found that high certificates have been granted in these countries too exclusively on the ground of attainments, and without sufficient reference to practical skill, although the latter branch of a Teacher's qualifications is equally essential with the former. The Victorian Board of Education seem also to have experienced the difficulty felt by the Council. In their Fifth Report, the Board state:—

“We believe that the Teachers now employed in Common Schools are, as a body, considerably superior to those who were employed when the Common Schools Act came into operation. Under the late Boards of Education, there were no regular and systematic examinations. In the case of one Board, there had not been any general compulsory examination for several years previous to the passing of the Common Schools Act; and under the other, a large number of Teachers were exempted from examination on the production of Home certificates, which did not, in practice, furnish sufficient evidence of their holders' qualifications; and many others were exempted from examination altogether on the grounds of length of service, or of their examination in certain subjects for honours, which gave no proof whatever of their qualifications to teach in Common Schools.”

Impressed with these considerations, the Council resolved to recognize no certificates but those granted by the late Board of National Education in the Colony, as these were determined by qualifications closely approximating to those required by the Regulations, and as they demanded practical skill commensurate with attainments.

In order to prepare for the examination of Teachers who desire to obtain the higher class certificates, the Council has taken steps to constitute a Board of Examiners; and the Rev. Dr. Badham, of the Sydney University, and A. B. Weigall, Esq., of the Grammar School, have expressed their willingness to act in that capacity. The action of the Council in this matter was stayed, however, in order to afford time for the consideration of a proposal to substitute for the Teachers' Examination in Alternative Subjects, the Public Examinations held under the authority of the University. The great amount of business of a pressing nature which has required the attention of the Council, has not allowed sufficient time for a full discussion of the question, although the Council is disposed to view the suggestion favourably, if certain practical difficulties can be lessened or removed.

The amount paid for Teachers' salaries during the year, in all schools, was £61,805 13s. 10d. Some progress has been made in the introduction of a uniform principle in the regulation of Teachers' salaries, so that all Teachers possessing similar qualifications may be paid at the same rate by the Council. A Teacher's salary, under this arrangement, is a measure of his qualifications, and the prospect of increased remuneration becomes a stimulus to improvement.

The amount of fees paid in Public Schools, £14,585 2s. 11d., is the property of the Teachers; and, in cases where more than one Teacher is employed in a School, the fees are shared among them in proportion to their respective salaries.

No general scale of fees has yet been adopted and authorized to be paid in all Schools. The result of much inquiry on this subject has been to shew that the distress consequent upon floods and other calamities, together with the widely varying principles on which gratuitous instruction was formerly given in different Schools, has rendered it difficult to introduce a uniform scale, without causing much inconvenience to both Teachers and parents. Two scales have been submitted for the Council's consideration by the Inspectors after mutual consultation, but as yet the Council has been unable to decide upon the adoption of either.

The provisions of the Public Schools Act on this head do not yet appear to be fully understood, and misconceptions have arisen in the minds of Teachers and parents as to their respective powers and duties; but the Council anticipates that further experience will in a great measure remove the ground of dispute. The fact that 2,968 free scholars

scholars attend the Public Schools of the Colony, may perhaps be considered as indicative of the existence of a large amount of poverty; but, except in a few districts which have suffered most severely from floods and bad seasons, the omission to pay school fees seems to arise less from inability than from disinclination or indifference on the part of the parents. In this belief, the Council has hitherto declined to accede to proposals to pay Teachers for the instruction of free scholars; and, bearing in mind the example afforded by the neighbouring Colony of Victoria, where the sum paid for this purpose amounted to £11,380 10s. 6d. in 1866, the Council is desirous to avoid introducing a practice that may ultimately become a serious burden upon the Parliamentary grant for education. The Board of Education in Victoria in their Report for 1866 remark—

“In previous Reports we have alluded to the difficulties surrounding this subject, and there can be no doubt that the privilege of free education to destitute children is greatly abused. Our Inspectors are unanimously in favour of the abolition of the payment for destitute children, and we feel that the whole subject requires special consideration.”

Much importance is attached by the Council to the employment and training of Pupil Teachers, a class from whom the teaching body in the Colony will, in all probability, be largely recruited. The number employed in Public Schools, 78, is already considerable, and the Council is on that account induced to regard their training with some anxiety. They can only be appointed in large Schools under Teachers whose classification gives evidence of the possession of the knowledge and skill required to impart to Pupil Teachers the rudiments at least of their professional education. The periodical reports upon the conduct and proficiency of the Pupil Teachers tend to shew that they are a most useful and, for their circumstances, efficient body, who give promise of becoming in the future even more valuable to the Country.

The subjects of Elementary Singing and Drawing being entirely new to a large proportion of the Schools, the Council appointed special Teachers for these branches. It is the duty of these Teachers to give instruction to candidates in the Training School, and to the children attending the Model School, and to visit all other schools within their circuit, as frequently as circumstances permit, for the purpose of assisting the regular Teachers by their advice and example. At present these arrangements are confined to the Sydney District, but the Teachers in the vicinity of Windsor have been instructed in both subjects by a competent master from Sydney, who visits them for this purpose every Saturday. As these arrangements have been in force but for a limited period, it would be premature as yet to discuss the result of the experiment; but the Council trusts that the cultivation of the arts of Singing and Drawing will become general, and that the beneficial influence which they exert will be widely felt.

INSPECTION.

The duties performed by the Inspectors in the course of the year are minutely Appendix H. detailed in their Reports, from which it will be seen that their time was much occupied in the extraneous duties incidental to the change of systems, and that in some districts the examination of Schools was not fully completed on that account. No report has been furnished upon the Schools in the Goulburn District, the Inspector, Mr. Harris, being unable from serious illness to attend to official business.

The trying position in which these officers have been placed has required of them the exercise of great judgment and forbearance, as well as energy and professional skill. On the whole, the Council believes that they have fairly met the claims on their ability, and that their functions have been discharged faithfully, and in such a way as to benefit the Schools and Teachers placed under their supervision.

The Council having found it necessary to withdraw Mr. Gardiner, the Senior Inspector, from the actual work of Inspection, and to confine his attention exclusively to the Revision of Examination Papers and of Inspectors' Reports upon Schools, appointed him to the office of Examiner, to which those duties properly appertain. To complete the Inspectoral Staff, the Council appointed Mr. J. S. Jones, who had previously acted for some time as Training Master, to be an Assistant Inspector.

The continued illness of Mr. Harris having rendered the services of another Inspector necessary, the Council selected Mr. E. H. Flannery, Teacher of the Certified Denominational Roman Catholic School at Yass, and appointed him as Assistant Inspector, in accordance with the understanding previously arrived at, that no person should be placed in sole charge of a District until he had acquired some practical acquaintance with his duties under the direction of an experienced Inspector. Mr. Flannery had been recommended to the Council for this appointment solely by his success as a Teacher and the general estimation in which he was held by all classes of the community in which he lived.

The Districts under the charge of the several Inspectors in 1868, will be as follows:—

Sydney	{ E. Johnson E. H. Flannery
Albury.....	J. Coburn
Armidale.....	J. S. Jones
Bathurst.....	J. M'Creddie
Camden	J. Huffer
Cumberland	A. L. Forbes
Goulburn	W. M'Intyre
Maitland	W. Dwyer
Newcastle	J. W. Allpass

LOCAL SUPERVISION.

During the period covered by this Report, the Council recommended for appointment, in accordance with the provisions of Section 22 of the Public Schools Act, 235 Public School Boards, comprising 1,066 individuals. With very few exceptions, the persons appointed to this office have cordially co-operated with the Council for the welfare of the schools of which they have the oversight; but, after making all necessary allowances for imperfect acquaintance with their powers and duties, for want of time and absorption in private business, it would appear that considerable improvement is still to be desired in the mode of exercising their functions. It must not be supposed that there is any lack of interest *felt*, but it is rarely manifested in energetic and judicious action except in the case of new schools. The want of means other than those contributed by themselves, is perhaps the most serious obstacle to effective local administration, and Members of Public School Boards are naturally disinclined to undertake the whole expense of works from which they, in most cases, derive no direct benefit, although they willingly assist in the establishment of schools and sometimes subscribe a very large proportion of the whole cost. For this reason, the Council has endeavoured to devise some means by which Local Schools Funds could be raised, to be administered by the various Public School Boards, and to be appropriated in payment of the many incidental expenses which are found by experience to be necessary. The difficulties which surround the subject have hitherto prevented the Council from arriving at a satisfactory conclusion, but it will receive further consideration hereafter.

FINANCE.

Appendix I.

A Balance Sheet is appended to this Report, shewing the receipts and disbursements during the year. It may be remarked upon this document that, while the system was in course of re-organization, the expenditure was less under control than it will be when all the arrangements have settled down into regular order. Some items of expenditure incidental to the initiation of the new system, and which have added materially to the expenses, will not appear in future accounts. Among these may be specified the charges for buildings and repairs, for travelling expenses, for books and printing, and for miscellaneous expenses, many of which were incurred for the use of the schools generally, although it was not practicable to separate the different amounts chargeable to individual schools, the materials purchased being obtained in large quantities and distributed as occasion required.

CONCLUDING

CONCLUDING REMARKS.

ON reviewing the facts set forth in this Report, the Council believes that the conclusion is evident, that the Public Schools Act is generally acceptable, and that it fairly meets the educational wants of the country. That in the first year of the operation of the Act, and before its provisions could have become fully and extensively known, no less than 129 applications should have been made for the establishment of Schools is a proof both of the necessity for increased means of education and of the public confidence in the legal provisions by which those means are to be supplied.

Although there is every reason to expect that applications for new Schools will continue to be made in 1868 at the same rate as hitherto, the fact cannot be concealed that extensive districts of the Colony are still entirely destitute of education. Omitting the provision requisite to supply the natural increase of the population and the re-distribution occasioned by the opening up of new tracts of country, the squatting districts generally will need a large development of educational agencies. Maneroo, the Murray District, and the great plains to the west and north are in this position. Judging by the results already attained, the Half-time System seems eminently adapted to meet the peculiar requirements of these districts, and attention will be given to this part of the Council's operations with a view to extend the system as far as practicable.

A further extension of the means of education may be accomplished by means of the provision authorized to be made for boarders in Public Schools under the 14th section of the Act. Although inquiry has been made on this head, in order to collect the information necessary to guide the Council, it has not hitherto been found practicable to make arrangements for this purpose in any existing Public School.

Some re-distribution of the means of education supplied at the public expense will be necessary in the course of 1868, the number of schools in some localities being in excess of the requirements, while large districts are entirely destitute. The re-arrangement which this circumstance suggests, would have the further effect of economizing the public funds, as more places would be supplied with education without additional expense.

While persuaded that the Public Schools Act is generally appreciated by all classes in the Colony, and that as much has been effected during the past year as could have been reasonably expected, the Council is aware that much remains to be accomplished both in the internal organization and in the gradual extension of the Public School System. The result of the Council's labours during the current year will, it is hoped, show that progress has been made in both directions.

In conclusion, we have pleasure in referring to the following extract from the dispatch of His Grace the Duke of Buckingham and Chandos, dated 26th March, 1867 :—

“ With regard to the Act No. 22, to make better provision for Public Education, I must express my satisfaction that a decision has been arrived at on a matter of so much difficulty and importance to the welfare of the Colony, and I hope that the Act will be found to work well and satisfactorily to parties of all religious persuasions.”

We submit this as our Report upon the Public Schools for the Year ending 31st December, 1867 ; and, in testimony thereof we have caused our corporate Seal to be affixed hereto, this thirtieth day of March, one thousand eight hundred and sixty-eight.

(L.S.)

APPENDIX F.

CORRESPONDENCE relating to the establishment of a Public School at Nimitybelle.

GOULBURN DISTRICT.

Report upon application for the establishment of a Public School at Nimitybelle.

1. The majority of the persons who signed the annex to application for the establishment of a public school at Nimitybelle are Roman Catholics, almost all of whom now refuse to send their children to the proposed school, as the Most Rev. Archbishop Polding, and the Roman Catholic clergyman of the District—Rev. M. Kavanagh—have, in most emphatic terms, commanded them to give no support to a public school, under pain of religious censure.

2. While at Cooma, the Rev. M. Kavanagh informed me that he had applied to the Council of Education for a teacher for the Roman Catholic School at Nimitybelle; and I am of opinion that the efforts made to deter the Roman Catholic portion of the inhabitants from availing themselves of the advantages to be derived from the establishment of a public school, arise from the expectation that the Council will grant a salary for a Roman Catholic Denominational school, a certificate for which was shewn to me by Rev. M. Kavanagh.

3. The Roman Catholic Denominational school at Nimitybelle was discontinued twelve months since; and I cannot ascertain that any steps were taken towards its re-establishment, until the inhabitants applied for a Public School; nor do I believe that the minimum average daily attendance for a Denominational school, specified in the Public Schools Act, could be maintained, should the Council of Education sanction its re-establishment.

4. Under present circumstances, I do not consider that the establishment of a Public School at Nimitybelle could be successfully carried out.

Nimitybelle, 14 March, 1868.

E. H. FLANNERY,
Assistant Inspector,
Goulburn District.

The Secretary to the Council of Education to David Bell, Esq.

Council of Education Office,
Sydney, 24 January, 1868.

Sir,

I have the honor, by direction of the Council of Education, to acknowledge the receipt of your formal application, dated 31st December, 1867, for the establishment of a Public School at Nimitybelle, signed also by the gentlemen named in the margin.

2. In reply, I am instructed to acquaint you that the Council sees no objection to the establishment of a public school at Nimitybelle. Notice of the application has therefore been sent for publication in the *Government Gazette*, in accordance with the requirements of the 24th section of the Public Schools Act of 1866.

3. A further communication will be made to you when the necessary notice has been published.

I have, &c.,
W. WILKINS,
Secretary.

B.

Application for the Establishment of a Public School at Nimitybelle.

To the Council of Education.
Gentlemen,

31 December, 1867.

We, the undersigned residents at or around Nimitybelle, request that you will be pleased to establish a public school at that place, under the provisions of the Public Schools Act of 1866.

For this purpose we have provided the requisite buildings, as hereafter described; and we are prepared to execute a lease of these premises for a term as required, at a nominal rent.

We have, &c.,

Local Committee. { David Bell, Nimitybelle.
William Jurvine, Curry Flat, near Nimitybelle.
Samuel McDonald, Nimitybelle.
Donald Campbell, Thistle Brook, near Nimitybelle.
William Hayes, Nimitybelle.
A. McDonald, near Nimitybelle.

Information to be supplied by Local Committee.

- 1.—Describe the position of the proposed school. In or near the centre of Nimitybelle.
- 2.—What other schools, maintained or aided by the Council of Education, are within two miles of the site of the proposed school? None.
- 3.—If none are within two miles, what is the distance of the nearest school? —
- 4.—Are there any primary schools, not aided by the Council of Education, within two miles of the proposed school? If so, of what character, and how attended? None.
- 5.—State the number of children, from four to fourteen years of age, living within a radius of two miles of the site of the proposed school, e.g. :—

Boys	19
Girls	12
Total	31
Religious Denominations—	
Church of England	5
Roman Catholic	23
Presbyterian	3
Total	31

(As per Memo. there are considerably more.)

DAVID BELL,
(On behalf of Local Committee.)

Particulars

Particulars relating to the proposed Public School at Nimitybelle.

Building.	Number of Pupils in actual Attendance, or expected to attend.						
	Boys.	Girls.	Total.	C. E.	R. C.	Pres.	Total.
Two buildings offered, neither yet accepted—cannot therefore describe, but will procure those most suitable.	19	12	31	5	23	3	31

DAVID BELL,
(On behalf of the Local Patrons.)

Land suitable for the erection of a Public School at Nimitybelle.

Town Reserve, about 5 acres in extent, between blocks 49 and 50, bounded by Monaro-street South and Clarke-street North.

This portion was pointed out to Mr. Inspector Harris, who, I am informed, approved of same. It would be well that the same was granted for the purpose of a Public School. There will be no difficulty in procuring the necessary proportionate cost of erecting a school and residence from the inhabitants. Respectfully submitted,—

DAVID BELL
Nimitybelle.

Annex to Application for Establishment of a Public School at Nimitybelle.

We, the undersigned parents (or guardians) of children residing within the undermentioned distances from the site of the proposed Public School at Nimitybelle, hereby undertake that our Children, whose names are inserted below, shall attend the said school.

APPENDIX H.

INSPECTORS' REPORTS.

GENERAL REPORT.—ALBURY DISTRICT.

INSPECTOR'S REPORT upon the Public and Denominational Schools of the Albury and a part of the Bathurst District, visited during the year 1867.

I HAVE the honor to submit, for the consideration of the Council of Education, the following Report upon the schools visited by me during the year 1867:—

I.—AMOUNT OF INSPECTION.

All the schools in the Albury District, with one exception, have been at least once inspected during the year. In accordance with the instructions of the Council, I also visited and reported upon twelve schools in the Bathurst District. During the year, applications have been received from the following places for the establishment of Public or Provisional Schools:—*Public*—Adelong (Upper), Adelong (Lower), Bungowannah, Coramundra, Lake Albert, Mount Pleasant (Wagga Wagga), and Tumberumba; *Provisional*—Gilmore Creek, Terryamah, Urana, and Womargama. Several applications may be shortly anticipated from other localities in the Albury District.

During the early part of the year, I was employed in visiting, for the purpose of certification under the Public Schools Act, the various Denominational Schools in the district. On the completion of this work, I was called upon to attend the Conference of Inspectors, held in March and April in Sydney. The rest of the year has been occupied in inspecting schools, visiting localities for the purpose of reporting on applications, making inquiry anent the means of education, preparing reports, and conducting the general correspondence and business connected with the schools in the district.

The following summary will shew the amount of work done during the year:—

Number of Public and other schools inspected	39
Number of pupils enrolled in those schools	1,983
" present	1,410
Number of visits of inspection	52
Number of visits of inquiry	49
Number of teachers and pupil teachers examined	7
Number of miles travelled	4,851

Annex A.

The

The subjoined table contains a list of the schools and places visited for purposes of inspection and inquiry :—

Public Schools.	Public Schools.	Places visited for inquiry.
<p><i>Albury District.</i> Adelong. Adelong (Upper). Albury. Primary Schools. Infants' do. Balranald. Black Range. Bowna. Deniliquin. Enston. Gundagai. Howlong. Moama. Moulamein. Thurgoona. Tumut. Wagga Wagga. Boys' School. Girls' do. Wentworth.</p> <p><i>Bathurst District.</i> Binalong. Crowther (Prov.)</p>	<p>Forbes. Grenfell. Marengo. Murrumburrah. Young.</p> <p>DENOMINATIONAL SCHOOLS. <i>Albury District.</i> Albury R.C. Albury C.E. Corowa C.E. Gundagai R.C. Jugiong R. C. Mulwala C.E. Tumut R.C. Tumut C.E. Wagga Wagga R.C.</p> <p><i>Bathurst District.</i> Burrowa R.C. Burrowa C.E. Currajong Wes. Lambing Flat R.C. Young C.E.</p>	<p>Adelong (Lower). Adelong (Upper). Bethungra. Big Ben. Billabong. Bungowannah. Collendina. Conargo. Coolac. Coramundra. Crowther. Gerogery (Huon). Gilmore Creek. Gocup. Jindera. Lake Albert. Moorna. Moorwatha. Mount Pleasant. Mullengandra. Murrumburrah. Piney Range. Teramiah. Tocumwal. Tumberumba. Urana. Womargama. Wombat.</p>

Bungowannah public school, which was opened during my absence in the Bathurst District, was closed for the Christmas vacation previous to my return to Albury. It was not therefore inspected.

II.—CHARACTER OF THE INSPECTION.

The inspections made, and reports furnished, of all schools, have been of the General and Regular kinds. The time spent in examining each school has varied, according to circumstances, from about four to seven hours. The situation of the building, the general condition, and the supply of furniture, apparatus, and books, together with the occupation of the pupils, as shewn in the time-tables and programmes, and the condition of the school records as to neatness and correctness, have all been carefully observed and noted; the discipline under the several heads of punctuality, regularity, cleanliness, order, and government, has been scrutinized; and the attainments of the pupils have been tested in accordance with the requirements of the Standard of Proficiency sanctioned by the Council. The proficiency of the pupils has been estimated by oral and written examination, the object having been to ascertain, as far as possible, the knowledge of the various subjects possessed by each individual member of the class, so as to obtain data for the formation of an opinion as to its average condition. Defects observable in the organization, discipline, or instruction, have been pointed out, and suggestions made, either verbally or in writing, for their correction. The habits of the children, as exhibited in their general conduct—whether quiet, orderly, attentive, promptly obedient, self-reliant, cheerful, and respectful, or the reverse—together with their powers of observation and thought, and the general spirit of the school, have all been watchfully observed, and carefully considered in forming a final estimate of the moral and mental influence of the school.

III.—ORGANIZATION.

Public Schools.

Annex B.

Situations.—The situations of about seven-eighths of the schools rank from fair to good. The sites are, therefore, on the whole, satisfactory.

Buildings.—About two-thirds of the school buildings vary from fair to good. There is a very marked distinction between the buildings which are, and those which are not, vested in the Council; the former being decidedly superior to the latter, which are often of a temporary and unsuitable character. This discrepancy will probably shortly disappear from the Albury District, as the promoters of non-vested schools are almost unanimous in their desire for vested schools, as soon as circumstances will permit of their establishment.

Playgrounds.—Three-fifths of the schools have good or fair playgrounds, but about one-fourth of them are destitute of fencing. Nearly all are furnished with the necessary out-houses, though some of them are only tolerably suitable.

Furniture and Apparatus.—The furniture of three-fifths, and the apparatus of one-half of the schools, range from fair to good. Generally speaking, the vested have a marked superiority over the non-vested schools in these respects, one-fourth of the schools—all non-vested—being very defective in these points. Since their inspection, however, improvements have been effected in several of them.

Books and Records.—The supply of books in the majority of schools may be regarded as satisfactory, and the school records are, in general, neatly and accurately kept.

Denominational Schools.

Situations, Buildings.—The situations of nearly all the schools are reasonably satisfactory. If the buildings in which the schools are conducted were proper school-rooms, there would be little ground for dissatisfaction under this head; but of the fourteen schools inspected, seven are held in churches, and two others in premises rented by the teachers themselves. The following are the remaining five schools which are built and organized expressly for school purposes :—Albury District—Corowa C.E. and Jugiong R.C.; Bathurst District—Burrowa R.C., Currajong Wes., and Young C.E.

Playgrounds, Furniture, and Apparatus.—The playgrounds are generally suitable, furnished with the necessary out-houses, and properly fenced. The supply of furniture and apparatus in about one-half of the schools is reasonably sufficient, but the arrangement is often objectionable, and the furniture not of the most suitable kind.

Books.—Owing partly to the inability of the Council's Agent to meet the sudden and large demand for books, and from other causes, some of the schools, when inspected, were scantily furnished in this respect, and the examination of the pupils in reading had to be conducted in books not sanctioned by the Council. This state of matters is now, however, remedied.

Registers.—In about one-third of the schools, the registers are not in a satisfactory state. This, in some instances, has arisen from ignorance on the part of the teacher; but in others it appears to have been caused by carelessness and sheer neglect. The next inspection of these schools will probably disclose a considerable improvement in the keeping of these records.

IV.—DISCIPLINE.

Public Schools.

Punctuality.—On the whole, the punctuality of the pupils may be regarded as fairly satisfactory. Where this is very defective, I am disposed to think that, as a rule, the teacher is himself to blame. Experience and observation alike incline me to the opinion that, where the teacher is himself uniformly punctual, and the school in organization, discipline, and instruction is attractive, there is usually little to complain of in this respect. Much may be done in this direction by the earnest and judicious teacher.

Regularity.—The regularity in about three-fourths of the schools varies from fair to good. In the remainder, irregularity of attendance continues to be the main obstacle to the progress of the pupils. It varies greatly, however, according to the pursuits of the people in the district in which the school is situated. In mining and agricultural localities the work of the teacher is much impeded from this cause, especially at certain seasons of the year. I was particularly struck with this fact when visiting certain schools established among mining communities in the Bathurst District. I am strongly of opinion that nothing short of the establishment of a compulsory system will meet or satisfy the requirements of the case. So long as there are parents who are ignorant, indifferent, or avaricious, there will be some who, unless compelled by law to act otherwise, will continue to keep their children wholly or partially away from school, on the most frivolous pretexts, or for the most mercenary reasons.

Cleanliness.—In the majority of schools the cleanliness is satisfactory, judging from the appearance of the children when inspected. It is difficult, however, to form a correct opinion as to the normal condition of a school from an inspection of which previous notice has been given, as the school and pupils are sure then to look their best. The general state of a school in this respect is best ascertained by incidental inspection.

Order.—Seventeen of the twenty-five schools examined range from fair to good in point of order. In some cases the organization is such as to interfere very materially with the maintenance of proper order, but in most instances, schools are defective in this respect, from inattention on the part of teachers to those petty details which all go to its formation. Uniformity of movement, prompt obedience to command, and sustained attention by the pupils, are not sufficiently insisted upon. Drill is a valuable auxiliary towards this end, but it is practised in only a few schools.

Government.—Though not entirely disused, corporal punishment is not often resorted to in the government of schools. It is generally felt that it should only be appealed to after other modes of punishment have been exhausted to no purpose. Where the teacher is a man of firmness, energy, and decision of character, and at the same time habitually self-controlled and uniformly watchful and prudent, the application of the rod will seldom be necessary. If good order be maintained, the occupation well regulated, and constant vigilance exercised, little trouble need be experienced with the government. On the whole, the condition of the schools visited is fairly satisfactory, there being two-thirds of them varying from fair to good.

Denominational Schools.

Regularity, Punctuality, Cleanliness, Order and Government.—The regularity of one-half of the schools visited is estimated at from fair to good, and the same estimate is formed of the punctuality of about one-third. In regard to cleanliness, eleven of the fourteen schools inspected rank from fair to good. The order and government also of about one-third may be considered in a reasonably satisfactory state. From this summary, it will be observed that while these schools, in point of cleanliness, are in a fair condition, they fail, on the whole, to come up to a reasonable standard under the other headings. This failure is, in my opinion, partly to be attributed to defective organization, want of training on the part of some of the teachers, and the former almost total absence of inspection of the schools situated in this district, by reason of which even trained teachers have fallen into apathetic and careless habits, which have acted prejudicially upon their schools.

The general remarks made with reference to Public Schools are at least equally applicable to those now under consideration, but they need not be here repeated.

V.—INSTRUCTION.

Public Schools.

Classification.—The classification of more than three-fourths of the schools ranks from fair to good. Generally speaking, not more than three classes are organized in country schools under the charge of one teacher, and a fair attempt is made, in the majority of them, to have the pupils in the same class fairly equal in point of intelligence and general attainments. There is sometimes a tendency, however, to subdivide the first class to too great an extent. This class, in a school conducted by one teacher, should never contain more than two divisions.

Occupation.—Three-fifths of the schools provide from fairly to well for the occupation of the pupils. In some, however, the "time-tables," but especially the "programmes," are defective. In regard to time-tables, some fail in arranging the subjects for the various classes, so that the oral lessons do not clash with each other; others do not allot time to the subjects according to their relative importance; whilst others, again, are wanting in precision and explicitness. In only one school, however, was there no time-table suspended. Thoroughly intelligent programmes are rarely met with. They are not often properly graduated, and are frequently very vague and indefinite. The registers of lessons are not well kept in most instances. Few teachers enter the lessons sufficiently in detail to be of much use in judging of the instruction of the school. The mutual relation and value of these instructional documents do not seem to be well understood or appreciated—the time-table as pointing out definitely what and how much time shall be devoted to each particular subject, the programme as shewing for a quarter the amount of work to be done weekly in each subject, and the register of lessons as recording for *each day* what work is actually done. The importance and value of such documents cannot be over estimated in regard to the efficient instruction of the school.

Methods.—The methods in use vary much, according to the ability and practical skill of the teacher. Except in the case of untrained teachers, whose methods are often unsuitable, they are generally of the modern kinds, but some fail in their application, from want of tact, and lack of knowledge, experience, or energy. On the whole, the methods are fairly suitable. The best methods sometimes fail, however, to produce good results, from the absence of penetrative power in the teaching. It is not enough to communicate to the pupil; care must also be taken that the instruction be received and assimilated. For the purpose of ascertaining this, close pertinent questioning should be regularly practised. The neglect of this is apparent from the remarks sometimes made by teachers, when the Inspector fails to elicit from the pupils some information required from them. It is said, "Well, they should know that; they have often been told all about it." This may be perfectly true, and yet the teaching has failed evidently from the want of searching examination on the lessons given. Frequent recapitulation of previous work is necessary to fix the instruction in the pupil's mind, and also to enable the teacher to test the results of his labours, which every judicious teacher will do. No lesson should be considered as mastered, unless it can be reproduced in substance, either orally or in the form of an abstract on slate.

Subjects.—The subjects taught in the schools are reading, writing, arithmetic, grammar, geography, object lessons, needlework, Scripture, and, occasionally, drawing and vocal music; in a few, geometry, mensuration, algebra, and Latin are added to these.

Reading.—Except in the upper classes of a few schools, good reading is seldom heard. There is not much to complain of in the pronunciation, but it is deficient in intelligence and expression. In some schools the pupils read in too low a tone, and too fast, and with a monotonous undulating intonation that produces

produces anything but pleasurable feelings in the listener; in others it is too slow, and is accompanied by a sing-song drawl equally unpleasant. The neglect of instruction in the art of reading, the teacher seldom reading as a model for the imitation of his pupils, and insufficient practice therein, form, it is believed, in the main, the causes of the defects in this subject. Many hurry over the reading to get to what they consider more important work—spellings, meanings, derivations, and explanation of the subject matter. It would be well that, at least *once* a week, a lesson in reading *only* should be given. In this way the portions previously read might be recapitulated, each pupil reading a paragraph, and not a sentence. Spelling is taught in connection with the reading lesson, but principally from dictation, exercises in which are given to all the classes.

Writing.—The writing is, as a rule, not supervised with sufficient care. The writing exercises for the first class are seldom properly graduated, and little attention is given to the manner in which they are performed. This is a grave mistake on the teacher's part, considering what the future effect of this neglect must be to him. The best writing is generally found where the teacher sets his own copies.

Arithmetic.—Arithmetic is taught orally, the black-board being used in explaining principles and giving illustrative examples for practice. The examples given in the simple rules are commonly of too abstract a nature. Much might be done to interest the pupils and relieve the dryness of the subject by concrete questions bearing on things with which they are familiar. Notation is on the whole fairly taught, but mental arithmetic does not receive that attention which its importance as a mental exercise demands. Instruction in geography and grammar including analysis, is given orally, no text book being used in teaching them. In only a few schools are these subjects well taught.

Object lessons continue to be only tolerably satisfactory in the majority of schools. Of their value, when properly given, in cultivating the perceptive faculties, especially of the young children, few seem to have an intelligent conviction. There appears to be a great difficulty experienced by some in obtaining suitable subjects for these lessons in the first class. The cow, the cat, the horse, and the dog, are stock subjects. Greater variety in the selection of subjects, and higher skill in their treatment, are much needed. The children are fairly acquainted with the principal narratives of the Old and New Testaments contained in the Scripture Lesson series.

Denominational Schools.

Classification.—The classification of one half of the schools is judicious—varying from fair to good. In the remainder, the defects arise from there being too many classes, from the inequality of the pupils in point of intelligence and attainments, and from there being too many subdivisions of classes—especially in the first.

Occupation.—In regard to the occupation of the pupils, these schools, as a body, were, at the date of inspection, very imperfectly provided for, there being only three suitably furnished with time-tables and programmes. The remaining eleven had no programmes, and unsatisfactory time-tables. In only one school of all those visited was a register of lessons kept. In every instance of the absence of these documents, ignorance was pleaded as the cause of their not being constructed. The mode of framing them, and their design, having been explained during the course of inspection, it is probable that a more satisfactory state of matters now exists.

Methods.—The methods in use in five of the schools are satisfactory. In the remainder they are for the most part neither suitable nor effective. The tendency of the teaching is, in most cases, mechanical, the methods in use not being calculated to cultivate the mental powers, except the memory, which is laden with a mass of undigested materials. Grammar, geography, and spelling, for the most part, are learned by rote from text books. This is directly opposed to the most approved modes of modern education, and the expressed opinions of the most eminent educationists. One of the greatest of modern philosophers says—“Oral instruction is, in the earlier stages of education, of principal importance; and written ought therefore, at first, only to be brought in as a subsidiary.” The same authority says, in reference to memory—“To commit to memory what we read before we elaborate it into an intellectual possession, is not only useless but detrimental; for the habit of laying up in memory what has not been digested by the understanding, is at once the cause and the effect of mental weakness.”

With the exception of vocal music and drawing, which are rarely taught, the subjects are similar to those already enumerated, and the general remarks made in reference to them are applicable likewise to those now in question. The answering on the subject matter of the reading is often unintelligent and incorrect, and shews conclusively that the examination thereon is neither searching nor careful. Dictation and transcription of the lesson seem very little practised as means of teaching spelling. For instance, when three-fifths of a second class of five pupils, in writing from dictation the sentence “A great man is one who does great and noble things,” spell the words dictation, great, who, and does, thus—dictases, dickton, grat, grait, garte, ho, Ho, dos, and dose, it may safely be inferred that such exercises have been neglected.

The writing and arithmetic of the first class are very badly conducted; in fact, in some cases, these two subjects are not even attempted. Mental arithmetic is also defectively treated in all the classes.

With two or three creditable exceptions, the instruction in grammar is far from satisfactory. In only two schools is analysis of sentences studied, and in these, the proficiency attained therein is only tolerable.

Geography and object lessons are not treated in an intelligent manner. In many instances, the whole geography consists in pointing out on the map the position of certain towns, &c. and repeating tasks from books. Instruction in the principles of physical geography is rarely given. Object lessons are very imperfectly understood. Many seem to suppose that talking, or reading from some book, to the children about the particular subject is giving an object lesson. Few have an intelligent idea of their design, and fewer still have the skill so to treat them as to stimulate and sustain the attention of the children, and to cultivate the preceptive faculties.

J. M'CREDIE,

Inspector, Albury District.

Albury, 2nd March, 1868.

ANNEX F.

DETAILED Statement of the Condition of Public Schools inspected during 1867.

Name of School.	Date.	Remarks.
Adelong (Non-vested.)	1867. 5 Aug. ...	The building is in a wretched condition, utterly unfitted for school purposes. Since the date of inspection, more suitable premises have been obtained. The organization is defective, and the discipline and instruction are not satisfactory. The teacher is untrained, and has never been examined or classified. The attainments of the pupils are meagre, and the moral tone is low.
Adelong (Upper) (Vested.)	25 Nov....	The school has just been opened in temporary premises—the school-room not being yet ready for the reception of pupils. Neither books nor apparatus have yet been received from Sydney. In the circumstances, the organization, discipline, and instruction, are satisfactory.
Albury (Primary) (Vested.)	12 Nov....	The building is in good repair, and the general organization is excellent. The discipline is well sustained and thoroughly effective; and the methods are of the most approved kinds—suitable and effective. The general spirit of the school is pleasing, and the moral tone is good. In addition to the ordinary subjects, Latin, algebra, geometry, music, and drawing are also taught. The proficiency of the pupils is satisfactory. In every respect this school takes rank as the model school of the district.
Albury (Infants') (Vested.)	11 Nov....	The material condition of the school is excellent. The pupils are very cleanly and orderly. The subjects and methods are appropriate to young children, and the instruction is characterized by intelligence, energy, and tact. For the time the school has been in operation, the attendance and proficiency are good.
Balarald (Non-vested.)	17 Oct. ...	The school building is fairly suitable, and in good condition. There is no teacher's residence. The supply of furniture and apparatus is deficient, and the playground is unfenced. The discipline is fairly efficient, and the attainments tolerably up to the standard.
Binalong (Vested) ...	19 Dec....	The building needs repair. The organization is fair; the classification appropriate. The discipline is effective, the subjects and methods suitable, and the general spirit of the school pleasing. The school has improved in every respect since the present teacher took charge.
Black Range (Non-vested)	25 June...	The building is of a temporary character, but tolerably suitable. It is fairly supplied with furniture, but the apparatus is somewhat deficient. The playground is not fenced. The order is fair, and the government efficient. The pupils are irregular. The proficiency is, in the circumstances, reasonably satisfactory.
Bowna (Non-vested)	24 June...	The school building is fairly suitable, but there is no teacher's residence. The supply of furniture and apparatus is scanty, and the playground is unfenced. The attendance is fair for the population. The classification is suitable; the order and government very fair, and the subjects and methods suitable and effective. The pupils are fairly up to the standard of proficiency.
Crowther (Provisional)	9 Dec....	The building is fairly suitable, and tolerably furnished. The instruction is confined to reading, writing, and arithmetic. The pupils have made tolerable progress for the time the school has been open. The order is tolerable, but good methods are not understood.

ANNEX F—continued.

Name of School.	Date.	Remarks.
Deniliquin	1867. 17 Sept....	The building is in urgent need of repair. It is well supplied with furniture and apparatus, and the classification and occupation are good. The discipline is effective, the subjects appropriate, and the methods suitable. Fair progress seems to have been made during the year.
Euston (Non-vested)	8 Oct....	The building is tolerably suitable, but there is no teacher's residence. It is almost devoid of furniture, and the apparatus is very scanty. The classification is injudicious; there are no instructional documents; the school records are badly kept, and the teaching is altogether mechanical and ineffective. The attainments of the pupils are low. The teacher has since resigned.
Forbes (Non-vested)	12 Dec....	The material state of the school is far from satisfactory. A new building is urgently required. The order and government are good. The subjects and methods suitable, and the proficiency fair. The pupils are attentive, and manifest fair intelligence and self-reliance. The moral tone is good.
Grenfell (Non-vested)	16 Dec....	The school building is tolerably suitable, but there is no residence or proper playground. The supply of furniture is tolerable; that of apparatus, very fair. The order and government are tolerably effective. The pupils are very irregular; their attainments are therefore only moderate. The moral tone is fairly promising.
Gundagai (Vested)...	12 Aug....	The material state of the school is fairly satisfactory. The playground is now securely fenced. The furniture and apparatus are sufficient. Maps of more modern construction are, however, desirable, those in use being old and dingy. The discipline and instruction are reasonably satisfactory. Fair progress is being made by the pupils.
Howlong (Non-vested)	28 June...	The building is fairly suitable. The organization of the school is reasonably satisfactory. The order and government are good, and the instruction is intelligent and energetic. The pupils are attentive and self-reliant. The general spirit of the school is pleasing.
Marengo (Non-vested)	17 Dec. ...	The school building is in a good state of repair. The furniture is clumsy and unsuitable, and the apparatus is defective. The discipline is tolerably efficient, but the instructional documents are not well regulated. The attainments are tolerably satisfactory, but there is a lack of spirit in the school operations.
Moama (Non-vested)	23 Sept....	The building is only tolerably suited for school purposes. The furniture and apparatus are fairly sufficient, and suitable. The classification is judicious; the discipline is fairly effective; and the instruction is tolerably regulated. The attainments and general tone of the school are reasonably satisfactory.
Moulamein (Vested)...	25 Oct. ...	The building is a good one, thoroughly suitable, and very fairly organized. The material condition is good; the discipline firm and vigilant; and the instruction sound and systematic. The attainments are satisfactory, and the general spirit is pleasing. Energy and earnestness characterize the general management.
Murrumburrah (Non-vested.)	20 Dec. ...	The building in which the school is held is only tolerably suitable. The erection of proper school premises is very desirable. The supply of furniture and apparatus is only tolerably sufficient. The occupation is not well regulated, and the order and government are barely tolerable. Considering the circumstances of the school, the proficiency is tolerable.
Thurgoona (Non-vested.)	8 Nov. ...	A new building is urgently required. The present school-room is too small, and unsuitable in other respects. Steps are being taken for the erection of a vested public school. Additional furniture and apparatus are needed. The discipline is effective, and the instruction tolerably well regulated. The attainments are reasonably satisfactory, and the general spirit of the school is pleasing.
Tumut (Non-vested) ..	7 Aug....	The building is unsuitable, and badly provided with furniture and apparatus. Suitable premises will shortly be erected. The order and government are tolerable; the subjects are suitable; but the methods are mechanical and ineffective. The mental powers of the pupils have received little cultivation.
Wagga Wagga (Boys) (Vested.)	29 July ...	The building is in a good state of repair, but the school-room is too small. The furniture is fairly suitable and sufficient, but a supply of apparatus, especially of maps and diagrams, is required. The order and government are effective; the subjects and methods are appropriate; and the general spirit of the school is satisfactory. The moral tone is good. The proficiency ranges from tolerable to good.
Wagga Wagga (Girls) (Vested.)	30 July ...	The organization is similar to that of the boys' school. The classification is judicious; the order and government efficient; the methods suitable and fairly effective; and the moral tone very fair. The proficiency ranges from tolerable to very fair.
Wentworth (Non-vested.)	1 Oct. ...	The material state of the school is bad. The building is unsuitable; the furniture and apparatus meagre and inappropriate; and the playground unfenced. The classification is fairly judicious. The order is not satisfactory; the government is wanting in firmness and vigilance; and the moral tone is low. The proficiency is moderate.

APPENDIX.

29

ANNEX F—continued.

Name of School.	Date.	Remarks.
Young (Vested)	1867. 3 Dec. ...	The building is in good repair, and is fairly supplied with furniture and apparatus. The classification is judicious; the pupils are attentive; and the teaching is energetic and intelligent. The order and government are effective; the methods fairly skilful; the proficiency satisfactory; and the moral tone very fair.

DETAILED Statement of the Condition of Denominational Schools inspected during 1867.

Name of School.	Date.	Remarks.
Albury, C.E....	1867. 26 June...	The school is conducted in a building furnished and rented by the teacher himself. The furniture is sufficient, but the supply of apparatus is defective, there being no maps or diagrams. The occupation is seriously defective; there are no programmes, or suitable time-table, and no registers of lessons. The pupils are orderly, quiet, and attentive; the government is stern and severe. The methods employed are not modern. Except in reading, which is well taught, the attainments of the pupils are low.
Albury, R.C....	27 June...	The school is conducted in the R.C. Church; the organization is therefore not satisfactory. The furniture is fairly sufficient, but the supply of apparatus is somewhat defective. The classification is fairly judicious, but the occupation is not well regulated, there being no programmes or registers of lessons. The order is bad; the pupils being noisy, restless, and inattentive; and the government is ineffective. The moral tone is not good. The proficiency ranges from indifferent to fair.
Burrows, R.C.	18 Dec. ...	The building is fairly suitable, and tolerably supplied with furniture and apparatus. The occupation is fairly regulated, the order and government efficient, and the moral tone very fair. The methods are suitable and effective, and the general proficiency is satisfactory.
Burrows, C.E.	18 Dec. ...	The school is conducted in the C.E. Church. There is no teacher's residence. The attendance is small. The furniture and apparatus are tolerably sufficient; the occupation is moderately satisfactory; and the order and government are tolerable. The methods are suitable, but only moderately effective. With two exceptions, the proficiency of the pupils is moderate.
Corowa, C.E....	12 Sept....	This is the best denominational school building in the Albury District. Additional furniture is needed, but the supply of apparatus is sufficient. The occupation is not well provided for; the order and government are not good; and the methods are mechanical and ineffective. The average attainments of the pupils are only moderate. The moral tone is low.
Currajong, Wes.	13 Dec. ...	The building is fairly suitable, and is well supplied with furniture and apparatus. The classification is judicious; the occupation very fairly provided for; the order and government, good; and the methods very fairly effective. The proficiency is reasonably satisfactory; and the moral tone is good.
Gundagai, R.C.	13 Aug. ...	The school is held in the R.C. Church. The furniture and apparatus are deficient. There are neither time-tables, programmes, nor registers of lessons, and the school records are kept in a disgraceful manner. The methods are obsolete, and the whole teaching is mechanical and unintelligent. The attainments of the pupils are small.
Jugiong, R.C.	15 Aug....	The building—a substantial stone structure—is well situated and fairly suitable. The furniture and apparatus are tolerably sufficient, but badly arranged. The classification is injudicious; the occupation very imperfectly provided for; and the order and government far from satisfactory. The methods are obsolete; the general teaching, mechanical; and the moral tone, low. The proficiency of the pupils is only moderate.
Laming Flat, R.C.	6 Dec. ...	The school is conducted in the R.C. Church. It is insufficiently supplied with furniture, and the apparatus is very defective. The classification is tolerably judicious, but the occupation is not well regulated. The order and government are reasonably satisfactory, and the methods fairly suitable. The average proficiency is only moderate.
Mulwala, C.E.	13 Sept....	The school is conducted in the C.E. Church. The furniture is very scanty, and there is no apparatus. The supply of books is good. There is no attempt made to regulate the occupation by a time-table or programme. The order is bad, and the government only tolerably effective. Good methods are unknown, and the general proficiency is but small. The attendance is small—not more than required for a provisional school.

ANNEX F—continued.

Name of School.	Date.	Remarks.
Tumut, R.C....	1867. 8 Aug....	The school is held in the R.C. Church. The apparatus is sufficient, and the furniture tolerably so. The classification is injudicious; the occupation of the pupils is badly regulated, and the school records indifferently kept. The discipline, instruction, and attainments of the pupils are not satisfactory. The entire management is characterized by apathy and carelessness.
Tumut, C.E.	9 Aug....	The school is conducted in the ballroom of an ex-public-house, which is rented by the teacher herself. It is suitable, and fairly supplied with furniture and apparatus, which are however not well arranged. The classification is judicious, and the occupation tolerably provided for. The order and government are fair, and the general spirit of the school is pleasing. The methods are tolerably effective, and the range of proficiency is from tolerable to fair.
Wagga Wagga, R.C.	26 July...	The school is conducted in the R.C. Church. The classification is judicious; the occupation fairly regulated; and the school records well kept. The discipline is efficient, and the instruction sound. The proficiency is reasonably satisfactory, and the whole management is marked by intelligence and energy.
Young, C.E....	4 Dec. ...	The school premises are good, but the teacher resides in a miserable bark hut, erected by himself. The furniture and apparatus are fairly sufficient, but the former is badly arranged. The discipline and instruction are tolerable, and the average attainments of the pupils moderate. The moral tone is only moderate.

ARMIDALE DISTRICT.—INSPECTOR'S GENERAL REPORT FOR 1867.

PUBLIC SCHOOLS.

I BEG to submit, for the consideration of the Council of Education, my General Report upon the condition of the Public and Provisional Schools inspected by me, in the Armidale District, during the year. A separate report upon each school visited was furnished as my inspection proceeded, and it is from these reports, my observations, and weekly journals, that the following general statement is compiled.

OCCUPATION OF TIME.

A considerable portion of my time at the beginning of the year was occupied in visiting denominational schools, in order to ascertain in what cases the conditions of the Public Schools Act, entitling them to certificates, were fulfilled. I was also employed for a short period attending the Conference of Inspectors in Sydney, which was convened for the purpose of discussing various matters of school management and arranging a systematic course of inspection. Several matters connected with the business of the Central Office required a share of my time, so that it was not until 6th June that I commenced the general inspection of the schools. The establishment of new schools, the selection of suitable sites, the numerous inquiries relative to the educational wants of the various settlements, several investigations, the examination of pupil teachers, the amount of travelling to be performed, and the writing of the numerous reports and memoranda upon all these matters, required much of my time and attention, business hours being usually from 7 o'clock in the morning to 6 or 7 o'clock in the evening daily.

SCHOOLS IN OPERATION.

At the beginning of the year there were twenty-six public schools in operation in the Armidale District, attended by 1,485 children, being an average of 57 scholars for each school. The school at Bendemeer was closed during the first quarter of the year. The following table shews the places where the Public Schools in the District are situated.—

NAME OF SCHOOL.	SITUATION.	NAME OF SCHOOL.	SITUATION.
Armidale	New England.	Seven Oaks	Macleay River.
Bendemeer	Do.	Smith's Flat	Clarence River.
Bingera	Gwydir River.	Saumarez Creek	Near Armidale.
Casino	Richmond River.	Strontian Park	Clarence River.
Dandingalong	Macleay River.	Tamworth	Liverpool Plains.
Euroka	Do.	Summerland	Macleay River.
Grafton	Clarence River.	Tenterfield	Near Queensland.
Inverell	MacIntyre River.	Umarra	Clarence River.
Kelly's Plains	Near Armidale.	Uralla	Near Armidale.
Lismore	Richmond River.	Walcha	Apsley River.
Macleay	Clarence River.	Warialda	Gwydir River.
Palmer Island	Do.	West Ballina	Richmond River Heads.
Port Macquarie	Hastings River.	West Kempsey	Macleay River.
Rocky River	Near Armidale.		

During

APPENDIX.

During the year eleven new schools were opened, which are attended by 427 scholars, making a total of thirty-eight schools in the district on 31st December last, attended in the aggregate by 2,366 scholars in the year. The following statement shews the places where the new schools have been established :—

PUBLIC SCHOOLS.		PROVISIONAL SCHOOLS.	
NAME OF SCHOOL.	SITUATION.	NAME OF SCHOOL.	SITUATION.
South Grafton	Clarence River.	Brushgrove	Clarence River.
Southgate	Do.	Dark Water Creek ...	Macleay River.
Tucki Tucki	Richmond River.	Redbank	Hastings River.
Wallabadah	Liverpool Plains.	Wardell	Richmond River.
Woodford Dale	Clarence River.	Woodford Park	Clarence River.
		Yetman	McIntyre River.

PLACES WHERE SCHOOLS ARE REQUIRED.

The following table shews the names and situations of the places where twenty-one schools, which will probably be attended by 500 children, are in course of establishment :—

PUBLIC SCHOOLS.		PROVISIONAL SCHOOLS.	
NAME OF SCHOOL.	SITUATION.	NAME OF SCHOOL.	SITUATION.
Woodford Leigh	Clarence River.	Ashford	Fraser's Creek.
Chatsworth Island ...	Do.	Falconer	Near Ben Lomond.
Yarrowell	Macleay River.	Coraki	Richmond River.
Rainbow Reach	Do.	Rose Hill	Do.
Cherry-tree Hill	Near Armidale.	Coldstream	Clarence River.
Violet Hill	Do.	Lawrence	Do.
Wauchope	Hastings River.	Rose Bank	Do.
Gundurimba	Richmond River.	Saumarez Bridge	Near Armidale.
Bowling Alley Point...	Peel River Diggings.	Bundarra	Gwydir River.
Bellenger	Bellenger River.	Limestone Creek	Near Armidale.
Narrabri	Namoi River.		

In addition to the thirty-eight public and provisional schools in operation, and the twenty-one in the course of establishment, there are numerous localities where a supply of the means of education is much required ; and I hope that, during the current year, I shall be able to assist in making some arrangements to bring the advantages of the Public Schools Act within the reach of the residents of some of these places. The localities I refer to are situated as shewn in the following statement :—

PLACES where a supply of the means of Education is required.

NAME OF PLACE.	SITUATION.	NAME OF PLACE.	SITUATION.
The Tweed River ...	North of Richmond River	Rawdon Island ...	Hastings River
Codrington ...	Richmond River	Ellenborough River ...	do
Rocky Mouth ...	do	Cockburn River ...	Near Tamworth
Bald Hill ...	do	Neminga ...	do
Harwood Island ...	Clarence River	Wooloomool ...	do
Swan Creek ...	do	Quirindi ...	Near Wallabadah
Urara Meat Works ...	do	Carroll ...	Namoi River
Nymboida ...	do	Somerton ...	do
Tabulam ...	do	Bogabri ...	do
Toooloom ...	do	Wee Waa ...	do
Nambuera ...	North of Macleay River	Moree ...	Gwydir River
Kinchela Creek ...	Macleay River	Barraba ...	Liverpool Plains
Darkwater Vale ...	do	Manilla ...	Manilla River
Austral Eden ...	do	Wellingrove ...	New England
Turner's Flat ...	do	Tableland ...	Near Tenterfield

Maloney's Flat ...	do	Gulligal ...	Namoi River
Deep Creek ...	do	Pimlico ...	Richmond River
Blackman's Point ...	Hastings River	Cookamerica ...	Hastings River

AMOUNT OF INSPECTION.

Since the 6th June, I have inspected all the public and provisional schools in the district, excepting the following :—

Wallabadah.—This school was not in operation when I inspected the premises.

Wardell.—Owing to the state of the wind and tide in the river, I could not reach this school on the day fixed for its inspection, until after the pupils were dismissed; and as I was not aware of its existence prior to the date of my visit, my engagements would not permit me to delay another day to examine the pupils.

Yetman.—This school was not established when I visited the western part of my district. To some of the schools convenient to my station, I paid several incidental visits on the Council's business; but owing to the extent of country over which my duties call me, including the districts of the Tweed, Richmond, Clarence, Bellenger, Nambuera, Macleay, Hastings, New England, Macintyre, Gwydir, Namoi, Peel, and Liverpool Plains, several places where schools are required could not be visited. During the year I travelled about 3,500 miles.

CHARACTER OF THE INSPECTION.

The inspection of the schools was tolerably rigid in all respects. The examination of each school generally occupied from six to eight hours; but in the case of large schools, or schools consisting of several departments, two, and sometimes three days were occupied. In every instance I endeavoured to ascertain if the Council's fundamental regulations were complied with. I noted the suitability of the site, the character of the school buildings and furniture, and if the time-tables, programmes of study, and occupations of the pupils were suitable, and in accordance with the requirements of the Public Schools Act and Council's Regulations. I inquired into the classification of the scholars, inspected the school library, the mode of keeping the school records, and the books in the hands of the children. As regards the discipline, I noted the punctuality, regularity, cleanliness, order, conduct, and manners of the scholars, also the moral tone of the school and system of government. In most cases, I examined every child, noted the subjects taught, the proficiency of the pupils, the rate of school fee, the professional skill and usefulness of the teachers, and the efficiency of the local supervision. At the close of every inspection, I made such suggestions to the teachers and to the School Boards as I concluded would improve the schools and benefit the public.

GENERAL CHARACTER OF THE SCHOOL PREMISES.

The sites of thirty of the schools are suitable in almost every respect, and six are tolerably so. The only two of an indifferent kind are Seven Oaks and Summerland, which are liable to inundation occasionally; they are, however, built on the highest land that could be obtained, both on the Lower Macleay; the former, about 12 miles from Kempsey, and the latter about 15 miles from Trial Bay. All the schools vested in the Council in this District are, with few exceptions, well furnished, in good repair, and suitable for the purposes of teaching. Important and valuable improvements have been made during the year to the school-buildings at Ballina, Casino, Armidale, Kempsey, Seven Oaks, and Port Macquarie; and very fine school-buildings are in course of erection at Lismore, Chatsworth Island, Uralla, and Woodford Dale; and tolerably substantial and spacious school-houses at Tenterfield and Euroka were completed about the beginning of the year. Arrangements for the erection of a large number of school-buildings, and for making important alterations and improvements, are in course of progress. The school-houses at Bingera, Rocky River, Darkwater Creek, Dondingalong, Redbank, Strontian Park, Wardell, and Tucki Tucki, are small, badly furnished, and not sufficiently suitable for the purposes of teaching, but in most cases, action has been taken to remedy the deficiencies. The low price of agricultural produce, the drought, the depressed state of the Colony, the extreme poverty which prevails among the free selectors where schools are most required, have been much against the collection of the local contributions required by the Council, and have caused the establishment of several schools to be postponed. The Council, however, having decided to accept labour and materials from the settlers of such localities as cannot contribute their quota in money, may have a beneficial tendency. In some cases, I have been informed by the settlers, that it was possible for them to cut and supply timber for a school-house, but they could not contribute money, because they could barely supply food for their families. The playgrounds attached to the schools generally contain an area of two acres, and the land is in most cases fenced. The playgrounds of a few schools are of an indifferent kind, either from the nature of the soil, the want of draining, or the insufficiency of the accommodation. In two or three instances, a convenient supply of water is much needed.

ORGANIZATION.

In most cases, the schools are fairly supplied with books and apparatus. Time-tables for regulating the time devoted to each branch of instruction, and programmes, shewing the course of study prescribed for each class for the quarter, are to be found in almost every school, but in some cases they are not constructed with much skill, nor adhered to with sufficient strictness, though in general the instruction is carried on in a progressive and systematic manner, and the daily work recorded in the register of lessons. In most of the schools the classification of the pupils is judicious, and the school records are kept with considerable neatness and care. In some cases I found the promotions of the scholars, and the quarter of enrolment, were not recorded at the proper time, nor the class-roll duly closed at the end of the quarter. But, on the whole, the school accounts are carefully and honestly kept, and the returns kept in progress, and punctually dispatched at the close of the quarter.

DISCIPLINE.

The Council's rules relative to punctuality, regularity, and cleanliness, receive due attention in most schools; and the most pleasing feature in the general discipline is the cleanliness observed. This is in itself of great importance to the community, because it is so conducive to health and morality. It has been often and truly said that "cleanliness is a virtue," and it is generally admitted there is an intimate connection between purity of person and purity of mind. Some one has written, "that cleanliness like righteousness exalteth a nation," and that "habits of cleanliness and decency carry with them an hereditary morality that descends from parent to child, and whose influence is felt by succeeding generations." As a general rule in all the public schools in the Armidale District, about ten minutes to 9 o'clock, the children form themselves into parallel lines for inspection in cleanliness, and then the teachers pass along the lines and satisfy themselves, by personal inspection, that the boots, clothes, hands, face, and ears of the children are clean, and their hair brushed. Should any child continue deficient in cleanliness, the parents are made acquainted with the fact, and every legitimate means used to promote habits of cleanliness and decency. After the children have been inspected they march into school, and take their places in an orderly manner, and the business of the day commences. Generally speaking, I found the scholars clean, and the furniture and apparatus well kept. In two-thirds of the schools the order and punctuality appear to range from fair to good, and in the remainder, from tolerable to indifferent. With regard to the government, moral suasion is the ruling principle in all the schools, but I did not inspect any in which corporal punishment had been wholly abandoned, neither did I hear of undue severity (save in one case) having been practised by any teacher.

So far as I have been able to ascertain, the fundamental regulations of the Council are faithfully observed; and as regards the moral tone of the schools, the character and extent of the instruction imparted, the order and general discipline maintained, the proficiency of the pupils and general management, the following may be taken as a just classification of the schools inspected:—Ten are well or fairly managed; eighteen are tolerably or passably conducted, and seven are moderately or indifferently managed.

ATTENDANCE OF PUPILS.

The following table exhibits the attendance of pupils at the schools inspected:—

	Boys.	Girls.	Total.
Number of pupils on school rolls at time of inspection	817	766	1,583
Number of scholars present at examination	723	686	1,409
Number of scholars on rolls for last quarter of year	998	914	1,912
Average attendance for the same period	721	658	1,379
Number of scholars who attended in the year	1,214	1,152	2,366

By

By a comparison of the figures in the foregoing table, it will be seen that about seven-eighths of the pupils on the rolls at the time of inspection were present at examination, and that the daily average attendance of pupils for the last quarter of the year was but little less than the number of children examined. It also appears from the above statement, that 72 per cent. of the number of pupils on the rolls attend school regularly. This result is on the whole perhaps not unsatisfactory, when it is remembered that the average daily attendance in Great Britain and Ireland does not amount to much over half the number on the rolls. The irregularity of the scholars at many schools may be traced, to a certain extent, to all or some of the following causes—such as the poverty of the parents, the high price of labour, the drought, the heavy rains, floods, sickness and disease, and in some cases the indifference of parents to the moral and intellectual improvement of their children. As a general rule, the excellence of a school and the regular attendance of the pupils go hand in hand, and a large and regular attendance of pupils, compared with the number enrolled, may be considered as the result of a teacher's industry and skill. In schools well managed, I find the scholars are more regular, and the average attendance generally exceeds 80 per cent. of the number of pupils enrolled.

AGES OF THE CHILDREN EXAMINED.

Of the 1,409 pupils examined, 295 boys and 256 girls were 7 years of age and under.

109	"	94	"	8	years of age.
86	"	74	"	9	"
65	"	74	"	10	"
54	"	53	"	11	"
72	"	94	"	12	years of age and above.

From this statement, it may be observed, that about three-sevenths of the pupils are not over seven years of age; that one-fourth are over seven, and under ten years, and that 30 per cent. out of the entire number present were above ten years.

AGES OF CHILDREN ON SCHOOL ROLLS.

Of the 1,583 pupils on the rolls of the schools at the time of inspection, there were—

344	boys and 309	girls	7	years of age and under.
129	"	108	"	8 years of age.
92	"	84	"	9
80	"	88	"	10
65	"	65	"	11
97	"	112	"	12 years of age and above.

In this statement, the proportions of the different ages are much the same as in the number of pupils examined.

PROFICIENCY OF THE PUPILS.

The following table shews the number of pupils learning the different branches.

Learning—The alphabet and to read monosyllables	578.
To read easy narrative	500.
To read ordinary prose	331
To write on slates	670.
To write on paper	550.
Simple rules of arithmetic	820.
Compound rules of arithmetic	330.
Advanced rules of arithmetic	259.
Elements of English grammar	500
Advanced parts of the subject	331.
Analysis and composition	200
Elements of geography	500
Advanced parts of the subject	331
To write from dictation	1,000.
Scripture history	831
Lessons on common things and objects	1,309
Drawing	380
Music	700
Extra branches, including algebra, geometry, &c.	12
Needlework, knitting, netting, crochet, &c.	450 girls.

Taking into consideration the very tender years of so many of the pupils, the short time a number of them have been under instruction, and the fact that several schools have been recently opened, the following classification of the pupils will not perhaps be considered unsatisfactory:—

First class	312 boys, 266 girls; total, 578.
Second class	248 boys, 252 girls; total, 500.
Third class	170 boys, 161 girls; total, 331.

In many schools, the teachers have no knowledge of drawing or vocal music, but in all other respects, the subjects taught agree with the "Course of secular instruction" prescribed by the Council. The actual proficiency of the scholars, as ascertained by examination, is as follows:—

READING.

Able to read ordinary prose correctly	243
Can read easy narrative correctly	388
Able to read monosyllabic composition	375
Able to read ordinary prose moderately to tolerably	88
Can read easy narrative moderately to tolerably	112
Able to read easy monosyllabic composition	138
Learning alphabet and words of two letters	125

As reading is the most essential part of the course of instruction, it is of great importance that it should be well taught. I think reading may be called good when it is easy, firm, and clear in tone, definite and exact in enunciation, without affectation, expressing the meaning intended with distinctness, and joining with this, expression of sentiment, judgment, and taste. The pupils in some schools read with hesitation and indistinctness; in others, the enunciation was rapid and incorrect, and in an unnatural pitch of voice. The pupils in many of the schools, however, read with a pleasing expression, accommodated to the subject, and varying with the sense. The meanings of the words and phrases in the lessons are now generally taught in connection with the reading, rather than from the vertical columns at the beginning of the lessons, and, generally speaking, the pupils have a tolerably correct knowledge of the subject of the lessons read.

SPELLING.

As spelling is usually taught in connection with reading, and as it is a subject of so much importance, and one upon which a good deal has been written by educationists, I have to report that, in addition to *viva voce* spelling, which is taught in all the schools, the dictation of sentences by the teacher, to be written by the pupils, is the usual method of teaching and testing the proficiency in this branch; but I find that some teachers, forgetting the object of the exercise, pay little attention to the correction of the errors by the pupils. Transcribing portions of the reading lessons is also practised; and as the opinions of the most eminent educationists agree that good spelling does not depend upon sound, upon analogy, nor upon rules, but upon the exercise and memory of the eye, it therefore appears this is a very judicious method of acquiring a knowledge of the subject. Spelling is carefully taught in many schools, and the most improved methods are generally adopted.

WRITING.

The following statement shews the proficiency in this useful branch of instruction:—

Able to write with correctness	500
Can write with tolerable accuracy	500
Write indifferently	269
Cannot write	140

The penmanship in many schools is creditable, but in several it is performed in a careless manner. In all schools where writing is well taught, the teachers are careful to mark all errors of imitation in the shapes of the letters, the breadth of the strokes, their slope, their regularity, their distance from each other, and the manner in which they are joined. In some schools, under classified teachers, I found the pupils use small bits of pencils, and in others, a page is written before the defects are pointed out. I have endeavoured to impress upon the teachers that success in teaching writing depends upon effort and care on the part of the pupil, and vigilant and constant supervision on the part of the master. I have frequently observed that many pupils can write much better upon slates than paper, and I am of opinion if the elder pupils wrote more upon paper, and none upon slates, their progress would be more satisfactory. Paper is the great medium of communication in the present age, and of course excellence in writing upon it, and not upon slates, is the object in view. It is a generally received opinion now in France and Holland that writing upon slates is objectionable, and their use is in many cases forbidden. For these reasons I have requested some teachers, for experiment, to adopt this plan as much as possible.

ARITHMETIC.

The subjoined table exhibits the proficiency in this subject:—

Able to solve questions in proportion and higher rules	181
Can work compound rules with tolerable accuracy	241
Learning tables and simple rules	478
Infants learning to read, write, and add digits	509

There are few schools where this branch is well taught. The methods that ensure success are but little understood, the principles are seldom rightly introduced to the pupils, and the elements—such as the tables, notation, and numeration—are not sufficiently dwelt upon. There is not enough of competitive work among the pupils. I very often find children working proportion, and they fail in the simple rules. There are several schools, however, where the pupils have made good progress, and the method of teaching excellent. The attainments in mental arithmetic, generally speaking, admit of much improvement.

GRAMMAR.

The proficiency in this branch is shewn in the following statement:—

Can parse syntactically, and have made some progress in composition and analysis of the English language	200
Able to distinguish parts of speech and parse etymologically	431
Learning mere elements	200

The elements of English grammar are taught in all the schools, excepting two or three recently established. In several instances, the subject is not taught with much skill. Some teachers are content if their pupils can repeat the names of the parts of speech, and point out those most easily known, such as the noun, article, and adjective, while others, aiming at something more, pursue it in such an unsystematic manner that the results are of little value. In the most of the schools, however, grammar is very fairly taught, and many of the pupils have made considerable progress in composition and analysis of the English language.

GEOGRAPHY.

Of the 1,409 children examined, 831 were learning geography. A considerable number of these were studying the mere elements, such as the cardinal points, the topography of the school district, the uses of a map, the definitions of the common geographical terms, the relative positions of the Continents and Oceans, and the outlines of the geography of Australia. The more advanced pupils have a fair knowledge of the physical and descriptive geography of the globe, with Europe and Australia more in detail.

Mathematical geography, and the use of the globes, are taught in none of the schools to any appreciable extent, but considerable attention is devoted to the study of the geography of the Colony. This subject is chiefly taught by means of maps, reading lessons, and lectures. Maps are in use in nearly all the schools, but globes are found in few, and map-drawing is not much practised.

Learning the mere elements	180
Can define the relative positions of the continents and oceans, and know the outlines of Australia	420
Have in general, a tolerable or fair knowledge of the descriptive and physical geography of the globe	331

SCRIPTURE.

A large number of the pupils examined were learning scripture, either from the second or third reading books, or the Scripture lessons published by the Commissioners of National Education in Ireland. The pupils in the second class have made considerable progress in such subjects as the following:—

- “How the World was made.”
- “Adam and Eve.”
- “Cain and Abel.”
- “The Flood.”
- “The Tower of Babel.”
- “Parting of Abraham and Lot.”
- “The Destruction of Sodom and Gomorrah.”

In most schools, the third class pupils were learning the history of the birth, life, death, and resurrection of Christ, and the teaching of His Apostles, from the New Testament extracts, or from the Old Testament Scripture lessons, such subjects as—

- “The History of Abraham and his descendants.”
- “Birth of Isaac, and Expulsion of Ishmael.”
- “Trial of Abraham’s Faith.”
- “Death of Sarah.”
- “Jacob and Esau.”
- “History of Joseph.”
- “History of Moses.”
- “Deliverance of the Israelites.”
- “The Law.”

The attainments of the elder pupils were in most respects either tolerable or fairly satisfactory.

THE KNOWLEDGE OF COMMON THINGS.

This much esteemed branch of school instruction is attempted to be taught in the majority of the schools. This is gratifying, because an accurate knowledge of things bearing upon matters of life daily, such as the food we eat, the water we drink, the air we breathe, the clothes we wear, the soil we till, the manufactures we use, the minerals, plants, and animals with which we so often come in contact, is perhaps the most useful and important of all secular studies, except reading and writing. Several schools are not supplied with the necessary prints, models, and diagrams for the illustration of the objects, and in some cases the teachers are not much skilled in the methods of teaching the subject. Considerable interest is, however, manifested among the teachers, marked progress is visible, and beneficial results must follow.

NEEDLEWORK.

This useful branch of domestic economy is taught in nearly all the schools, and in some very successfully. This must be very beneficial to the public, because a competent knowledge of needlework, especially the plainer branches of the art, is one of the most essential parts of female education. To girls in the humbler, as well as the middle classes of society, a practical acquaintance with cutting out and making up articles of wearing apparel is of great importance; and fancy work, if skilfully taught, with due regard to what is useful and most required for domestic purposes, is also beneficial as a means of cultivating the task. Sewing machines have lessened the drudgery of plain needlework, but they cannot originate the fashions, cut the garment, finish the article, nor do fancy work. Knowledge of this kind is therefore still required.

VOCAL MUSIC.

Although vocal music is systematically and successfully taught in the Model Schools in Sydney, it is not so in this district. In a large number of the schools the subject is not taught, and where it has been introduced, the method of teaching is far from satisfactory. There are, however, a few schools where some progress has been made in singing by Tonic Sol-fa method. As the teachers in the training department now receive instruction in music, it is to be hoped the subject will soon be more generally and more efficiently taught. This would be a great public benefit, because it is generally believed that a better preservation of pure morals, a more innocent amusement, and a more cheerful stimulant to all exercises, whether of study, labor, or religion, cannot be devised.

DRAWING.

Of the utility of drawing it is almost unnecessary to speak, because all persons conversant with educational matters must discern what immense advantages are derived from the cultivation of an art which not only improves the knowledge, but elevates the moral character. It is of great use to smiths, carpenters, engineers, and others engaged in works of construction and to the tourist, and those employed in the physical sciences, it is almost indispensable. In a number of the schools in the Armidale District, elementary drawing has been introduced upon the plan used in the public schools in Great Britain, under the authority of the Department of Science and Art, and some progress has been made; but in many schools the subject is not taught, and generally speaking, the methods of teaching admit of much improvement.

TEACHERS.

There were employed in the public and provisional schools in the district at the close of the year, 38 teachers and 3 pupil teachers. Of these, 37 were males and 4 females. The following statement shews the salaries paid by the Council:—

2 at £138 per annum.	Public schools.
1 at 120	„
1 at 108	„
5 at 96	„
11 at 84	„
4 at 72	„
7 at 60	„
1 at 40	„
4 at 48	Provisional schools.
2 at 36	„
1 at 30	„
1 at 24	Pupil teachers.
1 at 18	„

From the above statement, it appears that the average salaries of the teachers in the public schools are £85 13s. 6d.; provisional schools £44; and from another statement, it will be found that the average amount of school fees paid to the teachers in the public schools during the year was about £39 4s. 4d. to each.

COST OF EDUCATION PER PUPIL.

The average daily attendance of pupils at the public and provisional schools in the district for the last quarter of the year, as shewn on the Abstract of Returns, is 1,379; the number on the school rolls for the same period being 1,912, and for the year 2,366. From the same returns, it appears that the annual salaries of the teachers, with the cost of inspection added, amount to £3,696. The total amount of school fees received by the teachers was £1,248 8s. 7d.; and if the grants made by the Council for permanent improvements in repairs and the erection of school buildings are not taken into account, it will then be seen to follow—

	£	s.	d.
That each pupil who attended the schools in 1867 cost the Council ...	1	11	3
And the people, in the shape of school fees ...	0	10	0

From these statements, which are based upon authenticated returns, it is evident that the cost of the education of each pupil is rather less than in former years. The numbers of gratuitous scholars who attended the schools in the year were 70 boys and 62 girls, making a total of 132.

CONCLUDING REMARKS.

There is every reason to expect that, owing to the settlement of the education question, the condition of the schools will shortly be much improved. The Public Schools Act gives much public satisfaction, and the demand for additional schools and more frequent inspection is on the increase. The interest manifested in educational matters by all classes since the passing of the Act is remarkable. The teachers appear to take considerable interest in the methods of imparting knowledge, the local supervision is in general intelligent and tolerably efficient, considering that the service is gratuitous.

W. M'INTYRE,
Inspector of Schools,
Armidale District.

Armidale, 15 February, 1868.

ARMIDALE

ARMIDALE DISTRICT.—INSPECTOR'S GENERAL REPORT FOR 1867.

DENOMINATIONAL SCHOOLS.

I BEG to submit, for the consideration of the Council, the following General Report upon the condition of the Denominational Schools in this District, for the year 1867.

SCHOOLS.

At the beginning of the year there were seventeen schools in operation, attended by 926 pupils, being an average of fifty-four scholars for each school. Of the seventeen schools in the district, nine are Church of England, three are Roman Catholic, three are Presbyterian, and two are Wesleyan. The following statement shews the names of the places where these schools are situate :—

Name of School.	Situation.	Name of School.	Situation.
CHURCH OF ENGLAND SCHOOLS.		PRESBYTERIAN SCHOOLS.	
Armidale	Borough of Armidale.	West Kempsey	Macleay River.
East Kempsey	Macleay River.	Wallaby Hill	Wilson River.
Frederickton	Do.	Wauchope	Hastings River.
Goonoo Goonoo	Liverpool Plains.		
Glen Innes	New England.		
Nundle	Peel River.		
Port Macquarie	Hastings River.		
Tamworth	Peel River.		
ROMAN CATHOLIC SCHOOLS.		WESLEYAN SCHOOLS.	
Armidale	Borough of Armidale.	Carr's Creek	Near Grafton.
Grafton	Borough of Grafton.	Ulmarra	Clarence River.
Gunnedah	Namoi River.		

All these schools have been in constant operation during the year, excepting Ulmarra, Carr's Creek, and Port Macquarie, which were vacant a few weeks, owing to the resignation of the teachers. There has been no application for the establishment of any new denominational schools in this district made since the Public Schools Act came into operation; but the inhabitants of several localities where denominational schools are situated have expressed a desire for the establishment of public schools instead thereof; and in one case (that of Wauchope) the inhabitants have actually made application to the Council for the establishment of a public school. The clergy and some of their parishioners appear to take an interest in the management of the schools; but generally speaking, the colonists in this district are perfectly satisfied with the means of education supplied in public schools.

AMOUNT OF INSPECTION.

All the Denominational schools in the district were visited twice during the year. In the first instance, for the purpose of ascertaining whether they were entitled to be certified under the 28th section of the Public Schools Act; and secondly, for general inspection, to ascertain their condition as regards organization, discipline, and instruction, and to give directions for their better management. The only school not subjected to the course of general inspection was Port Macquarie, which was closed at the date of my visit, owing to the resignation of the teacher.

CHARACTER OF THE INSPECTION.

The inspection was, in all respects, the same as in public schools, and carried out with as much strictness. The examination of each school occupied a day, and in some cases more. In every instance I observed if the fundamental regulations of the Council were complied with. I noted the suitability of the school premises and furniture—if the necessary instructional documents were in use, such as the time-tables, programmes of lessons, and lesson-register. I also inspected the school records, the library, the books in use, and noted their condition, as well as the suitability of the classification, and occupations of the pupils.

With reference to the discipline, I endeavoured to arrive at every school in sufficient time to notice the punctuality of the pupils. I examined the rolls to ascertain whether the attendance was regular. I noted the cleanliness of the teachers, the school-rooms, and the scholars, and if the desks, seats, and maps were free from dust, ink, and stains. I duly noted how the operations of the schools were carried on, and observed the conduct and manners of the scholars, as well as the moral tone and system of government. The instruction of the schools occupied the greater portion of my time. Excepting in the case of mere infants, I examined every pupil present, noted the subjects taught, the rate of school fees, the professional skill of the teachers, the proficiency of the scholars, and if the Local Boards manifested an intelligent interest in the usefulness of the schools. At the close of every inspection I made such suggestions, for the better management of the schools as I considered necessary, and in my reports I embodied information upon all these matters.

SCHOOL PREMISES.

Of the seventeen schools, there are only three—the Church of England Schools at Armidale, Port Macquarie, and Tamworth—held in buildings which have been erected for denominational school purposes. Of the others, they are all held in churches belonging to the respective denominations, excepting the Roman Catholic schools at Armidale and Gunnedah, which are held, the former in good premises, the private property of the teacher, and the latter in a building lent for the school by a neighbouring squatter, and in much need of repairs. Although the churches in which the majority of the schools are held are unsuitable in some respects for the purposes of teaching, they are in general in a passable state of repair, but badly furnished. In several instances the playgrounds are not fenced, and out-buildings and a supply of water for the use of the schools are much needed.

ORGANIZATION.

The furniture of the schools is, in almost every instance, unsuitable and badly arranged; in many cases it is insufficient in quantity, and seldom kept with sufficient care. The desks and forms are never of graduated heights suited to the ages of the scholars; they are generally too high, the desks sometimes double, and otherwise unsuitable. The schools are all well supplied with maps, and in most cases with clocks. In almost every instance where the apparatus and books were insufficient in quantity, application had been made for a supply. In several schools I found neither time-tables nor programmes of school work in use, and in most cases where the teachers had prepared these documents they were unsuitable, and not adhered to. Every one who knows anything of school organization will admit that the formation of suitable instructional documents for a school requires professional skill, but the teachers in general have little or no experience in these matters; they do not see the use of time-tables and programmes of study for their classes; they never analyze what they have to teach, neither do they consider the point from which they ought to start in explaining a subject, because they hardly know the object they seek to attain, nor the course by which they

they mean to proceed. There is no doubt, however, but so soon as they give attention to these matters, they will see the use of time-tables and programmes of lessons. Intimately connected with this subject is the classification of the pupils. In general they are classed too highly, which is a great mistake. To allow a child to commence reading a book or working arithmetical exercises too difficult for him, is only to obstruct and retard his progress. In some schools I found a different classification for each of the subjects of instruction, and in one case the teacher informed me he had seventeen classes, which he enumerated as follows:—"Four reading classes, four spelling classes, two writing classes, two grammar classes, one parsing class, two geographical classes, two arithmetical classes, and a number of pupils I have never been able to class." At the date of my first visit I found the school records in the majority of the schools kept in the most careless manner, but considerable improvement in this respect has been effected during the year. Since the general inspection of the schools, the organization has been altered for the better in many respects; and so soon as the teachers have an opportunity of attending the Council's training department, they will become better acquainted with their profession.

DISCIPLINE.

The schools in general admit of much improvement in this respect. The pupils are in many schools unpunctual, restless, talkative, and disorderly. This arises chiefly from the imperfect organization, and the want of due provision being made for the useful and constant employment of the pupils. Punctuality in attendance on the part of the pupils is a matter which depends greatly upon the teachers; they can generally enforce compliance with any regulation they may make on the subject, but in some cases it appears there is no effort made by the teachers to improve the discipline in this respect, and some of them do not appear to know that efficiency of instruction, and the usefulness of the education they impart, have a tendency to make the pupils more punctual and regular in attendance. In some cases the teachers do not begin the business of the day at the moment marked on the time-table; or, in other words, they wait until the late pupils arrive, and in this way they discourage the habit they wish to promote. In the majority of the schools there is no drilling of the boys, no uniformity of movement among the classes nor physical exercises among the children in use of any kind. The pupils in many instances rush in and out of the schools without any apparent control or discipline. In the majority of the schools the cleanliness is tolerably satisfactory, but there are several instances where the inspection as to cleanliness is not sufficiently strict. The attention of the teachers has, however, been directed to these matters, and it is to be hoped that ere long considerable improvement will be visible.

So far as I have been able to ascertain, the fundamental regulations of the Council are faithfully observed, the school accounts are in most cases carefully kept, and the returns punctually despatched at the close of the quarter. As a general rule, the government of the schools is lax. The means of maintaining order and obedience is usually the infliction of corporal punishment; the use and advantages of moral influence are not generally known, and therefore the government and discipline of the schools exercise little influence upon the characters of the scholars.

ATTENDANCE OF PUPILS.

The following statement shews the attendance of pupils at the Denominational Schools inspected:—

	Boys.	Girls.	Total.
Number of pupils on rolls at time of inspection	408	329	737
Number of pupils present at examination	320	252	572
Number of pupils on rolls for last quarter of year	463	395	858
Average attendance for same period	310	258	568
Number of pupils who attended the schools in 1867	689	563	1,252

By comparing the figures in the above statement, it may be observed that about three-fourths of the pupils on the rolls at the time of the general inspection were present at examination, and that the average attendance for the last quarter of the year was but four less than the number of children examined. It also appears that 66 per cent. of the pupils on the rolls attend school daily, or regularly. It is a singular fact that, during the last half-year, the pupils on the rolls have decreased 8 per cent.—from 926 to 858.

AGES OF THE CHILDREN EXAMINED.

Of the 572 pupils present at the time of inspection—

147 boys and 102 girls were 7 years and under.

39 " 46 " 8 years.

30 " 24 " 9 "

38 " 25 " 10 "

33 " 20 " 11 "

33 " 35 " 12 " and above.

From this statement, it appears that nearly one-half of the children examined were not over 7 years of age, that about one-fourth were over 7 years and under 10 years, and that about one-third, or 33 per cent. of the entire number enrolled, were above 10 years of age. The proportions of the different ages of the pupils enrolled are much the same as they appear in the number examined.

PROFICIENCY OF THE PUPILS.

The following statement shews the numbers of pupils learning the different branches in the schools inspected:—

Learning—

The alphabet and to read monosyllables	241
To read easy narrative	202
To read ordinary prose	129
To write on slates	220
To write on paper	180
Simple rules of arithmetic	150
Compound rules of arithmetic	81
Learning more advanced rules	32
Elements of English grammar	152
Advanced parts of the subject	32
Analysis and composition of English language	27
Elements of geography	160
Advanced parts of the subject	66
To write from dictation	250
Object lessons... ..	200
Drawing	120
Vocal music	140
Extra branches (French and algebra)	1
Needlework	157 girls.

The

The condition of the schools as regards instruction is, in most cases, far from satisfactory. The attainments of the pupils are low, and there is no thoroughness in the teaching in any subject. The improved methods of tuition are but little known, and the result is that, in many schools, the pupils make the smallest possible progress. In the management of these schools the want of trained teachers and inspection is evident. In some instances, I found children of an average age of 7 and 8 years, who had been at school for two years, and they could write none, and unable to read easy monosyllables, having no knowledge worth noting of the spelling or meaning of the words, the number of the lesson, the page of the book, or elements of arithmetic. Under ordinary successful teaching, such pupils would have been able to read easy narrative, write the same from dictation, work exercises in the four simple rules of arithmetic, define and distinguish the parts of speech in their reading lessons, define the geographical terms with examples, give the relative positions of the great divisions of land and water on the globe, with some knowledge of Scripture history, and the elements of drawing and vocal music. In other cases I found children who had been, according to the teacher's own shewing, three and four years in the third class, and they did not know the parts of speech in the English language, could not multiply nor divide money, and unable to give the boundaries of the continents and oceans. Such pupils would have been able, in a school properly managed, to work arithmetic, and parse well, and well acquainted with analysis, composition, and modern geography, together with a knowledge of linear drawing, vocal music, and Scripture history. The teachers, in almost every instance, have to learn that the three great means of instruction are *explanation, interrogation, and repetition*; and many of them do not see that the pupils should be made well acquainted with one lesson before they proceed to another. Satisfactory results, however, cannot be expected until all teachers are educated and prepared for the discharge of their duties, as in other professions. All the teachers are very careless in making any previous preparation for the proper performance of the work that daily engages them, and, in many instances, the pupils are not supplied with the necessary lesson books for home study. In the schools the end of the instruction seems to be to impart a certain amount of knowledge, rather than to improve the intellect in the course of its acquisition. The want of skill that is shewn in teaching the junior classes, and in presenting the elements of the several subjects to the minds of the pupils, is lamentable in the extreme. The Roman Catholic and Church of England Schools in Armidale are managed with considerable efficiency.

READING.

Reading is attempted to be taught in all the schools, but in the majority, the modes of teaching are far from satisfactory. The tones of the voices of the children are seldom the same as in speaking, the pronunciation is often incorrect, the final syllables in words and the closing words in sentences are not pronounced distinctly, and it is remarkable how little attention is generally paid to the punctuation. In some schools the pupils read very fast, in others loudly, but in the majority indistinctly. The subject read is seldom well understood, and in very few of the schools do the scholars read with that intelligence, expression of sentiment, and intonation of voice, which the passage demands. Of the 572 pupils examined, there were learning the—

Alphabet, and to read monosyllables	241
To read easy narrative	202
To read ordinary prose	129

As regards spelling, writing from dictation has recently been introduced into the most of the schools, and some attention is now devoted to the explanation of the words and meaning of the lessons read. In a few of the schools the reading is tolerably satisfactory.

WRITING.

In but few schools is the writing taught with sufficient care. In many cases, the desks are badly constructed for the purpose. The slates are seldom properly ruled for the junior classes, and the pupils are generally allowed to use short bits of pencils. The children who write on paper have sometimes bad pens, bad paper, or unsuitable copies, and they are allowed to write too much before their work is examined, and the defects in the penmanship are seldom pointed out. In a number of the schools I found the copies written with considerable neatness and care. Of the 572 pupils examined, I found—

Writing on slates	220
Writing on paper	180
Unable to write	172

ARITHMETIC.

The condition of the schools, as regards progress in arithmetic, is very backward. In all the denominational schools in this district, I have not found thirty children able to write correctly from dictation such a number as 1,003,010. The most advanced pupils are not acquainted with the elementary tables. In very few schools did I find any of the scholars able to add and subtract mentally, with readiness and correctness, one of the digits, such as 7, in the following manner:—

Addition—7, 14, 21, 28, 35, 42, 49, 56, 63, 70, 77, 84, 91, 98, 105.
Subtraction—105, 98, 91, 84, 77, 70, 63, 56, 49, 42, 35, 28, 21, 14, 7, 0.

The old and obsolete method of teaching arithmetic by rule instead of principles is still common; and instruction in numeration and notation receives little or no attention. The fact is, the elements of the subject are taught in the most immethodical manner, and therefore, the progress of the pupils is very slow and unsatisfactory. Of the 575 pupils examined, I found—

Learning the mere elements	150
Working compound rules	81
Learning more advanced rules... ..	32
Entirely ignorant of the subject	309

The black-board, in teaching this subject is not much used, the simple rules are not sufficiently dwelt upon, the teaching is mechanical, and the subject is generally treated as an art without any reference to its claims as a science. Much improvement in the method of teaching this branch of useful instruction is urgently needed.

GRAMMAR.

With the exception of three schools, I cannot say that any progress has been made in this subject. In the majority of the schools little more is known than the definitions of the parts of speech, and in some nothing more than their names. The subject is usually taught by requiring the pupils to commit to memory, without comment or explanation, a number of rules, and the result is that little or no progress is made. Of the 572 children examined, there were learning—

The mere elements	152
Advanced parts of the subject	32
Analysis and composition	27

The improved methods of teaching this subject orally are not generally known nor practised in denominational schools.

GEOGRAPHY.

GEOGRAPHY.

The number of children learning geography is somewhat in excess of the number learning grammar, but the methods of teaching are unsatisfactory, and the attainments of the scholars very low. The schools are all well supplied with maps, but globes are found in few. Generally speaking, the instruction is chiefly confined to the study of the Continent of Europe, while the knowledge of the other portions of the globe is wholly neglected. The study of Australian geography has been recently introduced, and I have no doubt more prominence will be given to the subject in future. Of the 572 pupils examined, there were learning—

The mere elements	160
Advanced parts of the subject	66

Mathematical geography is taught in very few schools, and map-drawing is seldom or never practised.

DRAWING, MUSIC, OBJECT LESSONS, AND NEEDLEWORK.

These subjects are not taught in any of the schools to any appreciable extent. Vocal music is not taught in a methodical manner in any of the schools, but in a few linear drawing is practised on slates. The use of object lessons is generally unknown, and the teachers have no scientific knowledge whatever of the philosophy of common things, or of the method of imparting such information. I have not seen a good display of needlework in any of the schools, and I am therefore convinced there is not sufficient attention devoted to this useful branch of domestic economy.

COST OF EDUCATION.

The total average daily attendance at the denominational schools in the district for the last quarter of the year was 568, the number on the rolls for the same period being 858, and for the year 1,252. The amount of the annual salaries of the teachers with the cost of inspection added is £2,002, and the total amount of school fees received from the pupils was £575 16s. 6d. It therefore follows that each pupil who attended the schools in 1867 cost the Council £1 11s. 11d., and the people for school fees 9s. 2d. From this statement, it appears that about three-fourths of the emoluments of the teachers are paid by the Council, and about one-fourth by the parents and guardians of the scholars in the shape of school fees.

TEACHERS.

There were employed in the denominational schools in the district at the close of the year fifteen male teachers and five female teachers, two of whom are assistants. The school at Port Macquarie being in operation during a portion of the last quarter of the year, the teacher is included in this statement. The salaries attached to the provisional classifications are as follow:—

2 teachers at £108 per annum each.		
5 "	84	"
6 "	72	"
5 "	60	"
2 assistants at 30		"

The total amount of school fees received was £575 16s. 6d. From this statement it appears that the average salaries are £80 10s. nearly, and the average school fees £33 17s. 6d., making the total average annual income of each teacher £114 7s. 6d. In addition to this, excepting in three or four cases, they have residences free of rent.

LOCAL SUPERVISION.

The inspection of the schools by the Local Boards is very seldom. In some cases the teachers are not aware of the names of all the members, and as a general rule the influence of the Boards in encouraging the teachers in the efficient discharge of their duty, or in promoting education of a useful character, is of very little value. One teacher informed me that the Local Board of his school had not met on business for ten years. In country districts the clergy have so little time to spare from church matters that they cannot devote much attention to the improvement of the schools under their immediate control; indeed, in very few instances in this district can they spare time to visit the schools to give religious instruction. In three or four cases I found the Local Boards manifest some interest in the affairs of the schools under their supervision.

CONCLUDING REMARKS.

The majority of the schools are held in churches, and inadequately furnished. Although the buildings are unsuitable in some respects, they are in passable repair. The organization, discipline, and instruction of the schools admit of much improvement. The instruction is badly arranged, the average attendance of pupils is very low compared with the number enrolled, and the attainments of the scholars are small and unsatisfactory. The teachers are wanting in professional skill, the local supervision is of little value, and there is a prevalent feeling abroad that the advantages of denominational schools are not so great as formerly supposed, but that, notwithstanding this, the means of education afforded therein will soon be improved under the Council's supervision.

W. M'INTYRE,
Inspector of Schools.

Armida, 29 February, 1868.

BATHURST DISTRICT.—INSPECTOR'S GENERAL REPORT FOR 1867.

ON 22nd January, I received from the Secretary of the Council of Education an acting order as Inspector; and I was, at the same time, instructed to visit certain Denominational schools in and near Sydney, for the purpose of reporting upon the applications for certificates which had been made by them.

2. In accordance with these instructions, I visited and reported upon the following schools:—two (2) C.E., twelve (12) R.C., and one (1) Pres.

3. On 2nd February, I received my appointment as an Inspector of Schools under the Council of Education; and, at the same time, I was ordered to continue my former duties. Following these instructions, I visited and afterwards reported upon twenty-six (26) C.E., thirteen (13) R.C., two (2) Pres., and four (4) Wes. schools. These schools were situated in the northern part of Cumberland, the south of Northumberland Counties, and in the Moruya District. I also visited two (2) Public schools for special report, and the same number of private schools that had applied to be converted into Public.

4. When these duties had terminated, I attended the Inspectors' Conference, which was held in Sydney, from 25th March to 10th April.

5. Having been appointed to the Bathurst District, I left Sydney, and arrived at my head quarters on 20th April. For a considerable time after my arrival, I was prevented from visiting the schools from various causes. My time, however, was occupied with various clerical duties, and in inquiring, by personal visits, into applications for new schools.

6. The total number of schools in the Bathurst District at the end of the year was eighty-three, viz. :—

Fifty-one	(51)	Public Schools
Twenty-two	(22)	Cert. Denomin. do.
Ten	(10)	Provisional do.

Eighty-three (83) Total.

7. The magnitude of my district, coupled with the short time I had for inspection, and the time occupied in attending to the applications for new schools, prevented me from visiting the whole of the schools within the year. I have, however, inspected the schools in and near Bathurst, those lying on or near the Main Western Road as far as Bourke, and those situated in the north-western part of the district. I have also visited for special report a few other schools; and in the course of my journeys, "incidental" visits were paid to seven (7) schools that received no other visit.

8. The following statements shew the number of schools inspected during the year, and also the number of visits paid to schools during that time. Before my arrival at Bathurst, I inspected—

Two	(2)	Public Schools
Twenty-eight	(28)	C. E. do.
Twenty-five	(25)	R. C. do.
Three	(3)	Pres. do.
Four	(4)	Wes. do.

Sixty-two (62) Total.

Since I took charge of this district, I have inspected—

Twenty-eight	(28)	Public Schools
Nine	(9)	C. E. do.
Four	(4)	R. C. do.
One	(1)	Pres. school
One	(1)	Provl. do.

Forty-three (43) Total.

The total number of schools inspected is therefore—

Thirty	(30)	Public Schools
Thirty-seven	(37)	C. E. do.
Twenty-nine	(29)	R. C. do.
Four	(4)	Pres. do.
Four	(4)	Wes. do.
One	(1)	Provl. School

One hundred and five (105) Total number of inspected schools.

To this number (105) must be added the following—

Seven	(7)	schools, visited "incidentally" only
Five	(5)	private schools, visited with the view of their being accepted as provisional schools

Twelve (12) Total number visited only.

Thus the total number of visits paid to schools is—

Twelve	(12)	not formally inspected
One hundred and five	(105)	formally inspected

One hundred and seventeen (117) Grand total.

9. The number of applications for the establishment of Public and other schools I have reported upon, after personal visits to the localities, is eighteen (18). Of these, six (6) were not completed at the end of the year, and four (4) were ineligible. In some instances, applications of this nature were entertained by the Council without my report.

10. The number of schools opened in this district during the year is as follows :—

Seven	(7)	Public Schools
Ten	(10)	Provisional do.

Seventeen (17) Total.

11. In consequence of press of other work, I have not been able to hold any examinations of teachers, with the exception of pupil teachers and candidates for pupil teacherships.

12. The total distance I have travelled during the year is 3,026 miles, viz., before my appointment to this district, 1,103 miles; since that time, 1,923 miles.

13. The amount of correspondence since my arrival at Bathurst has been 945 letters, et cetera.

14. I now proceed to submit the following remarks upon the several topics on which Inspectors are required to report, when engaged in examining the schools.

ORGANIZATION.

Situation.—In general the schools I have visited have been found to be well situated, not only as regards proximity to the population, but also in other respects.

The following are exceptional cases—three (3) were too near creeks or rivers, one (1) was adjacent to a slaughter-yard, one (1) quite buried in the bush, and two (2) were much too near the main street and road. There is frequently no supply of water on the premises; sometimes the water has to be brought some distance, and almost always at the expense of the teacher.

School-room.—The majority of rooms are suitable, but at nine (9) places they are too small for proper accommodation.

There are a good many Public Schools without class-rooms; and several have either no inscription, or a wrong one, over the entrance.

New schools are being built at three places, and a handsome and convenient C. E. school has been built at Bathurst during the year.

Accommodation for boarders has been provided at a few schools, and others have made efforts to provide similar apartments.

The ventilation of the school-rooms is often bad, because the windows do not open at the top.

With two exceptions, wooden floors are laid down; the exceptional cases are where a brick and an earthen floor are found.

Residences

Residences are generally provided, but four (4) public and two (2) C. D. schools are without them, while at four places they are in very bad repair.

Playground.—Very generally provided. At one school there was none at the date of my visit, but since that time a good one has been secured.

At ten (10) schools the playgrounds are unenclosed, at four (4) they are too small, and at one (1) the pupils have to go some distance to get to their ground for recreation.

A very common fault is the absence of trees or other means of shelter from these grounds.

The playgrounds are not always separated for the sexes; and although out-offices are, with one or two exceptions, provided, they are, in a few instances, only partially divided into the proper compartments, when only one building has been erected for each school.

Furniture.—This is, in general, fully supplied to the schools, and is of the proper shape. Four (4) schools are, however, not properly stocked; at two (2) the furniture is very old, and is unfit for use; at twenty-one (21) schools the stock is very good. In a few schools the only fault in the construction of the furniture is the great height of the desks and forms, or of one or other of these. When I have found this to be the case, I have told the teacher to reduce these articles to the proper size. Clocks and hat-pegs are too often unprovided.

Apparatus.—The stock was found to be insufficient at twelve (12) schools, and there was none at four (4) places, if a few maps be excepted.

Very often the stock is deficient in pictures only. This is felt to be a great drawback in the matter of object lessons especially.

Books.—Requisitions for books, &c., have been furnished to all the teachers of the district, with the exception of the new schools, which were supplied direct from Sydney.

The C. D. schools had not been fully supplied with proper books at the date of inspection of each, and several of the Public Schools were short of stock.

This has arisen, I am informed, through the temporary exhaustion of the stock in the Council's depôt.

In general, I find the books, maps, &c., to be well kept, although there are comparatively few book-presses provided.

Classification.—For the most part judicious. In the great majority of instances, there are three (3) classes in each school; in eight (8) schools there are four (4) in each; in one (1) of these the classification is inappropriate.

The mode of classifying the pupils being dependent on the reading, and the same reading books not being found in all the schools, there must of necessity be some unevenness in this matter, but this will soon disappear.

Organization.—*a.* Time-tables.—These are in general drawn up more correctly than the document *b.* They are, however, capable of being amended in many cases, in respect of the equal distribution of studies. I have recommended the teachers to revise them at least every quarter. As the drawing up of this document requires great care, and takes up the teacher's spare time to some extent, it is desirable that *blank forms* of this and document *b* should be obtainable, at a cheap rate, from the Council's agent for books.

At one (1) school only was there no time-table.

The usual hour of opening school is 9:30 a.m., in some 9 a.m., and at two (2) or three (3) 10 a.m. is chosen instead. In the latter case some special reason was given for the practice.

In a few country schools the "dinner recess" was made to be too long.

b. Programmes of lessons.—In seven (7) instances these were almost useless, from the manner in which they had been drawn up.

The C. D. schools had, in many instances, incomplete and imperfect specimens hung up in them; and in two (2) cases these were not always kept displayed on the walls.

Some of the Public Schools had very poor specimens to shew, as regards neatness of construction.

The same school reported as having no time-table was also without this document.

School Records.—In general these are fairly kept. The entire set is *very neatly* kept at fourteen (14) schools; *very fairly* at twelve (12); *very moderately* at two (2) only.

In some of the new schools there were no official records when I visited them; but private records of attendance and fees had been kept, and these would be transferred. "Visitors' Books" were sometimes not to be found; and, occasionally, when such were in the school, no use had been made thereof. The school fees, in general, range from one shilling (1s.), to sixpence (6d.) per head per week; and in many country schools they are paid quarterly. It is very much to be wished that the Council could see their way to authorize a "scale of fees"; at present the payment of these moneys is often resisted, and is, in very many instances, a constant source of trouble, to both Local Boards and Teachers.

DISCIPLINE.

Punctuality.—This important item of good discipline is reported as "good" at fifteen (15) schools, and as "very bad" at nine (9) others. At the rest it may be styled "fair."

As regards the means employed to secure punctuality, I find that, in general, calling on or sending to the parents, keeping the late-comers in, and corporal punishment are adopted.

At three (3) schools *extra* means are tried, namely, keeping a daily record of late-comers, by means of a monitor appointed for that purpose; prizes in the shape of small books are also given, and in one case late pupils are made to do all the day's work they missed by being late. Some teachers do not insist on work being done by the children when they are kept in.

Regularity.—In seventeen (17) schools about two-thirds ($\frac{2}{3}$) of number on the roll attend regularly in fifteen (15) about three-fourths ($\frac{3}{4}$), in four (4) less than two-thirds ($\frac{2}{3}$), and in five (5) more than three-fourths ($\frac{3}{4}$).

The usual causes of irregular attendance are in operation in this district, viz., carelessness and indifference of parents, the demands of labour, the state of the weather and of the bodily health. I am strongly of opinion that, until a compulsory system of education is introduced, some of the above causes will not be overcome.

Cleanliness.—In general, I have been able to report this as "good"; but it should be remembered that notice of my visit was sent, in each case, a few days beforehand. Still, I believe most of the schools are clean and neat in general.

At three (3) schools "very good" was reported of their state in this respect, at fifteen (15) "very fair", and in two (2) instances only did I find the teacher untidy.

In connection with this heading, I may here refer to the untidy habit prevalent in too many schools of cleaning the slates without using dusters or sponges, and also the very frequent absence of any means for washing hands and faces.

Order.—Generally speaking the order maintained is "very fair"; at ten (10) schools however it does not reach that standard, while at five (5) the report gives "very good" as the estimate thereof. The great fault I have to find with the order, as kept by the great majority of the teachers, is a want of due attention to the *minor* points or matters, if I may so term them. Like "trifles," they go to make "perfection." In such cases the children do not sit or stand properly in class, nor do they hold their books and slates as they should; in short, they do a thousand little things in a negligent manner.

Where the schools above spoken of as "very good" excelled the rest was, in minute attention to little matters. In C. D. schools there was a general neglect of marching out of school and premises at dismissal.

In the matter of making obeisance to the authorities of the school (if to no others), I find a great diversity of action. I always advise the practice of proper respect.

Government.—The chief faults of this item of discipline are either a want of firmness or mildness on the teacher's part, and the partial neglect of the uses to which the "uncovered schoolroom"—the playground—should be put.

Except in one instance, I did not hear any undue severity (by corporal or other punishment) on the part of the teachers complained of; and on investigation, this charge broke down.

The practice of having to register the several cases where punishment is inflicted has a wholesome effect.

The moral character and influence of our teachers was, on due inquiry, found to be in almost every instance satisfactory; in some cases better persons could hardly have been obtained. I regret to have to report that one teacher was dismissed for drunkenness during the year, and the character of another (since gone away) was found to be very unsatisfactory.

INSTRUCTION.

Subjects.—The subjects taught are those prescribed by the Council, with the following exceptions. The "Tonic Sol-fa" method is only taught at two (2) schools, and in these only in the initiatory stages.

Singing	is not practised	at twelve (12)	schools.
Drawing	do	fifteen (15)	do.
Needlework	do	five (5)	do.
Object lessons	do	four (4)	do.
Scripture lessons	do	one (1)	do.
Geometry	do	five (5)	do.

Method.—I had no opportunity during the year of hearing teachers give oral lessons; and the only means afforded of judging the method was by the results, as shewn in the examination of pupils. The "individual" method is not professedly employed in any school; but I find it practised in a few. "Collective" teaching is almost solely used for object lessons. There is a manifest want of revision of work in too many instances; and further, of the necessary *training* for the duties required of teachers, on the part of some of those at present employed by the Council.

"Home lessons" are very seldom required of the pupils; and if the study of these should be insisted upon, there is great difficulty experienced in getting the pupils to buy the necessary books.

The teachers' wives, in addition to teaching needlework, sometimes volunteer their services for other subjects. In two cases, where the school is in charge of the wife, the husband teaches writing and arithmetic.

SCHOOL BOARD.

In almost every instance *some* members of the Local Boards attended my examination, and at several schools the parents of the pupils and others were also in attendance.

The visits paid by the members of the Local Boards were found to vary in a great degree. At two (2) schools these were made almost daily; at nineteen (19), the visits are very fairly regular; at five (5), there have been no visits paid; and at six (6), a few of these attendances are recorded.

The "Visitors' Book" has not been used at (10) schools; but this is often the fault of the teacher, in not placing it in the proper place.

Meetings of the Local Boards have been held as under:—

At four (4) schools, regularly, and generally monthly.

At eighteen (18), at irregular intervals.

For the rest, no meetings appear to have been held; but in some of these cases no Local Boards for 1867 had been nominated, and the members of 1866 Boards either declined to act, or confined their actions to signing the teachers' official papers.

Records of these meetings have been kept by the Hon. Secretaries of seventeen (17) School Boards.

I have found *visiting* to be the weak point of these Boards. In some cases, the dislike to perform this duty has arisen from the want of education on the part of the visitor; in others, from nervousness, or some feeling similar; but in too many instances, from decided indifference to duty and the interests of the school.

This is a difficult matter to deal with, more especially as the number of persons eligible for membership of these Boards is often very limited.

Attendance of Pupils.—The following is the number of pupils *on the rolls* at inspection:—Boys, 1,296; girls, 1,164; total, 2,460.

The number *present* at inspection, was,—Boys, 1,059; girls, 926; total, 1,985.

PROFICIENCY OF PUPILS.

In general, the classes were enrolled as for the "second quarter" of the "standard of proficiency," which was received in July by the teachers.

Reading.—The chief defects of this subject are, a want of distinctness of utterance, and a lack of due expression—the latter fault being characteristic of the reading in the upper classes.

There is also noticeable a want of appreciation of the nature of the different points or stops used in composition; no inflection, or an improper kind of inflection of the voice takes place at the period, note of interrogation, and other pauses, and thus a monotonous style of delivery is caused.

Another fault is, the abuse of the aspirate; it is either too prominently marked, or more frequently omitted altogether.

Many of these defects would be greatly modified, if not removed, by a judicious course of simultaneous reading.

Writing—including Dictation.—In general, the writing on slates is much better than that on paper.

In the latter case, there is too great a variety in the kind of copy-book used, some being little better than useless. Copy-books with a graduated set of head lines are not in use so often as they should be; and to secure the best specimen of these books for general use, it would be necessary that the Council should recommend a series. In writing on slates, lines are not required for any class above the second, but they are often used.

Dictation is generally fairly well done, with the exception of the first class, where the idea that reading and writing should be taught simultaneously does not seem to be as fully acted upon as is required.

Writing from dictation on paper is practised in a few schools, as is also letter-writing; but more attention to both is required. The practice of writing narrative from the memory is, on the whole, fairly well attended to.

Some teachers vary the kind of dictation, by using such excellent text books as Sullivan's "Spelling-book Superseded," and Davis' "Composition."

Arithmetic.—As an art, this subject is very fairly done in most cases. The theory of the different stages however, requires much more attention on the teachers' part.

Notation

Notation is in general too much neglected ; at any rate, the "standard" requirements are as yet not often fully reached. In the third class the pupils are, in several instances, in advance of the required point ; but when this is the case, there is often a weakness in the knowledge and ready use of the back rules, through want of frequent and careful revision of work.

Occasionally, correctness and readiness in working sums were obtained at the sacrifice of neatness. *Object Lessons.*—In the great majority of cases, this is the only subject in which collective teaching is employed.

From the answers given at inspection, it is evident too often that the method of giving these lessons is defective, chiefly in being too mechanical.

There is often a deficiency in the supply of the diagrams that are necessary for this subject ; but on the other hand, I have found a few teachers who have collected their own specimens for illustrating these lessons, and in other ways supplied what the school did not furnish.

Singing.—This subject is generally taught by ear. In two (2) schools the Tonic Sol-fa method is taught, and in a few, Hullah's.

Two instances are known where the teachers, being unable to teach, employ persons to perform this duty ; and in several schools, singing is taught by the teachers' wives. In some schools, I have had to call attention to the silence of the boys at singing time ; at others (but only a few) to the puerile character of the songs taught to the elder children.

Grammar.—Too frequently this is the weak subject of instruction.

The definitions, not only of the parts of speech, but also of the technical terms in common use, are frequently indistinct, and sometimes incorrect, while, from want of an authorized text-book, they vary almost with the number of schools.

In the mode of parsing, there is, as one would expect from having an official guide thereupon, a great and favourable contrast to the last-named point.

In the higher classes, very little instruction seems to have been attempted as regards the art of composition ; and the analysis of sentences requires more attention than it at present receives.

Geography.—The general knowledge of this was found to be superior to that of the last subject.

In the earlier stages of instruction, however, the teaching is not so carefully done as it ought to be.

Maps are in general supplied in sufficient abundance ; and those illustrating Australian Geography are of the most recent date, with very rare exceptions.

The drawing of maps has not been extensively practised ; but if maps in outline or projections could be easily and cheaply bought, an impetus would be given to this practice.

Drawing.—This branch of school work is beginning to receive its due share of attention ; but several teachers out of the fifteen (15) who do not teach it, are deterred from attempting it from a real or fancied inability to teach it. Having such suitable books as those of Mr. Fowles' to guide them, I believe there is very little (if any) excuse to be made for neglect of this subject. When taught, more oral teaching—chiefly by way of explanation—is required in most instances.

In a few schools, the drawing is done on paper ; and in some individual cases, considerable skill and taste are shewn by the pupils.

Scripture Lessons.—On the whole, this subject receives its proper share of attention.

At one or two schools that I visited, the time for needlework was identical with that set down for these lessons, consequently only the boys read them.

In one public school these lessons were not used ; and none of the C.D. schools studied them, with the exception of one or two, in which the teacher based a series of oral lessons on one or other of these books.

I believe these lessons will be applied for by some of the teachers of C.E. schools.

In connection with this subject of instruction, I may state that, in the public schools I have visited and inspected, there is very little special religious instruction given by the clergy or other authorized persons. At two schools, however, such instruction is regularly imparted by the clergymen of the C.E. stationed nearest them.

Geometry.—This subject has received but little attention, at present being taught at three (3) schools only. In these, only the very elementary parts of the subject have been studied.

As the schools get into full work under the present system, this subject will receive its full share of attention, I have no doubt.

Needlework.—In general, care is taken to teach this in a proper manner.

Plain needlework is taught at almost all the schools ; but in one or two, it was evident that a decided preference was given to fancy work, from a foolish desire to please the parents, who desired such only to be taught. In too many instances, it is only with much trouble that parents are induced to supply materials for this useful branch of girls' education.

Bathurst, 25 March, 1868.

I. COBURN,
Inspector, Bathurst District.

CAMDEN DISTRICT.—GENERAL REPORT FOR 1867.

INSPECTOR'S Report upon the Schools—Public, Provisional, and Certified Denominational—in the Camden District, for the year 1867.

The number of schools in operation in this district, in the first quarter of the year, was ninety-nine (99), viz. :—forty (40) Public schools, one (1) Provisional school, and fifty-eight (58) Certified denominational schools. Twelve (12) new schools—five (5) Public and seven (7) Provisional—were added to the list in the year. At the end of 1867, therefore, the total number of schools on the list was one hundred and eleven (111).

Amount of Inspection.—The following statement exhibits the number of visits paid, and the distance travelled by me, in connection with my duties, in the year :—

Number of visits paid for inquiry relative to the certifying of denominational schools	26
Number of visits for inquiry relative to applications for establishment of new schools	27
Number of visits for General Inspections	79
Number of visits for special inquiries	42

Total distance travelled, 3,714 miles.

TABLE

TABLE shewing the numbers of Schools examined, and not examined in the year.

	Public.	Provisional.	Certified Denominational.				Total.

Schools visited for examination	33	3	22	14	5	2	79
Schools <i>not</i> visited for examination	14	5	8	8	...	1	36
Totals	47	8	30	22	5	3	115

N.B.—1. In the case of three (3) schools, one consisting of three (3) departments and two (2) of two (2) departments each, each department is given in the above table as a separate school.

2. In the case of eleven (11) of the schools *not* examined, six (6) were closed, and five (5) had not been brought into operation in the last quarter of the year. The latter, with one exception, have since been opened.

The numbers on the rolls of the schools inspected on the day of examination, and also the numbers actually present on the occasion, with the pupils' ages and sexes, are shewn in the following tables:—

Numbers enrolled.

Schools.	7 years and under.		8 years.		9 years.		10 years.		11 years.		12 years and upwards.		Total.

Totals	690	511	202	177	203	154	177	147	137	132	254	210	1663	1331

It will be seen from the above tables that the numbers present on the day of inspection must, in many cases, have been small as compared with the numbers enrolled. This was caused, chiefly, by the inclemency of the weather. The prevalence of measles had also an injurious effect upon school attendance, in different parts of the district, during the year.

Character of Inspection.—In the inspection of the schools, the Council's "Regulations," the "Instructions to Inspectors," and the "Standard of Proficiency," were strictly adhered to. The examination of the pupils was searching in its character, and, as far as practicable, the educational results, as shewn by the conduct and attainments of the pupils, were carefully ascertained.

CONDITION OF THE SCHOOLS INSPECTED.

A detailed statement, shewing the condition of the various schools at the time of examination, will be found appended to this report. The condition of each school is described under the heads of—

1. Material Condition
2. Moral Character.
3. Instruction.
4. Proficiency.

I.—MATERIAL STATE OF THE SCHOOLS.

Situations.—The Public schools at Croobyar, Jamberoo, Peterboro', and Worragee, are not sufficiently central to the populations in their respective localities. The situations of the other Public schools examined may, in most respects, be considered satisfactory. As regards the Certified Denominational schools, they have good sites, but, in several instances, they are placed nearer to each other, or to a Public school, than the educational requirements of the localities render necessary.

Buildings.—Of the Public schools inspected, eighteen (18) are conducted in buildings the property of the Council, and the remaining thirteen (13) in premises belonging to private persons. Of the vested buildings, twelve (12) may be considered satisfactory, and three (3) tolerably so. The remaining three (3) are indifferent or unsuitable for school purposes. Seven (7) non-vested buildings are fairly satisfactory. Of the Certified denominational schools inspected, eight (8) are conducted in buildings which are either unsuitable or in bad repair, whilst the buildings in which the remaining thirty-five (35) are conducted may be considered fairly satisfactory. There are ten (10) Certified denominational schools where teachers' residences are not provided.

Playgrounds.—

Playgrounds.—In nearly all cases playgrounds are provided; but some are not fenced in, and at ten (10) schools—four (4) Public and six (6) Denominational—the necessary out-buildings have not been erected.

Furniture.—In thirty-two (32) of the schools visited—nine (9) Public, three (3) Provisional, and twenty (20) Denominational—the furniture is either unsuitable or there is an insufficient supply. In forty-seven (47) schools the furniture may be described as good or fair. Those public school buildings in which the furniture is insufficient and unsuitable are, chiefly, non-vested.

Books and Apparatus.—These are supplied by the Council. At the time of inspection, the whole of the schools had not received their grants; but all have now been properly supplied. In the majority of the Certified Roman Catholic denominational schools, the teachers, acting by direction of their Local Boards, did not apply for school requisites until the third quarter of the year.

Records.—In most of the schools visited these are carefully and honestly attended to by the teachers, and the necessary returns are properly furnished. In three cases, however, it was found that teachers had wilfully falsified the records and returns. The offenders have been dismissed from the Council's service.

II.—MORAL CHARACTER.

Attendance.—In many of the schools inspected, the attendance of the pupils, both as regards regularity and punctuality, is very unsatisfactory. Parents are, undoubtedly, to a great extent answerable for this; but, at the same time, it is unquestionable that teachers are also much to blame in the matter. To effectually remedy the evil of irregular attendance, I am strongly of opinion that a compulsory system of education will have to be introduced. But, in the meantime, the duty of teachers in connection with the matter is plain. By earnest, well-directed, and persevering exertions, they should, in the first place, strive to make good and cheerful schools that would have an attractive influence over the children; and, in the second place, they should constantly communicate and reason with the parents, with the view of securing their co-operation, as far as possible.

Cleanliness.—In this respect the condition of the schools, as a whole, is tolerably satisfactory. In a considerable number of the schools visited the matter is exceedingly well attended to.

Order and Government.—In three-fourths of the schools inspected the pupils are quiet and orderly, and the government is mild and fairly efficient. In these respects six (6) schools are indifferent or bad.

TOTALS	30	33	16

III.—INSTRUCTION.

Classification.—In the schools inspected, the classification of pupils is, on the whole, tolerably judicious. In one-half of the schools it may be considered good or fair: in one-fourth, tolerable or moderate; and in the remaining one-fourth, indifferent or bad.

Occupation.—In three-fourths of the Public schools inspected, and in one-half the certified denominational schools, the work is regulated by suitable time tables and programmes of lessons. In the remainder of the schools, at the date of inspection, these documents were either not in use, or, if in use, they were constructed in such a manner as rendered them nearly valueless for the purposes intended. In this respect, however, a great improvement has been made since the schools were inspected. In all cases the required documents are, I believe, now in use.

Subjects and Methods.—Reading, writing, arithmetic, grammar, and geography are taught in all the primary schools visited. The scripture lessons are used in the Public schools and in many of the Denominational schools. In nearly all the Public schools, and in about one-half the Certified denominational schools, object lessons are given with more or less skill. Singing and drawing are more or less taught in about three-fifths of the schools, and in five (5) schools—three (3) Public, and two (2) Certified denominational—elementary instruction in Latin, geometry, and algebra, is given to a few pupils. Needlework is taught in about three-fifths of the schools. As regards the methods of instruction practised, there is great room for improvement in the schools visited. In about two-fifths of the Public schools the methods may be considered good or fair; in two-fifths, tolerable or moderate; and in the remaining one-fifth, indifferent or bad. Of Certified denominational schools, in twelve (12)—seven (7) C.E., three (3) R.C., and two (2), Pres.—the methods may be considered good or fair; in fourteen—seven C.E., four R.C., one Pres. and two Wes.—tolerable or moderate; and in seventeen (17)—eight (8) C.E., seven (7) R.C., two (2) Pres.—indifferent or bad.

" Wesleyan "	2
TOTALS	23	37	19

IV.—PROFICIENCY.

The results in this respect are tested by the "Standard of Proficiency." At the time of inspection copies of the standard had not been received in several of the schools, whilst in others they had only been in use a short time. Partly from this cause, in a considerable number of the schools examined the results were found to be far below the standard. But at next examination, when all teachers will have had an opportunity of instructing their pupils in accordance with the standard's requirements, the results will, I believe, prove more satisfactory. At present, only sixteen (16) schools—ten (10) Public, four (4) C.E., one (1) R.C., and one (1) Pres.—can be considered as up to the standard. In reading, writing, and arithmetic, the schools, as a whole, are moderately satisfactory; whilst in grammar, geography, and object lessons, the proficiency in the majority of cases is but indifferent or bad.

TEACHERS.

The teachers in the schools visited are, as a body, respectable, and they are conscientious in the discharge of their duties. They are also anxious to become better qualified for their work. On all occasions I found them ready to receive and act upon my suggestions for the improved working of their schools.

" III	17	21	20	

LOCAL SUPERVISION.

In a few instances the schools are regularly visited, and meetings are held by the Local Boards; and in about one-half the schools inspected the local supervision is, I believe, more or less beneficial. In some places the reverse of this is the case, and in others no interest whatever is manifested in the welfare of the schools.

J. HUFFER,
Inspector of Schools, Camden District.

APPENDIX.

DETAILED Statement of the condition of Schools inspected in the Camden District in 1867.

The remarks under head 1 relate to the material condition of the schools.
2 to their moral character.
3 to the subjects and methods of instruction.
4 to the proficiency of the pupils.

PUBLIC SCHOOLS.

AYONDALE (Vested) :—Visited, 28th August, 1867.

Numbers present :—Boys, 13; girls, 13; total, 26.

1. The material condition of the school is tolerably good. 2. The pupils are only moderately regular and punctual. The cleanliness, order, and attention are tolerably good. 3. The prescribed subjects are taught—singing and drawing excepted. The teaching is conducted with earnestness and care. 4. The proficiency of the pupils is moderately satisfactory.

BERKELEY

BERKELEY (Vested) :—Visited, 3rd October, 1867.

Numbers present :—Boys, 21 ; girls, 12 ; total, 33.

1. The material appliances are fairly satisfactory. 2. The discipline is healthy. 3. The instruction is tolerably efficient. 4. The proficiency is fairly satisfactory.

BOOLONG (Non-vested) :—Visited, 19th September, 1867.

Numbers present :—Boys, 15 ; girls, 21 ; total, 36.

1. The site is good, and the building is tolerably satisfactory. 2. The pupils are neither regular nor punctual. The moral tone is tolerably pleasing. 3. Singing and drawing are not taught. The teaching is carried on with industry, but with a want of thoroughness. 4. The proficiency is only moderately satisfactory.

BROUGHTON CREEK (Non-vested) :—Visited, 21st September, 1867.

Numbers present :—Boys, 17 ; girls, 24 ; total, 41.

1. The material condition of the school is good. 2. The moral tone is pleasing. 3. The ordinary subjects are taught. The teaching is carried on with industry and tolerable skill. 4. The proficiency is tolerably satisfactory.

CAMDEN (Vested) :—Visited, 6th December, 1867.

Numbers present :—Boys, 50 ; girls, 43 ; total, 93.

1. The material state of the premises is reasonably good. 2. Regularity and punctuality, good ; moral tone satisfactory. 3. The prescribed subjects are taught ; the methods are effective. 4. The proficiency is satisfactory.

CAMBEWARRA (Vested) :—Visited, 17th September, 1867.

Numbers present :—Boys, 13 ; girls, 15 ; total, 28.

1. The material state of the school is fairly satisfactory. 2. The discipline is tolerably healthy. 3. All the subjects are taught. The teacher is tolerably skilful. 4. The pupils' attainments are fairly satisfactory.

COOLANGATTA (Non-vested) :—Visited, 20th September, 1867.

Numbers present :—Boys, 19 ; girls, 18 ; total, 37.

1. The material condition of the school (requisites excepted) is bad. 2. The regularity is very unsatisfactory. The general tone is fairly healthy. 3. The ordinary subjects are taught. The methods are not satisfactory. 4. The pupils' attainments are only moderate.

CARARAWELL (Non-vested) :—Visited, 5th June, 1867.

Numbers present :—Boys, 16 ; girls, 13 ; total, 29.

1. The working materials are good. The building is unsuitable. 2. The discipline and moral tone are very satisfactory. 3. The teaching is carried on vigorously. The methods are effective. 4. The proficiency, under the circumstances of the school, is satisfactory.

CROOBYAR (Non-vested) :—Visited, 28th May, 1867.

Numbers present :—Boys, 13 ; girls, 15 ; total 28.

1. The material condition is fairly satisfactory. 2. The discipline is fairly healthy. 3. All the subjects are taught. The methods used are fairly satisfactory. 4. The proficiency is tolerably good.

FAIRY MEADOW (Vested) :—Visited, 7th October, 1867.

Numbers present :—Boys, 37 ; girls, 34 ; total 71.

1. Some repairs and additions are needed. 2. The discipline is tolerably satisfactory. 3. Except singing, all the subjects are taught. The teacher is earnest, and tolerably skilful. 4. The proficiency ranges from tolerable to fair.

GLEDSDOOD (Vested) :—Visited, 3rd December, 1867.

Numbers present :—Boys, 9 ; girls, 14 ; total, 23.

1. Some repairs are needed, otherwise the material state would be good. 2. The discipline is only moderate. 3. The ordinary subjects are taught. The methods are bad. 4. The proficiency is not satisfactory.

JAMBEROO (Vested) :—Visited, 11th September, 1867.

Numbers present :—Boys, 22 ; girls, 10 ; total, 32.

1. The site is not central. In other respects the material condition is fairly satisfactory. 2. The discipline is tolerably healthy. 3. All the subjects are taught. The methods, though apparently skilful, are not effective. The results are unsatisfactory.

LIVERPOOL (Non-vested) :—Visited, 26th November, 1867.

Numbers present :—Boys, 43 ; girls, 22 ; total, 65.

1. The material state (furniture excepted) is fairly satisfactory. 2. The discipline is healthy. 3. The prescribed subjects are taught. The teacher is energetic and tolerably skilful. 4. The attainments are, on the whole, fairly satisfactory.

MARSHALL MOUNT (Vested) :—Visited, 26th September, 1867.

Numbers present :—Boys, 18 ; girls, 14 ; total, 32.

1. Some additions and painting are needed ; in other respects the material condition is good. 2. The pupils are clean and orderly. The tone is pleasing. 3. The ordinary subjects are taught. The methods are suitable. 4. The proficiency is tolerably satisfactory.

MOUNT KEIRA (Non-vested) :—Visited, 21st August, 1867.

Numbers present :—Boys, 30 ; girls, 21 ; total, 51.

1. Requisites excepted, the material condition is bad. 2. The discipline is moderately healthy. 3. The ordinary subjects are taught. The methods are only moderately skilful. 4. The results are tolerably satisfactory.

MEROO (Non-vested) :—Visited, 18th September, 1867.

Numbers present :—Boys, 16 ; girls, 17 ; total, 33.

1. Additions to the teacher's quarters, and outbuildings are needed. Otherwise the material condition is good. 2. The discipline is very good. 3. The teaching is carried on with energy and care. 4. The attainments, considering the short time the school has been in operation, are good.

NORTH BULLI (Non-vested) :—Visited, 4th October, 1867.

Numbers present :—Boys, 15 ; girls, 6 ; total, 21.

1. The present state of the school premises is not satisfactory. 2. The discipline and general tone are good. 3. The teaching is effective. 4. The attainments, under the circumstances of the school, are highly satisfactory.

NOWRA (Vested) :—Visited, 6th June, 1867.

Numbers present :—Boys, 18 ; girls, 28 ; total, 46.

1. The material state is fairly satisfactory. A teacher's residence is needed. 2. The discipline and general tone are fairly healthy and pleasing. 3. The ordinary subjects are taught. The methods are moderately skilful. 4. The general proficiency is only moderate.

OMEGA RETREAT (Vested) :—Visited, 10th September, 1867.

Numbers present :—Boys, 27 ; girls, 23 ; total, 50.

1. The buildings are in an unfinished state. 2. The discipline is very good. 3. The prescribed subjects are taught. The instruction is conducted with energy and considerable skill. 4. The proficiency ranges from fair to good.

PETERBORO' (Vested) :—Visited, 9th September, 1867.

Numbers present :—Boys, 14 ; girls, 9 ; total, 23.

1. With the exception of school requisites, the material state of the school is very bad. The premises are unsuitable. 2. The discipline is tolerably healthy. 3. The ordinary subjects are taught. The instruction is carried on with earnestness, but without much skill. 4. The results are only moderately satisfactory.

PICTON, UPPER (Vested) :—Visited, 21st October, 1867.

Numbers present :—Boys, 21 ; girls, 13 ; total, 34.

1. The material condition of the school is only moderate. 2. The pupils are fairly orderly and attentive. The moral tone is tolerably healthy. 3. The prescribed subjects are taught—singing and drawing excepted. The teacher is intelligent and industrious. 4. The proficiency is fairly satisfactory.

PYBEE (Non-vested) :—Visited, 12th June, 1867.

Numbers present :—Boys, 38 ; girls, 34 ; total, 72.

1. With the exception of requisites, the material state is bad. 2. The discipline is very good. 3. The prescribed subjects are taught. The teachers are intelligent, skilful, and painstaking. The results are highly satisfactory.

SHELLHARBOR :—Visited, 5th September, 1867.

Numbers present :—Boys, 37 ; girls, 28 ; total, 65.

1. The material condition is bad. Steps have been taken for the erection of new premises. 2. The discipline and general tone are fairly satisfactory. 3. All the subjects are taught ; the teachers are earnest and industrious. 4. The results are fairly satisfactory.

SMITHFIELD (Vested) :—Visited, 29th November, 1867.

Numbers present :—Boys, 24 ; girls, 19 ; total, 43.

1. Since the date of inspection a new residence for the teacher has been completed. The material condition is now good. 2. The discipline is fairly healthy. 3. The prescribed subjects are taught ; the teacher possesses an average amount of skill. 4. The proficiency is, on the whole, fairly satisfactory.

STONY CREEK (Vested) :—Visited, 14th September, 1867.

Numbers present :—Boys, 22 ; girls, 16 ; total, 38.

1. The material appliances are fairly satisfactory. 2. The discipline and moral tone are healthy. 3. The teacher is intelligent and painstaking. 4. The proficiency is, on the whole, satisfactory.

TOMERONG (Non-vested) :—Visited, 1st June, 1867.

Numbers present :—Boys, 17 ; girls, 16 ; total, 33.

1. The material condition of the school is good. 2. The school has a healthy tone. 3. The ordinary subjects are taught ; the methods employed are not the most suitable. 4. The proficiency ranges from tolerable to fair.

ULLADULLA (Non-vested) :—Visited, 29th May, 1867.

Numbers present :—Boys, 14 ; girls, 5 ; total, 19.

1. The school-room is in bad repair. 2. The discipline is healthy. 3. The instruction is tolerably effective. 4. The proficiency is, on the whole, tolerably satisfactory.

VIOLET HILL (Vested) :—Visited, 23rd August, 1867.

Numbers present :—Boys, 17 ; girls, 22 ; total, 39.

1. The material condition is tolerably good. 2. The pupils are punctual, and they are tolerably orderly and attentive. 3. The ordinary subjects are taught with tolerable success. 4. The attainments range from tolerable to fair.

WORRAGEE (Vested) :—Visited, 3rd June, 1867.

Numbers present :—Boys, 15 ; girls, 7 ; total, 22.

1. The material condition is bad. 2. The discipline is only moderately healthy. 3. The teaching is not effective. 4. The proficiency is moderate.

WOLLONGONG,

APPENDIX.

49

WOLLONGONG (Vested)—Boys :—Visited, 13th August, 1867.

Number present, 47.

1. The buildings are in a bad state of repair.
2. The discipline is good—regularity and punctuality excepted.
3. The instruction is well attended to.
4. The results are fairly satisfactory.

WOLLONGONG (Vested)—Girls.

Number present, 21.

1. The buildings need repairs.
2. The regularity and punctuality are fair; the general tone is only moderately satisfactory.
3. The instruction is not effective.
4. The proficiency is but moderately satisfactory.

WOLLONGONG (Vested)—Infants :—Visited, 14th August, 1867.

Numbers present :—Boys, 17; girls, 5; total, 22.

1. The material condition is reasonably good.
2. The discipline is healthy.
3. The ordinary subjects are fairly taught.
4. The proficiency is very fair.

WOODBURN (Non-vested) :—Visited, 27th May, 1867.

Numbers present :—Boys, 7; girls, 4; total, 11.

1. The material condition is moderately satisfactory.
2. The discipline is fairly healthy.
3. The instruction is moderately effective.
4. The proficiency is moderate.

PROVISIONAL SCHOOLS.

BOMADERRY :—Visited, 19th September, 1867.

Numbers present :—Boys, 17; girls, 16; total, 33.

1. The material condition is tolerable; additional furniture is needed.
2. The discipline is fairly healthy.
3. The ordinary subjects are taught with much industry and care.
4. The results are fairly satisfactory.

NOWRA HILL :—Visited, 20th September, 1867.

Numbers present :—Boys, 6; girls, 4; total, 10.

1. The material condition is not satisfactory.
2. The discipline is but moderately healthy; the attendance is very irregular.
3. The classification is totally neglected; the instruction is not skilful.
4. The proficiency is, in some respects, higher than could be expected from the character of the instruction.

SAGGART FIELD :—Visited, 16th December, 1867.

Numbers present :—Boys, 8; girls, 13; total, 21.

1. Furniture is needed, otherwise the material condition is fair.
2. The attendance is good; the general tone of the school is but moderately healthy.
3. The teaching is very unskilful.
4. The proficiency is very moderate.

CERTIFIED DENOMINATIONAL SCHOOLS.

CHURCH OF ENGLAND.

BANKSTOWN :—Visited, 21st and 22nd November, 1867.

Numbers present :—Boys, 8; girls, 6; total, 14.

1. The material condition is tolerably good.
2. The discipline is moderate.
3. The teaching is conducted with industry.
4. The proficiency is small.

CAMDEN (Primary) :—Visited, 4th December, 1867.

Numbers present :—Boys, 19; girls, 21; total, 40.

1. The material condition of the school is good.
2. The discipline is very good.
3. The prescribed subjects are taught with industry and skill.
4. The results are, on the whole, satisfactory.

CAMDEN (Infants).

Numbers present :—Boys, 10; girls, 25; total, 35.

1. The material condition is fair.
2. The discipline is healthy.
3. The instruction is fairly effective.
4. The proficiency may be considered satisfactory.

CAMPBELLTOWN (C.E.) :—Visited, 16th December, 1867.

Numbers present :—Boys, 37; girls, 21; total, 58.

1. New closets are needed; and the interior of the schoolroom should be cleaned.
2. The prevailing tone of the school is healthy.
3. The prescribed subjects are taught with energy and skill.
4. The proficiency is fairly satisfactory.

CANTERBURY (C.E.) :—Visited, 18th November, 1867.

Numbers present :—Boys, 33; girls, 23; total, 56.

1. The material state is good.
2. The discipline is moderately satisfactory.
3. The prescribed subjects are taught; the methods are not satisfactory.
4. The proficiency ranges from moderate to fair.

DAPTO (C.E.) :—Visited, 2nd September, 1867.

Numbers present :—Boys, 16; girls, 11; total, 27.

1. The school building is in bad repair, but the working materials are fairly satisfactory. A new residence has been provided.
2. The discipline is tolerably healthy.
3. The ordinary subjects are taught; the teacher is moderately skilful.
4. The proficiency is not satisfactory.

DENHAM COURT (C.E.) :—Visited, 28th November, 1867.

Numbers present :—Boys, 16 ; girls, 10 ; total, 26.

1. The material state of the school is very unsatisfactory.
 2. The discipline is moderately healthy.
 3. The ordinary subjects are taught with earnestness ; the teacher is not skilful.
 4. The proficiency is low.
-

FOX-GROUND (C.E.) :—Visited, 16th September, 1867.

Numbers present :—Boy, 1 ; girls, 2 ; total, 3.

1. The material condition is fairly satisfactory.
 2. Although 42 pupils were enrolled only 3 were present—the parents refusing to allow them to attend until a new master had been appointed.
-

GERRINGONG (C.E.) :—Visited, 23rd September, 1867.

Numbers present :—Boys, 27 ; girls, 17 ; total, 44.

1. Material condition, fair.
 2. The discipline is moderately satisfactory.
 3. The ordinary subjects are taught with industry and care ; the teacher is moderately skilful.
 4. The proficiency is moderate.
-

HOLSWORTHY (C.E.) :—Visited, 28th November, 1867.

Numbers present :—Boys, 2 ; girls, 4 ; total, 6.

1. The building and the supply of requisites are fairly satisfactory. The furniture is old and unsuitable.
 2. The discipline is very moderate.
-

JAMBEROO (C.E.) :—Visited, 13th September, 1867.

Numbers present :—Boys, 21 ; girls, 21 ; total, 42.

1. The material condition (requisites excepted) is unsatisfactory.
 2. The discipline and tone are tolerably healthy.
 3. The prescribed subjects are taught with intelligence and tolerable skill.
 4. The proficiency is moderate.
-

KIAMA (C.E.) :—Visited, 6th September, 1867.

Numbers present :—Boys, 58 ; girls, 23 ; total, 81.

1. The material appliances are not satisfactory.
 2. The discipline is good.
 3. The prescribed subjects are taught with industry and tolerable skill.
 4. The results range from tolerable to fair.
-

LIVERPOOL (C.E.) :—Visited, 25th November, 1867.

Numbers present :—Boys, 44 ; girls, 19 ; total, 63.

1. The buildings are old and unsuitable.
 2. The discipline is fairly satisfactory.
 3. The prescribed subjects are taught with industry and tolerable skill.
 4. The proficiency is fair.
-

LORD'S FOREST (C.E.) :—Visited, 12th December, 1867.

Numbers present :—Boys, 26 ; girls, 15 ; total, 41.

1. The material condition is fairly satisfactory ; new closets should be erected.
 2. The discipline is healthy.
 3. The prescribed subjects are taught with intelligence, earnestness, and tolerable skill.
 4. The proficiency ranges from tolerable to fair.
-

MACQUARIE RIVER (C.E.) :—Visited, 3rd September, 1867.

Numbers present :—Boys, 16 ; girls, 16 ; total, 32.

1. Material condition, tolerable to fair.
 2. The attendance is not good ; in other respects the discipline is fairly satisfactory.
 3. The ordinary subjects are taught with industry, but the teacher is unskilful.
 4. The proficiency is moderate.
-

MENANGLE (C.E.) :—Visited, 18th December, 1867.

Numbers present :—Boys, 12 ; girls, 15 ; total, 27.

1. The material condition is tolerable.
 2. The discipline is tolerably healthy ; the general tone is pleasing.
 3. The ordinary subjects are taught with much care ; the teacher's skill is moderate.
 4. The proficiency is tolerably satisfactory.
-

NARELLAN (C.E.) :—Visited, 5th December, 1867.

Numbers present :—Boys, 10 ; girls, 12 ; total, 22

1. The material condition is moderate.
 2. The discipline is fairly healthy.
 3. The prescribed subjects are taught ; the teacher is tolerably skilful.
 4. The proficiency ranges from moderate to tolerable.
-

PICTON (C.E.) :—Visited, 10th October, 1867.

Numbers present :—Boys, 4 ; girls, 6 ; total, 10.

1. The material appliances are tolerably satisfactory.
 2. The discipline and general tone are very moderate.
 3. The instruction is very unsatisfactory.
 4. The results are very small.
-

APPENDIX.

51

TERRARA (C.E.) :—Visited, 10th June, 1867.

Numbers present :—Boys, 18 ; girls, 12 ; total, 30.

1. The material condition is fair. 2. The discipline and general tone are very moderate. 3. The ordinary subjects are taught. The teacher's skill is very moderate. 4. The results are very unsatisfactory.

ULLADULLA (C.E.) :—Visited, 30th May, 1867.

Number present :—Boys 3.

1. The material condition of the school is bad. (In consequence of heavy rain on the day of inspection only 3 pupils were able to attend. The school has not been re-opened since.)

WOLLONGONG (C.E.) :—Visited, 15th August, 1867.

Numbers present :—Boys, 47 ; girls, 23 ; total, 70.

1. The material state and keeping of the school are, on the whole, satisfactory. 2. The discipline is good. 3. The prescribed subjects are taught with earnestness and skill. 4. The proficiency of the senior class, very fair. The proficiency of the junior classes, moderate.

WOONONA (C.E.) :—Visited, 12th August, 1867.

Numbers present :—Boys, 32 ; girls, 26 ; total, 58.

1. Material condition of the school, tolerable. 2. The discipline and general tone, fair. 3. The ordinary subjects are taught. The methods, though suitable, are unskillfully used. 4. The proficiency is moderate.

ROMAN CATHOLIC SCHOOLS.

APPIN (R.C.) :—Visited, 8th October, 1867.

Numbers present :—Boys, 15 ; girls, 9 ; total, 24.

1. The material condition of the school is moderate. 2. The discipline, failure. 3. The instruction, failure. 4. Proficiency, failure.

CAMDEN (R.C.) :—Visited, 5th December, 1867.

Numbers present :—Boys, 22 ; girls, 17 ; total, 39.

1. The material condition is tolerably good. 2. The discipline is fairly satisfactory. 3. The instruction is moderately effective. 4. The results, under the present teacher, may be considered tolerably satisfactory.

CAMPBELLTOWN (R.C.) :—Visited, 17th December, 1867.

Numbers present :—Boys, 40 ; girls, 43 ; total, 83.

1. The material condition is very fair. 2. The discipline is healthy and the tone pleasing. 3. The prescribed subjects are well taught. 4. The proficiency ranges from tolerable to good.

CHARCOAL CREEK (R.C.) :—Visited, 2nd October, 1867.

Numbers present :—Boys, 23 ; girls, 20 ; total, 43.

1. The material condition is bad. 2. The discipline is moderate. 3. The ordinary subjects are taught with industry and care ; the teacher is not skilful. 4. The results may be considered moderately satisfactory.

DAPTO (R.C.) :—Visited, 27th August, 1867.

Numbers present :—Boys, 14 ; girls, 11 ; total, 25.

1. The material condition—furniture excepted—is reasonably good. 2. The discipline is moderately satisfactory. 3. The ordinary subjects are taught ; the instruction is not effective. 4. The results are considerably below the standard.

GERRINGONG (R.C.) :—Visited, 25th September, 1867.

Numbers present :—Boys, 12 ; girls, 10 ; total, 22.

1. The material condition is tolerably satisfactory. 2. The discipline is moderate. 3. The ordinary subjects are taught with industry and painstaking. 4. The proficiency is moderate.

IRISHTOWN (R.C.) :—Visited, 22nd November, 1867.

Numbers present :—Boys, 31 ; girls, 21 ; total, 52.

1. Furniture excepted, the material condition is fairly satisfactory. 2. The discipline and general tone are fair. 3. The ordinary subjects are taught with intelligence and tolerable skill. 4. The proficiency is tolerably satisfactory.

JAMBEROO (R.C.):—Visited, 12th September, 1867.

Numbers present :—Boys, 37 ; girls, 14 ; total, 51.

1. The material condition is tolerably good. 2. The discipline is moderately healthy. 3. The ordinary subjects are taught. The methods used are tolerably appropriate, but the teacher apparently lacks energy and skill. 4. The results are tolerably satisfactory.

LIVERPOOL (R.C.):—Visited, 27th November, 1867.

Numbers present :—Boys, 13 ; girls, 16 ; total 29.

1. The material condition is tolerably satisfactory. 2. The discipline is fair. 3. The instruction is not effective. 4. The results are very moderate.

MENANGLE (R.C.):—Visited, 18th December, 1867.

Numbers present :—Boys, 20 ; girls, 18 ; total 38.

1. The material condition is tolerably good. 2. The discipline is only moderate. 3. The instruction is very inefficient. 4. The proficiency is, on the whole, very unsatisfactory.

ROCKY POINT (R.C.):—Visited, 13th December, 1867.

Numbers present :—Boys, 17 ; girls, 16 ; total 33.

1. There are no out-buildings, and the furniture is unsuitable. In other respects the material condition is good. 2. The discipline is bad. 3. The ordinary subjects are nominally taught. The teacher is very unskilful. 4. The proficiency ranges from moderate to failure.

ULLADULLA (R.C.):—Visited, 31st May, 1867.

Numbers present :—Boys, 9 ; girls, 8 ; total, 17.

1. The material condition is moderately satisfactory. Furniture is much needed. 2. The discipline is bad. 3. The instruction, failure. The proficiency, failure. The teacher gave up the school on the day of inspection.)

SHOALHAVEN (R.C.):—Visited, 4th June, 1867.

Numbers present :—Boys, 26 ; girls, 16 ; total, 42.

1. The material condition is fair. 2. The discipline is tolerably satisfactory. 3. The ordinary subjects are taught with care and industry ; the teaching is tolerably skilful. 4. The results are moderately satisfactory.

WOLLONGONG (R.C.):—Visited, 16th August, 1867.

Numbers present :—Boys, 43 ; girls, 50 ; total, 93.

1. Furniture excepted, the material condition is tolerably good. 2. The discipline is only moderate. 3. The ordinary subjects are taught with much industry and painstaking ; the methods are unsuitable. 4. The proficiency is moderate.

PRESBYTERIAN SCHOOLS.

BAMERANG (Pres.):—Visited, 7th June, 1867.

Numbers present :—Boys, 10 ; girls, 13 ; total, 23.

1. The material condition is only moderate. Furniture and out-buildings are needed. 2. The discipline is moderate. 3. The ordinary subjects are nominally taught ; the methods are not suitable. 4. The proficiency is very moderate.

CAMPBELLTOWN (Pres.):—Visited, 17th December, 1867.

Numbers present :—Boys, 21 ; girls, 23 ; total, 44.

1. The material condition is only moderate. 2. The discipline is tolerably healthy. 3. The prescribed subjects are taught. The methods are suitable, but only carried out with moderate skill. 4. The proficiency is moderate.

CHARCOAL CREEK (Pres.):—Visited, 5th October, 1867.

Numbers present :—Boys, 15 ; girls, 17 ; total, 32.

1. The material condition is not good. 2. The discipline is tolerable. 3. The prescribed subjects are taught. The methods are moderately effective. 4. The proficiency is moderate.

DAPTO (Pres.):—Visited, 30th August, 1867.

Numbers present :—Boys, 26 ; girls, 22 ; total, 48.

1. The material condition is tolerably good. 2. The discipline is moderate. 3. The prescribed subjects are taught in a mechanical and unskilful manner. 4. The proficiency ranges from tolerable to failure.

SHOALHAVEN (Pres.):—Visited, 11th June, 1867.

Numbers present :—Boys, 32 ; girls, 25 ; total, 57.

1. The material condition, requisites excepted, is bad. 2. The discipline is good. 3. The prescribed subjects are taught. The methods are suitable, and skilfully used. 4. The proficiency ranges from fair to good.

WESLEYAN SCHOOLS.

GEORGE'S RIVER (Wcs.) :—Visited, 12th December, 1867.

Numbers present :—Boys, 14 ; girls, 18 ; total, 32.

1. The material condition of the school is moderate. Closets are much needed. 2. The discipline is fair. 3. The prescribed subjects are tolerably well taught. 4. The results are tolerably satisfactory.

ROCKY POINT (Wes.) :—Visited, 13th December, 1867.

Numbers present :—Boys, 25 ; girls, 18 ; total, 43.

1. The material condition, furniture excepted, is good. 2. The discipline is tolerably healthy. 3. The prescribed subjects are taught with energy and care, but the methods are unskilful. 4. The results are only moderate.

CUMBERLAND DISTRICT—INSPECTOR'S REPORT FOR THE YEAR 1867.

The work performed has been various in character, and spread over a somewhat extensive surface. In the early part of the year I was commissioned to the Hunter and Northern District, to inspect, prior to their being certified, several Denominational schools. A like duty has been attended to at a more recent period in the case of two applications within my own district. Annex A shews this division of my work.

A considerable amount of time has also been occupied with visits of special inquiry in connection with applications for the establishing of new schools, or the granting of aid to existing schools. This is set forth in Annex B.

Visits of special inquiry, different in their nature and object from those just mentioned, and incidental visits of inspection, have occupied no small portion of my time and attention.

Much the largest portion of my time, however, has been devoted to the work of inspection proper,—ascertaining the material condition, the educational appliances, the intellectual and social status, and the general working of the schools intrusted to my supervision. Before entering upon this, the most important part of an inspector's duties, I received a list of schools to be inspected. Some time had to be expended in arranging a programme of the work to be accomplished, and the order in which it might be most systematically and effectively performed ; this being done, the duty was entered upon, and the extent and results of its performance it is the main design of this Report to describe.

I.—NUMERICAL SYNOPSIS OF INSPECTION WORK.

Number of schools inspected for certificates	18
Number of pupils enrolled in these schools	724
Number of pupils present at inspection	517
Number of schools thoroughly examined	61
Number of pupils enrolled in these schools	3,614
Number of pupils present at examination	2,733
Number of regular visits of inspection	63
Number of incidental visits	10
Number of visits of special inquiry	13
Number of visits on applications for new schools	10
Number of teachers supervised at examination	8
Number of pupil-teachers supervised at examination	7
Number of miles travelled	5,267

The number of miles, which may seem excessive, would not have been nearly so great had I not availed myself of the railway whenever that was practicable, but the time required for a like amount of duty would have been considerably more ; I have thus accounted for a large portion of the time devoted to the work of inspection. As regards the remainder, it may be sufficient to state that it was fully occupied in writing reports upon the schools examined, and attending to the various clerical and other duties inseparably connected with my office.

II.—DESCRIPTION OF INSPECTION.

The whole of the sixty-one schools have been subjected to the same kind of inspection—the general inspection. By this is meant that full observation has been taken, full inquiry instituted, and full examination held, respecting all that appertains to these schools—from their external arrangements, through their internal management and working, to their attainments and final results. An inspection of this kind, minutely, quietly, and intelligently conducted, collects and records all that needs to be known of what may be designated the body of the school ; but it does far more, it reveals its inner life, its intellectual condition, and moral influence. From the data thus supplied, the State has the means of estimating the character of the institutions that it maintains, and of judging of the nature, extent, and value of that education under whose influence its children are being prepared for the business of life. The whole organization, material and mechanical, comes under review ; the discipline, as evidenced by the conduct and bearing of the pupils, is carefully noted, and the character and results of the teaching and training are ascertained by minute examination. In conducting the several classes in a school, from the lowest to the most advanced, through the various subjects of instruction, there is a full opportunity afforded of learning the methods and results of the teaching, and of studying the development of mind and the formation of character which ought to be its highest aim.

These remarks indicate the kind of examination to which a general inspection subjects a school, and the knowledge of its state which is thereby necessarily obtained. Annex C shews the schools thus inspected, whilst Annex D contains the numbers and ages of the pupils on their class rolls, as also of those present at the dates of inspection.

III.—ORGANIZATION.

The importance of this subject cannot well be over-estimated. Very much of the healthy and efficient working of a school depends upon its organization. Its character, in many of its most important features, is largely moulded by it. The principle of observation soon operates in the young ; their eyes are the inlets to their minds of their earliest and most permanent impressions ; hence arises the necessity for their surroundings being of a kind that will prove beneficial. Let them be brought as much as possible in contact with the neat, the beautiful, and the orderly, and their minds will be undergoing an invaluable education. If this be true in the general, how careful ought the promoters of schools to be in the selection of sites, the erection and furnishing of the buildings, the laying out of the grounds, and, in short, in every particular within their province that can make the school a pleasing, healthful, and profitable attraction to the young. Let all, outside and inside, of the school arrangements, be designed and fitted to cultivate, silently yet effectively, a taste for order and beauty in the minds of those whose good it is intended to secure.

As regards the schools inspected, a fair estimate of their organization is given in Annex E.

In

In the great majority of these, the organization ranks from fair to good; this applies to nearly all its parts. In the minority the case is very different, the buildings are inferior, and the furniture is in keeping with them; to this there are some exceptions. In some of the inferior school buildings there is a good supply of suitable furniture and apparatus; whilst, on the other hand, in some of the good buildings, the furniture and apparatus are not of the most approved description. This occurs mainly in instances in which the same buildings are used as schools and regular places of worship; hence I regard this arrangement as being very unsatisfactory. Several of the schools stand much in need of proper playgrounds and suitably arranged outbuildings; indeed there are schools put down in the annex as indifferent in their particulars that, strictly described, have no proper playgrounds. The greatest difficulty, however, with which many teachers have had to contend, has arisen from the want of a sufficiency of proper books; this is being obviated as speedily as possible. It remains here to be noted that the keeping of the records in many schools bears an unfavourable testimony. The want of accuracy and neatness is too prevalent. In two or three instances there is the appearance of something even worse; at the least, there is a manifest neglect of the simplest and most intelligible direction for their keeping.

IV.—DISCIPLINE.

A greater amount of attention needs to be paid to this subject in most schools than it appears as yet to have received. Although the comfort and success of a teacher's work depend so much upon this, it is a remarkable fact that very few schools are distinguished for the excellence of their discipline. Even teachers, in other respects competent, fail here. They either regard the want of punctuality and regularity, the neglect of cleanliness and tidiness, the noise and disorder, and inattention in their pupils, as matters of too little moment to be specially dealt with; or they do not succeed in effectively applying the remedy. I admit that, in many instances, teachers have very much to contend against; but by intelligence, prudence, and firmness, coupled with a full realization of the vast responsibility of their office, many difficulties now apparently insuperable would be overcome, and the actual work of teaching would then, in a measure, resemble the casting of seed into well-prepared soil.

In some schools the pupils, whether sitting or standing, are allowed to present themselves in all attitudes and positions but those that are becoming, either from want of observation in the teachers, or from their indifference to strict propriety in these particulars. Again, the want of sustained attention is a very common evil. This must arise from one or other of two causes: either the teachers do not make the lessons given, sufficiently attractive, so as to command attention; or, they are not sufficiently particular in discovering whether their instruction has taken effect. In those schools in which the lessons are well taught, and in which the results of the teaching are tested and rendered more enduring by constant pertinent questioning upon the lessons, there is little to complain of as regards attention. Another and a serious fault in several schools is the continual whispering and talking allowed to be carried on, to the destruction of that quiet and order that should prevail. The teachers seem so used to this state of things, as to be unconscious of the noise amid which the business of their schools is carried on.

The points of discipline to which reference has thus briefly been made, go far to form those habits in the pupils, and to bring about that condition in the school which has been termed its "moral tone," and which is the highest test, when properly applied, of a school's true value.

For a numerical estimate of the state of the discipline in the schools examined, see Annex F.

V.—INSTRUCTION.

As essential to profitable and successful teaching, due regard must be paid to the classifying of the scholars. Wherever this is judiciously done, creditable results will reward fair teaching talent, energetically and faithfully exercised. It requires no small amount of discernment and skill to classify a school of any great extent properly; but this once effected, an important step has been taken towards its future and progressive prosperity. The unnecessary multiplication of classes is objectionable in any case, but specially so when the teaching staff is limited to one or two teachers. In some instances I have been introduced to six and seven classes, where three, or at the most four, should have been the extent. Instead of concentrating skill and labour upon a few classes, they were diffused over the many, and so rendered of little effect. It is a foolish idea that the number of classes in a school is any evidence of its true character for efficiency. Another error, and not an unusual one, is the placing of children in classes beyond their capacity. This is sometimes done at the instigation of ignorant parents, who imagine that if their children have the name of being in a higher class they must of necessity be making progress. To act thus is wrong in principle, and it is doing an injustice. No child ought to be punished by being put into a higher class, for I reckon it nothing else, until he or she has acquired a reasonable fitness for it. And, moreover, no class ought to have any such drag placed upon its progress. Reading has been made the basis of classification, and some teachers, by adhering too rigidly to the letter of this arrangement, have acted as if reading alone had to be taken into account. Whilst reading may safely be taken as the basis, this does not imply that attainments in other branches are to be disregarded. A really good classification should proceed from an accurate knowledge of the proficiency of the pupils in the other fundamental branches of their instruction. If this were more generally attended to, the progress of classes would be more decided and regular.

An impropriety sometimes met with, as regards classification, is the detaining of pupils in classes when they are fit for promotion. This may suit the convenience of a lazy indolent teacher, who depends upon such means to bring up his classes, but it is a pure injustice to those so kept back. To remove all difficulties out of the way of a proper classification, all that a teacher has to do is to give due attention to the teaching and training of his classes according to their standing and capacity; always bearing in mind that the foundation of true enduring success must be laid in the thorough teaching of the elementary classes.

The employment of the pupils, or the manner in which their time is occupied, comes next to be noticed. In almost all the schools the time is apportioned among the several classes and subjects by means of time-tables. In many cases as yet these are imperfect, but experience will no doubt lead to improvement. In one or two instances I found nothing deserving the name of a time-table. Programmes of lessons in many instances I found of little value. The drawing up of these was something quite new to many of the teachers, and therefore considerable allowance must be made. In the certified Denominational schools, one hour of the five is allowed for special religious instruction. This privilege is not used in all cases; and in a few instances there is very little departure from the routine of the Public school throughout the whole of the school day. In all schools in which the arrangements are intelligently made and punctually carried out, about two-thirds of the whole time are devoted to reading, writing, and arithmetic, and one-third is occupied with grammar, geography, and object lessons. One hour a day is usually given to the instruction of the girls in needlework. The division referred to, is in a small degree modified in the case of several of the schools in which music and drawing form part of the course of instruction. In the Public schools, and in several of the Denominational also, the Scripture lessons are taught. In connection with the subjects of instruction, the methods employed deserve to be noticed. For my own part, I find no method of imparting instruction so generally efficacious as the common sense method—that method which presents a lesson or a subject clearly and fully in all its phases and bearings to an individual or class, and by close questioning out of the lesson given, ascertains to what extent the teaching has been profitable. Give me this method in the hands of a faithful, energetic, and fairly-educated teacher, and I have no doubt about finding good effective teaching as the result. Let a teacher fully comprehend what he intends to teach, and with a reasonable knowledge of the human mind, a fair aptness of explaining and illustrating, and fair tact in ready discriminating questioning, let him earnestly devote himself to his work.

work, and success will crown his labours. In thus performing his duty, he will enlist, though he may not know them by name, the most appropriate methods, and employ them with advantage; this I have found to be the case of some, whose teachers could talk about the various technical methods of teaching, there were not like good results. Correct methods are good, and it is very desirable that a more perfect acquaintance with them should be possession, but after all much more depends upon the teachers than upon the methods. In a majority of the schools the methods, estimated by results, vary between fair and good, in a small minority they rank as indifferent, and in a considerable number as tolerable; this is shown in Annex G, which likewise contains the classification and occupation. In those schools, in which the occupation and methods are characterized as indifferent, the teaching is to a large extent purely mechanical. The lessons are gone through after a fashion, but little is done to make the children intelligently acquainted with their contents; hence, when they were examined and found incapable of answering the simplest questions, the teachers expressed their astonishment, affirming that "they ought to answer," that "they had been taught these lessons."

Reading.—In a large majority of the schools, considerable attention is paid to correctness of pronunciation; much more than this, however, is required to produce good, intelligent, pleasing, reading. Tone and time, pause and emphasis, are just as much importance in the teaching of reading, as they are in the teaching of music; this has yet to be realized, studied, and acted upon by most of the teachers. Specimens of good reading should often be presented to the scholars by their teachers, so as to accustom them to its appreciation and practice. In schools, where this is done, the effect is very observable in the more artistic manner of the reading generally; much indistinct, imperfect enunciation and bad reading would be avoided, were more care taken with the pupils in the lower classes, in teaching them how to clearly and decidedly give forth the sounds of letters, syllables, or words, as the case may be. Attention to this point, I feel confident, will prevent in the future many of the faults that are now so common in the reading of too many of the schools.

Besides, the teaching of reading as an art, it is the aim of the great majority of the teachers to make their scholars understand what they read, by explaining to them and questioning them upon the meanings of the words and subjects of their lessons. Spelling also is, to some extent, taught from the reading lessons, but more generally and effectively from dictation, and the reproduction of lessons given. It may here be remarked, that one obstacle to greater success in the teaching of the subject of reading is to be found in the neglect of the teachers to make themselves masters of the lessons in all their parts, before attempting to give them to their scholars. Too many teachers see the lesson for the first time when the book is opened to hear the class read; this is not wise, and it cannot be profitable. The enunciation and elocution should be gone over beforehand, the meaning and derivation of words, together with the meaning of the subject, carefully studied, and, if need be, the leading points noted and thrown into the form of questions, as a due preparation for attractive, interesting, and successful teaching.

Writing.—This subject is well taught in several schools, and fairly in a majority of the remainder. In some the writing is very bad. There are two notable examples—the spelling is bad, the writing is illegible, in almost every line of several pages; and yet, across these very pages, the teachers have written such expressions as "very fair," "good," "very good," with the initials of their names and the dates. The principle and motive of such conduct I leave to be inferred.

Arithmetic.—As a rule, in the teaching of this subject, too little attention is paid to the requirements of every-day life. It is not taught in such a manner as to be readily available in practice. Its principles are not sufficiently explained and illustrated; hence, when a very simple question is put about an ordinary matter of buying and selling, involving no operation beyond multiplication or division of money, even an advanced class has been at a loss to know how it should be done. In several schools, books are put into the hands of the scholars, and from these they take the sums under the several rules; and so long as they are not turned out of the beaten track, they appear to considerable advantage, but take away the books, and give them similar sums, slightly varied in the mode of expressing them, and they are surrounded with difficulties. This mode of teaching arithmetic is disappearing, and by a goodly number of the teachers it is being taught with fair skill and effect. This will be increasingly the case as the principles of arithmetic become more generally and thoroughly comprehended by the teachers themselves, and when these principles, rather than mere rules, are instilled into the minds of the pupils, by skilful illustrations, and rendered operative by the performance of many and varied exercises on the black-board and on slates.

Grammar.—Much the same account may be given of the teaching of grammar as has been given of the arithmetic. In some instances, the dry profitless work of committing and repeating rules occupies a considerable portion of the time, even in the schoolroom; thus its teaching is a mere name, a worthless engaging of the memory and a waste of time. It is evident that grammar is little understood by those who profess to teach it in such a manner; in a majority of the schools, however, the case is different. In these it is taught mainly from the reading lessons, and by the aid of the black-board. In this way it becomes a profitable and pleasing exercise of the intellect, and an excellent mental culture. Considerable attention is bestowed upon parsing in most of the schools; and into a good many of them the analysis of sentences has been introduced with profitable results.

Geography.—Even this, in not a few schools, is attempted to be taught by assigning to the scholars lists of names or paragraphs in books on geography, as lessons to be learned by rote. An important point in the teaching of geography, is to begin it early, and to employ the observation and local knowledge of the pupils, as instruments in conveying to them their first formed lessons upon it. They will thus be prepared for accompanying the teacher with intelligence and profit as he gradually leads them outward to a knowledge of more distant parts, and for entering with eagerness upon this study in its higher departments. The giving of large lessons, and of lessons not adapted to the capacity of the classes, is carefully to be avoided. It is a prudent and a safe course to do a little, but to do it well. The inefficient teaching of geography arises very frequently from a desire on the part of teachers to conduct their scholars over a wide area. The work thus performed is most superficial; it might nearly as well have been left undone. It is not to be inferred, from these observations, that geography is in no cases well taught. The contrary is the fact. In a fair proportion of the schools the acquaintance of the pupils with this subject is very creditable. Notwithstanding this, there is too much room for the assertion that in very few schools does geography receive that amount of attention which its importance demands, and which it is destined yet to have bestowed upon it. There are indeed few subjects of study more calculated to develop and expand the faculties of the mind. This is specially true as regards the power of memory and the principles of comparison and association.

With respect to the other subjects of instruction, the Scripture and Object Lessons, it may be enough to state that in many schools they are fairly taught. In a few schools vocal music and drawing are very fairly and successfully taught. A tabular estimate of the results of teaching in the several subjects is given in Annex H, from which I take the following abstract of proficiency:—

Of 958 pupils examined in monosyllables, about 455 vary in the degree of accuracy with which they read from fair to good, and the remaining 503 from moderate to tolerable.

Of 795 examined in easy narrative, the reading of 327 is estimated as fair to good.

Of 793 examined in ordinary prose, the reading of 383 is regarded as varying between fair and good.

Of 1,041 writing on slates, 453 rank from fair to good.

Of 1,449 writing in copy books, 742 rank from fair to good.

Of 1,691 examined in the simple rules of arithmetic, 797 range in attainments from fair to good.

Of 655 examined in the compound rules, 223 vary from fair to good.

Of 96 examined in higher rules, 66 range from fair to good.
 Of 749 examined in elementary grammar, 344 vary from fair to good.
 Of 726 examined in advanced grammar, 299 vary from fair to good.
 Of 779 examined in elementary geography, 238 range from fair to good.
 Of 733 examined in more advanced geography, 319 vary from fair to good.

A reference to the table will, I consider, be sufficient as to the state of proficiency in the remaining subjects.

In addition to the above, it may not be wholly profitless if I present the teaching in the schools examined in a somewhat different aspect, by affixing to each subject an estimate of the manner in which it is taught. In doing this I omit a few exceptional schools that rank low in almost everything.

Reading, as an art	Indifferent.
Reading, as respects knowledge of subjects	Fair.
Writing, as an art	Fair.
Dictation	Fair.
Grammar	Tolerable to fair.
Geography	Fair to very fair.
Arithmetic	Nearly fair.
Object Lessons, on common things	Tolerable.
Object Lessons, more difficult	Moderate.
Scripture Lessons	Fair.
Needlework	Very fair.

Such is an average estimate of the state of education in the majority of the schools examined. In several of the schools, taken by themselves, the estimate would be considerably more favourable.

VI.—TEACHERS.

At present the teachers are classified as under:—

1ST CLASS.		2ND CLASS.		3RD CLASS.			Probationers.
Section A.	Section B.	Section A.	Section B.	Section A.	Section B.	Section C.	
—	1	1	2	9	24	25	9

In the great majority of the schools the teachers are persons of good reputation and social position. That they are not all alike successful in the results which they produce, is true. This is to a large extent accounted for by the circumstance, that many of them have betaken themselves to teaching without due consideration of the nature and responsibilities of the office, and consequently without being fully qualified for the performance of its duties. In all such cases the labour may be regarded as more or less unskilled, and therefore not productive of the highest results. It is worthy of observation, however, that in almost every instance I found the teachers open to counsel and willing to receive such hints and suggestions as were deemed necessary for the more successful working of their schools. As regards a very few teachers it must be stated that, keeping in view the proper teaching and training of the young, they might do more good, but certainly less injury, in some less important situations. As a remedy for this unhealthy element in our schools, it is of great importance that the pupil teacher system be encouraged and extended as much as possible. To this source mainly I would look for a majority of our best and most successful teachers.

VII.—LOCAL SUPERVISION.

Nothing in connexion with the management of our schools would give me greater pleasure than to be able to commend the local supervision. There is, however, little ground for commendation. With a few exceptions the local supervision is almost entirely nominal. It is to be hoped that Local Boards will awaken to the importance and responsibilities of their office. Their frequent friendly visits to the schools under their supervision would tend to encourage and stimulate both teachers and scholars, whilst an occasional judicious hint to parents would go far to maintain and promote the influence and efficiency of the schools themselves.

VIII.—RESULTS OF INSPECTION.

Every trustworthy teacher hails inspection. He does not regard himself or his work as perfect; but, feeling that there is room for improvement, he is thankful for any friendly suggestion whereby his efforts may be rendered more successful. He does not, therefore, regard the Inspector with suspicion or alarm, but welcomes him as a friend. Apart from any suggestions, I have in many cases found that the examination of the scholars itself has gone far as a guide to the teachers in the performance of their duties. There are exceptional cases. There are a few to whose ears the term inspection convey no very agreeable sound, and on whose minds the work of inspection leaves no pleasing impressions. Their want of success, the result of their own incompetency and inefficiency, is, in some way, placed to the account of the Inspector or the system which he represents. In such cases there is little reason to hope for amendment, but they furnish strong proof of the necessity for inspection. It may not be out of place here to state, that a greater amount of harmony and unity of action is observed amongst the teachers than existed heretofore when they were working under a different arrangement. Generally, they now regard themselves as fellow workers in the same important field, and make it their study, by mutual intercourse and instruction, to acquire greater fitness for the successful performance of their arduous duties. This I regard as one very valuable result of the system of education recently inaugurated. In the schools, likewise, the benefits begin to appear; a new impulse has been given to teachers and scholars in connexion with their school work, and the lifeless routine, that was but too prevalent, is fast giving place to earnest and intelligent instruction. Much has been done during the year to bring about this desirable result, and also to extend the means of education throughout the district. A good deal remains still to be accomplished. There are several localities in which schools are required, and where, most probably, but for the disastrous flood with which the district has been visited, they would, ere this time, have been established. It is to be hoped, that in the course of the ensuing year the people in these places will bestir themselves and take the steps necessary for having their wants supplied. Earnest, intelligent, and united action will enable them to overcome any difficulties that may present themselves, and secure for the young in their neighbourhoods, one of the greatest blessings that any Government can confer, or any people enjoy—an enlightened and enlightening education.

ALEXANDER L. FORBES, A.M.,
 Inspector of Schools,
 Cumberland District.

APPENDIX.

57

ANNEX A.

List of Schools inspected on application to be certified.

Roman Catholic School, Muswellbrook, 22nd February.
Church of England School, Muswellbrook, 22nd February.
Do. near Muswellbrook, 23rd February.
Do. Scone, 25th February.
Roman Catholic School, Blandford, 25th February.
Church of England School, Blandford, 25th February.
Do. Tamworth, 26th February.
Do. Gunnedah, 28th February.
Roman Catholic School, Gunnedah, 28th February.
Church of England School, Goonoo Goonoo, 4th March.
Do. Nundle, 4th March.
Do. Cassilis, 7th March.
Do. Denman, 9th March.
Do. Jerry's Plains, 11th March.
Do. Broke, 13th March.
Presbyterian School, Westbrook, 14th March.
Roman Catholic School, Lane Cove, 16th October.
Do. Baulkham Hills (closed), 5th December.
Total—18.

ANNEX B.

List of places visited in consequence of applications for establishing new Schools, or for aid to existing Schools.

1. Kayuga, 6th March.	Castlereagh, 12th August.
Australian Farm, 5th May.	Newington, 23rd August.
Wright's Creek, 8th May.	Ryde, 25th September.
Prospect, 1st August.	Parramatta, 28th September.
Erskine Park, 2nd August.	10. St. Alban's.
Total—10.	

ANNEX C.

GENERAL INSPECTION.—List of Schools inspected during 1867.

<i>Public Schools.</i>	
1. Castlereagh.	Manly.
Colyton.	North Sydney.
Dobroyd.	Parramatta.
Five Dock.	Pennant Hills.
Freeman's Reach.	Penrith.
Llandeilo.	Petersham.
M'Donald River.	St. Mary's.
M'Donald River (Lower).	17. Wallgrove.
Mangrove.	
<i>Church of England.</i>	
1. Burwood.	Parramatta.
Castle Hill.	Pennant Hills.
Colo (Upper).	Penrith.
Dural.	Pitt Town.
Emu Plains.	Richmond.
Enfield, N.R.	Rouse Hill.
Hunter's Hill.	Ryde.
Kurrajong, North.	Seven Hills.
Kurrajong, South.	South Creek.
Marsfield.	Wilberforce.
M'Donald River.	22. Windsor.
<i>Roman Catholic.</i>	
1. Concord.	Petersham.
Ermington.	Richmond.
Kurrajong.	Ryde.
Nelson.	South Creek.
Parramatta.	11. Windsor.
Penrith.	
<i>Presbyterian.</i>	
1. Lane Cove.	Portland Head.
Parramatta.	5. Windsor.
Parramatta Junction.	
<i>Wesleyan.</i>	
1. Castlereagh.	Lane Cove.
Emu.	Parramatta.
Hornsby.	6. Windsor.
Total—61.	

ANNEX D.

ATTENDANCE OF PUPILS.

NUMBER and Ages of Pupils enrolled at the date of the Examination.

Pupils.	7 Years and under.	8 Years.	9 Years.	10 Years.	11 Years.	12 Years and over.	Totals.
Boys enrolled	733	218	238	238	204	343	1,974
Girls do	613	200	194	210	153	270	1,640

ANNEX D.—*continued.*

NUMBER and Ages of Pupils present at the date of the Examination.

Pupils.	7 Years and under.	8 Years.	9 Years.	10 Years.	11 Years.	12 Years and over.	Totals.

CUMBERLAND DISTRICT.

DETAILED Statement of the condition of the Schools Examined in 1867.

CASTLEREAGH (Public) :—Visited, 29th October, 1867.

Numbers present at the examination :—Boys, 12 ; girls, 11 ; total, 23.

1. The material condition of the school is bad, but new premises are about to be erected. 2. The pupils are very fairly clean and punctual, but not regular. 3. The ordinary subjects are taught with fair skill and effect. 4. The attainments of the pupils are in the main satisfactory.

COLYTON (Public) :—Visited, 30th August, 1867.

Numbers present at the examination :—Boys, 16 ; girls, 25 ; total, 41.

1. On the whole, the material condition of the school is good. 2. The pupils are regular and punctual in attendance, clean and tidy in person, and orderly and generally industrious. 3. The teaching is fairly intelligent and successful. 4. The progress being made is creditable, and the tone of the school is on the whole healthy.

DOBBOYD (Public) :—Visited, 20th September, 1867.

Numbers present at the examination :—Boys, 23 ; girls, 28 ; total, 51.

1. The schoolhouse is in good condition and well furnished. 2. The attendance of the pupils is fairly regular and punctual ; they are likewise clean and orderly, and on the whole attentive to their duties. 3. All the ordinary subjects are taught, together with singing ; and whilst there may be nothing positively objectionable in the methods employed, greater energy and tact are needed to give them due effect. 4. The proficiency of the pupils on the whole is nearly fair, and the moral tone of the school, generally, is satisfactory.

FIVE DOCK (Public) :—Visited, 12th September, 1867.

Numbers present at the examination :—Boys, 29 ; girls, 16 ; total, 45.

1. Materially viewed, the school is in good condition ; it is well supplied with good and suitable furniture and apparatus. 2. The attendance is neither punctual nor regular, but the cleanliness and order of the scholars are fairly satisfactory. 3. All the ordinary subjects are taught, and the methods employed are fairly suitable and tolerably effective. 4. The attainments of the scholars are not of a very satisfactory order, nor is the moral tone fully healthy. The present teacher has not been long in charge.

FREEMAN'S REACH (Public) :—Visited, 11th June, 1867.

Numbers present at the examination :—Boys, 18 ; girls, 16 ; total, 34.

1. The material condition of the school is tolerably satisfactory ; the play-ground requires to be fenced, and other external appliances have to be provided. 2. The pupils are not sufficiently punctual and regular in their attendance ; they are however clean and tidy in person and dress, and, upon the whole, well conducted. The moral aspect of the school is fairly healthy. 3. Singing is added to the ordinary subjects of instruction, and the whole work of the school is carried on with considerable skill and effect. 4. Generally speaking, the proficiency of the pupils is tolerably satisfactory.

LLANDEILO (Public) :—Visited, 29th August, 1867.

Numbers present at examination :—Boys, 19 ; girls, 23 ; total, 42.

1. The teacher's residence is not in good condition, but the school-house is tolerably good and fairly supplied with furniture, apparatus, and books. 2. The attendance of the pupils is neither regular nor punctual, but they are clean, orderly, and well conducted. 3. The ordinary subjects are taught, and earnestness and diligence mark the operations of the school. 4. The attainments of the pupils are, on the whole, satisfactory.

M'DONALD RIVER (Public) :—Visited, 5th November, 1867.

Numbers present at examination :—Boys, 14 ; girls, 8 ; total, 22.

1. The material condition of the building is by no means satisfactory, nor are the furniture and apparatus of the most desirable kind. 2. The pupils attend regularly and with punctuality. In person and dress they are clean and neat, whilst their behaviour is orderly and pleasing. 3. The ordinary subjects are taught with fair skill and effect. 4. On the whole, the proficiency of the scholars is fair.

M'DONALD RIVER, LOWER (Public) :—Visited, 4th November, 1867.

Numbers present at examination :—Boys, 12 ; girls, 5 ; total, 17.

1. The building is in a tolerable state, and it is fairly supplied with suitable furniture and books, but rather deficient in apparatus. 2. The scholars are fairly punctual, but irregular in attendance ; they are cleanly, and tolerably well conducted. 3. Only the ordinary subjects are introduced, and in the teaching of these there is a want of animation, energy, and tact. 4. The attainments are by no means satisfactory.

MANGROVE (Public) :—Visited, 7th November, 1867.

Numbers present at examination :—Boys, 9 ; girls, 12 ; total, 21.

1. The building stands in need of some repairs ; it is fairly supplied with furniture and apparatus, but there is a deficiency of books. 2. The attendance is fairly satisfactory, but for cleanliness the pupils are not remarkable. The moral tone of the school is somewhat low. 3. The ordinary subjects are taught with considerable skill and success. 4. On the whole there is reason to be satisfied with the attainments of the children.

MANLY (Public) :—Visited, 25th October, 1867.

Numbers present at examination :—Boys, 24 ; girls, 8 ; total, 32.

1. The material condition and general organization of the school are very satisfactory. 2. The discipline is not effective, nor is the moral tone of the school all that could be desired. 3. The ordinary subjects chiefly are taught, and the methods employed are marked by fair intelligence and success. 4. The proficiency of the pupils is on the whole fair.

NORTH SYDNEY (Public) :—Visited, 17th October, 1867.

Numbers present at examination :—Boys, 12 ; girls, 18 ; total, 30.

1. The material condition of the premises is good. The school is fairly supplied with suitable furniture, apparatus, and books, and the organization generally is correct. 2. The children are punctual, but not regular in their attendance ; they are fairly clean and orderly, attentive and diligent. The tone of the school is pleasing. 3. The ordinary subjects are taught, and the duties of the school are performed with earnestness, fidelity, and considerable success. 4. The pupils are making fair progress.

PARRAMATTA (Public) :—Visited, 19th June and 5th July, 1867.

Numbers present at examination :—Boys, 76 ; girls, 34 ; total, 110.

1. The building is excellent, well furnished, and fully supplied with suitable apparatus and books. The entire organization is very satisfactory, with the exception of the play-ground which is too small, and a portion of the fence which needs repairing. 2. On the whole, the attendance of the pupils is satisfactory ; they are likewise clean and tidy in person and dress, and generally orderly and well-conducted. The tone of the school is in the main healthy. 3. To the ordinary subjects are added singing and drawing ; and the whole business of the school is carried on with energy, skill, and success. 4. Generally, the attainments of the scholars in the various subjects of instruction are very creditable.

PENNANT HILLS (Public) :—Visited, 24th July, 1867.

Numbers present at examination :—Boys, 33 ; girls, 29 ; total, 62.

1. In scarcely one particular is the material condition of the premises satisfactory ; the building is unsuitable and in bad repair, and the furniture is neither very suitable in kind nor sufficient in quantity. New premises and new fittings are much required. 2. On the whole, the attendance is good, as are also the cleanliness and behaviour of the pupils. The tone is healthy. 3. Singing and drawing are being added to the ordinary subjects, and the work of teaching is performed with fidelity and care. 4. The attainments are fair ; the needle-work deserves special notice for its excellence.

PENRITH (Public) :—Visited, 8th and 9th August, 1867.

Numbers present at examination :—Boys, 35 ; girls, 9 ; total, 44.

1. The premises are on the whole in a satisfactory condition ; some slight repairs are required in the roof of the main building ; some addition to the furniture is also required. 2. The pupils are generally punctual and regular in their attendance, and fairly clean and tidy in person and dress ; apart from these points the discipline is not efficient, nor is the moral tone very healthy. 3. The required subjects are taught, but the methods employed are not fully effective. 4. The attainments rank from tolerable to fair.

PETERSHAM (Public) :—Visited, 11th September, 1867.

Numbers present at examination :—Boys, 31 ; girls, 26 ; total, 57.

1. The school-room is in bad condition. The furniture is neither good nor suitable, and there is scarcely a sufficient supply of apparatus and books. 2. The discipline of the school is fairly satisfactory, and the moral tone healthy. 3. The ordinary subjects are taught with fair skill and effect. 4. The proficiency of the pupils is on the whole creditable.

St. MARY'S (Public) :—Visited, 16th August, 1867.

Numbers present at examination :—Boys, 24 ; girls, 15 ; total, 39.

1. The school-room is in tolerably good condition, but neither sufficiently nor suitably furnished. 2. The pupils generally are punctual and regular, and fairly clean, tidy, and orderly. 3. The ordinary subjects and singing are taught. More vigour is needed to render the work effective. 4. The proficiency ranks from tolerable to nearly fair.

WALLGROVE (Public) :—Visited, 4th September, 1867.

Numbers present at examination :—Boys, 15 ; girls, 14 ; total, 29.

1. The material condition of the premises is fairly satisfactory, and the appliances for carrying on the work of teaching are suitable and sufficient. 2. Greater punctuality and regularity of attendance are very desirable ; in other respects the conduct and demeanour of the scholars are proper and pleasing. 3. The ordinary subjects are taught with fair skill and success. 4. The proficiency of the pupils is on the whole satisfactory.

BURWOOD (C.E.) :—Visited, 22nd August, 1867.

Numbers present at examination :—Boys, 28 ; girls, 25 ; total, 53.

1. The material condition of the premises is good ; the furniture of the schoolroom is fairly sufficient but scarcely suitable. 2. The pupils are wanting in regularity and punctuality ; the discipline of the school generally is ineffective, and the children, although not badly behaved, are noisy and under no proper sense of control. 3. The ordinary subjects are taught, but neither skilfully nor efficiently. 4. The attainments are barely tolerable.

CASTLE HILL (C.E.) :—Visited, 14th November, 1867.

Numbers present at examination :—Boys, 32 ; girls, 19 ; total, 51.

1. The building is in tolerable repair and fairly supplied with suitable furniture, apparatus, and books. The entire organization is in the main satisfactory. 2. The discipline of the school is generally effective and the moral tone fairly healthy. 3. Only the ordinary subjects are taught. The instruction is careful and fairly judicious. 4. Fair proficiency has been attained by the scholars generally.

COLO, UPPER (C.E.) :—Visited, 6th and 7th June, 1867.

Numbers present at examination :—Boys, 17 ; girls, 9 ; total, 26.

1. The material condition of the premises is tolerable ; furniture and apparatus are deficient. 2. The pupils are neither punctual nor regular in their attendance ; they are fairly clean and orderly, and on the whole pleasing in their demeanour. 3. The ordinary subjects, including needlework, are taught. The time-table is of little value, and there are no programmes of lessons. The teaching is too mechanical, and of little effect. 4. The proficiency is not satisfactory.

DURAL (C.E.) :—Visited, 13th November, 1867.

Numbers present at examination :—Boys, 22 ; girls, 15 ; total, 37.

1. The school building is in fair condition, well furnished, and tolerably supplied with apparatus and books. 2. The discipline is not effective. Much indifference and inattention prevail among the pupils, many of whom are slovenly in their appearance and dress. 3. In addition to the ordinary subjects of instruction, singing and drawing are introduced. The teaching wants life and energy. 4. The attainments of the pupils, with a very few exceptions, are only moderate, and the development of mental power is small. The teacher has not been long in charge.

EMU PLAINS (C.E.) :—Visited, 6th August, 1867.

Numbers present at examination :—Boys, 19 ; girls, 17 ; total, 36.

1. The building, furniture, apparatus, and books are in a fairly satisfactory condition, but the appearance and comfort of the school-room would be much improved were it lined or plastered inside. 2. The pupils are fairly clean and tidy, but neither regular nor punctual. The discipline is not fully effective, nor is the moral tone perfectly healthy. 3. The ordinary subjects and a little drawing are taught. The teaching is too superficial, not penetrative and engaging. 4. The proficiency can scarcely be estimated at more than moderate.

ENFIELD, N.R. (C.E.) :—Visited, 23rd May, 1867.

Numbers present at examination :—Boys, 9 ; girls, 15 ; total, 24.

1. The building is good, but, as it is a church, it is not furnished so as to be well adapted for the purposes of a school. The proper organization and efficient working of the school are, in consequence, injuriously affected. 2. The discipline is very fair, and the moral tone approaches to healthy. 3. The ordinary subjects, together with needlework and a little singing, are taught. The methods employed are marked by fair skill and success. 4. As yet the attainments are not very high. The teacher has been but a short time in charge.

HUNTER'S HILL (C.E.) :—Visited, 8th October, 1867.

Numbers present at examination :—Boys, 43 ; girls, 19 ; total, 62.

1. The material condition of the premises is good, and the whole organization fairly satisfactory. 2. In point of discipline and moral character, the state of the school is, on the whole, pleasing. 3. The subjects taught accord with the "Course of Secular Instruction," and the methods employed are fairly suitable and effective. 4. The attainments might reasonably be expected to be higher.

KURBAJONG, NORTH (C.E.) :—Visited, 20th May, 1867.

Numbers present at examination :—Boys, 21 ; girls, 17 ; total, 38.

1. The whole material condition of the school-room, including building, furniture, apparatus, and books, is fairly satisfactory. 2. The pupils are punctual, but irregular. The discipline of the school is, on the whole, effective, and the moral tone healthy. 3. The prescribed subjects are taught with earnestness and energy. 4. The proficiency, generally, taking into account the irregularity of attendance, is fair.

KURBAJONG, SOUTH (C.E.) :—Visited, 21st May, 1867.

Numbers present at examination :—Boys, 20 ; girls, 21 ; total, 41.

1. The internal arrangement and fittings of the school are very unsatisfactory, and those outside are equally so. 2. The discipline is feeble and comparatively worthless ; and, whilst no positive impropriety is noticeable, the inattention, inertness, and backwardness in answering that distinguish the scholars, do not augur well for the moral and intellectual health of the school. 3. The ordinary subjects are taught, but the work of teaching is manifestly carried on in a manner that indicates little energy or skill. 4. In none of the classes, and in no subject, are the attainments entirely satisfactory.

MARSFIELD (C.E.) :—Visited, 19th July, 1867.

Numbers present at examination :—Boys, 25 ; girls, 11 ; total, 36.

1. In almost every particular the material condition of the premises is satisfactory. The whole organization is fairly correct. 2. The discipline and moral tone are fairly healthy. 3. The ordinary subjects are taught, and with considerable energy and skill. 4. The pupils are making creditable progress ; they are being well grounded in the elements.

M'DONALD RIVER (C.E.) :—Visited, 6th November, 1867.

Numbers present at examination :—Boys, 11 ; girls, 8 ; total, 19.

1. The school building is in fair condition, but badly furnished and ill supplied with apparatus. 2. The pupils are punctual, but neither regular nor very clean and tidy. Discipline, properly so called, is wanting, and the moral tone is low. 3. The ordinary subjects are taught, but very ineffectively. 4. The proficiency of the pupils ranks from moderate to tolerable.

PARRAMATTA (C.E.) :—Visited, 18th July, 1867.

Numbers present at examination :—Boys, 31 ; girls, 33 ; total, 64.

1. The building is good, and sufficiently, though not very suitably, furnished. The outside arrangements are rather defective. 2. The discipline is not sufficiently firm and effective, and the moral tone is not very high. 3. The ordinary subjects and needlework are taught. There is too much of the merely mechanical, and too little of the intellectual and penetrative, in the methods employed. 4. The proficiency ranks from indifferent to tolerable.

PENNANT HILLS (C.E.) :—Visited, 6th September, 1867.

Numbers present at examination :—Boys, 43 ; girls, 33 ; total, 76.

1. The building is good, but at present not well furnished. There is a tolerable supply of apparatus and books. In other respects, the organization is satisfactory. 2. The discipline and moral character of the school are, on the whole, healthy. 3. The ordinary subjects, singing, and needlework are taught. The methods employed are marked by earnestness and fair practical skill. 4. The proficiency generally ranks from tolerable to fair.

PENRITH (C.E.) :—Visited, 8th August, 1867.

Numbers present at examination :—Boys 9, girls 5 ; total, 14.

1. The school-room is in tolerably good order, and fairly supplied with suitable furniture, apparatus, and books. The outbuildings are not in good condition. The school registers and lesson documents are not in a satisfactory state. 2. The discipline is feeble, and the moral tone not very high. 3. The ordinary subjects are introduced, but the teaching of them is devoid of energy and skill. 4. The attainments generally are rather indifferent.

PITT TOWN (C.E.) :—Visited, 13th June, 1867.

Numbers present at examination :—Boys, 19 ; girls, 23 ; total, 42.

1. The building requires considerable repairs. There is no playground, and the outbuildings are in a bad state. The school-room is fairly supplied with all requisites. 2. Neither in punctuality nor regularity do the pupils excel, and they are only moderately clean, tidy, and orderly. There is considerable room for improvement in the moral aspect of the school. 3. The ordinary subjects and needlework are taught, and the method employed, whilst tolerably correct, would be productive of better results were they practised with greater animation and energy. 4. The attainments do not rank high.

RICHMOND (C.E.) :—Visited, 29th May, 1867.

Numbers present at examination :—Boys, 41 ; girls, 29 ; total, 70.

1. The school premises are in tolerably good order. The furniture is about sufficient in quantity, but badly arranged. Of apparatus and books there is a fair supply. 2. On the whole, the discipline is tolerably satisfactory, and the moral aspect pleasing. 3. The ordinary subjects, including needlework and singing, are taught, and with tolerable energy and skill. 4. The proficiency ranks from tolerable to fair.

ROUSE HILL (C.E.) :—Visited, 15th October, 1867.

Numbers present at examination :—Boys, 19 ; girls, 23 ; total, 42.

1. With the exception of the furniture, the material condition of the premises is very fair. 2. The pupils are fairly punctual and regular, clean and orderly. The moral aspect of the school is on the whole pleasing. 3. The ordinary subjects are taught, and the methods are tolerably correct and suitable. 4. The proficiency is not high in any of the subjects.

RYDE (C.E.) :—Visited, 25th September, 1867.

Numbers present at examination :—Boys, 34 ; girls, 25 ; total, 59.

1. The material condition of the premises, with the exception of the playground, which is not enclosed, is fairly satisfactory. 2. The discipline is not effective ; the pupils are neither punctual nor regular in their attendance, nor are they remarkable for their cleanliness and industry. 3. The ordinary subjects, principally, are taught, and the methods shew tolerable skill. 4. The proficiency ranks from moderate to tolerable.

SEVEN HILLS (C.E.) :—Visited, 31st July, 1867.

Numbers present at examination :—Boys, 28 ; girls, 18 ; total, 46.

1. The material condition of the school is good. 2. The pupils are punctual and fairly regular. They are also tolerably clean and well-conducted. 3. The ordinary subjects, together with singing, drawing, and needlework, are taught, and the work of instructing is carried on with fair skill and energy. 4. The attainments rank between tolerable and fair.

SOUTH CREEK (C.E.) :—Visited, 27th August, 1867.

Numbers present at examination :—Boys, 30 ; girls, 28 ; total, 58.

1. The school-house needs considerable repairs ; the furniture also requires improving, and the supply of apparatus and books is somewhat deficient. 2. The discipline and moral tone of the school are on the whole satisfactory. 3. The teaching, which embraces the ordinary subjects and needlework, is marked by tolerable practical skill and considerable energy. The attainments generally are from tolerable to fair.

WILBERFORCE (C.E.) :—Visited, 12th June, 1867.

Numbers present at examination :—Boys, 23 ; girls, 27 ; total, 50.

1. The school-house is in fair repair, and fully but not suitably furnished. A supply of books is required. There is no proper playground. 2. The attendance is tolerably punctual and regular, as are also the cleanliness and order of the pupils. At work they are somewhat indolent. 3. The subjects chiefly taught are the ordinary, including needlework. The methods are tolerably correct and appropriate. 4. The proficiency is rather low.

WINDSOR (C.E.) :—Visited, 4th June, 1867.

Numbers present at examination :—Boys, 39 ; girls, 26 ; total, 65.

1. The premises are much in want of repair, but there is a good supply of suitable furniture and apparatus. 2. The pupils are punctual, but not regular in their attendance ; they are fairly clean and neat in person and dress, but not sufficiently orderly and well conducted at their work. The moral tone is not very healthy. 3. The ordinary subjects and needlework are those mainly taught as yet. The methods are in themselves correct, and were they more energetically employed better results would follow. 4. The attainments are not of a high order.

CONCORD (R.C.) :—Visited, 5th September, 1867.

Numbers present at examination :—Boys, 31 ; girls, 21 ; total, 52.

1. The school building is in good condition, but not suitably furnished. The organization is further rendered imperfect by the want of a judicious classification, and of the requisite "lesson documents." 2. The pupils are tolerably punctual and regular, and fairly clean and orderly ; but they are wanting in attention and industry. The moral tone may be regarded as tolerably healthy. 3. The ordinary subjects and needlework are taught. The teaching is too much of a mechanical routine, little mental development or culture. 4. The attainments are not high in any class or in any subject. They rank from moderate to nearly fair.

ERMINGTON (R.C.) :—Visited, 25th November, 1867.

Numbers present at examination :—Boys, 20 ; girls, 18 ; total, 38.

1. The material condition of the premises is, on the whole, very good ; the furniture is sufficient and fairly suitable, but apparatus and books require additions. 2. Tolerable punctuality and regularity mark the attendance. The pupils are also fairly clean, but not orderly ; the discipline is not satisfactory. 3. The ordinary subjects only are taught. In the working of the school there is an absence of correct method, energy, and practical skill. 4. The proficiency is barely tolerable. The present teacher has not been long in charge.

KURRAJONG (R.C.) :—Visited, 22nd May, 1867.

Numbers present at examination :—Boys, 21 ; girls, 33 ; total, 54.
1. The school-house is in very fair condition, but insufficiently supplied with furniture, apparatus, and books. Leaving out of view the building itself, the whole of the organization is most unsatisfactory. 2. The pupils are fairly punctual, but very irregular. The discipline is not healthy. 3. The ordinary subjects are introduced, but the teaching is to a large extent devoid of profitable method and practical skill. 4. The attainments are very indifferent.

NELSON (R.C.) :—Visited, 18 June, 1867.

Numbers present at examination :—Boys, 13 ; girls, 18 ; total, 31.
1. The building is new, but it is not very fully or suitably furnished, nor is it well supplied with apparatus and books. 2. On the whole, the attendance is fairly punctual and regular, but the pupils are neither remarkable for cleanliness nor order. The discipline is not good, and the moral tone is low. 3. The ordinary subjects are introduced. The teaching is unskilful and ineffective. 4. The attainments are very low. In no subject is the proficiency beyond moderate.

PARRAMATTA (R.C.) :—Visited, 25th July, 1867.

Numbers present at examination :—Boys, 25 ; girls, 24 ; total, 49.
1. The school building is in fair condition, but the furniture, whilst fairly sufficient and suitable, is very much disfigured by cutting and smearing with ink. There is a deficiency of apparatus and books. 2. The attendance is fairly punctual, but very irregular. Proper effective discipline is not maintained, and the tone of the school is not pleasing. 3. The ordinary subjects and needlework are introduced. The methods employed are evidently too mechanical and superficial. 4. The proficiency ranks from bad to tolerable.

PENRITH (R.C.) :—Visited, 14th August, 1867.

Numbers present at examination :—Boys, 37 ; girls, 36 ; total, 73.
1. The school-room, a slab building, is in fair repair, but the furniture is insufficient and in bad condition. There is a fair supply of apparatus, but a deficiency of books. The classification and lesson documents are unsatisfactory. 2. The discipline is imperfect, and the moral tone not healthy. Noise and disorder prevail. 3. To the ordinary subjects is added needlework. The methods do not appear to be intelligent, nor are they practised with sufficient energy and skill. 4. The attainments generally are very unsatisfactory.

PETERSHAM (R.C.) :—Visited, 10th September, 1867.

Numbers present at examination :—Boys, 30 ; girls, 28 ; total, 58.
1. The school building is in fair condition, but too small. The furniture is insufficient, and some of it is not suitable. Apparatus and books are deficient. The organization generally is imperfect. 2. The discipline is unsatisfactory, and the moral tone not entirely pleasing. 3. The ordinary subjects and needlework are taught. The methods employed are in themselves tolerably correct and suitable. 4. The thinking and reasoning powers of the pupils are not sufficiently exercised. The proficiency ranks from moderate to fair ; as a whole, it may be estimated as tolerable.

RICHMOND (R.C.) :—Visited, 28th May, 1867.

Numbers present at examination :—Boys, 36 ; girls, 42 ; total, 78.
1. The school-room is in tolerable repair, but neither sufficiently nor suitably furnished. There is a deficiency of apparatus and books. The classification is not judicious, and the occupation is not sufficiently defined. 2. The pupils do not attend either punctually or regularly ; with a few exceptions, they are fairly clean, but disorderly. The discipline is not effective, and the moral tone is low. 3. To the ordinary subjects are added singing and needlework. The methods are mainly mechanical, exercising the memory, but little beyond. Practical skill is very deficient. 4. The attainments, as a whole, are not by any means high.

RYDE (R.C.) :—Visited, 27th September, 1867.

Numbers present at examination :—Boys, 7 ; girls, 9 ; total, 16.
1. The material condition of the premises is fair. The furniture is not well arranged. There is a deficiency of apparatus and books. The classification of the pupils is injudicious, and the whole business of the school ill-regulated. 2. The discipline is very lax, and the general aspect of the school not pleasing. 3. The ordinary subjects are introduced, but the teaching is devoid of system and skill. 4. The attainments are very moderate.

SOUTH CREEK (R.C.) :—Visited, 28th August, 1867.

Numbers present at examination :—Boys, 15 ; girls, 23 ; total, 38.
1. The school is carried on in a front room of a small cottage ; the accommodation is far too limited, and the furniture insufficient and badly arranged. In almost every particular the organization is bad. No proper time-table and programmes of lessons regulate the business of the school. 2. The discipline is most unsatisfactory, and the whole tone of the school unhealthy. 3. The ordinary subjects and needlework are introduced, but the teaching is very ineffective. 4. The proficiency is very moderate.

WINDSOR (R.C.) :—Visited, 31st May, 1867.

Numbers present at examination :—Boys, 49 ; girls, 39 ; total, 88.
1. The school building is in tolerably good repair. The furniture is also fairly suitable, but badly arranged. Of apparatus and books there is a fair supply. The classification is injudicious, and the success of the teaching thereby retarded. 2. The discipline is fairly effective, and the moral tone, on the whole, healthy. 3. Singing and needlework are added to the ordinary subjects of instruction, and the methods employed are generally correct and suitable. 4. Several of the pupils acquitted themselves very creditably, but the proficiency of the whole cannot be estimated as much beyond tolerable.

LANE COVE (Pres.) :—Visited, 17th October, 1867.

Numbers present at examination :—Boys, 12 ; girls, 23 ; total, 35.
1. The whole organization is unsatisfactory, the furniture is badly arranged, and the supply of apparatus and books is inadequate ; the classification is injudicious, and the occupation, to a large extent, unprofitable. 2. The discipline is very ineffective, and the moral tone not healthy. 3. The ordinary subjects are taught, but unskilfully, and with little good effect. 4. The attainments, on the whole, are only tolerable.

PARRAMATTA (Pres.) :—Visited, 16th July, 1867.

Numbers present at examination :—Boys, 27 ; girls, 33 ; total, 60.

1. The school-room premises are only in very moderate condition. The furniture is fairly suitable, and the apparatus good. A supply of books is required. The working of the school, on the whole, is satisfactory. 2. The discipline is fairly effective, and the moral tone tolerably pleasing. 3. To the ordinary subjects are added singing, drawing, and needlework ; and the methods employed are, in the main, suitable. 4. The proficiency generally ranks from tolerable to fair.

PARRAMATTA JUNCTION (Pres.) :—Visited, 17th July, 1867.

Numbers present at examination :—Boys, 17 ; girls, 21 ; total, 38.

1. The premises are in tolerable repair, and the furnishing of the school-room is fairly suitable ; some increase to the apparatus and books is required. 2. The discipline is rather ineffective, but, on the whole, the moral aspect is pleasing. 3. The ordinary subjects and needlework are taught. The work of the school is carried on with earnestness and industry. 4. The proficiency is tolerably satisfactory.

PORTLAND HEAD (Pres.) :—Visited, 14th June, 1867.

Numbers present at examination :—Boys, 19 ; girls, 18 ; total, 37.

1. The school premises are in good condition ; the furniture is badly arranged ; the supply of apparatus and books is sufficient. The instruction is not regulated by a time-table or programmes of lessons, hence it is comparatively ineffective. 2. The discipline is very feeble, and the moral tone not very high. 3. Only the ordinary subjects are attempted. There is little deserving the name of method or skill displayed in the teaching. 4. The attainments, as a whole, do not exceed tolerable.

WINDSOR (Pres.) :—Visited, 30th May, 1867.

Numbers present at examination :—Boys, 13 ; girls, 11 ; total, 24.

1. The premises are in tolerably good repair, and there is a good supply of suitable furniture, apparatus, and books. The instruction, on the whole, is well-regulated. 2. The discipline and moral tone are good. 3. The ordinary subjects, together with needlework, are taught. The methods are suitable, and practised with energy and fair practical skill. 4. The proficiency is, on the whole, very fair.

CASTLEREAGH (Wn.) :—Visited, 15th August, 1867.

Numbers present at examination :—Boys, 18 ; girls, 30 ; total, 48.

1. The school-room is in good condition, well and suitably furnished, and supplied with sufficient apparatus and books. The classification and instructional documents are as yet not fully correct. 2. The discipline is fairly effective, and the moral tone, on the whole, satisfactory. 3. To the ordinary subjects are added singing and needlework. The methods are tolerably suitable, and earnestly applied. 4. The proficiency is, on the whole, nearly fair.

EMU (Wn.) :—Visited, 7th August, 1867.

Numbers present at examination :—Boys, 9 ; girls, 7 ; total, 16.

1. The building is good, but ill furnished for school purposes. There is a fair supply of apparatus, but not of books. The instruction is not well-regulated. 2. The discipline is very feeble, and the general aspect of the school unsatisfactory. 3. The ordinary subjects are taught ; the methods are too mechanical and superficial. 4. The attainments are only moderate.

HOENSBY (Wn.) :—Visited, 26th September, 1867.

Numbers present at examination :—Boys, 20 ; girls, 10 ; total, 30.

1. The school is neither sufficiently nor suitably furnished. This, in a measure, interferes with its efficient working. 2. The discipline is not fully effective, nor is the moral aspect perfectly satisfactory. 3. The ordinary subjects are taught. The methods are not very suitable, nor does the teacher, as yet, possess much practical skill. 4. The proficiency ranks, on the whole, as moderate.

LANE COVE (Wn.) :—Visited, 16th October, 1867.

Numbers present at examination :—Boys, 17 ; girls, 15 ; total, 32.

1. The outside arrangements are very imperfect. The building itself is good, but not suitably furnished. Of apparatus and books there is a fair supply. The classification is not judicious, and the instruction is not well-regulated. 2. The discipline is somewhat lax, but the moral tone is tolerably healthy.

PARRAMATTA (Wn.) :—Visited, 26th July, 1867.

Numbers present at examination :—Boys, 54 ; girls, 7 ; total, 61.

1. The school-room is in tolerably good repair, and well-supplied with apparatus and furniture. A supply of books is needed. The classification is judicious, and the instruction carefully regulated. 2. The discipline is effective, and the moral tone healthy. 3. To the ordinary subjects are added singing and drawing. The methods are appropriate, and fairly effective. 4. The proficiency of several of the pupils is very creditable, and that of the school, as a whole, is fair.

WINDSOR (Wn.) :—Visited, 5th June, 1867.

Numbers present at examination :—Boys, 32 ; girls, 37 ; total, 69.

1. The general condition of the premises is fairly satisfactory. The furniture requires to be renewed. Of apparatus and books the supply is sufficient. The classification is not quite perfect, and there are no programmes of lessons whereby to regulate the instruction. 2. The punctuality is very fair, not so the regularity of the attendance ; cleanliness and order are only tolerable. The discipline is not fully effective, but, on the whole, the aspect of the school is satisfactory. 3. The ordinary subjects and needlework are taught. The methods are tolerably suitable, and energetically applied. 4. The proficiency ranks from tolerable to fair.

M. L. FORBES, A.M.

MAITLAND DISTRICT—GENERAL REPORT.

In January, 1867, I received a temporary appointment as Inspector of Schools under the Council of Education, which was changed to a permanent one early the following month; and I was employed in the Bathurst District until the end of March. Having received previous notice of removal, I then proceeded to Sydney to attend the Conference of Inspectors, and in the middle of April entered upon the charge of the Maitland District. My duties for the year may be briefly summarized as follows:—I visited for certification 21 Denominational Schools entailing 950 miles of travelling, inspected incidentally 27, and examined 57 schools. The entire distance travelled in the performance of my duties was 2,175 miles.

My list of schools, as furnished from the Council's Office, contained 68, which may be classed as follows:—Public 30, Church of England 24, Roman Catholic 9, Presbyterian 4, Wesleyan 1. On the 31st December, the number in operation was—Public 31, Provisional 1, Church of England 23, Roman Catholic 9, Presbyterian 3, Wesleyan 1; total, 68. Considering each department for the purpose of examination as a separate school there were examined—Public 17, Church of England 24, Roman Catholic 12, Presbyterian 3, Wesleyan 1; total, 57. That is, every Denominational School open in December was inspected; but 14 Public Schools, equivalent to 15 departments, were obliged for want of time to be left unvisited.

PUBLIC SCHOOLS.

I.—ORGANIZATION.

Situations.—In this respect there are two formidable obstacles peculiar to this district, viz., scarcity of water at certain seasons and liability to floods at others. It is a matter of great difficulty to avoid both evils; but in all other respects the sites are eligible for the most part. Of the schools inspected there are none badly situated as regards the ground, while 10 are satisfactory and 7 tolerably so.

Schoolrooms.—Though differing in material and structure, the general design of the schools inspected is tolerably satisfactory. Scattered chiefly among poor communities, it is seldom that anything more than barely necessary accommodation and comfort is attempted. Most of them have been many years erected, and require in some instances entire renewal, in others considerable repairs. Only 8 of the premises inspected are vested in the Council. The general character of the buildings is tolerable. In 6 there are no residences for the teachers; and in most of the others, these are inferior in kind, deficient in accommodation, and much in need of repair. Number of schools whose material condition is—

Good or fair	2
Tolerable or moderate	14
Indifferent or bad	1

Playgrounds.—As regards extent and suitability of ground there is seldom much to complain of; but in respect of their protection from adjacent thoroughfares, weather, and, above all, their necessary adjuncts the out-offices, few are satisfactory. This last circumstance is indeed the great desideratum, and what in the main influences the judgment on this head. In some there are no out-buildings, in others only one, and even in some of the best premises they form but one building, divided by a partition, without any external contrivances to secure privacy. The condition of the playgrounds inspected is—

Good or fair	3
Tolerable or moderate	8
Indifferent or bad	6

Furniture.—A fair idea of what school furniture ought to be obtained in most localities where a public school is established, and in general a good attempt at arrangement is evinced. It is not the knowledge or will of teachers and School Boards that is at fault in this respect, but the means of improvement. In one or two schools the furniture is old and decidedly unsuitable; in others the stock comprises little more than desks and forms of rude material and construction; in nearly all there is a deficiency of shelves or presses for books and also of hat-pegs. Number of schools in which the furniture is—

Good or fair	3
Tolerable or moderate	8
Indifferent or bad	6

Apparatus.—The stock in use is generally of approved character, but more or less limited in quantity. There are, however, few schools in which the more essential articles, as a black-board, two or three maps, and a sufficiency of slates, are not to be found. The defects lie in the condition of these: sometimes a blackboard is too small, sometimes awkwardly mounted; maps are old and worn, and slates broken and unfit for use. I regard any school as deficient under this head where a map of New South Wales and a ball-frame are not provided; and under the Regulations previously in force in national schools, as well as under those which now govern public schools, there is no room, if teachers are at all prudent, for such serious defects. The condition of the schools inspected was, under this head,—

Good or fair	2
Tolerable or moderate	11
Indifferent or bad	4

Books.—The books sanctioned by the Council are—(1) the Reading Series and Scripture Lessons of the Irish National Board, (2) Constable's Series, and (3) the Australian Class Book. The first named are those most generally met with; and, with the exception of local allusions and associations, their general character is very well adapted to public schools. Of the second, it may be said that they offer a greater variety of gradation and matter, with perhaps a somewhat improved style; but they contain likewise allusions and illustrations which cannot be well understood in our latitude. Their price too is considerable, and must limit their use in competition with the others. The third set is so far only introductory. It consists of three parts, graduated to the capacities of young children beginning to read, each of which is, as far as I have seen, very appropriate, and free from the defects noticed in the others. Owing, however, to the long familiarity of teachers with the books of the Irish National Board, they have continued in most instances to use them. Recent editions of these books have been published, and as their compilation seems much more judicious, and their illustrations much more copious and perfect than the older editions, their substitution for these would be a decided improvement. As regards the supply of books, the condition of the schools examined is—

Good or fair	9
Tolerable or moderate	6
Indifferent or bad	2

Records.—In general these are kept with punctuality and accuracy. Most teachers were under a false impression as regards the date of commencing the Admission Register, but otherwise the records are tolerably well kept. Under this head, the condition of the schools was—

Good or fair	4
Tolerable or moderate	12
Indifferent or bad	1

II.—DISCIPLINE.

Punctuality.—This is, in general, a pretty satisfactory feature in the discipline of public schools. With two exceptions the teachers were punctually at their post, and by their own example—always the most

most powerful incentive—won, on the part of children and parents, a degree of co-operation securing an amount of success as nearly complete as possible. The state of the schools inspected under this head was—

Good or fair	12
Tolerable or moderate	3
Indifferent or bad	2

Regularity.—The obstacles to regularity are numerous and serious, but reducible to two principal causes—the high price of labour and the general poverty of parents. In this district the bulk of the population is almost wholly engaged in agricultural pursuits, and being for the most part leaseholders, at best in merely moderate circumstances, as soon as the children are old enough to go to school, there are a hundred little jobs which they can do as well, or nearly as well, as a hired servant, and hence the temptation to put their services into requisition is almost irresistible; and, as they grow up, becoming more and more useful, their going to school at all becomes a matter of secondary importance. When to this, force of circumstances, the losses and misfortunes of several years, are added, there would seem to be a very plausible excuse for the negligence and indifference of parents, as there undoubtedly is for the repugnance with which children long accustomed to the free and easy tone of out-door intercourse regard being shut up in a school for several hours a day. Considering these impediments, the state of the schools inspected, under this head, is not unsatisfactory. Parents seem to have some appreciation of the value of education, but always subordinate to material interests, and they endeavour to spare the children during certain seasons for awhile at school. The question of payment seems to operate somewhat against the more general attendance of pupils. Many parents are, I believe, absolutely unable to pay anything, and will not allow their children to attend free; and others bargain, in the most trifling manner, for concessions of a paltry nature, but aiming at the greatest possible reduction in the rate. A difference of opinion between themselves and the teacher reacts upon the children, whose brief period of instruction is thereby interrupted, and whose scanty progress is almost totally neutralized. In fine, as this is the most essential condition of the efficiency and prosperity of a school, so it is the most difficult of attainment. There is generally some obstacle: at one time a flood, at another sickness; while the occupations of home, both in town and country, always furnish a source of interruptions which, under present circumstances, can scarcely be wholly avoided or overcome. Number of schools in which the regularity is—

Good or fair	7
Moderate or tolerable	5
Indifferent or bad	5

Cleanliness.—Cleanliness is general in public schools, but neatness of person and dress is less common. The inspection is upon the whole regular and effective, and the condition of the schools visited tolerably satisfactory. Number of schools in which the cleanliness is—

Good or fair	6
Tolerable or moderate	11
Indifferent or bad	0

Order.—In most of the schools inspected the character of the order presented was passable, and in a few satisfactory. Teachers are, however, very apt to be deceived as to the proper notion of what order is, and to be satisfied with a part instead of endeavouring to compass the whole. In some schools the movements of the pupils are made with tolerable uniformity, while their demeanour is unbecoming and their attention slight; in others the reverse is the case. Now, in either, order exists only in part. As I understand *order*, it comprises not only ease and grace of motion, but recollection, mildness, respect on the part of pupils for teachers and for each other, and a general deportment embodying and manifesting these conditions as its principal constituent elements. Judged by this standard, few schools are orderly; but those are hopeful in which the teachers aim at such, though probably convinced of the almost insurmountable difficulties which oppose its realization. Number of schools in which the order is—

Good or fair	5
Tolerable or moderate	10
Indifferent or bad	2

Government.—In the public schools visited the authority of the teacher seems pretty well established, and the work proceeds with a general uniformity seldom disturbed, or calling for any special effort to sustain it. In three instances there might be said to have been no government, but rather anarchy—utter confusion. The teachers did not know their duty, and possessed little or no influence to enforce it even if they did. In all other cases the governing power is tolerably suitable, and judiciously exercised. Number of schools in which the character of the government is—

Good or fair	5
Tolerable or moderate	9
Indifferent or bad	3

III.—INSTRUCTION.

Classification.—The classification of the pupils is for the most part from tolerable to fair. This is not a matter of much difficulty, though very important, and requiring some amount of judgment in its proper adjustment. Three things have to be observed:—(1) the ages and capacities of the pupils, (2) the facilities or difficulties of the school-room, and (3) the teaching power. In proportion as these considerations are kept in view, the better the classification is decided on; but on this head the instructions laid down for the guidance of teachers are few and simple, and, along with their own experience, generally suffice to indicate the principle of classification which comprehends most advantages and fewest disabilities. Number of schools in which the classification is—

Good or fair	6
Tolerable or moderate	8
Indifferent or bad	3

Occupation.—Upon this point, also, abundant instructions and subsidiary aids have been issued, so that a really faulty arrangement of school work is the result either of gross negligence or great stupidity. What with Specimen Forms, Course of Secular Instruction, and Standard of Proficiency, there seems no need of or room for much further assistance. Yet, I found four schools either destitute of any defined occupation, or with work of so desultory a character as to call forth immediate and strong suspicion of the teacher's incompetence. Number of schools in which the occupation is—

Good or fair	9
Tolerable or moderate	4
Indifferent or bad	4

Subjects.—In addition to the ordinary subjects prescribed in the Course of Secular Instruction, and forming the essential basis of education in public schools, the following are taught:—

Vocal music, in	7 schools
Linear drawing, „	9 „
Euclid, „	2 „
Algebra, „	1 „
Needlework, „	11 „

Methods.—

Methods.—The results collected shew the methods of instruction to be, in their nature and application, of a passable character, as a whole; but it is not to be thence inferred that they at all approach perfection or complete satisfaction. For the most part, they are a little more than a mechanical compound, generalized from brief experiences, rarely descending below the surface, and bound by no principle of logical procedure. To begin, very frequently, at the end or in the middle; to look at things as they appear, and leave them so, without inquiry into their origin, mutual relation, or ultimate tendency; to fill the mind with facts, without any cultivation of its own native powers;—these are among the features of the methods pursued most generally. And while this is the case, is it surprising that examinations turn out so unsatisfactorily to all concerned? While teachers run rapidly over and beyond the programmes laid down, seldom caring to ascertain whether their instructions have been received, they are surprised when the pupils fail in the merest rudiments of what they had been taught. Pupils, in these circumstances, are set down as stupid, idle, &c.; but, so far as I have been able to observe, the fault lies wholly, or almost wholly, in the teachers. They have not tested the capacities of the pupils; they have allowed themselves to be led away from their true stand-point by fanciful and hopeful anticipations, and to be only restored to consciousness by the practical solution which an examination affords of the real value of their previous work. Notes of lessons are recommended by almost every authority on education; yet I have not once witnessed the use of them, though, as my inspections related principally to results, I may have overlooked them. Still, if used, I am confident it is by very few teachers.

Number of schools in which the methods are—

Good or fair	2
Tolerable or moderate	11
Indifferent or bad	4

IV.—PROFICIENCY.

Numbers.—The following table exhibits the numbers of pupils on the rolls, and present at examination:—

	7 years and under.		8 years.		9 years.		10 years.		11 years.		12 years and over.		Total.	
	M.	F.	M.	F.	M.	F.	M.	F.	M.	F.	M.	F.	M.	F.
Number on rolls	165	121	47	36	35	50	48	35	27	30	57	50	371	322
Number present	128	86	40	27	28	39	36	26	21	19	47	33	283	230

Reading.—Of the pupils present, 88 per cent. were reading, as follows:—

Monosyllables	38.6	per cent.
Easy narrative	33.4	"
Ordinary prose	25	"

These are the gradations of the subject common to primary schools. In the first, the sounds and combinations of letters form the chief exercise; in the second, the mechanical utterance of words; in the third, the intelligent and sometimes expressive reading of ordinary prose passages. It is only in this last that good reading, properly so called, can be expected. The peculiar function of mechanical reading, and the end it is destined to accomplish, is well explained as follows:—"The muscles of the throat, like those of the hand, have to be trained to their work, to be made flexible, to be brought under the ready command of the will. Both organs are educated by example: the copy is set to the hand by the eye, to the throat by the ear. The singer's exercises, the painter's touch, must needs be mechanically excellent before they can themselves excel. So in the use of the throat or hand in reading or writing, the excellence of their work depends on the perfection with which the uses of those instruments have been learnt. Articulation must come before expression. The eye must acquire great readiness in translating symbols into sounds, before that much more difficult translation of them into sense can be accomplished.

Articulation being thus secured, faults of pronunciation are detected and amended, and dialectic varieties, which arise in schools, as among nations and tribes, from laziness or difficulty in using the organ of voice, are corrected or prevented. If mechanical excellence be not acquired by beginners, they spend their whole school-life in acquiring it, and in learning to use instead of using the implements of their minds." With regard to the third or highest state of reading usually attempted in primary schools, the results noted are small, shewing only about 28 per cent. tolerably satisfactory. There is one important element of success in this exercise often omitted or carelessly observed, viz., explanation, including the meaning and derivation of words and allusions; the use of synonyms and equivalent phrases. Intelligent, and still more, expressive reading, is impossible without understanding the passage in all these relations, and this is rarely attempted in a thorough-going and efficient manner. The following percentage will shew the proficiency in this subject:—

Fair to good	17.4	per cent.
Moderate to tolerable	62.7	"
Indifferent to bad	19.9	"

Writing.—In this subject the same proportion of pupils was engaged as in the preceding, and in nearly equal numbers, on slates and paper, with fairly satisfactory results. In teaching the subject, I have observed that, as a rule, small-hand is attempted much too soon, and that large and round hands are correspondingly neglected. This, so far as my experience goes, is a mistake, and appears to proceed only upon the reversion of a fundamental principle of good teaching—that the simple and complex stand to each other in no necessary relation, and that a knowledge of the one is not necessary to a knowledge of the other. Dictation forms a distinct exercise, and is of very general application. Instruction in it proceeds by sentences to be written, and proficiency is judged by the correct spelling and punctuation exhibited in the reproduction. The results shew a passable proficiency of 77 per cent. of the pupils examined. In regard to penmanship, the knowledge evinced may be stated thus:—

Fair to good	31.1	per cent.
Moderate to tolerable	47.9	"
Indifferent to bad	21	"

Arithmetic.—Of the entire number of pupils present, 87 per cent. were learning the subject as follows:—

Simple rules	76.5	per cent.
Compound rules	23	"
Higher rules	5	"

Their proficiency shews a slight preponderance in favour of the higher results. The great fault observable in the teaching of arithmetic is the delusion into which teachers fall of fancying that, once a rule is explained and illustrated, it therefore is, or ought to be, understood; and upon this they often build

a progress, like castles in the air, which falls to pieces at the first touch of reality. In nearly all the schools examined, the pupils were advanced considerably beyond the standard laid down for their average periods of enrolment; but when tested only within that range, their ignorance was often surprising. This is not a subject which can be treated lightly: to present it in suitable and sufficient portions to the minds of the pupils, and to be certain that, as thus delivered, it is received, is by no means so easy a task as might, at first sight, be supposed. To do so properly implies an amount of preparation which is seldom, and by very few bestowed, while constant repetition must be always counted as an element of success. The principal defects are found in teaching the simple rules, so that, as the pupils advance, their fundamental knowledge being insecure, they are frequently puzzled by the first commonplace question put to them. I am of opinion that the requirements of the standard will have a very good effect, as regards arithmetic: it insists so much on thoroughness that, where it is observed, good results must follow. Mental arithmetic is taught in every public school; but the proportion of satisfactory instances elicited by examination is small, being only about 36 per cent. of the number examined. In this subject the proficiency may be stated as follows:—

Fair to good	31 per cent.
Moderate to tolerable	22 "
Indifferent to bad	47 "

Grammar.—Upwards of 54 per cent. of the pupils examined are learning the subject with the following progress:—Elementary, 60 per cent.; advanced, 40 per cent. The results are, upon the whole, tolerable, and taken in connection with the abstract nature of grammar, afford fairly satisfactory evidence of pretty successful teaching. Although the answering as a result, however, bear a favourable interpretation, much of it is nevertheless mechanical. Although children readily give the correct definitions of the principal parts of speech, distinguish them in a sentence, and point out their inflections in some cases, they very seldom have any notion that the whole subject of discourse relates to signs and not to things. This, to be sure, would be rather difficult for them; but I observe that the distinction is not always borne in mind by teachers, who would otherwise inculcate greater definiteness and precision in their instructions and illustrations. This becomes especially evident in the parsing, where much unnecessary verbiage is often let loose. On the back of the standard of proficiency a paradigm of parsing is set forth, which is simple and natural, but not, it would seem, sufficiently comprehensive for the number of subtle distinctions which some teachers originate; and is not, therefore, so well observed as it should be. In the analysis of sentences, 57 per cent. of the number learning it failed, the remainder ranging from tolerable to fair. The same want of precision is observable in this as in the elementary portions; but in the better class of schools, I am happy to say, that the teachers devote great attention to it as a preparation for their own examinations, and their pupils accordingly reap the advantage of their industry. In four schools analysis was not taught. Composition is, in general, unsatisfactory. The proficiency of the pupils in grammar is—

Fair to good	16 per cent.
Moderate to tolerable	39 "
Indifferent to bad	45 "

Geography.—About 55 per cent. of the pupils examined receive instruction in geography, in the following stages and proportions:—Elementary, 39 per cent.; advanced, 61 per cent. Their proficiency is, however, unsatisfactory; and this result is mainly attributable to that mistaken zeal for advancement which teachers are so prone to display. A knowledge of the locality, which should be the beginning of instruction in this subject, is seldom attempted at all, and even where it is, is confined to mere technicalities and speedily disposed of. The next step is the use of a map, and in this likewise a cursory acquaintance and evanescent impression are the general effects produced. Some teachers seem to think that they are not teaching geography at all, unless obliged to carry, in imagination, their pupils into remote regions, away from every landmark which would serve to connect the various stages of their journey with its beginning, and help to enable them to make it for themselves. The teaching of geography is, upon the whole, dry and mechanical. The results are—

Fair to good	4 per cent.
Moderate to tolerable	28 "
Indifferent to bad...	68 "

Object Lessons.—These lessons are very generally given in public schools, but their treatment is, as a whole, injudicious; and their results are small and uninteresting. Instead of leading children to think, the general methods pursued would seem to be intended to save them that trouble. Specimens are not usually presented for observation, and beyond the exercise of memory, the faculties come in for a very small share of cultivation. The object of this instruction is therefore but partially attained. In giving object lessons, teachers seek too much assistance from books, and too little from reflection and preparation. The arrangement of a lesson often follows no regular order, but proceeds according to what the chances of the moment may bring uppermost in the teacher's mind; and hence, in the reproduction of a lesson, the pupils usually exhibit a most incongruous accumulation of words, often grossly irrelevant, and seldom evincing any genuine exercise of thought. Percentage of proficiency—

Fair to good	0
Moderate to tolerable	23.2
Indifferent to bad...	76.8

Scripture Lessons.—About 22 per cent. of the pupils examined receive instruction in these lessons, but their proficiency is for the most part small—

Fair to good	0 per cent.
Moderate to tolerable	36 "
Indifferent to bad...	64 "

V.—TEACHERS.

The public schools inspected are conducted by seventeen teachers and three pupil teachers. The former are classified as follows:—

Class II.	{	Section A	2
		Section B	1
Class III.	{	Section A	1
		Section B	8
		Section C	1
Probationers	4	
Total					17

The latter—

Class II	2	
Class III...	1	
Total					3

By

By a minute of the Council dated the 28th July last, it was decided that the teachers of public schools should, without examination, be confirmed in the classification which they had held as National teachers, subject to certain conditions; accordingly, none were examined. As far as I have been enabled to judge, the teachers whom I have met are, as a class, intelligent, devoted to their duties, and capable of achieving good results. It is no disparagement to their merits to say that they are still in need of much improvement, and that a knowledge of themselves, of their powers and defects—especially of those last, is necessary to their increased usefulness. The average emolument of teachers in this district is—salary, £82 1s. 6d.; fees, £28 19s. 5d.; total, £111 0s. 10d., which, with house or allowance for rent, makes their average income in round numbers about £130 per annum. This might seem a reasonable sum; but if the salary and fees of the higher class be omitted, the average falls to £97 4s. 6d., exclusive of house or rent—an amount which, for the bare maintenance of a teacher and his family, in any sort of a respectable manner, is very inadequate. It is satisfactory to know that, beyond this, there is a good prospect of improvement open to all teachers willing to put forth the necessary effort; but how very few will be able to attain to these advanced positions, while their constant struggle with adversity distracts their attention, enfeebles their energy, and imparts a tone of selfishness to their efforts? They are at present merely able to live, but what are they to do for the future? When physically enfeebled by age, and destitute of mental vigor, what is to become of them? They can spare nothing from their incomes, and to insure their lives would be a sacrifice too great for most of them; so that, at present, their only prospect in old age seems utter destitution. Other public servants are protected by the country, and very justly, from so deplorable a consequence; and I can see no valid reason why a teacher, who has given the best years of his life to the service of the State, and that in no capacity of meanness, but in such a way as to affect for good the whole organization of society, should, when no longer able to earn his bread, be cast a pauper on the world. As this, however, is matter of suggestion, I do not, agreeably to instructions, offer any; but I have strong hopes that the Council of Education will spontaneously consider it, and take measures to provide against an evil which must soon begin to be felt.

VI.—SCHOOL BOARDS.

Every public school inspected was under the local supervision of a Board, appointed under the twenty-second section of the Public Schools Act; but the duties also therein prescribed have not been satisfactorily fulfilled. I found very few visits recorded or reported; comparatively few meetings were held, and, with one or two exceptions, no record of meetings was kept. These omissions might appear, at first sight, to justify the imputation to School Boards of want of interest in the institutions with which they are connected; but I think they arise chiefly from the small amount of business to be done, the inability of many members to conduct it in a proper manner, and (the strongest motive of all) the constant care of their own affairs which generally overrules all efforts of philanthropy. When spoken to individually, members exhibit a general interest in the welfare of the schools; but it is usually very short-lived, and seldom survives the occasion which excited it. Upon the whole, however, I am of opinion that, under all circumstances, the efficiency of these Boards is praiseworthy, and their connection with the schools productive of considerable good.

CERTIFIED DENOMINATIONAL SCHOOLS.

I.—ORGANIZATION.

The number of separate departments examined was forty. In general, their condition bears a strong analogy to that of public schools, and accordingly, my remarks upon those will frequently apply to these also. I shall therefore endeavour to condense my observations in this part of the Report, contenting myself with stating results, and offering explanations where necessary.

Situations.—The same impediments to perfect satisfaction, noticed in treating of public schools, exist, to the like extent, in these; otherwise their condition as regards eligibility of site is generally satisfactory. Number of schools in which the situation is—

	C.E.	R.C.	Pres.	Wes.
Good or fair	17	9	3	1
Tolerable or moderate	7	3
Indifferent or bad

Schoolrooms.—With a few exceptions, the general condition of the schoolrooms ranges from tolerable to fair. Their internal arrangements are often very inconvenient for teaching; but in the generality of the Church of England schools, they serve the double purpose of church and school; this is also the case in three Roman Catholic schools. In schools solely used for their normal purpose, there is, generally, some peculiarity of design, which, however ornamental to the building, seldom adds to its convenience. In most schools the accommodation provided is just about equal to the requirements, and nothing more; even in the best, a class-room is not to be found. Attached to twenty-two schools there are residences for the teachers, chiefly in the Church of England schools, there being but one Roman Catholic and one Presbyterian school so provided. The condition of the schoolrooms is—

	C.E.	R.C.	Pres.	Wes.
Good or fair	8	4	1	1
Tolerable or moderate	15	5	2	...
Indifferent or bad	1	3

Playgrounds.—In the great majority of cases, these may be set down as tolerable; in six they are fair to good, in nine indifferent or bad, the latter being those wholly destitute of out-offices. This is not a large proportion; but as most of these schools have been long established, it is rather surprising that so obvious a defect should remain so long unnoticed. The condition of the playground is—

	C.E.	R.C.	Pres.	Wes.
Good or fair	4	2
Tolerable or moderate	13	10	1	1
Indifferent or bad	7	...	2	...

Furniture.—In five schools, the character and supply of furniture are good, in twenty tolerable, and in fifteen indifferent or bad. One striking circumstance under this head is the variety of arrangement which prevailed. In schools where the desks and forms were movable, it was not unusual to find them placed in all possible directions, but most commonly at right angles. In those used as places of worship, the desks are generally fastened to the walls by hinges. Wherever any improvement could be made without inconvenience, I have found the teachers and Local Boards willing to give their assistance. The state of denominational schools under this head is—

	C.E.	R.C.	Pres.	Wes.
Good or fair	3	...	1	1
Tolerable or moderate	10	9	1	...
Indifferent or bad	11	3	1	...

Apparatus.—Six schools were deficient in their stock of apparatus; in others it was generally tolerable both in character and quantity. The provision made by the Council for affording aid, has been pretty generally availed of; and by this means, the condition of several schools, under this head, was much improved before the date of inspection. Number of schools in which the apparatus was—

	C.E.	R.C.	Pres.	Wes.
Good or fair	8	2	1	...
Tolerable or moderate	12	9	1	1
Indifferent or bad	4	1	1	...

Books.

Books.—The books in use in very many schools were unsuitable, as not sanctioned by the Council, but generally sufficient in quantity. In Church of England Schools the reading series published by the Society for Promoting Christian Knowledge, in the Roman Catholic Schools the books compiled by the Christian Brothers and those published by Burns and Lambert, were very generally used; in the Presbyterian and Wesleyan Schools the Irish National Board books were adopted. In all these cases in which I found books not sanctioned by the Council of Education, I invariably pointed out the violation of the Public Schools Act and Regulations involved in using them, and suggested their discontinuance. During the last quarter of the year, however, I found that although the requisitions had been made up, approved, and forwarded from most schools, the supplies had not been received in several, and only partly in others. It is now, I believe, and has been for some time past, the desire of the heads of all denominations in the district to comply with the rule of the Council under this head; but of course, until the grants are available, its rigid observance cannot well be enforced. The state of the schools inspected as regards books, is—

	C.E.	R.C.	Pres.	Wes.
Good or fair	7	...	2	...
Tolerable or moderate	5	2	...	1
Indifferent or bad	12	10	1	...

Records.—I found in almost every school that the teachers had but a very confused idea of the nature of the books to be kept, and that they were, in general, apparently lost in doubt as to the proper mode of keeping them. It was therefore necessary to explain at length their purport and construction, and to exemplify in each case the exact manner of proceeding. The Admission Register was in particular open to correction, but as the form was quite new to teachers of denominational schools, their mistakes and confusion are not surprising. Number of schools in which the keeping of the records was—

	C.E.	R.C.	Pres.	Wes.
Good or fair	2	4	1	1
Tolerable or moderate	10	5
Indifferent or bad	12	3	2	...

II.—DISCIPLINE.

Punctuality.—As regards the hour of commencing business, the generality of schools exhibit a fairly satisfactory character in this respect; but the observance of the ordinary routine was not so good. In fact, teachers did not seem to take particular care, so long as the main points were observed, whether the subordinate ones received much attention. This will appear more evident in speaking of the occupation. Number of schools in which the punctuality was—

	C.E.	R.C.	Pres.	Wes.
Good or fair	14	8	1	1
Tolerable or moderate	8	4	2	...
Indifferent or bad	2

Regularity.—Under this head much the same influences prevail as noticed in connection with the public schools, with this difference—that in these the local supervision extends not only to the school but even to the children in their homes, and that a pretty constant pressure is kept on the parents, whose excuses are less likely to pass in consequence. It is the teacher against the parents in the one case—the teacher and School Board in the other. Number of schools in which the regularity is—

	C.E.	R.C.	Pres.	Wes.
Good or fair	10	4
Tolerable or moderate	9	4	2	1
Indifferent or bad	5	4	1	...

Cleanliness.—The cleanliness of the pupils in Denominational Schools is equally satisfactory with its observance in Public Schools; but from my inquiries on the point, I am aware that the same amount of pains is not bestowed in both cases. With few exceptions, the inspection made by teachers in these schools, as to the appearance of the children, has been more nominal than real, sometimes occurring but once or twice a week. It is not easy to judge of the usual state of a school, in this respect, from an inspection previously notified, when all appear to advantage; and the few instances in which the local secretaries failed to acquaint the teachers with the date of examination, prove that the ordinary appearance of the children, and their appearance on the day of inspection, are very different. I do not say that the same may not be the case in public schools; but it is less likely, inasmuch as the precautions taken have been more regular and effective. Condition of the schools under this head:—

	C.E.	R.C.	Pres.	Wes.
Good or fair	6	4
Tolerable or moderate	18	7	3	1
Indifferent or bad	1

Order.—With very few exceptions, this feature of the character of denominational schools is very unsatisfactory, being indifferent or bad in eighteen schools, and satisfactory only in eight. Indeed, for the most part there was no order whatever; noise and confusion reigned supreme, and, except by sight, it was often difficult to know that a teacher was present. Before much improvement can be expected under this head, the training of the teachers, where not too old, will be requisite; for, as their notion of order is at its lowest point, it is vain to look for any in their schools. Condition of schools in respect of order:—

	C.E.	R.C.	Pres.	Wes.
Good or fair	3	4	...	1
Tolerable or moderate	7	5	2	...
Indifferent or bad	14	3	1	...

Government.—In rather more than half the number of schools the government is passably suitable and effective; but the number in which its principles are understood is very small indeed. In some schools the pupils are naturally mild and docile, and government with them, as a coercive power, is unnecessary; in others, they are rude, noisy, and troublesome, and render frequent appeals to the cane quite requisite. If the teacher be a person of mild temperament, he will probably suffer much annoyance before interfering, and will then, perhaps, inflict a punishment so inadequate as to encourage, rather than suppress the evil. I have not noticed any instance of extreme violence. What is wanted is system, law, administered rigidly, but calmly, dispassionately, and firmly; but before this can be generally established, the teachers must, in several instances, be trained, or replaced by those who are. Schools in which the government is—

III.—INSTRUCTION.

Classification.—With the exception of one school, the classification accorded, in name, with that prescribed in the Course of Secular Instruction; but, in practice, it varied very considerably. In several schools it was badly proportioned to the teaching power; in several it was founded upon various principles; and in several, though theoretically well defined, it was so confused that one class could not be well distinguished from another. I generally found that after testing the Admission Register in this way, many pupils would occupy a different position from their ordinary one in the school, and that, for the real purposes of instruction, the classification in force had very little meaning. Number of schools in which the classification was—

	C.E.	R.C.	Pres.	Wes.
Good or fair	6	6	1	...
Tolerable or moderate	9	4	2	1
Indifferent or bad	9	2

Occupation.—In this respect very few schools were satisfactory. In most an attempt was made to comply with the requirements of the Council in so far as having time-tables and programmes was concerned. But in too many instances they were constructed to meet the eye and not to methodize the school work. In some schools the religious instruction was not restricted to its proper hour; but this was promptly remedied as soon as noticed, and I believe it occurred in all cases through mistake or want of thought. But, looking at the generality of time-tables as regards their merely scholastic character, there were few indeed which bore evidence of care in their preparation. The same may be said of the programmes of lessons. Some were wholly different from the specimen forms, and others but feeble imitations of them. Upon the whole the real utility of these documents was badly understood, and their application tended to confuse rather than simplify the work of the school. Number of schools in which the occupation was—

	C.E.	R.C.	Pres.	Wes.
Good or fair	4	1	...
Tolerable or moderate	11	5	1	1
Indifferent or bad	13	3	1	...

Subjects.—In most schools the majority of the subjects prescribed were taught; in one history was added for a second class. Along with these the following formed part of the instruction:—

	C.E.	R.C.	Pres.	Wes.
Singing	10	3	1	1
Drawing	10	2	2	1
Needlework	15	4	1	1
Euclid	2	3	...	1
Algebra	2

Methods.—Of intelligent method in the communication of knowledge, or of its legitimate and mainly desirable end—the promotion of the power of correct thinking, very few teachers know anything. With the great majority, instruction proceeded in a stiff monotonous strain, generally in the form of tasks in which the whole burden was thrown upon the learner whose memory was solely exercised, but whose understanding was left blank. In my examinations I have very often been told by teachers that the pupils knew the subjects perfectly for them, which for me they did not know at all. Accordingly, I would sometimes request them to put my question; but the result was invariably the same, except that after a long trial, and frequent appeals to association, a glimpse of light might break upon them; or they would so alter the shape of the question as to bring it under the accustomed formula and so draw out an answer. The question is frequently asked—Why not leave teachers to pursue their own methods, and hold them responsible for the results? To this the answer is very simple. Results are attainable only through method, which must necessarily be of some kind—good, bad, or indifferent—if good, corresponding results may be expected; if otherwise, bad, or at least unsatisfactory. This being undeniable—what is the best qualification in a teacher? Evidently the power of exercising the minds of his pupils to the fullest and freest possible extent, without overstraining them; and can it be maintained that this exercise lies in the committing to memory which has hitherto prevailed? Experience proves the contrary. It is not to be inferred from this, that I advocate a knowledge of method at the expense of acquirements. This is not my intention; if a person does not know a subject he cannot teach it. But in the case of scholars, simply as such, they acquire knowledge for its own sake; in the case of teachers they acquire knowledge for the sake of others, and its utility is measured by their power of communicating it. There is thus in the education of teachers a twofold object to be attained, which the more fully it is realized in each phase, the more skilful and effective will be their efforts, and *vice versa*.

Number of schools in which the methods are—

Reading.—

Reading.—The course of reading is chiefly elementary, and its quality, for the most part, from moderate to tolerable. In the majority of schools a reading lesson was a most mechanical and uninteresting exercise. It consisted of reading alone, with sometimes the addition of spelling; and such reading as may be imagined, where the monotonous drawl or half-muttered articulation is all that strikes the ear. There was seldom any attempt to make the lesson intellectual, by an examination of its contents, or an explanation of the words occurring therein. "In the hands of a good teacher, a reading lesson to an advanced class, given without hurry, in a class-room or a quiet school, should be the most interesting, instructive, and educating lesson of the day. He should explain the words which they do not understand, by reference to others which are familiar to them; he should contrast their ungrammatical language with the expressions in the book before them; he should point out upon the map the names of all the places mentioned, so as to localize the impressions of the children; he might, here and there, mention important circumstances connected with these places, and explain, in simple terms, the historical allusions, where they relate to our own country, and above all when they relate to his own neighbourhood; he should point out to the children the points to be imitated and admired in the characters and conduct of the persons about whom they were reading." Statement of results:—Per centage of pupils able to read—In Church of England schools, 70; in Roman Catholic schools, 73; in Presbyterian schools, 81; and in Wesleyan schools, 54 per cent. Of these there are the following proportions in,—

	C.E.	R.C.	Pres.	Wes.
	Per cent.	Per cent.	Per cent.	Per cent.
Monosyllables	25·6	36·	38·7	42·
Easy narrative	37·2	35·	35·3	34·2
Ordinary prose	37·2	29·	28·	23·8
Proficiency—				
Fair to good	9·8	24·3	5·4	13·2
Moderate to tolerable	52·5	51·6	65·6	47·8
Indifferent to bad	37·7	24·1	29·	39·

Writing.—My remarks upon this subject, in speaking of the public schools, will be applicable to these also. In general, the writing in denominational schools was taught with considerable care, and gave reasonable promise of increased excellence in future. Upwards of 66 per cent. of the pupils present were practising dictation, but with only moderate success. In this subject the results are as follows:—

	C.E.	R.C.	Pres.	Wes.
Per centage of pupils learning	67·	67·	81·	60·
" " writing on slates	35·3	40·	41·	44·
" " " in copies	64·7	60·	59·	56·
Per centage of proficiency—				
Fair to good	24·	20·7	12·3	24·
Moderate to tolerable	53·	53·7	37·	59·
Indifferent to bad	23·	25·6	50·7	17·

Arithmetic.—With the exception of three or four schools, the progress of the pupils did not exceed the compound rules. As a whole, the subject was injudiciously taught, and the proficiency, in consequence, very small. The general mode of teaching was the old-fashioned one of working sums out of books, and in some cases entering them on paper. The black-board was very little used, and explanation, as a rule, was not given, except in that mechanical style which perhaps brought out the answer but left the pupil in ignorance as profound as before. In my examinations I dictated questions usually of a commonplace character, and often in an indirect manner, so as to test the pupils' knowledge most effectually. The results were for the most part unsatisfactory, and not in one rule or class but generally. Teachers seem not to understand that, except in the case of advanced scholars, the use of text books is injurious. They themselves must be both book and teacher if they would thoroughly drill the minds of children into the conception and manipulation of numbers; they must, in fact, be prepared to exert themselves more vigorously and systematically, if they desire—as I doubt not they do—to confer real and lasting benefit on the pupils entrusted to them. In mental arithmetic the proficiency is very poor.

Moderate to tolerable	13·3	25·1	18·2	25·
Indifferent to bad	79·	55·3	62·7	39·

Grammar.—About 50 per cent. of the pupils in denominational schools were learning this subject. Their knowledge is for the most part poor, and of a mechanical cast. Accustomed, in general, to book learning with little or no intelligent exercise, they seemed thoroughly nonplussed when questioned in a common-sense manner. Many who could repeat considerable portions of the text-book by rote, could not distinguish the parts of speech or tell the inflections of the noun. It is almost needless to point to the causes of failure, as those of success were almost wholly wanting; but it may be stated at once, that the character of the instruction was such as to leave no other result attainable. In eighteen schools the pupils knew absolutely nothing of the construction of a simple sentence, and in the others the knowledge of analysis and composition was of the most meagre and partial character. A fresh and energetic impulse needs to be given to the teaching of this subject before any satisfactory degree of progress or proficiency can be looked for; and the first step in the procedure must be taken by the teachers, by improving their own knowledge and method of imparting it.

	C.E.	R.C.	Pres.	Wes.
Per centage of pupils learning the elementary portions	51·5	55·	46·	36·
Learning the advanced portions	48·5	45·	54·	64·

Geography.—

APPENDIX.

73

Geography.—Much the same number of pupils was learning this as the preceding subject, and with very similar results. In some schools it was not taught; in some it was taught only in name, and in very few with intelligence or earnest effort. The methods and proficiency are for the most part superficial.

	C.E.	R.C.	Pres.	Wes.
Percentage of pupils learning the elementary portions	52·7	57·8	47·	46·
Learning the advanced portions... ..	47·3	42·2	53·	54·

Fair to good	1·2	12·	2·	4·
Moderate to tolerable	9·2	17·	16·	12·
Indifferent to bad... ..	90·6	71·	82·	84·

Object Lessons.—In eight schools these were omitted, and in most of the others their teaching was merely nominal, and inserted in the occupation to evince a compliance with the requirements of the Regulations. Last year may be said to have witnessed their introduction to the majority of schools. The subjects are tolerably suitable, but their treatment is in no instance satisfactory, and their effect in the mental development of the pupils scarcely perceptible. The character of the knowledge evinced does not rise above moderate, while in the main it is indifferent or bad.

Tolerable or moderate	20·	25·	17·	20·
Indifferent to bad... ..	80·	75·	83·	80·

V.—TEACHERS.

The numbers of teachers employed in Denominational Schools during the past year was 46; pupil teachers, 3. Their rank, as provisionally awarded in conformity with the Council's Minute dated 20th July last, is as follows:—

	C.E.	R.C.	Pres.	Wes.
Class III ... { Section A	3	2	1	1
" B	3	2
" C	5	6	2	...
Probationers	15	4	1	1
Pupil Teachers { Class II	1
" III	1	1

In the case of 16 teachers this classification corresponds with the salaries they had received from the late Denominational Board; in 9 it is above, and in 16 below them. This result was mainly decided by the condition of the several schools. Some of these teachers, I am sorry to say, are thoroughly and hopelessly incompetent, but the majority are capable of improvement, and likely to become efficient, while a few evince a decided aptitude for, and a fair amount of skill and judgment in teaching. I may say that, upon the whole, I found these teachers very willing to receive instruction as to the better performance of their duties, and to carry out the Regulations of the Council. There seemed to prevail, for a time at least, a most unjust suspicion among several of them, that their schools were "doomed," and that simple justice, as between the Council and themselves, was not to be expected. This was sometimes openly expressed, especially when the examination proved a failure, and the feeling was even shared in by Local Boards. I trust that experience has since proved its groundlessness; and that they now understand that a rigid exaction of duty may not be incompatible with a care for the individual interests of teachers, and need not be construed into a threat of extermination against a school. The average emolument of teachers of Denominational Schools is—

	C.E.			R.C.			Pres.			Wes.		
	£	s.	d.	£	s.	d.	£	s.	d.	£	s.	d.
Salary per annum	85	4	9	71	11	5	79	10	0	63	0	0
Fees for year	31	4	8	16	10	5	15	4	1	20	4	4
	£116	9	5	88	1	10	94	14	1	83	4	4

My remarks under this head upon Public Schools, both as to present salary and future prospects, apply with equal force to Denominational teachers, and render any further discussion of the matter unnecessary in this place.

VI.—SCHOOL BOARDS.

As a rule the Boards of Denominational Schools are very deeply interested in the institutions, and leave nothing undone, as far as they can, to ensure their success. The burden of work, however, usually falls to the lot of some one, generally the Clergyman, who performs the double duty of Chairman and Secretary. The meetings are not of a formal character, nor are they held with any regularity or business like proceeding; but notwithstanding this, the supervision exercised is zealous and assiduous.

CONCLUDING OBSERVATIONS.

A new era in the education of the country commenced last year, and this fact should recommend the system and its administration to the indulgent consideration of all reasonable minds. In a very large number of schools the new order was introduced amidst doubt, difficulty, and various contending opinions, not unmixed with a large share of prejudice; in others it was hailed with welcome as the solution of a long-standing and formidable difficulty. To inspire confidence in its provisions, as the means of reconciling both interests, and to apply, at the same time, the hand of reform, and that in no unsparing manner to admitted or ill-concealed abuses, to invade what had hitherto been, to some extent, privileged precincts, and to question the apparently prescriptive rights of individuals with the view of testing their validity, were objects of so conflicting, so complicated a nature, as to make their successful accomplishment a matter rather to be desired than attempted. Yet such was necessarily the first step in adapting the existing institutions to the new *regime*. And now, that the first shock is over, and a more perfect understanding established between all parties, it is earnestly to be hoped that mutual concessions, of a reasonable nature, will be made, and that the advantages which the Public Schools Act is capable of conferring, may be worked out to the fullest possible extent.

W. DWYER,
Inspector, Maitland District.

MAITLAND DISTRICT.—APPENDIX TO GENERAL REPORT.

A brief notice of the state of each school inspected is subjoined as follows :—

1. Material Condition.
2. Moral Character.
3. Subjects and Methods of Instruction.
4. Proficiency of the Pupils.

Name of School.	Date of Inspection.	Number of Pupils present at Examination.			Remarks.
		Boys.	Girls.	Total.	
PUBLIC SCHOOLS. Aberdeen	1867. 31 Oct. ...	14	13	27	1. The schoolroom and its appointments are moderately passable, but the playground is unenclosed and unprovided with out-offices. 2. The moral aspect of the school was tolerable. 3. The subjects were suitable, and the methods moderately intelligent, though chiefly mechanical. 4. The general proficiency was partial, but the pupils evinced a reasonable degree of intelligence.
Bishop's Bridge	16 July ...	19	10	29	1. The school is very unsuitable, and the premises, as a whole, are very defective. 2. The personal appearance of the pupils was not satisfactory, but their conduct and order were passable. 3. The instruction was appropriate, but not well arranged; the methods were intelligent and carefully applied, but not sufficiently penetrative. 4. The general proficiency was but moderate, and the mental culture indifferent.
Cessnock	17 July ...	13	15	28	1. The site is objectionable, the premises are very defective, and the organization is every way unsatisfactory. 2. The pupils are naturally well behaved, but the discipline of the school counteracted, rather than promoted this tendency. No order existed. 3. The instruction was tolerably suitable in name, but otherwise utterly inappropriate. 4. The proficiency and mental culture of the pupils were extremely small.
Falbrook	23 Sept....	12	17	29	1. The teacher's residence is too small, and the whole building needs repair. The general organization is tolerable. 2. The moral character of the school was fairly satisfactory. 3. The instruction was tolerably suitable and imparted with considerable earnestness; the methods were, however, mechanical. 4. To a partial extent the proficiency was tolerable, but, upon the whole, indifferent. The pupils evinced a thoughtful disposition.
Lochinvar	15 Aug....	21	12	33	1. The premises are moderately suitable, and the organization is tolerable. 2. The pupils were well conducted, tolerably attentive, and orderly. 3. The subjects were appropriate, tolerably well arranged, and imparted with considerable skill and judgment. 4. The pupils evinced a tolerable readiness in answering, and a reasonable degree of mental development.
Merriwa	16 Oct. ...	22	23	45	1. Repairs and general cleansing needed, otherwise the premises are in a tolerably effective state. 2. The pupils were fidgetty and inattentive, and their discipline wanted energy. Moderate order was, however, maintained. 3. The instruction was suitable, tolerably well arranged, and imparted with moderate intelligence. 4. The general proficiency approached moderate, but was, upon the whole, unsatisfactory.
Murrurundi	25 Oct. ...	25	10	35	1. The schoolhouse is unsuitable, insufficient, in bad repair, and inadequately provided with appliances. 2. Owing to the awkwardness of the rooms order is observed with difficulty. The pupils were, however, modest and agreeable in manner, and tolerably well trained for their opportunities. 3. The subjects prescribed were taught with the exception of singing and drawing; but their arrangement was unsatisfactory. The methods were fairly intelligent and skilfully applied.

Name of School.	Date of Inspection.	Number of Pupils present at Examination.			Remarks.
		Boys.	Girls.	Total.	
Murrurundi— <i>contd.</i>	1867.	4. The classification was inappropriate, and the general proficiency poor; but in reading, writing, and grammar, a tolerable knowledge was evinced.
Oswald	16 Aug....	13	5	18	1. The schoolroom is moderately satisfactory in every particular except cleanliness, which was badly observed. 2. The pupils were irregular and unpunctual, addicted to objectionable habits, and in poor order. 3. The occupation was tolerably suitable, but arranged in a slovenly manner. The methods were disconnected, rambling, and ineffectual. 4. Both the progress and proficiency of the pupils were very poor, and bore no evidence of mental culture.
Quorribolong ...	30 Aug....	5	7	12	1. The playground accommodation is very defective, and the supply of school materials extremely limited; otherwise the condition of the premises is tolerable. 2. Regularity and punctuality were not at all observed; order was not recognised, and the moral aspect of the school was very low indeed. 3. The subjects prescribed were but partially taught, and without any attempt at arrangement. The methods do not deserve the name. 4. Extreme ignorance and complete imbecility of thought characterized the results of the examination.
Scone	21 Oct. ...	12	7	19	1. The premises are not enclosed, but in good repair. The organization of the school is tolerable. 2. The pupils, all very young, were well-behaved, and in fair order. 3. The subjects were appropriate and fairly arranged; imparted with moderate intelligence, energy, and zeal. 4. The pupils were too highly classed for their ages, and their general proficiency was small in consequence. They evinced, however, some acquaintance with the simpler exercises of thought.
Scott's Flat	19 Sept....	35	15	50	1. The schoolroom is much too small, and the organization very defective. 2. Several pupils were beyond the regular school age. The order of the school was unsatisfactory. 3. The instruction was suitable in character and fairly arranged. The methods evinced considerable earnestness; but want of preparation and awkwardness in applying them render their effect very slight. 4. The general proficiency was tolerable.
Singleton—(Primary)	11 & 12 Sept	31	19	50	1. The premises are suitable, sufficient, and well organized, but in need of cleansing and minor repairs. 2. The order of the school was fair upon the whole, but below what might reasonably be expected, considering its character and numerous advantages. 3. The instruction was appropriate, well arranged, and judiciously imparted. 4. The proficiency ranged from tolerable to fair; but the mental culture of the pupils was not satisfactory.
Singleton—(Infants)	12 Sept....	15	18	33	1. The schoolroom is very small and insufficiently furnished, but otherwise in fair condition. 2. Cleanliness, order, and attention among the pupils were tolerably manifest; but regularity was subject to serious interruptions through sickness. 3. The subjects were suitable, arranged with tolerable judgment, and carefully taught. 4. The proficiency was very moderate, and evinced but slight mental culture.
Stanhope	6 Sept....	14	18	32	1. The school buildings are old, and in need of repair, but tolerably effective, and carefully kept. 2. The school operations were conducted with reasonable order, and the manners of the pupils were pleasing.

Name of School.	Date of Inspection.	Number of Pupils present at Examination.			Remarks.
		Boys.	Girls.	Total.	
Stanhope— <i>contd.</i>	1867.	3. The subjects were suitable, and the methods moderately intelligent, though mainly mechanical. 4. The proficiency and mental culture were moderate.
Sugarloaf	29 Aug...	14	21	35	1. The schoolroom is a new slab building, suitable, sufficient, and tolerably well organized. 2. The pupils were thoughtless, inattentive, and awkward in manner, but evinced a moderate degree of order in their movements. 3. The subjects accorded with the "Course of Secular Instruction," and were arranged in the requisite guides. The methods were moderately intelligent, but wanting in vigour and interest. 4. The proficiency was very small throughout. The teacher had only been a short time in charge.
Watagon	25 July...	18	9	27	1. The building is of a very rude description, but moderately furnished. The premises generally are very defective. 2. In manner and address the pupils were diffident and awkward; their attention was very passive, but their movements were made in moderate order. 3. Owing to a faulty classification, the instruction was badly adapted to the requirements of the school. The methods were tolerably intelligent, but in the main, mechanical and superficial. 4. With two or three exceptions the proficiency and mental culture were very small.
Wollombi	22 & 23 July	31	23	54	1. The school was conducted in temporary premises, pending the removal and re-erection of the proper building out of the reach of floods. 2. The pupils betrayed a tendency to unsteadiness; but their conduct, attention, and movements were otherwise fair. 3. The instruction was tolerably suitable and well arranged. The methods were intellectual, well applied, and moderately effective. 4. The proficiency was tolerable, but below what might be expected from the teaching power, average periods of enrolment, and general advantages of the school.
CERTIFIED DENOMINATIONAL SCHOOLS. CHURCH OF ENGLAND.					
Bishop's Bridge ...	19 Dec...	20	22	42	1. The schoolroom is in good repair, but badly organized, and the playground is deficient in out-offices. 2. The pupils were not properly drilled, but were, upon the whole, well-conducted and in tolerable order. 3. The subjects were for the most part appropriate, but badly arranged; the methods were hurried, desultory, and ineffective. 4. The proficiency ranged from indifferent to bad, with slight mental culture.
Blandford	28 Oct. ...	9	5	14	1. The premises are old, but in moderate repair; the schoolroom is small and very scantily furnished. 2. The pupils were well-behaved, but entirely ignorant of order. 3. Only reading, writing, and arithmetic were taught; they were wholly destitute of arrangement, and imparted by obsolete methods. 4. The pupils knew absolutely nothing.
Bolwarra	17 Dec. ...	14	20	34	1. The schoolroom is in a wretched state of repair, and quite unfit for the accommodation of pupils. 2. Punctuality and regularity had been very carelessly observed of late, both by teacher and pupils. The order of the school was low. 3. The subjects were in partial accordance with the prescribed course, but subject to no guidance or arrangement. The methods were allowed to fall into mere routine. 4. For the ages and average attendances of the pupils, the results were small; but considerable intelligence was evinced.

APPENDIX.

77

Name of School.	Date of Inspection.	Number of Pupils present at Examination.			Remarks.
		Boys.	Girls.	Total.	
Buchanan	1867. 16 Dec. ...	11	5	16	<ol style="list-style-type: none"> 1. The premises are in moderate repair and reasonably sufficient, but the organization of the school is very defective. 2. The pupils were well-conducted, tolerably attentive, and orderly. 3. The subjects were suitable, but not arranged in the requisite guides; the methods were very inanimate, devoid of energy, and almost ineffective. 4. The proficiency was very small in every class and subject, with the sole exception of writing in the third.
Cassilis	18 Oct. ...	21	10	31	<ol style="list-style-type: none"> 1. The premises are fairly suitable and in good repair, but the appliances are insufficient and badly arranged. 2. The pupils were subject to no discipline worth mentioning; order was unknown in the school. 3. Reading, writing, and arithmetic constituted the bulk of the instruction, but subject to no arrangement; the teaching was of the most mechanical character. 4. The proficiency evinced was small and poor in the extreme.
Denman	14 Oct. ...	18	14	32	<ol style="list-style-type: none"> 1. The building is in good repair, and moderately well furnished, but too small for the attendance. 2. The discipline was very lax, and the order, in consequence, very unsatisfactory. 3. The instruction was to a partial extent nominally appropriate; but, in reality, it was mechanical, feeble, and ineffectual. 4. The proficiency and intelligence of the pupils were extremely small.
Ellalong	19 July ...	23	15	38	<ol style="list-style-type: none"> 1. The premises are in tolerable repair, and the schoolroom is moderately furnished. 2. The discipline was very superficial, and the order of the pupils very unsatisfactory. 3. The instruction was injudiciously arranged, mechanically rendered, and but slightly effectual. 4. The proficiency and mental culture were very small.
Gresford	21 Aug. ...	10	10	20	<ol style="list-style-type: none"> 1. The schoolhouse is moderately sufficient, but badly organized; there are no out-offices. 2. The moral character of the school was moderate. 3. The prescribed subjects were nominally taught, but the methods were extremely mechanical and unintelligent. 4. The progress and proficiency of the pupils were very small, and evinced no intellectual cultivation.
Hinton	13 Dec. ...	30	28	58	<ol style="list-style-type: none"> 1. The school-room is suitable, sufficient, and fairly organized; the premises generally are in good repair. 2. With the exception of a habit of prompting, prevalent among the pupils, the moral aspect of the school was tolerable. 3. The subjects were appropriate and the methods tolerably intelligent. 4. The proficiency and mental culture were moderate, but partial.
Jerry's Plains	11 Oct. ...	23	13	36	<ol style="list-style-type: none"> 1. The schoolroom is in good repair, but very inadequately furnished. The teacher's residence was in bad condition. 2. The pupils were noisy, inattentive, and highly disorderly. 3. The subjects taught were very few, and without arrangement of any kind; the methods, judging by results, were unsuitable and ineffectual. 4. The pupils' knowledge was extremely small and bore no evidence of mental culture.
Laguna	24 July ...	17	12	29	<ol style="list-style-type: none"> 1. The premises are in tolerable repair, but the supply of furniture and apparatus is insufficient. 2. The pupils were well-conducted but very awkward and utterly ignorant of order. 3. The subjects were in partial accordance with the prescribed course, the methods were obsolete and unintelligent. 4. The proficiency was very small in every respect. The pupils knew almost nothing.

Maitland West (St. Mary's ; Boys.)	1867. 22 & 25 Nov.	65	...	65	<ol style="list-style-type: none"> 1. The out-offices are badly situated, otherwise the premises are in good repair. The schoolroom is fairly organized. 2. The pupils were somewhat addicted to talking ; but their conduct, demeanour, and movements were, upon the whole, tolerably pleasing. 3. The subjects were suitable and arranged with moderate judgment. The methods were tolerably skilful and intelligent. 4. The general proficiency was partial, but ranging, in most important subjects, from moderate to tolerable.
Maitland, West (St. Mary's ; Girls.)	25 Nov.	59	59	<ol style="list-style-type: none"> 1. The material condition and general organization of the school are fair. 2. The conduct, manner, and bearing of the pupils were pleasing, and their order was very fair. 3. The subjects were suitable and arranged with tolerable care. The methods were earnest, intelligent, and tolerably effective. 4. The general proficiency ranged from moderate to tolerable.
Maitland, West (St. Paul's.)	8 & 12 Nov.	44	29	73	<ol style="list-style-type: none"> 1. The schoolroom is new, suitable, fairly sufficient, and moderately equipped ; but the out-offices are badly placed and otherwise objectionable. 2. The pupils, though individually not ill-behaved, were, as a whole, most unruly, and evinced the utmost disorder in their movements. 3. The subjects were appropriate but without arrangement, imparted with little judgment, preparation, or effect. 4. The proficiency was very bad.
Millfield	18 July ...	11.	14	25	<ol style="list-style-type: none"> 1. The premises are in barely tolerable condition, and in need of repair. Furniture unsuitable and appliances very limited. 2. The several features of discipline were but feebly developed. The moral aspect of the school was moderate. 3. Most of the prescribed subjects were taught, but without much guidance or judgment, as regards either quantity or measure. 4. The knowledge evinced was very poor.
Morpeth (Primary.)	5 & 6 Dec.	36	35	71	<ol style="list-style-type: none"> 1. The premises are in good condition, suitable, and sufficient ; and the school-room is fairly organized. 2. The discipline was very lax ; the pupils' manners were rather forward, and their order, attention, and industry very slight indeed. 3. The subjects were appropriate and tolerably well arranged. The methods were very intelligent,—skilfully but not effectively applied. 4. The classification was very recent and quite injudicious. The proficiency and mental culture were small in every class.
Morpeth (Infants) ...	6 Dec. ...	18	24	42	<ol style="list-style-type: none"> 1. The schoolroom is suitable and sufficient, but inadequately furnished. 2. Several pupils were untidy in appearance ; intelligent discipline was wanting ; and order was feeble and ineffective. 3. The subjects were moderately suitable, but not arranged in any guide. The methods were extremely crude, unskilful, and ill-adapted to the children. 4. The proficiency and mental culture were small and poor.
Muswellbrook	24 & 25 Sept.	53	29	82	<ol style="list-style-type: none"> 1. The premises are badly situated, but in tolerable repair ; reasonably suitable and fairly supplied with the requisite appliances. 2. The pupils were forward in manner, unsteady in deportment, and very disorderly in their general conduct. 3. The subjects were appropriate, but badly arranged. The methods were almost wholly suggestive and superficial. 4. The classification was highly injudicious, and the answering of the pupils, in general bad.
Muswellbrook (Railway.)	27 Sept....	15	13	28	<ol style="list-style-type: none"> 1. Erected to meet a temporary want, the premises are of a tolerable character, and moderately provided with furniture apparatus and books.

Muswellbrook (Railway) — <i>contd.</i>	1867.	2. The general appearance and conduct of the pupils were fairly satisfactory, but they had not been subjected to a proper discipline, and hence evinced little acquaintance with good order. 3. The instruction was suitable in kind, but injudiciously arranged and mechanically imparted. 4. The proficiency and mental development were very small.
Paterson	20 Dec. ...	20	8	28	1. The buildings are very old and much in need of repair. The organization of the school was moderately satisfactory. 2. The moral character of the school was tolerable. 3. The subjects were appropriate, and arranged for the senior classes with moderate judgment; the methods were intelligent and fairly applied. 4. The general proficiency was small but promising. The teacher had only been a few weeks appointed.
Port Maitland	15 Nov. ...	8	20	28	1. The fences are broken and the schoolroom is much injured by floods. The organization is unskilful. 2. The pupils were well behaved, clean, and neatly dressed, but fidgetty, talkative, and inattentive. 3. The subjects were without arrangement or guidance, but suitable as far as they went. The methods were tolerably intelligent, but wanting animation and penetrative force. 4. The results were very unsatisfactory, no subject approaching the standard, except writing on paper.
Scone	22 & 23 Oct.	31	42	73	1. The premises are tolerable in all respects, and, to a partial extent, the school is fairly organized. 2. For the most part the pupils were well-conducted and in moderate order, but talking and unsteadiness were prevalent habits among them. 3. The instruction was suitable, fairly arranged, and imparted by intelligent and skilful methods. 4. In reading, writing, and arithmetic a tolerable but partial proficiency was evinced; in the other subjects the knowledge was feebler and more vague.
Singleton	13 & 17 Sept.	71	41	112	1. The premises are in excellent condition, and the school is fairly organized. 2. The pupils were very inattentive and much addicted to talking; their movements were made in passable order, but their general deportment was far from pleasing. 3. The subjects were tolerably appropriate, but very injudiciously arranged; the methods were fragmentary, inanimate, and superficial. 4. The proficiency and mental culture were unsatisfactory.
Wollombi (Broke) ...	29 July ...	10	15	25	1. The premises are tolerably suitable and in good repair, but badly provided with the requisite appliances. 2. The pupils were most disorderly, and appeared to be under no effective control. 3. The occupation was, in theory, tolerably suitable and well-defined, but impracticable, owing to want of discipline. The methods were mere repetitions, and wholly ineffectual. 4. Reading and writing were moderate in the highest class; but the general proficiency was small and unintelligent.
ROMAN CATHOLIC SCHOOLS:— Blandford	29 Oct. ...	29	24	53	1. The ground is not enclosed, but the building is substantial and tolerably well furnished. 2. The pupils were well-behaved, for the most part very attentive, and in fair order. 3. The subjects were suitable, but not properly arranged. The methods were intelligent, appropriate, and fairly effective. 4. The general proficiency was moderate, but partial.
Lochinvar	14 Aug. ...	12	13	25	1. The schoolhouse is in excellent repair and tolerably well furnished. 2. The pupils were well behaved, but not under orderly training.

Name of School.	Date of Inspection.	Number of Pupils present at Examination.			Remarks.
		Boys.	Girls.	Total.	
Lochinvar— <i>contd.</i>	1867.	3. Most of the subjects prescribed were taught, but their arrangement was confused and injudicious. The methods were earnest and tolerably skilful, but awkwardly applied. 4. The general proficiency was moderate, and the mental culture partial.
Maitland East (Boys)	28 and 29 Nov.	61	...	61	1. The schoolroom is much too small, and the furniture awkward and badly arranged. 2. The pupils were, for the most part, untidy, addicted to talking, and awkward in their movements, but considerable allowance must be made for defective organization. 3. The instruction was fairly appropriate and well arranged, imparted with earnestness of purpose, though sometimes wanting connectedness and spirit. 4. The general proficiency ranged from moderate to tolerable, with a partial display of intelligence.
Maitland East (Girls)	2 and 3 Dec.	...	47	47	1. The school is badly situated, of very diminutive proportions, extremely uncomfortable, unsuitably furnished, and, in every respect, unfit for its present purpose. 2. The pupils were generally well behaved, moderately attentive, and in tolerable order, under the circumstances; whispering was prevalent among them. 3. The subjects were, for the most part, in conformity with those prescribed and arranged in proper guides; the methods were not witnessed, but seemed, judging by results, moderately intelligent and suitable. 4. The general proficiency may be regarded as tolerable, and the mental culture moderate.
Maitland West (Boys)	14, 15, and 18 Nov.	93	...	93	1. The schoolroom is suitable, fairly sufficient, and tolerably well organized; but the playground is extremely limited in extent. 2. Many of the pupils were untidy in appearance and not satisfactorily clean; all were addicted to talking, and attention was poorly maintained. 3. For the most part the instruction accorded with the prescribed course, and was laid down in the requisite guides. The methods were intelligent and earnest, but counteracted in their effects by ineffective discipline. 4. The proficiency was partial—reading, writing, dictation, and arithmetic being best understood.
Maitland West (Girls)	13 and 14 Nov.	...	64	64	1. The schoolroom is upstairs, and is rather small for the attendance, but otherwise, with the exception of books, fairly organized. 2. Talking was indulged in by the pupils, but their general behaviour, attention, and order, were tolerable. 3. The subjects were fairly suitable, and the methods intelligent, skilful, and zealously applied. 4. The proficiency was partial in general, but ranging from moderate to fair in a considerable number of instances. The classification was, however, too low.
Maitland West. (Infants.)	12 and 13 Nov.	10	67	77	1. The room was on the same floor with the girls', and divided from it by a partition; it was tolerably well provided with furniture and apparatus. 2. Talking was prevalent among the pupils, and order was not an acquired habit. The moral aspect of the school was moderate. 3. The subjects were for the most part suitable, and the methods intelligent and earnest, but wanting simplicity in their application. 4. The proficiency and mental culture were moderate, but partial.
Morpeth	10 and 11 Dec.	58	62	120	1. The premises are fairly suitable, well kept, and in good repair, but the furniture is insufficient, and the organization unsatisfactory. 2. With the exception of a habit of whispering and prompting, the moral aspect of the school was tolerable. 3. The subjects were suitable and well arranged; the methods were rather suggestive, but tolerably intelligent and skilful. 4. The general proficiency was small.

WESLEYAN SCHOOL. Maitland West.....	20 & 21 Nov.	27	31	58	4. The pupils were able to read and write a little, but were otherwise extremely ignorant. 1. The playground is very small and the out-offices are badly situated, otherwise the condition of the premises is fair. 2. The pupils were clean, well-behaved, and, in general, orderly and attentive. 3. With the exception of drawing, the prescribed subjects were taught, and tolerably well arranged. The methods were, to a partial extent, tolerably intelligent and skilful. 4. The proficiency and mental culture ranges from moderate to tolerable.

NEWCASTLE DISTRICT.—INSPECTOR'S GENERAL REPORT.

Inspector of Schools, Newcastle District, to The Secretary, Council of Education.

Newcastle, 31 December, 1867.

Sir,

I have the honour to submit, for the information of the Council of Education, my Report, for the Year ended 31st December, 1867, on the Public and Certified Denominational Schools in the Newcastle District.

2. My appointment as Inspector of Schools dates from the 1st April last. During the months of April and May my work was chiefly of a special character; the following six months were devoted to the general inspection and examination of schools, the business of special inquiries, and subsequently to the general inspection of certain schools in the Cumberland District. December has been occupied in official correspondence, and the compilation of this General Report.

The following is a detailed summary of these duties, and the time occupied therein:—

Inspection of schools, travelling to schools, examining pupil teachers	130
Writing reports upon schools, diary reports, special reports upon cases referred, general correspondence, transmitting records to the several schools, writing general report, and examining the quarterly returns of schools	86
Attending Conference of Inspectors	9
Off duty (public holidays, and removing family from Sydney to Newcastle)	5
Detention by floods	6
Sundays.....	39
Total days.....	275

3. The Newcastle District includes that portion of the Hunter River District, extending from Newcastle as far as Miller's Forest and Raymond Terrace, The Williams, Karuah, Myall, and Manning Rivers, and Lake Macquarie.

The schools in operation are:—

Public schools	46
Provisional schools	1
Denominational schools:—	
Church of England	9
Roman Catholic	4
Presbyterian.....	2
	<u>62</u>

Twenty-five of these schools are in the Hunter River District, 14 on the Williams River, 16 on the Manning River, 5 on the Karuah and Myall, 1 at Barrington near Gloucester, and 1 at Coorumbong.

The whole of the schools in the district have undergone the general inspection and examination; and in addition, twelve schools have been incidentally inspected *twice*, and thirty four schools *once*.

In two schools the examination extended over two days, but in others, from five to seven hours were found to be sufficient for the purpose.

The time spent in the incidental inspections, varied from one to three hours.

The number of miles travelled in visiting these schools and others in the Cumberland District was 2,289.

IV.—ORGANIZATION.

School Buildings.—Nearly one-fifth of the schoolhouses in this District are built of brick or stone; the remainder are of wood. Owing to the perishable nature of the material, and perhaps through lack of proper local oversight, about one-third of these latter structures are in great need of repair.

Teachers' Residence.—With one exception (Newcastle Presbyterian) all the Denominational schoolhouses have masters' dwellings, and, excepting Dungog (C. E.) these residences are adjacent to the schoolhouses. As regards the Public Schools quite one-third are without teachers' residences. One of these is a Vested School (Dungog), the remainder being Non-vested. Apart from the annual expense in form of allowance for rent, the want of a proper residence for the teacher is a serious evil. Frequently the residences obtained are so remote from the schoolhouses, that unless the teachers leave their homes at an unduly early hour, there is little opportunity of controlling and disciplining the children as they gather for school. My experience testifies to the fact that much mischief of a moral and physical nature occurs in those schools over which the teachers are unable to exercise *early* supervision.

Playgrounds

Playgrounds and Out-offices.—Under this head, I have to report unfavourably. More than one-half of the schools in the district have no playgrounds, or only such as are practically useless. The want is about equally shared in proportion to numbers, by the Public and Denominational Schools. The non-provision of suitable out-offices is, however, a more serious defect. Sixteen (16) Public and two (2) Denominational Schools have no closets attached, and in fourteen (14) other instances, nine (9) of them being Public Schools, either but one has been provided, or, if two, no attempt has been made to give privacy to the sexes. How the managers and promoters of these schools imagine that the teachers can train the children to habits of decency, I am at a loss to perceive. It needs, however, little penetration to conclude that children, who grow up with a lack of proper training in this respect, will not be very remarkable for decency or morality in after life.

School Furniture and Working Appliances.—As a whole, the schools may be reported as being tolerably supplied with suitable furniture, apparatus, books, maps, &c., although the Public Schools have the advantage.

I subjoin a tabulated Return of the material condition of the Public Schools.

PUBLIC SCHOOLS.

	Good in supply or condition.	Fair and moderate.	Bad or not provided.
<i>a.</i>			
Schoolhouse	26	14	7
Teacher's residence	13	15	19
Playground	24	...	23
Out-offices	18	4	25

	Good in supply or condition.	Fair and moderate.	Bad or not provided.
<i>a.</i>			
Schoolhouse	6	7	3
Teacher's residence	6	7	3
Playground	9	...	7
Out-offices	5	4	7
<i>b.</i>			
Furniture and apparatus	4	4	8
Books, maps, &c.	4	6	6

Classification of Pupils.—As this is the basis of systematic education, its absence or defectiveness defeats either discipline or instruction, and perhaps both. It is, therefore, natural that considerable attention should have been paid to this branch of school polity by the Council, and that an Inspector's first duty should be to judge of schools by their perfection in this respect. Defective classification is a fertile topic with H.M. Inspectors of Schools in England. One of them, for example, writes: "I had occasion to remark in many cases what seems to me the very faulty organization of schools. They are unnecessarily divided into minute but ill-defined classes, requiring many more teachers than the school-staff is able to supply. Some of the upper lads are therefore, often against their will, drafted off from the first class, and appointed to teach to other children subjects of which they know little, and in which they take little interest. I have, for instance, found a school of 45 boys arranged in 7 classes; another of 112 boys and girls, in 13 classes; again, 40 boys in 5, and 82 girls in 8 classes. Altogether, in 18 of these schools, containing 1,018 children there are 114 classes, for the instruction of which there are 18 masters or mistresses, and 7 pupil teachers, *i.e.*, there are $4\frac{1}{2}$ classes for every teacher competent or incompetent. It is needless to say that where this is the case, either the discipline of the school or its progress must suffer, and not unfrequently both. I may add, that some of these schools are amongst the worst in my district."

This kind of experience is not unfamiliar to School Inspectors in this Colony. In this district, some short time since, a school, having an attendance of about 70 pupils, was divided into 7 classes; another in which the attendance was about 28, into 4 classes; and a third, of about 50 pupils, into 7 classes. I need scarcely add that little children, termed monitors, had to be freely used as teachers in these schools. The masters evidently imagined that their schools were organized after the English model, whereas they were but reproducing the exploded abuses of the monitorial system. In schools that have been subjected for some time to inspection, little improvement in this branch of school organization may have been needed, but in schools that have not been previously so influenced, reform was imperative, and the introduction of a general system of school organization would naturally have caused embarrassment to both teacher and inspector, had not the Council's Regulations made the technicalities of school work so unmistakably plain. To the decisive tone of these Regulations I attribute the improvements that have taken place in schools that were previously defectively conducted. I would not, however, be understood to imply that technical classification was not carried out heretofore. In no school, I presume, were scholars received without being subjected to a preliminary ordeal and a necessary classification; but, assuming that this normal test was correctly applied, what I wish to indicate is, the faulty way in which the mental powers of the children have been cultivated after taking the first step in classification. A cursory inspection will enable a visitor to see that the majority of the children who attend our elementary schools is in the lower classes. The early removal of children from school to work will partly account for this, but I am inclined to think that an unskilful distribution of time and power on the part of teachers, has increased the evil. An ordinary school generally consists of three classes, and the teacher is expected to devote his time proportionately to them; but, unfortunately for the younger children, close attention is not paid to this principle. I visited a school some short time since, and saw by the time-table that the children of the lowest class (little ones below seven years of age) were expected to look over their reading lessons from 9 till 10.40, and again in the afternoon for another half-hour. I scarcely believed it to be a correct statement, and really hoped that, in this instance, the *practice* would not accord with the *plan*. I was mistaken, and daily were these little ones subjected to a mental and physical cruelty that extended over two-fifths of the school time. The school consisted of less than thirty children.

In

In another school (Public) of about forty pupils, the time-table provided that the lowest class (children mostly below six years of age) should write on slates 13½ hours out of the weekly 25. Generally, it may be said that the little ones get but a very small modicum of suitable instruction from the teacher; so that, even after making a fair allowance for the effects of irregular attendance, it need not be a matter of surprise that the junior classes should remain *bulky* and *dull*.

The quarterly returns for December shew that the children on the rolls, in Public and Certified Denominational Schools of this District, were as follow:—

Public Schools	3,181
Denominational Schools	1,334
	4,515

My reports upon schools also shew that 2,737 children were present at the examinations, and were arranged in classes as follow:—

	Classes.				Totals.
	1st.	2nd.	3rd.	4th.	
47 Public Schools.....	862	592	431	33	1,918
16 Denominational Schools.....	361	241	203	14	819
	1,223	833	634	47	2,737

These attendances are somewhat less than the usual averages; but, owing to the effects of floods and sickness, many of the schools were examined at unfavourable times. The ordinary average attendance at the schools is about two-thirds of the numbers on the rolls. Of the children attending school in this District, three-fourths are in the two lower classes, and about two-thirds leave school before they are ten years old, and before their education has been sufficient to fit them for the upper classes, *i. e.*, they are only able to read very easy narratives, to write a little, and to stumble through the four simple rules of arithmetic.

I feel sure that the grave importance of this phase of school experience has challenged the anxieties of teachers, and that the several causes have passed under review; but, after all, is it not to be feared that the evil is greatly aggravated by misapplied power? Many of the teachers lack the skill of *equal manipulation*, and do what, under the circumstances, appears to them to be the best, *i. e.*, *work on the upper classes*, and leave the junior classes, and all their difficulties, to the future. I venture to predict that, if they would somewhat reverse the plan, and give more time to the lower, and less to the upper classes, school classification would soon wear a more satisfactory aspect.

V.—DISCIPLINE.

The discipline prevailing in a large number of schools of this district is of a very moderate character. Fair attention has been paid to what is termed school drill, but in numerous instances little good has been effected, whilst in others the discipline has been absurdly managed. In one school a very elaborate sort of drill was gone through on the schoolground, and the marching was perfect until the children crossed the threshold of the schoolroom, then laxity began to shew itself, and from the beginning to the end of the school hours talking and lounging were everywhere evident. In another school the children were in the morning systematically examined on the "lines," and marched into school in an orderly manner, but at the afternoon assembly the signal for "school" was no sooner given than the children pressed into the room pell-mell. It is true that these are exceptional cases, yet in many of the schools not only are some of the important externals of discipline neglected, but the watchful eye to detect, and the skilful hand to stay the beginnings of disorder are wanting. Few of the teachers are very sensitive to noise, and most of them appear to believe that it betokens industry, and they are surprised if an Inspector designates the discipline as faulty, or hints that the industry is not of the right sort.

There is also what appears to me an important feature of discipline, or, to say the least, of good manners, neglected in the majority of the schools—the according due respect to a stranger upon his entering the schoolroom.

I have subjoined a tabular estimate of the discipline which prevailed in the schools at the times of inspection.

	Good.	Fair.	Moderate.	Bad.
Public Schools	18	12	12	5
Denominational Schools	1	4	6	5

VI.—INSTRUCTION.

The special work of the year has prevented what is termed Ordinary Inspection, a visitation which enables an Inspector to see a day's work of an ordinary kind, and without which he cannot closely criticise the methods of instruction adopted. I have, it is true, seen some of the schools twice, and others three times, still I think it is undesirable that I should say much about the methods used, excepting as deduced from the results of the examinations. In general terms the character of the instruction is tolerably satisfactory. In many schools a highly intelligent spirit pervades the teaching, but of an equal number, it may be said that the instruction is dull and monotonous.

Reading.—Although one of the staple items of school instruction, and perhaps the most important aid to the mental future of the children, this subject is by no means satisfactorily taught in our schools. If mechanical correctness be acquired by the pupil, the teacher too frequently accepts it as all that is sufficient and desirable. Through the prevailing mode, a boy may acquire the means of informing his own mind, but will certainly, by such reading, be unable to contribute to the information or pleasure of others. The fact is, *teaching* to read is supplanted by "hearing to read." Passage after passage is read, and the monotony of the pupils' voices is only relieved when a stumble occurs, and the teacher gives the pronunciation, or upon a child's arrival at a "period" the teacher desires the "next" to read. I have frequently, when examining an upper class, abandoned the book and listened to the reading, but in very few schools have I detected talent likely to inform a listener, or prove that the children have been put on the right road to acquire an intelligent style of reading.

Writing.—

Writing.—The writing in the majority of the schools is satisfactory as far as the copybooks are concerned, but the practical defects are sufficient to create the conviction that the art is seldom *taught* by the teacher but acquired by the imitation of “head lines”, and that, when acquired, it is kept distinct from the ordinary work of the school. The copybooks pass creditable muster, but “home lessons” and general school exercises are too frequently permitted to be done in a style little better than a scrawl.

Dictation.—This subject is not so successfully taught as one could wish. The children are not only insufficiently taught to analyze words, and to observe the differing structures of words of similar sound, but the style in which the exercises are too frequently written, is, as has been previously hinted, of such a slipshod character, that an examiner would be quite justified in suspecting that such writing was an artifice to hide ignorance. A difficult word occurs, and an indistinct scrawl stands as its representative.

Arithmetic.—The results of the examinations shew that in this subject many schools pass but indifferently, whilst others are positively bad. This is partly to be attributed to defective classification, and partly to a want of intelligent teaching. In some schools the practice hitherto has implied that the ordinary classification is unsuitable for arithmetic, and the teachers have failed to perceive that it is possible to construct classes that will exhibit something like equality of attainments in reading and arithmetic. The notion is, that to attempt such a thing is to risk the progress of *proficient* pupils; but those who entertain this idea, fail to see that the neglect of systematic classification is a sure hindrance to the progress of the *majority* of the pupils. The real cause of this anomaly in school management does not however arise so much from a desire to benefit the forward pupils as from an inability to cope with the difficulty. Arithmetic is not *taught* in such schools. The children are seated in the desks and allowed to work “sums” from books (generally those that have the answers), and to scramble on as best they can, receiving, at most, occasional suggestions and promptings from the master. The precocious children soon work through the “tutor” and are looked upon by the master as a credit to his *teaching*, and further, he flatters himself that they will be received as fair representatives of the whole school. My experience of these *forward* children is not very flattering. I generally found that, when tested in the elementary rules, or with questions worded in a practical but unbookish way, they were no better than the less advanced members of the class.

Grammar.—This is a subject in which the Public Schools of the district give very fair results, but in the Denominational Schools it has scarcely been attempted as a definite study.

Geography is certainly not a strong point in many of the schools, and in some the results are wretchedly feeble. The majority of the schools are fairly, and some even profusely, furnished with maps; but I have sometimes been at a loss to perceive that they have been put to any other use than ornamentation. Creditable results in “physical geography” were shewn by several schools, but the pupils were seldom able to point out, with accuracy, or give intelligible description of, the positions of important places, or say how the capabilities of one country affect the interests of others. The tendency to *race* the subject and give the pupils a general idea of all the divisions of the world, is the main cause of this lameness, and the result is, that the pupils have a disconnected and smattering knowledge of the science. The standard of proficiency will, however, check a perpetuation of the evil, and until a school has pupils that are sufficiently advanced to constitute a fourth class, the teacher will be expected to confine the geographical studies of the pupils to Australia, Tasmania, New Zealand, and Europe.

Object Lessons.—Few of the teachers are proficient in this kind of teaching. It is a formidable subject to them—a something they suppose they *must* teach—because the Regulations say so; but of the true character of such lessons they have little conception. It does not occur to them that the main intention of defining the subject was to ensure a full explanation of things incidentally brought out in other lessons, so that by these and similar materials the creation of thought and mental activity in the children may be effected. One of the most useful text books of “object lessons” is intitled “Lake’s Object Lessons,” and it is remarkable how slavishly the majority of teachers follow it, both as regards *subject* and *text*. Quarter after quarter the same subjects appear on the “programmes,” whilst “common things,” that are not mentioned by “Lake,” but are realities to the children, and about which they might well be instructed, remain unnoticed. In short, no branch of elementary teaching is used so ineffectively as that termed “Object Lessons.”

Drawing and Vocal Music.—These subjects have not received much attention in the schools of this district. Drawing forms part of the school work in nine Public and two Denominational Schools. Singing, upon the “Tonic Sol Fa Method,” in eight Public Schools, and upon Hullah’s Method in two Denominational Schools.

I annex a table, shewing the relative proficiency of the schools in all the subjects upon which I have treated.

PUBLIC SCHOOLS.

	Good.	Fair.	Moderate.	Bad, or failure.
Reading	4	15	19	8
Writing	14	22	9	1

VII.—LOCAL SUPERVISION.

The local supervision of the Public Schools of this District is generally of a very nominal character. In most instances the teachers are favourably reported by School Boards, but it is to be regretted that the interest in the welfare of the schools is of a negative character. At nineteen Public Schools none of the members of the Boards were present at the examinations. As regards the Denominational School Boards the lay members are nominally such, as a rule, and the work of supervision generally devolves upon the clergy. With one or two exceptions, the Denominational School Boards were represented at the inspections. I cannot forbear adding that in *all* instances I have been received most courteously by the School Boards, and, excepting in two instances, by the teachers also.

8. Summaries of my detailed reports are appended.

I have, &c.,

J. W. ALLPASS,

Inspector of Schools, Newcastle District.

ANNEX A.

NEWCASTLE DISTRICT.—TABULATED REPORTS FOR 1867.

PUBLIC SCHOOLS.

BANDON GROVE (Vested) :—Visited, 5th September.

Pupils enrolled :—Boys, 15 ; girls, 19 ; total, 34.

Pupils present :—Boys, 15 ; girls, 17 ; total, 32.

Excepting that the out-offices are unsuitable and much in need of repair, the school premises are substantially good. The school is well furnished, and has a good supply of working material. The discipline is good, and the instruction satisfactorily effective. The local supervision is tolerable ; two of the School Board were present at the examination.

BARRINGTON (Non-vested) :—Visited, 9th September.

Pupils enrolled :—Boys, 21 ; girls, 13 ; total, 34.

Pupils present :—Boys, 16 ; girls, 12 ; total, 32.

The schoolhouse, a wooden structure, is in fair condition, and tolerably furnished, and supplied with working material. The playground is not enclosed, nor are there any closets. The methods of instruction exhibit no great amount of skill, but in mechanical work the results are reasonably satisfactory. Local supervision is systematically conducted. All the members of the Board were present at the examination.

BENDOLBA (Vested) :—Visited, 24th June.

Pupils enrolled :—Boys, 18 ; girls, 16 ; total, 34.

Pupils present :—Boys, 13 ; girls, 9 ; total, 22.

The school premises, which are of wood, are much out of condition, and no out-offices have been provided. There is a fair supply of school furniture and apparatus, but the books are in poor condition. The organization, discipline, and methods of instruction, are satisfactorily effective, and the tone of the school is good. The local supervision is but nominal, and no members of the School Board were present at the examination.

BO BO CREEK (Non-vested) :—Visited, 11th September.

Pupils enrolled :—Boys, 15 ; girls, 10 ; total, 25.

Pupils present :—Boys, 9 ; girls, 5 ; total, 14.

The site of this school is pleasant, but not sufficiently central. The schoolroom is fairly furnished, and supplied with working material. There is a piece of land called the playground, but, being open to an adjoining farm, it is nothing better than a cow-yard in a filthy state. There are no closets. The discipline is of a negative character ; the methods of instruction are worthless, and the results correspond. The tone of the school is very unsatisfactory. The local supervision is only moderate. Most of the members of the Board were present at the examination.

BOOLAMBAYTE (Non-vested) :—Visited, 11th June.

Pupils enrolled :—Boys, 15 ; girls, 13 ; total, 28.

Pupils present :—Boys, 14 ; girls, 12 ; total, 26.

The schoolhouse is pleasantly situated, and is in good condition, but the furniture and apparatus are bad and insufficient. There are no closets, nor is the schoolground enclosed. The classification is defective, and the discipline is of a very moderate character. Judging the methods of instruction by the results, they are of little value. The reading is wretched. The school has been in operation rather more than twelve months ; previous to its establishment the children were in a very ignorant and neglected state, and in estimating the value of the education imparted, some allowances must be made for the shortcomings ; still, considering that through the influence of the proprietor of the settlement, Mr. D. M'Crae, regular attendance at school is almost compulsory, the teacher ought to have produced higher results. The school is well supervised by Mr. M'Crae.

BOORAL (Non-vested) :—Visited, 6th June.

Pupils enrolled :—Boys, 17 ; girls, 15 ; total, 32.

Pupils present :—Boys, 15 ; girls, 15 ; total, 30.

The schoolhouse is a wooden structure in excellent condition, well furnished, and supplied with working requisites. The playground is properly fenced, and suitable out-offices have been provided. The methods of instruction are good ; the teaching is intelligent and energetic, and the results are satisfactory. Local supervision is but moderately exercised.

BROOKFIELD

BROOKFIELD (Vested) :—Visited, 26th June.

Pupils enrolled :—Boys, 26 ; girls, 30 ; total, 56.

Pupils present :—Boys, 13 ; girls, 20 ; total, 33.

The site of the school buildings is an unpleasant one, being low and swampy ; but it is said to be healthy. The schoolroom is in fair condition, and the internal and external appointments are suitable and sufficient. The organization is satisfactory, but the discipline lacks decision. The instruction has been careful, and has produced satisfactory results. Local supervision is only nominal, nor were any of the School Board present at the examination.

CLARENCE TOWN (Vested) :—Visited, 27th June.

Pupils enrolled :—Boys, 48 ; girls, 41 ; total, 89.

Pupils present :—Boys, 34 ; girls, 30 ; total, 64.

The schoolhouse is a brick building in excellent condition, and, excepting that the closets are badly arranged, the material condition of the establishment is very satisfactory. The organization is correct, the discipline is excellent, and the results of the teaching are very satisfactory. The reading is very good. A healthy spirit pervades all the classes. One member of the School Board was present at the examination.

COORUMBUNG (Non-vested) :—Visited, 1st November.

Pupils enrolled :—Boys, 19 ; girls, 12 ; total, 31.

Pupils present :—Boys, 18 ; girls, 11 ; total, 29.

The schoolhouse is in good condition, and is tolerably furnished and supplied with working appliances. Although there are five (5) acres of ground attached to the school, no portion of it is enclosed, nor have out-offices been provided. The school organization is satisfactory, the discipline is effective, and the results of the teaching are moderately satisfactory. Local supervision is not exercised.

CROKI (Vested) :—Visited, 20th September.

Pupils enrolled :—Boys, 27 ; girls, 29 ; total, 56.

Pupils present :—Boys, 23 ; girls, 28 ; total, 51.

The schoolhouse is pleasantly situated, and is substantially in good condition, although needing some repairs. The schoolground is properly fenced, and the necessary out-offices have been provided. The furniture and school apparatus are in a satisfactory state. The organization is correct, but the discipline is wanting in firmness and precision. The methods of teaching are satisfactory, and the results are moderate. Local supervision is but nominal. All the members of the School Board were present at the examination.

CROOM PARK (Vested) :—Visited, 17th June.

Pupils enrolled :—Boys, 17 ; girls, 23 ; total, 40.

Pupils present :—Boys, 11 ; girls, 15 ; total, 26.

The school building is in good condition. Suitable out-offices have been provided, and the schoolground, at present unenclosed, will shortly be securely fenced. The furniture and working material are good in condition, and moderate in supply. The organization and discipline are judicious and effective ; the methods of instruction appear to be inductive, and the results are satisfactory. Local supervision is but nominal. One member of the Public School Board was present at the examination.

CUNDLETOWN (Vested) :—Visited, 18th September.

Pupils enrolled :—Boys, 33 ; girls, 23 ; total, 56.

Pupils present :—Boys, 27 ; girls, 19 ; total, 46.

The schoolhouse is pleasantly situated, but, like many of the wooden structures in the district, is greatly in need of repair. The furniture is of a wretched kind, the apparatus is insufficient, and the maps are old and nearly useless. The organization is correct, but the discipline is wanting in firmness. The results of the examination are satisfactory, and the tone of the school is pleasing. Local supervision is a nominal affair. The members of the School Board were present at the examination.

DINGO CREEK (Non-vested) :—Visited, 26th September.

Pupils enrolled :—Boys, 17 ; girls, 16 ; total, 33.

Pupils present :—Boys, 15 ; girls, 15 ; total, 30.

The schoolhouse is a neat and substantial building, well furnished, and supplied with working materials ; but the teacher's dwelling is a wretched hovel. The schoolgrounds are unfenced, and no out-offices of any kind have been provided. The details of organization are satisfactory, but the discipline is bad. Although the teaching betokens considerable labour, the methods are unskilful and ineffective. Local supervision is but nominal. Two of the School Board were present at the examination.

DUNGOG (Vested) :—Visited, 18th June.

Pupils enrolled :—Boys, 36 ; girls, 36 ; total, 72.

Pupils present :—Boys, 23 ; girls, 22 ; total, 45.

The schoolhouse is a brick structure, in good condition, and fairly supplied with furniture and apparatus. The organization is judicious, but the discipline is capable of improvement. The teaching has, on the whole, been efficient, and the results are fair. The local supervision is said to be tolerably effective ; but none of the Board were present at the examination.

DUMARESQ ISLAND (Vested) :—Visited, 2nd October.

Pupils enrolled :—Boys, 18 ; girls, 21 ; total, 39.

Pupils present :—Boys, 15 ; girls, 19 ; total, 34.

The schoolhouse is a neat structure, and is well furnished and supplied with working appliances. The playground is properly fenced, and the closets are suitably placed, but they are in need of repair. The school is well organized, the discipline and the methods of instruction are good, and a healthy tone pervades the several classes. The local supervision is but nominal. Two members of the Board were present at the examination.

EAGLETON (Vested) :—Visited, 15th November.

Pupils enrolled :—Boys, 22 ; girls, 27 ; total, 49.

Pupils present :—Boys, 21 ; girls, 26 ; total, 47.

Excepting that the out-offices are very injudiciously placed, the material state of this school is excellent. The organization and discipline are effective, and the teaching produces good results. Local supervision is very infrequent ; three members of the School Board were present at the examination.

GHINNI GHINNI (Non-vested) :—Visited, 19th September.

Pupils enrolled :—Boys, 26 ; girls, 27 ; total, 53.

Pupils present :—Boys, 26 ; girls, 27 ; total, 53.

The schoolhouse, a wooden structure, is small and very unsuitable. The supply of furniture and working materials is insufficient and inferior. There is no playground, and as regards out-offices, there is one closet in a wretched state. The organization and discipline are effective, the teaching is painstaking, and the results are satisfactory.

GLENWILLIAM (Vested) :—Visited, 2nd September.

Pupils enrolled :—Boys, 19 ; girls, 19 ; total, 38.

Pupils present :—Boys, 14 ; girls, 17 ; total, 31.

The schoolhouse, which is substantially good, is in need of repair. The furniture and school appliances are sufficient and suitable, but the ground is unfenced, and only one out-office has been provided. The organization, discipline, and instruction are fairly effective. The local supervision is said to be satisfactory, but no member of the Board was present at the examination.

HANBURY (Non-vested) :—Visited, 17th July.

Pupils enrolled :—Boys, 49 ; girls, 40 ; total, 89.

Pupils present :—Boys, 48 ; girls, 37 ; total, 85.

The present schoolhouse is too small ; but suitable and commodious premises are in course of erection. There is a fair supply of furniture and school appliances, but no playground is attached to the present building ; neither are there any closets. The organization is satisfactory, but the discipline is lax. The children whisper and lounge incessantly. The methods of instruction are fair, and the results are moderate, but I am inclined to think that increased energy would have effected higher results. Considerable allowance should, however, be made for the migratory character of a large portion of the population which seriously affects the progress of the children. I believe that the members of the School Board are systematic in the discharge of their official duties, but none of them were present at the examination.

HEXHAM (Non-vested) :—Visited, 28th October.

Pupils enrolled :—Boys, 21 ; girls, 12 ; total, 33.

Pupils present :—Boys, 21 ; girls, 12 ; total, 33.

The schoolhouse is a wooden building, in good condition ; but the schoolground (2 acres) is unfenced, and situated, as it is, close to the main road, the children are exposed to danger from the droves of cattle that are continually passing. The school is fairly furnished, but there is but one closet. The organization and classification are somewhat unsatisfactory ; the discipline is tolerable ; the teaching may be painstaking, but it is unskilful, and the results are but moderate. The mental cast of the pupils is unsatisfactory ; they exhibit little perseverance. There is no evidence of local supervision, nor were any of the School Board present at the examination.

LAMBTON (Vested) :—Visited, 12th and 13th August.

Pupils enrolled :—Boys, 143 ; girls, 115 ; total, 258.

Pupils present :—Boys, 116 ; girls, 86 ; total, 202.

This schoolhouse is an excellent structure, and is complete in all the requirements for school work ; but I question whether a much worse site could have been found. In every direction there are elevated tracts of land, but the spot chosen for the schoolhouse is low, and, in wet weather, must be nearly unapproachable. The organization and discipline are excellent, and the instruction is suitable and effective. A healthy local supervision is exercised, but no member of the School Board was present at the examination.

MINMI (Non-vested) :—Visited, 1st August.

Pupils enrolled :—Boys, 54 ; girls, 28 ; total, 82.

Pupils present :—Boys, 47 ; girls, 18 ; total, 65.

The schoolhouse is a brick building, in excellent condition, but is not sufficiently commodious. The furniture and school appliances are sufficient and good. The organization is correct, the discipline effective, and the teaching produces satisfactory results. Local supervision is unknown, nor were any members of the Board present at the examination.

MOSQUITO ISLAND (Non-vested) :—Visited, 3rd August.

Pupils enrolled :—Boys, 18 ; girls, 21 ; total, 39.

Pupils present :—Boys, 18 ; girls, 17 ; total, 35.

The school premises are small, and much out of condition. The playground is but partly enclosed, and but one closet has been provided. The school is suitably furnished, and supplied with working materials. The organization is satisfactory ; the discipline is excellent ; the instruction is methodically regulated and carefully imparted, and the results are very good. The teacher's heart is in his work, and the tone of the school is very satisfactory. Local visitation is rare, but all the members of the School Board were present at the examination.

MONKERAI (Non-vested) :—Visited, 14th June.

Pupils enrolled :—Boys, 7 ; girls, 10 ; total, 17.

Pupils present :—Boys, 6 ; girls, 9 ; total, 15.

The schoolhouse is a slab building, roofed with bark. It is low-pitched, but in other respects suitable. The school furniture and appliances are in tolerable condition, and moderate in supply. The organization is not skilful. The discipline is very lax ; but I think that this is attributable to the extreme deafness of the teacher. From the cause just stated, the instruction has been very unsuitable, and the results are very feeble. The teacher retires from the work of teaching in a few days. Local supervision is nominal, nor were any members of the Board present at the examination.

NEWCASTLE (Vested) :—Visited, 20th, 21st, and 22nd August.

Pupils enrolled :—Boys, 142 ; girls, 85 ; total, 227.
Pupils present :—Boys, 118 ; girls, 67 ; total, 185.

The school buildings are in good condition, but too small for the requirements ; and it is to be regretted that greater space has not been allotted to the playground. The premises are properly fenced, but the out-offices are insufficient and defective. The schoolroom is excellently furnished, and supplied with requisite appliances. The organization and discipline are very good ; the instruction is regulated by modern and efficient methods, and the results are excellent. The school is in a very healthy state. Local supervision is but rarely exercised, nor were any members of the Public School Board present at the examination.

OXLEY ISLAND (Non-vested) :—Visited, 3rd October.

Pupils enrolled :—Boys, 22 ; girls, 29 ; total, 51.
Pupils present :—Boys, 22 ; girls, 29 ; total, 51.

The schoolroom is a wooden building, suitable, and in fair condition, and tolerably furnished ; but the ground is unenclosed, and there are no closets. The school is but moderately organized and disciplined, the teaching is unskilful, and the results are just passable. Local supervision is nominal. Two members of the School Board were present at the examination.

PARADING GROUND (Vested) :—Visited, 3rd June.

Pupils enrolled :—Boys, 23 ; girls, 19 ; total, 45.
Pupils present :—Boys, 19 ; girls, 14 ; total, 41.

This schoolhouse is a suitable building, but at present in need of repair. It is fairly furnished, and supplied with working material. The organization is unskilful, there being too many classes. The discipline is tolerable, and the results of the teaching are moderate, excepting in the younger class, which is very backward, and cannot have received fair attention. Local supervision is nominal, but three members of the Board were present at the examination.

PARKHAUGH (Non-vested) :—Visited, 13th September.

Pupils enrolled :—Boys, 26 ; girls, 19 ; total, 45.
Pupils present :—Boys, 24 ; girls, 17 ; total, 41.

The building used at present as the schoolroom is small, and in every respect unsuitable ; but a good schoolhouse is in course of erection. The ground is unfenced, and no closets have been provided. The organization is tolerable, the discipline is judicious, and the methods of instruction are suitable and fairly effective. Local supervision is rarely exercised, but all the members of the Board were present at the examination.

PELICAN POINT (Non-vested) :—Visited, 4th October.

Pupils enrolled :—Boys, 9 ; girls, 5 ; total, 14.
Pupils present :—Boys, 9 ; girls, 5 ; total, 14.

The schoolhouse is a neat and substantial wooden structure, and it is well furnished and supplied with suitable appliances. The organization is injudicious, the discipline is moderate, the teaching is unskilful and unsatisfactory. Local supervision is fairly exercised, and two members of the Board were present at the examination.

PITT TOWN (Non-vested) :—Visited, 2nd August.

Pupils enrolled :—Boys, 66 ; girls, 56 ; total, 122.
Pupils present :—Boys, 50 ; girls, 34 ; total, 84.

The schoolhouse is very unsuitable and much out of condition, being extensively damaged by the white ant. Good out-offices have been provided, but the school-ground is unfenced. The organization is good, the discipline is effective, the methods of instruction systematic, and the results are from fair to good. The tone of the school is pleasing. The School Board has not been gazetted.

PLATTSBURG (Non-vested) :—Visited, 30th July.

Pupils enrolled :—Boys, 81 ; girls, 45 ; total, 126.
Pupils present :—Boys, 31 ; girls, 23 ; total, 54.

The schoolroom is in good condition, well furnished, and supplied with working appliances ; but it is too small. There is no school-ground, nor have closets been provided. The organization is satisfactory, but the discipline is wanting in firmness. The instruction is fairly regulated, and the results are moderate. Local supervision is but nominal. One member of the Public School Board was present during a portion of the examination.

PURFLEET (Vested) :—Visited, 30th September.

Pupils enrolled :—Boys, 9 ; girls, 11 ; total, 20.
Pupils present :—Boys, 9 ; girls, 11 ; total, 20.

The schoolhouse is built of wood, and is in tolerable condition, but it is precariously close to the river (Manning). The play-ground is small, portions thereof having been washed away by successive floods. The furniture is fair in condition and supply, but the apparatus and books are very insufficient. The organization and discipline are fair, and the teaching is tolerably effective. Local supervision is moderately effective, and three members of the Board were present at the examination.

RAYMOND TERRACE (Non-vested) :—Visited, 6th November.

Pupils enrolled :—Boys, 36 ; girls, 24 ; total, 60.
Pupils present :—Boys, 27 ; girls, 20 ; total, 47.

The schoolhouse is in good condition, but it is not sufficiently central, and the site is low and swampy. The playground is small, and, for the reason stated above, is frequently of no value. There are no closets. The furniture is sufficient, but very inferior. Apparatus insufficient ; but there is a good supply of books. The organization and discipline are tolerable ; the teaching is painstaking and moderately skilful, and the results are moderate. Local supervision is very infrequent, nor were any of the School Board present at the examination.

REDBANK (Vested) :—Visited, 1st October.

Pupils enrolled :—Boys, 27 ; girls, 17 ; total, 44.
Pupils present :—Boys, 27 ; girls, 17 ; total, 44.

The schoolhouse is tolerably suitable, but much in need of repair. The school-ground is fenced, and suitable closets have been provided. With the exception that the books are insufficient, and much worn, the furniture and working materials are sufficient and good. The organization is suitable, and the discipline is effective. The pupils are much below the "standard" in attainments, and they exhibit very little self-reliance or thought. The teacher has been but recently appointed, and is not responsible for the defects. Local supervision is moderately exercised. All the members of the School Board were present at the examination.

SEAHAM (Vested) :—Visited, 30th August.

Pupils enrolled :—Boys, 20 ; girls, 16 ; total, 36.
Pupils present :—Boys, 16 ; girls, 11 ; total, 27.

The schoolhouse is too small, and is much in need of repair. There is a fair supply of furniture and working appliances. The classification is satisfactory, but the time-table and the lesson programmes are defective ; the discipline is fair ; the teaching evidences painstaking, but it is by no means suitable for the younger children. The results of the examination were but moderate. Local supervision is but nominal. One member of the School Board was present at the examination for a short time.

STOCKTON (Non-vested) :—Visited, 26th September.

Pupils enrolled :—Boys, 15 ; girls, 10 ; total, 25.
Pupils present :—Boys, 10 ; girls, 7 ; total, 17.

The schoolroom is suitable and in fair condition. The school-ground is unenclosed and the closets require to be repaired. There is a fair supply of working appliances. The organization and discipline are effective, and the results of the teaching are moderate. The School Board had not been gazetted at the time of my visit.

TARREE (Vested) :—Visited, 16th September.

Pupils enrolled :—Boys, 48 ; girls, 39 ; total, 87.
Pupils present :—Boys, 37 ; girls, 31 ; total, 68.

The school-house is built of brick, is well situated and substantially good, but needs completion and repair. There is a well-fenced playground, and the space in the front of the school is laid out in flower borders. The school furniture is wretchedly insufficient, and there is none of the ordinary school apparatus. The organization is correct, but the discipline lacks decision ; the teaching is careful, but loses its force through want of energy in the teacher ; the results of the examination are tolerable. Many of the children are very indolent. The Local Board has but recently been appointed ; all the members were present at the examination.

TELEGHERRY (Non-vested) :—Visited, 13th June.

Pupils enrolled :—Boys, 46 ; girls, 20 ; total, 66.
Pupils present :—Boys, 38 ; girls, 17 ; total, 55.

The schoolhouse is in good condition, and properly supplied with furniture and apparatus ; but the books are insufficient. The organization and discipline are tolerably effective ; the methods of instruction careful ; and the results are fair. The tone of the school is pleasing ; local supervision is a rare event. No member of the Local Board was present at the examination.

TERALBA (Non-vested) :—Visited, 31st July.

Pupils enrolled :—Boys, 21 ; girls, 9 ; total 30.
Pupils present :—Boys, 18 ; girls, 8 ; total 26.

The school is taught in a small and low-pitched bark hut, which has an earthen floor lower than the surface of the ground outside the hut. The furniture consists of a small table and a few forms ; of apparatus, there is none. Books, good and sufficient. The land is but partly fenced, and no out-offices have been provided. The organization and discipline are correct and effective, and the teaching results are very satisfactory. The teacher is doing his duty faithfully, and it is to be regretted that he has to labour under such disadvantages. There does not appear to be any local supervision.

THALABA (Non-Vested) :—Visited, 3rd September.

Pupils enrolled :—Boys, 22 ; girls, 23 ; total, 45.
Pupils present :—Boys, 17 ; girls, 19 ; total, 36.

The schoolhouse, which is built of wood, is in fair condition, and is suitably furnished and supplied with working materials. The land is unenclosed, and the closets are badly situated, and are in an unfinished state. The organization and discipline are good and effective ; the methods of instruction are suitable, and the results are satisfactory. Local supervision is but nominal, and it appears that the notice of my visit miscarried, consequently no member of the Board was able to be present at the examination.

TINONEE (Vested) :—Visited, 12th September.

Pupils enrolled :—Boys, 29 ; girls, 23 ; total, 52.
Pupils present :—Boys, 25 ; girls, 22 ; total, 47.

The schoolhouse is in tolerable condition. There is a well-fenced playground, and suitable closets are about to be built. The furniture is insufficient in supply and inferior in kind. The apparatus is fair ; but the books and maps are insufficient. The organization is good ; the discipline firm and effective ; the instruction is intelligent and careful, and the results are very fair. The tone of the school is good. The local supervision is healthy ; and all the members of the School Board were present at the examination. This is one of the few schools, in this district, in which the School Boards do their work systematically.

TOMAGO (Vested) :—Visited, 30th October.

Pupils enrolled :—Boys, 14 ; girls, 16 ; total, 30.

Pupils present :—Boys, 12 ; girls, 16 ; total, 28.

Owing to the ravages of the white ant, the schoolhouse has to undergo immediate repair, and temporary premises have been taken, in which the school is carried on. There is a sufficient supply of furniture, but it is of a very inferior kind. The organization and discipline are moderate; the methods of instruction are intelligent, but insufficiently energetic; moderate progress has been made by the pupils. The local supervision is satisfactory. Mrs. Windeyer takes great interest in the school.

WALLESEND (Non-vested) :—Visited, 22nd July.

Pupils enrolled :—Boys, 58 ; girls, 49 ; total, 107.

Pupils present :—Boys, 49 ; girls, 39 ; total, 88.

The school is carried on in a slab hut which is low-pitched and much too small. There is no school ground, and although there is an apology for a closet, yet it is a wretched and disgraceful makeshift. The furniture and school appliances are good and sufficient; the discipline is firm and effective; the teaching is careful; and the results are from fair to excellent. Local supervision is occasionally exercised, but no member of the School Board was present at the examination.

WARATAH (Non-vested) :—Visited, 18th July.

Pupils enrolled :—Boys, 21 ; girls, 19 ; total, 40.

Pupils present :—Boys, 19 ; girls, 17 ; total, 36.

The schoolhouse is a wooden building, substantially good, but the roof requires repair, and the interior walls should be cleansed. The ground attached is too small to be of much service as a playground. The furniture is good, but the apparatus and books are insufficient. The organization is good; the discipline effective; the teaching is very careful, and the results are excellent. The tone of the school is very pleasing. Local supervision is moderate. None of the School Board were present at the examination.

WOOLLA WOOLLA (Non-vested) :—Visited 23rd September.

Pupils enrolled :—Boys, 19 ; girls, 21 ; total, 40.

Pupils present :—Boys, 16 ; girls, 19 ; total 35.

The schoolhouse is small and badly lighted, but in tolerable condition. The playground and closets are suitable, and the school furniture and appliances are sufficient and good. The school is properly organized; the discipline is judicious; the instruction is well regulated, and the results are fairly satisfactory. Local supervision is very occasional. Two members of the Board were present at the examination.

WINGHAM (Vested) :—Visited, 27th September.

Pupils enrolled :—Boys, 15 ; girls, 23 ; total 38.

Pupils present :—Boys, 12 ; girls, 22 ; total 34.

The schoolhouse is an excellent building, and as regards furniture, apparatus, and general working material, this school presents a pleasing completeness. The play-ground is properly enclosed, and suitable out offices have been provided. The organisation, discipline, and methods of instruction are excellent. This is a very pleasing school and testifies to the industry of the teacher. Local supervision is but nominal. One member of the Board was present at the examination.

PROVISIONAL SCHOOL.

UNDERBANK (Non-vested) :—Visited, 12th November.

Pupils enrolled :—Boys, 9 ; girls, 15 ; total, 24.

Pupils present :—Boys, 2 ; girl, 1 ; total, 3.

The school-house is a good wooden building, but the land is unfenced, and closets have not been provided. The furniture and school appliances are suitable. The organization appears to be well planned, but I am unable to give any opinion respecting the discipline or instruction. The small attendance of children is attributable to a heavy fall of rain in the morning of the day of visit. No member of the school Board was present at the examination.

DENOMINATIONAL SCHOOLS.

CHURCH OF ENGLAND.

DUNGOO :—Visited 17th June.

Pupils enrolled :—Boys, 44 ; girls, 51 ; total, 95.

Pupils present :—Boys, 32 ; girls, 40 ; total, 72.

The schoolhouse is built of brick and is in tolerable condition. The school-ground is unfenced and the closets are in a dilapidated state. The furniture is unsuitable and badly arranged, and the apparatus and books are insufficient. The organization is fair, but the discipline is lax. Many of the elder boys were very unruly. The results of the teaching are tolerable. Local supervision is satisfactorily carried out. The Rev. F. D. Bode and a lay member of the School Board were present at the examination.

HEXHAM :—Visited, 29th October.

Pupils enrolled :—Boys, 26 ; girls, 24 ; total, 50.

Pupils present :—Boys, 21 ; girls, 16 ; total, 37.

The schoolhouse is a wooden building tolerably suitable but in need of repair and cleansing. The furniture, apparatus, and books are very insufficient. The organization is defective, the children are too highly classified; the discipline is very lax; as regards the instruction the results are tolerable in reading and writing, but in other subjects valueless. The tone of the school is of a negative character, but it is due to the teacher that I state that the infrequent attendance not only sadly prevents the satisfactory progress of the pupils but interferes with their proper discipline. Scarcely one-half of the children have attended with any regularity for months past. The Rev. J. S. Wood was present at the examination.

MILLER'S FOREST :—Visited, 19th November.

Pupils enrolled :—Boys, 40 ; girls, 32 ; total, 72.
Pupils present :—Boys, 32 ; girls, 29 ; total, 61.

The schoolhouse, which is also used as a church, is in good condition, but the furniture is insufficient and unsuitable. There is no apparatus whatever, and as the Council's grant has not been received ; the books in use are of the series published by the Society for Promoting Christian Knowledge. The ground is unfenced, and but one closet has been provided. The children are fairly classified ; the discipline is judicious ; the teaching exhibits a considerable amount of painstaking ; and, considering the serious checks the floods and their after-effects have had upon the attendance, the results are reasonably satisfactory. The tone of the school is good. The Rev. S. Simm was present at the examination.

MYALL RIVER :—Visited, 10th June.

Pupils enrolled :—Boys, 13 ; girls, 12 ; total, 26.
Pupils present :—Boys, 8 ; girls, 7 ; total, 15.

The schoolhouse is much in need of repair, the land is unfenced, and but one closet has been provided. The furniture and apparatus are sufficient but very unsuitable. The books are also insufficient. The classification is bad ; the discipline is fair ; as regards the instruction, reading, writing, and arithmetic, are the only subjects that have been attempted, and they give very small results. Local supervision is unknown.

NEWCASTLE (Christ Church) :—Visited, 14th August.

Pupils enrolled :—Boys, 54 ; girls, 38 ; total, 92.
Pupils present :—Boys, 35 ; girls, 27 ; total, 62.

The schoolhouse is a commodious and substantial building, excellently furnished, and supplied with apparatus. The play-ground is very small, and practically useless as such, but the out offices are good and suitable. The pupils are satisfactorily classified ; the discipline is tolerable ; the teaching is methodical, but not sufficiently educative. The tone of the school is reasonably good. The Rev. J. Selwyn and a lay member of the School Board were present at the examination.

NEWCASTLE (St. John's) :—Visited, 15th August.

Pupils enrolled :—Boys, 58 ; girls, 43 ; total, 101.
Pupils present :—Boys, 48 ; girls, 32 ; total, 80.

The schoolhouse is commodious and in good condition ; it is well furnished and supplied with school appliances. The organization is fair, but the discipline is lax. As far as I can now judge, the instruction is not sufficiently educative, more especially that given to the junior classes. The results in the upper class were satisfactory. The Rev. G. C. Bode, and the lay members of the Board were present at the examination.

RAYMOND TERRACE :—Visited, 4th and 5th November.

Pupils enrolled :—Boys, 51 ; girls, 38 ; total, 89.
Pupils present :—Boys, 26 ; girls, 15 ; total, 41.

The schoolhouse is built of stone, and is in good condition. There is a small space in front of the school enclosed for play-ground. Suitable out-offices are in course of erection. The furniture and school appliances are good in supply and condition. The classification is satisfactory ; the discipline is mild, but tolerably effective, and the results of the examination are moderately satisfactory. The tone of school is pleasing. The Rev. S. Simm, Chairman of the School Board, was present at the examination. The small attendance, as compared with the number on the rolls, is caused by the prevalence of measles.

STROUD :—Visited, 7th June.

Pupils enrolled :—Boys, 21 ; girls, 21 ; total, 42.
Pupils present :—Boys, 14 ; girls, 10 ; total, 24.

The schoolhouse is a brick-building, substantially good, but somewhat in need of repair. The out-offices are also much out of condition. The furniture is sufficient, but badly arranged. The stock of books authorized by the Council is insufficient. The classification of the pupils is unsatisfactory ; the discipline is weak and indecisive ; the methods of instruction are neither suitable nor effective, and the tone of the school very unsatisfactory. The pupils seemed to be perfectly indifferent whether they answered my questions or not. Local supervision devolves upon the Clergyman mainly, but the parish is without one at present.

UPPER BENDOLBA :—Visited, 25th June.

Pupils enrolled :—Boys, 29 ; girls, 25 ; total, 54.
Pupils present :—Boys, 18 ; girls, 17 ; total, 35.

The schoolhouse, which is also used as a church, is suitable, and in moderately good condition ; and the play-ground and out offices are good. The school is badly furnished and supplied with working materials ; the classification is defective ; time-tables and programmes have not been introduced ; the discipline is fair, but judging the methods of instruction by the results of the examination, they are not effective. Local supervision is but moderate. One member of the Local Board was present at the examination. A subsequent visit enables me to state that this school is improving.

WALLSEND :—Visited, 29th July.

Pupils enrolled :—Boys, 70 ; girls, 65 ; total, 135.
Pupils present :—Boys, 45 ; girls, 40 ; total, 95.

This schoolhouse, which is also used as a church, is in good condition, and the school-ground and out offices are satisfactorily suitable. There is a good supply of furniture and apparatus, but the stock of books is insufficient. The classification is tolerably satisfactory ; the discipline is too noisy and demonstrative ; and the results of the instruction are moderate. Local supervision is but nominal, nor were any of the School Board present at the examination.

ROMAN CATHOLIC.

CLARENCE TOWN :—Visited, 28th June.

Pupils enrolled :—Boys, 24; girls, 21; total, 45.

Pupils present :—Boys, 20; girls, 17; total, 37.

This school is held in the church; the building is in fair condition. The school-ground is fenced and proper out-offices are provided. The furniture is wretchedly insufficient and unsuitable. The teacher has not applied for the books sanctioned by the Council, and those in use (of the Christian Brothers' Series) are very insufficient, and in bad condition. The classification of the pupils is tolerably correct; the discipline is severe and fitful, the general supervision being very defective; and the teaching, judging by the results, is by no means efficient. Local supervision is nominal, and none of the School Board were present at the examination.

MILLER'S FOREST :—Visited, 18th November.

Pupils enrolled :—Boys, 33; girls, 28; total 61.

Pupils present :—Boys, 27; girls, 27; total, 54.

The schoolhouse is suitable, and in fair condition, and there is a fair supply of furniture and working appliances. The organization is satisfactory; the discipline is firm, but the details need to be improved; the teaching is painstaking, and moderately effective. In measuring the work of this school I have made allowance for the serious hinderances it has experienced through the floods. The Rev. P. J. O'Quinlivan was present at the examination.

NEWCASTLE :—Visited, 19th August.

Pupils enrolled :—Boys, 57; girls, 46; total, 103.

Pupils present :—Boys, 41; girls, 32; total, 73.

The schoolroom, which is underneath the church, is, on the whole, suitable for the purpose, and is fairly furnished. The books authorized by the Council have not been received, hence the books in use are of the series published by the Christian Brothers, and of these the stock is very limited. The organization is moderate; the discipline is fair in some respects, but the supervision is not sufficiently comprehensive; the instruction imparted to the children of the upper classes is tolerably effective, but that to the juniors is very faulty. The local supervision has for some time past been suspended; neither did the clergyman, nor any of the lay members of the School Board, put in an appearance during the examination.

RAYMOND TERRACE :—Visited, 5th November.

Pupils enrolled :—Boys, 14; girls, 20; total, 34.

Pupils present :—Boys, 12; girls, 13; total, 25.

The schoolroom is in tolerably good condition, and the furniture and school material are suitable and sufficient. The playground is fenced, and proper out-offices have been provided. The organization is moderate, and the discipline is satisfactory. The instruction is mechanical, and not calculated to evoke thought in the pupils. Though mentally sluggish, the children were well-behaved. The Rev. P. J. O'Quinlivan was present at the examination.

PRESBYTERIAN.

DINGO CREEK :—Visited, 25th September.

Pupils enrolled :—Boys, 21; girls, 28; total, 49.

Pupils present :—Boys, 16; girls, 22; total, 38.

The schoolhouse is in fair condition, but the school-ground is only partly fenced, and no closets have been provided. There is a fair supply of books, but the school furniture is insufficient and unsuitable. The classification and discipline are moderate, but the teaching, judging by the result of the examination, is unskilful. The children exhibit a lack of self-reliance and mental activity. It was with the greatest difficulty I prevented them from copying. Local supervision is very rare. The Rev. J. S. Laing, and two lay members of the Local Board, were present at the examination.

NEWCASTLE :—Visited, 16th August.

Pupils enrolled :—Boys, 76; girls, 34; total, 110.

Pupils present :—Boys, 54; girls, 31; total, 85.

The school-room is a wooden building in good condition but too small. The playground is merely a small space of sand enclosed, and no out-offices of any kind have been provided. The furniture and apparatus are suitable and nearly sufficient. Books, insufficient. The classification is satisfactory; the discipline is weak; the instruction is careful and effective. Local supervision is infrequent. The Rev. Mr. Coutts, and a lay member of the Board, were present at the examination.

J. W. ALLPASS,

Inspector of Schools,
Newcastle District.

ANNEX B.

CUMBERLAND DISTRICT.

TABULATED REPORTS for 1867, upon Schools in the Cumberland District that were examined by the Inspector for the Newcastle District.

PUBLIC SCHOOLS.

BLUE GUM FLAT (Non-vested) :—Visited, 2nd December.

Pupils enrolled :—Boys, 20; girls, 27; total, 47.

Pupils present :—Boys, 18; girls, 24; total, 42.

The school-house is a substantial building, and is well furnished and supplied with working appliances. The ground is enclosed, but no closets have been erected. The pupils are properly classified, but the discipline is ineffective as regards the elder pupils. The results of the examination were tolerably satisfactory. The school is fairly superintended by the Local Board, and two members thereof were present at the examination.

GOSFORD

GOSFORD (Non-vested) :—Visited, 26th November.

Pupils enrolled :—Boys, 24 ; girls, 14 ; total, 38.

Pupils present :—Boys, 11 ; girls, 15 ; total, 26.

The school is held in a portion of the Catholic church. There is a tolerably fair supply of furniture and school appliances ; the grounds are enclosed, but the closets need repair. The organization and discipline are satisfactory ; the instruction is methodical but not sufficiently searching ; the results of the examination are reasonably satisfactory. Local supervision is very occasional.

DENOMINATIONAL SCHOOLS.

CHURCH OF ENGLAND.

ERINA :—Visited, 27th November.

Pupils enrolled :—Boys, 28 ; girls, 25 ; total, 53.

Pupils present :—Boys, 16 ; girls, 19 ; total, 35.

The schoolhouse is a wooden structure, and, excepting that it has an earthen floor, is fairly suitable to its uses. The school-ground is unenclosed, and there are no closets. The furniture is bad, and there is no apparatus whatever ; the books in use are of the series published by the Society for the Promotion of Christian Knowledge. The organization is bad ; the classification is defective ; the discipline is strict, but lacks geniality ; the teaching is very defective ; the mental cast of the children is low, and the results of the examination are very unsatisfactory.

GOSFORD :—Visited, 26th and 27th November.

Pupils enrolled :—Boys, 24 ; girls, 21 ; total, 45.

Pupils present :—Boys, 21 ; girls, 19 ; total, 40.

The schoolhouse is a wooden structure, and is very much in need of repair. It is wretchedly furnished, and indifferently supplied with apparatus and books. The organization is moderate ; the discipline is fair ; the teaching is wanting in energy, and the results are but moderate. The children are pleasing, but not very industrious. The school is under the supervision of the Rev. J. Shaw.

KINCUMBER :—Visited, 28th November.

Pupils enrolled :—Boys, 19 ; girls, 10 ; total, 29.

Pupils present :—Boys, 16 ; girls, 8 ; total, 24.

The schoolhouse is very small, and is much out of condition. The school-ground is enclosed, but no closets have been provided. The furniture is sufficient, but out of condition. There is no apparatus, and the books are insufficient. The Council's grant has not been received, and the teacher states that, for the past nine years, he has received no school appliances from the Denominational School Board. The organization is defective, and the classification is much too high ; the discipline is kind, but effective. Judging the teaching by the results, it is of small educative value. This school is under the supervision of the Rev. J. Shaw.

ROMAN CATHOLIC.

KINCUMBER :—Visited, 28th November.

Pupils enrolled :—Boys, 19 ; girls, 29 ; total, 48.

Pupils present :—Boys, 17 ; girls, 24 ; total, 41.

Though small, the building is fairly suitable. The furniture and apparatus are in excess of the requirements of the school. The books are chiefly of the Christian Brothers' Series. There are too many classes, and, altogether, the classification is much too high. Through misconception, the instructional documents (time-table and programmes) have been incorrectly constructed. The discipline is weak, and subjects the children to very little control. The methods of instruction are inferior and ineffective. A lay member of the School Board was present at the examination.

J. W. ALLPASS,
Inspector of Schools,
Newcastle District.

INSPECTORS' REPORT.—SYDNEY DISTRICT.

INSPECTORS' REPORT upon the condition of Public and Certified Denominational Schools, in the Sydney District, for the year 1867.

The schools of this District lie in the City of Sydney and Suburbs. They consist of fifteen Public Schools numbering twenty-nine departments, and forty-five Certified Denominational Schools comprising sixty-eight departments. The Public School in Sussex-street was opened, and the Public School in Bourke-street, Woolloomooloo, closed during the year. The certificate was withdrawn from the Roman Catholic School, Pitt-street South, during the same period. All the schools in this District were examined during the year except the Certified Roman Catholic Schools at Pitt-street South and Pyrmont. The Local Board refused to allow us to complete the inspection of the former, and the latter was not examined for reasons known to the Council. In addition to the general inspection, incidental visits were paid to all schools under our supervision, including the Roman Catholic Schools at Pitt-street South and Pyrmont.

The course of inspection was based upon the guides furnished by the Council, namely—the Regulations, the Instructions to Inspectors, and the Standard of Proficiency. It comprised an inquiry into the material condition of each school, its moral character, the quality of the instruction imparted—whether, in short, as an educational institution, each school was subserving those objects for which it was aided or maintained by the Council.

Material Con-
dition. Annex A.

Seven-eighths of the public schools have situations ranging from fair to good. Not one occupies a decidedly bad or unhealthy site. Five-sevenths of the denominational schools possess situations ranging from fair to good. Six Roman Catholic schools and one Wesleyan occupy bad or unhealthy sites.

Seven of the public schools, fifteen departments, are vested in the Council ; the rest are not. About five-sixths of the buildings vary from fair to good ; the remaining sixth are tolerable structures. Nearly five-eighths of the denominational school buildings range from fair to good ; the remaining three-eighths, from bad to tolerable.

In

In three-fifths of the public schools, the play-ground accommodation is fair or good; in one-fifth indifferent; and in the remaining fifth there is a total absence of this important provision. One-third of the denominational schools have fair or good play-grounds; one-half are tolerably provided in this respect; and the remaining sixth have no play-grounds at all.

All the public schools, with the exception of three, have a sufficiency of suitable furniture and apparatus; two-thirds are well found in these requisites, the furniture and apparatus being of a superior kind, well cared-for and well arranged. The schools most in need of improvement in these particulars are those at Watson's Bay, Botany Road, and Pitt-street South. Of denominational schools, one-half are reasonably provided with suitable furniture and apparatus; the supply in the remainder ranges from indifferent to tolerable.

Both public and denominational schools are well found in books; a few of the latter have not yet received their supplies from the Council's agent.

In public schools the records are, without an exception, punctually and correctly kept, and in a large proportion, with exemplary neatness and care; the same may be said of denominational schools, in only a few of which was any remissness exhibited in the proper keeping of these documents.

There is a pretty general complaint among teachers respecting the irregularity with which children attend school. We fully admit the existence of the evil complained of, but believe that in teachers themselves lies in part the power to remove it. After a tolerably wide observation, we have been struck with the fact that irregular attendance mostly obtains in schools conducted by inefficient and unpopular teachers—that schools, remarkable for a desultory attendance under one set of teachers, have, under others of a more energetic class, undergone a complete reformation in this particular. We are inclined to think too, that the subject of school fees has something to do with school attendance. We observe that in schools where a scale of fees has not been definitely fixed, or where, if fixed, it has not been rigidly acted upon, where the children are admitted at nominal rates, or without payment at all, the attendance is most irregular. We could instance schools (denominational), in which the number of children educated gratuitously during the past year amounted to nearly one-half of the total number on the roll, notwithstanding that a large proportion of the parents of these children, we were assured by the teachers, were quite able to pay for their education. It is a noticeable feature, in connection with this matter, that the children thus educated solely at the cost of the State, are the least regular in attendance, and are generally the least amenable to discipline. The average attendance at public schools and at denominational schools, for the quarter ending 31st December, 1867, bore the following percentages to the total number on the rolls:—

Public Schools	69.8
Church of England Schools	66.9
Roman Catholic	64.4
Presbyterian	68.2
Wesleyan	64.1

The mean average being 66.6, which is far from satisfactory.

The number of children on the roll, for the quarter ending 31st March, was 15,798; the number on the roll for the quarter ending 31st December, was 16,300. There has thus been an increase, during the year, of 502 pupils, or a little more than 3 per cent. The following table will shew how these 16,300 pupils were divided in respect to sex and religious denomination:—

	Boys.	Girls.	Total.	C.E.	R.C.	Pres.	Wes.	Others.	Total.
Total of Public Schools	3,281	2,473	5,754	2,263	911	779	664	1,137	5,754
" C.E.	2,684	2,106	4,790	2,795	118	285	339	253	4,790
" R.C.	2,101	2,312	4,413	42	4,346	1	7	17	4,413
" Pres.	344	318	662	272	70	178	97	45	662
" Wes.	400	281	681	121	30	26	414	90	681
	8,810	7,490	16,300	6,493	5,475	1,269	1,521	1,542	16,300

It appears from this table, that the number of children belonging to the Church of England, who attend schools of their own denomination, is 43 per cent. of the total number of Church of England children in attendance at all the schools under the Council's superintendance; that Roman Catholic schools are attended by 79 per cent. of children of their own denomination, Presbyterian schools by 14 per cent., and Wesleyan schools by 27 per cent. The most obvious inference is that, in the Sydney District, which offers the most favourable conditions for the development of denominational tendencies, these tendencies cannot be said to exist to any great extent.

The total number of pupils on the rolls of public schools inspected was 4,889; and of these, 3,788, or 77.5 per cent., were present at examination. Of those examined—

34.6 per cent. were 7 years of age, or under.

11.3 " " 8 years of age.

12.7 " " 9 " "

12.6 " " 10 " "

10 " " 11 " "

18.8 " " 12 years of age, or above.

The total number of pupils on the rolls of denominational schools inspected, was 9,126; and of these 6,672, or 73.1 per cent., were present at examination. Of those examined—

45.1 per cent. were 7 years of age, or under.

14.6 " " 8 years of age.

11.2 " " 9 " "

9.8 " " 10 " "

7.5 " " 11 " "

11.8 " " 12 years of age, or above.

A comparison of the above tables goes to shew that in public schools, children continue their attendance to a later age than in denominational schools.

Punctuality (another feature of school discipline) has much improved during the year, both as regards teachers and pupils. At our earlier visits to denominational schools, we observed that not only did unpunctuality prevail among the pupils of some schools to a large extent, but that the teachers themselves were in this particular not less remiss. We therefore deemed it desirable to enjoin on the teachers of these schools the observance of the practice already in use in public schools, namely, that of signing the time of their arrival at and departure from school. An immediate improvement in the punctuality of the teachers was the result, which was soon followed by a corresponding improvement in the punctuality of the children. But other more direct and positive means need to be taken by teachers to place the punctuality of their schools upon a fully satisfactory footing. Many, when spoken to relative to the habitual lateness of their pupils, throw the blame upon the parents, and seem to imagine that, by doing so, they relieve themselves of all responsibility in the matter. No greater mistake could be made. We hold

hold that the teacher is greatly responsible for the character of the punctuality which distinguishes his school, as it only needs the exercise of a little firmness, energy, and determination to render this as satisfactory as could be wished. There is another form of unpunctuality met with in far too many schools. We refer to the indifference or carelessness displayed by a number of teachers in commencing the actual business of teaching at the times indicated on the time-table. In some instances we have observed the loss of as much as half an hour before work actually began. We have invariably impressed upon such teachers that books, slates, and other materials should be placed upon the desks, ready for distribution, before the pupils were marched into school, and that the children should be punctually at work at the time set down for the opening of school in the morning and afternoon.

In reporting upon the cleanliness which distinguishes the schools of this district, we have viewed it in relation to the school premises, the furniture and apparatus, the teachers, the pupils. As regards school premises we have found a great number in a disgraceful state—the school-rooms not swept for days together, the play-grounds littered with loose paper and other rubbish, and the closets in a filthy and exposed condition. We have witnessed the results of gross neglect, on the part of teachers, in the keeping and preservation of the furniture and apparatus placed under their care, desks being hacked and besmeared with ink, doors off presses, maps torn and covered with dust, and books abused or carelessly destroyed. It is but just to the teachers of the schools in which these irregularities were observed, to state that they have evinced a general desire to remedy them, and to use all care and attention to prevent their repetition. As a rule, teachers seem sufficiently alive to the necessity of holding themselves patterns of personal neatness to their pupils. We do not remember an instance where we were called upon to remind a teacher of neglect in this particular. As regards the pupils themselves, we are constrained to report that in a large number of instances the inspection for cleanliness is not conducted with sufficient care or minuteness, and it is a noticeable circumstance, in connexion with this matter, that in a good proportion of schools no provision is made for ensuring habits of cleanliness among the children.

No doubt the most important feature in the discipline is order. Upon this depends in a great measure the efficiency of the teaching. To secure it as a habit of the school, necessitates on the part of the teacher the exercise of tact, judgment, and ability to govern. As applied to schools, it means something more than the absence of unnecessary noise. It implies precision and uniformity in the movements of the pupils, an absence of listlessness and inattention, a promptness in obeying commands, and the evidence of a spirit anxious to please. This is admittedly a high standard, but is one which a few schools have already nearly reached. In two public and nineteen denominational schools the order may be regarded as very unsatisfactory; in the remainder it ranges from tolerable to good.

The documents prescribed by the Council for properly regulating the instruction are a time table and a programme of lessons. The first is intended to apportion the time to the different subjects of instruction, according to their relative importance. The following may be taken as the ordinary distribution of time which obtains in the better conducted schools:—

Instruction.
Annex C.

To reading and scripture are given weekly	6	hours.
To writing, dictation, and composition	5½	”
To arithmetic and mensuration	5½	”
To grammar and analysis of sentences	1½	”
To geography	1½	”
To moral Lessons and object Lessons	1½	”
To needlework for the girls, or at the same time Euclid, Algebra, and Latin for the elder boys	2	”
To drawing.....	1	”
To music.....	1	”

Total number of hours 25 hours.

Where the higher subjects cannot be profitably introduced, the time is devoted to extra teaching in the leading subjects. In a large number of schools the time-table is, owing to its defective or injudicious arrangement, next to worthless; while in a few it has no existence. In these latter the most frivolous reasons were assigned by the teachers for its non-construction. Instances were not at all uncommon where the teachers displayed an utter ignorance of the advantage of such a document, never having before used it in their schools; while, in others, the teachers, in obedience to the Council's Regulations, having managed to draw up a time-table, and having suspended it on the walls of the schoolroom, took little or no notice of it afterwards. The object of the programme is to render the teaching in each subject systematic and progressive. It is required to be drawn up at the beginning of each quarter, and to contain the whole of the instruction to be given in each subject during that quarter. The instruction is thus divided into twelve weekly portions. In general terms, it may be stated that very fair judgment is displayed by the teachers of public schools in the arrangement of their programmes. In denominational schools, the character of this document is less satisfactory, the principal defects being a want of explicitness and fulness of detail.

One of the most important helps to effective teaching is a judicious classification. In order to secure it, regard must be had to the following points:—First, the ages of the pupils; secondly, their mental capacities; and thirdly, the requirements imposed by the Council's standard of proficiency. In a majority of schools these points have been steadily kept in view. In some it would be difficult to say that any classification had been attempted at all, as the pupils were arranged into a number of sections or subdivisions, which were taught in part by monitors, or the more advanced children of the school. It will be readily perceived that to examine under these circumstances was well nigh impossible; to do so in accordance with the guides laid down by the Council, it was absolutely necessary for the Inspector to reclassify the school before he began. This generally consumed a large amount of time, as the teachers evinced an ignorance of what was wanted, and the pupils in some instances were unable to state to what class they belonged. Where an attempt had been made at classification, it was not unfrequently the case that the teacher had been guided by other considerations than the right ones, and in general it may be said that too much deference was paid to the whims and wishes of parents.

As might be expected, the methods in use vary in kind and excellence. Whilst in a majority of cases they are tolerably well defined, in a large number they belong to no readily distinguishable type. Those most commonly employed, are combinations of the analytic and synthetic. It would be a great mistake to suppose, however, that the mere excellence of any method, considered in the abstract, afforded a reliable or certain indication that the instruction produced satisfactory results. Something more is required besides the mere knowledge of good methods to enable a teacher to make his instruction effective. He must possess the power to secure the attention of his pupils; he must have a knowledge of the nature of the human mind, in order that he may be able to select appropriate subjects to place before it at the different stages of its development; he must especially make himself familiar with the temperaments and mental capacities of his pupils, that he may know when to stop in the teaching of a subject, and when to go on—when to dwell upon a point, when not; he must be a man of a versatile mind, of good information, great power of illustration, and considerable tact and judgment. Such qualifications are high and varied, and are possessed in full but by a few of our most successful teachers. Given two men of equal attainments who have received the same advantages of training, the one becomes an able teacher of youth and the other fails to rise above mediocrity. How is this difference in success to be accounted for? Chiefly, if not entirely, by a difference in the individual character of the two men. And be it borne in mind that no amount of training, education, or after experience in the practice of teaching, can wholly remove this difference.

difference. As a general rule, however, it may be said that a determination to maintain order, a power to infuse energy and spirit into the teaching, a disposition to be dissatisfied with imperfect results, a distrust of the efficacy of any method not characterized by a searching examination of the pupils—are always promising signs in a teacher. Added to these qualifications, a teacher anxious to render his instruction thoroughly effective will do well to attach great importance to the frequent repetition of the lessons, and to require the pupils to reproduce the more important in writing. Where these tests are fully applied, there can be little doubt but that successful teaching must result.

Reading.—Speaking generally, it must be stated that the elements of reading are taught badly. The ordinary mistake made is to teach the names of the letters of the alphabet instead of the sounds of the letters. The time consumed in some schools before children even make this small progress ranges from six to twelve months. Teaching the alphabet is evidently regarded by many teachers as mere drudgery, and as so much lost time, if they are required to perform the duty. In many instances, therefore, this labour is delegated to monitors, whose time may be said to be wholly occupied in vain endeavours to obtain order. We would be understood now as referring more particularly to the practice ordinarily pursued in Denominational Schools. Faults equally objectionable characterize the teaching of reading in most of the succeeding stages. Little effort is made to explain the meaning of the more difficult words; nothing is done to relieve the lessons of tediousness and monotony, but the pupils read again and again until their minds get so accustomed to the never-varying succession of sounds as to be apprehensive of little else. Children taught after this fashion, when stopped in the middle of a sentence, and asked to explain the meaning of some word, phrase, or allusion, seem to awake as from a dream, look in perfect bewilderment at the examiner, and seem utterly unable to realize what they are expected to do. This purely mechanical aspect which is imparted to the teaching of reading is the great defect that underlies the whole of the after teaching. The minds of the pupils not being properly exercised upon the meaning and scope of the lessons, gradually relapse into a kind of lethargy, and when presented with other subjects requiring for their grasp a healthy development of the faculties, prove unequal to the strain thus imposed. This no doubt is a serious defect, but another and one more closely affecting the style of reading acquired, proceeds from the same cause. We refer to the expressionless and unintelligent reading common to the more advanced pupils. To hear these children read, one would suppose they had been taught to regard rapidity of utterance as the one great end to be aimed at. Listen to their reading with books closed, and it is almost impossible to distinguish one word from another; added to which, they read in so low a tone of voice as to be almost inaudible a few feet off. Few teachers really make an effort to cultivate a good style of reading among their pupils. A child reads and makes certain mistakes, he is told to read again; he reads again and falls into the same errors: he is ordered to read again; and this process is continued *ad libitum*. The proper course to pursue in such cases would be for the Teacher to read the faulty passage as it ought to be read, bearing in mind that reading is essentially an imitative art, and that a child to read well must hear good reading. Reading appears to be taught with more than ordinary care in the following schools:—St. Andrew's, C.E.; St. Andrew's, Pres.; St. Mark's, C.E.; Waverley, C.E.; Victoria-street, R.C.; Kent-street North, R.C. In Public Schools the method of teaching reading is tolerably uniform, its distinguishing features being the partial use of the phonic principle in the elementary stage, and the great importance which is attached to the thorough explanation of the words and subject matter of the lessons in succeeding stages. The application of this method, however, is open to some of the objections mentioned in connection with the teaching of reading in Denominational Schools, the principal being that exemplar reading by the Teacher is not practised to a sufficient extent.

Writing.—The elements of writing are taught upon slates. There is little attempt at method, but in most cases, the teacher having set the copies, the pupils are expected to do the rest. Very little regard is paid as to whether the slates are ruled or not, and letters of all sizes are found incorporated in the same word. But a small proportion of teachers have succeeded in laying down in their programmes a well-considered graduated course of teaching the elements. It not unfrequently happens, that children are set to write, more with the view of keeping them quiet than with any more useful object. Writing in copy-books is taught with greater success; but even here there is a wide margin for improvement. The following are the usual faults committed: the pupils are allowed to write too much at a time; habits of neatness and cleanliness in the keeping of the books are not sufficiently enforced; errors of style are permitted to pass unnoticed; and the supervision is of a lax and casual description. One good mode of teaching the subject, is to set the copy upon the black-board, and only to allow the pupils to write four or five lines before the books are inspected. If a large class, this examination need not necessarily be very searching, but being gone through, the teacher then points out a few of the more striking errors upon the black-board, and gives the necessary advice respecting their future avoidance. The pupils are then permitted to write a few lines more, when the examination of the books by the teacher is repeated.

Arithmetic.—Arithmetic is less successfully taught than any other branch. In general, teachers neglect to ground their pupils sufficiently in notation, and bestow their attention upon the giving of rules rather than upon the explanation of principles. This defective knowledge of the elements is also partly attributable to the fact, that many teachers continue to employ books in the teaching of arithmetic. It is not an uncommon occurrence to find children who are said to be working the higher rules fail to master a question in simple multiplication. Upon an average, not more than one child out of fifteen in the higher classes, has succeeded in working a question like the following, 70985793×60090 . Our advice to teachers has been,—dispense with the use of books, and trust solely to *viva voce* teaching; explain the principles of each rule thoroughly to the pupils; give plenty of examples; vary them as much as possible; and solve a sufficient number upon the black-board; above all things, hold regular and frequent examinations in the rules gone through.

Much of the uncertain and superficial knowledge displayed in the higher rules, arises chiefly from the defective manner in which the elements are taught. It is seldom that children will attempt to face a question out of the ordinary form, and unless the solution depend directly upon the obvious application of some well-known rule, the result is a failure. We have found it necessary, therefore, to continually press upon the attention of teachers, the importance of making their questions as practical as possible, so that children may thus be taught to apply the various arithmetical processes to the ordinary transactions of life. Mental arithmetic is professedly taught in most schools. In a small proportion, however, does the subject receive that care and attention which its importance as a means of intellectual training demands. Besides forming an agreeable relaxation from other studies, it may be made to occupy intervals which otherwise might unprofitably pass away. A few questions, judiciously chosen, and rapidly given between the changes of the lessons, not only tend to prevent the pupils' attention from flagging, but by giving to the current of thought a new direction, add vigor and elasticity to the mind, and enable it to put forth renewed effort. The frequent and intelligent use of mental calculation, not only exercises a powerful influence upon the cultivation of the reasoning faculties, but enables children to grasp readily the principles upon which the commoner arithmetical processes are based, and to work questions in slate arithmetic expeditiously and correctly. It is not an unusual occurrence to find children in one school, where due prominence is given to the practice of mental arithmetic, solve questions off-hand, and without any apparent effort, which the pupils of another school, in whose routine the same subject finds no place, evince great difficulty in answering with slate and pencil.

Grammar.—This branch is taught with fair skill in Public Schools; in Denominational Schools, it does not appear to have received proper attention, until after the issue of the Council's Standard of Proficiency. As yet, the methods of teaching it are crude and ill-considered. In many schools, books upon grammar are put into the hands of the children, who are expected to learn by rote as much of the contents as they can. It is hardly necessary to observe that such a mode of teaching the subject is productive of

more harm than good. It is absurd to expect the average child to comprehend the nice distinctions of an abstract science couched in the language of books. Grammar, to be taught effectively or even to be taught at all, must be stripped of its technicalities, must be communicated little by little, the same ground repeatedly gone over, every possible recourse had to concrete illustration, and the black-board freely used; above all, the teacher must convey his instruction by means of the living voice. Considering the small progress which the larger number of schools have made in the elements of grammar, it will be readily inferred that the teaching of the higher parts, as analysis and composition, is almost confined to Public Schools. As regards analysis, we have reason to believe that sufficient care is not taken to distinguish clearly between the elements that occasionally constitute the completion of a sentence, and those which form the extensions of the predicate. Another point, frequently overlooked, is the necessity of making the parsing harmonize with the analysis. It is quite a usual thing to see a sentence parsed one way and analyzed another—we refer, of course, to sentences of complex construction in which great uncertainty seems to be manifest as to which clause the conjunctive words belong.

Geography.—Notwithstanding that the order in which the different parts of geography should be taught is clearly laid down in the Council's Standard of Proficiency, a reference to Annex D will show that the extent of the attainments possessed by children in this branch is limited. We attribute the ill-success that attends the teaching of the subject to the following causes:—A large number of teachers do not prepare the lessons; many of those who do, attempt too much at a time; no proper tests are applied to see that the children have received the instruction given; too much reliance is placed upon printed maps, and upon chance information which they afford; there is a want of intelligent management in the lessons; and the methods are for the most part uninteresting and unskilful. Geography appears to be taught most successfully in those schools in which the teachers possess a moderate knowledge of linear drawing, and who turn this knowledge to account by sketching outline maps upon the black-board. It is surprising with how much greater effect the leading physical features of a country, the exact positions of its mountains, rivers, and towns can be taught by means of such a map than by the use of those of the ordinary kind.

Object Lessons.—Object lessons receive very general attention from our teachers. Their aim, however, is but imperfectly understood. As a means of mental culture, they are comparative useless, unless treated in a definite, intelligent, and comprehensive manner. The methods of communicating them are marked by a good deal of sameness. Were their object primarily to convey information, little fault could be found with the form in which they are presented to children. But, considering that their main purpose is to develop the perceptive faculties, we are forced to observe that in most cases they fail to effect this result. The "lecture" method is of all others the least calculated to rouse into activity the mental energies of children, and this is the commonest form in which object lessons are delivered. There is a sad dearth of intelligent questioning, of ready and appropriate illustration, and of power to make lasting impressions. Too much reliance is placed upon book information, and too little upon the knowledge afforded by a careful examination of external nature.

Drawing and Music.—Drawing and music in accordance with the Council's requirements forms part of the ordinary school course. They have been generally introduced into the schools, and are taught under the supervision of special masters. The progress made in them is not yet sufficiently general or decided to enable us to report further than that we believe reasonable results are being achieved. The step which the Council has taken in placing drawing and music among the ordinary subjects of examination for teachers' certificates, and in affording the teachers and pupil-teachers of the district an opportunity of acquiring a knowledge of these branches, cannot but be productive of the best results.

The Scripture lessons are used in all the Public Schools with fairly satisfactory results. They are also used in some of the Denominational Schools; but we have not considered it part of our duty to examine the pupils of these schools in Scripture.

Proficiency.—The following Tables of percentages are intended to shew the relative proficiency of Public and Denominational Schools in the different subjects of instruction.

PUBLIC SCHOOLS.

Teachers.—

Annex E.

Teachers.—The teaching staff of the schools of this district comprised at the close of the year 94 teachers, 57 assistant teachers, and 110 pupil teachers. These were distributed as follows:—In Public Schools, 26 teachers, 26 assistant teachers, and 49 pupil teachers; in Denominational Schools, 68 teachers, 31 assistant teachers, and 61 pupil teachers. The subjoined table shews the classification of the teachers and assistant teachers:—

First Class.		Second Class.		Third Class.			Not Classified.
Section A.	Section B.	Section A.	Section B.	Section A.	Section B.	Section C.	
1	5	16	18	37	27	19	28

As a body, the teachers are earnest, diligent, and painstaking, evince a willingness to receive suggestions, and endeavour to carry them out to the best of their abilities.

Local Supervision.—It is almost premature to offer any general opinion upon the character of the local supervision of schools. It may be sufficient for the present to state, that in many instances the Local Boards appear to manifest an earnest, an intelligent, and an abiding interest in the schools with which they are connected.

Summary.—The results of the year's inspection may be briefly summed up thus,—The Public Schools are in a fair state of efficiency; and, whilst the condition of Denominational Schools is less satisfactory, much has been done to render them more efficient, and they afford every indication of future improvement.

E. JOHNSON, }
J. S. JONES, } Inspectors, Sydney District.

Sydney, February, 1868.

ANNEX F.

DETAILED STATEMENT of the Condition of Public Schools in the Sydney District inspected during the Year 1867.

The remarks under the head 1 relate to the material Condition of the schools; under 2, to their moral character; under 3, to the subjects and methods of instruction; under 4, to the proficiency of the pupils.

BALMAIN (Mixed):—Visited, 31st July and 1st and 2nd August.

Numbers present at examination:—Boys, 98; girls, 59; total, 157.

1. A very good schoolroom, well equipped. 2. Order and moral tone, excellent. 3. The methods are modern, but vary greatly in quality; their average merit is about tolerable. 4. The attainments of the classes may be described thus,—First class, moderate; second and third classes, small; fourth class, very fair.

BALMAIN (Infants):—Visited, 31st July.

Numbers present at examination:—Boys, 32; girls, 31; total, 63.

1. A very fair schoolroom, in good repair. There is a sufficiency of the necessary educational appliances. 2. The Government is mild and judicious; the conduct of the pupils is unexceptionable. 3. Too much reliance is placed upon the use of the elliptic method. The questioning needs to be more individual and distributed more equally throughout the class. 4. Better results might reasonably be expected from a second class teacher.

BOTANY ROAD (Mixed):—Visited, 12th June.

Numbers present at examination:—Boys, 32; girls, 25; total, 57.

1. The building is in good repair, and the arrangements are the best possible; but the playground is too small, and the furniture is unsuitable. 2. The discipline is good. 3. The methods are characterised by skill and energy. 4. The progress for the year has been reasonably satisfactory. A decided improvement has been effected under the present teachers.

BOURKE-STREET (Mixed):—Visited, 7th and 8th October.

Numbers present at examination:—Boys, 118; girls, 91; total, 209.

1. This school, though badly situated, is in fair material condition. There is no playground, and the out-offices are unsuitably placed. The furniture is insufficient, and in some respects unsuitable. 2. The discipline is barely satisfactory; the pupils need to be more punctual and orderly, and the school operations conducted with greater precision and quietness. The government is mild, but deficient in uniform firmness. 3. In addition to the ordinary subjects, the instruction comprises Latin, French, and Algebra. The methods are marked by zeal, energy, and fair intelligence. 4. The pupils have made tolerable progress, and exhibit a like degree of mental culture.

BOURKE-STREET (Infants):—Visited, 8th October.

Numbers present at examination:—Boys, 47; girls, 50; total, 97.

1. The schoolroom is altogether too small for the present attendance, and is badly lighted and ventilated. A book-press is required; otherwise, the material appliances are sufficient. 2. The order and discipline are good. 3. The instruction is very painstaking. 4. Fair progress has been made.

CAMPERDOWN (Mixed):—Visited, 10th June.

Numbers present at examination:—Boys, 33; girls, 15; total, 48.

1. A classroom is required; otherwise, the material condition and organization are reasonably satisfactory. 2. The discipline is fair. 3. The methods are defective. 4. The progress is slow, and the mental power only moderate.

CLEVELAND-STREET (Mixed):—Visited, 14th and 15th August and 20th December.

Numbers present at examination:—Boys, 204; girls 151; total, 355.

1. The building is unsuitable and too small, but the supply of working materials is ample. 2. The children are regular, punctual, clean, and well governed. 3. The instruction is careful; in the upper classes, thorough. 4. Good progress has been made during the year.

CLEVELAND-STREET (Infants):—Visited, 20th December.

Numbers present at examination:—Boys, 56; girls, 26; total, 82.

1. The schoolroom is small and in bad repair; the organization is in other respects satisfactory. 2. The government is mild, judicious, and effective. 3. The subjects of instruction are appropriate, and the methods are characterized by skill and energy. 4. Substantial work is done in this school. The pupils acquit themselves well under examination.

FORT-STREET (Boys) :—Visited, 22nd and 27th May, and 27th and 28th June.

Number present at examination :—430.

1. The material condition and organization are excellent.
2. The discipline is fairly satisfactory.
3. All the ordinary subjects are taught, together with geometry, algebra, and the elements of Latin. In point of skill, the methods range from tolerable to good; their average merit is about fair.
4. The proficiency is tolerable in the lower classes, and fair in the higher.

FORT-STREET (Girls) :—Visited, 9th, 10th, 11th, and 12th July.

Number present at examination :—308.

1. The organization is the best possible.
2. The order and moral tone are excellent.
3. The methods are characterized by earnestness, energy, and skill.
4. The attainments range from tolerable in the lower classes to very fair in the higher. The pupils of the fifth class acquit themselves well under examination.

FORT-STREET (Infants) :—Visited, 20th and 21st May.

Numbers present at examination :—Boys, 168; girls, 126; total, 294.

1. The organization is very good.
2. The government is judicious and effective. Good order is maintained. A cheerful and healthy tone prevades the school.
3. The methods are appropriate, and are applied with intelligence and effect.
4. The attainments are satisfactory. The higher classes in particular acquit themselves well under examination.

GLEBE (Mixed) :—Visited, 7th, 8th, and 9th August.

Numbers present at examination :—Boys, 90; girls, 73; total, 163.

1. A very good building, but in need of repairs. The school is well found in material appliances.
2. The pupils are extremely unpunctual. The government is feeble and vacillating, and the order unsatisfactory.
3. The classification is defective. The methods are not very skilful. The pupils are listless and inattentive under instruction.
4. The attainments are moderate, and the intelligence of the pupils is only partially developed.

GLEBE (Infants) :—Visited, 7th and 8th August.

Numbers present at examination :—Boys, 35; girls, 29; total, 64.

1. The pupils are taught in the same schoolroom as the elder children.
2. This circumstance renders it almost impossible to maintain order.
3. The methods are suitable.
4. The pupils evince tolerable proficiency.

NEWTOWN (Mixed) :—Visited, 14th and 15th August.

Numbers present at examination :—Boys, 70; girls, 33; total, 103.

1. A fair schoolroom, well provided with teaching appliances.
2. The school is fairly disciplined.
3. The methods are skilful, and are applied with zeal and earnestness.
4. The proficiency of the pupils is very fair, and their mental power considerable.

NEWTOWN (Infants) :—Visited, 14th August.

Numbers present at examination :—Boys, 26; girls, 19; total, 45.

1. The schoolroom is barely large enough, but presents a clean and comfortable appearance. There is a sufficiency of apparatus.
2. For an infant school, the discipline is good.
3. The methods are skilful and effective.
4. Very respectable results have been produced.

PADDINGTON (Mixed) :—Visited, 23rd, 24th, and 25th July.

Numbers present at examination :—Boys, 94; girls, 57; total, 151.

1. An iron building, in fair repair. The school is well furnished.
2. The pupils are fairly regular and punctual. Their behaviour is satisfactory.
3. The methods are suitable, but need to be applied with greater vigor and earnestness; some remissness is shewn in the proper keeping of the lesson documents.
4. The attainments are fair.

PADDINGTON (Infants) :—Visited, 23rd July.

Numbers present at examination :—Boys, 24; girls, 22; total, 46.

1. The schoolroom is tolerably suitable, and amply found in appropriate apparatus and furniture.
2. Little fault can be found with the discipline.
3. All the subjects proper to infant schools are taught. The teaching is deficient in energy and animation.
4. The average proficiency is moderate.

PITT-STREET (Mixed) :—Visited, 13th and 17th June.

Numbers present at examination :—Boys, 44; girls, 41; total, 85.

1. Suitable furniture and a playground are much wanted. In other respects, the organization of the school is good.
2. The discipline is fair.
3. The methods are modern, and the instruction is painstaking.
4. The teachers are attentive; the progress of the pupils is reasonably satisfactory.

PITT-STREET (Infants) :—Visited, 17th June.

Numbers present at examination :—Boys, 40; girls, 25; total, 65.

1. The pupils are taught in the same room as the elder children.
2. They are in fair order.
3. The methods are appropriate, and are applied with zeal and earnestness.
4. Reasonable results have been produced.

PITT-STREET SOUTH (Mixed) :—Visited, 27th August.

Numbers present at examination :—Boys, 27; girls, 14; total, 41.

1. The schoolroom is rather small; it is in fair repair. The furniture is sufficient for present wants, but of inferior quality.
2. The pupils are disposed to be restless and talkative; in other respects, the discipline is fair.
3. The instruction is painstaking and skilful.
4. The proficiency is very fair.

PITT-STREET SOUTH (Infants) :—Visited, 27th August.

Numbers present at examination :—Boys, 36 ; girls, 17 ; total, 53.

1. A passable schoolroom but without a gallery ; a few desks are also needed.
2. The discipline is good.
3. The methods are fairly skilful.
4. The attainments are fair.

PYRMONT (Mixed) :—Visited, 20th and 21st August.

Numbers present at examination :—Boys, 81 ; girls, 30 ; total, 111.

1. The schoolroom is too small, and is not centrally situated ; it is fairly furnished. The playground is very limited in extent.
2. The moral tone of the school is good.
3. The methods are modern and are applied with considerable skill.
4. Good results have been produced.

PYRMONT (Infants) :—Visited, 20th August.

Numbers present at examination :—Boys, 41 ; girls, 22 ; total, 63.

1. A small and inconvenient schoolroom, but adequately furnished.
2. Fairly disciplined.
3. The methods are appropriate, but need to be applied with greater energy and animation.
4. The pupils acquit themselves fairly under examination.

SUSSEX-STREET (Mixed) :—Visited, 28th November.

Members present at examination :—Boys, 56 ; girls, 57 ; total, 113.

1. A very fair schoolroom, amply found in teaching appliances. A playground is badly needed.
2. The pupils are rather irregular in attendance ; in other respects, the discipline is very satisfactory
3. The methods are skilful and effective.
4. Substantial work is done in this school.

WATSON'S BAY (Mixed) :—Visited, 29th August.

Numbers present at examination :—Boys, 8 ; girls, 10 ; total, 18.

1. The school is but indifferently supplied with furniture and apparatus.
2. The pupils are punctual but very irregular in attendance.
3. The methods are mechanical and ineffective.
4. The proficiency is small. The teacher has since been removed.

WILLIAM-STREET (Boys) :—Visited, 5th, 6th, 9th, and 10th September.

Number present at examination :—234.

1. A classroom is badly needed. Otherwise the school is well provided with material appliances.
2. Punctuality excepted, the discipline of the school is very good.
3. The course of secular instruction is faithfully observed ; the subjects taught are judiciously selected, and the methods employed, fairly suitable and effective.
4. The average proficiency is fair.

WILLIAM-STREET (Girls) :—Visited, 3rd and 4th September.

Number present at examination :—132.

1. The material state is very good.
2. The discipline is excellent.
3. The methods are fairly skilful and effective.
4. Substantial work is being done.

WILLIAM-STREET (Infants) :—Visited, 5th and 6th September.

Number present at examination :—Boys, 169 ; girls, 133 ; total, 302.

1. The school is amply found in material appliances.
2. The discipline is good.
3. The instruction is skilful and effective.
4. The proficiency is of a very reasonable character.

WOOLLOOMOOLOO (Mixed) :—Visited, 22nd August.

Numbers present at examination :—Boys, 38 ; girls, 22 ; total, 60.

1. A good schoolroom, but very dirty. There is a very fair supply of furniture and apparatus. The want of a playground is a serious drawback.
2. The pupils are regular, but unpunctual. The government is feeble, the order indifferent, and the moral tone unsatisfactory.
3. The methods are defective ; little real work is done.
4. The attainments are small. The school has since been closed.

WOOLLOOMOOLOO (Infants) :—Visited, 22nd August.

Numbers present at examination :—Boys, 23 ; girls, 12 ; total, 35.

1. The pupils are taught in the same schoolroom as the elder children.
2. They are disposed to be restless and talkative ; in other respects, the discipline is fair.
3. The methods and subjects of instruction are appropriate. Passable results have been achieved. The school has since been closed.

DETAILED STATEMENT of the condition of Certified Denominational Schools in the Sydney District, inspected during the year 1867.

The remarks under the head 1, relate to the material condition of schools. Under 2, to their moral character. Under 3, to the subjects and methods of instruction. Under 4, to the proficiency of the pupils.

BALMAIN, C.E. (Mixed) :—Visited, 17th September.

Numbers present at examination :—Boys, 58 ; girls, 35 ; total, 93.

1. The school is fairly organized.
2. The moral character is very fair.
3. The course of secular instruction is observed. The methods are fairly suitable and effective.
4. The proficiency is tolerable.

BALMAIN, R.C. (Boys) :—Visited, 13th December.

Number present at examination :—55.

1. A fair schoolroom. Book-press and two additional desks are needed. Otherwise, the material appliances are sufficient.
2. The pupils are clean and punctual, but not very regular ; their behaviour is fairly satisfactory.
3. The methods are practical, but require to be applied with greater energy and spirit.
4. The proficiency is small.

BALMAIN, R.C. (Girls) :—Visited, 11th December.

Numbers present at examination :—50.

1. A new schoolroom, tolerably suitable. A few diagrams are wanted. In other respects, the supply of teaching appliances is reasonable. 2. The pupils are punctual, but not regular in attendance. They are clean, modest, and well-behaved. 3. Programmes have not yet been constructed. The methods are mechanical and ineffective. 4. The attainments are indifferent.

BALMAIN, R.C. (Infants) :—Visited, 11th December.

Numbers present at examination :—Boys, 16 ; girls, 17 ; total, 33.

1. A very fair schoolroom. Reading tablets and diagrams are badly needed. 2. The attendance was much smaller than usual on the day of examination, owing to the prevailing sickness. The pupils are clean and well-behaved. 3. The course of instruction is defective, and does not appear to be regulated by either time table or programme. 4. The attainments are inconsiderable. The pupils are very young. The teacher (unpaid) was absent on the day of examination, through sickness.

CAMPERDOWN, R.C. (Mixed) :—Visited, 10th and 11th December.

Numbers present at examination :—Boys, 68 ; girls, 54 ; total, 122.

1. The building is old, and not very suitable ; the supply of furniture, apparatus, and books, inadequate ; and the play-ground undivided for the sexes. 2. The discipline is, in most respects, unsatisfactory. 3. The instruction does not accord with the standard course, and is imperfectly regulated. The methods are mechanical and ineffective. 4. The attainments are very moderate.

CHIPPENDALE, Wes. (Mixed) :—Visited, 3rd October.

Numbers present at examination :—Boys, 96 ; girls, 62 ; total, 158.

1. The organization of this school is defective as regards the condition of the schoolroom, classroom, and out-offices. The supply of furniture is insufficient, and the classification of the pupils is faulty. 2. In general, the pupils are neat, clean, and regular, but neither punctual nor well-behaved. The government is not uniformly strict, and the school operations are not conducted with order and decorum. 3. The instruction is in accordance with the standard course, but the methods need to be characterized by greater animation and skill. 4. The average proficiency is barely tolerable, and the mental power moderate.

CHURCH HILL, R.C. (Girls) :—Visited, 10th and 12th December.

Numbers present at examination :—87.

1. A fair schoolroom ; light and ventilation defective. A tolerable supply of furniture and apparatus. 2. The regularity, punctuality, and cleanliness of the pupils are unsatisfactory. The order is tolerable. 3. The classification is defective, and the occupation of the pupils not fully regulated. The methods vary greatly in point of skill. Their average merit is not high. 4. The attainments are small, and the mental power is low.

CHURCH HILL, R.C. (Infants) :—Visited, 10th December.

Numbers present at examination :—Boys, 101 ; girls, 72 ; total, 173.

1. A small, dark, inconvenient schoolroom ; walls badly in need of whitewash. The appliances for teaching are very limited. The organization is in other respects defective. 2. The pupils are noisy and inattentive, and not very clean. 3. The choice of subjects is inappropriate. There is neither time-table nor programme to direct the teaching, which is conducted by two young and inexperienced pupil teachers. 4. The attainments are very low.

CHRIST CHURCH, C.E. (Mixed) :—Visited, 28th, 29th, and 30th October.

Numbers present at examination :—Boys, 191 ; girls, 92 ; total, 283.

1. An excellent schoolroom, well provided with appliances for teaching. 2. The school is fairly disciplined, but the operations of teaching require to be carried on more quietly. 3. Object lessons need to be added to the subjects of instruction. The methods vary in kind and quality, but in point of average merit they do not exceed moderate. 4. The proficiency of the highest class is tolerable, and of the lower classes, small.

CHRIST CHURCH (Infants) :—Visited, 28th, 29th, and 30th October.

Numbers present at examination :—Boys, 103 ; girls, 78 ; total, 181.

1. The material condition of the building is good, but the schoolroom is objectionably elevated above the playground, and its appearance, as to cleanliness, is barely satisfactory. The gallery and forms are too small, the hat-pegs unsuitably placed, and the supply of books is inadequate. The playground is small and untidy, and the out-offices are badly arranged. 2. The moral character is very fair ; the pupils are clean, regular, and punctual, and tolerably well-behaved. 3. The choice of subjects is appropriate, but the methods are deficient in tact, energy, and skill. 4. The intelligence of the pupils is only very partially developed, and the attainments are barely tolerable.

DARLINGHURST, C.E. (Mixed) :—Visited, 11th September.

Numbers present at examination :—Boys, 55 ; girls, 51 ; total, 106.

1. A substantial stone building in good repair. There is a very fair supply of furniture and apparatus. 2. The order is capable of improvement ; in other respects, the discipline is fairly satisfactory. 3. The methods are for the most part empirical, but applied with zeal and earnestness. 4. The attainments are small in the first class, and very moderate in the second and third.

DOUBLE BAY, C.E. (Mixed) :—Visited, 11th and 12th September.

Numbers present at examination :—Boys, 34 ; girls, 21 ; total, 55.

1. The organization of this school would be good but for the objectionable condition of the playground and out-offices. 2. The moral aspect of the school is pleasing. 3. The subjects of instruction accord with the standard course ; the methods are suitable, and are applied with fair skill and intelligence. 4. The proficiency is fair.

DOUBLE BAY, C.E. (Infants) :—Visited, 12th September.

Numbers present at examination :—Boys, 37 ; girls, 38 ; total, 75.

1. A good schoolroom. A few desks are needed ; in other respects, the supply of requisites is fair. 2. The pupils are clean, punctual, and regular. They are inclined to be fidgety, but their general behaviour is not unsatisfactory. 3. The range of subjects is somewhat limited. The methods are fairly judicious, and are applied with zeal and earnestness. 4. The proficiency is tolerable.

DOUBLE BAY, R.C. (Mixed) :—Visited, 13th December.

Numbers present at examination :—Boys, 32 ; girls, 18 ; total, 50.

1. A suitable weather-board building, recently enlarged. The supply of furniture and apparatus is insufficient, and the condition of the school records unsatisfactory. 2. The moral aspect of the school is moderate. 3. The instruction does not altogether accord with the standard course ; the methods are unskilful. 4. The proficiency is very moderate, and the mental power low.

ERSKINE STREET, Pres. (Mixed) :—Visited, 23rd and 24th October.

Numbers present at examination :—Boys, 39 ; girls, 66 ; total, 105.

1. The situation of this school is unsuitable. There is no playground, and the out-offices are incomplete and badly arranged ; in other respects, the school is well supplied with material appliances. 2. The pupils are clean and fairly regular and punctual, but their conduct is not well-regulated as regards order, attention, and diligence ; the government is feeble. 3. The course of secular instruction is observed. A want of tact, energy, and skill characterizes the teaching. 4. The attainments and intelligence of the pupils are moderate. Grammar and geography have only recently received any attention.

GLEBE, C.E. (Mixed) :—Visited, 26th November.

Numbers present at examination :—Boys, 53 ; girls, 34 ; total, 87.

1. This school is fairly provided with material appliances. 2. The pupils are tolerably regular, punctual, clean, and well-behaved, but the school operations are not conducted with sufficient order and decorum. 3. The classification is faulty, the time-table defective, and the instruction is not properly regulated. The methods require to be applied with greater energy and earnestness. 4. The proficiency is moderate.

HAYMARKET, R.C. (Boys) :—Visited, 13th November.

Number present at examination :—122.

1. This school is held in a church. The organization is defective as regards accommodation, and the supply of furniture, apparatus and books. 2. The moral character is unsatisfactory ; the government is lax, the order bad, and the pupils are neither clean nor regular. 3. The classification is injudicious, and the occupation of the pupils is not properly provided for. A few of the subjects only have received adequate attention. The methods are practical, and only partially effective. 4. The proficiency and mental culture are very moderate.

KENT-STREET NORTH, R.C. (Boys) :—Visited, 21st October.

Number present at examination :—128.

1. Building badly situated, schoolroom too small, and dingy in appearance. The playground is scarcely worth the name ; and the out-offices are incomplete and in bad repair. The organization, so far as the teacher is responsible for it, is very fair. 2. The school is well-disciplined. The pupils are clean, attentive, and orderly. 3. All the prescribed subjects except music are taught. The methods are characterised by skill and energy. 4. The proficiency ranges from moderate to fair, geography and grammar being the weak points in the instruction.

KENT-STREET NORTH, R.C. (Girls) :—Visited, 18th October.

Number present at examination :—54.

1. This school is deficient in material appliances. The school-room is dirty, and in bad repair. 2. The pupils are fairly clean and orderly, but very irregular. The school operations require to be conducted more methodically. 3. The usual subjects are taught, except music. The methods are mechanical. 4. The attainments are small in arithmetic and grammar, and moderate in the other subjects.

KENT-STREET SOUTH, R.C. (Boys) :—Visited, 12th December.

Number present at examination :—68.

1. The building is totally unfit for the purpose. The supply of furniture and apparatus is insufficient. There is no playground, and the closets are built against the school-house. 2. The discipline is not quite satisfactory, but has much improved during the year. The operations of teaching are rather noisily conducted, but the teacher labours under great difficulties. 3. Drawing and music are not taught, otherwise the instruction accords with the prescribed course. The methods are judicious, and are applied with fair energy. 4. The attainments are moderate.

KENT-STREET SOUTH, R.C. (Girls) :—Visited, 16th December.

Number present at examination :—78.

1. The material condition of this school is the same as that of the boys'. 2. The pupils are fairly clean and punctual, but irregular and disorderly. The government is lax and ineffective. The moral tone of the school is unsatisfactory. 3. The instruction is not properly regulated, and is of a very elementary character. The methods are mechanical and inefficient. 4. The attainments are low. It is but just to mention that the teacher labours under unusual difficulties.

NEWTOWN, C.E. (Mixed) :—Visited, 15th October.

Numbers present at examination :—Boys 56, girls 22 ; total, 78.

1. Owing to the presence of church furniture, only a portion of the room can be used. The desks are unsuitable, and are affixed to the walls of the schoolroom. There is a fair amount of apparatus. No provision is made for a supply of water. 2. The school is fairly disciplined. 3. The methods are moderately skilful. 4. The proficiency ranges from indifferent to moderate.

NEWTOWN

NEWTOWN, C.E. (Infants) :—Visited, 15th October.

Numbers present at examination :—Boys, 30 ; girls, 30 ; total, 60.

1. This school is well found in material appliances. 2. The moral character is tolerable. The government is deficient in tact and firmness. 3. Dictation requires to be added to the subjects of instruction. The teaching is mechanical and feeble. The pupils are listless and inattentive. 4. The attainments vary from small to moderate.

NEWTOWN, Wes. (Mixed) :—Visited, 10th and 11th October.

Numbers present at examination :—Boys, 71 ; girls, 44 ; total, 115.

1. The material condition of this school is very good. 2. The pupils are clean, regular, punctual, and in fair order. The moral tone is pleasing. 3. The methods are characterized by zeal and earnestness. 4. Creditable work has been done in this school within the past year.

NEWTOWN, R.C. (Mixed) :—Visited, 6th December.

Numbers present at examination :—Boys, 14 ; girls, 15 ; total, 29.

1. A small two-storied dwelling-house, very unsuitable for the purpose. There is no playground, but one closet, and an insufficient supply of working materials. 2. The pupils are tolerably clean, but irregular, unpunctual, and disorderly. The discipline is lax. 3. The instruction is very elementary, and is not regulated by time-table or programme. The methods are mechanical and ineffective. 4. The attainments of the pupils are low.

PADDINGTON, C.E. (Mixed) :—Visited, 16th September.

Numbers present at examination :—Boys, 39 ; girls, 40 ; total, 79.

1. The walls of the schoolroom require cleaning ; otherwise, the material condition of the building is good. A classroom is wanted. The furniture is insufficient, and in bad order. 2. The discipline is defective. The government is not uniformly strict ; the pupils are restless and inattentive under instruction. 3. There is a lack of tact and animation in the teaching, and of attention and mental effort in the pupils. 4. The proficiency is tolerable.

PADDINGTON, R.C. (Mixed) :—Visited, 5th December.

Numbers present at examination :—Boys, 33 ; girls, 42 ; total, 75.

1. A fair weather-board building, with teacher's residence. The playground is spacious, but is not divided for the sexes, and the closets are injudiciously arranged. There is but a very scanty supply of working materials. The presence of church furniture renders proper organization impossible. 2. The discipline is tolerable. 3. Drawing and music have yet to be added to the subjects of instruction. The methods are practical, and only very partially effective. 4. The attainments are very moderate. Reading is carefully taught.

PARRAMATTA-STREET, R.C. (Boys) :—Visited, 11th and 12th November.

Number present at examination :—103.

1. The organization of this school is defective, as regards the situation and condition of the building, cleanliness of the schoolroom, supply and state of the furniture, and the character of the playground. The closets are in a filthy condition. 2. The pupils are irregular, very unpunctual, and not very clean. The government is feeble and ineffective ; the order is bad. 3. Music is not taught ; otherwise the subjects of instruction accord with those prescribed. The methods are deficient in skill and efficiency. 4. The attainments are very moderate.

PARRAMATTA-STREET, R.C. (Girls) :—Visited, 11th, 12th, and 13th November.

Number present at examination :—156.

1. The building is old, and in bad repair. There is a tolerable supply of educational appliances. 2. The pupils are clean, but irregular and extremely unpunctual. The government is deficient in vigor. The schoolroom is so crowded as to render it almost impossible to maintain order. The noise at times is very great. 3. The classification is faulty. The methods are chiefly mechanical ; learning by rote is their leading characteristic. 4. The average proficiency is small. Writing is well taught in the upper classes.

PARRAMATTA-STREET, R.C. (Infants), SYDNEY :—Visited, 11th November.

Numbers present at examination :—Boys, 75 ; girls, 51 ; total, 126.

1. The pupils are taught in the girls' schoolroom ; there is a very scanty supply of the necessary apparatus. 2. The order is indifferent. 3. The instruction is rather undefined, and is not regulated by a time-table or programme. The methods are unskilful. 4. The general attainments are low.

PYRMONT, C.E. (Mixed) :—Visited, 18th September.

Numbers present at examination :—Boys, 50 ; girls, 50 ; total, 100.

1. A suitable building, and in good repair ; in most other respects the organization is very defective. 2. The moral character of the school is unsatisfactory. The pupils are unpunctual and disorderly, the government is lax, and the school operations are of a desultory character. 3. The usual subjects are taught, but due prominence is not given to grammar, geography, and object lessons. The methods are mechanical and ineffective. 4. The attainments are low.

RANDWICK, C.E. (Mixed) :—Visited, 19th September.

Numbers present at examination :—Boys, 26 ; girls, 12 ; total, 38.

1. The building is pleasantly situated and in good condition. There is a fair supply of working materials. 2. Were the pupils more regular in attendance, the moral character would be fairly satisfactory. 3. Geography and grammar do not receive adequate attention. The teaching is only moderately skilful, and needs to be carried on with greater energy. 4. The proficiency is tolerable.

REDFERN, C.E. (Mixed) :—Visited, 16th, 17th, and 18th September.

Numbers present at examination :—Boys, 107 ; girls, 83 ; total, 190.

1. The material state of the school is fair. 2. The pupils are fairly punctual and regular, but require to be more closely inspected for cleanliness. The order is defective ; listlessness and inattention prevail to a great extent. 3. The classification is injudicious. The methods are, for the most part, mechanical and ineffective. 4. The average proficiency is small.

REDFERN,

REDFERN, C.E. (Infants) :—Visited, 18th September.

Numbers present at examination :—Boys 88, girls 62 ; total, 150.

1. An indifferent schoolroom, much too small for the number of pupils in attendance. This defect is about to be remedied. 2. The pupils are regular and punctual, but neither clean nor orderly. The school operations are not conducted with becoming quietness. 3. The subjects of instruction are not judiciously chosen. The classification is bad, and very imperfect provision is made for the full and profitable occupation of the pupils. The methods are unskilful. 4. The attainments are indifferent. The children are allowed to answer indiscriminately, and at random.

ST. ANDREW'S, C.E. (Mixed) :—Visited, 31st October.

Numbers present at examination :—Boys, 34 ; girls, 34 ; total, 68.

1. The schoolhouse is too small, and is greatly in need of repairs. It is in contemplation to transfer the school to a more suitable site. There is a reasonable amount of furniture and apparatus. 2. The pupils are regular, punctual, clean, and in very fair order. The moral tone of the school has greatly improved under the present teacher. 3. The methods are modern, and are calculated to produce satisfactory results. 4. The proficiency ranges from moderate to tolerable. The teacher has only been in charge a short time ; he gives promise of good work.

ST. ANDREW'S, C.E. (Infants) :—Visited, 31st October.

Numbers present at examination :—Boys, 43 ; girls, 52 ; total, 95.

1. The schoolroom is small, and out of repair, and the supply of furniture and apparatus insufficient. There is no playground, and no proper out-office. 2. The moral tone of the school is fair. 3. The subjects of instruction are appropriate, and are taught with fair efficiency. 4. The proficiency ranges from small to fair.

ST. ANDREW'S, Pres. (Mixed) :—Visited, 22nd and 23rd May.

Numbers present at examination :—Boys, 67 ; girls, 24 ; total, 91.

1. The position of this school is bad, being close to the street. The schoolroom is too small, and has no playground deserving of the name. The organization, so far as the teacher is responsible for it, is satisfactory. 2. The discipline is very fair. 3. The teaching is earnest, painstaking, and fairly skilful. 4. The attainments are fair. In the upper classes the mental culture is satisfactory, and the tone healthy.

ST. BARNABAS', C.E. (Mixed) :—Visited, 25th and 26th September.

Numbers present at examination :—Boys, 110 ; girls, 55 ; total, 165.

1. This school is in good material condition, and is very fairly provided with educational appliances. The playground, however, is too small, and the out-offices are not suitably arranged. 2. The moral character is satisfactory. The pupils are regular, punctual, clean, orderly, and well-behaved. The government is mild, but firm and effective. 3. The prescribed subjects are taught. The methods vary in skill and efficiency from indifferent to fair. 4. The attainments and intelligence of the pupils are tolerable. The general tone of the school is pleasing, and the prevailing spirit healthy.

ST. BARNABAS', C.E. (Infants) :—Visited, 30th September.

Numbers present at examination :—Boys, 70 ; girls, 60 ; total, 130.

1. The apparatus is insufficient. Otherwise, the school is very fairly supplied with working materials. 2. The school is very fairly disciplined. 3. The subjects of instruction are appropriate, the programmes carefully constructed, and the methods evince fair skill and intelligence. 4. Reasonable results are being produced.

ST. JAMES', C.E. (Mixed) :—Visited, 29th, 30th, and 31st May.

Numbers present at examination :—Boys, 109 ; girls, 71 ; total, 180.

1. The situation is favourable, the building is in good repair, and the supply of working material is sufficient. 2. The pupils are regular, punctual, and, on the whole, orderly. 3. The instruction is of modern cast, but, apart from the upper class, the methods want more penetrative power to evoke the self-reliance and thinking powers of the children. 4. Tolerable progress has been made. The teachers are diligent and conscientious.

ST. JAMES', C.E. (Infants) :—Visited, 5th and 6th June.

Numbers present at examination :—Boys, 66 ; girls, 77 ; total, 143.

1. The schoolroom is suitable, and its appliances are sufficient. 2. The pupils are regular, punctual, clean, but not orderly. Undue noise pervades the school business. 3. The methods are modern. 4. The senior classes are intelligent, and have made very fair progress ; but in the lower sections the results are very moderate.

ST. LEONARDS, C.E. (Boys) :—Visited, 23rd September.

Number present at examination :—48.

1. A stone building in fair repair. The schoolroom, however, is much too small, and the supply of furniture, apparatus, and books, inadequate. The closets are in bad order, and not well arranged. 2. The moral character of the school is good. 3. The methods are tolerably skilful, and are applied with great diligence. 4. The proficiency of the pupils approaches fair. There is evidence to shew that the formation of good mental habits has received the careful attention of the teacher.

ST. LEONARDS, C.E. (Girls) :—Visited, 27th November.

Number present at examination :—36.

1. A very fair schoolroom, but almost devoid of suitable furniture. The supply of apparatus is also very scanty. The playground is small and inconveniently placed. 2. The pupils are irregular and unpunctual. In other respects, the discipline is satisfactory. 3. The lesson documents are incomplete. The methods are practical. Drawing has yet to be introduced. 4. Passable results have been produced.

ST. LEONARDS

ST. LEONARDS, Pres. (Mixed) :—Visited, 24th September.

Numbers present at examination :—Boys, 37 ; girls, 11 ; total, 48.

1. This is a good building. The playground is not fenced in, and a large part of it is let on a building lease. The out-offices are incomplete, and badly situated. Proper hat-pegs are needed ; otherwise the furniture is adequate and suitable. 2. The discipline is unsatisfactory. 3. All the ordinary subjects are taught. The methods are, to a large extent, mechanical and ineffective. 4. The proficiency is moderate.

ST. LEONARDS, R.C. (Mixed) :—Visited, 9th December.

Numbers present at examination :—Boys, 31 ; girls, 16 ; total, 47.

1. A weatherboard building in tolerable repair, but not lined. Part of it is occupied by the teacher as a residence. The schoolroom is too small, and in a very untidy state. The furniture is insufficient, and in bad order. The out-offices are rudely built, and are not sufficiently private. Part of the playground is used by the teacher as a garden. 2. The pupils are fairly regular and punctual ; in other respects, the moral character of the school is moderate. 3. The methods are suitable, and appear to be applied with tolerable diligence. 4. The attainments range from small to moderate.

ST. MARY'S, R.C. (Boys) :—Visited, 13th, 14th, 15th, and 16th May.

Number present at examination :—225.

1. The want of a playground is a most striking defect in the organization of this school ; a book-press and more suitable desks are also needed ; otherwise the school is fairly found in educational appliances. 2. Tolerable order is maintained. Measures need to be devised to improve the punctuality. 3. The classification is unsuitable. The methods are modern, and range in point of skill from moderate to very fair. They appear to be applied with energy and diligence. 4. The pupils evince fair proficiency in reading and arithmetic, but in other subjects the attainments are less satisfactory. The intelligence of the senior pupils has been carefully and successfully cultivated.

ST. MARY'S, R.C. (Girls) :—Visited, 13th and 14th May.

Number present at examination :—99.

1. The school business is conducted in the temporary cathedral. There is no playground. The material condition and organization are, under the circumstances, tolerably satisfactory. 2. The school is fairly disciplined. 3. The teaching is painstaking, but the methods are not very suitable. 4. Fair progress has been made in the upper classes ; but as a whole, the attainments are moderate, and the thinking faculty is not highly developed.

ST. MARY'S, R.C. (Infants) :—Visited, 20th May.

Number present at examination :—56.

1. The schoolroom is suitable, and is reasonably well supplied with working materials. 2. Though not punctual, the pupils are regular in attendance, and otherwise neat, clean, and orderly. 3. The teachers are diligent, but to a great extent, the instruction is superficial. 4. The progress and mental development are only moderate.

ST. PHILIP'S, C.E. (Mixed) :—Visited, 9th October.

Numbers present at examination :—Boys 56, girls 54 ; total, 110.

1. An excellent schoolroom, amply found in educational appliances. 2. The pupils are regular, punctual, clean, and in fair order. The moral tone is promising. 3. The methods are suitable, and are applied with zeal. 4. The average proficiency is tolerable. For the time the present teacher has been in charge, satisfactory results have been produced.

ST. PHILIP'S, C.E. (Infants) :—Visited, 10th October.

Numbers present at examination :—Boys, 103 ; girls, 126 ; total, 229.

1. The material condition of the building is good, but the schoolroom is much too small, and a gallery and hat-pegs are needed. In other respects the organization is satisfactory. 2. The moral character of the school is good. 3. The subjects of instruction are appropriate. The methods vary in skill from moderate to tolerable. 4. Moderate progress has been made.

SURREY HILLS, C.E. (Mixed) :—Visited, 5th November.

Numbers present at examination :—Boys, 33 ; girls, 12 ; total, 45.

A commodious schoolhouse, but badly in need of repairs. The desks are not very suitable, and the maps are much the worse for wear. 2. The government requires to be more strict. 3. The methods are rather crude ; the children, however, work. 4. The average proficiency is tolerable. The school, during the absence of the teacher through sickness, has been placed in the temporary charge of an inexperienced person, and has evidently suffered from this cause.

SURREY HILLS, C.E. (Infants) :—Visited, 5th November.

Numbers present at examination :—Boys, 60 ; girls, 37 ; total, 97.

This school is in fair material condition. There is a fair supply of apparatus, but the furniture incomplete in desks and hat-pegs ; in other respects the organization is fair. 2. The discipline is good. 3. Dictation has yet to be added to the subjects of instruction. The methods are tolerably judicious, and efficient. 4. The average proficiency is tolerable.

SURREY HILLS, R.C. (Boys) :—Visited, 18th November.

Number present at examination :—131.

1. A very inconvenient schoolroom, lying below the level of the road, and much too small for the number of children in attendance. The light and ventilation are defective. There is a tolerable supply of working materials. 2. The discipline is not satisfactory, but the teacher has to contend against unusual difficulties. 3. The instruction is careful and tolerably judicious. 4. The average proficiency is tolerable.

SURREY HILLS, R.C. (Girls) :—Visited, 14th November.

Number present at examination :—80.

1. The situation of the building and the plan of the schoolroom are great defects in the organization. The supply of furniture and apparatus is tolerable, but they require to be more appropriately arranged. There is not a separate playground for each of the sexes. 2. The pupils are clean, tolerably well-behaved, but very unpunctual and irregular. 3. The subjects of instruction are those prescribed. The methods are practical, and not very effective. 4. The attainments are moderate.

SURREY HILLS, Wes. (Mixed) :—Visited, 11th and 30th July.

Numbers present at examination :—Boys, 49 ; girls, 20 ; total, 69.

1. The building is good, and the organization is, on the whole, satisfactory. 2. The pupils are clean, orderly, and attentive. 3. The methods are deficient in penetrativeness. 4. Fair progress has been made ; the mental power is tolerable.

SURREY HILLS, Wes. (Infants) :—Visited, 22nd July and 1st August.

Numbers present at examination :—Boys, 34 ; girls, 13 ; total, 47.

1. The schoolroom is suitable, and its appliances are sufficient ; the organization, so far as the teacher is responsible for it, is very defective. 2. The discipline is lax ; the children are slovenly. 3. The methods are not readily distinguishable ; whatever kind, they are quite ineffective. 4. The attainments are so small as to be scarcely appreciable. A new teacher has been appointed.

TRINITY, C.E. (Mixed) :—Visited, 4th November.

Numbers present at examination :—Boys, 60 ; girls, 37 ; total, 97.

1. A fair schoolroom ; requires to be recoloured internally ; desks in indifferent condition—have been badly used ; a fair supply of apparatus. 2. The pupils are punctual, but irregular, and not very tidy ; the government lacks vigour and firmness ; order, unsatisfactory. 3. The methods are not of a high order ; the pupils are inattentive, and indisposed to mental exertion. 4. The attainments are moderate.

TRINITY, C.E. (Infants) :—Visited, 4th November.

Numbers present at examination :—Boys, 81 ; girls, 66 ; total, 147.

1. A substantial stone building, in fair repair ; schoolroom, tolerably suitable ; playground, small out-offices unsuitably arranged. There are no desks, and the hat-pegs require to be re-arranged. 2. The school operations are rather noisily conducted ; otherwise, the moral character is tolerable. 3. The choice of subjects is appropriate ; the methods, which are not very skilful, need to be characterized by greater animation and energy. 4. The proficiency is barely tolerable.

VICTORIA-STREET, R.C. (Girls) :—Visited, 9th December.

Number present at examination :—52.

1. A good schoolroom, suitably furnished. 2. The order and discipline are excellent. 3. The methods are fairly skilful, and are earnestly and diligently applied. 4. The proficiency ranges from fair to very fair.

VICTORIA-STREET, R.C. (Infants) :—Visited, 7th December.

Numbers present at examination :—Boys, 42 ; girls, 42 ; total, 84.

1. The schoolroom is fairly suitable. Some additional furniture and apparatus are wanted. 2. The pupils are fairly regular, punctual, clean and tidy, and well-behaved. 3. The methods are appropriate, and are earnestly and intelligently applied. 4. The proficiency is fair.

WAVERLEY, C.E. (Mixed) :—Visited, 22nd November.

Numbers present at examination :—Boys, 50 ; girls, 34 ; total 84.

1. The material condition is very fair. 2. The discipline is very good. 3. The methods are characterized by skill and energy. 4. The proficiency ranges from tolerable to very fair.

WAVERLEY, R.C. (Mixed) :—Visited, 5th December.

Numbers present at examination :—Boys, 36 ; girls, 18 ; total, 54.

1. A fair weatherboard building. The schoolroom is clean and tolerably commodious, but inadequately furnished. The books are insufficient, and in bad order. There is only one playground, which is approached through the schoolroom, and but one outhouse for both sexes. 2. The pupils are regular and punctual, but neither clean nor well-behaved. The government is characterized by a fair amount of energy, but is wanting in firmness. 3. The instruction accords with the standard course. The methods are suitable, and moderately effective. 4. The average proficiency is very moderate. The teacher has not long been appointed.

WAVERLEY, Pres. (Mixed) :—Visited, 22nd November.

Numbers present at examination :—Boys, 25 ; girls, 16 ; total, 41.

1. An inferior weatherboard building ; playground unenclosed ; supply of furniture, insufficient. 2. The pupils are fairly regular and punctual, and tolerably clean. The order, however, is capable of great improvement. More energy and firmness need to be infused into the government. 3. The course of secular instruction is observed. The methods are mechanical and feeble. 4. The attainments are moderate.

WATERLOO, C.E. (Mixed) :—Visited, 6th November.

Numbers present at examination :—Boys, 35 ; girls, 27 ; total, 62.

1. With the exception of the fences, the material condition of the school is fair. 2. The discipline has been placed upon a sound basis. 3. The methods are calculated to produce fair results. 4. The average proficiency is barely tolerable. The teacher has not long been appointed.

WATERLOO,

1867-8.

NEW SOUTH WALES.

REPORT

OF THE

COUNCIL OF EDUCATION

UPON THE CONDITION

OF THE

CERTIFIED DENOMINATIONAL SCHOOLS

FOR

1867.

Presented to both Houses of Parliament, by Command.

By Authority:

SYDNEY: THOMAS RICHARDS, GOVERNMENT PRINTER.

1868.

COUNCIL OF EDUCATION to HIS EXCELLENCY THE GOVERNOR,

SUBMITTING

REPORT ON DENOMINATIONAL SCHOOLS FOR 1867.

To His Excellency the Right Honorable SOMERSET RICHARD, Earl of Belmore, Member of Her Majesty's Most Honorable Privy Council in Ireland, Governor and Commander-in-Chief of the Colony of New South Wales, and Vice-Admiral of the same.

MAY IT PLEASE YOUR EXCELLENCY,

We, the Council of Education, have the honor to submit to your Excellency this our Report upon the Certified Denominational Schools of the Colony for the year 1867, as required by the 27th section of the Public Schools Act of 1866.

The number of Denominational Schools in operation in 1867, exclusive of those which, on the application of the Local Boards, were converted into Public Schools, was 317; and the aggregate number of pupils in attendance was 35,306. A return of these schools and of children attending them during the quarter ending 31 December, 1867, or during the last quarter in which they were open, is appended hereto. Additional statistics are given in Appendix B.

Appendix B.

In the course of the year, the Council received four applications for Certificates to Denominational Schools, viz. :—

Locality.	Denomination.
1. Pitt-street, Sydney...	Hebrew.
2. Baulkham Hills ...	Roman Catholic.
3. Lane Cove ...	do.
4. Huon ...	do.

The first of these applications was declined by the Council, on the ground that the Council considered "that it could not widen the ground of support to Denominational Schools, by giving aid where hitherto aid had not been given, without violating the spirit of the Public Schools Act."

In the second case, when the Inspector visited for the purpose of inquiry and report, he found that the school was not then in existence.

The third application was granted, on the ground that the school had been in operation as a Denominational School in the previous year, 1866.

In consequence of the last-mentioned locality being more than five miles from the nearest Public School, the application could not be entertained.

Certificates were withdrawn from two Roman Catholic Denominational Schools—Pitt-street South, and Gundagai. The correspondence relating to the former has already been laid before Parliament, and copies of the papers respecting the latter are appended hereto.

Appendix C.

The

The Local Boards of eight Denominational Schools applied to have them converted into Public Schools, viz. :—

1. Botany-street, Sydney	Wesleyan
2. Bourke Town, Araluen	Presbyterian
3. Bowrall	Church of England
4. Castlereagh.....	Wesleyan
5. Redbank, Araluen	Presbyterian
6. Westbrook	do.
7. Windsor	Wesleyan
8. Windsor	Presbyterian

Difficulties connected with the tenure on which the property of the school at Botany-street is held prevented the change from being effected, although the Council's consent had been given to the application. In the case of Castlereagh and the two schools at Windsor, the Council's consent was withheld. The application was acceded to in each of the remaining cases, and these schools are now in operation as Public Schools.

On the application of the Local Boards, the Roman Catholic Denominational School at Rosebrook was converted into a Provisional School at the end of the year, and the Church of England School at Colo, into a Half-time School.

By express desire of the Local Boards, the undermentioned schools were finally closed :—

1. Berrima	Church of England
2. Gunning	do.
3. Penrith	do.
4. East Maitland.....	Presbyterian
5. Emu.....	Wesleyan

The following have been allowed to lapse by the Local Boards, in consequence of the very small number of pupils in attendance :—

1. Breadalbane	Church of England.
2. Holdsworthy	do.
3. Kippelaw	do.
4. Picton.....	do.
5. Picton.....	Roman Catholic.
6. Kiora	Wesleyan

The extreme difficulty of procuring qualified teachers willing to accept the charge of very small schools, in connection with the supineness of Local Boards in some instances, led to the temporary closing of a few schools, viz. :—

1. Adaminiby	Church of England.
2. Gundagai South	do.
3. Theresa Park.....	do.
4. Collector	Roman Catholic.
5. Hartley	do.
6. Nimitybelle	do.

The first, second, and fifth of these have now been re-opened.

In the case of the Roman Catholic School at Prospect, the Council declined to appoint a teacher recommended by the Local Board, because the number of Roman Catholic children in the school was only 19, those belonging to the Church of England being 20.

The general administration of Certified Denominational Schools being in all respects identical with that of Public Schools, it is not necessary to enlarge upon this subject. The Council may be permitted to remark, however, that every effort has been made to apply the regulations with equal care and consideration to all classes of schools. This fact, it is believed, is now recognized by a very large majority of Local Boards and Teachers. Any suspicion or hesitation that existed at first has now disappeared; and, with very few exceptions, the Local Boards cordially co-operate with the Council to secure an effective administration of the Public Schools Act.

The

DENOMINATIONAL SCHOOLS.

5

The school books sanctioned by the Council have now been introduced into all schools, and are found to be generally acceptable.

The condition of the Certified Denominational Schools is very fully disclosed in the Inspectors' Reports appended to the Council's Report upon Public Schools. It is satisfactory to find that the teachers are, in general, willing to receive advice, and desirous to carry out the Regulations of the Council to the best of their ability. Regarding the results already attained as a point from which future progress may be estimated, the Council now desires simply to state its conviction that, on the whole, these schools are in a state of tolerable efficiency.

The question of school fees, which has been much agitated in the Public Schools, has also excited great attention in Certified Denominational Schools, in which the number of free scholars seems to be somewhat disproportionate, as may be seen from the following Table :—

Schools.	No. of free scholars.
Church of England	2,104
Roman Catholic	3,004
Presbyterian	300
Wesleyan	227
Total... ..	5,635

The inquiries which will be made in the course of 1868, will probably elicit some explanation as to the presence of such a large number of free scholars in Denominational Schools.

We submit this as our Report upon the Certified Denominational Schools for the year ending 31 December, 1867; and in testimony thereof, we have caused our corporate seal to be affixed hereto, this thirtieth day of March, one thousand eight hundred and sixty-eight.

(L.S.)

HENRY PARKES, President.
 GEORGE ALLEN.
 W. M. ARNOLD.
 JAMES MARTIN.
 J. SMITH.

W. WILKINS, Secretary.

APPENDIX A.

RETURN of the Attendance of Children at the Certified Denominational Schools of New South Wales, as certified by the Local Boards, for the Quarter ending 31st December of the Year 1867, or for the last Quarter in which the Schools were in operation respectively.

Name of School. I.	Number of Children on Rolls.									Average Weekly Attendance.

APPENDIX C.

CORRESPONDENCE RELATING TO THE WITHDRAWAL OF THE CERTIFICATE FROM
THE ROMAN CATHOLIC DENOMINATIONAL SCHOOL AT GUNDAGAI.

No. 1.

MEMORANDUM to the Secretary, Council of Education, Sydney.

Gundagai R. C. School Quarterly Return.

I have written to the Teacher of the Gundagai R.C. School regarding the Return not being forwarded, and will report as soon as I hear in reply.

J. M'CREIDIE,
Inspector of Schools,
Albury District.

Inspector's Office,
Albury, 3rd June, 1867.

No. 2.

MEMORANDUM to the Secretary, Council of Education, Sydney.

Return of the Gundagai R.C. Denominational School, for the Quarter ending 30th March, 1867.

This Quarterly Return has not yet been received, and no notice has yet been taken of my letter of the 3rd instant on the subject.

J. M'CREIDIE,
Inspector,
Albury District.

Inspector's Office,
Albury, 17th June, 1867.

No. 3.

The Secretary, Council of Education, to Rev. J. Foley.

Council of Education Office,
Sydney, 22 June, 1867.

Rev. Sir,

I have the honor, by direction of the Council of Education, to acquaint you, that the Return of the Gundagai Certified Roman Catholic School, for the Quarter ending 31st March last, has not been furnished, as required by Article 18, Section II, of the Regulations of the 27th February, 1867, and that no notice has been taken, by the Teacher, of the Inspector's letter of the 3rd instant on the subject. Copy forwarded
herewith.

2. As the Regulations of the Council have been infringed hereby, I am directed by the Council to request, through you, that the Local Board will be good enough to shew cause why the certificate should not be withdrawn from the School, in accordance with Article 11 of the Regulations above-mentioned.

I have, &c.,
W. WILKINS,
Secretary.

No. 4.

MEMORANDUM to the Secretary, Council of Education, Sydney.

Gundagai and Tumut R.C. Schools' Quarterly Returns.

No Returns have been received from the above Schools for the Quarter ending 29th June, 1867. A memorandum has been forwarded to the Teachers regarding the delay.

J. M'CREIDIE,
Inspector,
Albury District.

Inspector's Office,
Albury, 15th July, 1867.

No. 5.

The Secretary, Council of Education, to The Most Reverend Archbishop Polding.

Council of Education Office,
Sydney, 23 August, 1867.

My Lord,

I have the honor, by direction of the Council of Education, to forward, for your Grace's information, copy of a letter, dated 22nd June last, addressed to the Rev. J. Foley, Chairman of the Local Board, Certified Roman Catholic Denominational School at Gundagai, stating that the Return of the School, for the Quarter ending 31st March last, has not been furnished, as required by Article 18, Section II, of the Regulations of the 27th February, 1867. No reply to that communication has been received from the Rev. J. Foley.

2. As the Return for the School for the subsequent Quarter (June) has also not been furnished, notwithstanding frequent applications to the Teacher by the Inspector, the Council will be compelled to withdraw the certificate from the School.

I have, &c.,
W. WILKINS,
Secretary

No. 6.

The Very Rev. S. J. A. Sheehy, V.G., to The Secretary, Council of Education.

Vicar General's Office,
26 August, 1867.

Sir,

As Gundagai is within the Diocese of Goulburn, I have forwarded to the Right Reverend Dr. Lanigan, the Bishop of that Diocese, your letter of the 23rd inst., addressed to His Grace the Archbishop, on the subject of School Quarterly Returns.

I have, &c.,
S. J. A. SHEEHY, V.G.

No. 7.

No. 7.

MEMORANDUM to the Secretary, Council of Education, Sydney.

Gundagai R. C. School: Returns for Quarters ending March and June, 1867.

The Teacher could offer no valid excuse for her neglect in not making up and forwarding these Returns.

Upon inquiry, she said, first, that she thought Father Foley had written about them, and then that she could get no one to sign them for her. This was palpably untrue, as they could have been signed by Father Foley when he visited Gundagai. When pressed on that point, she had nothing whatever to say. Finding no Quarterly Returns in the School, she said they were at her lodgings, and it was only when I told her to send for them that she confessed that nothing had been done to them. The Daily Report Book had also to be sent for.

The neglect has been, in my opinion, partly owing to ignorance, but more to sheer carelessness.

J. M'CREIDIE,
Inspector of Schools,
Albury District.

Deniliquin, 19th Sept., 1867.

No. 8.

The Secretary, Council of Education, to Miss Barry.

Council of Education Office,
Sydney, 1 October, 1867.

Madam,

I have the honor, by direction of the Council of Education, to acquaint you, that a report, dated 19th instant, has been received from the Inspector, upon your verbal explanation of neglecting to furnish the Returns of the Certified Roman Catholic Denominational School at Gundagai, for the Quarters ending March and June last, in compliance with the requirements of Article 15, Section II, of the Regulations of the 27th February last, although you were repeatedly written to on the subject.

2. I am instructed by the Council to acquaint you, that your explanation is very unsatisfactory, and to state that it appears the neglect is attributable to sheer carelessness.

3. Under these circumstances I am directed by the Council to call upon you to shew cause why you should not be dismissed from office.

I have, &c.,
W. WILKINS,
Secretary.

No. 9.

The Secretary, Council of Education, to Rev. J. Foley.

Council of Education Office,
Sydney, 1 October, 1867.

Reverend Sir,

I have the honor, by direction of the Council of Education, to enclose a copy of my letter, dated 22nd June last, No. 1913, addressed to you,

2. As no reply has been received to that communication it is believed that you could not have received it, and the Council is therefore desirous of bringing the subject under your notice, before taking any further steps in the matter.

3. I beg also to state that neither the Returns mentioned in my letter above referred to, nor those for June, have yet been furnished.

I have, &c.,
W. WILKINS,
Secretary.

(Enclosure in No. 9.)

The Secretary, Council of Education, to Rev. J. Foley.

Council of Education Office,
Sydney, 22 June, 1867.

Rev. Sir,

I have the honor, by direction of the Council of Education, to acquaint you that the Return of the Gundagai Certified Roman Catholic School, for the Quarter ending 31st March last, has not been furnished as required by Article 18, Section II, of the Regulations of the 27th February, 1867, and that no notice has been taken by the teacher of the Inspector's letter of the 3rd instant on the subject.

2. As the Regulations of the Council have been infringed hereby, I am directed by the Council to request through you, that the Local Board will be good enough to shew cause why the certificate should not be withdrawn from the school, in accordance with Article 11 of the Regulations above-mentioned.

I have, &c.,
W. WILKINS,
Secretary.

Copy forwarded
herewith.

No. 10.

The Secretary, Council of Education, to Rev. J. Foley.

Council of Education Office,
Sydney, 6 November, 1867.

Rev. Sir,

I have the honor, by direction of the Council of Education, to acquaint you that the Quarterly Return of the Certified Roman Catholic Denominational School at Gundagai, for September last, has not been received.

2. As no notice has been taken of my former letter, bringing under notice that the Returns of this school, for the Quarters ending March and June, had not been furnished, in accordance with Article 18, Section II, of the Regulations of 27th February last, I am instructed to acquaint you that the Council hereby withdraws the certificate from the abovenamed school.

I have, &c.,
W. WILKINS,
Secretary.

No. 11.

No. 11.

Rev. J. Foley to The Secretary, Council of Education.

Tumut, 11 November, 1867.

Sir,

In reference to your letter of 6th instant, stating that the Quarterly Returns of the Certified Roman Catholic Denominational School at Gundagai have not been duly furnished, I have the honor to inform you that I was under the impression that they were always sent at the proper time. I now beg to forward them, and to state, for the information of the Council, that the cause of delay arose from the fact that the teacher did not know the proper method of compiling them, rather than from her unwillingness to do so.

She has been frequently advised as to the necessity of supplying the Council with all the information they may require, which she has not done, for the reason already stated, and hence no notice has been taken of your previous correspondence.

I also beg to submit the following, as the names of the gentlemen who constitute the Local Board, viz. :—

Messrs. Patrick Ryan,
Michael Doyle,
Michael Crowe,
Robert Riley.

I have, &c.,
JAMES FOLEY,
Chairman of the Local Board.

No. 12.

MEMORANDUM to the Secretary, Council of Education, Sydney.

Tumut and Gundagai R.C. Schools.

Letters from the Rev. J. Foley enclosed. Forwarded for the information of the Council.

Nov. 11, 1867.

Yarra Yarra, 18th November, 1867.

J. M'CREIDIE,
Inspector, Albury District.

(Enclosure in No. 12.)

Rev. J. Foley to The Inspector, Albury District.

Tumut, 11 November, 1867.

Sir,

With regard to the R.C.D. School at Gundagai, I beg leave to inform you that, having spoken to the teacher some time ago relative to the necessity of furnishing the Quarterly Returns, I was, up to the present time, under the impression that she had done so. On last week I have caused her to send them, and I have explained to the Council the reason why they were not forwarded before.

I also beg to submit the following as the names of the members of the Local Board of the Certified R.C.D. School at Gundagai, viz. :—

Messrs. Patrick Ryan,
Michael Doyle,
Michael Crowe,
Robert Riley.

I have, &c.,
JAMES FOLEY,
Chairman of the Local Board.

No. 13.

The Secretary, Council of Education, to Rev. J. Foley.

Council of Education Office,
Sydney, 20 November, 1867.

Rev. Sir,

I have the honor, by direction of the Council of Education to acknowledge the receipt of your letter of the 11th instant, stating the cause of the delay in furnishing the Quarterly Returns of the Roman Catholic Denominational School at Gundagai.

2. In reply, I am instructed to refer you to my letter of the 16th instant, in which you are informed that, as the Returns of this school for the Quarters ending March and June last had not been furnished in accordance with Article 18, Section II, of the Regulations of the 27th February, 1867, the Council had withdrawn the certificate from the school.

I have, &c.,
W. WILKINS,
Secretary.

No. 14.

Rev. J. Foley to The Secretary, Council of Education.

Tumut, 4 December, 1867.

Sir,

With reference to the withdrawal of the certificate from the R.C.D. School at Gundagai, communicated by you to me on the 6th November, and published in the *Government Gazette* of the 19th ultimo, I have the honor to draw your attention, and the attention of the Council of Education, to Section 28 of the Public Schools Act, which provides that from any school "no certificate shall be withdrawn before the 1st January 1868 from any existing Denominational School on account of the number of children attending thereat being less than the number required by this Act as long as such number shall not be less than the number required by the existing Regulations of the Denominational School Board nor shall such certificate be withdrawn at any time thereafter so long as there shall be in regular attendance at such school not less than thirty children."

I have also to submit, that the *incompetency of a teacher* is, by Section 10 of the same Act, purely a matter which may be remedied by the Council, by the appointment of a competent teacher to the school; and such incompetency could not be assumed as a reason for depriving the children attending such school of all means of education through the withdrawal of the certificate from it. I beg to state also, that the said school was never in such a flourishing condition as it is now, there being over thirty children in attendance thereat.

I hope, therefore, the Council will reconsider the matter, and, taking the premises into consideration, restore the certificate to the school.

I have, &c.,
JAMES FOLEY,
Chairman.

No. 15.

No. 15.

The Secretary, Council of Education, to Rev. J. Foley.

Council of Education Office,
Sydney, 12 December, 1867.

Rev. Sir,

I have the honor, by direction of the Council of Education, to acknowledge the receipt of your letter of the 4th instant, with reference to the withdrawal, by the Council, of the certificate from the Roman Catholic Denominational School at Gundagai.

2. In reply, I am instructed to remind you that the certificate was not withdrawn from the Gundagai Roman Catholic School on account of the incompetency of the teacher, or of the insufficient number of pupils. The 23th section of the Public Schools Act, cited in your letter, does not therefore apply to the case.

3. The actual ground for withdrawing the certificate was the infringement of Article 18, Section II, of the Regulations of the 27th February, 1867, which requires that certain Returns shall be furnished from all schools supported by the Council at stated periods. Notwithstanding frequent applications on the part of the Inspector, the Returns in question were not furnished; and the Council's repeated remonstrances having also been unheeded, there remained no alternative but to withdraw the certificate.

4. The Council having fully considered the whole of the circumstances, is compelled to decline acceding to your request that the certificate may be restored.

I have, &c.,
W. WILKINS,

No. 16.

Rev. J. Foley to The Secretary, Council of Education.

Tumut, 20 December, 1867.

Sir,

In answer to your letter of the 12th instant, referring to the withdrawal of the certificate from the R. C. D. School at Gundagai, in which you state that the actual ground for withdrawing the certificate was the infringement of Article 18, Section II, of the Regulations, &c., that is, that the returns of that school were not furnished to the Council; the article referred to says, "Quarterly and Annual Returns are to be furnished from every school—negligence in compiling returns will render a teacher liable to a fine, or, if repeated, to a loss of classification. Teachers found guilty of wilful falsification of registers or returns will be instantly dismissed." Now, sir, I have the honor, most respectfully, to submit that it is one thing to punish a *teacher* by fine or loss of classification, but that it is totally a different matter to cancel the certificate of a *school*; that the above-named Regulation expressly provides for the former, but does not even imply the latter; that visiting the neglect of the teacher alone upon the school itself is a manifest misapplication of the Regulation, and implies either the misapprehension or wilful distortion of the obvious meaning of its words, or the predisposition to destroy the school, and would establish the impracticable principle dangerous to all schools, viz., the identity of the teacher's efficiency with the existence of the school—a principle which, if acted upon, would endanger every school in the Colony.

Hence, I would respectfully urge that cancelling the certificate of the Gundagai R. C. D. School would constitute a precedent which would, in future, place the Council in the awkward position of either abandoning their own legalized Regulations, or of abolishing every school the present teachers of which may be found to be negligent or incompetent. I would, therefore, a second time, earnestly beg the Council to reconsider the matter, and restore the certificate to the school. Should, however, the Council deem it better to act otherwise, we indulge in the hope that they will see the advisableness of paying the teacher her salary for the past twelve months, and we respectfully request of them to grant us some aid towards the support of a Provisional School at Gundagai.

I have, &c.,
JAMES FOLEY, C.C.

No. 17.

The Secretary, Council of Education, to Rev. J. Foley.

Council of Education Office,
Sydney, 9 January, 1868.

Rev. Sir,

I have the honor, by direction of the Council of Education, to acknowledge the receipt of your letter, dated 20th December last, in further reference to the withdrawal by the Council of the certificate from the Roman Catholic Denominational School at Gundagai, and requesting that the Council will reconsider the decision arrived at in this matter. The grounds on which this application is based are substantially—1st. That the Regulations quoted by you (Article 18, Section II) only empowers the Council to punish the teacher who neglects the duty of furnishing Returns; and 2nd. That this regulation does not even imply the power to cancel the certificate of a school.

2. In reply, I am instructed to point out that the objections now advanced by you are inadmissible, inasmuch as the Council took no steps towards withdrawing the certificate until it had been found that the punishment inflicted upon the teacher—by depriving her of salary—was ineffectual. Further, the certificate was not withdrawn on account of the neglect of the teacher alone to furnish the Quarterly Returns of the school, but also because the Local Board, when communicated with through you as Chairman, virtually countenanced the infringement of the Regulations by omitting to take any steps to cause the Returns in question to be forwarded, notwithstanding that the matter was repeatedly brought under their notice. The Local Board having thus become parties to the systematic disregard of the Regulations, the Council could no longer deal with the teacher as the only person deserving of blame. It was further evident that the duties of the Local Board in the matter of school records and returns, as indicated in Articles 70 and 71 of the Regulations, could not have been performed.

3. As regards the second objection to the Council's action, specified in your letter, I am to remark that Article 11, Section II, of the Regulations expressly authorizes the Council to withdraw certificates when the Regulations are infringed. The Council withdrew the certificate from the Gundagai Roman Catholic Denominational School under this Regulation, and not, as you suppose, under Article 18.

4. As, therefore, your objection fails to meet the actual grounds upon which the certificate was withdrawn, the Council is unable to perceive any reason for departing from the decision already announced to you.

5. I am also instructed to point out that the Council can grant assistance to Provisional Schools "in remote and thinly populated districts" only, and that this description does not apply to the township of Gundagai.

I have, &c.,
W. WILKINS,
Secretary.
No. 18.

No. 18.

Rev. J. Foley to The Secretary, Council of Education.

Tumut, 24 January, 1868.

Sir,

In answer to your letter of January 12th, respecting the withdrawal of the certificate from the R. C. Denominational School at Gundagai, and stating as the Council's reasons for not restoring the certificate thereto,—1st. That the teacher did not punctually furnish the Quarterly Returns of the school—2nd. Because the Local Board virtually countenanced the infringement of the Regulations by omitting to take any steps to cause the Returns to be forwarded. For the former neglect you state the teacher has been punished by the deprivation of her salary. To the second, I beg to say that the only other party to the infringement of the regulations would be the Local Board, which did not exist, and, consequently, could not be charged with any neglect of duty. This Board was appointed by his Lordship the Bishop of Goulburn, in October, 1867, and that fact I notified to the Inspector for the district; but it was not known by me that the Council had, almost simultaneously, withdrawn the certificate. Thus it appears to me that reason 2 is not valid.

I may also state, that when the Council first communicated with me, I used every endeavour to cause the teacher to forward her Returns regularly, and I was under the impression that she did so.

It appears to me that it is the duty of the Council, as it has charge of our educational establishments, to inquire whether there is a Local Board for each school, and, if there is not such a body, to cause it to be appointed; and so I conceive that, practically, the certificate was withdrawn because there was no Local Board for that school, or that the extinction of certain Denominational schools is more an object of the Council's solicitude than their existence and support.

I have, &c.,

JAMES FOLEY,

Chairman.

No. 19.

The Secretary, Council of Education; to Rev. J. Foley.

Council of Education Office,

Sydney, 6 February, 1868.

Rev. Sir,

I have the honor, by direction of the Council of Education, to acknowledge the receipt of your letter, dated the 24th ultimo, stating that no Local Board of the Certified Roman Catholic Denominational School at Gundagai existed when the certificate was withdrawn from the school, and that consequently they could not be a party to the infringement of the Regulations, by omitting to take any steps to cause the returns of the school to be forwarded.

2. In reply, I am instructed by the Council to point out that the plea now advanced is inconsistent with the tenor of previous communications, in which you virtually admit your responsibility as Chairman of the Local Board. For example, in a letter dated 11th November, 1867, and signed by you as Chairman of the Local Board, you remark—"I was under the impression that they (the returns) were always sent at the proper time." In a letter of the same date to Mr. M'Creddie, Inspector of Schools, you observe—"Having spoken to the teacher some time ago relative to the necessity for furnishing the Quarterly Returns, I was up to the present time under the impression that she had done so." Again, the teacher's salary abstract for the month of April was signed by you as a member of the Local Board; and further, your letter now under consideration contains the following statement,—“I may also state that when the Council first communicated with me, I used every endeavour to cause the teacher to forward her Returns regularly, and I was under the impression that she did so.” It is obvious from these extracts that you have, throughout, regarded yourself, and acted, as Chairman of the Local Board.

3. If, however, any weight is to be attached to the point raised by you—that there was no Local Board—it was obviously your duty to have informed the Council at the outset that an error had been committed in addressing any communication to you on the subject.

4. With respect to your remark,—“That it is the duty of the Council, as it has charge of our educational establishments, to inquire whether there is a Local Board for each school, and, if there is not such a body, to cause it to be appointed,” I am to state that the Council has no power to cause a Local Board to be appointed to a Certified Denominational School, or to interfere in any way in such a matter. This duty devolves upon the head of the denomination, who alone possesses the necessary authority. Further, it is not requisite that the Local Board should be composed of more than one person; and, in fact, the Boards of several Denominational Schools consist of the Chairman only.

I have, &c.,

W. WILKINS,

Secretary.

No. 20.

Rev. J. Foley to The Secretary, Council of Education.

Tumut, 17 February, 1868.

Sir,

In answer to your letter of the 6th instant, in which you state that the plea advanced by me in my last letter, against the withdrawal of the certificate from the R.C.D. School at Gundagai, namely, the non-existence of a Local Board, is inconsistent with the tenor of previous communications, and in which you make quotations from my previous letters, in order to shew that I have throughout regarded myself and acted as Chairman of the Local Board, I have the honor to remark that those quotations do not prove any inconsistency on my part, as they are all extracts of letters on, and subsequent to, November 11th, 1867, on which date I was appointed Chairman of the Local Board, and informed both the Council of Education and the District Inspector of the fact; and that the Local Board was just then appointed. But I must remind you that the certificate was withdrawn five days prior to that date, and that up to that time I expressed nothing to the Council which could lead them to think that I was Chairman. In fact, I was not recognized by the Council in the first instance as having any connection with the school when they granted the certificate, for they did not communicate with me on the subject—and I may be pardoned when I say, that I doubt whether it was ever granted. Therefore, there is no inconsistency in my plea. Again, I must state that the “frequent remonstrances” made by the Council to the Local Board mentioned in your letter of December 12th, about the matter of school Returns, are comprised in one solitary communication previous to November 6th, and upon receipt of which I used my best endeavours, I must repeat, to cause the said Returns to be forwarded, and when I found that my advice was disregarded, I sent them myself. But previous to the withdrawal of the certificate, or until the appointment of the Local Board, I neither acted as Chairman—for I could not—nor otherwise officially than as head of the Catholics of the district, and having the interests of the school at heart. I surely could not compel the teacher to forward records, or punish her for neglect of duty. This was exclusively in the power of the Council, and their simple duty to do. And it followed consequently, that instead of blame being attached to the teacher and the Local Board, as you have mentioned.

mentioned in your letter of the 9th January, 1868, it should be attached rather to the teacher and the Council of Education. In your letter of the 12th December you state "the actual ground for withdrawing the certificate, was the infringement of Art. 18, Sec. II, which requires that certain Returns shall be forwarded," &c. This regulation empowers the Council to punish the teacher for neglect, and this has been done in the present case, as you state, by depriving her of salary. But it seems the Council can act as arbitrarily as they like with impunity, for not finding the last-named Regulation comprehensive enough for their purpose they change their "ground," in yours of the 9th January, to Art. 11, Sect. II, which, I may say, gives as much scope for cancelling the certificate of any school they may not be inclined to favour as the most despotic Council may require. Again, the certificate was withdrawn on November 6th, 1867, but by Art. 28 of the Public Schools Act it should not be withdrawn in any case until January 1st, 1868, except through decrease of attendance of pupils at the school; and although the Regulation Art. 18, Sec. II, gives ample latitude for abolishing any school for the most trivial infringement, after the 1st January, 1868, I fail to see how it could be consistently applied to the present case, except by adopting the novel mode of procedure of making a regulation overrule an *express Act of Parliament* in order to accomplish a predetermined object.

In conclusion, I have merely to state that seeing there is no probability of the Council restoring the certificate, I will submit the whole of the correspondence in this case to the public who will judge of the justice or expediency of withdrawing the certificate from the Gundagai R.C.D. School.

I have, &c.,

JAMES FOLEY.

No. 21.

The Secretary, Council of Education, to Rev. J. Foley.

Council of Education Office,

Sydney, 27 February, 1868.

Rev. Sir,

I have the honor, by direction of the Council of Education, to acknowledge the receipt of your further letter, under date the 17th instant, with regard to the withdrawal of the Certificate from the Roman Catholic Denominational School at Gundagai.

2. In reply, I am instructed to point out that, although your letters, from which the quotations given in my letter of the 6th February are extracted, are dated on and subsequent to the 11th November, the date on which you state you were appointed Chairman of the Local Board, the acts therein mentioned occurred at an earlier period, prior to the withdrawal of the Certificate.

3. I am further to remind you, that the question respecting the Returns was first brought under your notice by letter, dated the 22nd June, 1867, in which the Local Board are requested to shew cause why the Certificate should not be withdrawn, in accordance with Section II, Article II, of the Council's Regulations. Had you, on receipt of that letter, intimated to the Council that there was no Local Board, or that you were not a member of it, steps would have been taken to invite the attention of the proper authority to the fact. But in the absence of any information on this head, the Council, on the 23rd August, addressed a communication to His Grace the Archbishop, acquainting him of the facts of the case, in reply to which, the Very Reverend the Vicar General stated that the Council's letter had been forwarded to the Right Reverend Dr. Lanigan, the Bishop of the Diocese in which Gundagai is situated. On the 1st October following, a further communication was made to you, enclosing copy of the letter addressed to you on the 22nd June, again bringing the subject under your notice. The Teacher was written to on the same date; but no reply was received to either of these communications, until the Council's decision to withdraw the Certificate had been notified.

I have, &c.,

W. WILKINS,

Secretary.

REPORT

ON THE

COMMON SCHOOL SYSTEM

OF THE

UNITED STATES, AND OF THE PROVINCES OF UPPER AND LOWER CANADA.

MY LORDS AND GENTLEMEN,

On the 4th April, 1865, I received your instructions to proceed to the United States of America and to Canada, for the purpose of inquiring into, and then reporting to you upon, the system of education which prevails there. Extent and length of the inquiry.

You considered that such inquiry might be completed in six months, and the Report written in two months more. Six months proved ample time for the first purpose; but the composition of my Report has fully occupied twice the time that you expected it to do. I sailed from Liverpool on the 22nd April, landing in New York on the 2nd May. I returned from New York on 4th October, and set foot ashore at Liverpool on the 15th. I at once addressed myself to the Report, which I now have the honor of submitting to your perusal and consideration.

On arriving in the country I found that neither in the States nor in Canada is the summer half of the year the best period of time for visiting schools. The months of July and August are the ordinary months for what may be called the American "long vacation." The effects of heat on the schools are more serious than the effects of cold. In rural districts particularly there is more frequent demand in summer for juvenile labour; and the evil of what the Americans call "absenteeism," always considerable, exhibits itself in larger proportions. In cities and towns the teachers are a more permanent body; but in the country schools it is not usual to engage the teacher for more than a single session—summer or winter, as the case may be; and more pains are generally taken by the trustees to secure efficient teachers for the winter term, as being both the longest and the best attended, than for the summer one. Evening schools, as with ourselves, are only held in the winter months. Summer an unfavourable season for visiting schools.

It results, therefore, that so far as the actual visitation of schools is concerned, two out of the five months—from the beginning of May to the end of September—which I spent in the country were lost time. The schools were closed, and could not be visited. I could only occupy my time profitably, and I think I did occupy it very profitably, by extending the field of my inquiry among persons interested in educational questions, and particularly among those actually engaged in the management and supervision of schools, or by attending meetings of teachers' associations, where I could observe the tone and bearing of 500 or 600 educationists gathered from all parts of a State, and listen to the very interesting discussions on educational matters that ensued. It was thus that I made myself acquainted with the school system of the great cities of Cincinnati, St. Louis, Chicago, and Detroit, and, generally, with the system of the States of Ohio and Illinois, though I had no opportunity of inspecting one of their schools. It was thus that I attended a very instructive meeting of the Ohio teachers at Cincinnati, and another of the Upper Canada teachers at Toronto.* And though in this way I saw fewer schools, I certainly saw many more persons concerned with schools, and reached a larger range of opinion and sentiment upon the subject; while the schools themselves, when similarly circumstanced, are so uniform in character, and present so few distinctive differences, that to see two or three is almost to see all of the same class, and an extended survey merely multiplies your observations, without giving any greater clearness or precision to your ideas. Some compensation, however, for this.

* There was a marked difference in the character of these two teachers' associations, both as regards their "personnel" and their discussions. At the Ohio meeting there were present perhaps 500 members, of whom fully half were females. At Toronto there was a mere sprinkling of mistresses—not a dozen out of 150 members present—a difference which was to be expected from the proportion in which the two sexes are employed as teachers in the two countries—in the States there being a decided preference for female teachers, in Canada for male. There was much more movement and vivacity in the discussions at Cincinnati, but there was exhibited as much solid, practical sense at Toronto. There was a peculiar element in the Cincinnati gathering, arising from the presence of the ladies, which, of course, the Toronto assembly lacked altogether. The Cincinnati proceedings and addresses are reported in the "Ohio Educational Monthly," for September, 1865, and are well worth reading. I shall have frequent occasion to refer to them. Characteristics of the teachers' meetings at Cincinnati and Toronto.

Subject studied in every class of school.

I was charged in my instructions "to study my subject in small and in large schools, in the country districts as well as in the thickly peopled towns," and this I did sufficiently so to arrive at distinct and, I believe, accurate conclusions. When I did visit a school, it was for the purpose of thorough inspection. I spent my morning, sometimes my whole day there—a pertinacity which my kind guides at first did not seem to understand; * but when they did understand that I thought I could gain my object better by passing three or four hours in one school and making myself thoroughly master of the methods pursued, than by being hurried through half a dozen schools in the same time, they invariably yielded to my whim, at whatever cost of weariness to themselves, with the best grace imaginable. Indeed, nothing could exceed the readiness with which every facility was afforded me for obtaining the information I desired, or the cordial welcome that awaited me in every school; and my own dulness or negligence alone will be in fault if I shall be thought to have made but a poor use of the opportunities which I enjoyed. †

Report divided into two parts.

It will be convenient to break up my Report into two grand divisions, and to devote the first part to an explanation and review of the school system of the United States; the second part to the system (not altogether dissimilar, but considerably modified in several important details) which has been adopted in the provinces of Upper and Lower Canada. ‡

School visits in America generally too brief and rapid.

* The way in which American schools, and American sights in general, are commonly shown to visitors is too rapid to be entirely satisfactory. As I shall have occasion to remark in its proper place, thorough inspection of schools, such as we are accustomed to in England, is a great desideratum both in the States and in Canada.

I happened to be in the High School of Philadelphia when a deputation of perhaps 25 citizens of St. Louis—who (as is common in America) were on a sort of cruise among the eastern cities to observe their various municipal and social institutions—entered for the purpose of "seeing the school." Their visit was expected, and an address of welcome and two recitations had been prepared in their honor. To these they listened, and by the mouth of one of their number made a brief reply; and after having stayed perhaps 20 minutes, took their departure, "charmed," they said, "with what they had seen," but, beyond having seen the intelligent faces of about 500 boys, and observed the perfect order that was maintained, knowing, I should suppose, nothing more of the actual working of the school than when they came.

Persons to whom I am indebted for information.

† This perhaps will be as good a place as any for mentioning the names of those to whom I am principally indebted for information received. I desire to do so for a double purpose—both to show that I applied to the best sources, and also to express my gratitude for kindness which never seemed to grow weary of my importunity. My chief informants, then, were these:—

In the State of New York:—In New York City, Messrs. Boesé, Davenport, Hastic, Murray, Vance, and Nelson, of the Board of Education; Messrs. Randall, Kiddle, and Calkins, superintendents of schools; Messrs. James F. Gerard, A. R. Wetmore, Charles Brace, and B. M. Hartley, more or less connected with the schools or charitable institutions of the place; Principal Webster and Professors Owen and Docharty, of the Free Academy; Professors M'Vickar and Lieber, of Columbia College; Messrs. R. B. Minturn, sen. and jun.:—At Albany, Mr. J. V. L. Pruyn, Chancellor, and Dr. Samuel Woolworth, Secretary of the Board of Regents; Mr. J. W. Mason, Principal of the Albany Academy:—At West Point, Professors French, Bartlett, Church, and Mahan,

In the State of Connecticut:—At Newhaven, Professors D. C. Gillman, and Noah Porter, of Yale University; Mr. Kinne, Principal of the High School; General Russell, proprietor of a large private school; Rev. W. Kingsley and Miss Mary Hillhouse:—At Hartford, Hon. H. Barnard, editor of the American Journal of Education, and perhaps the oldest and most experienced practical educationist in the country; President Kerfoot and Professor Pynchon, of Trinity College; Bishop Williams, Mr. Stone, of the Deaf-Mute Asylum, Mr. Capron, Principal of the High School; Rev. W. C. Doane.

In Rhode Island:—At Providence, President Sears and Professor Dunn, of Brown University; Rev. D. Leach, Superintendent of Schools.

In Massachusetts:—At Boston, Hon. Governor Andrew, Hon. Joseph White, Superintendent, and Rev. B. G. Northrop, State Agent of Schools; Hon. J. D. Philbrick, City Superintendent; Bishop and Mrs. Eastburn; Mr. Geo. F. Ticknor; Mr. and Mrs. C. G. Loring; Mr. Samuel Eliot, formerly President of Trinity College, Connecticut; President Hill and Professors Child and Cutler, of Harvard University; Mr. C. Norton, of Cambridge; Mr. Gardner, Mr. Sherwin, Miss Caryl and Miss Stickney, Principals of High Schools:—At Lowell, Rev. T. Edson:—At Salem Training School, Principal Crosbie and Miss Smith:—At Westfield Normal School, Principal Dickenson and Miss Mitchell:—at Springfield, Mr. Parish, Principal of High School.

In Ohio:—At Cincinnati, Hon. E. E. White, State Commissioner of Schools; Mr. Rufus King, formerly President of Board of Education; Mr. Rickoff, Ex-superintendent; Mr. Harvey, President of Teachers' Association; Professor Andrews, of Athens University; Mr. Hough, a publishers' agent.

In Illinois:—At Chicago, Bishop Duggan (R.C.), Mr. W. Wells, Ex-superintendent, and Mr. Pickard, Superintendent of City Schools; Mr. Howland, Principal of High School.

At Philadelphia:—Mr. E. Shippen, President of Board of Controllers; Mr. Macquire, Principal of Boys' High School; Mr. Dallas, a school director.

In Canada:—At Toronto, Dr. Egerton Ryerson, Superintendent of Education in Upper Canada; Mr. Hodgins, of the Education Department; Rev. James Porter, Superintendent, and Mr. Barber, Ex-superintendent of Schools; Dr. MacCaul, President of Toronto University; Professor Daniel Wilson; Provost Whitaker, and Professor Ambery, of Trinity College; Mr. Cockburn, of Upper Canada College; Mr. Robertson, Principal of Normal School; Mr. Angus Dallas, Mr. R. Brookes, residents in the city and interested in educational questions:—At Hamilton, Dr. W. Ormiston, late Inspector of Grammar Schools, and Principal MacCallum, of the Central School:—At Ottawa, Mr. Cosens, Superintendent of Schools; Mr. Thorburn, Master of the Grammar School; Rev. W. Wardrop:—At Montreal, Hon. P. J. Chauveau, Superintendent of Education for Lower Canada:—At Quebec, Mr. Meredith, Assistant Secretary of Upper Canada; Mr. C. Dunkin, M.P. for Broome; M. Ignace Legare, of Naval University. Were I to add the names of the teachers of the different grammar and primary schools which I visited, I should swell my list beyond all reasonable limits. To all those gentlemen and ladies I am deeply indebted; to some of them, as *ex. gr.*, to Messrs. Barnard, Philbrick, Northrop, Gillman, Porter, Boesé, Ryerson, Hodgins, and Chauveau, my debt is heavier than I am ever likely to be able to repay. If this Report ever falls under their eye, they will at least see that I have not forgotten what I owe them.

‡ I may say here once for all that, as I shall need a discriminating epithet, I shall venture to use the adjective "American" as De Tocqueville has used it—exclusively of the United States. The adjective "Canadian" admits of no ambiguity.

PART I.—THE SCHOOL SYSTEM OF THE UNITED STATES.

The Common School system, which occupies so proud a position among American institutions, is almost exclusively a product of free soil. Into the Southern States, usually so called, it had scarcely penetrated before the civil war, with the exception, as I was informed, of a tolerably complete organization for the city of Charleston, S.C., and another for the State of Louisiana.* In the border States, as Kentucky and Missouri, the system existed, but in very dwarfed dimensions. In the new State of Western Virginia it was being organized during the period of my visit; but over the Northern States, from the Atlantic to the Pacific, and from the Ohio to the St. Lawrence, it has covered the land with a vast network of schools. The States which I actually visited, for the purpose of acquainting myself with its phenomena, were New York, Massachusetts, Connecticut, Rhode Island, Pennsylvania, Ohio, and Illinois, to which I may add the cities of Detroit in Michigan, and St. Louis in Missouri. I considered this field of observation sufficiently large, and from it I have gathered the materials of this Report.

The American common school the product of free soil.

States actually visited.

It had been apprehended by some that the moment when the country was convulsed by the tremendous struggle of its civil war was an unfavourable opportunity for examining calmly the operation of the American system and the condition of American schools; and I was even recommended to commence my investigations in Canada, in the hope that by the end of the summer the agitation which was supposed to prevail might in some degree have subsided. I was a little fearful myself, when the pilot who took our ship in charge off Sandy Hook brought to us the startling and unexpected tidings of the assassination of the President a fortnight before, that a new element of disturbance might have been introduced which would materially interfere with my inquiry; but all such apprehensions proved groundless. The ordinary march of life was interrupted in the Northern States, by the loss of their Chief Magistrate, hardly for an hour. The war—except in a border city like St. Louis, or in parts of Pennsylvania, as in the neighbourhood of Gettysburg, where its tide swept almost or quite up to men's very doors—exercised no detrimental influence upon the prosperity of the schools. It is true that the spirit of patriotism drew away from their peaceful occupation many teachers—no fewer than 3,000, it is asserted,† in the single State of Pennsylvania—to risk their lives for the maintenance of the unbroken nationality of their country; but the effect of this was, not to close the schools, but merely to transfer them to the management of women instead of men. While, on the other hand, never before were realized so strongly the national blessings of education, and the necessity of democratic institutions resting for a foundation upon the intelligence and public spirit of the people. Never before, therefore, were more liberal appropriations voted by the townships for the support of schools; never before were private benefactions more frequent or munificent; never before was there displayed a more universal determination to uphold in all its integrity, and, if possible, to carry onward to a still higher degree of efficiency, the education of the people.‡

The schools undisturbed by the war.

National feelings with regard to education.

* "Just 20 years ago, Governor Hammond, of South Carolina, said in his Message, 'The free school system has failed. Its failure is owing to the fact that it does not suit our people, our Government, our institutions. The paupers, for whose children it is intended, need them at home to work.'" Quoted by Rev. B. G. Northrop, in a *Lecture before the American Institute of Instruction*, 1864. Perhaps the foundation, slender enough, for Governor Hammond's opinion, was to be found in the state of things prevailing in Massachusetts about 30 years ago, described by Mr. Boutwell. (See below, p. 17.)

Governor Hammond's estimate of common schools.

† "We find the whole number that have entered the Army to be more than 3,000, and the number who have volunteered is, to the number drafted, as 1,051 is to 124," and this out of a total number of less than 8,000 male teachers. (*Pennsylvania School Report*, 1864, p. 43.)

School teachers in the Army.

‡ Evidences of this abound everywhere. I will note a few which came under my own observation:—

Instances of benefactions to education.

In the State of Massachusetts, the appropriations for 1864 were more than \$100,000 in excess of those for 1863; and those for 1865 were expected to be more than another \$100,000 in excess of those for 1864; and the year 1864 was chosen by the Secretary of the Board of Education as the time for recommending that the minimum sum required to be raised by local taxation to meet the State grant should be doubled.

In 1864, Yale University received in benefactions upwards of \$400,000, and the resources of Cambridge were, I believe, enriched by a nearly equal amount. In Cincinnati, a wealthy citizen had just bequeathed \$400,000 for the foundation of two colleges, one for male, the other for female students. Mr. Vassar, a brewer, of Poughkeepsie, N.Y., in the same year handed over to trustees \$400,000, for the foundation of "an institution which should accomplish for young women what colleges accomplish for young men," which has just been organized, and was to start on its career, in a noble building "set on a hill," and conspicuous from all the country round, last September. In 1865, Mr. Cornell, who began life as a mechanic, and by industry and skill has accumulated a large fortune, set apart the splendid donation of \$500,000, under trust, to found a university, which is to bear his name, and for which a site has been chosen at Ithaca, N.Y.

It is not the multiplication of colleges and universities—of which there are far too many in the States already—that I regard as a good thing; but these instances of individual munificence, so common in America, so rare among ourselves, are surely to be reckoned among the "signs," and not unhealthy signs, "of the time." Not without good grounds say the School Committee of Boston, in their Report for 1864—"In no year within the recollection of the present generation have so many opposing elements, military, political, financial, foreign, and domestic, seemed to threaten the stability of our most cherished institutions; in no year has the enlightened system of free schools throughout this Commonwealth and throughout New England been more liberally, more resolutely upheld, with the abatement of not one jot or tittle of faith, by a people in the very throes of a rebellion, the most gigantic in its proportions, the most desperate in its persistency, that the world has yet seen." (*Report for 1864*, p. 6.)

ORIGIN OF
COMMON
SCHOOLS.

To the far-seeing wisdom of the founders of the colony of Massachusetts Bay, the United States of America owe the grand idea of free common school education. In 1642, only 22 years after the landing of the pilgrim fathers from the *Mayflower*, "the general Court of the colony, by a public act, enjoined upon the municipal authorities the duty of seeing that every child within their respective jurisdictions should be educated."* By the terms of the Act, the "selectmen" of every township † were required to "have a vigilant eye over their brethren and neighbours, and to see that none of them shall suffer so much barbarism in any of their families as not to endeavour to teach, by themselves or others, their children and apprentices so much learning as may enable them perfectly to read the English tongue, and obtain a knowledge of the capital laws, upon penalty of twenty shillings for each neglect therein."

Act of 1647 the
foundation of
present system.

This law of 1642 was an attempt to secure the blessing of universal education; but it did not make education free, nor impose any penalty upon municipal corporations for neglecting to maintain a school. In 1647, therefore, a further legislative step in the same direction was taken, and the foundations of the present system—or, as Mr. Horace Mann thinks, of something even broader and more liberal than the present system—of free schools were laid. By this law, every township containing 50 householders was required to appoint a teacher, "to teach all such children as shall resort to him to write and read," and every township containing 100 families or householders was required to "set up a grammar school," whose master should be "able to instruct youth so far as they may be fitted for the University." The penalty for non-compliance with the above requirements was £5 per annum. In 1671 the penalty was increased to £10; in 1682 to £20; in 1718 to £30 for every township containing 150 families, and to £40 for every town containing 200 families; and so on, *pro ratâ*, for townships containing 250 or 300 families. The penalty was increased from time to time, to correspond with the increasing wealth of the township. All forfeitures were appropriated to the maintenance of public schools.‡

Its liberality of
view.

The greater breadth of conception characterizing these old New Englanders as compared with their descendants lies, in the opinion of Mr. Mann, in the requirement about grammar schools. In the language of the 17th century, a "grammar school" was a school in which the ancient languages were taught, and youth could be "fitted for the University." In the existing Massachusetts scheme, the "grammar school" is the grade that lies between the "primary" (or infant) and the "high" school, and is one in which dead languages are not taught at all. Under the present law, a township must contain 500 families before it can be required to maintain a school in which Latin is taught—called a high school of the second grade, and 4,000 inhabitants before it can be required to provide teachers qualified to give instructions in the Greek language—a high school of the first grade. There are at this date 334 townships in Massachusetts, but only 99 high schools of the first grade.§ Had the law requiring every township of 100 families to keep such a school been then in force, Mr. Mann says that, so long ago as in 1849 there would not have been more than twelve townships in the Commonwealth exempt from the obligation. In 1647 the entire population of Massachusetts Bay is computed to have not exceeded 21,000 souls; in 1860 it was returned at 1,231,066.

System rests on
two fundamental
principles.

In other senses, however, of the word liberality, the American common school of the 19th century does not stand at a disadvantage, when compared with the common school of the 17th century. It is based as upon the fundamental principle enounced by Washington,—that the "virtue and intelligence" of the people are the two indispensable securities of republican institutions, so upon the two great republican doctrines of perfect social equality and absolute religious freedom.|| In the constitution of the State of Rhode Island it is laid down¶ that, "the diffusion of knowledge as well as of virtue among the people being essential to the preservation of their rights and liberties, it shall be the duty of the General Assembly to promote public schools, and to adopt all means which they may deem necessary and proper to secure to the people the advantages and opportunities of education." By the school laws of Massachusetts,** "all children within the Commonwealth may attend the public school in the place in which they have their legal residence," and "no person shall be excluded from a public school on account of

"Towns" and
"townships."

* *Horace Mann's 10th Report*, 1849, p. 8.

† These municipalities are called "towns" in the New England States, but "townships" in the West. I shall use the latter word, as less likely to be misunderstood by an English reader. The "selectmen" are the municipal corporation of the township; three in the smaller, nine in the larger townships.—(*De Tocqueville*, vol. i, p. 73, note.) In New England, townships vary indefinitely in size; in the Western States they are laid out with a uniform area—six miles square—and divided into 36 sections of a mile square each.

‡ *Horace Mann's 10th Report*, 1849, p. 10.

Slight decline of
high school.

§ There seems to be some falling off in this grade of school. The number in the text is that given in the *28th Report*, 1865, p. 59; whereas, in the *24th Report*, 1861, p. 93, Mr. Boutwell, the then Secretary of the Board of Education, states that "there are now known to be 102 high schools in which the Greek and Latin languages are taught."

American civili-
zation the pro-
duct of the spirit
of liberty and of
religion.

|| "J'en ai déjà assez dit pour mettre en son vrai jour le caractère de la civilisation Anglo-Américaine. Elle est le produit,—et ce point de départ doit sans cesse être présent à la pensée,—de deux éléments parfaitement distincts, qui ailleurs se sont fait souvent la guerre, mais qu'on es parvenu, en Amérique à incorporer en quelque sorte l'un dans l'autre, et à combiner merveilleusement—je veux parler de l'esprit de religion, et de l'esprit de liberté." (*De Tocqueville*, vol. i, p. 52.)

¶ See *Acts relating to the Public Schools of Rhode Island*, 1857, p. 3.

** Law of 1849, ch. 117, s. 4; Law of 1845, ch. 256, s. 1. See *24th Report*, pp. 132-4.

the race, colour,* or religious opinions of the applicant or scholar." The whole idea, indeed, of the aims and objects of education, as contemplated by the American system, cannot be better expressed than it has been by Mr. Horace Mann. "Under our republican Government," says he, "it seems clear that the minimum of education can never be less than such as is sufficient to qualify each citizen for the civil and social duties he will have to discharge; such an education as teaches the individual the great laws of bodily health,—as qualifies for the fulfilment of parental duties,—as is indispensable for the civil functions of a witness or a juror,—as is necessary for the voter in municipal and in national affairs,—and, finally, as is required for the faithful and conscientious discharge of all those duties which devolve upon the inheritor of a portion of the sovereignty of this great Republic."† Upon these ideas the whole structure is built. Knowing the aims and avowed principles of the system, we can proceed to examine the machinery by which it is attempted to realize and embody them.

Mr. Horace Mann's description of the objects of American education.

This machinery is altogether framed in direct reference to the civil polity and municipal institutions. Local self-government is the underlying principle of democratic institutions; local self-government is the mainspring of the American school system. In the New England States, the township is the great municipal unit; in the New England States, therefore, the township organization forms the basis of the school system. In New York, Pennsylvania and the Western States generally, municipal powers are more concentrated in the *county*,‡ and there is a corresponding change in the constitution of the schools. But in both cases, the governing maxim is the same; it is what De Tocqueville says, flows necessarily from a recognition of the doctrine of the sovereignty of the people, viz., that the individual—and the township and county are individuals in relation to the Central Government—is the best and only judge of his own interests, and that society has no right to direct his actions unless his conduct becomes mischievous to her, or she has need to summon him to her aid.§

Its relation to the civil polity.

On the township then—as the political unit—in Massachusetts and the New England States, absolutely, and in the other States which have adopted the Common School system not quite absolutely, but still principally,|| lies the obligation to see that the means of education are brought within the reach of every American child.

The township the basis of the system of Common Schools.

Both the area and the population of a township vary indefinitely in the eastern States. In the new States of the west, the *area* of all townships is the same—36 square miles—unless they lie on the borders of the State, in which case they may

Area and population of townships.

* In many places provision is made for separate coloured schools; *ex. gr.*, in New York, New Haven, Providence.

† *Horace Mann's 10th Report, 1849, p. 17.*

‡ "Les Etats qui composent l'Union Américaine présentent tous, quant à l'aspect extérieur de leurs institutions, le même spectacle. La vie politique ou administrative s'y trouve concentrée dans trois foyers d'action qu'on pourrait comparer aux divers centres nerveux qui font mouvoir le corps humain. Au premier degré se trouve la commune, plus haut le comté, enfin l'Etat. Les communes ne sont en général soumises à l'Etat que quand il s'agit d'un intérêt que j'appellerai *social*, c'est à dire, qu'elles partagent avec d'autres. Pour tout ce qui n'a rapport qu'à elles seules, les communes sont restées des corps indépendants; et parmi les habitants de la Nouvelle-Angleterre, il ne s'en rencontre aucun, je pense, qui reconnaisse au gouvernement de l'Etat le droit d'intervenir dans la direction des intérêts purement communaux. A mesure qu'on descend vers le midi, on s'aperçoit que la vie communale devient moins active; la commune a moins de magistrats, de droits, et de devoirs; la population n'y exerce pas une influence si directe sur les affaires; les assemblées communales sont moins fréquentes, et s'étendent à moins d'objets. Le pouvoir du magistrat élu est donc comparativement plus grand, et celui de l'électeur plus petit; l'esprit communal y est moins éveillé et moins puissant. A mesure donc qu'on s'éloigne de la Nouvelle-Angleterre, la vie communale passe en quelque sort au comté. Le comté devient le grand centre administratif, et forme le pouvoir intermédiaire entre le gouvernement et les simples citoyens. Dans le grand Etat de New York, dans l'Etat d'Ohio, et dans la Pensylvanie, les habitants de chaque comté élisent un certain nombre de députés; la réunion de ces députés forme une assemblée représentative du comté. L'assemblée du comté possède, dans de certaines limites, le droit d'imposer les habitants; elle constitue, sous ce rapport, une véritable législature;... c'est elle en même temps qui administre le comté, dirige en plusieurs cas l'administration des communes, et réserve leurs pouvoirs dans des limites beaucoup plus étroites qu'au Massachusetts. La commune et le comté ne sont pas constitués partout de la même manière mais on peut dire que l'organisation de la commune et du comté, aux Etats-Unis, repose partout sur cette même idée; que chacun est le meilleur juge de ce qui n'a rapport qu'à lui-même, et le plus en état de pourvoir à ses besoins particuliers. La commune et le comté sont donc chargés de veiller à leurs intérêts spéciaux. L'Etat gouverne et n'administre pas. On rencontre des exceptions à ce principe, mais non un principe contraire." *De Tocqueville, i. pp. 70, 77, 96-98.* We shall notice continual applications of these principles as we proceed with our development of the constitution of American schools.

De Tocqueville on the township and the county.

|| "Le principe de la souveraineté du peuple plane sur tout le système politique des Anglo-Américains. Chaque individu forme une portion égale du souverain, et participe également au gouvernement de l'Etat. De là cette maxime, que l'individu est le meilleur comme le seul juge de son intérêt particulier, et que la société n'a le droit de diriger ses actions que quand elle se sent lésée par son fait, ou lorsqu'elle a besoin de réclamer son concours. La commune, prise en masse et par rapport au gouvernement central, n'est qu'un individu comme un autre, auquel s'applique la théorie que je viens d'indiquer." (*Ibid.*, i. 76.)

American theory of the "sovereignty of the people."

§ In the State of New York very large powers are vested in the State Superintendent. School districts are formed not, as in Massachusetts, by the township itself, but by the School Commissioner of the "assembly district," within which both the township and the school district lie. The State school moneys are distributed by *counties*. In Ohio and Illinois, *county* officers are largely concerned in the administration of the school funds; and the Board of Supervision of the county occupy much the same relation to the school that in Massachusetts do the "selectmen" of the township; and the School Commissioner of the county has considerable jurisdiction over the schools themselves. In all these three States, teachers are certificated by *county* officers or *county* boards. The Massachusetts Board of Education, which represents the Central Government, on the other hand, speaks of itself as "having no power whatever over the schools of the State," though it "still regards their progress with watchful interest." (*24th Report, 1861, p. 5.*)

Differences in New York, Ohio, and Illinois.

happen to be curtailed. In Massachusetts there are 334 townships to an area variously estimated at from 7,250 to 8,200 square miles, differing in superficial extent from Middleborough, which contains—or did contain in 1849—168½ square miles, to Newbury-port, which contains only one. But both in east and west, whether the area of the township is uniform or variable, the population fluctuates between the widest limits. The city of Boston, with its 170,000 or 180,000 inhabitants, forms but one township; the township of Hull is mentioned by Mr. Mann as having a population in 1845 of 231 only.*

Such, allowing for these unessential differences, is the territorial organization of the State, upon which the system of Common Schools is based, and to which the provisions of the school law are applied. I propose—

- (a.) To give a brief abstract of the laws of the State of Massachusetts upon this subject;
- (b.) To collate these with the laws of some other leading States, noting the chief features of difference;
- (c.) Having seen the system thus exposed in theory, to follow it out into practice, and observe how it is found to work; and, lastly,
- (d.) Briefly to criticise its more salient merits and defects, chiefly in the points in which it contrasts most markedly with our own.

If I can develop these four divisions of my programme intelligibly, I conceive I shall have accomplished what is expected from me. Under the two first heads, my statements, being chiefly quotations from legal documents, will necessarily be somewhat dry; but I trust the reader's interest in the subject will increase as he goes on. To commence with the actual requirements of the law. It is prescribed then—

- I. "That in every township there shall be kept† for at least six months in each year, at the expense of the township, by a teacher or teachers‡ of competent ability and good morals, a sufficient number of schools for the instruction of all the children who may legally attend public school

PLAN OF THIS REPORT.

Massachusetts school law. CLASSES OF SCHOOLS. Common schools.

* 10th Report, 1849, p. 34.

† The law is imperative, but the penalty attached to failure to comply with it might be difficult of infliction. Mr. Mann says that a township is indictable and punishable if it does not maintain one or more schools, and he refers in proof of this assertion to *Revised Statutes*, ch. 23, s. 60.

Penalties on townships.

"A township which refuses or neglects to raise money for the support of schools as required by this chapter shall forfeit a sum equal to twice the highest sum ever before voted for the support of schools therein."

But how would this apply to the case of a township freshly organized, which has never yet voted any school moneys, and should persistently refuse to vote any?

"A township which refuses or neglects to choose a school committee to superintend said schools, or to choose prudential committees in the several districts when it is the duty of the township to choose such prudential committees, shall forfeit a sum not less than \$500 nor more than \$1,000, to be paid into the treasury of the county, three-fourths of which shall be paid to the "selectmen" of the township from which it is recovered, who shall appropriate the same to the support of the schools of the township in the same manner as if it had been regularly raised by the township for the purpose."

This seems stringent enough, but there are cunning people in Upper Canada, if not in Massachusetts, who could contrive an evasion. An Upper Canadian Superintendent calls the attention of the Chief Superintendent to a "real grievance which sometimes exists, in parties being struck from a school section, avoiding thereby the payment of taxes to a neighbouring school, on the alleged ground, most probably, of distance to travel; carrying on from year to year the formality of electing trustees, but resting there without taking any subsequent steps for having a school established." (*Upper Canada Report for 1863*, p. 136.)

Apparently evaded.

In fact, though there is sufficient public spirit in every township in Massachusetts both to establish schools and to vote money for their support, yet in many places the provisions of the law are not observed in several very important particulars. Thus the law says the school must "be kept for at least six months"; but in 1864, it appears there were 87 townships—more than a fourth of the whole—which failed in this respect. "Twenty-two lack only three days of the required time; in 46 others the schools are kept five months or more; while in 19 townships the schools are less than five, and in some instances less than four months in length." (*28th Report, 1865*, p. 77.)

Again, though the statute to be presently quoted is equally explicit and equally peremptory about high schools, it appears that in 1864 there were eight townships out of 60 with a population of more than 4,000, which did not maintain a high school of the first class; and 32 townships out of 68 containing 500 families, but less than 4,000 inhabitants, which did not maintain a high school of the second class. (*Ibid.* p. 93.)

Once more; the law requires high schools to be kept open 10 months, exclusive of vacations. Of the 118 high schools kept in Massachusetts in 1864, only 88 fulfilled this requirement; 14 were kept open only for eight months; 16 for less than eight months. (*Ibid.*)

In the case of a township divided into districts, if one of the districts refuses to vote money to maintain a school or erect a school-house, the "selectmen" of the township, upon application in writing of five inhabitants of the district, and with the consent of the majority of the voters of the township, in the first case, and the school committee of the township *proprio motu*, in the second case, may authorize the assessment and collection of the money required for such purposes in the district, and carry the said purposes into effect. But there appear to be no corresponding powers given to the authorities of either the County or the State to compel the township itself to move. Happily the current of public opinion sets so strongly in favour of the schools that such powers are not required.

Number of scholars to a teacher.

‡ It is generally agreed in America that 50 scholars is the maximum number that can safely be committed to one teacher, though in carefully graded schools teachers are frequently found in charge of more. Hence the law provides, that "In every public school having an average of 50 scholars, the school district or township to which such school belongs shall employ one or more female assistants, unless such district or township, at a meeting called for the purpose, votes to dispense with such assistant." (*Revised Statutes*, ch. 38, s. 9.)

therein,* in orthography, reading, writing, English grammar, geography, arithmetic, the history of the United States, and good behaviour. Algebra, vocal music, drawing, physiology, and hygiene, shall be taught by lectures or otherwise in all the public schools in which the Committee deem it expedient.†

- II. "Every township may,‡ and every township containing 500 families or householders shall, besides the schools prescribed in the preceding section, maintain a school to be kept by a master of competent ability and good morals, who in addition to the branches of learning before mentioned, shall give instruction in general history, book-keeping, surveying, geometry, natural philosophy, chemistry, botany, the civil polity of this Commonwealth, and of the United States, and the Latin language. Such school shall be kept for the benefit of all the inhabitants of the township ten months at least, exclusive of vacations in each year, and at such convenient place, or alternately at such places in the township as the legal voters at their annual meeting determine. And in every township containing 4,000 inhabitants, the teacher or teachers of the schools required by this section shall, in addition to the branches of instruction before required, be competent to give instruction in the Greek and French languages, astronomy, geology, rhetoric, logic, intellectual and moral science, and political economy. Two adjacent townships having each less than 500 families or householders, may form one high school district for establishing such a school as is contemplated in the preceding section, when a majority of the legal voters of each township, in meetings called for that purpose, so determine."§

High schools (a) of the second class;

(b) of the first class.

* "All children within the Commonwealth may—*i.e.* have a legal right to—attend the public school in the place in which they have their legal residence, subject to the regulations prescribed by law;" and no child can "be excluded from a public school on account of race, colour, or religious opinions." (*R. S. ch. 41, s. 3 and 9.*) But children are not allowed to attend school who "have not been duly vaccinated" (*s. 8*); and it has been held in the Courts that the school committee have power, in order to maintain the purity and discipline of the public schools, to exclude therefrom a child whom they deem to be of a licentious and immoral character, although such character is not manifested by acts of licentiousness and immorality within the school." (*8 Cushing, 160.*) "The reasons," says Mr. Secretary Boutwell, "for which a child may be excluded absolutely from school neither are, nor can be, expressed in the law. Committees are responsible for the exercise of a sound discretion." (*24th Report, p. 135.*) The Committee is bound by law to state in writing, on application of the parent or guardian of a child, "the grounds and reason of his exclusion" (*R. S. ch. 41, s. 10.*) And a "child unlawfully excluded may recover damages therefor in an action of tort." (*Ibid. s. 11.*) Children living remote from any public school in their own township may be allowed to attend the public schools in an adjoining township; and the school committee of the township in which such children reside shall pay, out of the appropriation of money raised in the said township for the support of schools, such sum as may be agreed upon. (*R. S. ch. 41, s. 5.*)

Legal right of children to attend school.

The school age in Massachusetts is between five and fifteen, and one might have supposed that these rights were limited to that period; but Mr. Boutwell says no; "for it cannot be doubted that youth under 21 years of age are entitled to the benefits of the public schools." (*24th Report, p. 132.*) I do not know whether this is a private opinion, or a case that has been actually decided in the Courts. In some of the States, *ex. gr.*, New York, the school age is from 5 to 21.

The school age.

† The law of 1826 provided for instruction in orthography, reading, writing, English grammar, geography, and good behaviour. In 1857, the history of the United States was added to the list. By the law of 1850, physiology and hygiene were to be taught in the schools whenever the Committee should so require. In 1857, algebra was introduced into the scheme; and in 1859, vocal music and drawing. These three last studies, like physiology and hygiene, being left to the discretion of the Committee. A still more recent addition is agriculture.

Progressive legislation.

Previously to 1859, townships were only required to maintain one school for six months, or two or more schools for terms that should be together equivalent to six months. Now each school that is maintained at all is required to be kept open for this period. "The execution of this law," wrote Mr. Boutwell in 1861, "will be attended with several important results. Townships will gradually reduce the number of schools till they correspond to the actual necessities of the public, while the inhabitants of sparsely peopled sections will enjoy equal educational advantages with those of villages and populous neighbourhoods. The arbitrary and unjust rules by which money raised for the support of schools is sometimes distributed among the districts will disappear, and the opportunities given to the children in a township will answer more nearly to the principles of justice and equality." (*24th Report, p. 90.*) We have seen, however, that this provision of the law is only obeyed imperfectly. (*See above, p. 14, note.*)

‡ It appears that in 1864, there were 20 townships not required by their population to have a high school, which voluntarily maintained one. (*28th Report, p. 93.*) *Per contra*, there were 40 "delinquent" townships. (*Ibid.*)

High schools maintained when not required.

§ *R. S. ch. 38, s. 2 and 3.* By the law of 1847, every township containing 100 families was required to "set up a grammar school," the master whereof should "be able to instruct youth so far as they may be fitted for the University," under a penalty of £5, which in subsequent years was considerably increased. (*See above, p. 13.*) By statute of 1789, the duty of maintaining a grammar school, in which the Latin and Greek languages were to be taught, was limited to towns containing 200 families. The penalty for neglect was £30. The present requirements were first made by the Revised Statutes of 1826. The study of French was not required till 1857.

Laws about grammar schools.

The lawfulness of establishing and maintaining out of taxation a girls' high school was decided in the case of the township of Newbury-port. (*10 Metcalfe's Reports, p. 508.*) In the same judgment it was held by the Court, that "without regard to population, the general powers of townships were sufficient to justify appropriations for the support of townships schools of every grade." The present Secretary of the Board of Education, the Hon. Joseph White, thinks "the time has come when a sound policy demands such an amendment of the existing law as shall require all towns having 2,000 inhabitants to maintain a high school of the second grade." (*28th Report, p. 93.*)

First case of a girls' "high school."

As the law prescribes the length of time during which schools must be kept open, it may be as well to say here once for all that, in computations of school time, a month is taken as equal to four

What is meant by a school month.

Adult schools. III. "Any township may establish and maintain, in addition to the schools required by law to be maintained therein, schools for the education of persons over fifteen years of age; may determine the term or terms of time in each year, and the hours of the day or evening during which the said school shall be kept, and appropriate such sums of money as may be necessary for the support thereof."*

SUPPORT OF SCHOOLS. B. In every State of the Union in which the system of common schools prevails, there exists a State School Fund, the sources and amount of which, in a sufficient number of cases to give a general idea of its character, shall be a matter of subsequent detail. In Massachusetts it is intended that this fund shall ultimately amount to the capital sum of \$2,000,000. On the 1st January, 1864, it amounted to \$1,181,627, and produced an income of \$111,124, or nearly 10 per cent. on the principal. One-half of the annual income is divided, in the month of July in each year, by the treasurer and secretary of the State, among the townships, in proportion to the number of children in each between the ages of 5 and 15 years, on condition—

The State School Fund. First, that the proper annual returns from each school have been made to the Secretary of the Board of Education; and

On what conditions distributed. Secondly, that the township has raised, by local taxation, for the support of schools during the last school year, a sum of not less than a dollar and a half for each person between the ages of 5 and 15 years belonging to the township.†

Its trifling amount per child. In 1864, the sum applicable to the different townships from this source was \$55,562, yielding for each person in the State between the ages of five and fifteen the sum of 23.4 cents, or less than a quarter of a dollar. As the average sum raised by local taxes in the same year amounted to nearly six and a half dollars a child, it will be seen at once that in the merely financial point of view the subsidy of the State is little worth.‡ It is its moral influence that gives to it its value. Mr. Boutwell shall describe its effects:—

Its indirect influences. "The establishment of the School Fund was the most important educational measure ever adopted by the Government of this Commonwealth. In 1832, when an effort was made to obtain trustworthy returns from the different townships, it appeared that the 99 townships which responded were expending only \$1.98 each for the education of their children. In 1834, as far as could be ascertained, the sum of \$310,000 was raised for the support of public schools, and the sum of \$276,000 was paid for tuition in private schools.§ The faith of the people in a system of public schools was seriously undermined. The public schools were fast becoming pauper establishments, into which only the poor and neglected went; they were abandoned by large portions of those who could command the means of educating their children elsewhere; and the danger was imminent that the duty of providing at the public expense for the education of the whole people would be neglected. The progress that has been made since 1834 is unquestionably due to the establishment of the school fund,|| and to the institution of those measures

weeks of five days each, or 20 days. Hence the minimum time required for a "public school" is 120 days; for a "high school," 200 days.

It will be noticed that the received nomenclature "primary," "intermediate," "grammar," and "high" schools, is not to be found in the Statutes, which discriminate the class of schools only by the subjects taught in each.

Evening schools. * I am not aware that this permission has been used except for the support of evening schools. In the reports of School Committees for 1864, evening schools are spoken of as doing good service in Lawrence, Fall River, and New Bedford. In the last-named city they have been at work for 16 years. At Boston, as yet, there has been no public system of evening schools, but a movement is being now made in that direction. In New York city, Cincinnati, Brooklyn N.Y., St. Louis, San Francisco, Philadelphia, Providence, and elsewhere, there have been large and successful evening schools going on throughout the winter, on which considerable sums of public money have been expended. Owing to the season of my visit, I could not see any of these at work; but I will append some statistics of them in another place.

Appropriation how to be expended. † This is the amount to be expended only on wages and board of teachers, fuel for the schools, and care of fires and school-rooms. The cost of erection, enlargement or repair of buildings, remuneration of committee-men, &c., may not be reckoned under this head.

Boston school taxes. ‡ In the city of Boston the amount raised by local taxation in the year 1864 for the support of schools was \$379,815, exclusive of any sums expended on the erection of buildings. The city's share of the State School Fund in the same year was only \$7,393. (28th Report, Appendix, pp. xliii. and iii.)

Relative amount of money raised for public and private schools. § In 1864 the relative figures were—

Amount raised by taxes for public schools...	\$1,536,314
Paid for tuition in incorporated academies, of which there were 59	76,593
Paid for tuition in private schools and academies, of which there were 611	317,447

It is curious that though the number of private schools as compared with the previous year was diminished by three, yet the number of scholars in average attendance at them increased by 551, and the amount paid for tuition by \$40,102. The School Committees of Greenfield and of Lanesborough call attention in their reports to the fact that "there is a growing disposition among a large class of people to remove their children altogether from the public schools," and that "many of the best scholars are annually taken out of the public and sent to the private schools, especially those who are preparing to become teachers." (28th Report, pp. 59, 149, 157.)

Connecticut State School Fund. || The Act establishing the fund passed in 1834, and its existence dates from 1st January, 1835. Connecticut was a long time in advance of Massachusetts in the article of a State School Fund. It was constituted in 1796, and the first dividend made in 1797. In 1863 the dividend was \$132,589, or \$1.20 per capita,—a much larger sum, both absolutely and relatively, than that divided in Massachusetts; but in Connecticut there is no provision made for any increase of the capital of the fund.

Its advantages questionable. Opinions are very much divided in Connecticut as to whether the operation of the fund is beneficial or not to the cause of education. By some it is thought to stimulate, by others to crush

which are dependent upon the existence of the school fund. The fund was not established for the special benefit of the townships as such, but for the promotion of the public good in a wider sense. The State had interests of its own and a policy of its own, not inconsistent with the interests and policy of the townships, but yet creating an exigency which justified the inauguration of a system under the control of the State without the intervention of the municipalities. The existence of the school fund is the basis of this policy. With the fund it is possible to obtain accurate and complete returns from nearly every township in the State; without it, all legislation must prove ineffectual. By the aid of the fund, all material facts are annually made known to the State; without it, each township is kept ignorant of what its neighbours are doing. With the fund, we have a system; without it, all is disjointed and disconnected. It was not the purpose of the Legislature to assume in any sense or to any extent the support of the schools, but rather to give them aid and encouragement. This is done by the distribution of one-half of the annual income, on certain conditions, among the townships. A chief means by which schools were to be encouraged was the education of teachers. This result has been secured by the normal schools.* Thus have the objects contemplated by the creation of the fund been realized. It was intended to be a permanent fund, the principal of which cannot "be diminished"; and so it should ever remain, increasing with the population of the Commonwealth, but never so perverted as to allow the system under which we have prospered to be in any degree impaired.†

It will have been seen, however, that whatever be the stimulus to education supplied by the State school fund, the main cost of the schools has to be provided from other sources. It is provided exclusively by local taxation. "Rate-bills," as they are called in America,—“school fees” as we call them in England,—do not appear to be permissible under the law of Massachusetts.‡ The several townships are bound at their annual meeting, or at a special meeting called for the purpose, to raise such sums of money for the support of schools as they judge necessary; which sums shall be assessed and collected in like manner as other township taxes. Townships refusing or neglecting to raise such money, or refusing or neglecting to choose a school committee, are liable to penalties; and in this sense, though the amount of the rate is left undetermined, the support of schools by a township may be called compulsory.§

The amount of the rate is determined by the voters of the township; and local notions of what constitutes an efficient school, and of what is needed in the way of supplies to make a school efficient, vary probably as widely in New as in Old England.|| The effort made by the State to evoke liberality is very small. It only

local energy. From things I heard, I should judge that where townships are illiberally disposed, it has the latter effect. Indeed so much is admitted by the Superintendent in his *Report for 1864*, p. 40:—"The value of the school fund to the schools of the State cannot be estimated by figures; and yet it is undoubtedly true that there have been instances where the income from the public funds has been the only means for the support of common schools, that much less interest has been manifested by the people than in places where the schools were supported in part by taxes. Many of the friends of education believe it would be better and more equitable to have the distribution made according to actual attendance." As it is, the distribution is *per capita*, according to the number of persons in each township between the ages of 4 and 16. The clergyman of a country parish near Newhaven told me that "many of his people were excellent financiers. They calculated to a nicety how long the appropriation from the school fund would maintain the school, and then withdrew their children, refusing at the same time to vote a tax for the longer continuance of the school; so that those who wished the school kept open for a longer period had to submit to a "rate-bill" for the payment of the teacher."

* The other moiety of the school fund is applied to the maintenance of the four normal schools of the State, and to the establishment of 48 State scholarships (something like what our Queen's scholarships were) of the annual value of \$100 each, in order to maintain students at college, who may become qualified to be principal teachers in high schools (*R. S. ch. 37, s. 1, 6*). There is an annual saving of about \$10,000 under this head, which together with forfeitures, is added to the principal.

† *24th Report*, 1861, pp. 75-77.

‡ Such also appears to be the case in Illinois. The Act of the Legislature under which schools are established and maintained there is entitled "An Act to establish and maintain a system of Free Schools." The same rule obtains in Ohio. "Rate-bills" are allowed in New York, Rhode Island, and Connecticut. In Connecticut, the rate-bill must not exceed \$6 a year (except in the higher departments of graded schools), and it must be assessed upon all scholars at the same rate. It must be made out for the entire term; before 1856 it was levied according to daily attendance, and thus a premium was offered for absence. In Rhode Island it must not be more than \$1 per term of 11 weeks, unless in graded schools, where it may amount to \$2 for the higher grade. The sums levied under this head in 1864 were, in Connecticut \$31,422; in Rhode Island \$4,551; in New York the large amount of \$429,892 as against \$674,599 raised by local taxation. The system of rate-bills prevails almost exclusively in rural districts. Different opinions are entertained of its operation and effects. The Hon. H. Barnard, a very high authority, strongly impressed with the conviction that it is the duty of the parent rather than of the State to educate a child, is in its favour. In New York, the Reports of the School Commissioners on the point are very conflicting. The State Superintendent, Hon. Victor M. Rice, has a strong opinion adverse to it. He calls it "the odious rate-bill," and is confident that "it is a serious impediment in the way of attendance upon the schools"; and that "whatever other means may be employed to secure the education of all the youths of the State, the free school, at least, is absolutely essential to the accomplishment of that all-important end." (*New York 11th Report*, 1855, pp. 14-48.) Mr. Barnard confessed that public opinion was generally against his own view.

§ For the penalties, see above, p. 14, note.

|| They certainly varied very widely in Massachusetts in 1864, and the following table, which I have constructed from the returns published by the Board of Education, shows how little the method of "taking an average" is worth, when the extremes are very far apart, for the purpose of indicating the real condition of things.

requires that, to meet its own aid, itself very insignificant in amount, the sum of a dollar and a half per child shall be raised by taxes on the spot—a sum considered miserably inadequate for the purpose 30 years ago, and which, it is thought, the time has now come for raising to three dollars.*

ADMINISTRATION OF SCHOOLS.
The School Committee.

The management and control of the schools of every grade† in the township are placed in the hands of a School Committee, consisting of any number of persons divisible by three, one-third of whom are to be elected annually, who are appointed by written ballots at the annual meeting of the township. They are paid a salary, in cities of one dollar, and in townships of a dollar and a half a day, for the time they are actually employed in discharging the duties of their office. Those duties are—

Their duties.

- (a.) To select, contract with, examine, certificate, and in case of need, dismiss teachers;
- (b.) To visit all the public schools in the township twice in the term, to see that the scholars are properly supplied with books, and once a month to inquire into the regulation and discipline of the schools, and the habits and proficiency of the scholars therein;
- (c.) To direct what books shall be used in the schools, subject to the limitation that "no book calculated to favour the tenets of any particular sect of Christians shall be purchased or used," and to require the daily reading of some portion of the Bible in the Common English version;
- (d.) To procure at the expense of the township a sufficient supply of text-books—(which books are purchased by the scholars at cost price, the committee having the power to remit such price to indigent parents)—and also such apparatus, books of reference, and other means of illustration as they deem necessary;‡
- (e.) Where the township is not divided into districts—an arrangement of which we shall have to speak presently—to maintain a sufficient number of school houses for the township; to keep them in order, and to provide fuel and all other things necessary for the comfort of the scholars therein, at the expense of the township.

The Secretary of the Committee.

The School Committee are bound to appoint a secretary and to keep a permanent record-book, in which all their votes, orders, and proceedings are to be by him recorded.§

The Superintendent of Schools.

Further, any township annually by legal votes, and any city by an ordinance of the city council, may require the School Committee annually to appoint a Superintendent of public schools,|| who under their direction and control shall have

Township appropriations of Massachusetts in 1864 for the education of each child in the township between the ages of 5 and 15:—

Total number of townships = 333; average appropriation = \$6.49.

Some false inferences might be drawn from this table unless it is checked by another. See pages 31, and note.

* See 28th Report, 1865, p. 96.

Difference between American and Canadian system. The school and the bookseller.

† The American system herein differs from the Canadian. The grammar schools of Upper Canada are under the control of a different (and presumably a more intelligent) body of trustees from the common schools.

‡ This supply is provided with very different degrees of liberality. In the cities nothing can be more abundant, in many rural districts nothing can be more niggard than the supply. There is a loud and general complaint of the variety of text-books that get into the schools, seriously embarrassing the teacher. The whole arrangement appears to open a wide field to jobbery, of which the booksellers are not slow to take advantage. "The bookselling interest of this country," said Mr. Barnard to the School-teachers' Association of Ohio, "(and I don't like to speak disrespectfully of an influence otherwise so good and desirable) is doing more injury to our schools than any other agency. As soon as a teacher shows practical ability, that he can teach and administer a school well, the school-book publisher comes in and bids \$500 or \$600 more a year than teaching pays, for the purpose of using this knowledge of schools to introduce his books through the country. I have seen some of the best talent of the country taken out of the schools for the miserable business of changing one man's books for those of another." (See Report of Speech in Ohio Educational Monthly for September, 1865, p. 250.)

Secretary's duty often ill discharged.

§ Fears are expressed by the Secretary of the Board of Education that this important duty is not unfrequently neglected, and that often the records made are so meagre and imperfect that they would possess but little value in a Court of Justice, or as a faithful history of the educational policy of a township (24th Report, p. 102). The reference to "a Court of Justice" tempts me to remark that apparently, both in the States and in Canada, disputes about schools furnish plenty of work to the lawyers. The reports are full of cases that have been "decided by the Courts."

Superintendents of Schools.

|| Superintendents of Schools have become a regular feature in the organization of cities. In New York the work demands four Assistant-Superintendents too. "The direction of a single mind," says Secretary Boutwell, "is found to improve the discipline, give unity to the system, and challenge to the utmost the capacities of teachers." In rural townships, however, he thinks "the services of the School Committee will prove quite as valuable."

The first case.

The township of Gloucester was the first in Massachusetts to appoint a Superintendent of Schools (24th Report, p. 108). In 1863, however, the same township, to "the profound regret" of the School Committee, voted to discontinue the office. The vote was "on the ground of economy,

the supervision of the schools, with such salary as the city government, or township, may determine; and in every city in which such ordinance is in force, and in every township where such Superintendent is appointed, the School Committee shall receive no compensation, unless otherwise provided by such city government or township.

In 1789 an Act was passed by the Legislature of Massachusetts, with excellent intentions, but, as events have proved, with disastrous results. I refer to the Act of 1789, authorizing the division of townships into districts for school purposes. I will state first the provisions of the law as they now stand, secondly, its motives, thirdly, its effects.

A township, at a meeting called for the purpose, may resolve to divide itself into districts for the support of its schools. The whole territory of the township must be divided, or the measure is illegal. But when the division has once been made it may not be altered, so as to change the taxation of lands from one district to another having a different school-house, oftener than once in 10 years.

A school district becomes a body corporate, with power to sue and be sued, and to take and hold in fee-simple or otherwise any estate real or personal, given or purchased, for the support of the school.

Every township, divided into districts, is bound at its annual meeting to choose either one person or three persons in each school district, called the "prudential committee," whose duties are to provide a proper school-house for the district, and to keep it in order at the expense of the district; and, when the township so determines, to select and contract with the teachers. The choice of the site of the school-house, and the amount of money to be raised for erecting, purchasing, or repairing it, and for providing it with library, apparatus, and other necessary furniture, is determined by vote of the district at a meeting called for that purpose.* A district obliged by law to provide a suitable school-house, but neglecting for one year so to do, is liable to a fine not exceeding \$200, to be recovered by indictment, on complaint of any legal voter in the district, to be appropriated to the support of schools therein. In raising and assessing money in the several districts, every inhabitant of the district is to be taxed in the district in which he lives for all his personal estate, and for all the real estate he holds in the township under his own actual improvement. All other of his real estate in the same township is to be taxed in the district in which it lies. All the land within a township belonging to a non-resident is taxed in the same district, such district being determined by the assessors of the township.† The money voted by the district is assessed on

and in view of the depressed condition of the times," and not from any lessened sense of the value of such supervision.

In fact, the great desideratum of the Common School System, both in Massachusetts and generally in the States, is adequate, thorough, impartial, independent inspection of the schools. In New York and Pennsylvania a system of supervision by counties or wide districts has been introduced, and is at work with tolerable success; but even here the Superintendents (or Commissioners, as they are called in New York) appear, from their reports, to be more or less hampered by local prejudices and jealousies, and their salary is in part provided by the district which is the sphere of their labours. They are elected, too, in Pennsylvania by the "School Directors" of the several townships; in New York by the electors of the "Assembly District," by ballot.

More complete inspection needed,

A similar organization is strongly recommended by Mr. White, the State Commissioner for the Counties of Ohio. (*Ohio 11th Report*, pp. 37, 38.) A strong argument in the same direction, based both upon general principles and upon experience, is to be found in a lecture delivered before the American Institute of Instruction, in 1863, by the Rev. B. G. Northrop, Agent of the Massachusetts Board of Education, in which he says—"My observations in visiting thousands of schools throughout Massachusetts, and many in twelve other States, have clearly proved to my mind the wisdom of maintaining a Superintendent in all our cities and large townships, who shall devote his whole time to the care and improvement of the schools" (p. 3).

and felt to be needed.

Something like our English mode of inspection of schools by a body of perfectly independent and competent gentlemen, would be a great and valuable addition to the school system both of the United States and the Canadas. In Lower Canada, it is true, the system in theory does approximate to the English; for the Inspectors are appointed by the Governor, and are paid out of a central fund. But some how or other it is not popular, and I fancy considerable differences would be found to prevail in practice.

In the American cities, so far as I saw, *ex. gr.*, in New York, New Haven, Hartford, Providence, Boston, Cincinnati, St. Louis, Chicago, Detroit, the superintendence of the schools was thoroughly vigorous and efficient. Strangely enough, there is no Superintendent of Schools in the great city of Philadelphia.

Unfortunately, all these appointments to school trusteeships, directorships, &c., are frequently used for political ends, and I constantly heard of managers of schools who could hardly write their names.

* The legal voters of every township may, if they think it expedient, provide the schoolhouses for the several school districts at the common expense of the township. Mr. Boutwell considers this a wise policy to adopt, even when the district system exists. The functions of the Prudential Committee would then be limited to the supply of fuel, and the selection of and contracting with teachers; the latter, however, being a very important function.

Township may provide school-house.

† The object of this provision is to secure non-resident owners of real estate against the inconvenience of paying taxes in more than one district, but it must often produce difficulties and injustice in practice. The real estate and machinery belonging to manufacturing corporations or companies are taxed in the district where they are situated; and, in assessing the shares in such corporation or the personal estate of the owners of such establishments, the value of such machinery and real estate is to be first deducted from the value of such shares or personal estate. All assessments are based upon the township valuation of the preceding May, and only those are liable to be assessed, who resided or owned property in the district when the money was voted.

Object of the provision.

The law, which taxes all personal property in the place where the owner resides, occasionally leads to some "smart" practice. A Boston merchant, I was told, will slip out of the city just before the first of May, to Swampscott, or some other seaside residence where the municipal taxes are low, and get himself rated there, and so escape, for his personalty, the heavy Boston imposts. I happened to see the income tax returns for Swampscott, and was surprised to find so small a place containing so many rich people. I received the above explanation of the phenomenon. It would be true, I believe, of all taxes.

Evasion of taxation.

by whom applied.

the polls and estates of the several inhabitants by the assessor of the *township*, and collected by a collector of the *township*, and when collected is placed at the disposal of the *district* committee, to be by them applied to the purpose for which it was raised.*

Union schools.

Two or more contiguous districts in the same township, or in adjoining townships, may combine for the purpose of maintaining a "Union school, or a school of higher grade for the benefit of the older children; but the machinery for the purpose is cumbrous and complicated, and the permission granted by the statutes "has been exercised in a few instances only, and never," Mr. Boutwell believes, "with any advantage to the schools."†

Abolition of districts.

A township may at any time abolish its school districts, and take possession of their corporate property, which is to be appraised and a tax levied upon the township equal to the amount of such appraisal, and there is then to be remitted to the tax-payers of each district the appraised value of its property thus taken. In order to give an opportunity of undoing the mischief that has been done by the Act of 1789, once every three years every districted township is to take a vote upon the question, whether the district organization shall be continued or abolished; and the Secretary of the Commonwealth on the recurrence of the year, when the vote thus required should be taken, is to notify the selectmen of the several townships to that effect, and to require them to insert a special article for that purpose in the warrant summoning the annual meeting.

Object of the Act of 1789.

Such is the law which is thought to have worked so ill for the interests of education in Massachusetts and the New England States generally.‡ Its original

Township's power in case of district's neglect.

* In case a district refuses to make suitable provision for its schools, an appeal is provided, on application of five tax-paying inhabitants of the district, through the selectmen, to the voters of the township; and if deemed expedient, the township may vote such money as is thought necessary, order an assessment thereof upon the district, and finally expend it by the agency of the selectmen, the township School Committee, or a Special Committee chosen for the purpose. (See *24th Report*, p. 123-4.)

† *24th Report*, 1861, p. 125. I don't know why this should be. In the State of New York "Union Schools" of a similar description appear to be the most popular and flourishing of all the rural schools.

Opinions of the district system.

‡ "I consider," says Mr. Horace Mann, "the law of 1789, authorizing townships to divide themselves into districts, the most unfortunate law on the subject of common schools ever enacted in the State. During the last few years, several townships have abolished their districts, and assumed the administration of their schools in their corporate capacity; and I learn that many other townships are contemplating the same reform." (*10th Report*, 1849, p. 37). To this opinion Mr. Boutwell assents, trusting "that the day will again and speedily be seen, when every township in its municipal capacity will manage its schools, and equalize the expenses of education." (*24th Report*, 1860, p. 113).

Such anticipations, however, judging from the latest reports of School Committees, are rather sanguine. It appears there still exists strong "jealousy for district freedom." Another committee "cannot conceive why the inhabitants of the township cling so closely to the district system as if the education of their children depended on it, when, in reality, it does gross injustice to half of the children in the township." Another report:—"So fully are the larger part of our citizens attached to this system, so fully are they persuaded that centralized power is dangerous, that the township ought not to be entrusted with the entire care of the schools (although its officers preside in every other department), and that the reserved right of having an agent to have the care of their school-houses, and to employ the teachers of their children, is a privilege of vital importance, not lightly to be relinquished—that we do not with much hope look for better things." (See *Massachusetts 28th Report*, 1865, pp. 20, 153, 164, &c.)

Its anti-republican character.

And yet to some minds the district system appears essentially anti-republican. "The district system," say the Committee of Shutesbury, "tends directly to build up society on the same principles of aristocracy upon which society is built in some German States—by obliging people of limited means who are located in the sparsely populated districts to forego the advantages of education, and sell out at a sacrifice, and remove to the villages, thus causing the land to accumulate in the hands of a few, and building up a landed aristocracy. Cannot the united wisdom of the township devise some plan which shall place our public schools on a more thoroughly republican basis, and give a more equal advantage to all?" (*28th Massachusetts Report*, p. 153.) In a similar spirit, the Superintendent of Schools in Pennsylvania recommends the establishment of "graded schools"—which are almost an impossibility under the district organization—as "having a tendency to keep down that spirit of aristocracy in education which is too apt to prevail in our towns and villages." (*Report for 1864*, p. 28.)

The normal organization in New England.

The district system is the normal organization for school purposes in the New England States. In Rhode Island there are 33 townships, containing 400 districts. In Connecticut 162 townships, with 1,609 districts. In the latter State the average number of children in each district between the ages of four and sixteen is 71.

In Massachusetts and Rhode Island the appropriations of the districts—that is, the money they raise by taxation—are not separated, in the reports, from the appropriations of the townships. But in Connecticut, in 1864, the amounts available for school purposes, from the different sources of income, were as follows:—From the State Fund, \$177,816; from the *townships*, \$87,704; from *districts*, \$140,414; from rate-bills, \$31,422; from other sources, \$13,786.

The evil of districts felt in Connecticut.

In Connecticut the evils of the district system are felt, though perhaps not so vividly, as well as in Massachusetts. In his report for 1865, the Superintendent says—"It is not to be expected that good schools of each grade can be brought to the home of each child; but every township, borough, and city should have schools established at such points, and so provided with all necessary facilities, that a good elementary education may be obtained by all persons residing within their limits. Were graded schools organized in all places where a sufficient number of children can be conveniently brought together, and the ungraded country schools thoroughly classified, and a good public high school established in every township where practicable, there would be few children of the State not enjoying school privileges, and the school system would be greatly improved. Many of these advantages can be secured under the present arrangement of school districts, by the action of the township in establishing schools of a higher grade, but in many places the opportunity of providing economically and wisely for all of school age would be much increased were schools entirely under the direction of the townships." (Pp. 34, 35.)

School organization of the State of New York.

In the State of New York, the "township" almost disappears as an element in the organization of the school system, its only important constituents being (a) the county, (b) the district. There are 60 counties, and 13 cities, which are practically treated as counties. There are 11,717 districts; 285 in cities, and 11,432 in the rural townships. School districts are formed, and may be altered by School Commissioners—the administrative officers of the system, which in this State

object was not only innocent, but praiseworthy. In the preamble of the Act, it is stated that "whereas by means of the dispersed situation of the inhabitants of several townships in this Commonwealth, the children and youth cannot be collected in any one place for instruction, it has thence become expedient that the townships in the circumstances aforesaid should be divided into separate districts for the purposes aforesaid."

By this Act, however, no specific duties in regard to the schools were imposed on the districts; they were not constituted corporations; and the organization contemplated was apparently nothing more than what exists in the State of Ohio at the present day, where the townships indeed are nominally divided into sub-districts, but retain in their own hands the entire control of the schools.

The real mischief was done by later legislation. In 1817, the school districts were made corporations in name, and in 1827 were empowered to elect prudential committees, to whom were made over the care of the school-houses and the important duty of selecting and contracting with teachers. The system as it now stands is fraught with evil of every kind. There is the evil of double management—a sort of *imperium in imperio*—by the school committee of the township, and the prudential committee of the district.* There is great inequality, and sometimes

The real mischief done in 1817 and 1827.

What this mischief is.

is essentially bureaucratic—one to each "assembly district" (the electoral area which sends a member to the State Assembly), or about two to a county. The number of districts in each township may be as many as convenient. For each district, qualified voters elect one or three trustees, there being a general preference for only one, whose functions are very similar to that of the "prudential committee" in Massachusetts, but somewhat more extensive. Whatever local taxes are raised for the support of the schools are raised by the *districts*, and not by the *townships*. The incidence of taxation is often very unequal. "Many of our small districts," reports the Commissioner of the Second District of Otsego county, "are robbed of their resources by landholders who hold large tracts of land in them, but who *live* in other districts. This trouble would be avoided if the lands were taxed in the districts where they belong." (*New York 11th Report*, 1865, p. 270.) Of another district, in Cayuga county, it is reported that "it has not taxed itself, nor raised one cent by rate-bill during three years out of the four last past. The school is literally free, supported entirely by the public money." (*Ibid.* p. 119.)

Its evils.

The remedy suggested by New Yorkers for this state of things would make the hair on the head of those good Massachusetts citizens, who dread any tendency to "centralization," stand on end. "Would it not be better," asks the Commissioner, "for the State to take the matter of educating its children in hand, district the territory, build the school-houses, employ and pay the teachers, and then compel the attendance of the children, as they do in Germany? Would it not be economy? Could not the moneys now received from the various school funds, and a revenue by tax upon the property of the State equal to what is now raised by tax and rate-bill, be more judiciously expended, and furnish much better teachers and schools than we now have? I am inclined to believe that with the same expenditure, in the hands of a competent educational bureau, our common schools could be improved 100 per cent." (*Ibid.*)

Remedy suggested.

A peculiar feature in the New York system, arising out of the felt evil of districts, are the "Union free schools," which are becoming general in the State. They may be established by a two-thirds vote of the inhabitants of the combining districts, at a meeting summoned by the school trustees, on the requisition of fifteen persons out of each such district. Their object is to diminish expense, simplify machinery, and secure a more perfect classification and higher grading. Primary schools are sometimes retained by their side, for the convenience of the smaller children. When Union schools are established, the old trustees are superseded, and a Board of Education of not less than three nor more than nine members (divided into three classes, one class vacating office each year), is established in their room. They form a corporation, with power to levy taxes for school purposes, which the township has no power to refuse. All money required to pay teachers' wages in these schools, or in the academical department thereof, is to be raised by tax, not by rate-bill. An academical department—equivalent to the New England high school—may be established by the Board, whenever they think there is a demand for such instruction; or an existing academy may be adopted by the Board, as the academical department. Such academical department is further under the visitation of a Central Board called the "Regents of the University," who have the supervision of all the higher educational institutions subsidized by the State. teachers in Union schools are to be employed at the rate of not less than one for every fifty pupils. If the inhabitants refuse to provide for the necessary expenditure of the school, the Board may levy the requisite tax on their own authority.

New York Union schools.

In Illinois, again, the district and the district officers (called school directors) are much more important elements of the school system than the township and the township-officers (called school trustees). The whole management and control of the school, and the appointment and dismissal of the teachers, are in the hands of the "directors." The only tax annually levied upon property is levied on the property of the district by the directors, assessed by the *county* clerk, and collected by the *county* collector. It must be sufficient to maintain a school in the district for six months under a qualified teacher, which is the condition of sharing in the State's appropriation. The township trustees merely deal with the *finance* of the schools, ascertaining the amount of the several funds, and distributing them according to a certain prescribed method, but have no direct power of interfering with their constitution or management.

Organization in Illinois.

In Ohio, on the contrary, the district organization does not prevail, but the Board of Education of each township is supreme in all points relating to the schools. The Board, it is true, divide the township into sub-districts, but that is merely for territorial convenience, and does not call into existence any other functionaries or any subordinate organization; and it is expressly provided that no sub-district shall contain within its limits less than sixty resident scholars.

In Ohio.

In Ohio, however, every city, town, or incorporated village, containing not less than 300 inhabitants, is a separate school district, under a separate Board of Education of three persons, clothed with the same powers as the ordinary township Board. (See *the School Laws of New York, Illinois, and Ohio.*)

* "The Prudential Committee and the Superintending Committee," says Mr. Mann, "are illustrations of different hands of the same body; and if they are not animated and moved by a common spirit, either one can defeat the most praiseworthy efforts of the other." (*10th Report*, p. 55.) "We know we shall encounter opposition," says the School Committee of Methuen, Mass., "but we consider it our duty to express our opinion that the hiring and selection of teachers should be left to the Committee of the township rather than to the Prudential Committee of each district. As far as we are concerned, we do not seek for ourselves the power, nor do we envy the Prudential Committee the privilege of selection; but it seems hard that the responsibility of the success of the schools of the township should rest on our shoulders, while our hands are, in great measure, tied. We know that the great bugbear of "consolidation" and all that loose talk about "the want of

the evil of double management.

gross hardship, both in distributing the public money and in levying the local taxes.* The principle of subdivision of townships is frequently carried to such an absurd extreme that schools are found with not more than half a dozen children in them.† The unnecessary multiplication of schools leads to an unnecessary multiplication of teachers, and that to a reduction of salaries, and this to the employment often of incompetent persons.‡ Regular gradation of schools is rendered imprac-

democracy" in the proposed change, will be brought to bear against us. But is there any more "consolidation" in this than in the management of other township affairs? Do we call it consolidation when we entrust to our Board of selectmen a general superintendence over the affairs of the township? In making a contract as to any other subject-matter, do we have one man to engage the contractor, and another to decide whether he is qualified to perform the contract? And is there any great "want of democracy" shown in proposing that the township, which by its taxes pays for the support of its schools, should direct in what manner its money should be expended?" (*Massachusetts 28th Report*, 1865, p. 39.)

Principle of distribution of the public money.

* One-half of the income of the State School Fund is distributed among the cities and townships, in proportion to the number of children between the ages of 5 and 15 which they contain. In 1864 it yielded at the rate of 23.4 cents, not quite a quarter of a dollar per child. It is apportioned by the Secretary and Treasurer of the Commonwealth, and paid to the Treasurers of the several townships. Townships forfeit their share, unless they have raised by local taxation at least \$1.50 per child. It is to be spent exclusively on wages and board of teachers, fuel of schools, and care of fires and school-rooms; not on buildings, rent, repairs, or libraries, the cost of which must be defrayed by separate local appropriations. This State income is applied by the School Committee of the township to the support of their schools according to their judgment, and is not subject to the vote of the township. "It can be used," says Mr. Boutwell, "to redress inequalities"; but of course it also gives scope for the display of preferences and partialities.

The township and district tax.

The township tax (where townships are districted), goes to two objects only, viz., wages and board of teachers, and supply of proper apparatus to the school. The district tax goes to building or rent of school-house, repairs of the same, and supply of fuel and furniture. No returns are given of the amount of district taxes separate from the township taxes, in the Massachusetts Report, but they cannot be very considerable, except when a school-house has to be built. In New York State the cost of a school-house is limited by law to a maximum of \$800, unless with the consent of the Commissioner of the district. In Ohio the average cost of school-houses in 1864 was \$820; in small rural districts, therefore, the cost would probably vary from \$300 to \$400.

Unequal incidence of taxation.

With regard to hardships in the incidence of taxation, see above, p. 19, note, and also the provisions of the law stated on pp. 17-18. But upon this whole point, I will quote the words of Mr. Horace Mann:—"The circumstances of the districts are very various. Some contain but half a dozen scholars. Some have only a few small and poor farms; in others there is a concentration of wealth. Hence, in a township containing a dozen districts, it often happens that a majority of them pay but a small portion of the school tax, while the residue of it is principally derived from a few of the rest. It is obvious, therefore, that no specific rule can be devised for cases so various. This is probably the reason why the law has submitted all questions relative to the distribution of the school money among the districts to the townships respectively.

Inequalities of distribution.

"The manner of distribution has been quite as various as the circumstances which the townships have had to consult. In some cases, where no striking inequalities existed in the condition of the districts, the money has been equally distributed among them. In other cases, one-half, two-thirds, three-fourths, or some other fractional part, has been divided equally among the districts, and the residue according to the number of children they respectively contained between the ages of four and sixteen years, or between the ages of four and twenty-one. In some, the division has been made according to the number of heads of families in each district; and in others, according to the number of houses in each. Devices have been innumerable; and for want of recognizing a natural standard, the most arbitrary ones have been adopted. There is reason to fear, that in many cases, an equitable principle of distribution has not been applied. The stronger districts, being able to outvote the weaker, have sometimes assigned to themselves the lion's share." (*10th Report*, 1849, pp. 45, 46.)

Multiplication of small schools in Massachusetts

† "As proof and specimen of this," says Hon. Joseph White, "I quote from the report of one of the townships, which contains ten districts, and an average of seventeen scholars to each, the following description of one of the schools:—'No. 7, or Macedonia, district. But one term, Miss ———, teacher. This was the smallest school in the township, there being but four scholars, and two of these never having attended school before. 'Yet,' say the Committee, as if equally surprised and gratified at the result, 'perhaps no school in the township made more rapid progress than this.' Nor is this a solitary case. Another township appears to have eighty-eight scholars divided among ten districts, giving to each an average of less than nine. In 1852, Dr. Sears found that in thirty townships, whose whole number of districts was 345, there were 193 'in which the whole attendance fluctuated between five and fifteen.' I fear that the same number of townships might be selected now, whose school statistics would show no better results." (*28th Report*, p. 77.)

and New York.

A similar state of things exists in New York. "In my report last year," says a Commissioner, "I alluded to the town of Ira, by way of illustrating the injudiciousness of the school district system, and the expensiveness and inutility of dividing and subdividing districts till the schools are diminished to one-fifth of the number a good teacher is able to instruct. No township has better houses, and more of them to the square mile . . . but the schools are very small. A number of them when visited contained but five or six pupils. This is the result of a comparatively sparse population." (*New York 11th Report*, 1865, p. 121.) Of course the motive of this "dividing and subdividing" is to bring a school as near as possible to every man's door, and all other considerations are sacrificed to this one.

The district system, as affecting salaries and qualifications of teachers.

‡ "It is the opinion of the Committee that, while a township retains the district system, a 'sufficient number of schools' must equal the number of districts; in other words, that the people in each district are entitled to an amount of money that shall enable them to keep their school twenty-four weeks each year under a good teacher. It will be seen that, with the exception of No. 1 and No. 7, not a district in the township is able to comply with the requirements of the statute. In some of the districts the schools are very short, being but little more than one-half as long as the law requires. Doubtless such districts have a legal remedy, but we would not advise them to resort to it till all other means fail.

"Some of our best teachers cannot now be employed to conduct our schools, because the wages offered by the Prudential Committees are so low; and this evil is more likely to increase than to diminish. A young lady who can earn a dollar a day in a shop, will not teach school for two dollars a week; and the Committee do not know where suitable teachers can be found, unless by some means their wages can be raised . . . We shall have occasion to speak, in another part of our report, respecting the qualifications of those who offer themselves as candidates for teachers, and only add in this connection, that the tendency of the existing state of things is obviously to deprive our schools of the services of the best instructors." (*Athol School Committee in Mass. 28th Report*, p. 92.)

licable.* The appointment of teachers continually becomes a matter of jobbery or nepotism.† And there is a prevalence of those false and narrow notions of economy that are the characteristic and the bane of small neighbourhoods.‡ Less

* Here is not an improper place to define what Americans mean by a "graded school." "A graded school is a school in which the pupils are divided into classes according to their attainments, and in which all the pupils of each class attend to the same branches of study at the same time." (The Graded School, by W. H. Wells, Superintendent of Public Schools, Chicago, p. 7.) This is a definition by an established authority, and yet I should have rather called such a "classified" than a "graded" school.

What is meant by a "graded school."

"By the term 'graded schools' is meant schools in which there are two or more departments, either all in one building or having some of the grades in separate buildings, and all under one general Superintendent or Principal, with one teacher for each room, and the pupils to be promoted from the lower to the higher grade as they attain a specified degree of advancement." (Pennsylvania Report for 1864, p. 27.) This is much nearer my notion of the received meaning of the term "graded school"; and it is obvious that the district system which assigns all the children, in half a dozen classes, to one teacher, is fatal to a gradation of schools, which in the eyes of the American educationists is the one condition of their successful working.

† "Ties of blood, friendship, or caprice, often decide in the employment of a teacher."—"Some relation or friend is chosen, too often without reference to his fitness for the post."—"The practice of employing a relative or a particular friend to teach is, we fear, becoming a growing evil. Some of our prudential agents are elected to that office with the agreement to hire some particular one, independently of his ability to instruct. Persons wholly unfit to take charge of a school are in this way employed, and the School Committee are expected and required to approve them, especially if the applicant's book-knowledge is satisfactory. This practice is a strong and unanswerable argument against the district system, and will undoubtedly, sooner or later, procure its abolition. Some prudential agents have maintained that their favourite teacher has a right to keep the school, whether she obtains a certificate from the School Committee or not, provided that the majority in the district want her." (School Committees' Report in 28th Mass. Report, 1865, pp. 20, 40, 59.)

Motives that often rule in the choice of teachers.

‡ In New York State the law expressly requires that "no teacher shall be within two degrees of relationship to a trustee, except with the approval of a majority of the inhabitants." Yet even there the same complaints are heard. "So long as trustees insist on the Commissioner granting licenses to their friends and neighbours, feigning that such are qualified for their school, because it is small and backward, so long shall we have poor instructors of youth." (N.Y. 11th Report, 1865, p. 319.)

Law of New York.

"Quid leges sine moribus?" "Chez nous," said a Pennsylvanian gentleman to De Tocqueville, "il arrive quelquefois que la loi manque de force quand la majorité ne l'appuie point." (De Tocq., vol. ii., p. 400.)

‡ I quote, from the Rhode Island Report for 1864, a picture of the working of the district system, which I dare say could be drawn of other townships besides the one that sat for it.

Picture of the district system in Rhode Island

"There is a class in the township that have more or less to do with our schools, who might think it doing them an injustice to leave them out of this report. We know of nothing that would suit them better than to call them the all-knowing class, for they profess to know it all. Their doctrine is something like the following:—'Visits to the school-room are of no benefit to the school, especially by the Committee, and it is money thrown away to pay them for visiting the schools. Teachers are paid altogether too much; they labour but six hours a day, and it is mere play compared with the labours of the husbandman. They are models of laziness; their whole object is to get their living in the easiest way.' Every plan that was not in existence in their school-days is nonsense. Some go so far as to condemn the public school system, and contend that the old system of every man hiring his own schoolmaster and paying him himself, was altogether best. Some of these men claim to be the leading politicians of the township; but as we think their creeds will do but little injury, we will make but few comments on them. Their noise is worse than their influence."

The same Committee, in reference to a particular district of the township, are again sufficiently lively in their description:—

"There seem to be too many parties and too many knowing ones in this district, for the success of the school. Comparatively speaking, the northern portion of the district disagrees with the southern portion, and the middle part cannot agree with either north or south. Sometimes a teacher will seem to give general satisfaction to all parties; but for the most of the time since the school-house was erected, there has been more or less strife here, either about the school or school-house. The teachers, many times, have been scared or driven off, and the schools broken up. There are a few in the district, we think, that strive to have peace in the school, while there are others who seem to glory in a fuss. We would say plainly to the inhabitants of this district, 'You can never have a prosperous school till you all co-operate together for its welfare. As long as you keep pulling apart, disagreeing with each other, and allowing yourself to be so disinterested [*sic*; apparently an American sense of the word], in your school, just so long you must expect it to suffer.' We, or our successors, should hereafter allow none but old and experienced teachers to enter this school—teachers well fitted to govern and instruct; such, too, as are qualified to meet opposition with independence and fortitude. We would forewarn young and inexperienced teachers to keep out of this district. Too many of this denomination have gone in here, and got badly pelted. There are altogether too many fault-finding ones, disinterested ones (*sic*), and all-knowing ones in this district, for young teachers to contend with."

They conclude with some very sensible advice, that would benefit other neighbourhoods besides the one to which it was originally given.

"In conclusion, we would earnestly solicit all the people of the township to work together, with zeal and earnestness, for the prosperity of your schools. Tear down your old good-for-nothing school-houses, and build new ones: visit your schools often, and encourage others around you to visit them: appoint the best qualified men for your school officers: never allow your neighbourhood difficulties and prejudices towards each other to have anything to do with your schools: recollect that union is the greatest support of your schools, and that disunions, contentions, and disinterestedness (*sic*) all serve to destroy their prosperity. Never allow yourselves to be over-anxious to select out all the bad qualities of the teacher and school, and on the other hand never to think of their good qualities. Remember that teachers are not perfect beings who never err. Having so many different dispositions and minds to deal with, and so much bad influence repeatedly instamped upon the minds of the scholars outside of the school to contend with, you cannot reasonably expect that everything in the school will, at all times, move on in perfect order and harmony. Recollect, too, that that teacher who is influenced by good principles and motives, and who has correct ideas of what his duties are to children, and then endeavours to discharge those duties honorably and manfully, with a clear conscience in the sight of his Maker, has no easy task before him. His labours are fatiguing and perplexing, and wearing both to mind and body, and he needs all the influence you can exert in behalf of the welfare of his school, in order to do up his work successfully. Hoping that these remarks may have the desired effect of producing a reformation in the minds of all the worthy people of E— in regard to their schools, we will

than these would be grounds enough for the strong opinion of Mr. Horace Mann already quoted, that the Act of 1789, which authorized the division of townships into districts, was "the most unfortunate law on the subject of common schools ever enacted by the State." It is only the high public spirit which animates the larger proportion of the Massachusetts Municipalities, and which keeps the rest up to the mark, if not from the spirit of emulation, at any rate from a sense of shame, that prevents a law so pregnant with possibilities of mischief from being absolutely fatal to the schools.

ATTENDANCE OF
SCHOLARS.

As far as regards enforcing attendance in the schools, the laws of Massachusetts are as precise and peremptory as could be desired; but to no point does the remark of M. de Tocqueville's Pennsylvanian friend more forcibly apply:—"In America the law is powerless when it is not supported by public sentiment." In spite of legal enactments and penalties, "absenteeism and truancy" continue to be the great, and, indeed, the increasing evil of American schools.*

We have already seen that, irrespectively of race, colour, or religious opinions, every child has a right to claim admission into the school of the district in which he resides. The law not only secures the right of the children, but attempts to enforce the duty of the parents. The provisions having this end in view are as follows:—†

Parents to send
children to
school, under
penalty.

"Every person having under his control a child between the age of eight and fourteen years shall, annually, during the continuance of his control, send such child to some public school in the city or township in which he resides, at least twelve weeks, if the public schools of such city or township so long continue, six weeks of which time shall be consecutive; and for every neglect of such duty, the party offending shall forfeit to the use of such city or township a sum not exceeding \$20. But if it appears on the inquiry of the truant-officers or School Committee of any city or township, or upon the trial of any prosecution, that the party so neglecting was not able, by reason of poverty, to send such child to school, or to furnish him with the means of education, or that such child has been otherwise furnished with the means of education, for a like period of time, or has already acquired the branches of learning taught in the public schools, or that his bodily or mental condition has been such as to prevent his attendance at school or application to study for the period required, the penalty before mentioned shall not be incurred.

Inquiry to be
made into cases
of neglect.

"The truant-officers and the School Committee of the several cities and townships shall inquire into all cases of neglect of the duty prescribed in the preceding section, and ascertain from the persons neglecting, the reason (if any) thereof; and

now close up with our best wishes and desires for the future prosperity of the schools." (19th Rhode Island Report, pp. 119, 120, 123.)

Remarks on these
extracts.

These extracts are interesting in several ways.* They exhibit views that are widely prevalent in the United States. They show that the practical difficulties which encompass a school are much the same under any system, whether rate-supported and uniform, or voluntary and various. They point out also where the shoe really pinches under a system of rate-supported schools, even when that system is free from a further element of embarrassment—the *odium theologicum*. I do not observe that any of these difficulties arise out of religious prejudices. Nobody in America, except the Roman Catholics, questions the propriety, indeed the necessity, of maintaining intact the undenominational character of the schools. Indeed, on no other basis, in a country so infinitely broken up into different religious creeds, could a system of common public schools be maintained.

Evidence of the
increase of
truancy and
absenteeism.

* That the two evils are increasing does not admit of a doubt. The testimony on the matter is unanimous.

In the President's address to the Ohio State Teachers' Association, he calls loudly for "a law to check the growing evil of truancy and absenteeism." (*Ohio Educational Monthly, September, 1865, p. 267.*)

The Ohio State Commissioner says—"The obligation to make all possible effort to check and suppress the growing evils of truancy and absenteeism has never been so great as at the present time. The evident increase of these evils, the prolific source of juvenile rowdism and crime, is a fact of the deepest concern to every good citizen." (*Report for 1865, p. 39.*)

The New York City Superintendent, Mr. Randall, thus expresses himself:—"The dictates of self-preservation demand that the thousands and tens of thousands of destitute and vagrant children now roaming about our streets and alleys, untaught and undisciplined, should be reclaimed from their degrading and dangerous associations, and gathered into our public and private schools. The whole number of children between the ages of five and twenty-one residing in the city is estimated at 250,000. This estimate is believed to be much under the number." [?, the population of New York being not more than 800,000.] "The average number of such children in regular attendance upon our public schools, including the Free Academy, Evening Schools, and corporate charitable institutions of the city participating in the School Fund, does not exceed, upon the most liberal estimate, 90,000. We cannot, therefore, escape the conviction that there are not far from 100,000 children within the city who either attend no school, or whose means of instruction are restricted to the very briefest period." (*Report for 1865, pp. 4-6.*)

Mr. Assistant-Superintendent Calkins puts the number of absentees at 40,000 (*ibid.*, p. 82). Calculations of this kind are rather loose everywhere, and particularly loose in America, the fact not being disguised that statistical returns, with all their apparent completeness, are still very untrustworthy. The Census returns, which were being taken by the separate States while I was in the country, instead of being made up, as with us, from the date of a single night, appeared to take a fortnight or more in their collection; and dealing with so locomotive a people must, one would think, be full of inaccuracies.

The Rev. B. G. Northrop, Agent of the Massachusetts Board of Education, reports:—"No fact connected with our schools has impressed me so sadly as the extent of truancy and non-attendance, and the strange apathy of the public as to this fruitful form of juvenile crime. This great evil calls loudly for a remedy. In a few townships the laws in reference to truants and absentees from school are faithfully executed, and with the happiest results; while in others, these laws are overlooked or utterly disregarded. . . . School Committees can render no more important service to the public than by combining their own efforts, and enlisting the co-operation of their several constituents to repress this alarming evil." (*Quoted in Second Report on Truancy and Compulsory Education, by Hon. J. D. Philbrick, City Superintendent of Boston Schools, p. 47.*)

† Revised Statutes, ch. 41, s. 1, 2.

shall forthwith give notice of all violations, with the reasons, to the treasurer of the city or township; and if such treasurer wilfully neglects or refuses to prosecute any person liable to the penalty provided in the preceding section, he shall forfeit the sum of \$20.

"Each city and township may make all needful provisions and arrangements concerning habitual truants and children not attending school, or without any regular and lawful occupation, or growing up in ignorance, between the ages of five and sixteen years; and also all such bylaws respecting such children as shall be deemed most conducive to the welfare and good order of such city or township; and there shall be annexed to such bylaws suitable penalties, not exceeding \$20 for any one breach, provided that the said bylaws be approved by the Superior Court of the county. A minor convicted under such bylaws may, at the discretion of the Justice or Court having jurisdiction in the case, instead of the fine mentioned in the preceding section, or in default of payment thereof, be committed to any such institution of instruction, house of reformation, or suitable situation provided for the purpose, for such time not exceeding two years as such Justice or Court may determine.

"No child between twelve and fifteen shall be employed in any manufacturing establishment, unless within twelve months next preceding the term of such employment they have attended some public or private day-school under teachers approved by the School Committee of the place in which such school was kept, at least one term of eleven weeks, and unless they attend such a school for a like period during each twelve months of such employment. Children under twelve years of age shall not be employed unless they have attended a like school for a term of eighteen weeks within the twelve months next preceding their employment, and a like term during each twelve months of such employment.

"No child under twelve years of age shall be employed in any manufacturing establishment for more than ten hours a day. The owner or superintendent of a manufacturing establishment who employs a child in violation of any of the preceding provisions, is liable to a penalty of \$50 for each offence." *

* The Connecticut law varies somewhat from that of Massachusetts. It is this:—"All parents and those who have the care of children shall bring them up in some honest and lawful calling or employment, and shall instruct them, or cause them to be instructed, in reading, writing, English grammar, geography, and the elements of arithmetic. The select men, in their respective townships, shall inspect the conduct of the heads of families, and if they find any who neglect the education of the children under their care, they may admonish them to attend to their duty; and if they continue to be negligent, whereby the children grow rude, stubborn, and unruly, they shall, with the advice of a Justice of the Peace, take such children from their parents or those who have the charge of them, and bind them out to some proper master—males till 21, females till 18 years of age—that they may be properly educated and brought up in a lawful calling or employment."

The State Superintendent of Schools, commenting on this law in his Report for 1864 (p. 18), says—"The provisions of this section have sometimes been enforced, but facts are too abundant to admit of a doubt that there are many children in the State whose education has been neglected in open violation of the laws. Were there some milder penalty than removal from the home of the parents, it is believed that the law would be more strictly enforced."

I was informed by a Connecticut gentleman, himself a large employer of skilled labour, that the practice of apprenticing is almost, if not entirely, obsolete in the United States. Such is the demand for labour that boys earn wages at once.

The Connecticut law, with regard to the employment of children in factories, is identical with that of Massachusetts, except that the penalty for a breach of it is only \$25 instead of \$50. It is also made incumbent on the school visitors to examine into the situation of the children so employed in their several districts, and to report any violations of the law to some informing officer. On this head the Superintendent observes: "Several townships have enforced this Act, and the public schools have had largely increased attendance in consequence. I believe it would be more generally enforced were the age fixed at 14 years instead of 15 (Report U. S., p. 19).

In Rhode Island, again, as in Massachusetts, permission is given to the several townships to make such bylaws as they may deem best suited for the repression of truancy; such ordinances and bylaws, however, not to take effect till approved by the Commissioner of Public Schools. The penalties are milder; if a fine, it must not exceed \$10; if the child is committed to an institution of instruction, it must not be for a longer period than one year, and the institution must not be a place used for the reception of criminals, or a reform school. (School Acts of Rhode Island, pp. 24, 25.) There appears to be no law in Rhode Island upon the employment of children in factories, though, considering the development of manufactures in that State, such a law might be thought to be required.

I do not notice any provision upon the subject either of absenteeism or of truancy in the School Laws of Ohio, Illinois, or New York. In New York city, however, there is a department of the police force specially charged with the duty of looking after truants, called "truant-officers." But they are only seven in number, and quite unable to contend with the mass of truancy and absenteeism that is asserted to exist in that city. Their operations for 1864 are thus reported by the City Superintendent of Schools:—"The number of truant children reported by the several teachers of the city to the police, during the past year, was 4,663, of whom 2,880 were found absent from good cause, the residence of 300 was not found, 83 were arrested and sent back to school, 145 sent to the Juvenile Asylum, 275 remained truants, and 1,750 were induced to attend school regularly."

The duties of the truant-officers are very delicate, and much of the success of the plan depends upon the tact and good feeling of the persons employed to carry it out.

The Juvenile Asylum (just referred to), and the Children's Aid Society at New York, are two admirable associations, supported by voluntary benevolence, but subsidized by the Board of Education, for dealing with neglected children. They are received as boarders, and retained under discipline and instruction for a period varying from three months to two years, till their characters can be ascertained and vouched for, and are then transported in squads of thirty or forty at a time, through accredited agents, to the Western States, where they are eagerly sought after by the farmers, taken into their employ, and sometimes even adopted into their families. About 2,000 boys and girls are thus removed out of the way of direct temptations to crime every year. I visited the Juvenile Asylum, and was quite charmed with its arrangements, and with the tone that appeared to pervade the whole establishment.

The law as it is,
not operative.

The law, as will be observed, is emphatic enough; but I believe that its provisions are nearly, if not quite, inoperative. Public sentiment, so omnipotent in America, is not with it; and it stands, therefore, almost a dead letter upon the statute-books.*

A demand for
compulsory
attendance.

Meanwhile, from many sections of the community, and especially from those who would be called the educationists, the cry is rising both loud and vehement, that greater stringency is required in the law, and that compulsory attendance is the proper correlative of "free schools." For, it is argued, if the State taxes me, who perhaps have no children, towards the support of schools, "for the security of society," I have a right to claim from the State, for the security of the same society, that the schools which I am taxed to maintain shall be attended by those for whose benefit they were designed.† At the meeting of the Ohio State Teachers' Association which I attended at Cincinnati, the subject was very ably discussed in the presence of 300 or 400 teachers. A report, emanating from a committee that had been appointed to consider the question, was submitted, which "regarded truancy as a great and growing evil, and the fruitful source of crime," and felt that "the evil could not be effectually removed without legislation." A resolution, therefore, was offered, "That a Committee should be appointed to memorialize the next Legislature, praying that that body would take *immediate* action to secure a *stringent* truant law, providing truant officers throughout the State."‡

Resolution
proposed by the
Ohio teachers.

Boston system.

In Boston, also, truant-officers exist, and are said "quietly and unostentatiously to have done much good in checking vagrancy and vagabondism." But their position is hardly adjusted to the satisfaction of the School Committee, to whom they appear to make no direct report; and an opinion is expressed that their official action, so far as it pertains to the schools, should be directed by that Board. (*Boston Annual Report for 1864*, p. 44.)

Change in the
Massachusetts
law.

By a statute of 1862 (chs. 21 and 207), the duty of making by-laws relating to the matter of truancy was made *obligatory* on the township of Massachusetts, instead of remaining *permissive* only. I am not aware to what extent the obligation has been recognized, or what have been the effects of the change. From the report of the School Committee of Dedham, where such by-laws have been passed, very little (if any) abatement of the evil appears to have followed. (*See Massachusetts 28th Report*, 1865, pp. 168, 169.)

* I do not mean that "public sentiment" is not in favour of the repression of truancy, but not through the medium of pains and penalties.

The Maine
liquor law.

Other laws, and for the same reason, are in the same plight of abeyance. The "liquor law," which originated in Maine, is also the law of Massachusetts and Connecticut, but its enforcement is now, I believe, never attempted. A Newhaven gentleman told me that a phrase commonly substituted for the ordinary invitation to "take a drink," is "Will you violate the law?" and during my visit to the country, I read a paragraph from an Augusta (Maine) newspaper, stating that intemperance had got to a height in that neighbourhood which it had never reached before.

Again, the question forces itself upon the mind, "Quid leges, sine moribus?" and one sighs over the folly of legislating in obedience to fanatical agitation, rather than in harmony with the general conscience of society.

Argument of the
Ohio Commis-
sioner of schools.

† "Our system of free schools is built on this principle, viz., that the only sure basis for universal liberty is universal education. Its entire scope and expense are justified upon the ground that the highest security of the State and the well-being of society depend upon the universal diffusion of intelligence and virtue—the fruits of education. To meet this great necessity of free government, the free school stands with open doors. But why not carry out this principle to its logical result? The mere *provision* for the education of all the youth of the State is not its security, but the universal enjoyment of such provision. Free schools are only the means: the end sought is actual universal education. If it is the duty of the State to provide free schools as a means of universal education, it is also its duty to see that such means accomplish the desired end. In other words, the right to take one man's property to educate another man's children carries with it the duty of seeing to it that the said children receive the benefits of the education thus provided." (*Ohio 11th Report*, 1865, p. 39.) Similar sentiments are expressed by the school visitors of the township of Canterbury, Connecticut. (*See Connecticut Report for 1865*, pp. 50, 51.) Among their arguments it is stated as "a well-attested truth, that property in the vicinity of a good school is held at a higher price on that account, and will command a higher rate in the market."

Arguments for
and against the
resolution.

‡ (*See Ohio Educational Monthly for Sept.*, 1865, p. 245.) Some very pertinent remarks were made in the discussion which followed. State Commissioner Hon. E. E. White "proposed to amend the report of the Committee by striking out the word 'stringent' and substituting the word 'practicable.' It struck him that the first legislative step to be taken was to ask the State to step in only when parents criminally neglect their obligations, by allowing their children to wander about the streets without occupation, and they become vicious and criminal, and this, he thought, was as far as they could hope to go at the first step. In correcting such evils, the most stringent laws were not always the most efficient. If legislation is much in advance of public sentiment, it fails. He did not believe in legislating *down* to public sentiment, but he would keep within reach of it. In correcting the great evils of truancy and absenteeism, they must do as Massachusetts had done—commence with moderate measures, and work up to the proper standard as fast as possible."

Mr. J. D. Caldwell also spoke very much to the purpose. "It may be well," he said, "to call attention to this point:—Are we not depending too much upon the power of the law to enforce attendance upon school? We outsiders are anxious to have this great question settled in the best way; but I will point out this memorable fact,—that there has been no question upon which the people of Ohio have been so much exercised as upon the temperance question. We have in consequence enacted a 'stringent law' in reference to the selling and drinking ardent spirits. The law has been on our statute-book from seven to ten years, and what is the result? It is not enforced at all. I happen to have been placed in a position to enforce the law. I was made to represent the people of Hamilton County, and was required by law to swear I would make due diligence to find out if there were any violations of the law in this county. Such a scene followed as I never before witnessed. I held the host of liquor-sellers of this city (Cincinnati) in terror and anxiety for four weeks. I had the whole of them brought before the Court, and the infernal traffic was stopped for a whole month. And it can be stopped now any day, if the people of Ohio wish it. Here is a law for stopping it at once; and if public opinion demanded it, the traffic would be stopped. This association, to accomplish the object it desires in the matter of truancy, should appoint a Committee to report statistics on the evils of truancy, and thus bring their calcium light to bear upon this great evil. Who are our law-makers but the people? And if they are not with you, what is the use of a law? The idea of getting an enactment on any subject, and then going about our business satisfied, is ridiculous. You cannot accomplish this thing by law. We have attempted in our city schools to show up the evils of truancy, and you of the State Association should follow the same course." (*Ibid.*, pp. 247, 249, 250.)

The subject is discussed calmly, but forcibly, in the last report of the Superintendent of Schools in Connecticut;* and again, more passionately and not less forcibly, in the last Report of the School Commissioner of Rhode Island.†

I am afraid, however, that there is a great mass of apathy and unconcern which is neither stirred by this rhetoric nor ready to listen to these arguments, and, for aught that I can see, as in England, so in America, truancy and absenteeism will continue to be the burden of bitterest lamentation to the philanthropist, and the burden of sorest mischief to the schools.

But it is time to pass from schools in the abstract, as they are contemplated in the eye of the law, to schools in the concrete, as they present themselves to the eye of an observer. I was instructed to "inform myself of the manner in which the schools are supported, whether by any fund in the nature of endowment or appropriation by the State or Central Government, or by local taxation, or by subscription, or by school fees. If there were any funds appropriated by the State, I was to ascertain the source from which they are derived, whether from the sale or allotment of State lands, or from general taxation, or from any other source, their amount, and the principle of their distribution among the various local bodies. If they arose from special or local taxation, I was to learn the principle and manner of its assessment, and its amount relatively to the income of the ratepayer, and to the taxation of the country. And in all cases, I was directed

THE AMERICAN
SCHOOL AT WORK.

* "Common schools are State institutions, organized under State direction, and supported, to a great extent, from the State treasury, or from taxes collected by State authority. The principle which justifies this relation and the exercise of this authority is, that education is necessary for the good of the State, and for the welfare of society, which the State is bound to protect. The schools accomplish the object for which they were organized, mainly by receiving the children of school age and educating them for the responsibilities which are to devolve upon them as citizens of the State and members of society. If children do not attend school, the object is not accomplished. It is a question which has already received the attention of legislative bodies in other States and countries, and which may press itself forcibly upon your honorable body,—whether the safety of the State, and the best interests of society, do not require that some measures shall be adopted which shall insure the attendance of all of school age not justifiably absent. The services of the older children may be of some value to the parent or employer now, but it is not a wise arrangement, or one just to the child or the State, which robs one of his birthright under a free, intelligent Government, or the other of the power, security, and wealth, which educated minds bring." (*Connecticut Report for 1865*, p. 7.)

Opinion of the
Superintendent
of Schools in
Connecticut,

† "If virtue and knowledge protect property, then property should be taxed sufficiently to secure them. If every child has a right to moral and intellectual education, then every State has the power to secure that right to the child by compulsory laws. No child should be allowed to be deprived of it. With the State, popular education is a question of self-defence. There are hundreds of children in the city of Providence and in other parts of the State who are unable to read, who are habitual vagrants from school, educating for the worst and most dangerous forms of vice, utterly neglected, as though this mischievous and rapidly accumulating force was not to enter into our coming account. If the question 'What shall we do with them?' excite no interest, perhaps that other question 'What will they soon do with us?' may. There is only one thing we can do with them—educate them. Establish schools for them, and see that they attend them. But this would involve an 'appropriation.' So do criminal courts and gaols. The State must support one or the other. It can choose which. In 1819, compulsory laws, requiring every parent to educate every child, were enacted in Prussia. At first there was a violent opposition, and the usual hue-and-cry of 'invaded rights,' but in 12 years, crime and pauperism had diminished 40 per cent. Now no person would dare to propose a repeal of these laws. But, cries the timid lawmaker, 'We have no right to legislate in this way.' What! a right to cast into a dungeon, but no right to send to school? A right to suspend by the gallows, but no right to teach the Decalogue? A right to disgrace a man for ever, but no right to prepare him for honor, glory, immortality? Do our legislators know that juvenile crime is increasing in a much larger ratio than our population or our wealth? Is it not time that something was enacted to dry up these sources of frightful evil, before the swollen and impetuous stream shall inundate the land?" (*19th Annual Report*, pp. 25-27).

and of the
School Com-
missioners of
Rhode Island.

Increase of
juvenile crime.

Mr. James F. Gerard, a retired lawyer of New York, who having more than reached the limit of "three-score years and ten," but retaining all the vigour and freshness of youth, devotes a large portion of his time to visiting the city schools, and whose face must be known to every school-teacher and school-child in New York, and is loved wherever it is known, told me that his decided conviction was that the evil could only be reached by the voluntary, philanthropic action of the religious bodies, carried on in a missionary spirit, and organized on a much more extensive scale than anything which exists at present. "Parochial schools," that is, schools connected with different Christian congregations, do, it is true, already exist in considerable numbers all over the States, and in the hands of the Roman Catholics are often vigorous and well-attended. But they hardly lay hold of the class of children in view; while the industrial, or as we should perhaps call them, the Ragged Schools of the Children's Aid Society, though useful and well conducted as far as they go, are not numerous or powerful enough really to arrest the evil. Mr. Gerard's notion was that the children must be partly clothed and fed, as well as taught; for though people sometimes talk as though there were none of our European evils there, there are both poverty and ignorance in America. The only difference is, that in America, in most cases, both are voluntary.

Mr. J. F. Gerard's
opinion.

Parochial and
Industrial
schools do not
reach the evil.

It is almost superfluous to remark that the evil of an uneducated lower class is infinitely more serious in a country where political power, through universal or almost universal suffrage, is in the hands of the masses, than where, as with ourselves, both the structure of the constituencies and the tendency of public opinion support the theory of "progress under the direction of an educated minority." And even we feel that it is not socially safe to leave in ignorance a class who have no political power. The intensity, therefore, with which Americans think and feel on the matter, can easily be conceived.

Its formidable
consequences
in America.

"I cannot close," says the Superintendent of the Schools of Providence, "without repeating what I have said in all my former reports,—that our schools are suffering more from the evils of truancy than from all other causes combined. Nothing has yet been done effectually to check this prolific source of misery and crime. Could a true picture of the rapid increase of youthful depravity be portrayed in all its appalling colours, it could not but startle and astonish every friend to humanity and social order. The seed now being sown will produce in coming years a most terrible harvest. Short-sighted must that policy be, independent of all moral considerations, that hesitates to spend a few hundred dollars in the prevention of crime, rather than incur, with all the risks of life and property, the expenditure of thousands in punishing it, and in retrieving the miseries that follow in its train." (*Report for 1863*, p. 27.)

View of the
Superintendent
of Schools at
Providence.

to ascertain the average cost of the education of a scholar, and particularly its full cost to the parents." To the department of the subject thus marked out for me I will devote the present section of this report.

Action of the
"General Land
Office."

By the Constitution (art. iv., s. 3.2), the Congress of the United States has power to dispose of, and make all needful rules and regulations respecting, the territory or other property belonging to the nation. The administration of this property is confided to a bureau, called the "General Land Office," which was established in 1812 as a department of the Treasury, but was transferred in 1859 to the Ministry of the Interior. Out of the 3,250,000 square miles which constitute the territorial extent of the Union, the public lands embrace an area of 2,265,625 square miles, or 1,450,000,000 acres, and contain within their circumference 16 sovereignties known as the "Land States," and an extent of territory sufficient for 32 additional States, each equal to the great central Land State of Ohio.* This immense extent of territory, as it is gradually surveyed, is laid off in townships six miles square, each divided into 36 sections or square miles, of which the sixteenth is specially appropriated for the support of schools, and is called the "school section." When once land is granted and set off for this purpose, the control of it passes from the hands of the Central Government to those of the particular State within whose boundaries it lies; and the income arising from its management, whether let or sold, constitutes what is called the "Township Fund" in Illinois, and the "Irreducible Fund" in Ohio.†

Area over which
it ranges.

The "school
section."

* See *National Almanac for 1863*, p. 215.—The "Sixteen Sovereignties" are the States of Ohio, Indiana, Illinois, Missouri, Alabama, Mississippi, Louisiana, Michigan, Arkansas, Florida, Iowa, Wisconsin, California, Minnesota, Oregon, Kansas.

† The public lands that have belonged, and now belong to the General Government are situated—

(a) Within the limits of the United States as defined by the treaty of 1783, and are embraced by the States of Ohio, Indiana, Illinois, Michigan, Wisconsin, and Minnesota, all of which have been formed out of the north-west territory, as conveyed with certain reservations to the United States, by New York in 1781, by Virginia in 1784, by Massachusetts in 1785, and by Connecticut in 1786; also the lands within the boundaries of the States of Mississippi and Alabama, north of 31° N. lat., as conveyed to the United States by Georgia in 1802:

(b) Within the territories of Orleans and Louisiana as acquired from France by the treaty of 1803, including the portion of Mississippi and Alabama south of 31°, the whole of Louisiana, Arkansas, Missouri, Iowa, Kansas, Oregon, and the territories of Colorado, Nebraska, Dakota, and Washington:

(c) Within the State of Florida, as obtained from Spain, by the treaty of 1819:

(d) In New Mexico, Utah, Nevada and California, as acquired from Mexico by treaty in 1848:

(e) The 'Gadsden Purchase' of 23,161,000 acres south of the Gila River, acquired from Mexico in 1854.—(*National Almanac, as above.*)

The Irreducible
Fund of Ohio.

† The case of Ohio, which I take to have been the first State to which this method of endowment was applied, may serve as an illustration of the plan, and of its operation generally. It is now the law of settlement of all new States.

Ohio was admitted into the Union as a State in 1802—fourteen years after its original settlement. In the same year, Congress, in the Act of Organization, in order to induce the new State to accept a provision for exempting lands sold by the United States from taxation for a period of five years, proposed that "the Section No. 16 in every township, or where such sections had been sold, granted, or disposed of, other lands equivalent thereto and most contiguous to the same, should be granted to such township, for the use of schools." The Ohio Convention accepted the proposition, and it was voted that "all lands appropriated by the United States for the support of schools, should be vested in the Legislature of the State, in trust, for that purpose." The lands have been either sold or let; and the proceeds of sales, amounting to a capital sum of \$2,879,379 is held in trust by the State, the Treasury paying an annual interest of 6 per cent. The income of the property from all sources, for the year ended September 1st, 1864, was \$218,637. The income, however, is not distributed by a uniform rule. Certain portions of the State, which were settled under special terms—the Virginia Military District, the United States Military District, on which the soldiers of the revolutionary war were pensioned, and the Connecticut Western Reserve—receive their share according to the whole number of youth therein, while in the remainder of the State, the rent of section 16, or the interest arising from the proceeds of its sale, is paid exclusively to the inhabitants of the originally surveyed townships. This leads to inconvenience, as well as to great inequalities of benefit. One township may receive a larger sum, its section of land having been fortunately situated, or judiciously sold; while an adjacent township receives a mere pittance. In Indiana an attempt was recently made to redress this state of things, by consolidating the township funds, and distributing their income equally throughout the State; but the Supreme Court of the State decided that such a measure would be a violation of trust, and it was therefore abandoned.

Estimate of its
average value
to a township.

It may be worth while to attempt to estimate the value of this donation of Congress. A section of a township is a square mile, or 640 acres. The area of Ohio is estimated at 39,964 square miles; one thirty-sixth part of this gives 710,470 acres. It would, of course, when given, be uncleared ground, such as the Government are in the habit of selling at \$1.25 per acre. The donation, then, of section 16 would be equivalent to a donation to each township, on the average, of a capital sum of \$800 as an endowment for its schools; and this, at 6 per cent. interest, would produce \$48 a year. It appears, however, from the returns, that the land must have sold at a higher rate per acre than \$1.25; for the income of the "irreducible fund" for 1863-4 is set down at \$218,637, which, divided among the 1,351 townships of the State, would give an average of rather more than \$160 to each. It is probable, therefore, that the average value of the land would be \$3.50 or \$4.00 an acre, unless there have been accumulations of capital.

In the untimbered prairie lands of Illinois, where the cost of clearing would be very small, the value of the section would be considerably more. The Illinois Central Railway Company are now offering for sale about a million acres of land, adjacent to their line of road, in farms of 40 acres and upwards, at prices depending on situation, but varying from \$9 to \$15 an acre. The capital value of the "township fund" of Illinois is put down at \$3,515,118.

Commissioner
White's opinion
of its benefits.

Mr. White, the State Commissioner of Schools in Ohio, doubts whether the land endowment, as it has been used, has been productive of any real benefit to the schools. There would, he thinks, have been no difficulty in raising the required sum without it. It might have been made very useful, if it had been reserved for the support of high schools, which are much needed, but the value of which is not adequately appreciated by the people. There are whole counties in Ohio without a single high school within their limits.

In the year 1836, the Government of the United States found itself in a predicament unusual to Governments—in possession of large accumulations and surplus revenue, which had become rather embarrassing. It was resolved to apportion the amount, *pro rata*, among the States then constituting the Union, with leave to employ the annually accruing income in such ways as they might deem most expedient for their own local interests, subject only to the possibility, in event of any national emergency, of being recalled. It has not, however, been recalled, even under the pressure of the civil war; and though it is still treated as a loan, nobody seems to think that the time will ever arrive when it will be reclaimed. In many of the States the annual income of the fund, which is generally known as the "United States' Deposit Fund," is applied to the support of schools; in others, where no such item appears in the school accounts, it is devoted, I presume, to other local objects.*

The United States' Deposit Fund.

The only other general donation of the Central Government to educational purposes, so far as I am aware, is contained in what is commonly known as the "Agricultural College Act." By an Act of Congress dated 2nd July, 1862, there was granted to the several States which might choose to accept the terms, an amount of public land in quantity equal to 30,000 acres for each senator and representative in Congress to which such States are respectively entitled under the Census of 1860, for the purpose of endowing, supporting, and maintaining at least one college in each State, "where the leading object shall be, without excluding other scientific and classical studies, and including military tactics, to treat such branches of learning as are related to agricultural and the mechanic arts, in such manner as the Legislatures of the States may respectively prescribe, in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions of life."

Agricultural College Act.

Its object.

The endowment is liberal, and the utility of the object cannot be questioned. Up to the end of September, 1863, 15 States had accepted grants, and expressed their willingness to comply with the terms; others have declared their acceptance subsequently, and the amount of public land already assigned is nearly 5,000,000 acres. The disturbed condition of the country since the date of the Act has prevented any steps from being actually taken to constitute and organize such colleges, but the subject has been widely discussed, and in the Ohio State Commissioner's Report for 1865 the course of study and instruction to be pursued in such an institution, and the best plan of organizing it, are propounded in some detail. The quantity of land allotted to the State of Ohio is 630,000 acres; and it is estimated that, "with proper care in the location of the lands and in the sale of the scrip, the State ought to realize at least \$630,000, or one dollar per acre. This sum vested in 6 per cent. United States Stocks, or in the State Stocks, would yield an annual income of over \$37,000, one-half of which, according to the plan proposed, would endow an experimental school; the other half would endow the scientific and agricultural professorships."†

It is expressly, and perhaps wisely—considering the tendency of Americans in these things—provided in the Act that "no portion of the fund, nor the interest thereon, shall be applied directly or indirectly, under any pretence whatever, to the purchase, erection, preservation, or repair, of any building or buildings."

Every State which I visited, and I believe every State in the Union in which the system of Common Schools is organized, possesses a school fund, arising from various sources,—sale of lands, direct or indirect taxation, fines, penalties, escheats and forfeitures,—vested either in the State Legislature, in a Board of Education, or in an officer or officers specially appointed for the purpose, the income of which

State school fund.

* In Connecticut, the whole income of the fund, under the name of the "townships' deposit fund" is applied to schools; and similarly in Rhode Island. In New York, \$165,000 of the income is annually appropriated to the same object. In Massachusetts, unless it is included indiscriminately under the head of "State school fund," I cannot discover that any of the school income comes from this source.

Application of the United States' Deposit Fund.

The amount of the fund is considerable. In New York its capital sum is \$4,014,520, producing a revenue of about \$260,000, of which \$165,000 are annually credited to the school fund, upon which the salaries of the School Commissioners (112 at \$500—\$56,000), and the apportionment for libraries (\$55,000), constitute a first charge.

In Illinois, the amount is \$335,592, of which the income would be nearly \$20,000.

In Connecticut, the fund is \$763,660, producing an income of \$45,000. In this State the fund was deposited with the several townships according to population, as ascertained by the Census of 1830. It is to be invested at 6 per cent. interest, and both fund and income are to be exempt from any charge of expense of management. The legal requirement that the fund should be loaned at 6 per cent. was made in 1859, in consequence of its being discovered that some townships had directed the agent of the fund to loan it to the selectmen at a nominal rate of interest, in some instances as low as 1 per cent., thus virtually depriving the common schools of the larger part of their legitimate income. (See *Connecticut Report* for 1864, p. 50.) The use of the "U. S. Deposit Fund" in the States may be compared with the use made of the "Clergy Reserve Fund" by the townships of Upper Canada.

in Connecticut.

† *Ohio 11th Report*, pp. 51–58. States in which there remains a sufficient quantity of unsold public land, receive the grant in land within their own territory. Other States, in which there is not the quantity of public land subject to sale, take land scrip to the amount in acres for the deficiency of their distributive share, which scrip they are entitled to sell, but not to locate. The purchaser, however, has the power of locating it upon any of the unappropriated lands of the United States, subject to sale at \$1.25 per acre. All mineral lands are excepted from the grant.

The grant under the Act takes two forms.

The States which have accepted are: (a) in land; Iowa, 240,000 acres; Kansas, 90,000; Michigan, 240,000; Minnesota, 120,000; Wisconsin, 240,000; (b) in land scrip; Rhode Island, 120,000 acres; Illinois, 480,000; Kentucky, 330,000; Vermont, 150,000; New York, 990,000; Pennsylvania, 780,000; New Jersey, 210,000; Massachusetts, 360,000; New Hampshire, 150,000; Connecticut, 180,000; Ohio, 630,000. (See *National Almanac* for 1864, p. 254.)

Amount allotted to several States.

is annually distributed, with very curious differences of administration, for the promotion of education, chiefly, but not exclusively, through the instrumentality of the public schools.* The differences of administration which I have noticed—

* A long note will be necessary here. I will describe, sufficiently to illustrate the statement in the text, the school funds of Massachusetts, Connecticut, New York, Ohio, and Illinois; (a) as to their sources and origin; (b) as to their amount; (c) as to the principles that govern their administration.

MASSACHUSETTS. State school fund. Its origin.	I. The Act establishing the Massachusetts school fund was passed in 1834. The capital was derived from the sale of lands in the State of Maine, and from some claims of Massachusetts on the Government of the United States for military service. In 1854 the State Treasurer was directed to transfer to the fund such a number of shares of the stock of the Western Railroad as would, at the rate of \$100 a share, increase the capital to a million and a half of dollars. By a law of 1859, the rate is to be further increased by the proceeds of sales of land in the Back Bay. Its ultimate amount is fixed at \$2,000,000.
Its amount.	The capital of the fund in 1864 was \$1,181,627, and the accruing interest for the year was \$111,124. Of this amount, one moiety was applied to various educational purposes; viz., \$18,000 to the four State normal schools; \$4,800 for 48 State scholarships of \$100 each, for the purpose of training masters for the high schools in the State; \$3,000 for teachers' institutes; about \$500 to Indian schools; and about \$22,000 for other miscellaneous objects, leaving a surplus of \$10,538, which was added to the principal.
Its application.	The other moiety, \$55,562, was applied to the support of the common schools of the State, yielding to each child between the ages of 5 and 15 in the townships, the sum of 23 cents 4 mills—not quite a quarter of a dollar, or not a 25th part of the whole average cost of such child's education. The fund is apportioned, by the Secretary and Treasurer of the Commonwealth, to the school committees of the several townships, according to the number of children, between 5 and 15 years of age in each, on condition that the said township raises by local taxes \$1.50 per child to meet it. Schools are required by law to be kept by properly qualified teachers, and to be open for six months in the year; but these are not conditions of a township's receiving its share of the grant. The school committee distribute the money among the several schools of the township at their discretion, uncontrolled by any vote of the inhabitants. Twenty-five per cent. of the sum received may be expended on the purchase of books and apparatus; the remainder is to be applied to the direct support of the schools, that is, to the payment of teachers' wages, supply of fuel, and care of school-rooms. At one time, though it was called a school fund, townships were not required to apply what they received to educational purposes, though in fact most townships did so. But the law has become more imperative on this point. Yet even in 1861, Mr. Secretary Boutwell says that some townships were making an illegal use of the money, by spending it to defray the cost of building and repairing school-houses, which ought to be provided out of local assessment (24th Report, p. 79). With the view of correcting a laxity of practice in other directions which has crept into many townships, Mr. Secretary White now proposes to make the conditions of receiving the State money more severe; viz., (a) that the amount raised by the township be not less than \$3 per child; (b) that a sufficient number of schools be kept for at least six months in the year at the expense of the township; and (c) that the provision requiring a high school to be maintained, where the population is of given dimensions, be complied with (28th Report, 1865, p. 96).
Fresh terms proposed.	
CONNECTICUT. Origin of fund.	II. The school fund of Connecticut originated in the sale of public lands belonging to the State, but situated in that part of Ohio known as the Western Reserve. The lands were sold in 1795 for \$1,200,000, and out of the proceeds was constituted a fund, the annual income of which was appropriated to the support and encouragement of common schools throughout the State. The capital value of this fund in 1864 was \$2,049,426, invested in bonds, mortgages, bank stock, and cultivated land, and produced an income of \$132,589, or \$1.20 per child,—five times the distributive share in Massachusetts. Since 1810 the fund has been under the direction of a Special Commissioner, with whose advice it is annually apportioned by the Comptroller of the State among the townships in proportion to the number of persons resident in them between four and sixteen years of age, and subdivided on the same principle, herein differing from the Massachusetts rule, among the districts that have kept schools according to law in the preceding year, i.e., for six months, in a satisfactory building, under a qualified teacher. If any district receives less than \$35 the deficiency must be made up to it from the township local tax, or the "township deposit fund." (See above, p. 45, note.) The money so apportioned is applicable to the payment of teachers' salaries only.
Its amount.	
Its distribution.	
NEW YORK. Nature and amount of fund.	III. The capital of the New York State School Fund, which was established in 1805, amounts to \$2,734,313, and consists of Bank and State stocks, Comptroller's bonds, and money in the Treasury uninvested. It increases by the sale of lands, &c., at the rate of \$30,000 or \$40,000 a year. In 1806 it only amounted to \$183,162; in 1845 it had grown to \$2,090,630. Its income in 1864 was \$154,882, to which was added \$165,000 from the United States' Deposit Fund, and \$1,125,749 from the State school tax of $\frac{3}{4}$ a mill on the dollar of the capital value of all real and personal property in the State, the general State tax for other purposes being $4\frac{1}{2}$ mills on the dollar.
Its administration.	It deserves to be noticed that direct taxes in America (with the exception of the newly imposed income tax) appear universally to be laid on capital, which is usually assessed at perhaps a fourth below its actual value.
The "district quota."	The administration of this fund is vested in the Superintendent of Public Instruction primarily, and secondly in the School Commissioners of the several Assembly Districts. After laying aside \$56,000 for the salaries of 112 school commissioners, at \$500 dollars apiece, and \$55,000 for library money, to be divided among the districts according to the number of persons in each between five and twenty-one years of age, and \$2,000 for a contingent fund, the balance is divided by the Superintendent into two unequal parts, in the ratio of one-third to two-thirds. The one-third, called the "district quota," is divided among the districts which have kept their school open for twenty-eight weeks of five days each, and who have sent in reports according to law, at the rate of one quota for each qualified teacher who has taught in the schools for the said required term.
The "pupil quota."	The two-thirds, called the "pupil quota," with the library fund, is divided among the counties according to population.
Two-fold distribution of this.	The next step in the distribution is taken by the School Commissioners (be they one or more) of the county. Taking this "pupil quota," which is two-thirds of the whole sum, they divide it into two equal parts; one moiety, which will be one-third of the whole original amount, among the school districts, according to the number of children in each between the ages of four and twenty-one; the other moiety according to the average daily attendance in the schools; half, that is, according to the presumable need of the district, as tested by its school population, and half according to the effort it has itself made to supply that need, as tested by the attendance of the children in the schools.
New provision of law.	In 1864 the amount distributed as "district quota" was \$439,249; and the amount divided as "pupil quota" was \$893,607. New York city pays under the $\frac{3}{4}$ mill State-tax, nearly twice as much as she receives back. Her payment in 1864 was \$432,000; her receipt only \$260,896.
	The apportionment of one-half of the "pupil quota" on the basis of average daily attendance is a new provision of law, which will not come into operation till this year (1866), and is expected

and hardly any two States administer their fund exactly on the same principles—have arisen, I imagine, from the desire of those who have the disposition of the fund, to make the stimulus thus provided in the shape of a pecuniary subsidy, bear as directly and as effectively as possible on the schools. The Massachusetts method is the simplest; the New York method, or that of Illinois, the most complicated; the Connecticut conditions, perhaps the most stringent; but in none of the States does the end aimed at—the efficiency of the schools—appear to be completely attained. It is indeed evident, though we in England only discovered the fact after a formal inquiry, that the population of a township, or its acreage, or the amount of its taxable property, or the length of time during which the schools are kept open, or the certificates of the teachers, or the number of children within the school age, or the average number of scholars in attendance—each and all of which, separately or in combination, are made conditions in one State or another of receiving the State's bounty—are none of them adequate guarantees that the schools in a township are in the condition in which they ought to be, or are producing the results which they ought to produce. Our principle of "payment for results," combined with payment on average attendance, certain necessary conditions for the well-being of the school being also presupposed, the results in question being obtained by the process of direct individualized examination, conducted by a competent and perfectly independent inspector, has not yet been tried in America. Being asked to make an address to the Ohio State School Teachers' Association at Cincinnati, I took for my subject the English school system, particularly those parts of it that admitted of being brought into most direct comparison with their own. The two features of the system which seemed to strike my audience most forcibly and most favourably, both for their novelty and for their evident utility, were, first, our course of nine years' training of teachers—five years as pupil-teachers, two years at the normal school, and two years under probation; and, second, our method of inspection and our practice of "payment for results," especially that part of the practice which so frequently obtains among us, of allowing the teacher a certain fixed proportion of the sum which has been earned for the school by his ability and diligence. The amount of the State's aid, even when it is largest, as in Connecticut or Ohio, measured by dollars, is not, it is true, very considerable, at least not in proportion

Differences of administration.

Object incompletely attained.

Comparison of English and American methods.

materially to improve the attendance at the schools. Up to this time the whole of the "pupil quota" was distributed on one principle, according to the number of children of school-age in the district.

IV. The Ohio school fund,—not including the "irreducible fund" arising from the sale or letting of Ohio of "section sixteen," which belongs to the several townships (see *above*, p. 53, note 8)—is the product of a tax of $1\frac{3}{8}$ mill levied on each dollar of the capital value of all real and personal estate, together with certain fines and escheats, some of them, unless obsolete, of a sufficiently curious character. Among them, is one of 25 cents to one dollar for each offence, "If any person of the age of fourteen years or upwards shall profanely curse or damn, or profanely swear by the name of God, Jesus Christ, or the Holy Ghost." I am sorry to say, that if this fine were strictly inflicted just now in America, an enormous income might be raised, for the habit of profane swearing, and especially by the second of these holy names, is awfully prevalent. This particular fine, however, is payable to "the township treasurers, for the use of schools," and not to the State school fund. (See *Ohio School Laws*, p. 61.) The tax produced in 1864 an income of \$1,217,460.

The fund is administered by the State Auditor, and distributed to each county according to the number of children between 5 and 21 in the same; and then subdivided, on the same principle, among the several "sub-districts." In view of 2,040 sub-districts (out of about 12,000) which in 1864 kept their schools open for a period short of twenty-four weeks, the School Commissioner recommends that the distribution of the State fund to any district be made to depend upon the said districts having raised during the previous year sufficient funds to sustain, with the aid of its share of the State fund, good schools in the several sub-districts for at least twenty-four weeks, which is the Illinois law; and further, that in case the smaller sub-districts are deprived, by the action of the school authorities of the township, of a legal and equitable share of the funds arising out of such local taxation, that authority be given to effect a redistribution of such funds (*11th Report*, p. 17).

At present, the distribution of the State school fund appears to be unconditional, or, at least, the only condition is, that the district shall have returned the required enumeration of its inhabitants within the school age.

V. In Illinois, the school fund consists of a capital sum produced by 3 per cent. of the proceeds of the sale of public lands "donated" by Congress to the State, and is cumulative as fast as the lands are sold. One-sixth of the amount is set apart as a college fund. In 1863 the two amounts were \$613,362 and \$156,613 respectively. There is also an annual income produced by a tax of two mills on the dollar of all real and personal property, which realized in 1863, \$293,317. Such is the statement of the *National Almanac*. But I do not understand how a tax of $1\frac{3}{8}$ mill on the dollar should produce in Ohio \$1,217,460, and a tax of two mills on the dollar produce in Illinois—with 15,000 more square miles of area—only \$293,117, unless the basis of assessment in the two States is widely different. It is true that Ohio has an excess of more than 600,000 in population, but this is not sufficient to account for the difference. I have nothing, in this case, to check the almanac's figures by, and its account is somewhat obscure; and either it may be misstated, or I may have misunderstood it. (See *National Almanac for 1864*, p. 327.)

ILLINOIS.

Source of the school fund.

The apportionment of the income is rather complicated. It, together with the income of the "Surplus Revenue," (another name for the "United States' Deposit Fund") is first apportioned annually by the Public Auditor of the State to the School Commissioner of each county, one-third according to the number of townships or parts of townships, and two-thirds in proportion to the number of white children under 21, in each county. The Commissioner then, taking the fund in hand, divides it among the treasurers of the several townships, on the basis of one-third in proportion to acreage, and two-thirds according to the number of white children in each. And, finally, the School Trustees of the township apportion it among the districts, half according to the number of white children in each under 21, the remainder in proportion to average attendance. The only condition is, that the school, which must be free, shall have been kept open for six months, under a properly qualified teacher. There is a special provision for coloured children. "In townships, where shall be persons of colour, the Trustees shall allow such persons a portion of the school fund equal to the amount of taxes collected for school purposes from such persons in their respective townships." (*School Laws of Illinois*, p. 80.)

Its apportionment.

to the total cost of each child's education; but I am convinced that a thorough system of independent inspection, and a thorough system of individual examination, particularly in the rural districts, which most require looking up, and where evasions of the law seem to be most frequent, would very largely increase its beneficial influence upon the schools. And so many Americans themselves feel.*

SOURCES OF LOCAL SUPPORT.

Schools sometimes maintained without local taxes.

But a school's main reliance upon support, even in Connecticut, where the State fund is so disproportionately large, and the income from that source consequently so considerable, is upon funds either raised in or belonging to the township or district in which it lies.† At least, such would be the case with all efficient schools. There probably are in all the States except Massachusetts,—where the State subsidy is so low, and is required to be met by six times its amount raised by local taxation, and rate-bills do not exist, and township endowments are rare,—schools pretty much of the type of our old rural "dame's schools," which are maintained not in efficiency but in nominal life, for a greater or smaller portion of the year—from three to four months—without raising a dollar by local taxation.‡

Limitations to local taxation.

In some States, as in Ohio and New York—for what reason I do not exactly know—possibly to remove prejudices against the principle of assessments for education, or to prevent weak districts being overborne by the arbitrary will of the majority, limits are placed by law to the local sentiment of liberality. In New York the cost of a school-house must not exceed \$800, unless approved by the School Commissioner; apparatus must not cost in any one year more than \$25, nor books for the district library more than \$10, nor must contingent expenses run up to a higher figure than \$25.§

Limitations fixed by law in Ohio.

In Ohio, in cities having a population over 100,000, the tax raised for school purposes must not exceed two mills on the dollar of the capital value of all taxable property; where the population is between 40,000 and 100,000, it must not exceed three mills; and in cities with a population of less than 40,000, it must not exceed four mills on the dollar. In other districts, it must not exceed two mills on the dollar "for any school purpose other than the payment of teachers," nor a further two mills on the dollar "for the exclusive purpose of sustaining teachers in the central or high schools, or to prolong, after the State funds have been exhausted, the terms of the several subdistrict or primary schools in the township.||

Opinion of Ohio School Commissioner.

* "How marked would be the change," says the Hon. E. E. White, of Ohio, "if a school inspector, possessing eminent qualifications for the work, and clothed with requisite authority, should enter each of those forlorn school-rooms, test the value and thoroughness of the instruction imparted, the discipline, the classification of the pupils, and all the other elements of an efficient school! Still more fruitful would be the inspector's labours, if he should also be made the instructor and guide of these teachers, aiding them in mapping out a rational order of school work, and instructing them in truer methods of teaching and discipline—in short, setting up for them a higher and truer standard of work, and inspiring all engaged therein with an earnest, progressive spirit. His influence and labours should also be directed to the elevation of public sentiment in each sub-district, the awakening of a deeper interest in education, and a more cordial co-operation on the part of the patrons of the school. Who doubts that such an agency, reaching efficiently every school district in the State, would wonderfully enhance the efficiency and value of our schools? The returns of every dollar therein expended would be increased more than twofold." (*Ohio 11th Report*, 1865, p. 35.)

No State tax for schools in New England.

† In the New England States there is no general tax levied annually by the State for the support of schools, as there is in New York and in the Western States. As already noticed, there is less centralization.

Picture of State of things in Ohio.

‡ I again quote from Mr. White, of Ohio:—"Our school law provides that the Board of Education of each township, city, or village, shall make the necessary provision for continuing the schools in their respective townships or special school districts for at least six months in each year. It will be noticed that during the last five years the schools of the State have been kept in session, on an average, but four days more than the time required; and yet the schools in most of the special districts (*i.e.*, the cities and towns) have been taught from eight to ten months in each year. These facts led me to suspect that many schools in the State were in session considerably less than the time required by statute. An inquiry in this direction in a few counties revealed the fact that in several townships no local tax whatever is assessed for tuition purposes; that the schools are continued till the State funds are exhausted, and then closed. Feeling it to be my duty to ascertain the extent of this disregard of a positive requirement of the statute, the equity of which has never been questioned, I called upon the school clerks to give, in their annual returns, a statement of the number of schools (if any) kept in session less than twenty-four weeks in the year. The number of schools reported is 2,040, or nearly 20 per cent. of all the sub-district schools in the State.

No local tax sometimes raised.

Cases of unjust distribution.

§ In many instances these schools are situated in sub-districts that contain comparatively a small number of pupils, and which by an unjust and illegal distribution of the school funds arising from local taxation, by township boards of education, do not receive sufficient funds to sustain a good school six months. If authority were given to order a re-apportionment of funds on evidence of such unjust action by township boards, the evil would soon be remedied. It is now a very serious one.

Short school sessions.

¶ The returns also reveal the humiliating fact that there were 618 townships and special districts in the State, in each of which the schools were in session on an average less than twenty-four weeks (120 days) during the year. But this is not all; 340 townships sustained their schools less than twenty weeks; 203 less than sixteen weeks; and 45 less than twelve weeks! (*Ohio 11th Report*, 1865, p. 15.)

Limitations in Canada.

§ Limitations of a like kind are introduced in the school laws both of Upper and Lower Canada; in both cases, I believe, to overcome objections to taxation, by restraining it within certain bounds.

Mr. White thinks limitations unwise.

|| *Ohio School Law of March 25, 1864.* The School Commissioner has a strong opinion that these limitations are unwise. "It is impossible," he says, "by legislative limitation to affect the local school levies in the State at large, without destroying the schools in those districts that are comparatively poor in property and rich in children." (*11th Report*, p. 13.) It appears that "the average rate of school tax voluntarily imposed by the cities, towns, and villages of the State, for 1863-4, was 2.62 mills on the dollar: in the rural townships, only 1.24 mills. For 1864-5, the average rate in the cities, towns, and villages was 3.62 mills; in the rural townships, 1.40 mills." (*Ibid*, p. 14.)

The sum required to be raised by local taxation is considerably diminished in the Western States, as compared, at least, with Massachusetts, by the much larger amount of the State school fund, and by the large local endowment arising from the sale or rent of "school-section sixteen"; and in the State of New York, by the extent to which, in the rural districts, recourse is had to the system of school fees.* Yet, apparently, the greater wealth of Massachusetts, relatively to its population, brings things nearly, if not quite, to a level again. The population of Massachusetts, at the Census of 1860, was 1,231,022—more than a million below the population of Ohio, nearly two and three-quarter millions below the population of New York. Its property valuation, as given in the last returns, is \$897,795,326, upon which was levied in 1864 a tax to the amount of \$1,536,314, giving an average for the State of one and three-quarter mills on the dollar.

Local taxation higher in the Eastern than in the Western States.

On page 16 a table is exhibited, showing the township appropriations of Massachusetts in 1864 for the education of each child in the township between the ages of five and fifteen. That table taken alone would lead to very erroneous conclusions as to the actual incidence upon property of the cost of the schools. In almost every case, as a fact, and as a natural consequence, where the appropriation is largest in its rate per child it is smallest in its rate per dollar. I quoted, just now, an expression from the Ohio Commissioner, in which he spoke of districts "poor in property, but rich in children." The townships that stand highest in the table of page 16 are those, on the contrary, which are poor in children but rich in property. Taking Massachusetts by counties, the one in which the highest rate was levied was Barnstable, where the tax was 2.78 mills on the dollar; the lowest was Suffolk, in which the Boston schools lie, where it was only 1.21 mills on the dollar. In the city of Boston itself the tax was only 1.02 mill; and Boston stands 324th on the list of the 333 townships which compose the State, in the "percentage of valuation" appropriated to its public schools.†

Incidence of taxation upon property in Massachusetts.

In some of the large cities of the west—for instance, in Chicago and St. Louis—a considerable proportion of the local funds arises from endowments.‡ In Chicago particularly, school-section sixteen fell almost in what is now the centre of that wonderfully developed city; and though I was informed it had not been made the most of, and much of it is admitted by the school authorities to be "leased on very low rents," yet even now the proceeds from this source are nearly one-fourth of the whole annual cost of these schools; and when the present leases expire, and the land can either be sold or re-let on more advantageous terms, it is not at all improbable, considering its situation, that its yearly income will be sufficient, or almost sufficient, to sustain the whole burthen of the schools.

Land endowments in Chicago and St. Louis.

As a general rule, in the eastern townships, where schools are maintained in thorough efficiency, I was informed that in normal pacific times the ratio of the tax allotted to the schools to the whole sum raised for local purposes was about one-third. Just now, owing to the pressure of the war, the amount, though absolutely higher than it has ever yet been in most places, is relatively less; and it would generally be less in cities, owing to the greater variety of municipal purposes to which money is applied, than in rural districts, which have few public objects beyond the school.

Rates of school-tax to whole amount of local taxation.

* In Ohio, in 1864, the State tax was \$1,217,460; the "irreducible fund" produced \$218,637; the local tax amounted to \$1,221,033 (*Eleventh Report*, p. 6). In New York, the amount raised by taxes in rural districts in 1864 was \$674,599; by rate-bills, *i.e.*, by school fees, \$429,892. In Connecticut, where all the sources from which money can be got are used, the returns for 1864 were as follows:—From school fund proper, \$134,311; from township deposit fund, \$45,000; from township school tax, \$87,700; from district tax, noticed as being unprecedentedly large, \$140,144; from school fees, \$31,422; and from miscellaneous local funds, \$13,786. It appears that the two cities of Hartford and Newhaven raised upwards of \$54,000 of the district tax—more than one-third of the whole—chiefly to provide themselves with new or improved school-buildings; and that out of the 1,609 districts in the State, only 181 raised money by district tax over and above the proceeds of the township tax. In 305 districts (not quite a fifth of the whole) tuition fees were charged.

Figures in Ohio, New York, and Connecticut.

† In 1864, in Massachusetts, on the one dollar of valuation,
8 townships raised three mills, but less than four;
115 townships raised two mills, but less than three;
202 townships raised one mill, but less than two;
8 townships raised less than one mill;
Total, 333.

Appropriations of Massachusetts townships.

The sum raised by taxation for school purposes in Boston, for the year 1864, was \$379,815. The valuation of the city, in May, 1864, was \$332,449,900. The appropriation on this valuation for 1865 was \$485,000, or at the rate of 1.45 mills on the dollar.

It should be added, that these appropriations do not include in any case money expended on buildings—they only represent the cost of the actual maintenance of the schools.

‡ The capital value of the school fund of the city of Chicago, real estate or money loaned, is estimated at \$1,028,440. The income of this, for the year ended at Dec. 31, 1863, was only \$25,177. At the ordinary American rate of 6 per cent., it should have been more than \$60,000. The other sources of the schools' income were (a) the State appropriation of \$16,414; and (b) the two mill city tax, \$85,334; giving a total income of \$126,925. The total cost of the schools for the same period (not including 6 per cent. charged on capital sunk in lots and building), was \$112,709. (See *Chicago 10th Report*, pp. 49, 50.)

Chicago school fund.

The St. Louis Report for 1864 states that "By an Act of Congress of 1812, certain pieces and parcels of land in the city were granted to the State for the support of schools, provided the quantity did not exceed one-twentieth of the area of the town." Various tracts of land have been assigned from time to time under the authority of this Act, and the quota contemplated by law has now been filled. Its estimated capital value is \$1,855,568, and the revenue for the year ended Aug. 1, 1864, was \$35,345,—again a very poor return. These means are at present applied to the sole purpose of buying new sites and erecting school-houses; and though practically sufficient for this object, yet no surplus is expected from this source "for a long time to come" (p. 7).

St. Louis.

The ordinary annual amount of taxation for the city of New York, on an estimated capital value of \$600,000,000, is \$10,000,000. For this year, as a result of war expenditure, it is exceptionally high—\$18,000,000; of which the appropriation for schools will be about \$2,000,000; or one-fifth of the normal, one-ninth of the actual sum.

In Boston, upon a capital value of \$332,450,000, the total income raised for all purposes by taxation is nearly \$4,100,000, of which, \$485,000 (rather more than one-eighth) is the appropriation to schools for the current year.

These rates reduced to the English scale.

It is the habit, as already noticed, in the United States, to levy taxes not, as with us, upon income or rental, but upon the capital value both of real and personal estate. As the rate of interest is ordinarily computed there at 6 per cent., it is not difficult to reduce the above figures to our scale; and it must be confessed that the results are rather astonishing. The annual returns, at 6 per cent. interest, on a capital valued at \$600,000,000, which is the valuation of the city of New York, are \$36,000,000, on which the taxation this year is \$18,000,000, or 50 per cent., the school tax being one-ninth of this amount, or about five and a half per cent. In Boston, the income of a capital valued at \$332,450,000, at 6 per cent., would be nearly \$20,000,000, on which the taxation is \$4,100,000, or 20 per cent., including the amount appropriated to schools, which is \$485,000, or about two and a half per cent.*

These sums are not more than, nor in many cases so much as, many a clergyman among ourselves has to pay out of his income for the support of his village school, without any direct personal benefit accruing to himself or his family; while the American taxpayer, in return for his heavy impost, gets, or at any rate, can get, a free education for his children; but viewed as a burden pressing equally on the property of a whole community, I conceive that they are quite unparalleled. That they are borne so generally without complaint, and indeed that the amount appropriated to the public schools keeps growing so considerably year by year,† is a proof, if proof were wanting, of the value the Americans attach to their system of education, and of their determination that it shall be efficiently maintained.

Average cost per child.

Difficult to ascertain.

The average cost of this education per scholar is a matter that could be easily ascertained, if the statistics which accompany the reports in such profusion were as accurate as they are elaborate, and were all calculated on the same basis. But it is admitted on all hands, that it is next to impossible to obtain exact returns from the officers in charge of that department of the schools, and the bases of calculation in the different states and cities are so various as to render any tabulation of results for the purposes of comparison, in the highest degree untrustworthy and precarious. Averages, again, always more or less fallacious, are particularly so when the extremes are so wide apart as they are in the townships of Massachusetts, one of which, as already seen, spends on the average more than \$18 per child, while four others spend less than two. "Its full cost to the parents," which I was particularly charged to estimate, cannot be estimated at all, because the cost, being defrayed by taxation, is proportional to the property of the parent, and not to the number of children he sends to school.‡ I have, however, thrown

Taxation in New York city.

* I was given to understand that property in New York is not assessed at more than three-fourths its value, which will, of course, diminish the significance of these figures. Great dissatisfaction, moreover, is felt in the community at the way in which the public money is spent by the municipal authorities, who, whether justly or unjustly, do not enjoy the good opinion of their fellow-citizens. The Mayor and Comptroller had been summoned by the Governor of the State, just before I left the country, to answer to certain alleged charges of malversation; and the language in which the Press ventures to speak of the civic authorities is unmitigated, and the reverse of complimentary.

In Boston.

But even in Boston, where municipal matters are allowed to be well managed, though certainly, as it struck me, on an expensive scale, a resident gentleman told me that, what with national taxes, and state taxes, and city taxes, a man with a fixed capital bringing in 6 per cent. has to pay away nearly half his income.

In New York State.

Taking the wider area of a whole State, I find that, in New York, on an aggregate capital value of \$1,500,999,877, there was raised by taxation in the townships, counties, and state, \$39,873,945, at the average rate of 2.66 cents on the dollar. Of which there was spent on schools the State tax at three-quarters of a mill per dollar, \$1,125,749 + \$2,668,079, raised by taxes in cities and townships = total, \$3,793,828—nearly one-tenth of the whole.

In Ohio.

In Ohio, in 1863, there was raised by taxation an aggregate sum of \$10,135,285; of which there was spent on schools \$2,176,233—rather more than one-fifth of the whole.

To the New York expenditure will have to be added the rate-bill, levied exclusively in rural districts, and amounting to \$429,892; and in Ohio, the income from the "Irreducible Fund," equal to about \$220,000.

Increase of annual expenditure.

† The expenditure on the New York city schools has been as follows:—In 1855, \$917,853; in 1860, \$1,122,667; in 1865, \$2,000,000. It has more than doubled in ten years. It is true that there has probably been a proportionate increase both in population and in the value of property.

In Boston the expense has been,—in 1823, \$51,839; in 1833, \$67,173; in 1843, \$135,151; in 1853, \$250,664; in 1863, \$465,411. (See *New York Report for 1864*, p. 8; *Boston Report for 1864*, p. 10.)

Rate-bill schools.

‡ In New York city the schools are free in the most absolute sense. The very books used by the children are supplied from the depository of the Board of Education. In Boston, and most other cities, books are charged to the children at cost price, except in the case of indigent children, to whom the charge is remitted. In high schools, I ascertained that this item of expense averages \$5 a year. Where rate-bills are charged, they are in all cases (I believe) under limits; and I think none are allowed to exceed \$6 a year. In Cincinnati, the children of non-resident parents are admitted to the district or primary schools at a fee of \$16 per annum, and to the intermediate or grammar schools at \$20, payable in advance; such sums, I presume, being conceived to be the average cost of their education. (*Cincinnati 28th Report*, p. 100.) In one of the counties of New York State, it is said that there are parents too poor to pay the rate-bill, and at the same time too proud to own it; and that, to conceal their poverty, they keep their children away from school. It is very difficult, from the Reports of the School Commissioners, to strike the balance of feeling

together in the following table some figures illustrating this part of the subject; and though I will not vouch for their entire exactness, yet I believe they will be found approximately correct; at least, I have spared no pains to verify and check them as far as lay in my power. They are intended to show for eleven cities and for two States the average cost, calculated on the average number on the registers of the schools—not on the average attendance—of the education of each child, first, in schools of every grade collectively, (a) for tuition only, (b) for the whole expenditure, including tuition; and, secondly, in instances where it was procurable from the returns, the average total cost per child in each of the three chief grades of schools.*

Average cost of education exhibited in a table.

Name of City or State.	Average Cost in all the Schools for Tuition only.	Average Cost for whole Expenditure.	Average Cost in High Schools.	Average Cost in Grammar Schools.	Average Cost in Primary Schools.
	\$	\$	\$	\$	\$
Detroit	6.59
Toledo	8.34
Chicago	8.60	13.55	45.35	12.66	12.67
Newhaven	8.85
Providence	9.17
Philadelphia	9.38	13.33	{ 39.56 Girls } { 52.42 Boys }	8.97	8.97
St. Louis	11.17	13.67	54.45	12.20	12.20
Louisville	11.42
Cincinnati	11.48
Boston	12.04	16.89	{ 39.88 Girls } { 60.93 Latin } { 70.30 English }	17.29	11.96
New York City	17.29	88.13	16.60	16.60
Ohio	5.27	6.90
Massachusetts	7.41
Average for the Cities	10.39	14.36	{ 36.22 Girls } { 62.60 Boys }	13.54	12.48

It appears, then, from this table, that the average cost of the education of a child in the common schools of all grades, in eleven of the principal cities of the Union, is about \$10½, or £1 11s. 6d. a year for tuition only; and for incidental expenses, about \$4 or 12s. more; making a total of £2 3s. 6d., or at the outside £2 10s. 0d. In the high school, which is the American type of a school suitable to the education of the children of the middle class, and to which children are ordinarily admitted at the age of twelve or thirteen, and in which they remain till they are seventeen or eighteen, the average cost of a boy's education is \$62½, or about £9 9s.; of a girl's, \$36¼, or about £5 10s. a year.† It is evident that economy must be carefully practised, in order to secure such results at so small a price. It is practised chiefly under the head of teachers' salaries, about which I shall have a more convenient place to speak further on. But I may just say here, that the highest salary of a teacher in any class of school, or indeed in any college or university that I met with in the United States, is the salary of the Principal of the Free Academy at New York, and that is only \$4,000 (having been recently raised from \$3,000), or about £600 a year. I must have astonished the school teachers of Ohio—I hope I did not make them dissatisfied with their position—when I told them, in my sketch of the school system of England, that the net income of the head-master of Eton was probably \$25,000 a year; of the head-master

Inferences from this table.

Cheapness of American education.

Low salaries of teachers.

in the State at large for or against rate-bills. The State Superintendent is strongly opposed to them; but in many neighbourhoods we are told there is as strong a feeling in their favour. Even when public feeling is turning against them, there is a difficulty in substituting taxation and making the schools free, because those who have educated their children by rate-bills don't like now to contribute taxes for the free education of the children of their neighbours. The feeling may be taken a want of public spirit, but it is no more than natural.

Difficulty in substituting taxation for rate-bills.

* See 46th Philadelphia Report, p. 19; 22nd Detroit Report, p. 38. In the Philadelphia calculations, the cost of the Boston schools in the first column is set down at \$15.71. I have taken my figures from the Report of the Boston Superintendent for 1864 (p. 129), which I have verified. In turning American money into English, it must be remembered that these dollars are "green-backs," worth—at the date at which these calculations were made—with gold at from 40 to 50 premium, not more than 3s. or 3s. 6d. at a broker's, and in purchasing power, as compared with English prices, not worth so much as 3s. For a vast number of purposes, I found that in 1865 a dollar in the United States hardly went further than a shilling does at home.

Value of a dollar in English money.

† It will be seen, however, by reference to the table, how little the calculation of an average is really worth. The differences of cost, though, which are most marked, are not altogether inexplicable. Thus, the difference of \$5 between the average cost at Boston and New York may probably be accounted for by the much larger comparative expenditure upon the Free Academy, with its numerous staff of highly salaried teachers, than upon the more modest equipment of the Boston High Schools; and besides, as has been mentioned, it is the New York plan to provide text-books for the scholars free of charge. In other cities, also, teachers' salaries range much lower than at Boston or New York; and in Detroit, which does the work of education at lowest cost of all, the pressure upon the schools for admittance is so much greater than they can bear, and there is such an indisposition just now, under the smart of other heavy burdens, to lay out money on providing additional buildings, that a half-time system—the only instance that I met with in America—has been devised, which is working favourably, both in enlarging the capacity of the schools, and in sparing the pockets of the rate-payers. The question in Detroit at the present moment is, "not how much they can spend, but how little they can get along with, and meet the immediate wants of the people." (See Detroit 22nd Report, p. 21.)

Differences in the table accounted for.

Half-time system at Detroit.

of Harrow, even more. Such remuneration never enters into the heads of American teachers, even in dreams.*

Cost of education in rural schools.

The cost per child in schools in the rural districts is, of course, much less than in the towns; and when it is observed that in Massachusetts—the most forward State in the Union in this matter of education—the whole average cost per child both in town and country schools is less than seven and a half dollars, or about 25s. a year, an idea may be formed of the cheap rate at which a New England farmer, or, indeed, any rural resident, may provide for the education of his family. In the New York State Report, cases are mentioned in which the salaries of teachers—the main article of expense in such schools—are as low as \$2,—about 7s. a week, or even a dollar and a quarter, exclusive, I presume, of board. The school, perhaps, is not kept open for more than twenty-four weeks in the year, so that the whole expenditure would not reach more than \$100—about £15 or £16; and supposing it to be attended by thirty scholars, the cost would be barely more than \$3 or 10s. a head. Indeed, in the American Almanac for 1864, in the great State of Illinois, with its 9,811 schools, its 15,000 teachers, and its 516,000 scholars, the average rate of tuition per scholar for the whole State is only set down at \$2.55;† and the cost of incidentals for the whole State would certainly not raise the average above \$4, or 12s. or 14s. per child. So that I believe it is nothing more than a sober conclusion, that an American farmer frequently gets an education for his family, of the quality and quantity of which I will speak afterwards, at a cost to the community of not more than 10s. a year per child—one-third of the amount at which our own Committee of Council have been in the habit of rating the cost of the education of the children of an English mechanic or labouring man.‡

General conclusion.

ADMINISTRATION OF SCHOOLS.

The administration of the schools was the next point to which my attention was directed, in my instructions, to be paid; and I was ordered to inquire “into the relations which exist between the State or central Government and the local Government; into the constitution of the local governing bodies; into the relations between them and the teachers, and of the teachers among themselves and with their scholars; into the extent to which mistresses are employed in schools for either or for both sexes; into the character and frequency of any inspection or control by the Governors; into the qualifications, duties, and salaries of the teachers, the tenure of their office, and the character and repute of their profession.”

Fundamental idea of the common school organization.

As already observed, the idea upon which the American common school system is based is, the absolute competency of the township or local organization, by whatever name known, to determine for itself what is best to be done in relation to any of those interests in which it is supposed to be immediately and principally concerned. Hence, though the Legislature of the State often (indeed, generally) defines and constitutes these local organizations, yet, when they have been constituted, they are allowed to do their work almost unchecked in their own way. The central Government—of the State, of course, is meant, not of the nation—creates the local school administration, and then transfers all its powers to it. At the most, afterwards, it does but attempt to stimulate—it does not venture to dictate or control. This is signally the case in New England: it is true in its degree of New York and the Western States. The Massachusetts Board of Education§

Relation of the central Government to school.

In Massachusetts.

Rise in teachers' wages.

* Petitions have been almost universally presented by American city teachers requesting a rise in salary, in view of the rise in price of every article of consumption; and in most cases an advance has been made varying from 10 to 30 per cent., but in no case equivalent to the increased cost of house-keeping generated by high tariffs and the war.

† See *National Almanac for 1864*, p. 397.

Some particular instances of cost of education.

‡ One or two typical cases will set out this inference more clearly than can be done by a table of averages. In Saratoga County, New York, 2nd district, containing 505 square miles, and including 127 school districts, the school commissioner, whom I had the pleasure of meeting on one of his school errands at Saratoga, presents this balance sheet for the year:—

Income.		Expenditure.	
	Dollars.		Dollars.
State apportionment	10,149	Teachers' wages	15,588
Local tax	5,794	Library	182
Rate-bills	3,613	Apparatus	45
Other sources	338	Repairs and furniture	924
		Incidentals	2,435 •
Total	19,894	Total	19,174

The number of persons residing in the district between five and twenty-one years of age is 9,395, of whom 6,402 are reported to have attended school. The average cost in this case is not three dollars and a quarter a head. (*New York 11th Report*, p. 290.)

In Monroe County, second district, 6,959 children are reported to “have been enjoying school privileges,” at a total cost of \$27,306—a little under \$4 apiece. Salaries in this district are \$7 a week for masters, and \$4.50 for mistresses. (*Ibid.*, p. 235-6.)

In Lewis County, second district, the number of children taught for a longer or shorter period was 4,169; the expenditure was \$9,113; average, about \$2½ each. (*Ibid.*, p. 222-3.)

In Massachusetts, forty-six townships raised less than \$3 per child for the education of all within their territory between the ages of five and fifteen; and the addition of the State appropriation would only raise the average to \$3¼.

It is unnecessary to carry this accumulation of evidence any further.

Massachusetts Board of Education.

§ *Mass. 24th Report*, p. 5. The Massachusetts Board of Education (an institution, I believe, peculiar to that State) consists of the Governor and Lieut.-Governor of the State, and eight persons appointed by the Governor with the advice and consent of his Council; each to hold office for eight years from date of appointment, and one retiring each year. Their functions are to hold property in trust for educational purposes; to prescribe forms and registers for schools, and of returns to be made by school committees; to prepare an annual report for the information of the State Legislature; to appoint a Secretary to make abstracts of school returns, quicken interest, and diffuse information, and one or more agents to visit the townships for similar purposes; to

admit that they "have no power whatever over the schools of the State," and that all they can do is "to regard their progress with watchful interest." Even the stimulant which the central Government has in its power to apply is not very potent in its character. In Massachusetts it amounts only to an annual subsidy of less than a quarter of a dollar—about ten-pence—per child, on condition that the locality meets the donation with at least six times as large a sum raised from its own resources. In New York, and I believe in Pennsylvania too, the central Government, acting through the Chief Superintendent, has more influence over the schools, and the system is more bureaucratic; * but even there, judging from its own admission of inability to produce desired results, the power must be nominal rather than real. The visitatorial power of the Superintendent is exercised chiefly through the School Commissioners; and these officers, though removable by him and paid by him, are not appointed by him, but are elected by ballot in their several districts, and are dependent for a portion of their salary upon the liberality of the Supervisors of the county in which they act. These School Commissioners, again, are clothed with considerable authority; but, on the evidence of their own reports, "the *vis inertia*" of a district is a power against which they frequently find themselves struggling in vain.†

arrange for the meeting of teachers' institutes, and appropriate a portion of the State School Fund towards their expenses; and to fix the territorial divisions of the State, to which scholarships for the maintenance of students at colleges or normal schools are allotted.

* The nominal powers of the Superintendent of Public Instruction for the State of New York are considerable. It is his business to visit the common schools of the State and inquire into their condition; to apportion, according to certain prescribed rules, the State school moneys among the several districts; to grant and revoke certificates of teachers; to annul certificates granted by other bodies, upon cause shown to his satisfaction; to remove school commissioners and other school officers for neglect of duty, and to withhold part or the whole of their salary; to prepare suitable forms for reports and registers; and to submit to the Legislature an annual report; with such suggestions for improvement in education as he may deem expedient. (See *New York School Law of 1864*, title i. s. 1-19.)

† In the State of New York, the counties are divided into "assembly districts," as nearly equal as may be in respect of population, each returning one member to the House of Assembly in the State Legislature. They are 123 in number. For educational purposes they are called "commissioner districts," and for each of them is elected, by vote of the inhabitants, a "school commissioner." There are 112 of these officers, the sixteen districts embraced by the city and county of New York, apparently not being included in the organization, but having a special educational constitution of their own. A school commissioner's salary is \$500 a year out of the income of the United States' Deposit Fund, and \$200 for his expenses, levied by tax on the township of his district, together with any further sum that the Board of Supervisors of his district may think fit to allow him. His duties are, to form, and when necessary, to alter the boundaries of the school districts within his range; to visit and examine all schools as often in each year as practicable; to direct trustees to make any needful repairs not beyond the cost of \$25, in concurrence with the supervisor of the township; to condemn unfit school-houses; to examine and license such teachers as have not a State Superintendent's certificate or a normal school's diploma; to examine charges against teachers, and, if proved, to annul their certificate, by whomsoever granted; to report annually to the State Superintendent, by whose rules and regulations he is required to abide.

The functions, therefore, of a New York school commissioner are nearly those of a township school committee in Massachusetts, and the duties of a trustee in the former State are those of the prudential committee in the latter. In New York there is a tendency to concentrate power in individuals; in Massachusetts, to lodge it in bodies. Thus there is no Board of Education in New York, but its place is occupied by a State Superintendent. There is one school commissioner in place of a school committee; one trustee—three are allowed, but one is generally preferred—in place of a prudential committee (who, it is true, may be, and sometimes is, an individual also); one supervisor of the township, instead of a body of selectmen.

The present mode of school supervision in New York was introduced in 1856. Previously, inspection was performed by township superintendents, who, of course, still more than the school commissioners, would be under the influence of local prejudices and partialities. The results of the present system are affirmed by the chief superintendent to be "incomparably superior both in economy and efficiency." (11th Report, 1865, p. 43.)

In Pennsylvania a similar system was introduced in 1854, and is said to be effective; but even here, a mischievous element, that penetrates most American institutions, cannot be entirely excluded. "It is believed," however, says the State Superintendent, "that the method of electing these officers, as now directed by law"—that is, by the school directors of the several townships composing the county, in convention assembled—"is less exposed to the disturbing element of party spirit than any other that could be adopted. This energizing agency of the system is becoming more and more efficient and potent every year, and the labours and influence of the superintendents are being more and more appreciated by the people" (*Pennsylvania 31st Report*, p. 36). It appears, though, that the mode in which their salaries are fixed, "is still liable to insuperable objections, . . . and affords directors who are opposed to the office an opportunity to fix them so low that no man who is competent to perform the duties will accept the office" (*Ibid.*)

The Ohio State Commissioner, when recommending the adoption of the New York and Pennsylvania system in his own State, asserts that "whatever lack of efficiency it has exhibited, may be traced directly to *incompetent officers*, and that the prime source of this mischief is *political influence* . . . What is needed is, not simply the supervisory office, but the office so created as to guard it effectually from unqualified aspirants." He recommends, in consequence, that the person, chosen as in Pennsylvania by the school directors of the several townships, should be required, before entering upon the duties of the office, to procure a certificate of qualification from a competent board of examiners. (*Ohio 11th Report*, 1865, p. 38.)

But, in face of the public opinion which sets so strongly in favour of frequent changes of officers—this too, I suspect, traceable to political motives—he does not venture to suggest more with regard to the term of office than that "it should not be less than two years."

I was surprised to find how universally in the United States the mischievous influence of "politicians" was felt and deplored in its bearing upon the schools. In some of the wards of New York city, the political motive is omnipotent in the election of trustees, and the consequences are said to be very unsatisfactory both as regards the appointment of teachers and the general well-being of the schools. "If we cannot do this," said Mr. Barnard, in his address to the Ohio Teachers' Association, recommending the filling up of the vacancies in the United States Naval and Military Academies at Annapolis and West Point by examination, instead of by nomination—"if we cannot do this, it is simply because the politicians won't let us do it." (*Ohio Educational Monthly*, Sept. 1865, p. 270.)

Desire felt in some quarters for a Ministry of Public Instruction in the National Government.

Independent inspection the want of the American system.

Adequate supervision in the cities.

New York city system.

Board of Education.

Inspectors.

Mr. Barnard on a "Bureau of Education."

No supervision of schools in Philadelphia.

The school organization of Boston.

New York Board of Education.

Indeed, the want of a central bureau, as a department of the Secretaryship of the Interior, to preside over the interests of education—a Ministry of Public Instruction, or something analogous to our own Committee of the Privy Council—in spite of the antecedent dislike to centralization, appeared to be making itself widely felt in the United States.* The supreme control of the schools is too absolutely in the hands of local administrators with no adequate guarantee of competency; the inspection even of County Superintendents and Commissioners is often found to be nugatory and ineffective; legal requirements are constantly ignored or evaded, and a properly authenticated and *independent* officer like Her Majesty's Inspector of Schools among ourselves, armed with visitatorial powers, and with means provided for giving effect to his recommendations, appears to be the element wanting in the machinery of the system, to give it that balance which the complication of its parts requires.

In the larger cities, such as New York, Boston, New Haven, Cincinnati, Chicago, this element is supplied in the person of the City Superintendent, and the increase of vigour and efficiency that is thereby infused into the system is very observable.† It may be appropriate here to describe briefly the school organization of the city of New York, which in theory is as complete as that of Boston or of any other place, while in the extent and magnificence of its operations (administering upwards of \$2,000,000 a year) it outstrips all competitors.‡

By an Act of the State Legislature, passed the 25th April, 1864, the city of New York, which is co-extensive with the county, is divided into seven school districts, which include within their boundaries the twenty-two wards which form the municipal organization. The highest functions relative to the schools are vested in a Board of Education, consisting of twenty-one members, called "commissioners," who are elected by ballot, three for each school district, to hold office for three years, one retiring by rotation every year.§ For each district also

* "It was my intention," said Mr. Barnard, in the same address, "to speak on the creation of a Bureau of Education in the Department of the Interior, for the collection and dissemination of statistics. Why should not this great interest of 200,000 schools, 8,000,000 of children and youths, 500,000 teachers, receive the same attention from the general Government that other interests do of (to say the least) no greater magnitude? What is there, in all that concerns the civilization of this people, of as much importance as the matter of the right education of these millions of children? If we have found it necessary and desirable to establish a financial, commercial, and an agricultural bureau—if the Government has found it advisable to appropriate 600,000 acres of land to found agricultural and mechanical schools" [Mr. Barnard must refer to the appropriation to the single State of Ohio, which is 630,000 acres; the whole amount appropriated would be probably twenty times as great], "why should it not do something in the way of collecting and disseminating facts respecting this class of schools, and especially in establishing a competitive system of appointments and promotions?"

Mr. Barnard quite carried the opinion of the meeting with him. It was resolved, "That we heartily approve the measure of establishing at Washington, in the Department of the Interior, an Educational Bureau for the advancement of general and liberal education, and we would earnestly urge upon Congress the importance of establishing such a Bureau." (*Ibid.* p. 271 & 256.)

† I was astonished to find that, in the great city of Philadelphia, with its 376 schools, 1,278 teachers, and 74,343 scholars, there is no Superintendent. The schools are under the general management of a Board called "The Board of Controllers," consisting of 26 members, one from each ward. The schools of each ward are managed by "school directors" elected by the people. Each Board of Directors elect one of their number to serve as a member of the Board of Controllers. This latter Board appoint committees to take special charge of the two high schools. Political influences are said to act adversely to the interests of the schools in the appointment of "directors," some of whom are quite illiterate.

Mr. White, the State Commissioner of Ohio, reports unfavourably the results of a visit he paid to the schools of Philadelphia. "We speak freely," he says, "respecting the condition of the lower schools of Philadelphia, because we were not prepared to find such old-fogyism. A jury of intelligent educators would, in our opinion, pronounce them 25 years behind the district schools of Cincinnati. We think the explanation of this result is found largely in the fact that *the schools of Philadelphia are practically without supervision*. The supervision bestowed on the Cincinnati Schools would soon work a wonderful change in those of Philadelphia." (*Ohio Educational Monthly*, July, 1865, p. 216.) The omission is more remarkable, as supervision has formed a feature in the school organization of Pennsylvania for 12 years.

‡ I will describe in this note, for the purpose of collation, the organization of Boston. The administrative body is called "the School Committee," as elsewhere in a Massachusetts township. It consists of the Mayor and the President of the Common Council, *ex officio*, and 72 other persons, elected by the 12 wards of the city, six in each, their term of office being limited to three years, so as to allow the election of two fresh members each year. "The said Committee shall have the care and management of the public schools, and may elect all such instructors as they may deem proper, and remove the same whenever they may consider it expedient. And generally, they shall have all the powers in relation to the care and management of the public schools which the selectmen of townships or school committees are authorized by the laws of this Commonwealth to exercise." (*Charter of City of Boston*, s. 56.)

The city is divided, for convenience of management, into as many districts as it has grammar schools—at this date, 20 in number—each district taking its name from the grammar school within its boundaries; and the President of the School Committee is to appoint, at the first meeting of the Board in each year, and subject to its approval, a standing committee on each district, whose number in each case, varying from 8 to 12, shall be proportionate to the number of schools in the district. The Board is further organized into nine Standing Committees for various general purposes: (1) On elections; (2) On rules and regulations; (3) On salaries; (4) On accounts; (5) On text-books; (6) On school-houses; (7) On music; (8) On printing; (9) On gymnastics and military drill. Each standing committee consists of five members. The Board have a Secretary, and annually elect by ballot a Superintendent of Schools. It will be at once perceived, by comparison with the text, that the administration of the Boston schools has been constructed after a much simpler pattern than that which has been adopted at New York.

§ The Board of Education divides itself into 15 standing committees: (1) On the free academy; (2) on normal schools; (3) on evening schools; (4) on finance; (5) on sites and new schools; (6) on school furniture; (7) on warming and ventilation; (8) on buildings; (9) on supplies; (10) on auditing the accounts; (11) on bylaws, rules, and regulations; (12) on

are appointed three inspectors, one being nominated annually by the mayor of the city, subject to the approval of the majority of the Board of Education. In each ward there is a board of five trustees elected by ballot, one each year, to hold office for five years. Every school officer must reside in the district or ward for which he is elected—if he removes his home, he vacates his office.

The ward schools are classified into grammar, primary, and evening schools. Principals and vice-principals of schools are appointed by the Board of Education, on the nomination of a majority of the board of trustees of the ward. Other teachers and the janitors are appointed by a majority of the board of trustees. Teachers may be removed by the Board of Education, on the recommendation of the city superintendent or of a majority of the trustees of the ward, or of the inspectors of the district. The board of trustees may also remove teachers other than principals and vice-principals, subject, however, to appeal to the Board of Education. Licenses to teach are granted by the city superintendent or one of his assistants, after examination conducted in the presence of two inspectors designated for that duty by the Board. The license may be revoked by the same authority, under the check of a right of appeal to the State Superintendent of Public Instruction.

It is the duty of the Board of Education,—

- To report annually to the Board of Supervisors of the county the sum which will be required during the year for the current expenses of public instruction in the city ;
- To apportion the money so appropriated to the schools entitled to participate therein, and to file with the City Chamberlain a copy of their apportionment ;
- To supervise, manage, and govern the Free Academy, and to provide it with all things necessary to enable it to be properly and successfully conducted ;
- To provide evening schools, and also a normal school or schools for teachers, and to furnish both with all needful supplies ;
- To establish and to discontinue schools in the different wards of the city, as they may deem expedient, and to furnish them with what they may require ;
- To transmit annually to the State Superintendent of Public Instruction, and to the Common Council of the city of New York, a written report of all their proceedings, together with the usual financial and statistical returns required from schools.

The functions of the district inspectors, in the letter of the law, are more important than those of any other official persons connected with the administration of the schools. It is their duty to audit the accounts of the trustees, nor is any expense to be paid till it has been certified as correct by them. They are also to examine, at least once every quarter, all the schools in the district, in respect of the punctual and regular attendance both of pupils and teachers ; the number, fidelity, and competency of the teachers ; the studies, progress, order and discipline of the pupils ; the cleanliness, safety, warming, ventilation, and comfort of the school premises ; and specially, to see whether the provisions of the law in respect of the teaching of sectarian doctrines or the use of sectarian books have been observed or violated ; and to call the attention of the trustees, without delay, to every matter requiring immediate action. Finally, before the end of the year, they are to make a written report to the Board of Education and to the board of trustees, in respect of the condition, efficiency, and wants of the district, both as regards schools and school premises.*

elections and qualifications ; (13) on course of studies and school-books ; (14) on teachers ; (15) on appeals.

Also, the Board has the usual apparatus of officers—clerk, deputy clerk, auditor, assistant clerks, porter, messenger, and janitor.

The premises they occupy are spacious, and conveniently situated in the centre of the city. * See *Manual of New York Board of Education*, pp. 33-34. It is the duty of "Commissioners" also to "visit and examine all the schools entitled to participate in the apportionment"; but nothing is said of the number or frequency of such visits, nor of the mode or objects of such examination. The visits of Commissioners, therefore, when paid, would probably be of a more informal and perfunctory character, just a "dropping in," without any precise motive or previous notice, to see how things are going on.

The Superintendent, again, is charged, either by himself or by his assistants (of whom there are four), to visit every school connected with the Board of Education, "as often as once in each year"; but the purpose of his visit, as defined by law, is not more extensive than that of the visits of inspectors, while these latter are to visit the schools four times as often. The duties of inspectors appear to have been very much enlarged by the Act of 1864. Before I read its provisions, these officers were described to me as having little to attend to beyond the care of the premises and matériel of the schools; and even now, I suspect their powers are largely delegated to the Superintendent, whose examination is the only really thorough one that the schools undergo. Certainly, I did not hear very much of the action of inspectors in relation to the schools; and though in my visits I constantly met commissioners and trustees in the schools, I am not aware that I ever encountered an inspector. The office seems to me to be an unnecessary wheel in the system, and to add nothing in the way either of completeness or efficiency.

I could not help being struck with the general interest felt and taken, in such cities as New York, Boston, Cincinnati, &c., in the welfare of the schools. In New York the office of trustee is altogether unremunerated, and commissioners and inspectors are only allowed "their actual and reasonable expenses while attending to their duties." And yet it is not at all unusual to find men of business, lawyers, merchants, &c., to whom very emphatically time is money, devoting an hour or two in a morning, not once in a way merely, but week by week, to the visitation of schools, before they go to their office or store. The powerful effect of such influence upon the well-being

The Trustees. The Trustees are a corporation for holding all personal property* vested in them for school purposes in their respective wards. They are the persons really responsible for the conduct and management of the schools, though they do not appear to be bound to visit them till their action is called out by the report either of the Inspectors or of the Superintendent. They are charged with the safe keeping of the school premises of their ward, with the appointment of all teachers below the rank of principal or vice-principal, and with the financial arrangements of their schools; and are bound, at least five days before the 1st January in each year, to transmit to the Board of Education a detailed report of the number of schools under their jurisdiction, and the length of time each has been kept open; the number of scholars who have been taught free of cost in them; the average attendance; the amount of money received and paid on account of the schools, and the manner in which the same has been expended; and a particular statement of the condition of their schools, together with any other information that the Board of Education may require.

The machinery complex, but apparently working smoothly. One might have feared that such an apparent complication of management might occasionally lead to difficulties, and that, according to our homely proverb, so many cooks might spoil the broth. I did not, however, learn that in practice it was so. The machinery, though somewhat complex, appeared to run smoothly. Occasionally there might be resentment exhibited by a teacher at what was deemed an impertinent or an injudicious interference on the part of a Trustee; but these are events which must inevitably sometimes occur, whenever irritable or sensitive human beings have to act one towards another in any relation, whether of subordination or co-ordination. Indeed, the latter is perhaps the more difficult relation of the two; and the theoretic defect of the American system of school administration is, that it calls into existence too many administrators with co-ordinate and almost conflicting powers. In a modern phrase, it is not sufficiently "hierarchical." But when people are in earnest, and particularly when they are animated by a high public spirit, they are not apt to be touchy upon points of precedence, nor jealous for the claims of prerogative; and such I believe to be the happy state of public feeling which animates the administration of American schools.†

Too much co-ordination in the system. The field of administration of these New York school authorities is the most extensive in America, I suppose, in the mere article of education, and, considering the details into which it descends, the most extensive in the world. It comprehends fifty-three ward schools, nearly all in three departments, and containing on an average more than 1,000 scholars apiece; besides which, are forty-one detached primary schools, with an average attendance of more than 15,000; and nine coloured schools, with an attendance of 800; twenty-six evening schools, with an average of 9,500 attendants; twelve corporate schools of a charitable or reformatory character, educating on the average 4,800 children; and the Free Academy, with its 800 young men. It has to examine, license, superintend, and pay, nearly 2,300 teachers. It disbursed for the year 1864 the enormous sum of \$1,873,577,‡ or nearly £300,000. 208,000 children are reported in the course

The field of the New York Administration. of the schools can easily be conceived. It presents a marked contrast to the apathy and indifference on the part of both school officers and parents, which the reports so often describe and lament, as prevailing in rural districts. I admit that, so far as my own judgment goes, I wish these visits could be paid without so much speechification accompanying them. But this is the American habit, and it may have some advantages which were not apparent to me.

* By the "personal property" of a school is understood its library, school books, maps, globes, philosophical apparatus, cabinets, &c. The real estate—the lot and buildings—is vested in the City Council, and is placed under the care and control of the Board of Education. I am no lawyer, but it sounds to me odd phraseology to say, as the school law does say, that the trustees hold, as a corporation, all personal property vested in them for school purposes in their respective wards, and in the same breath to say that the title to all school property real and personal shall be vested in the mayor, aldermen, and commonalty of the city (see *Manual*, pp. 38 & 53); unless it be that the property held by trustees is the produce of private benefaction; that vested in the City Council, the fruit of taxation.

Public spirit and the politicians. † It is emphatically so in Boston. I never heard there so much as the whisper of a jar. It is so to a very large extent in New York; but, unhappily, in some of the wards, that prolific source of mischief, the politicians, are beginning to find out that the schools can be used to promote their interests or serve their purposes; and thus, of course, an influence creeps in, the most remote of all from true public spirit. In country districts, where ignorant or illiberal men are often dressed in a little brief authority, the harmonious action of all the parts of the system, as I judge from the tone of local reports, is not quite so perfect.

Money, how expended. ‡ The principal items in this large expenditure were as follows:—
For teachers' salaries, \$1,020,114:
For support of evening schools, \$76,731, varying at per scholar from \$20.19, the highest (a female school in the twelfth ward), to \$4.47, the lowest rate (a male school in the first ward):
To the Free Academy, \$80,357:
For janitors' wages, \$54,705; supplies of books and stationery, \$105,787; incidental expenses, including fuel, \$132,858:
For sites and buildings, \$203,544; for repairs, \$13,957:
For expenses of the board, and salaries of its officers, \$69,853. (*Report for 1865*, p. 5.)

How levied. The money is levied by the Board of Supervisors of the county, upon the property of all the inhabitants of the city and county of New York, as follows:—
(a) A sum equal to the sum apportioned to the county out of the State school moneys:
(b) A sum equal to one-twentieth of one per cent.—that is, half a mill on the dollar—of the capital value of all real and personal property in the city and county; and
(c) Such further sum, not to exceed the rate of \$5 for each scholar taught in the year, according to the official returns, as the Board of Education shall have reported to be necessary.

In 1864, the amounts received under these several heads were—(a) \$250,616; (b) \$297,077; (c) \$989,405; which, added to the State appropriation, produced a total sum of \$1,785,043, which left a balance, as compared with the expenditure, of \$86,533 to be provided for out of the fund of the next year.

of that year to have been taught for a greater or less period of time in its schools. I conceive it to be the largest *local* board of management—certainly the largest *local educational* board of management—in the world.

I pass on to consider the position, qualifications, and duties of a body of men and women, upon whose behaviour and competency the condition of education in the United States depends far more than on the united efforts of State commissioners, boards of education, local superintendents, and trustees. I refer to the "half-million of teachers," as Mr. Barnard roundly figures them, in whose hands are placed the instruction and discipline of American schools. "As is the teacher, so is the school," is a maxim the truth of which is as fully recognized in America as in England. That the schools in so many districts, particularly in rural districts, are not equal to what they ought to be, is set down with an almost unanimous consent of testimony, to one principal cause—the inefficiency of the teachers; while this again is as unanimously accounted for by the miserably low rate of stipend with which their services in so many instances are remunerated.

The vast majority of these teachers are females,* and most of them very young

If (b) represents one-twentieth of one per cent., (a) and (c) together amount to about one-fifth; so that the taxation levied for the school purposes of the city and county of New York amounts to one-fourth of one per cent., or two and a half mills on the dollar, of the capital value of the real and personal estate therein, which in 1863 was estimated at \$594,154,743 (*Report for 1865*, p. 5). If we add to this the State school tax of three-quarters of a mill on the dollar, which produces about \$450,000, and of which New York receives back little more than one-half, we get three and a quarter mills on the dollar as the total amount of tax for school purposes which each New York citizen has to pay on the capital value of his real and personal property, the same being assessed at about three-quarters of its actual value.

The whole of the money raised and received is paid into the City Treasury, and is disbursed by the City Chamberlain to the persons entitled to receive the same, upon drafts drawn upon him, signed, in the case of ward schools, by the President, and countersigned by the Clerk of the Board of Education, and one or more commissioners of the district for which the money is due; and in the case of other than ward schools, by drafts on the Chamberlain, signed by the President and Clerk of the Board, and made payable to the order of the treasurer of the trustees of such schools. These schools are the corporate schools mentioned in the text; *ex. gr.*, the New York Juvenile Asylum, &c.

* There is a strong preference in the United States for the employment of females as teachers, chiefly on the score of superior cheapness, but also, in the estimation of many, on the ground of superior efficiency.

"The returns," says the State Commissioner of Ohio, "show a continued increase in the number of female teachers employed, and a corresponding decrease in the number of male teachers. In 1862, only 48 per cent. of the teachers employed were women; in 1863, 59 per cent.; while this year shows an increase to 62 per cent. It is believed that the number of female teachers might be still increased without detriment to the schools, since it must be conceded that, in the great majority of our schools, women make better teachers than men. Even the supposed superiority of male teachers in school government is not confirmed by experience. The better class of female teachers are succeeding just as well, and often better, than the average male teachers. The Commissioner of Rhode Island gives it as his opinion that they are succeeding in that State oftener than male teachers, even in the management of turbulent boys; while in the formation of the manners, and in the cultivation of the morals and tastes of children, they are incomparably better teachers than men." (*Ohio 11th Report*, p. 11.)

The State Superintendent of New York is almost carried away by his sentiments in this regard. He "points with undisguised pleasure to the fact that nearly four-fifths of the teachers employed in the schools of the State are females. It is impossible to over-estimate the value of the influence thus brought to bear upon daily-developing mind and character in our schools. To teach and train the young seems to be one of the chief missions of woman. Herself high-minded, the minds of those with whom she comes in daily contact unconsciously aspire. Gentle herself, she renders them gentle. Pure herself, she makes them pure. The fire which truly refines the ore of character can be kindled only by her hand. Woman is more deeply read than man in the mysteries of human nature, at least of that of children. It might, perhaps, be nearer the truth to say that her superior knowledge in this respect is intuitive. Better her discipline of love than his reformatory theories, and austere rules, and stringent systems. Her touch conquers the rebelliousness which his but increases. Her persuasive reproofs far exceed his stern menaces and cold logic. Well may we be solicitous in regard to that pupil's course and destiny who does not pass from the scene of woman's ministrations with his moral sense so delicately attuned as to render the discords of a vicious life impossible; with his tastes vitalized, and his perceptions quickened; with his sensibilities and sympathies all ready for action; with his conscience trained to unremitting vigilance, and the best impulses of his heart in full play. I am sure that the future will be grateful for these labours of woman in our schools." (*11th New York Report*, 1865, pp. 16, 17.)

It is a bathos to descend from these realms almost of poetry and romance to figures and statistics; but the following table is worth notice, as illustrating the subject of this note.

Locality.	Number of Teachers employed.		Table showing proportion of male and female teachers.
	Males.	Females.	
State of Massachusetts	1,544	9,340	
" Connecticut, winter schools	757	1,338	
" " summer schools	135	1,892	
" Rhode Island	230	430	
" New Hampshire	759	3,262	
" New York	5,707	21,181	
" Ohio	7,832	12,326	
" Illinois	7,713	7,381	
" Pennsylvania	6,903	7,765	
City of Boston	63	522	
" New York	202	2,057	
" New Haven	10	66	
" Cincinnati	44	188	
" Philadelphia	84	1,155	
" Chicago	23	189	
" St. Louis	18	144	
" Detroit	8	75	

Teachers must be certificated.

But the certificate no sufficient guarantee.

females. By the regulation of the New York Board of Education, no certificate of qualification as a teacher is to be granted to any person whose age is less than seventeen years; and though I do not observe a similar restriction specified elsewhere, yet I presume that this may be taken as the average American notion of the minimum age at which a person is fit to be placed in a position of authority in a school.* It is the universal rule in the States and cities that no person shall be employed as teacher, under penalty, in most cases, of the school's forfeiting its share of the State appropriation, unless properly qualified; the amount of qualifications being ascertained by an examination, and generally attested by a certificate;† but from the complaints which are to be heard on all sides of the incompetence of a large proportion of the teachers, the examinations must often be very perfunctory, and the possession of a certificate, particularly of the lower grades, utterly untrust-

Difference between winter and summer school session.

It will be noticed that the State of Illinois—and even there the ratio may now be altered, as the latest return I have is for 1862—is the only one in which there is a preponderance of male teachers. In the cities, the ratio of males to females is much higher than the average of the States, being in fact nearly nine to one. In Philadelphia it is fourteen to one. The difference between the winter and summer sessions of the schools in Connecticut illustrates a general phenomenon, viz., that male scholars of maturer years are found in larger numbers in the winter schools; that male teachers are, therefore, more generally sought for the winter term; and that they are procured most frequently from students pursuing an academical course at some of the numerous colleges or universities in which the States abound, who, being perhaps in indigent circumstances, are permitted to interrupt their course of study for the purpose of earning one or two hundred dollars, which may enable them afterwards to complete it.

Frequent change of teachers a great evil in American system.

Ordinary term of engagement.

Symptoms of weak health among female teachers.

Age of teachers.

The figures in the above table do not represent the number of teachers at any one time in a State, but the number of persons employed in the year for which the return is made. A comparison of these figures with the number of school departments in each State would exhibit two very great evils in the American system; the first, the precariousness of teachers' tenure of their situations; the second, the frequency with which they change from school to school, or from school-keeping to some other mode of gaining a livelihood. In Connecticut, out of upwards of 2,000 teachers, only 949 are reported to have taught in the same school for as much as two successive terms. In almost all the reports, the rapid changes of teachers are deplored as one of the greatest hindrances to the progress of the schools. The changes occur chiefly in the rural districts, and among the junior teachers in the city schools. I found principals and vice-principals who had grown gray in their work, and had remained in the same situation, or in the same school, for ten, twenty, and even thirty years. The general rule in the cities is to appoint teachers for the year, with, of course, the prospect of re-election; in the country, to engage them only for the single term, which may not be more than a dozen weeks. Even if they are re-engaged for the ensuing term, the salary would not continue running during the vacations. The work, however, particularly in the city schools, where, in spite of the remonstrances of committees and superintendents, there is a good deal of competition, and consequently of "high pressure," appears to be very trying to the female constitution; and most mistresses, after four or five years' continuous employment in teaching, are found to require a longer or shorter period of repose. They take a great deal out of themselves, do these American teachers, by the energy with which they throw themselves upon their work. I was struck with the number of both mistresses and girls, in the higher classes of the schools, who wore glasses, or in other ways showed symptoms of weakened sight. I mentioned the circumstance to the Principal of the Salem Normal School, and he accounted for it by the habit of "voracious reading," coupled with the disinclination that most American women of all ages have for exercise in the fresh air.

* The item of "Teachers' Age" does not appear in the statistical tables published in the reports. With such a preponderance of one sex, and with Americans' habitual consideration for women, I suppose it is felt to be a delicate subject. Mr. Siljeström, in his very able report on the educational institutions of the United States, has tabulated some figures from the New York Report of 1844, from which he draws the following conclusions, which, according to what he was able to learn, might be considered as the general rule, viz. :—

- (a) That comparatively few public school teachers are under eighteen, or over thirty years of age;
- (b) That by far the greater number are under twenty-five years of age; and
- (c) That only a small number of teachers are continuously employed in the same school during more than one term, and that the number of those who follow the vocation of a teacher during a year or upwards is likewise but small. (See p. 185, *English Translation*.)

This statement refers to the condition of things which existed twenty years ago; but my own observation, combined with what I have read and was told, would lead me to similar conclusions now.

Modes of certifying in Massachusetts, New York, Ohio, and Illinois.

† In Massachusetts, the function of examining and certifying teachers devolves upon the school committee; in the State of New York, upon the school commissioner of the district. In Ohio, a county board is formed for the purpose, whose certificates are of four grades, and good respectively for six, twelve, eighteen, and twenty-four months. From returns published in the report, it appears that in 1864 there were throughout the State 24,895 applications for certificates, from 8,553 males and 16,342 females, of which 5,553, or nearly one in four, were rejected, and 19,342 were successful. Of certificates granted, 8,807 were for six months; 7,681 for twelve; 2,243 for eighteen; and 611 for 24. There is also in Ohio a State Board of Examiners, who grant certificates which, unless revoked by the Board, are good for life, and exempt from examination before the county boards. For these certificates, male applicants pay a fee of \$3, and female applicants a fee of \$2, which goes to the State fund for the support of teachers' institutes. The Board was only constituted in 1864, and has only held one examination, at which thirteen candidates presented themselves; all of them, I believe, being teachers of the highest ability in the State. Eleven certificates of the highest grade were issued, one of the recipients being a lady. It is hoped that this State diploma will confer dignity on the profession.

In Illinois, candidates are examined by the school commissioner, or by competent persons appointed by him, in English, penmanship, arithmetic, English grammar, modern geography, and history of the United States. There are three grades of certificate; (A) valid in the county for two years; (B) valid in the county for one year; (C) valid in a given district only for six months. Of course, in all these cases, the value of the certificate depends entirely upon the thoroughness and impartiality of the examination. "There is no feature in our system," says the Ohio Commissioner, "so vital to its success as that which places at the door of every school-room in the State a Board of Examiners, to determine who is qualified to enter there as a teacher and guide of our youth. These examiners are the sentries of our school system" (*11th Report*, p. 20). In New York city, teachers are examined and certificated by the city superintendent, assisted by two inspectors; in Boston, by an examining committee. In the latter city, teachers promoted from one grade of school to another must be re-examined.

worthy as a guarantee.* The training institutions of the country, as yet, are far from being organized with a completeness that corresponds with other portions of the system; nor is their capacity for supplying teachers at all adequate to the demand. In many places, too, there exists the same kind of narrow prejudice against the employment of trained teachers that for so long a time prevailed in England, and is scarcely extinct now; and the salaries are frequently so low that the services of really competent persons cannot be secured. All sorts of plans are adopted in the different States to improve the quality and increase the quantity of the teaching power, but hitherto, it must be confessed, with very limited success; and more complete appliances for training teachers is still one of the things wanting to the perfection of the American system of public schools.†

* In the first place, the standard is apt to vary. The commissioner of the second district of Madison County, New York, having stated that in the course of the year he had issued 3 certificates of the first grade, 27 of the second, and 122 of the third, "concludes, from reading reports of other commissioners as to the number of first-class certificates given, that there must be a difference in the standards adopted; for he cannot believe that teachers of his district are so much behind those of other counties as the difference in the number of the higher grade certificates would seem to indicate" (11th Report, p. 230). Again, it is found hard to resist certain influences. Another commissioner says that he is sometimes compelled to yield to the force of circumstances, and extend licenses to some utterly incompetent candidates, that all the schools of the district may be supplied (*ibid.*, p. 288). Sometimes the trustees put a pressure upon the examiner in favour of a friend (*ibid.*, p. 319). It is found also that those who have gained certificates often "relax their efforts, and become indifferent to self-improvement" (*ibid.*). Statements like these are universal.

† "More than 500 persons each year," says the Superintendent of Common Schools in Connecticut, "begin their experience in teaching in the common schools of the State. Very few of these have had the advantage of thorough systematic training in a college or seminary. A considerable number have enjoyed for a time the benefits of the normal school; a few others are graduates of some high school or academy; but the greater part have had no special preparation, nor any school advantages, except such as are obtained in common schools. . . . They enter the school-room with no well-defined plan of the work to be accomplished; they find 40 or 50 children of different ages, diverse habits and attainments, and in their hands a variety of books to be used; but no chart to mark out their course; no guide to specify what is to be accomplished each term. Is it strange that in these circumstances many fail, not in maintaining order simply, but in almost everything which is necessary to constitute thorough and systematic training and culture, without which the school is of very little benefit?" (Connecticut Report for 1865, p. 33. See also pp. 12, 13.)

Most States in which the common school system exists have normal schools; but the number of students they supply is quite inadequate to the demand, and a large proportion do not stay long enough to complete their course and graduate, but leave after a few months' residence, to take charge of schools. The course of training varies from one to two years; at Salem, Massachusetts, there is an advanced voluntary course of a year and a half more. In Massachusetts there are four normal schools, the earliest founded in 1839. In New York, complains the Superintendent, "with a population of 4,000,000, and with nearly 16,000 teachers, there is but one normal school, founded in 1844, and to that has been given only a meagre support" (11th Report, p. 41). In Connecticut there is one normal school, organized in 1850. "Michigan opened a State normal school in 1852, Rhode Island in 1854, New Jersey in 1855, Illinois in 1857, Pennsylvania one in 1858, another in 1860, a third in 1863. Minnesota organized a normal school in 1858, which was afterwards suspended for a short time, but re-organized with additional appropriations in 1864. Iowa established a normal department in her State university in 1860. California organized her normal school in 1863, Maine and Kansas theirs in 1864" (Connecticut Report for 1865, p. 15). In Pennsylvania it is in contemplation to establish, as soon as practicable, three more normal schools. Ohio enjoys the unenviable distinction of not maintaining a normal school, and of "not paying a dollar to train or qualify teachers" (Ohio 11th Report, p. 9). In Boston, a normal department was established in connection with the Girls' High School in 1864, the course being only one term of six months. In the winter there had been 30 students; in the summer, when I visited it, there were only 19. And yet this institution is expected to keep up the succession in a city which employs upwards of 500 female teachers in its schools.

But the following table will show at a glance the ratio between the demand—or at least, the need—and the supply.

Name of Normal School, and date of establishment.	No. of Students received from date of establishment.	No. of Students ordinarily in training.	No. of Students graduating annually.	Have graduated since establishment.	No. of Teachers in State employed at one time.
Albany, N. Y., 1844	1438	300	65	...	15,807
Salem, Mass., 1853	841	85	40	361	5,476
Bridgewater, " 1840	1442	90	32	934	
Westfield, " 1839	circ. 1900	100	32	circ. 400	
Framingham, " 1839	circ. 1400	120	50	circ. 850	
Rhode Island, 1854	...	50	...	600	660
Connecticut, 1850	2,218	100	20	650	circ. 2,000
Illinois, 1857	...	140	circ. 15,000

Six hundred is the number said to have "gone out" from the Rhode Island school, but I am not sure whether as "graduates," or only after a partial course; 650 are reported to be "teaching" in Connecticut, but probably nothing like that number had completed their course or received diplomas.

Teachers, however, are procured from other sources besides the normal schools. Many pass from the high schools, and even from the upper classes of grammar schools, direct to the charge of schools, without any special training. The high schools themselves are frequently furnished with teachers from the different colleges and universities, and are not seldom found under the charge of graduates of Harvard or of Yale. All over the States there are large numbers of so-called "academies" incorporated and under the management of trustees, in many of which, classes are formed for the special training of teachers; and there are institutions, like that of Mount Holyoke, in Massachusetts, where the number trained with more or less completeness is considerable. There is a special provision in the State School Law of New York to the effect that "The Treasurer shall pay yearly, on the warrant of the Comptroller, out of the income of the U. S. Deposit or

Deficiency, in part made up by natural aptitude.

At the same time, I must allow that the deficiency is very much less striking to the outward eye of a casual observer than would be the case under similar circumstances in England, on account of the much greater natural aptitude for the work of a teacher possessed, as it appeared to me to be, by Americans generally, and particularly by American women. They certainly have the gift of turning what they do know to the best account; they are self-possessed, energetic, fearless; they are admirable disciplinarians, firm without severity, patient without weakness; their manner of teaching is lively, and fertile in illustration; classes are not likely to fall asleep in their hands. They are proud of their position, and fired with a laudable ambition to maintain the credit of their school; a little too anxious,

'Literature' Funds, not otherwise appropriated, to the trustees of all academies selected by the Regents of the University, the sum of \$10 for every scholar, not to exceed 20 scholars in each academy, instructed under a course prescribed by the said regents, during at least one-third part of the academic year, in the science of common-school teaching." From the report of the regents, it appears that in 1862-3 there were 90 academies designated for this purpose, in which 1,616 pupils—421 males and 1,195 females—were instructed free of charge with this aim. But in 17 of the 90 academies the provision of the law requiring separate instruction in common school teaching, was not complied with (See *Regents' 77th Report*, p. 305). Students, before they are admitted to the advantages of this gratuitous instruction, are required to sign a declaration of intention to teach in the common schools of the State.

New York city normal school.

In New York city, what is called the normal school is nothing more than an assemblage of teachers every Saturday, from 9 to 1 o'clock, in one of the ward school-houses, to receive instruction in the best methods of dealing with the different subjects required to be taught in the primary and grammar schools. The general direction is in the hands of one of the assistant-superintendents of schools, and the lectures are given by another assistant-superintendent and some of the masters of grammar schools. In the Manual of the Board of Education (p. 29) it is laid down that the school "shall be attended by such of the teachers in common schools as the Board of Education by general regulations shall direct, under penalty of forfeiture of their situations as teachers." But this absolute requirement does not appear to be insisted on, for I was informed that the attendance was voluntary. Those who do attend are chiefly teachers holding a certificate of grade B, who wish to raise it to grade A. They are exclusively females. About 500 are inscribed on the register, and the ordinary attendance is 300 or 400. The day that I attended was very wet, and there were not more than 60 present. Six classes are formed, and lectures are given on mental science, methods of teaching the different subjects prescribed by the Board of Education for primary and grammar schools, principles of discipline, mathematics, natural philosophy. I heard five or six lectures given, most of them well arranged and clear. There appeared to be a good deal of inequality in the classes, some of the young ladies being much inferior to others both in quickness and attainments. There is nothing in the nature of a practising class attached to this school; but each teacher, coming fresh from the daily experience of her school, would easily be able to see the application both of principles and methods. My general impression of the working of the scheme was that, though it only attempted to deal with about one-fourth of the teachers of the city, it was conducted upon a sound plan, and must be producing beneficial results.

Normal school in Chicago.

In Chicago, the normal school is a department of the high school in which, over and above the ordinary teaching of a high school, instruction is given in "methods." There are about sixty students in it, who are admitted by examination. The course is two years, and the age of admission is sixteen. I heard a part of the examination for admission, for which the candidates—though I must confess the ordeal was enough to make them feel a little nervous—did not seem to be particularly well prepared.

Teachers' conferences.

They have also two other plans in Chicago for improving teachers, which are said to answer well. For an hour in the afternoon of the third Friday of every month, the teachers of each district school assemble together under their principal, to consult upon the special interest of their school. And on the morning of the second Saturday of each month, a collective conference is held of all the teachers of the city, at the high school under the city superintendent, for instruction on points of general scholastic interest. This is obligatory, and a record of attendance is kept, though there is no penalty for absence. The first hour is spent in hearing a lecture or essay; for the remainder of the time the teachers break up into sections, and consider subjects proper to their several grades. Classes of children are brought in from the district schools, to aid in the practical illustration of the points discussed. The illustrations are given by those who are considered the best teachers, who introduce their own classes. The children are said to be pleased to come, and the whole arrangement is that of a "mutual improvement society." The superintendent considers it to be working well.

Teachers' institutes.

Throughout the States, great reliance is placed on what are called "teachers' institutes"—that is, local gatherings of teachers, varying in number from 50 to 200—"the most good being accomplished," Mr. Boutwell thinks, "when the attendance is between 80 and 150"—who remain in session from ten days to a fortnight, generally taken out of either the spring or autumn vacation, and occupy themselves in listening to lectures and taking part in discussions on subjects connected with their professional duties. In Massachusetts, a sum not exceeding \$3,000 per annum is set apart out of the school fund to meet their expenses; no single institute, however, being entitled to an appropriation exceeding \$350. In Ohio, the fund raised by the fees on certificates is applied to their maintenance. In Illinois, the county Board of Supervisors are authorized to make appropriations out of the county treasury for their support, whenever they shall consider the interests of the schools and the public good can be thereby promoted. (*School Laws*, s. 71.) The importance attached to them in the State of New York may be estimated from the provision of law which, having fixed the annual school term at twenty-eight weeks of five days each, declares that "a deficiency not exceeding three weeks, caused by a teacher's attendance upon an institute within the county, shall be excused." (*School Law*, title iii, art. i. s. 7.) In 1864, eight institutes were held in Massachusetts, attended by 1,228 teachers. Their popularity is attested by the statement of the secretary that never before were "the invitations more earnest, the receptions more cordial, or the hospitality more bountiful"; never before was there "manifested a deeper interest in the exercises, both by teachers and the citizens generally." (*Mass. 28th Report*, p. 62.)

Estimate of their value.

The Rhode Island Commissioner gives the following estimate of their value:—"It is unnecessary to speak of the inestimable value of these teachers' gatherings in engendering and keeping alive a spirit of educational interest and enthusiasm.

The best teachers are always there—they cannot afford to be away. They communicate and receive good. The work of education is laborious, exhausting, complex, and ever changing. New truths, and new and improved methods of communicating truth, are continually presented, and the teacher who is not awake to this will some day wonder that he has slept so long.

Those who teach most diligently, most faithfully, and most successfully, feel most the need of these things; and it is evidence against a teacher's qualifications that he is indifferent to educational meetings." (*19th Report*, p. 37.)

The special difficulties.

It is a fair inference from the remark that "the best teachers are always there," that the worst teachers, those who most need stimulus and improvement, are not reached by institutes. In Ohio

perhaps, to parade its best side and screen its defects; a little too sensitive of blame, a little too greedy of praise; but still, as I judged them from the samples which I saw, and in spite of numerous instances to the contrary which I read of but did not see, a very fine and capable body of workers in a noble cause. The high public spirit that animates the mass may be estimated from one fact alone already mentioned:—In the single State of Pennsylvania, the number of male teachers who entered the Army in the recent war was upwards of 3,000, and the number who volunteered was to the number who were drafted in the ratio of eight to one.* And the flame of patriotism, though it may take another form, burns quite as brightly in the breasts of American women as in the breasts of American men. Apart from the question of adequate training, I know not the country in which the natural material out of which to shape the very best of teachers is produced in such abundance as in the United States. That, with the shaping process so very imperfectly performed, the results are what they are, is sufficient proof of the quality of the material.

The salaries of these teachers are in no case (measured by our English standard) high; and in many cases they are miserably low. I have already mentioned that the highest salary, so far as I am aware, paid to any school functionary in the United States is that paid to the Principal of the Free Academy in New York, which is \$4,000, or at the present value of the dollar, about £650 a year.† The lowest salaries of female teachers in rural schools frequently do

Teachers' salaries.

the difficulty is to find men "thoroughly competent to conduct" them. (11th Report, p. 9.) In fact, with the low salaries paid to inferior teachers, it is not easy to see how they could afford the expense of attending. "Many teachers," says the New York Superintendent, "receive salaries so small that they have been obliged to exercise the most rigid economy, even to denying themselves a participation in freely offered and much-needed instruction." (11th Report, p. 35.)

Institutes are maintained on a grand scale in the State of New York. In 1864 they were held in 54 districts, for periods varying from one to three weeks, and attended by 7,524 teachers, each attending on the average about eight days. Several thoroughly qualified instructors were employed by the Superintendent, and devoted their entire time to the work during the autumn months. While they confined themselves principally "to a theoretical and practical illustration of the principles of the elementary branches usually taught in the schools, and to the approved methods of teaching them," we are also told that "the proper mode of training schools in healthful physical exercise, of governing and classifying them, and of awakening a love of knowledge and virtue, received special attention." The Superintendent's opinion of their influence is expressed as follows:—"These institutes, whatever their imperfections, have this advantage,—that, at a comparatively small expense, they afford valuable instruction to persons who give earnest of their interest in the vocation of teaching, and who immediately carry back the information thus derived into the schools of all parts of the State; and I am gratified in being able to report that their importance in the successful operation of our school system is unquestionable. *Until other agencies for the preparation of teachers shall have been greatly increased in numbers*, institutes will be indispensable; and it is suggested that the appropriation made for their support should be commensurate with their necessities." (11th Report, p. 35.) The cost of institutes to the State in 1864 was \$9,991, at an average expense per teacher in attendance (7,524) of \$1.32. Ten years before, the attendance was only 1,100, and the State appropriation only \$1,100.

Scale on which they are held in New York.

The American Institute, which has thus been described, is not very unlike the "Teachers' Harvest Meeting," which, a few years ago, was a popular institution in England, though from some cause or other it seems to have fallen into desuetude. I fancy that we, with our practical notions, attach much less value than do the Americans to lectures as vehicles of actual instruction. With them the lecture is quite an educational influence, as I shall have a more proper place for noticing further on. On the other hand, the American training system seems deficient in the element of practical demonstration. With the exception of that at Boston, none of the Massachusetts normal schools has a practising school, or, as the Americans call it, "an experimental school," attached to it, which, in our system, is considered indispensable. Hence, though the superiority of normal students as teachers is generally admitted, the knowledge with which they start in their profession is chiefly theoretical, and they may, and often do, break down in their crude attempts to apply it to practice. They are like a young surgeon who has studied anatomy in books, but has never witnessed a dissection nor performed an operation. "The State normal school," says a New York school commissioner, "is a great benefit as far as it goes; but it is only as a drop in the great ocean. The mass of our teachers will never become what they should be with only one normal school for training them. Teachers' institutes are fine things in their way, and so are teachers' classes in academies; but they are not all, nor nearly all, we want for the education of our teachers." (11th Report, p. 211.)

Resemble our teachers' harvest meetings.

Deficiency of the practical element in the American system of training.

Its admitted inadequacy.

When all is said and done, the means employed to secure qualified teachers in sufficient numbers, evidently are, and are admitted to be, inadequate to the end.

* Pennsylvania Report for 1864, p. 43.

† The normal value of the dollar is 4s. 2d., or, \$4.84=£1. Just now, with gold ranging from 40 to 50 premium, it is not worth more than 3s. or 3s. 3d., or from \$6.50 to \$6.75=£1. Salaries have been very generally raised in view of this state of things. I do not know, if prices get to their ordinary level, whether they would be reduced again. The salary of the Principal of the Free Academy has recently been raised from \$3,000 to \$4,000. Teachers have to provide their own residences.

Value of the dollar.

The school reports of every State touch sharply and sympathizingly on the hardships suffered by teachers in this regard of salaries. I extract the following pertinent passage from the Ohio 11th Report, p. 13:—

General complaints of the lowness of salaries.

"Supposing the tax duplicate (*i.e.*, the assessment) to remain about the same, the aggregate school receipts for the present school year will be only 7 per cent. greater than the receipts of 1863-4, and they will be half of one per cent. less than the receipts of 1860-1. What other department of business will be conducted this year with the same nominal expenses as in 1860, or with an increase of 7 per cent. over the expenses of last year! Moreover, it must not be forgotten, that these reported rates are only nominal. Let the local school tax of the State be estimated by the gold standard, or, if this be objected to, by the money value of the products of our farms and factories, and it is reduced fully one half. The farmer pays his school tax with less than one half, I might say one-third, as many bushels of wheat or corn, or pounds of pork, wool, butter, and cheese, as it required before the war. The same is true of the manufacturer, taking his products as the measure of his school support, and also of persons engaged in all leading industrial pursuits. The school tax of the State has never before rested so lightly on the people. At the same time, it must be confessed, that these facts and figures are not very full of promise that even-handed justice is in store for the self-sacrificing, half-paid teachers of our schools; nor do they indicate

"Boarding round."

not exceed 8 or 10 dollars a month, exclusive of board; the teacher, in these cases, being "boarded round," as the phrase is, at the houses of the farmers, where, I am told, she is treated with great respect, and has the best room in the house assigned for her occupation, and is an occasion to the good housewife for producing her daintiest fare. The value of this board must be reckoned at from 2 to 4 dollars a week, according to its quality; but there must be countless cases in which the whole amount of a female teacher's salary, board included, does not exceed sixteen dollars (about 50s. a month), and that not secured for a longer period than a single term of three or four months' duration, and suspended during

Table showing average rate of salaries.

that the rapid withdrawal of the more enterprising from the profession, which is now crippling the schools, will speedily be checked."

The following table of the average monthly salary of male and female teachers in different States will show the actual state of things, as far as this can ever be done by an average; but, in drawing conclusions, it must be remembered that city salaries and high school salaries are included in the computation, and that an "average" is never so fallacious as when there is a wide disparity between the extremes. It perhaps gives a far truer view to say that the *highest* salaries in the best schools range, for males from \$100 to \$150 a month—a few Principals' salaries may be even higher—for females, from \$50 to \$60; the *lowest* salaries in the worst schools ranging meanwhile, for males, from \$20 to \$30 a month; for females, from \$15 to \$25.

State.	Average Monthly Salary, including Board.		Increase on last Year.	
	Of Males.	Of Females.	Males.	Females.
Massachusetts	\$ 46.78	\$ 19.37	1.91	0.47
New Hampshire	26.90	15.05
Connecticut	33.00	18.00
Ohio, Com. Schools	28.25	17.95
" High Schools	62.87	34.81
Pennsylvania	25.42	20.16	1.48	1.60

Table showing rate of salaries in certain cities.

In a country township which I visited in Connecticut—rather above the average in wealth and liberality, I imagine—I found the highest salary paid in the previous year was \$42 a month to a male; the lowest, \$16 a month to a female. In another rural district, in Massachusetts, also well to do, the mistress of the grammar department was receiving \$25 a month; the teacher of the primary department, \$17.

The succeeding Table exhibits the phenomena of some of the leading cities, in which, generally, a fixed scale is adopted, often, as at Boston and Chicago, rising by a regular graduation of 50 to 100 dollars, according to length of service, till a maximum is attained.

Name of City.	High School.			Grammar Schools.			Primary Schools.		
	Principal.	Vice-principal.	Assistants.	Principal.	Vice-principal.	Assistants.	Principal.	Vice-principal.	Assistants.
New York, Boys	\$ 4,000	\$ 3,500	\$ 12 at 3,000 3 at 1,750 5 at 1,500 4 at 1,250	\$ 1,500	\$ 1,200	\$ 800	\$ 675	\$ 500	\$ 300
" Girls	800	600	400
Boston Boys	2,600	1,800	1,400	1,800	1,400	1,400
" Girls	2,600	700	600	...	600	400	400
Chicago	2,000	1,500	...	400	300
Baltimore, Boys	1,800	1,600	1,400	1,300	500	350	500	...	300
" Girls	1,500	800	600	700	500	350
Providence	1,600	1,200	400 to 900	1,100	...	350	350	...	300
St. Louis	2,500	1,800	900 to 1,500	1,500	...	500	650	...	450
Cincinnati	1,320	800	300 to 600	1,200	800	300 to 600
Philadelphia, Boys	2,200	1,800	1,200 to 1,600	1,500	...	450	700	...	400
" Girls	1,800	...	600	750	...	300 to 450	400	...	300

Remarks on the table.

It was not very easy to construct this table, owing to the different organizations and nomenclatures which prevail in the schools. The rates given in New York are the *maxima* fixed by the Board of Education; salaries are actually paid, except in the case of a Free Academy, according to the number of children in attendance at each school. The same principal determines the number of teachers employed. In Boston, the *commencing* salary is the one given, which increases by \$50 or \$100 a year to a maximum of \$200 or \$300 above the figures given in the table. A similar rule obtains in Chicago. It was difficult also to distinguish between male and female teachers in the table; but I do not remember an instance of any female teacher's salary exceeding \$800, or about £120 a year; and, speaking generally, all the lower figures indicate the salaries of mistresses, the cities, as we have already seen, drawing by far the larger proportion of their teachers from the female sex. In Boston, all principals are males. In one or two instances in the reports, averages are struck: thus, in St. Louis the average salary of male teachers is \$1,522, of females \$582; in Detroit, of males, \$926, of females \$365. This is enough to illustrate the wide variations that prevail.

Extract from Philadelphia Report.

I close this note with a striking extract from the Report of the Board of Controllers of the Schools of Philadelphia (p. 31):—"Let us look at the salaries of teachers, and make comparisons. We have in our schools about 1,300 female teachers, cultivated and intelligent ladies, who follow the profession of teaching after years of study. We demand and receive the highest order of talent, and what do we pay them? About 800 receive 80 cents a day; about 200 receive a dollar a day; about 200 receive a dollar and a quarter a day; about 100 receive less than two dollars a day. In other words, there are upwards of a thousand teachers upon each of whom is lavished per diem a sum scarcely equal to the amount paid to the washerwoman, and about 800 of these obtain only two-thirds of a washerwoman's wages. A large proportion of the teachers receive less than the janitress who sweeps the school-house." At the same time, it may be remarked, that washerwomen, at least those employed by the hotels, charge exorbitantly for their work. I sometimes paid two dollars, and the ordinary charge was a dollar and a half, for a dozen articles. The amount of ladies' laundress' bills is said to be frightful.

vacations; and into this calculation is to be taken the fact that, at the present moment, the ordinary necessaries of life, food and clothing, are at least fifty per cent. dearer than they are in England.* The salaries of teachers in cities are certainly higher, and their tenure of office more permanent; but even there each appointment is only considered to be made for a year, and although the principals and superior officers of the schools generally retain their positions from year to year, there are great and frequent changes in the lower departments.

Indeed, it is the low range of salaries, acting powerfully as a motive upon the general restlessness of the American temperament, which produces those rapid and continual changes in the teaching staff of the schools, the effects of which are so deeply and unanimously deplored. It is thought a great thing to retain the same teacher in the same school for a whole year.† A calculation is made that "at least one-fourth of the money expended on the schools is thus wasted."‡ The quietness and success that has marked a school year is attributed chiefly "to the employment of the same teachers, who had taught for some time in the township before."§ To find a body of teachers who intend to "make teaching their business for several years" excites surprise.|| And yet it is felt and acknowledged that "a teacher is worth twice as much the second term as during the first."¶ "Frequent change of teachers" is classed, with their "incompetence," and the "irregular attendance" of scholars, as the three great "hindrances to the successful prosecution of the schools."***

The causes of the evil are partly to be found in the habit—which, however, is on the decrease—of employing male teachers in the winter and females in the summer; but more frequently in false notions of economy,†† or vicious practices of nepotism:‡‡ the two latter, from one's knowledge of human nature, one may venture to affirm, sources of mischief not very easy to reach, nor very likely to be cured.

The duties of teachers are large and varied, and the responsibility of principals of schools, whose function is rather superintendence than teaching, is considerable. The system of Cincinnati appears to be as perfectly organized as any other, and is quoted with high approval by Mr. Wells of Chicago, one of the most experienced practical educators in America, as having contributed more than anything else to the remarkable improvement of the Cincinnati schools.§§ Under this system, the

* The School Committee of Swampscott, Massachusetts, give an estimate, taken from an actual instance, of a female teacher's annual expenditure, as they deem it, on a moderate scale. (*Massachusetts 28th Report, Appendix, p. 45.*)

Board, 45 weeks at \$2.75 a week	\$123.75
Washing, at 50 cents a dozen	13.00
Fire and lights	8.00
Clothing, \$55; boots and shoes, \$13; bonnets, \$13	81.00
Books, lectures, and stationery, \$5; pew rent, \$3	8.00
Travelling expenses, \$10; incidentals, \$6.25	16.25
					\$250.00

Many teachers, however, must live at less than half this cost.

† "One improvement is greater permanency in our teachers. Nearly one-half of our schools have been taught by the same teacher through the year." (*Mass. 28th Report, App., p. 126.*)

‡ *Ibid.*, p. 153.

§ *Ibid.*, p. 198.

|| *Connecticut Report for 1865*, p. 75.

¶ *Connecticut Report for 1865*, p. 81.

*** *Ibid.*, p. 83. The evil seems to reach to a great height in Connecticut. "Not a single district," says one report, "has retained its teacher for two successive terms." (*Ibid.*, p. 72.) "We have employed," echoes another, "in our sixteen schools, during the year, 31 different teachers, and only one single teacher has been employed in the same school through the year." (*Ibid.*, p. 75.) And again,—"Few teachers have been employed in our schools during the whole year, only one continuing two terms in the same school." (*Ibid.*, p. 80.)

†† "The employment of new, and especially of inexperienced teachers, and of constantly changing them from term to term, which is caused in part by a desire to get teachers that are cheap, is operating very much to the disadvantage of our schools." (*Ibid.*, p. 81.)

‡‡ "Our schools suffer materially from the frequent change of teachers. A new committee is elected who will have some friend or relation to put into the school, and the experienced teacher must seek employment elsewhere." (*Ibid.*, p. 73.)

§§ *10th Annual Report of Chicago Schools, 1864*, p. 42. In New York, the organization of each department is complete in itself; and in one building, where there might be three departments, *ez. gr.*, a mixed primary, a boys' grammar, and a girls' grammar, department—as in School No. 14—there would be three principals, one male and two female, with independent powers.

In Boston, all the primary schools are organically connected with the grammar school of their district, and the principal of the latter is charged with the superintendence of them. That no similar provision for the overlooking of the young female teachers of the primary schools by the experienced principals of the grammar schools exists in Philadelphia is a matter of regret to the warmest friends of education there, and may partly account for the asserted inferior condition of the lower grade of schools in that city.

All grammar school principals in Boston are males—even the principal of the girls' high school. There is no faith, in Boston, in female principals. Boston teachers are ranged in an eight-fold gradation of precedence: 1. Masters = principals; 2. Sub-masters = vice-principals; 3. Ushers; 4. Head-assistants; 5. Assistants; 6. Primary school-teachers; 7. Music teachers; 8. Sewing teachers. It is proposed to abandon the name of usher, as having undignified associations connected with it. "There is something in a name," says the Superintendent, "and there is no propriety in applying the antiquated, and now, with us, unmeaning title of usher, to gentlemen whose acquirements and position place them on an equality with the professors in our colleges." (*Boston Report for 1864*, p. 184.) Masters, sub-masters, and ushers, are males; the rest, unless it be the music teachers, are all females. The five first-named are found exclusively in the high and grammar schools. Their distribution depends on the composition of the school, whether for boys only, for girls only, or mixed. The rates of salary for the different grades are very different. The scale is given in the *Report for 1864*, p. 244.

Low salaries lead to change of teachers.

Causes of the evil.

Duties of teachers.

The system of Cincinnati.

Duties of the Principal.

Sample of teacher's expenditure.

The evil very prevalent in Connecticut.

Organization in New York.

Boston organization.

Principal, as local superintendent, is responsible for the observance and enforcement of the rules and regulations of the Board of Education for the guidance and direction of teachers and the government of schools, and is invested with authority to carry them into effect. He classifies the pupils in the different grades; announces to the different departments the hour for beginning and closing school, for the recitations and for recess; he has to see to the safe keeping and protection of the house, furniture, apparatus, fences, &c., and to maintain the strictest cleanliness in the school and outhouses; he provides for the cleaning, and for the lighting and maintaining fires of the schools, by the employment of a janitor; he keeps the annual register of attendance; he must devote at least one hour per day for every 200 pupils in average daily attendance, to the supervision of his assistants and direction of the general work of the school; he is to keep the pupils equally distributed and properly classified; to see that they are constantly and profitably employed, to report cases of absence to parents, once at least each school month to satisfy himself, by examination, of the thorough progress of each class in all the departments of the school, and to report to the Superintendent and to the local trustees, if there be any just cause to doubt the qualifications of any teacher; and at the close of each school month, he is to transmit to the clerk of the board all bills for teachers' salaries, together with such additional information as the board may from time to time require, or as he may think it important to communicate; he is further to make and preserve a journal of the more important matters and events occurring in his school, which shall be subject to the inspection of the local trustees and Superintendent, and must be transmitted to his successor.*

Assistant teachers.

Assistant teachers are required to be present in their respective rooms and to report themselves to the principal fifteen minutes before the opening of the school in the morning, and five minutes before its opening in the afternoon, under penalty of a fine in case of failure. It is their duty "to make themselves acquainted with the rules prescribed by the board, and to enforce the same, so far as they relate to their several departments; to preserve perfect order in their respective rooms, watch over the morals of their pupils, restrain all improper speech and conduct, and report all cases of gross misconduct or immorality to the Principal, for his counsel and direction; to endeavour to gain, by courteous deportment, the influence and co-operation of parents in sustaining the teacher's authority and government over the children, and so far as practicable, to govern their pupils by the moral influence of kindness, and by appeals to the nobler principles of their nature."†

Visitation of schools.

In the cities, the inspection and supervision of the schools by the local authorities is, or at least ought to be, very thorough and very constant; in the country, upon this as upon so many other points connected with their management, no doubt greater laxity prevails. Yet even there, recurrent visits at certain or uncertain intervals, on the part of the trustees, or of somebody deputed to discharge this duty for them, are provided for by law; and, in the districts into which I penetrated, I found they were generally paid; whether as frequently as required, or, when paid, whether as effective as would be desirable, I cannot undertake, from my own observation, to say. The reports which notice them do not leave upon the mind a very high impression of their value.‡

In the country.

In cities,

In cities, and where the system of management is organized under a Superintendent, the state of affairs is very different. The chief part of the work is done by the Superintendent, but he is stimulated or checked by the collateral activity and watchfulness of other officers. Thus, for example, in Boston, each district committee, within ten days after its appointment, divides itself into a suitable

particularly in Boston.

Miscellaneous regulations.

* See *Cincinnati 28th Annual Report*, pp. 98-9. The "journal" which the principal is required to keep is equivalent to the "log-book" of our Revised Code.

† *Ibid.*, p. 96. In the regulations of the City of Providence, R.I., teachers are required, "when deemed necessary, to extend their supervision to pupils going to, and returning from, school." It is not, however, very easy to see how this can be done, and generally the responsibility of the teacher is supposed to terminate at the school-door, or at most to be limited to its immediate neighbourhood. By the same regulations, teachers are peremptorily forbidden to receive any present or gift from any of the classes under their charge at any time.

The Boston rules are less stringent. "Instructors shall not become the recipients during term time, and only from a graduating class at any other time, of any present-money or other property from the pupils." At Boston, "no subscription or contribution for any purpose whatever may be introduced into any public school." In New York I met with cases of subscriptions for an organ for the school-room, for the Sanitary Commission's funds for the relief of the Army, and for other objects. In almost all the cities, teachers are forbidden to have private pupils before 6 o'clock p.m., except on Wednesday and Saturday afternoons; and in Boston, they are interdicted from engaging "as editor of a newspaper, or of any religious or political periodical."

Slackness of trustees.

‡ "The office of trustee being one of much work for little pay, but few trustees discharge their duty in all respects as faithfully as the wants of the school demand. Some plead incompetency, or an ignorance of their duty, as an excuse for not doing it; others frankly confess that they cannot afford to devote the amount of time and labour necessary to a prompt and proper discharge of their duty, for no reward. (*N. Y. 11th Report*, p. 313.)

In the Ohio report, the returns of the local officers to the State department are, almost without exception, described as "meagre," "insufficient," "imperfect," "unreliable." In one case, in New York, a still graver charge is made, and supported by what looks like proper proof. "In the accuracy of the statistical reports," says a commissioner, "I have little or no confidence. Every trustee is well aware that upon his report the public money is to be granted or withheld. He knows, too, just what kind of report will enable him to effect his purpose. Hence, a statement which shall accomplish the desired result is given oftentimes at the expense of truth and justice." (*11th Report*, p. 305.) It is suggested elsewhere, as a remedy for flagrant cases of dishonesty of this kind, that trustees shall be required to verify their returns on oath. In many instances teachers are sworn to the truth of their returns.

number of sub-committees for the primary schools in its district. These sub-committees are to visit the primary schools assigned to each once a month, and to examine them quarterly, and to report in writing their condition and progress to the chairman of the district committee at least a week previous to each quarterly meeting of the board. Further, the district committee, is to visit the grammar school of its district not less than once a month, without notice to the instructors,* and must examine it quarterly, and make a report in writing, both as to the condition of the school in respect of instruction and discipline, and as to the condition of the premises. In particular, they are to state in their report whether the rule relating to the infliction of corporal punishment has been complied with, and are to observe whether any children are enjoying the privileges of the school who do not reside in the city.†

In New York city, according to the account I received from Mr. Randall, the Superintendent, the inspection and examination of the schools is very thorough. The duty occupies him and four assistants five days in the week for eight months in the year, the schools being in session about ten. Each class and each individual scholar in the class is examined orally, marked, and graded. A boys' school of 500 scholars would occupy two inspectors for four days of six hours each. I was present at some of these examinations. They evidently were regarded as serious matters both by teachers and scholars, and I have no doubt they help to keep all parties concerned in them up to their work; but the questions and answers given struck me as a little too mechanical, running along the groove of the text books, and hardly ever diverging even from the phraseology. They seemed, therefore, to touch the memory chiefly, the faculty which is rather too exclusively, or at least too prominently, cultivated in American schools.

In some schools, as at Chicago and Providence, I found examinations largely conducted in writing. I glanced over some of the papers, which appeared to be carefully done, but still not without traces of this habit of "memorizing," which, as everybody knows, when too absolutely relied on, will not save an exercise from serious occasional blunders. As far as my judgment goes, all these examinations need to be freer, dealing more with real knowledge, and less with conventional phraseology, and more completely emancipated from the fear of text books and the limitations of routine. It is a miserable thing that students who are supposed to

* Such also is the habit of the Superintendent. "By visiting the schools without notice, and with as little ceremony as may be, I am the better able to see them in their normal condition, without the excitement and special preparation which necessarily precede formal and expected visits."—*Report for 1864*, p. 102.

† See *Rules and Regulations of the Board of Education*, pp. 16-17. The Boston rule on the subject of corporal punishment is as follows:—"All instructors shall aim at such discipline in their schools as would be exercised by a kind, judicious parent in his family, shall avoid corporal punishment in all cases where good order can be preserved by milder measures, and in no case shall be had to confinement in a closet or wardrobe, or to other cruel or unusual punishment, as a mode of discipline. It shall be the duty of the several masters and teachers in the public schools, at the close of each month, to make in writing, to the chairman of their district committees, a report of all cases in which corporal punishment has been inflicted, which report shall state the name of the pupil, the amount of punishment, and the reason for its infliction. . . . Corporal punishment shall be inflicted only after the nature of the offence has been fully explained to the scholar, and shall be restricted to blows on the hand with a rattan, except in cases where a pupil refuses to submit to such punishment. Corporal punishment shall not be inflicted on a girl in a grammar school without the consent and approval of the master (*i.e.*, the principal), which in each individual case must be first obtained." (*Ibid.*, p. 32.)

This rule expresses the general feeling in America about corporal punishment. How to deal effectively with intractable pupils is a great difficulty to teachers in American schools, owing to the excessive sensitiveness of parents. While I was at Boston, there was great excitement in reference to the discipline of the Latin High School upon this point, and a "remonstrance" had been addressed to the Board of Education calling for the removal of the master, on the ground, among other alleged reasons, that he appeared "to be actuated more by a desire to gratify anger, than to secure reform in administering punishment." A committee was appointed to investigate the charges, and the result of their inquiry was the complete exculpation of the master from every allegation that had been brought against him. I was informed in Philadelphia that corporal punishment, though not formally abolished, had been practically abandoned in the schools without any detriment to discipline.

When I told American educators of the form in which corporal punishment is administered in our public schools, they lifted up their eyes in amazement that either parents or boys could be found to brook such indignity. I imagine that we are the only nation under heaven who retain the birch and its accompaniments as an instrument of discipline. The time, perhaps, will come when we too shall discover that something less barbarous and as effective may with safety be substituted for it. The Boston law does not say what is to be done to the boy who refuses to be rattanned; we may depend, however, upon it that he is not birched. The idea of this would be as intolerable to an American as to a Frenchman.

The punishments allowed to be inflicted at the N. Y. Free Academy, where the age of the scholars ranges from fourteen to twenty, are the following, rising in an ascending scale:—"Demerit marks; private admonition; admonition by the principal, in the presence of the section and of the instructor, in the recitation-room; suspension by direction of the principal; public admonition by the principal, in presence of all the students at roll-call; final admonition by the principal in a meeting of the faculty; and dismissal for misconduct, to be directed by a vote of the faculty. A 'book of discipline' is kept in which each punishment is recorded."—*New York Manual*, p. 157.

American punishments, however, cannot wholly escape the difficulty that has been experienced in other places where corporal punishment has been abolished or restrained. In spite of the prohibition of "cruel and unusual punishments," there are, it seems, teachers in Boston "who do not make much use of the rod, and so record few or no cases of corporal punishment, but resort to other modes of punishment which are quite as objectionable, such as shutting up children in closets"—though absolutely forbidden—"plastering up their mouths,"—"unusual," certainly, if not "cruel,"—"decorating their heads with the dunce's cap, placing upon them some badge of disgrace, or requiring them to stand in their chairs." Some wise hints and cautions are given by the Superintendent in relation to such practices. (*Report for 1864*, p. 124.)

be acquainted with a subject should be able to look at it only from one side, and express their knowledge in no more than one prescribed memorized form of words.*

Repute and social position of teachers.

As to the character and repute of the teacher's profession in America, it certainly stands very high. I do not suppose that there are any teachers of common schools or of high schools in America who mix as freely in the highest class of society as do the masters of the great public schools among ourselves; but that is chiefly owing to the slenderness of their income not enabling them to afford to do so. And, on the other hand, the teacher of the humblest district school occupies a far higher social position than the teacher of an elementary school in England. Opinion and sentiment upon a matter of this kind are formed in the two countries by two entirely different influences. To the credit of the Americans, it must be said that, though greedy as others of money for purposes of self-indulgence and display, they have not yet learnt—I hope they are not even getting to learn—to put a social ban upon a man because of his birth, or to despise him because of his poverty. As to birth, they set no store at all upon that; and as to poverty, they may pity it, but they do not despise it.† I have already mentioned how teachers who are "boarded round" in a country district are treated in the families with whom they take up their temporary abode. I heard of a case in which the richest man in the township allowed his daughter to teach in the district school for two years: because he thought it would do her good by making her realize the comfort of depending upon her own exertions. All hangs upon the teacher's personal character and qualifications; as far as his profession is concerned, he is on a level with anybody. I was occasionally invited to visit teachers at their homes. They appeared to me to live in a sort of cheerful and refined frugality; able to exercise a hearty, but inexpensive hospitality; often relieving the monotony of daily toil by the cultivation of some recreative but not uncongenial study or accomplishment—a social position not altogether dissimilar to that so happily enjoyed by many an English clergyman. There was a healthiness in all this which one could not but appreciate and admire.‡

Some examination questions at Philadelphia.

* At Philadelphia there was put into my hands the report of a committee appointed to investigate certain charges which had been preferred, chiefly by teachers of grammar schools, against the Principal of the Girls' High and Normal School, principally with reference to questions set at the admission examinations. Many of the questions instanced in the report certainly are objectionable, and some are silly. But what struck me was, that the objections to them turn chiefly on two points; either (1) that "the question is out of limits," or (2) that "the answer is not in the text books." Thus certain words are given to be defined, a prominent exercise in American schools, and an objection is raised to the list, because the words, with the exception of three, are not to be found in the "scholars' companion" within the established limits. An objection is taken to a question in interest, it being shown that the arithmetic used in the schools contained only two rules in banking, and under neither the principle required for the solution of this problem, which proves the imperfection of the text book. The question, "Why does the sun never set on the British dominions?" notwithstanding Daniel Webster's eloquent explanation, is excepted to, not by reason of its difficulty, but because it is not legitimate, "lying out of the limits." Examples also are given of inappropriate questions—"When, where, and by whom, was 'Yankee Doodle' written?" "Was Washington ever wounded? If so, when and where?" "Decline 'tailor's goose.'" It appears that the Principal did not prepare the questions, though he was responsible for them, and the result of the committee's investigation was that he resigned his situation.

Examinations closely watched.

Whatever defects there may be in the mode of these examinations, they are, at least, criticised by keen and jealous eyes, and any attempt at partiality, or any failure in perspicuity, is at once detected and exposed. Of course, travelling "out of the limits," if carried to an unreasonable extent, would be a capital fault in an examiner; but it seems to me absurd to limit the words of which definitions may be asked, to a few pages of a text book prescribed for use in the schools. I shall print, in an appendix, some samples of examination papers. In judging of the difficulty of the questions, and of the amount of knowledge required to answer them, this constant reference to "limits" and to "text books" must be borne in mind. I thought it one of the chief merits of the method of instruction pursued at Westfield Normal School, Massachusetts, that this mechanical reliance on text books was discouraged, and students were taught to illustrate and enlarge their knowledge of a subject from any source of information within their reach.

† "Le germe même de l'aristocratie ne fut jamais déposé dans la Nouvelle Angleterre. On ne put jamais y fonder que des influences intellectuelles." *De Tocqueville*, i., p. 56. "Du moment où, d'une part, le travail semble à tous les citoyens une nécessité honorable de la condition humaine, et où, de l'autre, le travail est toujours visiblement fait, en tout ou en partie, par la considération du salaire, l'immense espace que séparait les différentes professions dans les sociétés aristocratiques disparaît. Si elles ne sont pas toutes pareilles, elles ont du moins un trait semblable. . . Ceci sert à expliquer les opinions que les Américains entretiennent relativement aux diverses professions. . . Aux États-Unis, les professions sont plus ou moins pénibles, plus ou moins lucratives; mais elles ne sont jamais ni hautes ni basses. Toute profession honnête est honorable." *Ibid.*, ii. 171-2. A fine saying of Daniel Webster's will illustrate the American sentiment:—"It did not happen to me to be born in a log cabin, but my brothers and sisters were. A man who is not ashamed of himself, needs not to be ashamed of his original condition." So of old at Athens: "τὸ πένεσθαι οὐχ ὁμολογεῖν τιτὴ ἀισχρὸν, ἀλλὰ μὴ διαφέγγειν ἔργῳ ἀισχίον." *Pericles apud Thucyd.* ii., 40.

Tone of the teachers' meeting at Cincinnati

‡ I was very much prepossessed with the appearance and tone of the great body of Ohio teachers—four or five hundred in number—whom I saw assembled at Cincinnati. In spite of a little self-assertiveness which characterized some, there was an energy and an evidence of purpose in most which was very observable. An excellent lady, wife of a professor in one of the Ohio universities, to whom I was introduced, expressed a hope that I would not judge of the general tone of American teachers by what I saw there; she was afraid I might deem it frivolous and deficient in earnestness. The fact is, there were intermissions of business now and then, of which the younger teachers of either sex took advantage for harmless purposes of their own; and a little lively chattering and chattering took the place, for the moment, of serious discussions and elaborated addresses. I must say that I enjoyed the meeting very much; and though a stranger only sees the surface of things on such occasions, I saw nothing either to excite suspicion or to provoke criticism. The meeting lasted, if I remember rightly, for three days, and closed with a picnic, which, unfortunately I could not attend.

The next point to be considered, after the administration of the schools, is their internal organization; and here I cannot do better than follow the order of inquiry marked out for me by my instructions. As I consider that what the commissioners will most care to know is, how the system works in its best developments, I shall draw my picture chiefly from the better schools and more perfect instances, referring the reader to a note for marked departures from, or deteriorations of, the type.

Americans commonly divide their schools into classified and unclassified, graded and ungraded, schools. The unclassified school is one in which the organization is of the character that we call in England "higgledy-piggledy"; and, of course, is a type that is only found in the most backward rural districts.* The classified ungraded school is one in which the children are arranged in classes upon a certain recognized principle; but the school is not one of a graduated ascending series, being in fact supposed to be complete in itself, and all the classes are taught in one room, generally by a single teacher, with the assistance, perhaps, of monitors.† Such are most of our own English parochial and elementary schools. The graded school is part of a system divided into two, three, or more parts, each part, except the two extremes, organically connected both with one below, of which it is the advance, and one above, for which it is the preparation; each grade ordinarily corresponding with and representing a year's progress; and though that

The greatest hospitality is exercised on these occasions. Railway companies remit or lower their fares; and I suspect that very few of the 400 or 500 ladies and gentlemen assembled were put to any expense for bed or board during their sojourn in Cincinnati.

* Defective classification arises sometimes from defective organizing power in the teacher; more frequently from the mischievous multiplicity of text books. "In most of the schools," reports a N.Y. commissioner, "a uniform series of text books is adopted, and a good classification of the scholars can be made; while in others the scholars bring such books as they happen to have; consequently, each pupil constitutes a class by himself, the time of the teacher is divided, and his labour enhanced, while the pupil makes but slow progress." (11th N.Y. Report, p. 256.) And again:—"A great evil in our schools at the present day is the diversity of text books in use; many, perhaps most of them, may be works of merit; but such is the variety of them, that it is in many cases quite impossible for teachers to classify their pupils according to their attainments, or to conduct the recitations by the most approved methods." In the Pennsylvania statistics, it appears that in 1862 there were 1,245 of these unclassified schools in that State, but in 1864 the number was reduced to 198. (Report for 1864, p. 17.) One may hope, therefore, that the species is dying out. In the same year, in the same State, there was an increase over 1862 to the amount of 143 in the number of graded schools. "Only those schools," says the superintendent, "should be returned as graded schools which have a regular system of grading the pupils from the primary to the most advanced branches taught." (Ibid., p. 29.)

† "In a school of the past winter, consisting of sixteen scholars, were found twenty-five distinct classes:—to make such a thing possible, of course the same scholar would be placed in a different class in different subjects:—"while in another school, of the same number of scholars, were found thirty classes, each of which must be daily exercised. We were informed by the teacher that she could not consistently make the number of classes less, and that it was only by dint of skilful management that she could make a complete round in six hours. But in a school that is properly classed, sixteen pupils may be taught a principle in the same time that would be required to present it to each of four classes of four pupils each; so, in the latter case, the pupil can have but ten minutes for his recitation, while in the former he receives an exercise of forty minutes. We believe that seventy or eighty scholars, brought together in one house, and there divided, according to their rank, into two schools, each under the care of a teacher adapted to its particular need, would be better taught, at less actual expense than is now possible while we find them in several different schools, each embracing every grade." (Massachusetts 28th Report, p. 212.) The instances noted were instances of imperfect classification; children perhaps classified, one while according to their power of reading, another while according to their power of ciphering. The remedy suggested is, to classify according to a uniform principle, and to grade the school by breaking it up into departments, the one subordinate to the other, under separate teachers. The school committee of Cambridge say they have tried to improve their schools by a similar proceeding:—"Besides reducing the number of grades in the inferior schools, we have introduced a uniform classification, dividing all the grammar schools into six classes, and the primary into four, besides the alphabet class. For each class in both schools we have prescribed a definite course of study, so that henceforth the degree of advancement of the children in any class will be the same at the same time in all the schools." (Ibid., p. 53.) This would be a nearly perfect organization.

The following passage from Mr. W. H. Wells's useful little manual on "graded schools" will throw light on the American system, and help to make its phraseology intelligible.

"In all cities and large towns there are numerous transfers from one school to another. As pupils from different schools are thus brought together, it is often found that those who are equally advanced in one branch of study are very unequally advanced in other branches. This creates confusion and inconvenience in the classification. Hence the importance of some uniform system of gradation in all the schools of a city or town. It is obviously unreasonable to expect one school to make the same progress in all cases as another more favourably situated; but it is not impracticable so to arrange the course of study that there may be certain stand-points in it, at which the pupils shall be required to reach a given standard of attainment in all the parallel branches, and from which no one shall be allowed to advance in one branch before all the other branches are brought up to the same standard. At these particular points, it is plain that the pupils will be together in all the branches in all the schools; and if these points are made sufficiently numerous in the course, a pupil may pass from one school to any other in the city or town at any time, and he will find some class equally advanced with himself in all studies. In classifying the pupils of cities and large towns, it has been found convenient to divide all that belong to the grammar and primary schools into ten grades—four grammar grades and six primary. In smaller towns, a less number of grades will be found more convenient. It is important that the divisions between the successive grades should be plainly and sharply defined." (The Graded School, p. 8.)

"All the pupils in any one class attend to precisely the same studies and use the same books. In each room there will be a first and second class, and it is important that the identical pupils who compose the first class in one branch should constitute the first class in every branch pursued by the same class. By this arrangement, while one class is reciting, the other is preparing for recitation, and an alternating process is kept up through the day, affording the pupils ample time to study their lessons, and the teacher ample time to instruct each class. . . . This is what is meant by a graded and classified school." (Ira Divoll, Superintendent of St. Louis Schools, quoted by Mr. Wells, *ibid.*)

progress is meant to be equable throughout, at certain points in it there are well-defined breaks, and the scholar passes from the primary or infant school into the grammar or secondary school, and from that again into the high school, in which the system culminates. The period of time ordinarily assigned to the whole course is about thirteen years, from the age of five to the age of eighteen, of which three to four years would be spent in the primary school;—three years is the prescribed period in Boston;—four to five in the grammar school; and again four to five in the high school. The “grades” correspond somewhat to our “standards” of examination under the revised code—promotion from one grade to another taking place at fixed periods, seldom oftener than twice a year, and always as the result of examination.

Effects of
competition.

There is a pretty general complaint that the desire of teachers in all the grades to make rapid and numerous promotions, and the competition which exists between different schools of the same grade with this aim, have a mischievous influence upon the system;* and, as a consequence, stringent rules are laid down by most of the Boards of Education to regulate the time and system of promotions, which, however, do not appear to be thoroughly successful in checking the evil.† The number of promotions from the Primary School to the Grammar School with which it is connected, or again from the Grammar School to the High School, is made, by the public, and by the teachers among themselves, a test of their respective efficiency as compared with their neighbours; and hence the natural results of superficiality and making “more haste than good speed,” or else of “high pressure,” under which the health both of pupils and teachers often breaks down.‡

Ages of entering
the different
grades.

The ages at which children enter these different grades of schools vary, but the rule may be stated to be as follows:—They enter the primary school at five or six, the grammar school at eight or nine, the high school at twelve or thirteen.§ The stage to which a child is advanced in the primary school may be judged of by the examination he is required to pass on admission to the grammar school. By the regulations of the Boston School Committee, “Any pupil may be admitted into the grammar schools who, on examination, shall be found able to read at first sight easy prose; to spell common words of one, two, or three syllables; to distinguish and name the marks of punctuation; to perform mentally such simple

Boston standard
of attainments
at eight years
of age.

Mr. Randall of
New York on
rapid promo-
tions.

* “The course of study pursued through the several departments is as nearly uniform as is attainable, and the various grades are judiciously arranged. There is too great anxiety, however, in many of the schools, stimulated not unfrequently by outward pressure, to make frequent promotions from one grade to another, often before all the studies of the grade from which promotions are made are thoroughly completed and reviewed. Except in special cases, promotions should not be made oftener than twice in a year, and in no case should a class or a pupil be transferred from the primary to the grammar school, or from a lower to a higher grade, without having fully passed through the preceding course. Thorough scholarship is of far more importance than rapid promotions, and neither the partial judgment of parents, nor the natural but injudicious desire of teachers to fill up their classes or complete their grade, should be permitted to interfere with the substantial welfare of the pupils. . . . The time for the completion of each grade is unlimited, and the teacher can occupy as long or as short a period as will suffice for doing his work well.” (*Superintendent of N. Y. Schools, N. Y. 11th Report*, pp. 243-4.) It is on points like this that the supervision of a judicious Principal becomes all-important. One driving teacher, if unchecked, can of course drive the whole school—one dragging teacher, retard it.

Boston rule of
promotion.

† The Boston rules are:—No scholars are to be promoted from one class to another till they are familiar with all the lessons of the class from which they are to be transferred, except for satisfactory reasons. Promotions from the primary to the grammar school are only to take place twice a year; but, occasionally, promotions may be made on the Monday of any week, whenever the sub-committee of the primary school and the master of the grammar school may deem it necessary. Promotions are made after examination by the master of the grammar school, who gives certificates of admission to those whom he finds qualified.

New York rule.

The New York rule is:—“No pupil shall be promoted from any primary school unless examined in the highest grade of studies provided for primary schools, and found to be qualified by the principal of the grammar school to which the promotion is to be made, or by the city superintendent, or such of his assistants as he may designate for that purpose; and when so qualified, such promotion shall be immediately made by the principal of the primary school. Promotion from a lower to a higher class shall in all cases be made when, on examination, the city superintendent or his assistant shall find the whole or any portion of such lower class qualified for such promotion.” (*The Manual*, p. 87.)

High pressure.

‡ The judicious and experienced Superintendent of the Boston schools calls attention to this evil in more than one of his reports. It appears to exist chiefly in the grammar schools, and more extensively among the girls than among the boys. It is found both in the upper and lower classes, but operates most injuriously in the highest division, where the competition for medals is severe. “I think,” says Mr. Philbrick, “there are teachers who put on the ‘high pressure,’ not because they think it for the good of their pupils, but because they feel compelled to do so, for fear of being considered inefficient if their pupils do not come up as high on examination as the pupils of certain other schools.” (*Report for 1864*, p. 115.)

A certain amount of competition, no doubt, is a wholesome stimulant, but it appears to be carried to an excess which is seriously injuring the physique of the pupils, and producing effects which it is feared may tell with fatal influence on generations yet unborn. The subject is being taken up with much earnestness in Boston—not a day too soon—and not only are calisthenic exercises being largely introduced into the girls’ schools, but a new system of vocal culture is being employed under the direction of its author, Mr. Monro, which invigorates the organs at the same time that it largely augments their power.

Boston interme-
diate schools.

§ In Boston there are certain schools called “intermediate,” or (in the rules of the School Committee) “schools of special instruction.” They are intended for pupils who are not qualified for admission to the grammar school, and yet are too old or too big to be admitted into or to remain in the primary school, where they might possibly interfere with discipline or retard progress. There are twenty-eight such schools in Boston, and they are said to be found very useful. They are generally ungraded, or at least only partially graded schools, and thus allow of more individualized instruction and more individualized promotion than is possible where a thorough system of grading prevails. The course of instruction is substantially the same as that in the primary schools, to which class they therefore properly belong. Both equally are feeders of the grammar school.

questions in addition, subtraction, and division, as are found in Eaton's Primary Arithmetic; to answer readily to any proposed combination of the multiplication table in which neither factor exceeds ten; to read and write Arabic numbers containing three figures, and the Roman numerals as far as the sign of 100; and to enunciate clearly and accurately the elementary sounds of our language."^{*}

In the programme of the New York primary schools rather more is attempted, but I doubt whether more is actually achieved; and the above list may be accepted as exhibiting the average attainments of an American child, who has been taught in the common schools, at eight years of age.†

New York estimate.

The age of admission to the high schools varies, but thirteen may be taken as the mean. For admission to the Latin High School at Boston, a candidate must be not less than ten;‡ to the English High School, not less than twelve; to the Girls' High School, not less than fifteen, nor more than nineteen; to the Free Academy at New York, he must be fourteen.

Age of admission to high schools.

The qualifications for admission to the Latin High School are, that a boy "shall be able to read English correctly and fluently, to spell all words of common occurrence, to write a running hand, to understand mental arithmetic and the simple rules of written arithmetic, and be able to answer the most important questions in geography, and shall have a sufficient knowledge of English grammar to parse common sentences in prose. A knowledge of Latin grammar is considered equivalent to that of English."§ For admission to the English High School for boys and the High School for girls, the terms are nearly the same: certificates of age and moral character, and ability to pass a satisfactory examination in spelling, reading, writing, English grammar, arithmetic, modern geography, and the history of the United States.

Qualifications for admission to Boston Latin High School,

to the English High School, and Girls' High School.

The normal period of the course at each of these schools is, at the Girls' High School, three years; at the boys' English School, four years; at the Latin School, six years. The full course of the New York Free Academy, which receives boys only, is five years of two terms each.

Length of the course.

It must not be imagined, however, that the bulk of the children who are admitted to the primary school at the age of five or six, pursue this course, which is theoretically marked out for them, to its completion. One of the New York assistant superintendents computes that *not more than one-half* of the children who attend the primary schools ever enter the grammar schools;|| and another states that a considerable number do not even complete the primary course.¶ A similar

This course not completed in the case of the large majority of children.

* Boston School Regulations, p. 50.

† I will print, in an appendix, the programme of study for each grade of school at New York and Boston, together with some examination papers sufficient to illustrate the points noticed in the text. What is done in these two cities may be taken as a sample of what is done, or at least of what is attempted, elsewhere. The New York programmes are the grander and more ambitious of the two, but I think that the Boston system produces sounder results.

Boston and New York programmes.

‡ It is not expected that those admitted to the Latin High School should have completed the grammar-school course. The reason for so low an age of admission as ten being fixed upon is thus stated by Mr. Philbrick:—"The method of instruction pursued in this school requires the larger portion of the Latin and Greek grammars, now grown to a large bulk, to be committed to memory very thoroughly. Experience and observation seem to have settled the fact that this memory work is, as a general rule, accomplished more successfully and satisfactorily by the pupils who begin at the age of ten or twelve than by those who commence at the age of fifteen or sixteen. Besides, the English branches, which are by no means neglected at this school, are learnt much more easily in connection with the ancient languages, or after having made some progress in them, than previous to commencing them. . . . And then, if a boy is to learn both the English grammar and the Latin, there is great economy in beginning with the latter; for while a knowledge of English grammar affords but little aid in acquiring the Latin, an acquaintance with the Latin grammar makes the study of the English almost unnecessary.

Early age of admission to Boston Latin High School.

"There is another consideration in favour of sending boys to this school at an early age:—Those who enter late feel it necessary to take what is called 'the short course,' in order to be prepared for college at the usual age, doing six years' work in three or four. Of those who undertake this task, some succeed very well, but many either get discouraged and drop out of the school, abandoning the idea of a college education, or break down in health, or injure their eyes by too much night study on the fine print of their text books." (Boston Report for 1864, p. 145.)

It will be seen from this, that the Latin High School rather breaks in upon the principle of sequence and gradation which prevails in the other parts of the system, and that in fact, it and the grammar schools, in some subjects of instruction, overlap one another.

§ Boston Regulations, p. 61.

|| Mr. Calkins' Report (in N. Y. Report for 1864), p. 82.

¶ Mr. Jones' Report (ibid.), p. 55:—"Tens of thousands leave school without entering the grammar departments, and some before they have finished the studies of the highest primary class. A much larger number seldom enter those classes in which the study of grammar or history is taught. The necessities of parents impel them to take this step, and the various factories where employment can be had invite them to enter. However much we may lament these things, they nevertheless exist, and every year increases the evil. These children who leave so early are found in subsequent years in the evening schools, groping their way along, knowing less than when they left the primary school."

Many children never get beyond the primary school.

The Controllers of Philadelphia notice the same thing:—"While the high schools are deserving of every care as valuable institutions, we must not forget that out of the 75,000 pupils now in our schools, not more than 500 are received into these institutions per annum. The huge portion never see the interior of these schools; a very large number never get into the grammar schools; very many never reach a secondary."—(Report for 1865, p. 23.) The secondary school in Philadelphia occupies an intermediate place between the primary and the grammar school. Its rank may be estimated from the following rule of promotion:—"Before pupils in any of the primary schools are promoted to secondary schools, they shall be well grounded in long division by three figures, and pupils from secondary schools shall understand compound division before they are admitted into the grammar schools." From this it looks as though proficiency in arithmetic were made the chief basis of classification in Philadelphia schools.

Secondary schools at Philadelphia.

The local organization of Philadelphia is, like that of Boston, into 26 sections, each with its own board of directors, and its own subordinated series of grammar, secondary, and primary schools.

Case of the Free Academy in this respect.	phenomenon in relation to the Free Academy, which unites in itself the characters of an English and Latin High School, is still more noteworthy. The average number taught in the grammar and primary schools of New York, for the year 1864, was 69,616—or, to speak roundly, 70,000, of whom it would perhaps be fair to assume that one-half, or 35,000, were boys. At the Free Academy, in the same year, there were only enrolled 648 students, of whom only 536 “pursued for four months of the academic year the classical studies of the higher branches of an English education required by the Board of Regents.”
The dwindling of classes.	Again, at the beginning of the year, in February, the senior class consisted of forty-three scholars; the junior, of forty; the sophomore, of sixty-one; the freshmen class, of 111; the introductory class, of 273. Six months later, at the July examination, the numbers in these classes had respectively dwindled to forty, thirty-four, fifty, eighty-eight, one hundred and ninety-nine.* No doubt the process of growing “fine by degrees, and beautifully less” will continue; and by the time that the introductory class has reached the dignity of seniors, their number probably will not exceed forty-five. Indeed, in no year since the establishment of the academy has the number of pupils who have completed their course and graduated, reached fifty.†
Similar case in Boston	The same fact, though it assumes smaller proportions in Boston, is still perceptible there in a degree. The whole number, the superintendent reports, promoted from the primary to the grammar schools in March, 1864, was 1,724, or in the ratio of the whole number belonging to the primary schools, of one to seven and a half. As three years is the primary course, and promotions take place half-yearly, the true ratio should have been one to six. The number actually promoted fell short of this by 400.‡ Again, the same authority states that the increase of pupils in the English High School ought to have been twelve times as great as it has been, in order merely to have kept pace with the growth of the city, and twenty-one times as great to have held its own in comparison with the aggregate growth of the public schools.§
Boston figures for 1864.	The following figures for the year 1864 will show the state of the case:— There were enumerated that year in Boston 32,854 children between 5 and 15 years of age. Of these, 26,960 were enrolled in the public schools, and 24,617, or 91.6 per cent. of the enrolment, were in average attendance. Of these, the average whole number belonging to the three high schools,—Latin, English, and Girls’,—was only 725, and the average attendance at them only 691. It will be seen at once, from these figures, what a very small proportion of the number of children
Explanation of terms.	* “Senior,” “junior,” “sophomore,” “freshman,”—these usual terms of American collegiate nomenclature correspond to a student of the fourth, third, second, and first year, respectively. As the course of the Free Academy is one of five years, the four classes indicated by these names are each rated a year higher, and students of the first year form the “Introductory Class.”
Difference in the supply of different grammar schools to the Free Academy.	† Another observable fact in relation to the Free Academy is the proportion in which its pupils have been supplied from the different ward schools. These are fifty-three in number, of which, however, only forty-nine have boys’ departments; and of these forty-nine, six have never so much as furnished a candidate for admission, while others have admitted as many as 202, 290, 703, 956. In 1864, sixteen schools did not send up a candidate for examination; and nine more, making up more than half of the whole number, only admitted one, while one school passed as many as fifty-five, another as many as 107. It will be seen, therefore, that the benefits of the Free Academy are very unequally distributed. Indeed, the New York system, considering its immense extent, is very defective in its highest grade. There is no high school at all for girls, and the only substitute for one is the supplementary department tacked on to the excellent girls’ school No. 47, and that only educates 130 pupils. The Free Academy is thought by many to have departed from its original purpose, which, I was informed, was not so much to give a classical education, qualifying for entrance upon the learned profession, as a scientific and practical course of training, fitting for the requirements of every-day life. As a consequence, it is not attractive to the mass of boys in the grammar schools. One grammar school master told me that he could have sent in sixty candidates for admission—he only did send in three. What is wanted in New York seemed to me to be, a thoroughly good commercial high school—something after the pattern of the English high school at Boston.
Deficiency in New York system.	So too, perhaps, the fact that “not more than one-half” of the children in the primary schools ever enter the doors of the grammar schools, may be partly accounted for by those schools not offering to the children the education that their parents consider suitable to their prospects in life. It is all very well, in a rhetorical speech, for a visitor to tell a mass of boys before him, as I heard them told again and again, that in a free country like theirs it was open to any of them to become President of the Union; the boys themselves, probably, and their parents, have no such ambitious aims swelling within their bosoms. The scale is pitched too high for the lowest class of children, though, of course, an American does not like to admit that there is a “lowest class.” Not a stitch of sewing is done in a New York school, nor is any form of industrial work taught, except in the Children’s Aid Society’s Schools. Indeed, Mr. Boesé, the Clerk to the Board of Education, a gentleman who observes very closely and intelligently the working of things as they are, thinks it will become necessary to establish two grades of schools in some localities, and to acknowledge the fact, which is ignored in the common school theory, that all children do not need the same education, nor expect to have opened out to them the same career. Grand theories not unfrequently come across stubborn facts, and must submit to be modified by them. Even Mr. Superintendent Randall, admirer as he is of the present system generally, and of the Free Academy in particular, doubts whether the girls’ grammar schools meet “the growing demand for a practical education, adapted especially to the future requirements of life,” and entertains no doubt that the “re-introduction of needlework” (for it had a place in the superseded system of the Public Schools Society) “would materially add to their practical utility.” (See his <i>Report for 1864</i> , pp. 18–21.)
Free Academy not generally attractive.	‡ <i>Boston School Report for 1864</i> , p. 135.
Opinions of Messrs. Boesé and Randall.	§ “This is a startling fact,” says Mr. Philbrick, “which we cannot contemplate with satisfaction. It shows a virtual falling off, to a very great extent, in respect to higher education among the young men of the city who are destined to business pursuits. It is true, no doubt, that the education received in the grammar schools is better than it was thirty or forty years ago; but this education is still elementary, and is almost exclusively confined to what are called the common branches; and however well these may be taught, they can never become a substitute for that higher course of instruction which is furnished at our English High School.” (<i>Boston School Report for 1864</i> , p. 152.)
Falling off at Boston for demand for higher education.	

nominally educated under the common school system receive the complete education which that system contemplates—how many boys and girls must carry away with them into ordinary life no more knowledge than every boy and girl can carry away from an average efficient English elementary school; and that, if it be true, as it very likely is, that there are very few Americans who cannot read and write, there must be a considerable number who, in the way of literary accomplishments, can do nothing more.*

For, in addition to the incompleteness of the course through which many of the children pass, there is another "startling fact" which the reports reveal in relation to attendance. I have already touched upon this point, when speaking of compulsory laws; but it may be as well to illustrate the general statements there made by a few figures. The following table exhibits, in the case of six States and of eight important cities, the total amount of persons within the school age, the total enrolment on the registers of the schools, the average attendance at the schools, and the percentage of "attendance" upon "enrolment." In my report to the Duke of Newcastle's Commission, I drew up a similar table exhibiting the same facts with reference to the agricultural district which had been assigned to me; and it there appeared that the percentage of average attendance upon the whole number of children enrolled in the schools was 73; the variations being between 78, the highest, and 65, the lowest.† It will be seen that the American figures present a state of things even worse in this respect than we are accustomed to and deplore at home.

Name of State.	Total No. of Persons in School Age.	Total No. enrolled on School Register.	Average Attendance.	Percentage of Attendance on Enrolment.
Massachusetts	241,644	226,400	181,669	80
Rhode Island	56,934	29,641	23,256	78
Connecticut	114,772	77,126	55,361	72
Pennsylvania	not given.	709,930	460,065	64
Ohio †	938,972	694,920	396,256	57
New York	1,307,822	881,184	not given.	...
Average	70

Name of City.	Total No. of Persons in School Age.	Total No. enrolled on School Register.	Average Attendance.	Percentage of Attendance on Enrolment.
Boston	32,854	26,960	24,617	91
Newhaven	8,116	5,131	3,670	71
Cincinnati	not given.	23,188	14,911	64
St. Louis	not given.	12,152	7,058	58
Detroit	not given.	8,111	4,437	54
Chicago	not given.	21,188	10,002	47
Brooklyn, N. Y.	not given.	50,366	21,143	42
New York	circ. 250,000?	173,717	70,388	40
Average	58

The subsequent table is interesting in the same relation. It exhibits the periods of attendance of the scholars enrolled in the registers of the public schools in the State of New York, and in the cities of New York and St. Louis.‡

Name of State or City.	Attended less than 40 days.	More than 40, less than 80.	More than 80, less than 120.	More than 120, less than 160.	More than 160, less than 200.	More than 200.	Whole Enrolment
New York State	223,137	239,442	175,816	114,868	63,208	64,713	881,184
New York City	35,689	32,213	26,170	23,938	20,724	41,391	188,125
St. Louis	2,098	2,058	1,910	2,109	3,864	123	12,152

It may be thought that three instances, as in this table, constitute an imperfect induction upon which to build a general conclusion; but the three reports from which I have taken these figures are the only ones in my possession

* In the Massachusetts prison statistics for 1862, it appears that there were in that year 9,705 persons committed, of whom, 1,576—one in six nearly—were minors, and 1,965—one in five—could not read or write. (*National Almanac* for 1864, p. 296.) It is true that of the 9,705, 6,296 were of foreign birth; but it would be going too far to assume that all of the 1,965 ignoramuses were of alien extraction. The Board of State Charities in Massachusetts, in their Report for 1865, "urge that more attention be paid and more money be expended for the instruction of prisoners, since more than one-third of all committed are unable to read and write." p. xliii.

† See *Report of Duke of Newcastle's Commission*, vol. ii., p. 33. The average result of the 10 specimen districts was rather higher than mine, viz., 76 per cent. In Mr. Winder's manufacturing district it rose as high as 82 per cent., higher than in favoured Massachusetts. (*Report*, vol. i., p. 648.)

‡ In Ohio and New York, the school age is reckoned between 5 and 21; in the other States, between 5 and 15, or else 4 and 16 years.

§ The figures are taken from the respective reports. (See *New York State 11th Report*, p. 14; *New York City 23rd Report*, Superintendent Randall's Report, p. 5; *St. Louis Report* for 1864, p. 49.) There is a variation between the "enrolment" of the New York City schools here and in the former table. There the ward schools only are reckoned; here the corporate schools are included too. It seems impossible everywhere to get statistics taken upon a uniform and consistent basis.

which tabulate the phenomena of attendance under the category of time. It is probable that things would be better in Boston, possible that they would be better in Massachusetts; but when it is remembered that eighty-seven townships, more than one-fourth of the whole number in that State, kept their schools open for a less period than 120 days in 1864, one ceases to be confident that a more favourable return could be made even there.* Anyhow, it would seem that the condition of schools in America, as respects both the percentage of attendance and the period of attendance, is no better than, indeed hardly so good as, the average condition of schools among ourselves. Of course, this is no matter for exultation; but it may at least dispose us to acquiesce in a shortcoming which appears inevitable, and teach us that, under all systems, there will remain a mass of apathy, thriftlessness, and ignorance, against which it is certainly our duty to fight, but which it is vain to hope ever effectually to subdue.

Sex of scholars.

No uniform rule.

Public feeling itself varies.

New York arrangements.

There is no settled principle governing the American system in the matter of the distribution of the scholars according to their sex. Perhaps what most approaches to a rule is, that all schools below grammar schools are mixed, but that grammar and high schools are separate. This is the rule in New York city; but it is a rule that has many exceptions. In Baltimore, in all the gradations—high, grammar, and primary—the sexes are separated; in Newhaven and Chicago, in all the grades equally, they are mixed. In Boston the practice is not uniform. The high schools, it is true, are separate, and the primaries are mixed; but of the twenty grammar schools, seven are boys' schools, seven are girls' schools, and six are mixed schools.

There is a wide diversity of opinion and sentiment upon the subject. Some parents will not send their children, particularly their girls, to the primary school, for fear of the influence of association with children of a lower caste, but will send them to the grammar school, where the class of scholars, from causes already noticed, is more select.† Others, again, who have no objection to the mixture of boys and girls for the purposes of instruction up to the age of twelve or thirteen, think the same intercourse no longer safe or prudent when they have become four or five years older. Mr. Hager, Principal of the High School at West Roxbury, near Boston, one of the ablest and best esteemed of the Massachusetts teachers, told me, as the result of sixteen years' experience, that he had observed much less appetency on the part of scholars of different sexes one to another, where the schools were mixed, than where they were separate; they seemed to meet more on the footing of brothers and sisters. In New York, in very many cases, there are three schools under one roof, but with different entrances, offices, and playgrounds. A mixed primary school will be on the first floor; a girls' grammar school on the story above; a boys' grammar school at the top. But even in the mixed schools the mixture is chiefly nominal; for the boys and girls only meet

The table below gives the centesimal proportions :—

Attended.	Less than 40 days.	More than 40, less than 80.	More than 80, less than 120.	More than 120, less than 160.	More than 160, less than 200.	More than 200.
N. York State	25	27	21	13	7	7
N. York City	21	18	14	14	11	22
St. Louis	17	17	15	18	32	1
Average	21	21	17	15	16	10

These results may be compared with advantage with those obtained by the Duke of Newcastle's Commission for the ten specimen districts.

Attended.	Less than 50 days.	50 days, but less than 100.	100, but less than 150.	150 to 200 inclusive.	Above 200 days.
Average per cent.	17.4	18.9	20.9	24.4	18.4

See *Report*, vol. i., p. 651. Here, again, it will be perceived, the condition of English schools does not contrast unfavourably with the condition of American schools. The periods taken in the returns are not quite the same, but they are sufficiently near to admit of comparison.

* See above p. 12, note.

Practice in Philadelphia.

Tendency in New York.

† This, I was told, is a common practice in Philadelphia. There are many parochial schools—that is, schools attached to and supported by different churches—and also many private schools in this city. The average charge for instruction is 10 cents a week. The master of one of the grammar schools informed me that these schools are preferred, for younger children, by many parents who do not like the mixture in the primary and secondary schools. We have already seen that in some places more than half the scholars never rise as high as the grammar school. Of course, these would, as a general rule, be the children of the poorest class of parents. In a rural township in Connecticut I met two little girls who went to a private school at some distance, in preference to the district school which was just opposite their door. They gave me as a reason that their mother did not like to send them there because the boys used such bad language. In New York, where children are not limited in their choice of a school to their own district, but are free to go to what school they please—a liberty that is not allowed at Boston—there is a manifest gravitation which carries “*τὸν ἕτοιμον ὡς τὸν ἕτοιμον.*” The gentility of some schools forms a marked contrast to the rough aspect of others. In the summer-time you will find hundreds of boys in the New York schools, and indeed throughout the country, whose whole attire consists of a cap, a shirt, and a pair of trowsers.

together in the assembling room, and even there occupy different sides. In the class rooms they are taught separately, and the girls are dismissed a few minutes before or after the boys. But of course all these precautions cannot prevent the occasional occurrence of difficulties out of school and on the road home; and the most approved plan is to have two grammar schools in a ward, in different localities, one for boys and the other for girls, each with a mixed primary school subordinated to it, or, at least, in the same building; for, strictly speaking, there is no subordination.*

I will reserve what I have to say about the more general question of the education of girls for the conclusion of this Report, where I will offer a few brief criticisms of some of the more salient features of the whole system.

By the theory of a common-school system, scholars of every rank are supposed to come within the sphere of its operation. But actual—I don't know whether they can be called natural†—distinctions cannot be disposed of by a theory, and, as a matter of fact, social distinctions do tell with a very marked effect upon American schools. Speaking generally, they are in possession of the great middle class—the artisans, storekeepers, farmers. The system works with a much nearer approach to its *idea* or theoretic perfection in the country, where ranks are more equalized, and there is no one rich and no one poor, than it does in the cities and towns. Yet, even in country districts “aristocratic feelings” and prejudices (very foolishly and unhappily, it must be admitted) are beginning to prevail.‡

Social status of scholars.

* It is interesting to collate the practice of different places. The schools in Cincinnati, which take a high rank, are divided into three grades—district, intermediate, and high. The period allowed to each is, six years in the district schools—twice the time allowed to a Boston primary; two years in the intermediate; four years in the high. The difference of time, as compared with Boston or New York, shows, of course, a difference of *arrangement*, but not any real difference of *system*. There are eighteen district schools, with about 900 children in each; two intermediate schools, with 450 scholars apiece; two high schools, each with 200 pupils. These high schools are partly endowed, and work with a not very wholesome jealousy one of another, on the part of their trustees. All these schools are mixed; but boys and girls occupy separate rooms for study, and, in the district schools, for recitations also; so that, though they are in the same building, they never meet. In these schools, forty-eight pupils is the number assigned to a teacher, and the same teacher instructs the class in all their studies. In the intermediate and high schools, the teachers take branches of instruction, and teach the same subjects to different classes. Boys and girls, at the allotted hour of each recitation, go to the room in which that particular subject is taught, and sit together, but on opposite sides of the room.

Cincinnati schools.

In the Bigelow Grammar School, South Boston—an excellently organized and efficient school—the sexes are mixed, and by an arrangement which is unusual, the classes are mixed also in every sense, there being no strict line of demarcation between boys and girls during recitation—they sit at their desks intermingled.

A Boston arrangement.

In many places I noticed a much larger proportion of girls than of boys in the upper departments. In Providence, where all schools are mixed, in the grammar and high schools the number of girls to boys was about two to one. In the high school at Springfield, Mass., there were eighty-five girls to forty-five boys. In Massachusetts, all the high schools, except those at Boston and Newburyport, are mixed.

More girls than boys in upper departments.

Newburyport is interesting in the history of American education, as being the first town which established a high school for girls, and obtained a decision of the Courts in favour of its being legal to levy a tax in support of such a school. Up to that time, it had been taken for granted that the State law only contemplated high schools for boys.

† They certainly may be called so, in Bishop Butler's meaning of the word “natural.” “There seems scarce any other possible sense to be put upon the word, but that only in which it is here used; ‘similar, stated, uniform.’” (*Analogy*, part i., ch. i.) And social distinctions certainly seem to be a stated uniform result of God's providence, and to make themselves felt, if not quite in the same way, yet in quite as marked a way, under democratic as under monarchical or aristocratic institutions. The theory of the literal and absolute equality of all men is sometimes vindicated in a summary and unpleasant way by an American who thinks you are forgetting it, and wishes to help you to realize it; but, as a rule, it is not recognized in practice. The offensive features of social superiority do not often exhibit themselves in America—the general sentiment is too strong for them. But, with proper feeling and real refinement, they need not exhibit themselves anywhere; and where they do, they are a sufficient proof that the superiority is artificial and accidental—not real and inherent.

Social distinctions.

‡ The Commissioner for the First District of Queen's County, N.Y., reports:—“Pupils begin generally to attend school at too young an age, say from five to six; then they are taken from the schools at from twelve to fourteen—by the wealthy to be sent to boarding-schools, and by the poor to be put to work. If they are to be taken from the district school, I think the wealthy also might better ‘put them to work.’ The children of many of the wealthy are never sent to the district school, from an aristocratic feeling on the part of the parents, ‘who do not want their children to associate with those of the poor. In a few cases the practice has almost destroyed the district school.” (*11th Report*, p. 276.)

Uppgrowth of aristocratic feelings and tendencies.

The Superintendent of common schools in Pennsylvania, speaking of academies and private schools, says:—“We do not require such a multiplicity of these institutions as we have in the State—schools where the most primary branches are taught. Such schools are drawing from the common schools the very influence and support that they should have; that is, the influence of men of wealth and position in society—men whose support would of itself render them popular, and the withholding of which has a tendency to render them unpopular.” (*Report for 1864*, p. 34.) We have already heard this gentleman recognizing as a special merit in the graded school its anti-aristocratic influences. (*Above*, p. 18, note.)

The tendency of parents to prefer private to public schools is lamented by the school committee of Greenfield, Mass.:—“The committee cannot but express their regret at what seems to be a growing disposition among a large class of our people to remove their children altogether from the public schools. We say this in no spirit of hostility to private schools. We appreciate the motives which prompt parents to withdraw their young children from what they fear to be the corrupting influence of the public schools.” (*Massachusetts 28th Report*, p. 149.)

Preference of private to public schools.

Another committee think that private schools are gaining ground upon the public schools, by reason of the higher education they offer. (*Ibid.*, p. 157.) But this is not the general, nor is it my own, opinion. I believe the preference for the private school is dictated solely by social motives. “It is a noteworthy fact,” says another N. Y. commissioner, “that private schools, with no better qualified or more successful teachers than may be found in the adjoining district schools, are much

And in all the cities, New York, Newhaven, Hartford, Providence, and even in Boston, the wealthier class—indeed, all who can afford to do so, almost without exception—send their children to private schools. Of the persons whose acquaintance I made in the country, most of whom I should rate at about the same level of social rank and social feeling as myself, I do not remember one who used, either for sons or daughters, the common schools. In all these cities there are finishing schools for young ladies,* just as there would be in cities of the same character among ourselves; and there are private day or boarding schools for boys, at which they remain till they are fit for college. The charge for tuition at these private schools would be from \$150 to \$200 a year; for boarders, the terms would rise as high as \$500 or \$600. The education—at least, in the girls' schools—would not, indeed could not well, be of a higher type than that offered to public acceptance by the high schools; but probably more attention would be bestowed upon "accomplishments"—on music and the modern languages. At Yale College, Newhaven—which, and Harvard University, near Boston, are the Oxford and Cambridge of America,—I was informed that, though a large proportion of the

Terms in private schools.

more liberally patronized than the latter." (11th N. Y. Report, p. 305.) The "fact" is attributed to "apathy." It is more probably attributable to pride.

Occupation of parents of students in high schools of New York and Philadelphia.

In illustration of the class of pupils who are found in the high schools, I append the following lists, extracted from the different reports. In interpreting them, the large sense in which the word "merchant" is used in America, as in Scotland, must be remembered. In analyzing the Philadelphia list a little more closely, I found one of those so classed was a "rag merchant."

A. Parentage of 351 pupils admitted to the introductory class of the Free Academy, N. Y., in July, 1864.—Artists, 2; auctioneers, 2; brokers, 8; book-keepers, 7; builders or contractors, 11; bankers, 3; brewer, 1; clerks or agents, 28; clergymen, 6; dealers or pedlers, 3; engineers, 4; hotel-keepers, 2; lawyers, 13; labourers, 3; masons, 3; merchants or manufacturers, 53; mechanics or artisans, 24; officers in army, 3; physicians or medical men, 13; professors or teachers, 11; publishers, editors, or authors, 6; police inspectors, 9; storekeepers or tradesmen, 74; shopmen, 3; miscellaneous, 9; occupations not given, many of them apparently widows, 42; independent or retired from business, 8; total, 351.

B. Occupations of parents or guardians of 160 students admitted July 5th, 1864, to the Central Boys' High School, Philadelphia:—Agents, 2; assessor, 1; baker, 1; beamsman, 1; blacksmiths, 4; boarding-house keeper, 1; bookbinders, 2; book-keepers, 3; bookseller, 1; brick-layer, 1; broker, 1; cabinet-makers, 3; carpenters, 6; chandlers, 2; clergyman, 1; clerks, 9; clothiers, 4; coachman, 1; contractor, 1; conveyancers, 3; cordwainers, 9; engraver, 1; farmers, 2; fire marshal, 1; furriers, 2; grocers, 4; hatter, 1; innkeepers, 4; iron-founders, 2; jeweller, 1; lawyers, 2; machinists, 4; manufacturers, 14; mariners, 3; merchants, 22; miller, 1; millwright, 1; pattern-maker, 1; perfumer, 1; physicians, 3; potter, 1; printer, 1; saddler, 1; sail-maker, 1; seamstresses, 2; sexton, 1; silversmith, 1; stationer, 1; surveyors, 2; tailors, 5; teachers, 2; tragedian, 1; undertakers, 2; upholsterer, 1; victualler, 1; watchmaker, 1; watchman, 1; not engaged in business, 8; total, 160.

C. The pupils in high schools are of course a sort of *corps d'élite*. The St. Louis statistics give the occupations of the parents of the whole number of pupils, 12,349 enrolled in the common schools. They are as follows:—Agents, 266; artists, 99; barkeepers, 204; boatmen, 707; butchers, 209; clerks, 407; draymen and teamsters, 333; farmers and gardeners, 286; labourers, 1,194; laundresses, 276; manufacturers, 590; mechanics, 2,875; merchants, 1,414; professional men, 433; public officers, 620; seamstresses, 385; unclassified, 2,051; total, 12,349.

Ladies' private schools.

* A young lady at Boston gave me the following account of the private school in which she was receiving her education:—There are seventy pupils and three regular teachers, with special teachers of French, Italian, German, drawing, and natural philosophy. Oddly enough, music is not taught. Hours of study are from 9 a.m. to 2 p.m., with a recess of half an hour. Home lessons occupy two, or two and a half hours. Terms are \$150 a year. Vacations are thirteen weeks in summer, one week at Christmas, one in May. The subjects of instruction are—arithmetic, algebra, geometry, geology, chemistry, geography, history, rhetoric and belles-lettres, Latin, French, Italian, German, drawing. The young ladies read Virgil, Horace, and Cicero, are obliged to speak French one to another in school, sometimes translate English plays into French. The usual age of entrance is fourteen, and the school period is four or five years. There is no periodic examination of the school.

Hopkins' endowed grammar school, Newhaven.

Hopkins' endowed grammar school at Newhaven, which I visited, is a sample of a type of school, outside the common-school system, not uncommon in New England and in other parts of the Union. Phillip's Academies at Exeter and Andover, Massachusetts, are of the same class. Their chief function is to prepare students of a superior class for the University.

Hopkins' grammar school was founded in 1662, by Edward Hopkins, Cromwell's Administrator of the Admiralty, who was himself educated at Shrewsbury School, and was for some time Governor of Connecticut. It is governed by a body of trustees—a close corporation, self-electing—and is endowed with land producing about \$600 a year. There are, however, no scholars on the foundation—all pay \$40 a year. There is one principal and one assistant teacher, and an average attendance of sixty pupils. Most of these have been prepared at private schools, and stay here from three to five years; fifteen or twenty come from distant States. The whole course of study is determined by the requirements of Yale College, beneath whose shadow the grammar school lives. The terms, which are forty weeks in the year, and vacations, exactly correspond with those of Yale. I was struck with the fine appearance and frank manners of the boys; there was the unmistakable tone of the gentleman about them.

Its programme of study.

The programme of study includes Latin and Greek, arithmetic, algebra, and two books of Euclid, ancient and modern geography, ancient and modern history, essays and compositions, but no modern language. The hours of study are from 8:45 a.m. to 12:15 p.m. and from 2:30 to 4:30 p.m., for five days in the week. The time devoted to some of the principal subjects is as follows:—Latin, five recitations a week, of an hour each; Greek, four recitations of an hour; arithmetic, three recitations of forty minutes; Euclid, during one term of the year only, three recitations a week of 45 minutes; algebra, four recitations of 45 minutes; geography, two recitations of 30 minutes. Greek is commenced late. The third class, aged about fifteen, had been learning Latin two or three years, but had only studied Greek seven weeks. In two years they would enter college. I thought this language hardly had attention enough paid to it. As universally in America, Greek is read by accent, and the vowels and diphthongs are pronounced in what, I believe, is called the German fashion.

This is a type of the highest American school preparatory to college; and while it will be seen that the programme is quite as limited as any that was ever adopted in any English public school, the progress—at any rate, in the classical department—is very much slower than we should approve. It would be a rare and exceptional case to find a boy of fifteen at Rugby or Shrewsbury who was in his "first lessons" in Greek.

students had been educated in the common schools,* yet, as a general rule, they finished off with a year's preparation in a private school, with a view to a more exclusive reading in the classics.

There can hardly be said to be any competition between these different classes of schools—the common school on the one hand, and the academy or private school on the other. They exist side by side in an amicable way, because apparently there is a demand for both. In wealthy neighbourhoods the latter flourish and abound; where property is more equally distributed, it is to the interest of the inhabitants to support the former.† They hardly ever draw their supplies from the same class of children. Either those in the private school and the academy are children of richer parents, or they are older children. The education given in them either is more costly, or it is more advanced. And the number of children reported to be educated in these private or corporate seminaries, even in States where they are most numerous, after all, does not amount to much, when compared with the number found in the public schools. It will be sufficient to illustrate this by a table drawn up from statistics supplied by the three States of Massachusetts, New York, and Ohio.

No exact competition between public and private schools.

Statistics of academies and private schools

Name of State.	Number of Incorporated Academies.	Aggregate Attendance in them.	Number of Private Schools.	Their aggregate Attendance.	Aggregate Attendance in Public Schools.
Massachusetts	59	3,169	611	16,125	226,400
New York	230	36,768	1,490	33,302	881,184
Ohio	42	9,615	380	13,302	694,920
Totals	331	49,552	2,481	62,729	1,802,504

It is not pretended, in the reports, that these figures are either complete or perfectly accurate. In New York there is an omission, through the fault of the commissioners whose duty it was to make the returns, of the private schools in four cities,—including New York and Buffalo,—and several districts; so that the complete number of schools would probably amount to 1,600, and of scholars to 35,000; but even then the percentage on the whole aggregate attendance would be in the academies about 4 per cent., in private schools the same, in the common schools about 92 per cent.

In Massachusetts there was an increase in 1864, as compared with the previous year, of attendance in the academies, of 381; in the private schools, of 511; while, though there was an increase in the population between 5 and 15 years of age of 3,263 persons, there was a falling off in the public schools of 852. But I do

* Students with very humble means contrive to get an education at Yale or Harvard, often through the liberality of private patrons, though there are also exhibitions for the relief of meritorious poverty. Real talent in humble rank is nearly sure to meet with help in America, and I was told of many instances of students of narrow resources who were maintained at Harvard by rich Boston merchants. A sad event happened at Harvard while I was at Boston, which threw a gloom over the gaiety of the annual "class day." A student from Buffalo, New York, had died the day before, of typhoid fever brought on by a want of sufficiency of nourishing food. The young man was poor, and he stinted himself in the absolute necessaries of life that he might be able to pay his way. One of the professors, with characteristic benevolence, observed his haggard looks, and having ascertained the cause, out of his own by no means ample income gave him \$50, with a charge to spend it on better living. But either the relief came too late, or the young man could not prevail upon himself to change his ways. Fever struck him, and he died.

Poor students at the University.

The average annual cost of a university education at Yale or Harvard, to a moderate man, is \$500 or \$600 a year. Some students spend as much as \$1,000 or \$1,200. The difference chiefly lies in the expenditure upon style of living and dress. Very few students indulge in expensive amusements in which the rest cannot share, and only now and then a young man keeps a riding horse. A large number have rooms in college, the rest board with families in the town. There is no such thing as a college buttery or kitchen. For meals, the ordinary plan is to form little messes of ten or twelve, who are provided for at a fixed rate per week, in private houses in the town. Vacations at Yale are seven weeks in the summer, two at Christmas, three at Easter. The terms, which are three, consist of fourteen, fourteen, and twelve weeks, respectively.

Expense of university education.

† I take an illustration from two counties in the State of New York. In Suffolk County, Second District, the Commissioner reports a marked progress in the common schools:—"The spirit of reformation has entered into the very constitution of the educational system, which it has invigorated, and in some instances created anew. The Union school remains in a flourishing condition. The only academy continues a sickly existence." (11th Report, pp. 307-9.) On the other hand, this is the picture of Tioga County:—"Too large a number of our school-houses are quite unsuitable. Many of them are old and shabby, inside and out; ventilated (if at all) by gaps through the floor or wall; badly arranged. There is generally no furniture, not even a chair for a visitor or the teacher. Black-boards are usually manufactured out of two boards, partially held together by strips nailed on the end or back, with a sizable crack between, having a surface of 2 x 3, or 3 x 6 feet; and on account of their coarse condition, and the want of either crayons or chalk, seldom used. A few houses in this country, located in wealthy neighbourhoods, were you to visit them, you would condemn as unsuitable to shelter any animal, much less tender and delicate children. . . . It seems to me that many, nay most, of these schools are making no progress whatever." As a natural companion picture:—"There are two academies in this county, having an aggregate of 150 pupils—the Owego Academy and the Waverley Institute. They very successfully teach the higher mathematics, classics, and sciences, and to a remarkable degree shew the public confidence. There are also fifteen private schools in the county, having an attendance of 431 pupils. Some of these schools are striving for a high standard of education, and are well sustained." (11th Report, pp. 318-20.)

Illustration from State of New York.

I have no doubt that an inquirer in these two counties would find, in the different social condition of the people, an explanation of these discrepant phenomena. The Tioga commissioner admits the existence of "wealthy neighbourhoods."

not think that these figures are serious enough to indicate any change in general public sentiment.

and Ohio. In Ohio there are 19 male academies, educating 4,530 boys; and 23 female seminaries, attended by 3,340 girls; to which I have ventured to add, in my table, the 1,745 students in the preparatory classes of the 18 colleges and universities of the State. And, all told, the result in these three populous States is, that the proportion of the population educated in the public schools, as compared with those educated in the academies and private schools, is as 95 per cent. to $2\frac{1}{2}$ per cent. and $3\frac{1}{2}$ per cent. respectively.*

Incorporated academies.

* This will, perhaps, be the best place for describing, in outline, the constitution and objects of these academies. I prefer throwing my description into a note, to disturbing the continuity of the text by it, because the academy really lies outside the common school system, the true sequence of whose component parts is:—1, the primary school; 2, the secondary school, by whatever special name known; 3, the high school; 4, the college or university. The last-named is outside the system also, but still is its natural and intended culmination, the original object of the Massachusetts Grammar School, which by the law of 1647 was to be established in every township containing 100 householders, being "to instruct youth, so far as they may be fitted for the universities." The existence of academies is collateral to this system, and is due to later conceptions and tendencies.

Their constitution.

The academy is an endowed school under a body of trustees, who form a corporation, and can hold property; in some instances, as in Massachusetts and New York, though apparently not in Ohio, subsidized by the State, on condition of submitting to certain visitation, or fulfilling certain requirements, presumed to give a higher education than can be ordinarily procured in the public schools. The pupils received are mostly boarders, not, however, in all cases housed in the academy itself; sometimes living with families in the town or village in which the academy is situated.

I have not in my possession any document exhibiting the statistics and condition of the Massachusetts academies, but there is a fairly complete account of those in Ohio in the Report of the State Commissioner, and a very complete account of those in New York in the Report of the Board of Regents of the University. From these sources of information I abstract the following details:—

Academies in Ohio.

In Ohio, the date of the establishment of the oldest academy is 1820—eighteen years after the constitution of the State; of the oldest female seminary, 1832. The course of instruction occupies a period of from three to five years, and the academic year consists of from thirty-two to fifty weeks. The average annual cost of education in an Ohio academy, including board, is about \$150 or £25, the lowest terms being \$60 (for thirty-six weeks), the highest \$300. In the female seminaries the charges are higher, ranging from \$125—the lowest, to \$500—the highest. Of the nineteen academies, only six report a classical, only three a scientific (special) course of study. They employed, in 1864, 111 teachers to an average attendance of 2,658 pupils, that is, about one teacher to every twenty-four scholars. The value of their buildings was estimated at \$162,500, or about \$8,000 apiece; of their apparatus, \$8,830; of their libraries, \$10,850. The cost for tuition varies from \$16—the lowest, to \$100—the highest rate for the year, the average being \$34. The cost of board would vary from \$2 to \$4 a week.

Female seminaries.

In the female seminaries, which are supposed to accomplish for women what the colleges do for men, the average cost of tuition is \$45 a year. "The female seminaries," says the Commissioner, "are enjoying an unusual degree of prosperity. The fact that there are more young women in the State receiving a higher education than there are young men, is one of the signs of the times. If, with the manifest change in public sentiment respecting the value and importance of female education, a demand for thorough and solid instruction is awakened, the progress will be real, and the results substantial. I am, therefore, pleased to add, that in several of these seminaries the ornamental branches are properly subordinated to the disciplinary and useful studies. . . . Several of the academies of the State have regular courses of study, classical and scientific, able and accomplished instructors, and good facilities for thorough instruction. In all these respects, they are at least equal to some of the so-called colleges and universities. It is also worthy of note, that they are receiving a generous patronage. The exceedingly low charge for tuition in several academies must call for a self-sacrificing spirit on the part of their teachers." (*Ohio 11th Report*, p. 48.)

The New York Board of Regents of the University.

In New York State, there is an educational body, armed with executive and visitatorial powers in relation to all colleges and incorporated academies in the State that claim a share in the appropriations of what is called the "Literature Fund," whose title is "The Board of Regents of the University." It consists of four *ex-officio* members, the Governor, the Lieutenant-Governor, the Secretary of State, and the Superintendent of Public Instruction, and nineteen other members elected for life. They appoint out of themselves a chancellor, a vice-chancellor, and a secretary. They are charged with the visitation of colleges and academies, and with the distribution of the "Literature Fund," and that portion of the "United States Deposit Fund" which is set apart for the promotion of higher education. They also grant charters of incorporation to colleges and academies. They publish annually an elaborate report, giving detailed accounts of each college in the State, and statistical tables illustrating the condition of the several academies.

Statistics of New York academies.

In 1864, there were 230 incorporated academies in the State subject to their visitation, of which, 207 reported their condition for the previous year. Of the 36,000 pupils in attendance at them, 22,179, of whom 10,446 were males and 11,733 were females, claimed to have pursued those classical or higher English studies which entitled the academy to claim in their behalf a share in the State grant. The grant amounted to \$40,000, or about \$1.85 per scholar. The financial statement exhibited the value of the buildings at \$2,362,872; the libraries, \$151,812; the apparatus, \$121,661; other property, \$415,400; total, \$3,051,745, on which there were debts chargeable to the amount of \$293,427. The revenue of the year was \$583,524; the expenditure, \$579,320. The sum paid as salaries to teachers was \$423,822; the income derived from tuition fees was \$339,362, giving an average rate of about \$9.50 per scholar. In some places, as at the Brooklyn Polytechnic Institute, the tuition fee is as high as \$90 a year. The excess of salaries over receipts from tuition was supplied from the Literature Fund, from endowments, and in the case of academical departments in the Free Union schools, where tuition fees are not allowed to be charged to the children of inhabitants of the district, from taxes raised in the Union district.

The number of teachers employed was 1,049, or one teacher to about every thirty-five scholars. The age of the scholars varied from fifteen to eighteen; the length of the vacations ranges from eight to fifteen weeks. The cost varies from \$80 to \$350 a year, the charge for board ranging from \$2 to \$7.50 a week. In Rutgers Female Institute, New York, where the whole cost is set down at \$357, tuition in the highest grade is charged \$60, and cost of board is put at \$7.50 a week. There were eighty-six academies, out of ninety specially designated for the purpose, which had special classes for a third of the year, attended by 1,777 scholars free of charge, for instruction in the science of common school teaching, an allowance being made to the academy, by the State, of \$10 for every scholar so instructed.

There is, however, another element of consideration, not yet noticed, which no doubt called into existence and still maintains many of these academies and seminaries, and particularly those intended for the education of females. A large number of them are attached to particular religious bodies, or represent particular phases of religious opinion. Of the twenty-three female seminaries in Ohio, thirteen

Connection of academies and colleges with religious bodies.

The subjects of instruction in these academies, as returned by them to the Board of Regents, are:—

Subjects of instruction.

- A. Ordinary elementary studies: Arithmetic, book-keeping, English grammar, geography, pronunciation, reading.
- B. Mathematics and natural philosophy: Algebra, astronomy, geometry, natural philosophy, surveying, trigonometry, calculus, civil engineering, navigation, perspective, technology.
- C. Ancient and modern languages: Latin and Greek grammar, Roman and Grecian antiquities, mythology, French, German, Italian, Spanish.
- D. Natural sciences: Physiology and hygiene, botany, chemistry, geology, natural history, meteorology, mineralogy, zoology.
- E. Moral, intellectual, and political science: Criticism, evidences of Christianity, general history, history of the United States, constitutional law, logic, natural theology, political economy, rhetoric, principles of teaching.

A magnificent programme, embracing nearly the whole circle of knowable things. That a tenth part of these subjects are taught at all, or if attempted, can be taught with any thoroughness, those who are conversant with such matters will not suppose for a moment.

The academy is comparatively a modern institution. Of the 207 reporting to the Regents, only thirteen date their incorporation in the last century, the oldest being established in 1787, while 138 have been founded since 1840. Their endowment has generally come from private sources, and municipal liberality has not unfrequently enriched them with buildings, libraries, and apparatus. It is a curious form that the general interest in education sometimes takes in America, that towns, and even railway companies, will make handsome bids of money or other advantages to entice a projected institution to their locality—whether always from a direct educational motive, or in the prospect of some reflex commercial benefit, I am not prepared to say.

Modernism of academies.

The academy of which I saw most was that for boys at Albany. The building, which is substantial and suitable, was raised about fifty years ago by subscriptions, supplemented by a donation from the city. It is excellently furnished with philosophical apparatus, carefully kept in glazed cabinets. It is under the management of sixteen trustees, who appoint the Principal and other teachers. There are ten teachers, of whom one is a female. It is divided into two departments—a preparatory and an academic. It is only in respect of the latter that it can draw money from the State "Literature Fund"—a resource of income amounting to about \$250 a year. The total annual cost is about \$9,000, of which \$7,500 goes to pay salaries of teachers. There is an excess of revenue over expenditure, the fees from pupils alone amounting to nearly \$10,000. Boys can enter at any age, and, in the preparatory department, at any point of preparation. Owing to this peculiar feature, this academy somewhat interferes with the gradation and completeness of the common school system, and instead of being content simply to take the place of a high school, which does not otherwise exist in Albany, it really does the work of a primary school too. In the preparatory department there are about 120 scholars, divided into four classes; in the academic about 150, divided into five classes. The average age of these latter, as reported to the Regents, is sixteen. About fifty read Latin; about thirty-five, Latin and Greek; the rest take only a general English course. French is taught, but not very successfully; the number of other subjects, as the phrase is, "crowd it out." I was informed that the study of languages is pursued with more vigour in provincial academies. In those in cities, a more practical education is demanded. One scholar from each district school in the city is educated gratuitously; admitted, I presume, by examination. The vacations are, nine weeks in the summer, commencing with the last Friday in June, and one week at Christmas. The daily session is from 9 to 2, with a quarter of an hour's recess. Saturday is a whole holiday.

Albany academy.

The Board of Regents do not appear to be quite satisfied with the condition of these academies, nor with the principle on which the aid of the State is apportioned to them. It is simply at so much—in 1864, at \$1.85—per scholar, according to the number returned as pursuing a particular department of study. "Neither merit in learning, nor proficiency and merit in instruction, are allowed to enter as an element in the mode of distribution. The Regents suggest the expediency of making the distribution depend upon merit, as ascertained by competition and comparative examination, upon which might be made to depend also promotions and honors, in the form of scholarships and fellowships in the colleges, which would be sought with enlightened emulation as honorable distinctions, and also as a positive evidence of actual merit. It is the system of State competitive examinations which gives to public education in Europe much of that thoroughness and exactness which is wanting in this country, and without which, schools fail everywhere to produce their highest results. . . . The free academies of New York, Troy, Utica, Syracuse, Rochester, and Buffalo, receiving their pupils by promotion from the common schools on competitive and comparative examinations, and by similar examinations advancing them to the higher grades of an established curriculum, exhibit in a most favourable light the salutary effect of such examinations, not only in the direct power of these higher institutions, but also in their reflex influence upon the common schools in stimulating a laudable emulation, and on public opinion among their pupils in favour of careful study, intelligent progress, and good order." (77th Annual Report, pp. 19-22.)

Condition of these academies hardly satisfactory to the Regents.

Competitive examinations recommended.

No doubt the cause of "thoroughness and exactness" would be much promoted by examination; perhaps also as much more, by cutting down the extravagant programme of studies with a somewhat ruthless hand. But it seems to me that, to carry out these ideas and effectuate these reforms, it would be necessary to entirely remodel the constitution of these academies, and to bring them into organic connexion with the common-school system, as is the case with the New York Free Academy, which is quoted as a pattern; and to oblige them to descend from the position which they now occupy as independent, and, in a certain sense, superior institutions.

The Secretary of the Board of Education in Massachusetts expresses a wish that the New York arrangement for forming classes in the science of teaching, in certain selected academies, were imitated in his own State:—"Such an arrangement with those academies which are within convenient distances of those portions of the Commonwealth least favoured with public schools of the higher grades, would do much towards meeting the constantly increasing and deeply felt want of teachers of higher qualifications for the common schools, and towards elevating their character and condition." (28th Report, p. 63.) It appears, on the same authority, that the fifty-nine academies in Massachusetts, with their 3,169 scholars, received, in the year 1864, \$55,508 from local appropriations, and \$76,593 from school fees. This gives an average appropriation of about \$900 per academy, and an average tuition fee of \$24 per scholar. The 16,124 pupils in the private schools paid \$317,477 in tuition fees—an average of not quite \$20 each. (Ibid., p. 59.)

Classes in the science of teaching.

Academies in Massachusetts.

In Pennsylvania it is reported that incorporated academies are diminishing in number. "Some have failed from want of patronage, and the buildings and lands of others have been transferred by the trustees to the directors of the common school boards in the districts where they are located, and are now used for graded schools." It is considered that there is already more than enough

In Pennsylvania.

appear to be presided over by clergymen, or at least by ten "reverends" and three graduates in divinity. The Roman Catholics are well known to have a predilection for separate schools, and the titles of many of the academies and colleges indicate that they belong to that communion, which is inferior in zeal to none in the States for an education after its own kind. The "religious" or "denominational" question, therefore, in America as well as in England, affects the constitution of schools and the character of education in some, though, as has been observed, in a very insignificant degree.

Relation between
the academy and
the common
schools.

The true and normal relation between the college and the academy and the common school cannot, perhaps, be better put than it is by Mr. E. E. White, the able Commissioner of Common Schools for the State of Ohio:—"Between the college and the common school," he says, "there is a mutual dependence and essential unity. The public high school creates a wider demand for higher instruction, and the more completely and thoroughly it does its work, the higher and broader will be the work of the college. The college, on the other hand, supplies the common school with materials for a larger success, and, invites it to a grander work and a nobler destiny. Female seminaries that aim at thorough and liberal education sustain a relation to public instruction similar to that sustained by the college.

Nor is there any antagonism between the academy and the common school. The true function of the academy is to complete what public instruction fails to accomplish in a satisfactory manner—in other words, to supply its defects. Whenever the common school does its work perfectly, the duplication of that work will not, of course, be found profitable. There are, however, certain natural limitations to public instruction, arising from sparseness of population and other causes, that will always make a demand for a limited number of academies of a high order."*

Size of schools

It is impossible to fix upon any number which shall indicate the average size of a common school. Indeed, the extremes are so far apart, that to take the arithmetical mean would be of no value for any practical purpose; and this is equally true of rural districts and of cities and towns. In the city of New York, I visited one school building in which there are ordinarily gathered together in its three departments, every day, about 2,500 children. I observe, in the tabulated statistics, others, also in three grades, where the daily attendance does not exceed 500; one, in two grades, where it does not reach 100.

and of classes.

But though it is thus useless to attempt to measure by any average the size of *schools*, it is not difficult to measure the size of *classes*, and the proportion of scholars assigned to a single teacher, because this is a matter generally determined by rule. The classes in the lower grades are allowed to exceed the average, and those in the higher grades fall below it; but, speaking generally, it appears to be the received opinion in America that one teacher to fifty pupils is a just proportion.† Of course, with such numbers, individual instruction is impracticable to

of academies and seminaries of the class which now exists. What the educational system does require is—"a few more academies well endowed and well patronized, so that they will support a good corps of teachers of the first grade, and thoroughly qualify pupils of both sexes for any position in life, and prepare young men for entrance into the best colleges in the land. Such higher institutions we do need for those who desire to pursue a classical course and prepare for college, and cannot have the opportunity of the high schools in our cities and large towns; but we do not require such a multiplicity of private institutions as we have in the State, pursuing studies that are or should be taught in almost every common school, and drawing from the common schools the very influence and support they should have. It is not probable that more than one-eighth of the students in the academies and seminaries pass on through a college course." (Abridged from *Pennsylvania Report for 1864*, pp. 33, 34.)

New York
Commissioners
opinion of
academies.

The School Commissioners in New York State were specially requested to report on the condition of the academies in their respective districts, and in most instances they have done so. Their accounts, drawn, however, apparently more from hearsay and impressions than from actual examination, to which I am not aware that the academies are legally subject at their hands, are very fluctuating. Some appear to be healthy and working well, others to be sickly and doing more harm than good. Those that have classes for instruction in the science of teaching seem to be the most useful. The following picture is very likely to be accurate:—"The teachers of this district principally resort to these institutions, and from them we get our best drilled and most successful instructors. The primary branches, however, are much neglected. Increased rates of tuition, and a desire to secure a large share of the funds appropriated by the State to the support of academies, is an incentive to urge to the too early study of the higher mathematics and languages." (*N. Y. 11th Report*, p. 287.) And so the house is built upon the sand.

* *Ohio 11th Report*, p. 41.

Size of classes in
New York,

† In New York city there is a minimum limit, but I do not find a maximum. No teacher is to be appointed by the local trustees, unless the average attendance of pupils is equal to thirty to each teacher in a grammar school, and equal to forty-five to each teacher in a primary school. In the Free Academy, "the students in each full course of the first three years are to be divided, as nearly as may be practicable, into sections of thirty-five, and in the other classes, of forty students, for the purpose of recitation, and no class is to be organized with less than twenty students."

in Boston,

In Boston, the maximum number allowed to a teacher in a primary school is fifty-six; the same number in a grammar school, with permission to appoint an additional female assistant whenever there are "thirty scholars above the employment for the teachers already in the school." In the English and Latin High Schools, one instructor is assigned to every thirty-five pupils; in the Girls' High School, the ratio is not to exceed one teacher for every thirty pupils.

in Cincinnati.

In Cincinnati, "no additional teacher is to be appointed to any school unless there be an excess of forty-five pupils over and above an average daily attendance of forty-five to each teacher in the district, exclusive of the principal."

In Boston, the actual average, in 1863-4, of teachers to scholars was 1 to 50; in 1855, it was as 1 to 59. (*Report for 1864*, p. 288.) At Cincinnati, there were employed in the high school 10 teachers for an average attendance of 278, and in the district schools, 202 teachers for an average attendance of 9,724.

Simultaneity.

But here again, averages are uncertain guides. In the large New York school, referred to in the text, I saw primary classes of eighty all being taught at once by a single teacher. At a

any extent, and indeed can hardly be said to be attempted. The class is the unit. In a perfectly graded school, each member is supposed to be advanced to exactly the same point, and to be capable of receiving exactly the same instruction. The theory, too, is, that each scholar is equally advanced in all the studies of his grade.*

Effects of the system of grading.

As a general rule, the whole class is, or ought to be, promoted at once.† There are advantages in this system, and there are disadvantages. The great advantage is, the facilitation thus afforded to the teacher. It is eminently what the Americans are so fond of—a “labour-saving” contrivance. The great disadvantage is that common to all simultaneous methods—it is indiscriminating. The teaching is directed to the quicker scholars, and the slower are swept off their feet and carried upwards and onwards, like a weak man by the impetuous rush of a crowd. I suspect that this want of individual teaching, in the lower and larger classes, is the great cause of that want of thorough grounding which is so much complained of in the higher and smaller classes. Perfection of grading *may* merely mean perfection of mechanism, and mechanism is incompatible with individuality, because it excludes conscious independent effort.

And the evil does not end with the school. “There is no general independence of thought and opinion in the States,” writes an American himself; “everybody is tied to the platform of his party.”‡ “Je ne connais pas de pays,” says De Tocqueville, “où il règne en général moins d’indépendance d’esprit et de véritable liberté de discussion qu’en Amérique. . . . Je pense que c’est à l’action toujours croissante du despotisme de la majorité aux États-Unis qu’il faut surtout attribuer le petit nombre d’hommes remarquables qui s’y montrent aujourd’hui sur la scène politique.”§ Now that I reflect upon what I observed, and try to revive my impressions of American schools, the fact that strikes me most is, how few figures of individual boys or girls present themselves to my memory. I can recollect individual teachers by the score, but the taught only come before my mind’s eye in the mass. The grand defect of all which I should venture to signalize in the American system is, that it ignores, if it does not smother, individuality.||

Loss of individuality.

As a general rule, in all grades below the high school, the teachers instruct by classes; in the high school itself, by subjects. The former method is called the “class” system, the latter the “departmental.”¶ The practice, however, is not uniform. It is so in New York; but in Boston, the class system is carried, at any rate, into the English and Latin High Schools, and a mixed system prevails in the Girls’ High School; and at Cincinnati, the departmental system begins in the intermediate schools. Mr. Philbrick considers the class system preferable for such an institution as the Boston English High School, though he admits that the principal high schools in Europe, and some of the most important in America, are conducted on the departmental plan. I should have thought myself that, when scholars are advanced to a higher and wider range of subjects, it would be a matter of considerable difficulty to meet with teachers competent to instruct with equal efficiency in all, and that, therefore, the departmental method—which is merely an application of the principle of the division of labour—would become a necessity; but I should be sorry to set my *à priori* impression against the evidence of results that are pronounced to have been “entirely satisfactory” for upwards of forty years.**

Mode of teaching.

In the large schools of Chicago, in some of which there is an average attendance of 1,000 scholars, the principle of parallel or co-ordinate classes under different teachers is adopted—a plan similar to that which prevails, I know not

Co-ordination in Chicago.

grammar school in Newhaven, I saw a writing lesson being given to 108 children at the same time. It is true there were two supervising mistresses; but the theory of the lesson was, that every child should be engaged, not only on the same copy, and the same line, and the same word, but upon the same letter, and, if possible, upon the same part of the letter—the same curve, or upstroke, or downstroke—at the same moment of time. The principle of simultaneity could hardly go further.

* “The advantages which will accrue from this classification of studies is obvious. The teacher or parent can tell the scholar’s proficiency in *all* his studies, by knowing his advancement in any one. The different schools can be readily compared with one another in respect of scholarship, by a glance at the number of scholars reported in each of the grades.”—(*Superintendent of St. Louis Schools, Report*, p. 64.)

† “As far as practicable, the promotions should be made *by classes* at the close of the quarter, though particularly meritorious and capable pupils should receive promotion irrespective of their classes.” (*Ibid.*, p. 66.)

‡ *Nichols’ Forty Years in America*, vol. i., p. 326.

§ *De Tocqueville*, i., pp. 307, 310.

|| I do not mean by “individuality” the same thing as De Tocqueville means by “individualism,” which he considers to be the natural product of an age of equality, and which he thus defines:—“L’individualisme est un sentiment réfléchi et paisible, qui dispose chaque citoyen à s’isoler de la masse de ses semblables, et à se retirer à l’écart avec sa famille et ses amis, de telle sorte que, après s’être ainsi créé une petite société à son usage, il abandonne volontiers la grande société à elle-même.”—(vol. ii., p. 110.) This is merely a form of selfishness, or as a Greek would have called it, of social or political ἀπαρμωσύνη. By “individuality,” I mean the development of individual abilities and character.

Individualism and individuality.

¶ I cannot do better than let the Superintendent of the Boston Schools describe the two plans:—“This plan of organization is called the class system, because each teacher, under the general direction and control of the Principal, has the government and instruction of a class for a certain period—in this case, a year—giving instruction in all the branches which are studied during that period. The departmental system requires a very different management. Its type is found in our colleges, where each teacher instructs in a single branch, or in a group of kindred branches. The pupils are under the immediate government of the Principal. They are seated in a common study room, where they remain when not engaged in recitation. From this room they are sent to several recitation rooms during the day, where they receive instruction from the teachers of the several departments of the course.” (*Boston Report for 1864*, p. 171.)

The class and departmental system.

** *Ibid.*, p. 172.

whether from the same motives, at Cheltenham College among ourselves.* The Chicago schools were not in session at the period of my visit, so I had no opportunity of observing the working of the arrangements. I have examined at Cheltenham College, and it did not approve itself to my judgment as a happy contrivance there.

Classification
of grammar
schools.

By the Boston "regulations," each grammar school is divided into four classes, and each class consists of two or more divisions, each of which pursues the studies and uses the text books proper to the class.† Sometimes a class is divided into as many as six sections, depending, of course, upon the number of scholars belonging to it. The general rule is, to have a separate teacher and a separate room for each division; but there are cases in which two teachers would have charge of one division, and others in which two divisions would be under the charge of one teacher. Though studying the same text books, there would, in most instances, be a graduation in the divisions of the same class; but where the divisions are numerous, there, probably, the principle of co-ordination is applied. In other places, as at Providence, each class is divided into two sections, the one subordinate to the other.‡ The teacher would be the same for both, and the one half would recite while the other half are studying, both divisions occupying the same room.

The school day.

The ordinary school day consists of six hours, but different arrangements of time prevail in different cities, and even in different schools of the same city.§ In Boston, the division of the day into two sessions of three hours each is preferred; in New York, the more usual plan is to have one continuous session of five or six hours, interrupted at intervals by a recess. I observed in New York that, whether for the sake of purer air or on account of the greater cheapness of house rent, many of the teachers reside in the suburbs; and to them, no doubt, a continuous session, enabling them to finish the work of the day by 3 o'clock, would be more convenient than a divided one. But remembering the intensity with which American teachers teach and American scholars learn, I cannot help thinking that the Boston arrangement, which in the heat of summer allows a three hours' interval between the morning session and that of the afternoon, must be more conducive to health,

Preference for
the Boston
arrangement.

Co-ordination
in Boston.

* The plan of co-ordination exists also in Boston, in the *lower classes* of some of the larger grammar schools. It is an arrangement not preferred on its own account, but adopted where the system of graduation would produce classes too large to be handled successfully by a single teacher.

† *Boston School Regulations*, ch. x., s. 8.

Number of
divisions in a
class variable.

‡ "As a general rule, the pupils assigned to each teacher in the grammar department, that is, the four highest grades, should be divided into two classes, in the fifth, sixth, seventh, and eighth grades into three classes, and in the ninth and tenth grades into four. The number of pupils in a division, or other circumstances, may make it desirable in certain cases to depart from this arrangement. It is desirable that each class in the grammar department should not number more than twenty or twenty-five pupils, and each class in the lower grades, not more than ten or fifteen pupils. This arrangement is impracticable where a division numbers more than forty or fifty pupils."—(*Wells on Graded Schools*, p. 32.) A good deal of difficulty is occasioned to an inquirer by the confused nomenclature of the American system. The word "grade" is sometimes used as equivalent to "department," sometimes as including no more than the word "class." Mr. Wells, in the passage just quoted, inverts the Boston terminology; the Boston "class" is his "division," and the Boston "division" is his "class."

School hours in
Boston,

§ The Boston hours are, morning session, in summer, from 8 to 11 a.m.; in winter, from 9 to 12 a.m. Afternoon session, in summer, from 2 to 5; in winter, from 2 to 4. Twenty minutes are allowed for "recess" in the morning session, and also in that of the afternoon, when the hours are from 2 to 5. The hours of the three high schools, however, differ, and are, on the New York plan, one long session from 9 to 2, on Saturdays terminating at 1. Half an hour is allowed for recess, and an interval of three minutes between each recitation.

in New York,

In New York, the hours in most of the ward schools are continuous, from 9 to 3, with two recesses, one of a quarter of an hour or twenty minutes at 10.30 or 10.45, the other of three-quarters of an hour to an hour, terminating at half-past 1. During the long recess, many of the children who live in the neighbourhood go home to dinner; the rest spend the time in the playground. Besides the open yard, the ground floor of most of the buildings is occupied by a covered play-room for each sex's use in wet weather. Most of the children whom you see going to school in the streets of New York are provided with a luncheon-box in addition to their little bundle of books tidily strapped together. Neatness and order (at any rate, in the cities) are great characteristics of all American school arrangements.

in Philadelphia.

In Philadelphia, the hours are from 8.30 a.m. to 11.30, and again from 2 to 4.30 p.m.; but if the day is stormy, a five hours' continuous session is substituted, and on such days I suppose children are expected to come provided with something to eat during the recess.

Half-time in
Detroit.

At Detroit, owing to the pressure for room in the primary schools, and the deficiency of accommodation, a half-time system has been adopted for the last year or two, the results of which are thus reported by the Superintendent:—"The working of this system during the past year has been highly satisfactory. Some of the finest primary classes I have ever seen in Detroit have been trained in these schools since the introduction of the system. I regard it as a well-established fact, that children in these schools, other things being equal, make as good progress in the course of study as in the whole-day schools. It was feared at the out-set that the half-day's absence would render them wild and intractable in school during the remainder of the time. This fear has not been realized. The half-day schools are quite as orderly and easy of management as others. The system has proved a very great relief where the schools are overcrowded. I have lately heard few complaints against it, except on the part of parents who are desirous that their children should be kept out of the way during a larger portion of the day. I am aware that, with the poor, in cases where the parents are sometimes out at labour during the day, this is almost a necessity; but it is evident, nevertheless, that the first duty of the Board of Education is, to provide proper instruction for the largest possible number of the children of the city. Relieving parents of the care of them may be important in many cases, but it is undoubtedly secondary to the grander aim above mentioned. I suppose there is no member of this board who would not rejoice in being able to provide means for keeping these children under the care of teachers during a longer portion of each day, but under the present circumstances it is simply impossible." (*Detroit 22nd Report*, pp. 43-4.) As Detroit is the only place in America, so far as I am aware, in which the half-time system has been tried, I thought it worth while to quote thus in full the estimate of its working. The application of it is limited to primary departments, and indeed it is obvious that it is not so suitable to the higher grades. It is strictly a *half-day*, and not (as generally with us) an *alternate-day* system.

and so to progress. Even in Boston there are complaints of the physical ill-effects of "high pressure," and the urging system pursued by some teachers is strongly reprobated in the Superintendent's two last semi-annual reports; nor can there be any doubt that everywhere—at least, in the city schools—a severe strain is put upon the physical strength both of teachers and pupils, particularly in the girls' schools. And this strain, I fancied, seemed to be felt even more in New York than in Boston. There appeared to me to be a more vigorous tone in the schools of the latter city, more spring, and elasticity, and animal spirits; and I remember very distinctly, in a New York school, at the close of one of those little addresses which, in my capacity of a visitor, I was so often called upon to make in the schools, in which I had endeavoured to explain our English system, and had spoken of the growing prevalence of the opinion that five hours of study properly distributed over the day were as much as it was prudent to attempt to get out of young people between the ages of twelve and eighteen, a general sigh issued from the class of girls who had been listening to me, followed by the audible expression of a wish from several that the same opinion might begin to prevail there.

Of these five school hours—for when the recesses have been allowed for, the school hours are reduced to even something less than five—in some schools the larger portion is devoted to recitations, and the smaller portion to study; in other schools this proportion is reversed. Of course there is less study and more recitation, comparatively, in the lower grades, and more study and less recitation in the higher grades, and in the latter more or less time is allowed for study in school hours, according to the larger or smaller number of studies that the pupil is pursuing.* In some schools, as at Cincinnati, the study and the recitation rooms are different; in other schools—and this is the general rule—they are the same, the class that occupies the room being divided into two sections, one engaged in preparation while the other is reciting. Assistance, varying in amount according to the nature of the subject, and sometimes, but not so often, according to the requirements of the individual scholar, is given by the teacher when lessons are being prepared under his own eye; and the general theory is, that the lessons prepared in school are such as are likely to require such assistance, while those taken home are such as chiefly call into play the faculty of memory.

It is the Boston rule that no home lessons should be given to children in the primary schools, and none also to girls in the grammar schools; nor is a longer lesson to be assigned daily "than a boy of good capacity can acquire by an hour's study"; and out-of-school lessons on Saturday are prohibited.

The New York rule is equally strict with regard to primary schools, and forbids any text book being taken from the school except by pupils in the two higher classes; while, with regard to grammar schools, the regulation is, that no home lesson shall be given until it has been sufficiently explained and illustrated by the teacher to the class; nor shall the lessons assigned be such as to require, in the case of a child of average capacity, a longer period of study than two hours. The New York system does not distinguish, as does the Boston, between the physical capacity for work of boys and girls.

It is a peremptory rule in Boston—not, however, always observed—that scholars shall not be allowed to occupy with study the time allowed for recess. Another

* In primary schools, where the received maxim is that the lessons should be "short, many, and varied," frequently alternating with drill, marching, or calisthenic exercises, the lessons requiring preparation are few, and the time allowed to study, short. I append the time-table for the first class in the primary department attached (as a practising school) to the Girls' Normal School at Boston. The average age of the children was eight years.

A.M. 9. 0—	9.15 Devotional and other exercises.	P.M. 2. 0—	2.20 Reading.
"	9.15— 9.35 Prepare spelling.	"	2.20—2.40 Prepare spelling.
"	9.35— 9.50 Recite spelling.	"	2.40—3. 0 General lesson, geography, &c.
"	9.50—10.10 Exercise in numbers, adding, subtracting.	"	Recess of 5 minutes.
"	10.10—10.30 Writing on slates.	"	3. 5—3.25 Recite spelling.
"	Recess of 20 minutes.	"	3.25—3.40 Slate exercise.
"	10.50—11.10 Object lesson.	"	3.40—4. 0 Numbers.
"	11.10—11.25 Reproduce numbers on slates.		
"	11.25—11.40 Reading.		
"	11.40—12. 0 Singing, silent study, or writing.		

In West Roxbury High School, Massachusetts, the ordinary division of the day was,—three hours for recitation, two and a half hours for study, half an hour for recess, one to two hours home work.

At the Boston Latin High School, about one-third of the time is occupied in recitation, two-thirds in study. Home lessons for the three lower classes do not exceed an hour, nor for the three upper classes are they intended to exceed two hours.

In the same city, at the Girls' High School, I heard a lesson—three stanzas of Hor. Od. i. 2—which had been prepared at home, and had occupied an hour. Certain studies in this school (*ex. gr.*, Latin and German) are optional. If a girl pursues the whole course, she would only have one hour a day for study in school, and would therefore be required to spend more time in preparing her work at home. Those who restrict themselves to the narrower programme would have four hours a week for study in school more. The rule in this school is, to have five recitations in a session—from 9 to 2—occupying each from three-quarters of an hour to an hour. The lessons are so arranged that only two shall have to be prepared each day at home; and as a basis of the time-table, the case of those is taken who do not study Latin or German. Some girls study both, but the rule is, that a pupil is not allowed to take either unless she is doing well in her other work.

In Providence, home lessons are not set below the upper classes of the grammar schools.

important direction is, that the lessons which require most attention and thought should come early in the forenoon, while the mind is in the freshness of its power. Certainly every precaution that prudence could suggest appears to have been taken, both by the devisers and administrators of the system, that neither the mental nor the physical powers of the pupil should be overstrained; but, I am afraid, only with very partial success.* Something, possibly, is to be set down to climatic influences, and still more to natural temperament. Americans generally are very susceptible of motives of ambition, and do all their work with an intensity which has no parallel among us more phlegmatic Englishmen; to use a common and expressive phrase, they "take twice as much out of themselves" in the same time as an ordinary English school boy or school girl would do. The result is exciting serious apprehensions in many far-seeing minds.†

Excellent methods in primary schools.

This evil develops itself much more prominently in the grammar and high schools than in those of the lower grade. To my judgment, nothing appeared more admirable in the whole of the American schools system than the organization and conduct of the primary schools. I was told—and I see the same statement repeated again and again in the reports—that there is more inefficiency in the teachers of primary schools than in those of any other department. It may be, probably is, so; but I speak of the primary school as it is in the hands of such teachers as Miss Stickney, of the Boston practising school, or of Miss Myers, Principal of the primary department of Ward School No. 14, in New York. The way in which object lessons are used by Miss Stickney to quicken observation and stimulate intelligence is most interesting;‡ and the discipline by which those 1,200 or 1,400 little restless 'primarians'—as Mr. Philbrick calls them—are moved and controlled by Miss Myers, as though they were all possessed but by one will and moved but by one set of muscles, was the most wonderful spectacle of the kind that I ever beheld.§

Rules not observed.

* Mr. Philbrick complains that these excellent rules are so often violated. "The provision that prohibits out-of-school lessons for girls should be sacredly regarded. It is now violated both directly and indirectly. In some schools it is put to the vote of the children to decide whether they will consent to get lessons out of school. Is this right? Of course the pupils will vote as their teachers wish them to do. The provision is violated indirectly, by permitting or requiring pupils to come before school hours and remain after school hours, for the purpose of learning their lessons. The rule in regard to recess is violated. Pupils are permitted or required to study at recess, instead of occupying the time prescribed in exercise and recreation. Nor is the provision requiring gymnastic exercises each half-day (and which might, by a liberal construction of its language, permit such exercises twice each session) generally complied with. If it were faithfully carried out in all the departments of every school, it would operate very powerfully both in preventing and in counteracting the effects of the 'high-pressure' system." (*Boston Report for 1864*, p. 117.) If all scholars belong to one or other of two classes, of which "alter eget frænis, alter calcaribus," it is easy to see to which class American school children must be assigned.

Serious apprehension of mischief.

† "A visit to the school-rooms throughout the city will reveal at a glance to the practised eye where these palpable violations of the laws of health are insisted on. It can be seen in the rounded backs and hollow cheeks, in the sallow complexions, the lack-lustre of the eyes, and in the listless pose of the occupants of the desks. Nothing is more certain within the sphere of medical knowledge and observation, than that a persistent and long-continued overworking of the brain produces deterioration of the blood, and all its train of attendant physical evils, as surely as an inadequate supply of nourishment, or a too long exposure to unfavourable hygienic influences, of whatever nature; and when this straining of the mental powers is accompanied, as is too often the case, with a high temperature and an insufficient and vitiated atmosphere, the degeneration is doubly accelerated. Nor is the physical health alone endangered by such excesses. Says Dr. Ray—a most eminent authority on such matters:—'Among the remoter agencies in the production of mental disease, I doubt if any one, except hereditary defects, is more common at the present time than excessive application of the mind when young.' There is no doubt something in the very nature and composition of our climate that renders these habits of the children of the present day more hazardous to the future well-being of the mature man or woman in America than almost anywhere else upon the civilized globe. Says the distinguished authority already quoted:—'The remarkable nervous excitability of our people, as indicated by restlessness, impulsiveness, impetuous and boisterous movement, is probably due to this cause, and is strikingly manifested in the insanity of this country as compared with that of others.'" (*Boston School Committee's Report for 1864*, pp. 47-49.) I did not myself notice many "lack-lustre eyes" or much "listless pose." The symptoms that struck me were just the contrary—a hectic, flashing brilliancy of the pupil of the eye, and an intense, quivering energy of the whole nervous system, plainly visible in the tremulous motion of the thin, eagerly-extended hands.

Object teaching.

‡ Object teaching was first introduced, I understand, on the other side of the Atlantic, not more than three or four years ago, into the schools of Oswego, New York, by Miss Jones, who was specially imported by some liberal promoters of schools, from the Home and Colonial Society's Institution in London, for the purpose. I believe that Miss Jones did not remain more than twelve months in America; but her method has struck its roots deeply into the soil, and has become a universal feature in the instruction of primary schools. Miss Stickney frankly confesses that she owes all she knows in the matter to Miss Jones, and speaks in the highest terms of the method, as conducing, above all others, to promote general intelligence and inquisitiveness of mind. Object teaching was only introduced in 1863 into the programme of the Boston Primary Schools. (*See Report for 1864*, p. 104.) Its beneficial results are admitted on all hands. But here, as elsewhere, indeed more than elsewhere, all depends on the skill of the teacher. Desultory, aimless object lessons, I conceive to be as unprofitable a way of occupying children's time as can be devised. Nor do I think they should be allowed to exclude or throw into the shade other methods—those, for instance, which discipline and strengthen the memory—which are no less necessary for the due and proportionate development of the youthful mind. In the hands of a lively, systematic, judicious teacher, the object lesson is an educational instrument of vast power; in the hands of one with the reverse of these qualities, it is worse than a waste of time. *Corruptio optimi fit pessima.*

Its advantages and disadvantages.

Perfection of drill and discipline.

§ I know that some competent judges consider the discipline of this school too repressive and mechanical, and produced at too large a cost of labour and time. No doubt it must have cost much time and labour to initiate it; but now that it is fairly started, it can be maintained, I should think, without any great expenditure of either. A batch of fresh children—even so many as a hundred—when first joining this school, must feel themselves at once lost in the mass, and instinctively from the mere force of imitation, doing what they see their neighbours do. The movements are simple enough; it is the precision and absolute synchronism with which they are executed that is the astonishing thing. The drill of the Brigade of Guards could not be more

The ordinary age at which children enter the primary school at Boston is five, and by eight they ought to be ready to be promoted to the grammar grade. In New York the children seem to enter a year earlier, and to remain a year, or even two years longer. At Boston, if a "primarian" is not ready for promotion in three years, he is transferred to the "intermediate" school, whose special function it is to deal with the bigger, duller, or more neglected children. The programme of the primary school is very simple. It merely embraces the subjects of reading, spelling, ciphering—chiefly mental calculation—writing (on slates), singing, object lessons, and physical exercises. When a pupil can "read at first sight easy prose; can spell common words of one, two, or three syllables; can distinguish and name the marks of punctuation; can perform mentally simple questions in addition, subtraction, and division; can answer readily to any proposed combinations of the multiplication table in which neither factor exceeds 10; can read and write Arabic numbers containing three figures, and the Roman numerals as far as the sign of 100, and can enunciate clearly and accurately the elementary sounds of the language,"*

Age of entrance, and programme of primary schools.

perfect. It did not seem to me to impose any uneasy restraint upon the children; on the contrary, nothing could exceed the spirit they threw into their manoeuvres.

On the subject of repressive discipline Mr. Philbrick has some excellent remarks:—"True order consists in a quiet attention to the work of the school. Scholars should have as much liberty as is consistent with the proper business of the school. All restraint beyond this tends to make school distasteful. I dislike a noisy school, full of play and mischief, but I am rather pleased to see a little primarian twist and turn in his seat, if he is doing it unconsciously, while really engaged about his work. I do not say that a class standing at recitation should not be made to 'toe the line,' but I like to see their hands left free. I wish all teachers would fairly try the experiment of free hands as a general rule. Perhaps all would not succeed, but I think some might." (*Boston Report*, 1864, p. 135.)

Mr. Philbrick on repressive discipline.

The Boston discipline must strike any observer as something very different from that of New York. The coup d'œil of a Boston school is much less brilliant, the symmetry of movement less perfect, the light, springing step of the boys, the "glissade" of the girls, more rare. Perhaps the difference is in a great measure owing to the rarer use of the assembly room for the purpose of aggregating the children together, and to the more infrequent presence and employment of pianos. In Miss Myers' school, every movement, every gesture, is indicated by the instrument.

Contrast between Boston and New York schools.

With the habits and tempers of English children, particularly of English boys, it would be quite hopeless to attempt to introduce anything like this sort of discipline into our schools, yet it is a powerful auxiliary of order.

* *Rules and Regulations of Boston School Committee*, ch. x., s. 4. It is mentioned, in the report for 1864 (p. 23), as a curious fact, that the primary school is comparatively a modern institution. "The apex of the pyramid was planned and perfected long before its solid foundations were at all considered or provided for." The Latin school was founded in 1635, the grammar school system established in 1682, the primary school was not introduced till 1818. Not till 1854 were they placed under the control of the general School Committee. It is within the last ten years that the present admirable system has been developed and perfected. The schools are now thoroughly classified, and each class is placed under the charge of a separate teacher. It is now considered as important to have good school-rooms and good desk and seat accommodation for "primarians" as for scholars of any other grade. The course of study is defined by a rigid programme. This I will reserve for an appendix, but I may briefly here signalize some of the chief principles and methods of instruction, which, under the direction of the experienced Superintendent, are carried out in the Boston primary schools.

Recent establishment of primary schools.

Their methods.

The slate is used for printing, drawing, and writing. On the broad, flat, wooden frame are pasted strips of coloured paper, on which are printed alphabets (both print and script), numerals (Arabic and Roman), marks of punctuation, simple geometrical figures, &c., which serve as copies. In teaching writing or printing, "each letter should be taught by itself, beginning with those which are simplest in form. The great point is, to make the pupil see what the form is. This is done by comparing the various errors in form with the true form. For example, take the letter H in the print form; make a model letter on the board or show it on the tablet, and require the pupils to find it on their slate frames. They are next required to imitate it. Then proceed to illustrate the faults. Make the letter with the vertical lines too far apart, too near together, one oblique, both oblique but parallel, both oblique but not parallel, the cross line too high up, too low down, oblique. In this way every letter to be printed or written, and every figure to be drawn, should be taught. This is the short, time-saving method; more can be accomplished by it in one hour than in ten hours by merely telling the children to imitate their copy."

Use of the slate.

The alphabet is almost universally taught in America by the "phonic method." "The first day the child enters school he should commence on the elementary sounds, by hearing his teacher utter some of them, and then trying to imitate her. The *sounds* of the letters should be always taught with their *names*; and in the first steps of reading words and sentences, every word should be *spelt by sound* as well as by letters; that is, it should be analyzed, each elementary sound being uttered by itself. This course might be continued, perhaps, through the first book, and subsequently, whenever a new or difficult word is met with, it should be treated in the same way. This should be done both in the reading and spelling lessons."

Teaching the alphabet.

Great stress is laid upon making children understand the sense of what they read. "It is time worse than wasted to attempt to make pupils read with expression, when they have no distinct idea of the meaning of the words which compose the lesson. Young children should not be called on to give formal *definitions*, but the teacher should picture out the lesson by ingenious questions, illustrations, and explanations. The reading lesson should be used as a means of intellectual training and imparting information. Children must be drilled, of course, in calling words at sight, without regard to their meaning; but this is not the whole of reading—it is only a small part of it.

Reading.

"The spelling lesson should always be read aloud by the class before it is given out for study. It is best to require the pupils to read the words in turn. . . . If a child fails on a word, he should be made to spell the word *by sound*. . . . When a word occurs which is pronounced like some other word which is spelt differently, both words should be written on the black-board, and the difference in the meaning and orthography noticed.

Spelling.

"The numerical frame should be constantly used. Before the child is made to repeat the formula that 'four and three are seven,' he should be made to see that four things and three things are seven things. Much more time should be spent with concrete numbers than with abstract. . . . The first steps of addition and subtraction should be taught together, and so of multiplication and division." (*Boston Report*, 1864, pp. 106-110.)

Arithmetic.

The Providence schools have a high character for the accuracy of their spelling. One of the professors of Brown University told me that he noticed a marked superiority in this respect, in students who had been educated in the Providence schools to those educated elsewhere. There is

Spelling, in the schools of Providence.

he is considered fit to be promoted to the grammar school, and is promoted accordingly. I cannot give a better account than this of the estimate which the American system forms of the legitimate intellectual attainments of a child of eight or nine years of age. No one can say that it is extravagant or impracticable. If the statement already quoted be true, as I have no reason to doubt, of the large number of "primarians" who never reach the secondary grade, it is a standard that is, perhaps, as often missed in America as amongst ourselves, but, at least, it cannot be said that it is pitched extravagantly high.*

Primary teachers
in New York
and Boston.

It is noticed in the New York Report that a practice prevails there, which is justly reprobated as "pernicious," of "placing totally inexperienced young persons in charge of the lowest classes and youngest pupils in the primary schools."† In Boston, the importance of securing the very best teaching power for such a position is fully recognized, and the salaries of teachers in primary schools are as high as those of teachers of corresponding standing in grammar schools; and the result is, that "the teachers now engaged in these schools are generally persons of excellent education and of agreeable manners," exerting a most "happy influence over the children placed under their charge." In Boston, when the people find they have a good public servant, they are sensible enough to wish to keep him, and they make it worth his while to stay. They do not admire that wisdom which moves an officer from a situation for which he is fitted by nature and capacity, and where he is found useful and effective, to another for which he has no natural aptitude, and will very likely fail as an administrator, and call such transference a "promotion." When they have got "the right man in the right place," they like to keep him there. And so teachers' salaries being determined not so much by the rank of school as by length of service, and grammar schools being really rated no higher than primary schools, there can be no room for discontent, nor for that restlessness which is always looking out for an opportunity of bettering its condition. The maximum salary of a teacher in a Boston primary school, all being females, is \$550 per annum.‡

Boston teachers
keep their places.

Ceremonial of
opening school.

In this connexion it may not be uninteresting to describe the opening ceremonies of a New York primary school.§ The children assemble in the covered play-room on the ground floor, and, having put away their caps, bonnets, cloaks, &c., in the proper receptacles, which are very conveniently arranged, they proceed to their respective class-rooms, where their teacher, who is bound to be at her post fifteen minutes before the opening hour, is in readiness to receive them. The

a coloured intermediate school whose performances are quite wonderful in this way. Mr. Northrop, the agent of the Board of Education in Massachusetts, has mentioned in one of his reports the fact of his setting the children in this school seventy-five of the hardest words in their spelling-book, and of their being spelt without a mistake. I saw something of a similar kind myself. I don't think the phonic method is used in Providence. The ancient method by spelling-books, of trusting to the eye and memory, is preferred. Words are spelt fluently and correctly, of the meaning of which the speller has not the remotest notion. I heard a little girl of eight spell without a fault "impermeability," "stereotypography," "parallelepipedon." She was not, however, nearly so quick, when I dissected the words, in spelling "permeate," "typography," "parallel." A certain amount of mechanical process, I believe, is necessary in teaching both reading and spelling, but I thought the Providence method, though producing some marvellous results, a little *too* mechanical.

Americans not
said to be good
spellers.

In a Massachusetts report, it is noticed that children learn to spell with much greater ease from books where the words are arranged in columns than where they are thrown together, after "a comparatively recent method," in paragraphs. (*Massachusetts 28th Report*, p. 90.)

Good spelling is not said to be the forte of Americans generally. New York commissioners who examine teachers constantly report their sins against orthography.—(*N. Y. 11th Report*, pp. 300, 297.) "I find them most deficient in orthography."—(p. 291.) "They are mostly deficient in grammar and orthography."—(p. 281.) "They are most deficient in spelling and reading."—(pp. 272, 259.) School committees in Massachusetts repeat the complaint.—(See *28th Report*, pp. 127, 190.) "We find applicants for admission to the high school more deficient in spelling than in any other branch." In some places, however, improvement is noted.—(*Ibid.*, pp. 179, 213.) I had the united testimony of the professors of West Point Military Academy, that the candidates who present themselves for the admission examination, as a rule, are very ill-prepared. The examination is only in reading, ciphering, and spelling from dictation, and it is in the last two points chiefly that their deficiencies appear.

Attainments of a
primary school
in New York.

* I copy my notes of the attainments of the first class of a New York primary school, the age of the children ranging between nine and ten, all boys:—"Arithmetic, as far as long division; geography, North America, and general knowledge of the world; reading, in the Third Primary Reader—not quite so hard as an ordinary Third Reader with us; writing, on slates only; spelling, punctuation, object lessons. No history, or grammar, or composition. Dictation rarely given. The reading which I heard was loud, distinct, emphatic, and displayed a fair measure of intelligence. Arithmetical tables were not very perfectly known. In attempting to subtract 99 from 1,001, and to divide 344 by 55, a good many gave wrong answers. In finding out, mentally, how many yards there were in half a mile, very few were right. The arithmetical attainments were not high."

This may be regarded as an average primary school. It was kept in the same building with what I was told was the best boys' grammar school in the city.

† See *N. Y. Report for 1864*, p. 74.

‡ *Boston Report for 1864*, p. 23.

Why a New
York instance
is chosen.

§ There is no objection to taking the finest specimen to illustrate a subject; and certainly the "ceremonial," so to call it, of the New York schools, is grander and more complete than what I saw anywhere else. No doubt something is sacrificed to it. The proportions required for an assembling room which will seat from 500 to 1,500 children at once, and which is comparatively little used for other purposes, necessarily crib and confine the dimensions of the class rooms, which are generally too crowded and too small. An average Boston class room would be four times the size.

The ceremony of opening a grammar or high school does not essentially differ from that of a primary, except that the musical exercises would ordinarily be followed by the recitation of an essay, or a declamation. In the higher grades, too, there would be less of the pantomimic element.

Principal of the school, meanwhile, is on her raised dais in the assembly or reception room, an apartment probably of 70 feet x 50 feet, from which she can communicate by bells with each class-room. Upon the given signal from her, the classes, headed each by its teacher, march in order from their respective rooms, and take their places in the assembling hall. Boys enter by one door, girls by another; and the two sexes occupy opposite sides of the room. They march with a light, elastic step, their heels hardly touching the ground, to avoid noise, to a suitable inspiring air, played on the piano by one of the mistresses. When all are in their places, the music ceases and a perfect silence ensues, broken after a moment's pause by the Principal's simple salutation, "Good morning, children," to which is made a corresponding reply. The Principal then reads a portion of Scripture, which is listened to with marked attention.* A few chords are struck on the piano, and the children rise with a stamp, by a perfectly simultaneous movement. The Lord's Prayer is then said, the children repeating the words after the mistress. Then comes a hymn, accompanied by the piano. Then, after a pause, perhaps will follow some secular songs of a patriotic or else of a humorous kind, the latter affording scope, occasionally, to dramatic or mimetic accompaniments.† Last of all, is introduced a drill or calisthenic exercise, to which one of the teachers, or else a child called out of the mass and placed on the platform facing the rest, gives the cue. The precision, simultaneity, rapidity, energy, with which all this is done, are wonderful;‡ and music plays as important a part in the whole performance as it probably did in an old Greek school. The opening exercises concluded, which have occupied, perhaps, twenty minutes, unless some one has been present who has been called upon to make a speech, which would prolong the ceremony proportionably, according to the amount of good counsel given or of twaddle talked, the children are marched back again, in the same order in which they came, to their class-rooms, and the real teaching work of the day begins.

The grammar school, though not in all places known by that name, is the grade which normally succeeds the primary. It includes children of both sexes, sometimes mixed and sometimes separate, whose ages range from eight to seventeen.§ By far the largest proportion of scholars who are admitted to the grammar schools never pass beyond this grade—probably not one in twenty is promoted to the high

The grammar school.

* Such, at least, was the case whenever I had the opportunity of observing. I cannot, however, attach much importance to the exercise as a means of stimulating or deepening religious impressions, or of imparting religious knowledge. The Scriptures are read in too desultory a way for that—to-day a psalm; to-morrow, a passage from the Gospels; the day after, a fragment of a prophet, or of an Old Testament historical narrative. If a trustee or other school officer, or even a casual visitor be present, very probably he will be asked to read. I ventured sometimes to suggest whether it might not be advantageous, as it certainly would be possible, to make this Bible-reading more profitable, by giving it either an historical or a doctrinal continuity—by using it to develop either the Christian story, or the Christian faith, or the Christian life. But I am afraid the dread of the taint of sectarianism—the *déte noire* of American schools—would prevent that.

Religious exercises at opening school.

It is the rule of the New York Board of Education that all its public schools "shall be opened by the reading of a portion of the Holy Scriptures, without note or comment." The rule is generally observed; but in some of the districts where Roman Catholic influences are paramount, objections have been taken, nominally to the use of our "authorized version," and the consequence is, that in a few schools so situated Scripture reading is abandoned.

There is, I believe, no rule about prayer in New York; but in Boston, the regulation is that the "reading of Scripture is to be followed by the Lord's Prayer, repeated by the teacher alone." In one New York school—a coloured school—I heard the Lord's Prayer chanted, and in the same school they sang Jackson's "Te Deum." In the Newhaven High School the master used an extempore prayer, simple, earnest, unsectarian, but with a distinct reference to the fundamental verities of the Christian scheme. The really devotional part of these opening exercises seemed to me to lie in the hymn-singing, which, in some instances—though the "timbre" of the American voice is somewhat metallic—was very beautiful and touching.

† Coloured children excel in these. In one of the coloured schools in New York I got a very hearty laugh out of a dramatic scene in verse, acted with great humour and perfect "abandon," by a boy and girl, each about ten years old. The general estimate formed of the capacity of coloured children is, that they have retentive memories and great quickness up to a certain point; but beyond that, they cannot be got to go.

Coloured children.

‡ The manipulatory exercises are, some of them, quite beautiful. Miss Myers' 1,400 "primarians" seemed literally "*micare digitis*," so rapid and glancing were the movements of their little hands. I may add, that scrupulous personal cleanliness is a virtue as of Americans generally, so of American school children. Even those whose attire, as I mentioned some pages back, often consisted of nothing more than a shirt and a pair of trowsers, had clean hands and faces, and looked perfectly sweet and wholesome. In schools of a higher grade, and in better localities, I could not help thinking sometimes that the toilettes of the young ladies must have occupied rather too much of their time, and might possibly have the effect of keeping the children of some of their humbler neighbours out of the school. For as in America—to use the very words of my informant—"one man thinks himself pretty much as good as another," so one man, and still more perhaps one woman, does not like to be reminded by any marked contrast of dress and outward circumstances, that in spite of the theoretic equality there is still a practical difference.

Personal cleanliness.

§ "The grammar schools of Boston are for the instruction of pupils of the ages of from eight to fourteen or fifteen years." (*Boston Report*, 1864, p. 18.) In New York I found numbers of scholars in the grammar schools ranging in age from fifteen to seventeen. In Boston, the statistical tables shew that there were in 1864, in attendance at the grammar schools, 11,347 scholars between eight and fifteen, and 811 over fifteen. In the Report of the Committee of the Boston Girls' High School, it is remarked that "another year in a good grammar school would give them knowledge and discipline that will make their studies here easier and more beneficial" (p. 82), and the present age of admission to the Girls' High School is not under fifteen, nor over nineteen.

Age of pupils

The complaint is sometimes heard that the grammar school is viewed and treated too much as though it was merely a stepping-stone to the high school, instead of as a school with a work of its own—that work being to give "thorough and complete instruction in those important studies which are absolutely essential in the management of practical affairs, and which form the basis of all true education." (*Charleston, Mass., Committee, 28th Report*, p. 54.)

school;* so that, for the mass of children, the education offered and received in the grammar school is the maximum attainable. The programme of this education is considerably more ambitious in New York than it is in Boston, but in neither city did it seem to me to rank higher or to produce more solid and practical results than the system applied with so much success by the present Dean of Hereford to his well-known school at King's Somborne.

Course of instruction.

The Boston course is laid out for four classes, the New York course for six, to which in some schools there are appended two supplementary grades for girls. The Boston course comprises simply ten subjects,—spelling, reading, writing, arithmetic with book-keeping, geography, English grammar (including exercises in composition and the analysis of sentences), history of the United States, natural philosophy, drawing, and vocal music.† The New York course adds to this list algebra and astronomy; and, in the supplementary grades, geometry, ancient and modern history, rhetoric, Latin, and French or German.‡ In Boston, the spirit of emulation is maintained by the annual public distribution, on what is called exhibition day, of medals and certificates of merit in the schools, at the rate of one of each to every sixty scholars.§ In New York, those who pass a thorough examination in the studies prescribed for the supplementary course are entitled to a certificate of graduation.||

Teachers.

The teachers in these schools, numerically considered, are chiefly females. Even in a boys' grammar school at New York there would probably be twice as many female teachers employed as males, the lower classes being confided to their care: in a boys' grammar school at Boston there would be a male master, sub-master, and usher, while all the other teachers would be of the other sex. In grammar schools for girls, all the teachers in New York would be females; in Boston, the Principal would be a male. The deference which a woman everywhere commands in America appears thoroughly to penetrate the schools; and I believe these grammar school mistresses, many of whom are very young, find no difficulty in enforcing discipline or maintaining order.

Comparison of Boston and New York grammar schools.

If I must undertake the invidious task of drawing comparisons, I must say that I decidedly prefer the system pursued in the Boston grammar schools to that pursued in those of New York, simply on the ground that the programme being more limited, allows of the teaching being more thorough. In New York, too often the text book seemed to supersede the teacher, and the memory to be more cultivated than the understanding; and, as is usual in such cases, the memory, exercised apart from the reasoning powers, was incapable of retaining for long the stores of knowledge it had acquired. Subjects supposed to be mastered in a lower class are dropped in the higher—"crowded out," as the phrase is; and, if inquired after, are found to be forgotten.¶ The rivalry of large and rapid promotions from a lower to a higher grade—"before all the studies of the grade from which promotions are made are thoroughly completed and reviewed,"** thus leaving a weak link in the chain ever after—is mischievous everywhere; but the mischief seemed to me to be more under control at Boston than elsewhere. The habit of answering questions so rapidly as almost to preclude the possibility of reflection, which is too generally encouraged in American schools as a sign of smartness, is wisely mistrusted by Boston educators.††

Proportion who pass in high school.

* At Boston, in 1864, the average attendance at the grammar schools was 12,601; the average attendance at the high schools was 691. The number of boys admitted that year to the Latin High School was only 57; to the English High School, including those admitted on trial, 138. In New York, in a grammar school of 850 boys, said to be the best in the city, I found a class of 55—an unusually large proportion—preparing for the examination of the Free Academy. Similar results are attained by comparing the number of scholars in the several classes of the grammar schools themselves. Thus at Boston, on July 31, 1864, there were 4,389 in the fourth or lowest class, 3,317 in the third, 2,499 in the second, 1,854 in the first.

† See *Boston Regulations*, ch. x., s. 9.

§ *Boston Regulations*, ch. iv., s. 17.

|| *N. Y. Manual*, p. 128.

Memory too exclusively cultivated.

¶ In a New York grammar school which I visited in company with the Superintendent, it was assumed that the first class were acquainted with the subject of astronomy, which they had studied in the class below, a month or two previously. Upon examination, however, it was discovered that they had forgotten even the most elementary phenomena and principles. Mr. Randall informed me that he constantly found that pupils of the Free Academy, who had perhaps studied there for three years, but did not complete their course, and then came to him to be examined for a certificate as teachers, would have entirely forgotten almost all their grammar school studies, their geography, astronomy, &c. Mr. Assistant Superintendent Kiddle notices the "servile adherence to text books, which banishes both activity and independence of thought." (*N. Y. Report*, p. 46.) Mr. Philbrick remarks—"Another fruitful source of overdoing arises from the erroneous notion that thoroughness in a branch requires the text book on the subject to be committed to memory bodily; and this error not only produces over-working, but is also the parent of the 'cramming system' of teaching, which stuffs the memory with words, words, words, soon to be forgotten. If this is the true method, then we do not need teachers of skill—we only need persons to hear recitations and assign tasks." (*Boston Report for 1864*, p. 142.)

** *Mr. Randall*, in *N. Y. 11th Report*, p. 10.

Effects of habit of rapid answering.

†† "I think very rapid recitation in any branch should not be encouraged, and least of all," where it seemed to me to be most encouraged, "in the analysis of difficult problems in arithmetic. Stammering, and a confused, disagreeable, and indistinct utterance, are the result of excessive rapidity in recitation." (*Mr. Philbrick*, in *Boston Report for 1864*, p. 142.)

A still more mischievous result, in my opinion, and one that I could distinctly trace in many schools, is, the hap-hazard style of answer, as likely to be wrong as right, which may always be expected from a mechanical process hastily performed and imperfectly understood. I was particularly struck with this in a *vivâ voce* examination in arithmetic of some female candidates for admission to the normal department of the high school, which I heard at Chicago. The questions were very simple; the answers frequently were very wild.

I have before me the notes which I took in a visit to one of the best New York boys' grammar schools, which will serve as a specimen, and will illustrate the standard aimed at, or rather the standard attained, better than any general remarks could do. It was a school of 450 boys divided into eleven classes, under a Principal who had been for many years at its head, five male and six female teachers. The Principal does not teach, but exercises general superintendence, and takes special oversight of the moral training and discipline. Corporal punishment is employed, when necessary, in the shape of caning on the hand. The first class consisted of twenty-six, varying in age from thirteen to seventeen. The subjects they were studying, the time devoted to each, and the points to which they had advanced, were—arithmetic, as far as compound proportion, four lessons a week of an hour each; algebra, as far as surds, three lessons a week of an hour; English grammar, including analysis of sentences, four exercises a week of half an hour; history of the United States (no general history), two lessons a week of half an hour; geography (not including use of the globes), two lessons a week of half an hour; drawing, one hour and a half; German, one hour and three-quarters a week; reading, composition, book-keeping. This class were not taught Latin, or French, or geometry, or astronomy; and the German lessons, I was told, were worth very little, the teacher owing his appointment to political influences, and taking no interest in his work.

Specimen of a New York grammar school.

Americans are hardly ever satisfied with things as they are—not from a mere idle love of change, but from a sincere belief in the possibilities of improvement; and I find that those who have the oversight of these grammar schools, both in New York and Boston, are not content with their condition, or disposed to condone their deficiencies. Mr. Philbrick detects at Boston too great a difference between the progress of the upper and that of the lower grades; and though the evil has been partly remedied by stricter and more regular examinations on the part of the Principal, suggests—or rather suggested in 1864 what, unless I misunderstood things, I found adopted in 1865—a permanent modification of the organization of the schools, which would assimilate the Boston system to that which is found to work so successfully in New York.* Mr. Randall, of New York, complains of the absence of “general intelligence”—a want of acquaintance with “subjects; in relation to which every well-informed young man is presumed to be familiar”—which is tolerated under the present system; † and, in particular, doubts whether

Changes suggested in the grammar schools.

* “The present organization of our grammar schools is comparatively new, having been commenced only about seventeen years ago. This change was by far the most radical and important which has ever been in our system of education. It was really revolutionary in its character. It has now had sufficient time to mature and to develop its capabilities and defects. As to its success, on the whole, I believe the most competent judges fully agree. But it is not perfect. It has its limitations and disadvantages. The movement was made in the right direction, but, as is too often the case in attempting reforms, it went too far in some respects. Under the old system, each master had all the pupils of his school and all his assistants in the same room with himself, and the pupils had to be promoted but two or three times before reaching the class taught by himself. Twenty-five years ago, the average number of pupils under the care of a master was 217, and in boys' schools the number of male teachers was double that of female. All this has been changed. In the schools for boys, the number of male teachers is to that of female in the ratio of one to four. Each master has, on an average, under his care 675 pupils, or more than three times as many as a master averaged twenty-five years ago. These pupils are distributed with their teachers into from ten to eighteen separate rooms, where they remain most of the time out of the sight of the master, who is occupied with his own class in his own room. This plan is attended with some disadvantages which deserve consideration. . . . In the present system there is too great difference between the excellence of the upper division, or the two or three highest, and the lower grades. The evil has latterly been to some extent remedied by the systematic examination which most of the masters have given to all the divisions of their schools, but I am fully satisfied that it demands a more effectual remedy. My plan is very simple, and it involves no additional expense. In each school for boys, let the sub-master take what is now the master's class, the usher take the sub-master's, and the head-assistant take the usher's; thus leaving the master free to divide his time among all the rooms, and manage the general affairs of the school. In the girls' schools, the only change required would be for the masters to give up the instruction of their first division to their head-assistants. . . . Much of the master's work now in the upper class consists in correcting errors and supplying defects, which, under the proposed arrangement, he would be able to prevent in the lower divisions. Then let the masters have the same jurisdiction over the primary schools in their respective districts which they have over the grammar schools. Each master thus becomes the real Principal of all the schools in his district.” (*Boston Report for 1864*, pp. 143–145.)

Mr. Philbrick's suggestion of reform.

“Old things and new.”

I believe that these recommendations have been adopted, and that the so-amended plan is now at work in Boston. I cannot see, however, how it can have been carried out without “involving any additional expense,” unless at the same time that the master gave up his class to the sub-master, the whole classification of the school was altered; for otherwise, the plan seems to “involve” the employment of an additional teacher.

† “With the exception here indicated, the course of study for boys in the grammar schools and Free Academy appears to combine most of the essential requisites of a sound and comprehensive education. If deficient in any respect, that deficiency may be found in the absence of a sufficiently thorough exposition of the peculiar frame of government under which we live, including an intimate and familiar knowledge of the Constitution of the United States, of our own State, and of the distinctive features of those of the other States in which they (especially differ from our own.” (*Mr. Randall, in N. Y. Report for 1864*, p. 20.)

Deficiency in knowledge of constitutional history.

The School Commissioner of Rhode Island, whose report contains much solid sense, almost lost sometimes amid its gorgeous rhetoric, complains of the same deficiency, and reports that there is no really complete text book of constitutional law. “I should rejoice,” he says, “to see a carefully prepared class-book, adapted for use in all our schools, embracing the Constitution of the United States, with comments illustrating its genius and spirit, and the elements of constitutional law and of our civil system growing out of it. It should include also a popular compend of those much-neglected, but very important, Madison papers. Such a work, made simple and arranged for the study of the youthful mind, would be an addition to our list of school books which I am sure would receive the hearty approbation of every right-minded man. I do not forget that we have already several valuable text books of this character, but I know of none fully adapted for use in our common schools.” (*19th R. J. Report*, pp. 31–32.)

the education provided for girls is "adapted to the requirements of their future life"; and, more particularly still, regrets the universal disappearance of "plain and ornamental needle-work" from the programme of girls' grammar schools.*

High schools.

The culminating grade of the American common-school system is the high school, the object of which, as contemplated by the Massachusetts legislators of 1647, was "to instruct youth so far as they may be fitted for the university," and which, though that is no longer its professed object, still to some extent discharges that function at the present day. The Free Academy of New York, which is the high school in the system of that city, and the high school of Philadelphia, are the only ones, so far as I am aware, which seem to exclude the idea of their students proceeding to a university, by themselves granting the degrees of Bachelor of Arts, Bachelor of Sciences, and Master of Arts; but all high schools confer upon those who complete their prescribed course the title of "graduates," and most bestow on them a diploma.

Mr. Randall on the want of practical utility in the education of girls.

* I will quote his very words:—"In the grammar schools for girls, it may admit of some question whether the growing demand for a practical education, adapted specially to the requirements of future life, is as fully and satisfactorily met as in those of the other sex. No difference whatever in the purely mathematical course, which occupies so large a portion of the course prescribed for both, is recognized. And yet it will scarcely be pretended by any one, that the same, or anything like the same, necessity for a thorough knowledge of higher arithmetic, algebra, and geometry, exists for the practical requirements of after-life in the one case as in the other. Except as a mere mental discipline, a very large portion of the scholarship thus communicated is wholly unavailable for any useful purpose in the ordinary transactions and duties pertaining to the sphere of womanhood; and for mental discipline, other studies of far greater practical utility, such as logic and intellectual and moral philosophy, might easily be substituted. As *accomplishments*, every branch of literature and science might be pursued to the utmost practicable extent, in institutions specially designed for that purpose; but whether it is expedient to make them necessary portions of the ordinary grammar-school course, to the extent at present required, may, to say the least, be regarded as problematical. In this connexion, it may be appropriate to refer to the almost universal abandonment of plain and ornamental needlework, which formerly constituted so prominent a feature in our female departments, and which is still recognized as an indispensable element in similar schools in other cities. In conjunction with modern improvements in this most appropriate and graceful department of female industry and skill, it can scarcely admit of a question that the reintroduction of this element would materially add to the practical utility of this class of schools." (*N. Y. Report for 1864*, pp. 20-21.)

Needlework in Newhaven,

In Newhaven, I was told, there are two public schools in which needlework is taught to the girls, between 11 and 12 o'clock daily, by some benevolent lady visitors, but a difficulty was felt about introducing it as a general feature of the system. It would lower the character of the school in the eyes of parents—they would come to regard it as a pauper school. Miss Mary Hillhouse, of Newhaven, a lady "of more than fourscore years," representing old ideas as well as an old historic family, and universally respected for her high character and strong common sense, regards this exclusion of industrial work, and the neglect of moral and religious training, as the two capital defects of the American system.

in Boston.

At Boston—the home of practical ideas in this matter of education, by the regulations of the School Committee, "plain sewing may be introduced into any primary school at the discretion of the sub-committee," and twelve sewing teachers are employed in as many grammar schools, at salaries varying from \$225 to \$450 per annum, who spend respectively 10, 12, 16, 20, and in one case 23 hours a week in the schools, giving instruction in that subject. In the school to which the largest amount of time is devoted, and which is attended chiefly by scholars of foreign parentage, the results are described as excellent. "The instruction," say the committee, "in sewing, given in the Bowditch school, is probably of as great practical value to the pupils as anything else taught there. Perhaps nine-tenths of the pupils would receive it in no other way, and it becomes absolutely indispensable that it be given to every individual child; while in some schools, a little supervision by the sewing mistress is all that is required. . . . It has been found that, notwithstanding our sewing teacher is employed for the largest period allowed by the regulations, it has been impossible for her to give the instruction needed." (*Boston Report*, 1864, pp. 21-22.)

Unpractical character of much of the education.

At the risk of being wearisome, I must make one more extract bearing upon this whole subject, and then pass on. "The average time," says the Superintendent of schools of New Bedford, Mass., "spent in completing the course of study in the grammar schools is a little more than three years, a very considerable portion of which is spent in memorizing the endless details of geography, whose prominent facts are all that have any real value; the unimportant events of history, including the time when this or that insignificant person was born and died; the time when a multitude of battles was fought, the number of killed and wounded, and much other equally frivolous matter; and the intricacies of grammatical analysis—all which, learned with so much difficulty, and of really no value when learned, very soon passes from the memory after entering upon active life. Are we realizing the best and most desirable results of true education, when we send forth from our schools so large a proportion of those so *educated* in them—if such a term can be allowed—that they can solve simple arithmetical problems so as to reach the result indicated in the printed answer of their book; but imperfectly (if at all) comprehending the principles which underlie the solution, and without which the process is simply mechanical; capable of repeating in most ungrammatical sentences such principles of grammar as their memories can retain; often with a chirography such as the great Roman historian said 'should be reckoned among the unpardonable sins'; and with such habits of reading, so devoid of correct emphasis and appropriate expression, as to make the inquiry of old a very pertinent one—'Understandest thou what thou readest?' Might not a portion of the valuable time now almost wasted in ways indicated above be far more profitably employed if devoted to some subjects of really practical value? Is not a knowledge of book-keeping, in its simplest forms, sufficient, however, to enable these future mechanics and operatives, it may be, to keep their own accounts and make out their bills for services rendered, without feeling ashamed of them, or depending upon others for this, of more importance to them than at least one-half of what is so painfully committed to memory in some bulky geography or history? Is not the ability to express one's thoughts correctly in good plain English, either in epistolary correspondence or in any form of writing, which might be acquired by devoting a portion of the time to compositions or letter-writing, of more value than much of the unintelligible jargon of analysis so glibly repeated after months of wearisome study? Does not many a young man wish that he had the confidence to stand up before his fellow-men in public assemblies when occasions demand it, which he might have acquired in his school-days, if the practice of declamation had been allowed to occupy a small portion of the time which an occasional omission of some less important exercises might have secured?" (*Massachusetts 28th Report*, pp. 193-4.) A somewhat overcoloured description, perhaps, but yet containing some important matter for reflection.

The course of study pursued in these schools is not dictated by the requirements of any particular university, in anything like the same sense in which (for instance) at New York, the course of so many boys' grammar schools is modified and influenced by the requirements of the Free Academy. In Newhaven I did not discover that the requirements of Yale College, though they were paramount in their influence upon the studies pursued at Hopkins' Endowed Grammar School, bore with any perceptible effect upon the studies pursued in the high school. At Cambridge, Mass., whose institutions might, from their proximity, be supposed to be affected by the influences radiating from Harvard University, and which, perhaps, once were affected, the School Committee plead for the plan of study laid down for the high-school course, that, whatever may be thought of its judiciousness, it can at least "no longer be said that it is made subordinate to the college course." It is meant to "embrace no more than it is desirable for all children to study whose worldly circumstances permit them to remain at school the necessary time."* The high school *does*—or at least, when the classical course is taken, it does—fit for admission to the university;† but it is also meant to be complete in itself. Its object is "to give a good elementary education in the usual English studies," as well as "to prepare young men for college, by affording them the best and most thorough training in the elements of the Latin and Greek languages."‡

The high school course not directly relevant to the university.

There is somewhat of a dislocation in the sequence which normally prevails between the different grades of the American school system, in the relations between a grammar school and a classical high school. It is decidedly recommended at Boston, on grounds already quoted, that a boy should be sent to the Latin school at an early age, and not be kept at the grammar school to complete the course there before being put to the study of Latin.§ In Newhaven, again, the high school has a preparatory department of its own, in which I found about forty children, whose parents design them for occupations in which some knowledge of Latin is necessary, but have no intention of sending them to college, and who, but for this circumstance, would still be on the register of a grammar school. Indeed, even so, the age at which the study of Latin is ordinarily commenced is so late, and the age at which the study of Greek is commenced so much later, and the languages, both modern and ancient are, unfortunately, so liable to get "crowded out" by other subjects, it is thought, of more pressing necessity, that, in spite of a wide and growing sense of their value, the classical authors receive no fair share of attention, nor are cultivated with any remunerative amount of success, under the present American system. We in England, at any rate, whatever else it may be profitable to us to learn from American schools, have nothing to learn from the way in which they teach Latin and Greek. Still, it may be worth while to know what that way actually is, and what are the opinions on the subject that generally prevail.

Dislocation between the grammar school and the classical high school.

Latin and Greek commenced late.

"In the organization of high schools," says Mr. Wells, in his extremely useful little treatise on graded schools, "three different forms have been adopted by different cities and towns:—

Three forms of high school organization.

"A. That which embraces a general course and a classical course in the same school, the parents or guardians of the pupils being allowed to elect between the two courses.

"B. A division into two distinct schools—an English high school and a classical school—each independent of the other.

"C. A union of the two courses in one classical and English school, in which all the pupils are required to study both the English branches and the classics.

"The first of these forms is illustrated by the high schools at Chicago and St. Louis, and the Free Academy at New York; the second form is illustrated by the high schools of Boston; the third form is illustrated by the high schools of Cincinnati,|| and Philadelphia.

The course of study in a high school generally occupies four years, each divided into two terms; but in the New York Free Academy the full course is extended through five years, and in the Boston Latin High School the ordinary period is six

Their course of study

* *Massachusetts 28th Report*, p. 52.

† In half a century, the Boston Latin High School has fitted 675 students for the university, or an average of nearly fourteen a year. The present Master, who has been at the head of the institution for thirteen years, has in that time fitted 252, or nearly twenty a year; the admissions meanwhile being at the rate of about eighty a year, and the whole number of students in August, 1864, being 220.

‡ *Report of Committee of Boston Latin High School*, 1864, p. 62.

§ *Boston Report for 1864*, p. 145.

|| *Wells on Graded Schools*, p. 120. Some high schools, *ex. gr.*, the Free Academy at New York, allow of what is called a "partial course," which embraces any studies less than either of the full courses, and has for its object the fitting young men for certain special future careers. The "partial course" may either extend over the whole period of time occupied by the "full course," or be limited to a certain portion of it: this would be determined by the special circumstances of the student.

Full and partial courses.

The Philadelphia authorities approve neither of "elective studies," nor of "partial courses," having an eye to the proper functions, as they conceive them, of a high school. "The high school," they say, "is a public institution subject to the scrutiny and criticism of every citizen; and those having its interests in charge must adopt such a course of study as will meet the wants of every relation in life—such as will develop the man in all his mental powers. If, in their deliberate opinion, there is any branch of study which may be deemed superfluous, whose function is performed by others, let it be abandoned, rather than resort to elective studies or partial courses, which enlarge to an unhealthy measure one faculty, whilst dwarfing others given by Providence for cultivation and use." (*Controller's Report for 1864*, p. 230.)

rarely completed years, while in the Girls' High School, in the same city, it is reduced to three.* A very small proportion, however, of those who commence the course, complete it. They fall out at various stages; some, because an opportunity occurs for getting out in life; others, because they fail at one or other of the periodic examinations for advancement. This fact is strikingly illustrated by the statistics of the Philadelphia Central High School, which justly enjoys the reputation of being inferior to none in the country. It appears that, from the first organization of the school, in October, 1838, to the year 1864, the whole number of those who have left is 5,272. Of these, 2,660 left before the expiration of two years of their course; 1,751 attended the school for a period of more than two years but less than four; 861 completed the full course.†

Case of the Boston English High School.

In Mr. Philbrick's perspicuous Report of the English High School at Boston—a school which I should have liked, if possible, to put under a glass case and bring to England for exhibition, as a type of a thoroughly useful middle-class school—there is an estimate that the grammar schools of the city ought to send to this high school each year not less than 150 pupils; and some calculations are made upon the hypothesis that of this number, fifty would probably leave at the end of the first year, fifty at the end of the second year, and fifty would remain to complete the course.‡ Of course it is obvious that the mass of students can derive but little benefit from the partial attendance upon a course of study the idea of which is only complete when it is pursued to the end.§ Indeed, it is asserted that many students seek admission to the high schools just for the name of the thing, "even though they have no intention of remaining, and have made up their minds to engage in some trade or business within a few months of their admission."|| It does not admit of a doubt that these young people would have consulted their own interests better had they remained those "few months" longer in the grammar school.

Examination for admission.

Universally, pupils are only admitted to the high school after a thorough and searching examination,—“within limits,” however, and “in the subjects of their text books,”—held twice a year, conducted by the Principal and teachers of the high school, under the supervision of the Committee, with a view to perfect impartiality; the reputation of the grammar schools being supposed to depend in public estimation upon the number of candidates whom they succeed in passing. Candidates for admission are designated by numbers merely, and neither their names nor the schools from which they come are made known to the examiners. The subjects of examination for admission do not vary widely in the different high schools, and those adopted at Boston may be accepted as a sample. For admission to the English High School—the average age of those admitted in 1864 being 15.38 years—a satisfactory examination is required to be passed in spelling, reading, writing, English grammar, arithmetic, modern geography, and the history of the

Boston four years' course.

* In the English High School for boys at Boston, the course is laid down for three years; but “those who wish to pursue further some of the higher departments of mathematics and other branches have the privilege of remaining another year at the school.” It is specially ordered that “no one shall remain a member of the school longer than four years.” (*Regulations*, ch. xi., s. 1, 5.)

Example from Philadelphia.

† *Report of Philadelphia Controllers for 1864*, p. 279. The following table illustrates the same fact as exhibited in a single term. It should be remarked, that the full course consists of eight terms, and the classes are indicated by the letters of the alphabet, from A, the senior, to H.

Classes.	A.	B.	C.	D.	E.	F.	G.	H.	Total.
Whole number at beginning of 52nd term, Feb. 15, 1864	19	24	23	31	53	83	136	138	507
Left during the term or at its close...	19	0	1	7	24	21	46	9	127

The 19 in class A constitute the graduating class, who were admitted to the degree of B.A. So that a class which enters 120 or 130 strong, dwindles in the course of four years to about 20, and the proportion of those who complete their course to those who withdraw is about one to six. It will be noticed that the withdrawals are most numerous in the early stages of the course, especially in the second term. The phenomenon may be accounted for by the following rule of the committee of management:—“Resolved, that any pupil of division H, failing to attain, during the first month of the next term, an average of fifty marks, shall be dropped from the list of students, and returned to the school from which he was sent.” At the close of the second year of the course, those who have attained the special and general averages required by the rules are entitled to a certificate, testifying to their having so far satisfactorily pursued the studies of the school. This will account for the number of withdrawals in division E. All the students beyond that stage probably intend, unless prevented by some unforeseen accident, to remain at the school and graduate.

Figures of the English High School, Boston.

‡ *Boston Report for 1864*, p. 183. The actual figures of 1864 were:—Number admitted clear, 110; admitted on trial, 28; total of admissions, 138; whole number belonging, 179; graduated, 17. It is noticed that “the graduating class was below the average of the last ten years. The special demand for young men, growing out of the present condition of the country, induced many to leave at the close of the second year of their course—some, to take clerkships in stores, and several to enter the Army.” (*Ibid.*, p. 72.)

Small benefit in incomplete courses.

§ “To derive much benefit from the high-school course, the pupils should remain three years. No plan can be contrived by which those who want only one or two years' higher education can study those branches which would be most useful to them, unless we sacrifice those who seek a more thorough training.” (*Cambridge School Committee, in Massachusetts 28th Report*, p. 52.)

|| *Charleston School Committee, ibid.*, p. 54.

United States.* For admission to the Latin High School—the minimum age of admission being ten, the average age of those admitted in 1864 being 12.80 years—a candidate must be able “to read English correctly and fluently, to spell all words of common occurrence, to write a running hand, understand mental arithmetic and the simple rules of written arithmetic, and be able to answer the most important questions in geography, and have a sufficient knowledge of English grammar to parse common sentences in prose.”†

In New York there is an organic connexion between the grammar schools and the Free Academy, nor is any candidate admissible for examination unless he has attended the common schools of the city for twelve months; and in case of the number qualified for admission exceeding the capacity of the institution to receive them, preference is given to those who have attended the common schools the longer time.‡ In Boston, though the privileges of the high schools, as places of free education, are limited to residents in the city, the connexion with the grammar schools is looser, and though most of the students are drawn from them, not a few are derived from other sources.§ The Free Academy at New York and the Central High School at Philadelphia appear to aspire to a higher rank, and to play a more distinguished part in the work of education than schools similarly related to the general system in other cities. They grant degrees; their teachers are dignified with the title of “Professor”; the Free Academy possesses a “Faculty.” It is not contemplated, I imagine, that students who graduate there should either need or seek further development, other than special, elsewhere. The function of the high schools at Boston (I speak now of those for boys only) is strictly preparatory; they are schools only, not special schools even, but schools of secondary instruction,|| in one of which—the Latin High School—boys are fitted for college; in the other, the English School, a collegiate course not being in view, pupils are furnished with the means “of completing a good English education, and fitting themselves for all the departments of commercial life.”

Connexion between high and grammar schools more or less strict.

Function of Boston high schools.

Such, at least, is the present aim of the English school, in default of any higher institution of special instruction to which it would naturally lead; but it is hoped that the sphere of its usefulness will be greatly enlarged, though its nominal functions will be contracted, by the establishment in Boston of the Massachusetts Institute of Technology, in which provision has been made for a special department to be called the “School of Industrial Science and Art,” which will stand to the English High School in a similar relation to that in which the university stands to the Latin school. The Latin school is related to the department of philosophy and *belles lettres*; the English school is a handmaid in the department of practical science and art. The one is to furnish the Commonwealth with its statesmen, physicians, lawyers, divines, *littérateurs*; the other is to supply it with capable men in the various fields of manufacturing, agricultural, and commercial industry.

The Institute of Technology at Boston.

The teachers in the two Boston schools of which we are speaking are required to have been “educated at some respectable college of good standing”—an indefinite phrase, but of which I suppose there exists a definite practical interpretation—and, in the case of those employed in the English school, they must be competent to instruct in the French language. I do not observe any similar requirement in the regulations laid down for the government of the New York Free Academy, at least as regards “professors;” but it is ordered that “when vacancies occur in the corps of tutors, “preference shall be given to the highest two on the merit roll of

Qualifications of teachers, &c.

* The New York Free Academy requires, in addition, a knowledge of elementary book-keeping, and of algebra as far as quadratic equations, inclusive.

† *Boston Regulations*, ch. xiii., s. 5.

‡ *New York Manual*, s. 137, 138, p. 147.

§ In 1864, the number of pupils admitted to the Latin High School was ninety-one, “of Practice at whom, fifty-seven, with an average of 12½ years, were received from the public schools of the city, and thirty-four, whose ages averaged 13½ years, were from other sources.” (*Boston Report*, 1864, p. 68.) In the girls’ high school, if there happen to be any vacant places, non-resident students are admitted on payment of tuition fees, which amount to about \$45 (the sum varies a little) a year. In 1864, there were twenty-two such students out of a whole number registered of 352. (*Ibid.*, p. 83.) The rule of admission at Philadelphia is as peremptory as at New York. Rule at Philadelphia. “No pupil shall be a candidate for admission to the high schools who shall not have been enrolled and in actual attendance at one of the public schools at least for one year previous to application; and no pupil is to be received into any of the schools of the district who is not *bond fide* domiciled therein.” (*Controllers’ 46th Report*, p. 323.)

|| “Secondary instruction occupies the intermediate place between elementary and superior Schools of instruction, following those branches which are instrumental and preparatory, to the pursuit of knowledge, and preceding the special studies which bear more or less upon the occupation of the individual in future life. This department is of two kinds, corresponding with the two divisions of superior education,—first, as preparatory to the universities or special schools in which students are educated for the professions usually designated as learned; and, second, as preparatory to the polytechnic institutions or special schools in which students are trained for the higher practical occupations which are rising rapidly into, or have taken their place in, the rank of the learned professions. Secondary education of the first kind is commenced in our Latin school, and completed in the college. This is the course for the student who is destined to the profession of law, medicine, or divinity, or who aspires to the highest grade of intellectual culture as a scholar and man of letters. The other branch of secondary education is provided for in our English High School. The course here is adapted to the wants of students who are destined to commercial occupations, or those industrial professions which require a systematic training in applied science, including a thorough knowledge of scientific laws and principles, and a large general cultivation, united with habits of close observation and exact reasoning. While it affords a good practical education of itself, it furnishes at the same time the necessary preparation for the highest special instruction which is requisite for the analytical and practical chemist, the builder and architect, the mining, civil, and mechanical engineer, the geologist, the astronomer, the naturalist, and the man of scientific culture.” (*Boston Report for 1864*, p. 176.)

the academy, provided they have sufficient qualifications for such appointment."* The universally recognized ratio of teachers to students in the high schools appears to be as one to thirty-five. The normal school-day is five or six hours, either continuous or divided; † of which, perhaps, half the time is spent in recitation and half in study. ‡ The vacations would be six or seven weeks in summer, from the middle of July to the first week in September, a week at Christmas, and in New York a week also in the spring. Saturday in each school week is generally a whole holiday, and certain days of national significance—July 4th, Washington's Birth-day, Thanksgiving Day, and a few more, are similarly observed. In Boston, holidays seem to be dealt out in more liberal measure than elsewhere, § and the schoolday is an hour shorter than in New York.

Rules of the New York Free Academy,

It may be well to give a brief abstract of the chief rules laid down by the New York Board of Education for the internal management of the Free Academy, which, whatever its actual educational results, at least is liberally planned and thoroughly organized.

as regards study,

A programme of study is laid down, which, however, may be modified by the Executive Committee (consisting of seven members of the Board of Education), on the recommendation of the Faculty. || The option of each student as to the course of study he is to pursue is to be made in writing by his parent or guardian, submitted to and approved by the Faculty, and registered and filed by the registrar. At the beginning of each term, the students in each full course of the first three years are divided, as nearly as may be, into sections of thirty-five, and in the other classes, of forty students, for the purpose of recitation; but no class is to be organized with less than twenty students. Each student is to have three recitations or lectures a day, besides drawing, and also an exercise in declamation and composition about once a month. The recitations and lectures are to be so arranged in alternation with the hours of study, that the professors, while not occupied themselves in instruction, may visit the recitation rooms of the tutors in their respective departments (which it is their duty to do), to observe the manner in which instruction is given, and to become acquainted with the students, their progress, and attainments. The professor of moral, intellectual, and political philosophy (who is also the Principal), is to give at least one lecture or hear one recitation each day; the professor of chemistry, three; and all the other members of the Faculty whose whole time is devoted to the institution, and the tutors, four. The professor of drawing is to teach descriptive geometry in the department of pure mathematics, when not engaged with his classes in drawing; and generally, the studies of cognate departments are to be so distributed among the professors and tutors as to give each full employment. Seventeen rooms are set apart as recitation rooms, and six rooms are occupied for study. ¶ While occupied in study the pupils are under the superintendence of an instructor, that duty devolving in rotation upon all the instructors except the Principal. The several professors and tutors are responsible for the maintenance of order in their several sections, and keep a full daily record of the merit and demerit of each student under his care, an abstract of which is entered in the books of the Academy. Each instructor must also keep a register of conduct, in which all cases of violation of good order by a student are entered, together with the amount of censure in demerit marks which he thinks the offence deserves. This register is to be left with the Principal at the close of each day for his approval, and returned to the teacher the following morning. No student is to be "demerited" without notice to him of the fact and the cause.

New York merit roll.

* *New York Manual*, s. 162. The merit roll is a document which is made up immediately after each semi-annual examination, containing a list of each class, in which each student is ranked as he approaches nearest to the maximum number of marks in his department, including both his examinations and conduct. (*Ibid.*, s. 157.)

Hours of daily session.

† At the Free Academy, the school day, as defined in the regulations, is from 9 to 3, with half an hour's recess at 12; but at the school, I understood the day's work terminated at 2—which is the Boston hour—and sometimes at 1. At Providence, the session is from 9 to 2 in winter, from 8 to 1 in summer. At Newhaven and Hartford, two sessions are preferred,—from 9 to 12, and again from 2 to 4 or 4:30.

Variation at Philadelphia.

‡ This is the general rule. But at Philadelphia there is no in-school studying at all—the whole school day is occupied with recitations or lectures.

Three recitations a day, in other places, would be the usual thing; though at the girls' high school in Boston, I found that some of the students, who took all the subjects, had five recitations—certainly a case of that "high pressure" which is said to be doing so much mischief.

Boston holidays.

§ The holidays of the high schools in Boston are: the long vacation from third week in July to second week in September; every Wednesday and Saturday afternoon; Christmas Day, New Year's Day, Feb. 22nd, Good Friday, May Day, Fast Day, Artillery election, and the 4th July; Thanksgiving week—the week immediately preceding the first Monday in March; one week, commencing on the Monday preceding the last Wednesday in May, and the two days of public exhibition at Harvard University. In addition, the President of the Board of Education has power to suspend the schools on such public occasions as he may think proper, not exceeding three days in any one municipal year. (See *Boston Rules*, ch. viii., s. 36.)

Faculty of Free Academy.

|| The Faculty is composed of the Principal and all the professors (acting as well as adjunct) employed in the academy. The professorial body consists of a professor of moral, intellectual, and political philosophy (who is also Principal); of English language and literature; of French language and literature; of German ditto; of Spanish ditto; of the Latin and Greek languages and literature; of history and belles lettres; of pure mathematics; of mixed mathematics; of chemistry and physics; of natural history and physiology; of drawing; an adjunct professor in the department of philosophies; another in the department of mathematics. As many "tutors" are employed as the number of students may from time to time require. At present there are twelve, at salaries varying from \$1,250 to \$1,750 a year.

"Partial course" students.

¶ Students who take the "partial course" are not supplied with rooms for study at the academy, but are expected to prepare their work at home, and only attend the academy for lectures and recitations.

The punishments inflicted at the Academy have been already named.* All as regards discipline. punishments, when inflicted, are to be recorded in the "Book of Discipline." As an appeal to emulation, a merit roll is made up after each half-yearly examination, on which the students are severally classed as "highest," "high," "good," "low." Conduct, as well as intellectual proficiency, is considered in determining the rank. A copy of this roll, when printed, is sent by the Principal to the parent or guardian of every student, whom he is also to notify of any case of habitual or gross delinquency. If a student has made so little progress in any of his studies, or has been so disorderly in his conduct as not to gain an average rate of at least half the maximum on the last merit roll, he is to be rated as "deficient," and so recorded; and if he is rated "deficient" on two successive merit rolls, he shall be dismissed from the Academy.†

As already hinted, the Free Academy at New York, in spite of its somewhat minutiose discipline, and the Central High School at Philadelphia, granting their degrees in arts and sciences, and with their array of professors and tutors, aspire rather to be ranked as colleges, and to put a finishing touch to education, than are content to occupy the humbler position, which is all that the Massachusetts system assigns to a high school, of "fitting youth for the university."‡ The great deficiency in the programme of these two institutions is, the inadequate attention that is paid to the two great classical languages, with their contained literature, of Greece and Rome.§ At the Philadelphia High School, Greek is not taught at all, and Latin chiefly as an adjunct to English, and then only as far as a little Horace and Virgil. The whole strength of the teaching is thrown upon mathematics and the sciences, in which departments of knowledge the students are said to advance as far as is done in any educational institution in the country. In the Free Academy, Latin is commenced in the first year, when the student must be at least fourteen, and may be fifteen or sixteen, and is studied five times every week. In the second year Greek is commenced, the pupil's age now ranging from fifteen to seventeen, and is studied twice a week the first term, three times a week the second term; Latin, on the other hand, being read three times a week the first term and twice a week the second. In the third year, throughout, Latin is taken twice a week, and Greek three times; in the fourth year, Latin is read twice a week, and Greek three times, during the first term; in the second term, to each language only one

Aims of the high schools of New York and Philadelphia.

Their chief deficiency.

No Greek taught at High School, Philadelphia.

Limited amount of classical teaching at Free Academy.

* See above, p. 47, note.

† See *Manual of N. Y. Board of Education*, ss. 144-160. The Principal informed me that there was very little trouble about discipline. He is very strict in cases of truancy. In the Philadelphia High School, certificates of distinction are issued each term to every boy who has attained an average of 95 marks in his division. A boy who attains a term average of not less than 85 is called "meritorious"; and a list both of the "distinguished" and the "meritorious" is published in the Controllers' Annual Report. If a student fails of promotion to a higher division at the half-yearly examination, he has to remain where he is, and to repeat the studies of the previous term; if he fails a second time, he is dropped from the list of students. The Principal of the Philadelphia School takes no part in the instruction, superintends merely, unless now and then he takes the place and the recitations of an absent professor. In the two Boston high schools, the "Master" appeared to be as much engaged in teaching as any of his assistants.

Discipline in Philadelphia.

‡ The Superintendent of Schools at Worcester, Mass., where the system is said to work with uncommon vigour, says—"It is folly for a high school to attempt too many things, and aspire to rival the college. Better far accomplish a little thoroughly, than to pass superficially over a more showy or high-sounding list of studies. Better to master whatever is touched, than to labour fruitlessly over books beyond present comprehension; and to advance by regular steps, than to leap at heights which cannot suddenly be scaled." (*Massachusetts 28th Report*, p. 121.)

Proper aim of high schools.

§ It is not a little remarkable to how small an extent conversation, or even literature, in America, is flavoured with classical thought, or coloured by classical allusions. Beyond a charming little society of about a dozen gentlemen, gathered from the most miscellaneous walks in life, who meet weekly in New York to read a play of Aristophanes, or a dialogue of Plato, one of whose "noctes cœnæque" I was permitted to join, I do not remember an instance in which even a remote allusion led me to suppose that he with whom I was conversing, or to whom I was listening, was familiar with the higher literature of Greece or Rome. Of course many of the cultivated scholars whom I met were thoroughly familiar with it; but the noticeable thing was, how little, in the ordinary intercourse of social life, they suffered their intimacy to transpire. And certainly, the fact seems to illustrate the small extent to which, as yet, classical culture has really penetrated the mass even of the best educated people. Yet De Tocqueville has acutely pointed out its special value in a democratic state of society:—"Il est évident," says he, "que, dans les sociétés démocratiques, l'intérêt des individus, aussi bien que la sûreté de l'Etat, exigent que l'éducation du plus grand nombre soit scientifique, commerciale, et industrielle, plutôt que littéraire. Le Grec et le Latin ne doivent pas être enseignés dans toutes les écoles; mais il importe que ceux que leur naturel ou leur fortune destinent à cultiver les lettres, ou prédisposent à les goûter trouvent des écoles où l'on puisse se rendre parfaitement maître de la littérature antique, et se pénétrer entièrement de son esprit. Quelques universités excellentes vaudraient mieux, pour atteindre ce résultat, qu'une multitude de mauvais collèges, où des études superflues qui se font mal, empêchent de bien faire des études nécessaires. Tous ceux qui ont l'ambition d'exceller dans les lettres, chez les nations démocratiques, doivent souvent se nourrir des œuvres de l'antiquité. C'est une hygiène salutaire. Ce n'est pas que je considère les productions littéraires des anciens comme irréprochables. Je pense seulement qu'elles ont des qualités spéciales qui peuvent merveilleusement servir à contrebalancer nos défauts particuliers. Elles nous soutiennent par le bord où nous penchons. Il suffit, en effet, de jeter les yeux sur les écrits que nous a laissés l'antiquité, pour découvrir que si les écrivains y ont quelquefois manqué de variété et de fécondité dans les sujets, de hardiesse, de mouvement, et de généralisation dans la pensée, ils ont toujours fait voir un art et un soin admirables dans les détails; rien dans leurs œuvres ne semble fait ni à la hâte ni au hasard; tout y est écrit pour les connaisseurs, et la recherche de la beauté idéale s'y montre sans cesse. Il n'y a pas de littérature qui mette plus en relief que celle des anciens les qualités qui marquent naturellement aux écrivains des démocraties. Il n'existe donc point de littérature qu'il convienne mieux d'étudier dans les siècles démocratiques. Cette étude est, de toutes, la plus propre à combattre les défauts littéraires inhérents à ces siècles; quant à leurs qualités naturelles, elles naîtront bien toutes seules, sans qu'il soit nécessaire d'apprendre à les acquérir." (*Démocratie en Amérique*, vol. ii., pp. 68-69.)

General want of classical culture in America.

De Tocqueville on value of classical culture to a democracy.

At the Boston
Latin School.

recitation a week is allowed. In the fifth or last year, one language has to give way to the other, and for no more than one recitation in the week of "Latin or Greek" can time be found. As a natural consequence, the attainments of the students, as compared with what we are accustomed to expect in England, are very insignificant. I heard the "Sophomore" class (students of the third year, of the average age of seventeen) construe with some difficulty about twenty-four lines of Xenophon's Anabasis, and answer, not always very correctly, a few questions of the most elementary kind in the accidence and syntax. Next year they would be advanced to Thucydides and Sophocles; but I imagine that one book of the historian and one play of the dramatist will be the extent of their reading; and there, with the addition perhaps of a couple of books of Homer, their acquaintance with Greek literature will end. They will hardly have cultivated a more extensive field in Latin; a little Virgil, a little Cicero, a little Livy and Sallust, and a little Horace—the last author being almost universally chosen to close the Latin course—will be all that, in the ordinary course of things, they will read there. In the Boston Latin High School the course, I think, is more thorough, but does not range even so high. The programme of the school does not profess to teach more than "the rudiments of the Latin and Greek languages." Latin is commenced at once; but boys do not enter upon Greek till they have reached the fourth class, by which time they would be on the average fourteen or fifteen years of age, and the highest points attained in that language are Xenophon's Anabasis and three books of Homer. In Latin, Cæsar, Ovid, Virgil, and Cicero, are read; but it cannot be said that any *great* proficiency in the language is exhibited, while the exercises in composition are confined to Kerchever Arnold's most unattractive books. That such "a run through the grammars," with "a hasty nibble at the edges of Virgil, Cicero, and Xenophon" (as an American professor himself describes the process),* should

American description of a
"classical curriculum."

* *Professor North, in Report of N. Y. Regents for 1864, Appendix, p. 45.* "Just look," he says, "at the hurried, superficial, unwholesome racecourse of study that is sometimes named—rightly enough named, all things considered—a classical curriculum. First, a feverish run through the Latin and Greek grammars, with a dyspeptic huddling into the memory of principles and paradigms; next, a guerilla raid among the borders of the authors first read, under a teacher who is more interested in other and larger classes—a teacher, who thinks he has no time to hear Greek and Latin pronounced; who calls it useless pedantry to write Greek and Latin; who always puts off the analyzing of words and sentences for a more convenient season; who has no knowledge of prosody, and therefore no faith in it; who thinks it immoral to understand heathen mythology, but who rejoices in a generous facility at writing certificates of fitness for the freshman class."

The writer of the above paragraph is advocating, with very sensible arguments, the more extensive use of the black-board in teaching Greek. It certainly is an admirable instrument in any study, and is used with great effect in all the best American schools. In the Professor's own case, however, it does not seem to have produced any remarkable results. He shall tell his own tale:—"In my own classes, no exercise has called out more enthusiasm than that of hellenizing old proverbs and familiar bits of verse. Two years ago, I called for Greek translations of a couple of stanzas from George Herbert. I copy the following versions, without changing an accent or a letter:—

I.

Sweet day! so cool, so calm, so bright,
The bridal of the earth and sky;
The dews shall weep thy fall to-night,
For thou must die.

II.

Only a sweet and virtuous soul,
Like seasoned timber, never gives;
But tho' the whole earth turn to coal,
Then chiefly lives.

Γλυκὴ ἡμᾶρ ὡς ψυχρὸν δὲ λαμπρὸν χ' ἥσυχον
τῆς γῆς τὸ νυμφεῖον τε καὶ τοῦ ἀέθρου,
σὺν πτώμα δ' ἔρσαι τῆδε νυκτὶ δακρυσαύς,
ἢ γὰρ πέπρωται καταθάνασθαι σοι τέλος.

Ψυχὴ μόνη χρηστὴ τὸ ἦθος κάγαθὴ,
ἕμοια τῇ ἀντὶ ὅλην εἴκει ποτ' οὐκ,
ἀλλ' ἢ πάσης τῆς γῆς ἔτ' ἠνθρακωμένης,
ἔπειτα μὲν ἤδε ζᾷε μακαράτως.

Another version was—

Ψυχὴ μόνη ἠδῶια τὶς τε καὶ καλὴ,
ἕλης δικτὴν ἀντὶ μαλ' εἴκει μήποτε,
ἔαν τύχη ἢ πάσα γῆ νῦν ἀνθρακῶι
ἔπειτα μὲν ζᾷ ἤδε καὶ μακάρατη." (*Ibid.*, p. 50.)

That such iambs should be quoted as specimens, is a sufficient proof that nothing very high in this line is either attempted or attained.

I cannot help quoting also the Professor's concluding remarks:—"One whose Greek studies are conducted in the way now proposed may pass over less of surface than under a different regime, but his knowledge of the language will be held by a stronger lien. The life of the old Greek authors will become a part of his life; it will sing to him in familiar English rhythms borrowed from the Greek drama; it will salute him from many household words and maxims, drawing their vitality from old Greek roots and myths. All the activities of his mind will be impressed with a peculiar signet that will stand as his patent of intellectual nobility. This he will carry to his grave, as the Attic freeman carried his *γνωρίσματα*; and throughout life's rough encounters and confusions, this will make good his title to the rank and privileges of a scholar. The sharp contests of the bar and the bema, the calmer teachings of the pulpit, the lecture room, and the press, even the unstudied communings of the fireside and the wayside, will all be redolent of a classic perfume, which will never cease confessing a genial nurture and discipline, never neutralized by years or cares, but ever present in their influence, and ever recognized as a power for good and a badge of honor." (*Ibid.*, p. 51.) This is what *is to be* when the use of the black-board has wrought a change. It does not contradict what I have stated in a previous note to be, as far as my own observation went, the *existing* phenomena.

produce any satisfactory results, could not be expected; and to me, retaining as I do, the old-fashioned notions about the best instruments of mental development, that is, of education, it was a source of regret to find that there was such very meagre provision, under the American system of instruction, for making its pupils acquainted with the grand literatures of Greece and Rome.*

The grammars and text books that are in use seemed to me to be fatal to anything like thorough grounding and intelligent progress. The grammars, "now grown to a large bulk,"† instead of contenting themselves with laying down principles simply and broadly, break these principles up into a multitude of minute rules, cumbering the memory, and scarcely illuminating the understanding; while the editions of the classical authors in common use are mostly of that miserable type introduced (or at least largely propagated) by Professor Anthon, in which all difficulties in the text are smoothed over by a ready-made translation, which supersedes effort at the moment and indisposes to effort in the future. I was so impressed with the defective character of these text books that, when I was at Boston, I ventured to write to my friend and old preceptor, Dr. Kennedy of Shrewsbury, and request him to send to the Master of the Latin High School a sample packet of his school grammars, &c., that my American friends might see how we manage these things in England,—a request with which, as was to be expected from his well-known liberality in such matters, he at once complied.‡

The superior wisdom which presided over the organization of the Latin High School at Boston, is shown both in the comparatively early period at which the study of both Latin and Greek is introduced into the course, and also in the early age at which it is recommended that boys intending to proceed to college should be placed at this school.§

* The regret is shared by many Americans. I quote from one:—

"There have sprung up of late, in almost all our higher seminaries, what are called 'partial courses.' They are favoured as most popular, most practical, and most immediately connected with the business of after life. They generally embrace, in largest proportion, the physical sciences, to the neglect of other departments belonging to the essential idea of liberal education. Now, it may be a serious question whether they secure, to any desirable extent, even the poor and partial end at which they aim, and for which so much that is fundamental has to be sacrificed. Permit the speaker to give his own thirty years' experience as a teacher here. It is decidedly to the effect that college students, on a partial course of this kind, are not, in general, so well acquainted even with their own chosen branches as those who have connected with them other studies deemed fundamental in a general course. There has been obtained a more solid acquaintance even with natural science and the mixed mathematics, and especially a better appreciation of those aspects that connect them with the whole field of knowledge, by young men who have been steadily pursuing, at the same time, the old course of classical, philosophical, and pure mathematical study. Here also may there be presented to our practical men the same test as before, and on their own vaunted ground of practical utility. Let the experiment be fairly tried with a dozen young men drilled for four years, mainly in the philosophical, the logical, the moral, the metaphysical, the historical, and mathematical sciences, together with what is generally known as the belles lettres. Let the same number, during the same period, be occupied with those physical branches that have usurped to themselves, almost exclusively, the names of the scientific and the practical. With the utmost confidence we would abide the resulting test that would settle the question which of the two courses proposed would turn out the most truly practical men, most efficient, best qualified to act their parts among men in all the moral, social, and political relations of life. A person once told me, by way of derision, that the course of studies in Trinity College, Dublin, was nothing but a round of Greek, geometry, and logic; and geometry, logic, and Greek; and logic, Greek, and geometry. This was, of course, a caricature; and yet, if these prime studies denoted a well-proportioned course in those departments of the classical, the mathematical, and the philosophical, of which they might be taken as the representatives, it was admirably adapted to produce a strong man among men, even though he may have had a very limited knowledge of the details of physical science." (*Professor Taylor Lewis, LL.D., on the True Idea of Liberal Education, Appendix to Report of New York Regents, p. 22.*)

I frequently heard the complaint that the "physical sciences" were "crowding out" not only the classics, but the mathematics also, from the course of study pursued even at universities of as high a standing as Yale and Harvard. At the Free Academy, Professor Docharly informed me that they have not time to teach mathematics thoroughly, and he thought that perhaps the programme was too extensive and multifarious.

† Mr. Philbrick's description of them. (*Boston Report for 1864, p. 145.*) In the Newhaven High School I found an exception to the general rule; the text books contained the mere text of the author, without note or comment. All that was needed in the way of explanation was supplied by the teacher. But this was straining away too far in the opposite direction. One of the regulations of the Boston Latin school is, that "no translations, nor any interpretation, keys, or orders of construction, shall be allowed in the school." But an "Interpretatio in usum serenissimi Delphini" could not be more mischievous than much of what is now permitted to find its way into the schools.

‡ There is a general complaint against the text books. "There is a sad lack of simplicity in our text books, generally prepared by devotees in love with their speciality. All possible minutiae and details are crowded into them, and they become encyclopædias for reference, instead of compact and elementary treatises for beginners. The memory is surfeited, and the pupil lost in the wilderness. Information, without mental vigour to use it, is worthless lumber on the brain. Compact, well-arranged, carefully-worded, elementary text books, thoroughly mastered, would be a great improvement over the crammed and cumbersome treatises, superficially studied, and poorly comprehended."—(*School Superintendent of Worcester, Mass., 28th Report, p. 121.*) "The genius of education," say a committee specially appointed at Cincinnati to report on the "Memoriter System," "The genius of education sits like Niobe in our schools, weeping over the maltreatment of the fresh and beautiful minds which she would endow with so many charms; and Memory, the deity to whom all this incense is offered, palls at last, and rejects the profuse sacrifice!"—(*Cincinnati 28th Report, p. 147.*)

§ See *Boston Report for 1864, p. 145-6*, quoted above, p. 51, note. And yet some authorities are for throwing the commencement of the study, at least of Greek, to a later period than it occupies even now! "I think the course of study in preparation for college should be made uniform by the Board of Regents for all the colleges of the State, and that it should comprise in common English, geography (descriptive and physical), grammar, reading and spelling, with analysis of words and sentences, with great thoroughness beyond what is now usual; in mathematics, a complete knowledge of arithmetic and algebra, with single and double entry book-keeping; in Latin,

Character of text books.

Wish for more classical culture and a more liberal education.

Fault found with the text books.

Comparative attainments of boys and girls.

The classics—and the mathematics too, for the matter of that—are studied to quite as high a point in America by young ladies as by young gentlemen; and in many of the mixed high schools, the female students not only outnumber the males, but are generally more advanced in all departments of study. In the Chicago High School, exclusive of the normal department, which consists entirely of females, of 263 students, 113 were males and 150 females; and of nineteen first-class prizes, fifteen were carried off by the girls. In Detroit the number of students in the High School in 1863 was 123, of whom seventy-five were girls and forty-eight were boys; and I observed in the classified list of studies, that the only pupils who are reported as reading "Homer's Iliad and Anacreon's Odes" are three girls; the only readers of "Horace's Odes and Art of Poetry" are three (probably the same three) girls; the only students of "elementary astronomy" are, for a third time, three girls; the only penetrators into the regions of "mental philosophy" are seven girls. But upon this feature of the American system—the style of education it provides for girls—I shall find a better place for speaking in the few criticisms I shall venture to offer upon it as a whole.

Boston English High School.

I have already mentioned the English High School at Boston as the one above all others that I visited in America which I should like the Commissioners to have seen at work, as I myself saw it at work on the 10th of last June—the very type of a school for the middle classes of this country, managed in the most admirable spirit, and attended by just the sort of boys one would desire to see in such a school. I propose to append Mr. Philbrick's narrative of its history, and his account of its objects and system, at the close of this Report; and all I shall attempt to do here is, briefly to record my own impressions. Its character corresponds to what I conceive to be the character of a German "Real School," and what it aims at giving is, a thoroughly practical English education, with the addition of the French and German languages. It is attended by about 180 boys, ranging in age from twelve to eighteen, and is under the management of a master (Mr. Sherwin), two sub-masters, three ushers, and a teacher of drawing. All the instructors are required to be competent to give lessons in the French language, over and above the branches of an English education proper to their respective grades. The normal length of the course is three years. The first is occupied with a review of preparatory studies, using the text books authorized in the city grammar schools. Algebra and French are commenced, ancient geography and general history taught, and drawing lessons given. In the second year, algebra, French, and drawing are continued, and the subjects of geometry, book-keeping, rhetoric, Constitution of the United States, trigonometry (in its varied applications to surveying, navigation, mensuration, &c.), and the evidences of Christianity, are entered upon. The third year continues French, drawing, trigonometry, and evidences; drops algebra, geometry, and book-keeping; and takes up astronomy, natural philosophy, moral philosophy, political economy, natural theology, English literature, with a permission to commence Spanish in lieu of French, and to study a treatise on physical geography, at the discretion of the master. A fourth year is frequently spent by some pupils in the school, the studies assigned to which are astronomy, intellectual

Its course of study.

Its chief features.

philosophy, logic, Spanish, geology, chemistry, mechanics, engineering, and the higher mathematics. It was not the programme of study (in which my own judgment would dispose me to make several alterations)* that elicited my admiration of this school (indeed I have learnt to attach very little weight either to programmes or systems), but the excellent spirit that seemed to pervade it, the healthy, honest, thorough way in which all the work on the part both of masters and pupils seemed to be done. By the regulations of the School Committee, the instructors, while rearing the above somewhat imposing superstructure, are charged to keep a constant eye on the condition and stability of the foundations. They are to "pay particular attention to the penmanship of the pupils, and give constantly such instruction in spelling, reading, and English grammar, as they may deem necessary to make the pupils familiar with these fundamental branches of a good education."

what is now required for admission into the best colleges; in natural sciences, two terms in natural philosophy, two in chemistry, one in anatomy and physiology, one in botany, and one in geology, omitting the Greek language entirely till the freshman year of college. (*Principal Gardner, of Whitestown Seminary on the "Course of Study preparatory for College," in Appendix to Report of New York Regents, pp. 42-3.*) He thinks that his plan would relieve the academies "of a great amount of expense now incurred in giving instruction in Greek, and believes that "two terms of instruction in Greek, given by a college professor, under the stimulus of a large class" (who, by the hypothesis, at the outset do not know the alphabet), "will advance the student quite as much in that language as he commonly is when he enters college." There is no end to paradoxes; and to those who suggest "that this plan will give less prominence to the classics than at present," the Principal replies—"By no means. I shall hope for greater accuracy and more extended knowledge in the ancient and modern languages, and a much better acquaintance with the Greek and Roman literature." (p. 46.) We will leave the Principal in the hands of Mr. Philbrick, who, I think, would hardly be for postponing Greek to the "freshman's year."

Criticisms of the programme.

* I do not quite like to see algebra and geometry dropped so soon; and I think, considering the objects of the school, that book-keeping might be continued right through the course. I should fear that a pupil, after two years' intermission of practice, would have forgotten its principles and methods just when he was required to apply them. The subjects of the last year are too exclusively scientific and philosophical; perhaps, also, too multifarious. Geology, and chemistry, and engineering, might possibly be reserved with advantage for the "Institute of Technology," which is to succeed the English school. I should also like to see a little more of the "belles lettres" element infused throughout the course, and particularly into the two last years, from which, as things are, it is now almost entirely absent; for "English literature," as generally taught in American schools, means little more than memorizing a jejune and meagre manual. I am also a little surprised to find Spanish, as a second modern language, preferred to German; but I presume it is for a practical object, with an eye to the extensive commercial intercourse that is carried on with Cuba, Mexico, and the Spanish-speaking South American nationalities.

Though the school is graded, individuals are not lost sight of. The master's eye is frequently brought to bear on the condition of each division, and once a quarter in each class there is a general review of all the previous studies of that quarter. The entrance examination is peremptorily required to be strict, and no student is admitted without a thorough knowledge of all the preparatory studies. In a word, everything is done to sustain the intellectual tone of the school at a high pitch, yet without straining; while there was an honesty, a frankness, and an absence of restraint in the "rapports" between the teacher and the taught, which indicated that the moral atmosphere of the school was as healthy and bracing as the intellectual.* Taking it for all in all, and as accomplishing the end at which it professes to aim, the English High School at Boston struck me as the model school of the United States. I wish we had a hundred such in England.

A noticeable feature in the instruction given in these schools is the extent to which the black-board is used, not, as with us, chiefly by the teacher, but almost exclusively by the pupils. All round three sides of the class room is let into the wall a panel either of slate or covered with some plaster composition,† which is the instrument understood by the "black-board." It is at a convenient elevation from the floor of the room, and varies from four to six feet in width. The upper portion, and sometimes too large a portion, of its surface is frequently reserved for drawings, sometimes touched in with coloured chalks, of a more or less artistic character, which I think are often allowed to occupy the space too long, and indeed are even bequeathed by the class of a former year to their successors. For exercises in Greek and Latin composition, for developing the paradigm of a Greek or French verb, for the analysis of a sentence, for illustrative sketches in anatomy or mechanics, as well as for the more usual purposes of geometrical demonstrations, and arithmetical or algebraic examples, the black-board is called into play. It is frequently divided by white vertical lines into compartments of a convenient size; and you will see eighteen or twenty students at once ranged in front of their allotted space, and working out their different problems with great activity. One great advantage in the method is that, when the results come under the critical eye of the teacher, who generally calls upon each pupil to exhibit or explain his own performance, it enables him to contrast before the class (who by the hypothesis of a graded school are equal in their attainments, and each therefore competent to understand and criticise his neighbour) different styles of setting out work, besides its further action as a stimulant upon the pupils to do their best, when they know that their work will presently be exposed to the criticism of all their class-mates.‡

Use of the black-board.

Lessons are generally short §—I don't refer to the time they occupy, but to the quantity of work done—and divided into two parts, called respectively the

No specially noticeable methods.

* Nor is physical culture neglected. The boys go through a regular drill, I think twice a week, under the orders of a United States officer, on Boston Common. I saw them put through their evolutions, which they executed, not with the beautiful precision of the cadets at West Point, but still with very creditable steadiness and promptitude.

Military drill.

Military drill has been introduced with excellent effect into the Boston boys' schools, in consequence of a movement of public opinion in that direction in 1863. In the report of the School Committee, English precedents are quoted for its introduction; but the Americans have, characteristically, taken the matter up with an energy and completeness which almost give to it the position of an original idea. The special committee that recommended its adoption did so on the ground that it would be both "a means of physical training, and ultimately of national defence"; and the belief of its promoters is, that it will be found to be "not only the best system of physical exercises for the schools, but, at the same time that it will inculcate a more manly spirit in the boys, strengthen and extend their faculties, invigorate their intellects, make them more graceful and gentlemanly in their bearing, and render them competent, at the age of sixteen or eighteen years, to enter the field as privates or officers of any regular military organization." (*Boston Report for 1864*, p. 33.)

† They have not thoroughly decided in America what is the best material of which to construct black-boards. It was a subject of discussion among the Ohio teachers at Cincinnati. In the most recent buildings I thought slate seemed to be superseding composition, which is found to have a tendency to crack and flake off. All along the bottom of the panel runs a groove for the chalk, and at convenient intervals a place for the rubber, which is not a dusting-cloth, as with us, but a flat, short-bristled brush, with a handle at the back. It is efficient, but produces a good deal of dust.

Composition of black-boards.

‡ I can remember the operation of this feeling when I was a schoolboy at Shrewsbury. It was the fashion there for the composition exercises of the sixth form, when they had passed under the revision of the head master, to be laid on the table for any boy in the school who chose to read. We dreaded this criticism of our schoolfellows far more than the remarks, though they were sometimes sharp and caustic, of our master. A false quantity, or any similar blunder, would be a standing joke against the perpetrator for a week. I attribute not a little to the action of this influence the remarkable excellence in Greek and Latin composition which so many Shrewsbury boys have attained. In America, where human nature is so much more sensitive in respect both of praise and blame, the influence would be more potent still.

Influence of mutual criticism.

§ In the "Sophomore" class, that is, the pupils of the third year, in the New York Free Academy, I found that 24 lines of the *Anabasis* was considered a fair amount for a lesson of an hour. At the high school, West Roxbury, Mass., 20 lines of an oration of Cicero—the third against Catiline—was the quantity prepared. In the Girls' High School at Boston, three stanzas of an ode of Horace (*lib. i.*, 2) was thought a sufficient result of an over-night's home preparation. I must say that the American teachers seemed to me to push the principle of "doing a little well" rather too far. It may lead to a mere frittering away of time, and to an elaboration of details burdensome to the memory, and not expansive of the understanding, or to a discursiveness which is fatal to a systematic appreciation of a subject. The mischief, too, is intensified when the pupil's mind is required to be occupied with so many subjects at once. In the Report of the New York Superintendent, it is considered as quite a moderate requirement that "the number of studies prescribed" at one time for the highest grade of the grammar schools "is but seven," and that therefore "the teacher has no excuse for overburdening the mental or physical faculties of any of his pupils." (*New York 23rd Report*, p. 11.) There is a tendency, however, to diminish the number of concurrent studies; and perhaps, in the reaction, things will run to as great excess the other way. At

Length of lessons.

Concurrent studies.

“review” and the “advance”; the former a retrospective glance at the lesson of yesterday, the latter a step onwards. I did not observe anything very special in the methods of teaching, beyond the use of the black-board just referred to, and beyond the remarkable energy and vivacity of the teachers, answered in most cases by corresponding interest and life on the part of the pupils.* Three lessons, however, which I happened to hear, all at Boston, have left a very distinct and very favourable impression upon my mind. One was an “advance” lesson in reading, in the Poplar Street Primary School; another, a lesson in French, at the English School; the last, a lesson in English literature (I suppose I must call it), at the Girls’ High School. I was also extremely gratified by some exercises in vocal culture, practised under the directions of Professor Munro, which I was told had trebled the vocal power of a class of girls, without calling upon them for any greater physical exertion.

Three particular lessons described.

1. Reading lesson.

With regard to the reading lesson, I noticed that the first step taken before reading a fresh passage is, to pronounce the words simultaneously, with a good deal of deliberation and precision. If a hard word is approached, and a pause ensues, they are bidden analyse it, and—here is the noticeable thing—enunciate, not the *names* of the letters, but the *sounds*.†

2. French lesson.

The French lesson was a translation of a passage from the text book of the class, followed by an extemporized dialogue, in the shape of question and answer, between the teacher and the boys, in a lively, playful strain, yet upon matters of a practical kind (in this case, I remember, connected with some of their previous lessons in natural philosophy), in which I thought it a great thing achieved to overcome a boy’s natural, or, at least, ordinary reluctance to talk freely in a strange tongue. I do not say that the pronunciation would have been considered perfect in Paris, but at any rate there was no silly hesitancy, and not many serious offences against either accident or syntax.

3. Lesson in English literature.

The third lesson of which I have spoken, and which, for want of a better name, I have called a lesson in English literature, was a composite lesson to a class of girls from eighteen to nineteen years of age, in reading, paraphrasing, grammatical analysis, mutual criticism, and general literary appreciation and taste. The class had commenced the play of Hamlet, and were engaged that day on a passage from the first scene of the first act. It was read by one girl, paraphrased by another; the paraphrase had to run the gauntlet of general criticism; questions were proposed as to the precise meaning of this phrase, the definite allusion in that; objections were raised to this and that interpretation; illustrations were adduced, and the whole exercise was characterized by much spirit and life. It was, perhaps, a little too elaborate, and occupied rather too much time. At the rate of movement of that morning—though it might have been retarded for my special benefit—it would

least, the Controllers of the Philadelphia schools ask, in a plaintive tone—“Cannot our public school pupils learn all the branches which are usually considered as being within the term ‘a good English education,’ when other institutions add the languages, dead and living, higher branches of mathematics, and a host of other studies, to those we teach? Why is it that geography is discontinued in the higher classes of the grammar school? Why is it that history is so much neglected? Why is it that algebra is banished, and our list of studies is diminishing year after year? Simply because of the cry, ‘hot-house pressure,’ and because of a desire to yield to an erroneous public impression.” (*46th Annual Report*, p. 36.)

Teachers devise their own methods.

* In fact, as a rule, teachers, a small proportion of whom have been specially trained, generally pursue their own methods, and those mostly developed out of their own aptitudes. They are rarely even limited by a time-table. The only real restraint upon their perfect freedom of action is the programme of study marked out for their grade. To that they are rigidly bound, and their method is either approved or condemned by its results. As a consequence of the inadequate extent to which the training of teachers is at present carried, there is less *routine* in American teaching, but more *empiricism*. In a great degree, however, the teacher is like the poet—“*nascitur, non fit*,”—and American soil certainly seems very favourable to his production. It must be admitted, also, that natural cleverness is a better educational instrument to work with than mere acquired mechanical power. The latter may get exhausted, or be deficient in adaptiveness; the former is fertile and perennial. It should be remembered, too, in this connexion, that the large majority of American teachers are women, who possessing perhaps more resources and mother-wit, require as a correlative, a freer field. At any rate, whatever be the philosophy, the fact remains, that method in America varies *ad libitum*, and that a teacher is continually called upon, and always permitted, to exhibit inventive power, and try a fresh plan.

American reading.

† Aristotle tells us that there are such things as *ἄσημοι φωνῆς* (*Rhet.*, iii. 2, 11.) Americans, however, do not consider that what are called the “consonants” of the alphabet belong to the class, for they attempt, scorning the aid of a vowel, to give them each a special value and a significant sound. The result is rather curious, and some of the sounds evoked are not altogether grateful to the ear; but there is, certainly, a value in the method, for the best reading in American schools (and their *best* reading is very good, whatever their worst may be) is formed under it.

Good reading is an accomplishment upon which Americans very justly set great store, and they are somewhat fastidious upon the matter. “To say that reading is more imperfectly taught than any other branch would,” writes the superintendent of the Chicago schools, “be saying what is generally true ‘of other cities as well as of our own.’—(*Tenth Report*, p. 17.) To my ear, the great defect in American reading is its want of naturalness and simplicity; it is too laboured, too intense, too self-conscious. As in so many other cases, the habit of minutiosity has told with ill effect here. There are supposed to be at least fifty different styles of expression, some of them distinguished by almost grotesque names. In one of the Boston grammar schools I heard an exercise in “Reading with Expression,” in which the whole class simultaneously passed with astonishing rapidity through, I am afraid to say how many, varieties of elocutionary expression, “from grave to gay, from lively to severe.” It was an excellent school, in all respects; but this particular exhibition, though I think the teacher was proud of it, did not edify me. It seemed a thing overdone. It would be most distressing to have to listen to such emphatically good reading for half an hour. In England we sin exactly in the opposite way; and an incurable slovenliness, arising from the fear of appearing stilted or theatrical, or from a lethargic and indolent nature, spoils the reading of many even of our best schools. The articulation of Americans generally is very distinct, and their speakers and preachers rarely fall into our bad habit of dropping the voice at the end of the period, thus cutting off, to the listener, the thought at its most vital point.

require a term to get through an act, and a couple of years at least to complete the play. But, apart from this, the exercise appeared to me profitable.*

Two other methods, or, perhaps, more correctly speaking, habits, of which in one I do not know that there is much value, and the other I consider decidedly mischievous, prevail extensively in American schools, and are specially noticeable in the schools of New York. The first is the habit, in the solution of problems in mental arithmetic, of repeating the question by the scholar before attempting the answer; the other is the habit of rapid answering, which is almost universally encouraged. The first is supposed to give precision and distinctness to the pupil's ideas; but it soon becomes a mere mechanical process, imparting an element of anything rather than interest to the lesson.† The second has for its object the accustoming children to deal with questions promptly and vigorously, and preventing the smallest approach to drowsiness, but it issues in a great many random and reckless answers, and almost precludes the exercise of reflection.‡

I have already said something about American text books. As a rule, I do not think that the best American text books are better than the best of the same kind that are in use at schools at home; the *worst* seemed about as bad as bad could be.§

* I cannot help fancying that this must be the school—perhaps the very class, similarly engaged—his visit to which Mr. Anthony Trollope has described with so much humour. "In one of the girls' schools," he says, speaking of Boston, "they were reading Milton, and when we entered were discussing the nature of the pool in which the devil is described as wallowing. The question had been raised by one of the girls—a pool, so called, was supposed to contain but a small amount of water, and how could the devil, being so large, get into it? Then came the origin of the word 'pool'—from *palus*, a marsh, as we were told, some dictionary attesting to the fact—and such a marsh might cover a large expanse. The '*Palus Mæotis*' was then quoted. And so we went on till Satan's theory of political liberty—'Better to reign in hell than serve in heaven'—was thoroughly discussed and understood. These girls of sixteen and seventeen got up one after another, and gave their opinions on the subject how far the devil was right, and how far he was manifestly wrong. I was attended by one of the directors or guardians of the school; and the teacher, I thought, was a little embarrassed by her position. But the girls themselves were as easy in their demeanour as though they were stitching handkerchiefs at home." (*North America*, vol. i., p. 413.)

Mr. Trollope's keen eye has caught the ludicrous side of the picture: I was more impressed by the serious. No doubt, occasionally, discussions of a rather delicate and embarrassing nature may be started; but I think he would allow with me that the lesson developed some useful qualities of mind, even if the young ladies were rather more self-possessed in the presence of strangers than he expected to see them. It should be remembered that the incursion of visitors into the show-schools of Boston and New York almost amounts to a nuisance, and necessarily leads to a mischievous degree of parade, which produces, perhaps unconsciously, that self-reliant air, which, in young people, to an English eye is not pleasing.

† The following extract from Mr. Wells' little treatise on "graded schools" will show how much importance American teachers attach, not only to precise ideas, but to correct expression of them:—"Recitations in arithmetic require constant watchfulness on the part of the teacher, to secure fulness and accuracy of expression. The following are illustrations of common faults: (a.) 'If one cord of wood cost \$5, six cords will cost 5 times 6,' instead of 'six times \$5.' (b.) 'If one cord of wood cost \$5, six will cost six times 5,' instead of 'six cords will cost six times \$5' (two errors). (c.) 'In $\frac{36}{9}$ of a dollar there are as many dollars as 9 is contained in 36,' instead of 'as many dollars as the number of times 9 is contained in 36,' or 'as many dollars as 9 is contained times in 36.' (d.) 'To subtract one fraction from another, reduce the fractions to a common denominator, and subtract the numerator,' or 'subtract one numerator from the other,' instead of 'subtract the numerator of the subtrahend from the numerator of the minuend.'" (*The Graded School*, p. 83.)

‡ See remarks above, p. 68, and quotation from Mr. Philbrick there, note ††.

§ I will leave the educational authorities of Canada to speak of one blemish in text books published in the United States, which I did not notice to any serious extent myself, but which, if true, constitutes a considerable defect, in a moral point of view—it is that, in their exuberant patriotism, they not unfrequently distort historic truth. "In regard to the exclusion of American text books from our schools," says the Chief Superintendent of Education in Upper Canada, "I have explained, as I have had opportunity, that it is not because they are foreign books simply that they are excluded, although it is politic to use our own in preference to foreign publications, but because they are, with very few exceptions, anti-British in every sense of the word. They are unlike the school-books of any other enlightened people, so far as I have the means of knowing. The school-books of Germany, France, and Great Britain, contain nothing hostile to the institutions or derogatory to the character of any other nation. I know not of a single English school-book in which there is an allusion to the United States not calculated to excite a feeling of respect for their inhabitants and government. It is not so with American school-books. With very few exceptions, they abound in statements and allusions prejudicial to the institutions and character of the British nation. . . . And as to the influence of such publications, I believe, though silent and imperceptible in its operations, it is more extensive and powerful than is generally supposed. I believe such books are one element of powerful influence against the established government of the country. From facts which have come to my knowledge, I believe it will be found, on inquiry, that in precisely those parts of Upper Canada where U. S. books had been used most extensively, there the spirit of the insurrection in 1837 and 1838 was most prevalent." (*Special Report on Measures adopted to supply School-sections with Text-books*, 1858, p. 22.)

It is certainly too much the fashion in America to speak contemptuously of the institutions and social condition of other peoples. As I write, my eye falls upon a passage in the Annual Report of the School Commissioner of Rhode Island, who is apt to use rhetorical language penned under the influence of excited feelings, which almost justifies the above strong statement of Dr. Ryerson. "Here," says the Commissioner, "we have free labour, free schools, and a free people. No man so poor, no man so low, but he may, if he chooses, clothe himself with power, and crown himself an aristocrat! Here the people pledge themselves, unconditionally and incontrovertibly, to the maintenance of the Constitution and the laws. Elsewhere free labour is a degradation, free schools are a by-word, and a free people an absurdity. There poverty is perpetual, and ignorance is condemned to helpless, hopeless servitude. There the masses are the tools of a supercilious and traitorous oligarchy, lifting its red hand against all constitutions and all laws—a curse to any people.—(*R. I. 19th Report*, p. 9.) The contrast may be intended to be only between the Northern and Southern States, but its language seems to be too general for that, and, anyhow, it exhibits the supercilious spirit which I have lamented.

I add another picture of ourselves, drawn by the hand of a School Committee in Massachusetts:—"England, with all her intelligence and Christian enlightenment, and material wealth, and political greatness, has never had, and cannot have to-day, a system of schools open alike to the children of

1. Readers. The best "Readers" appeared to me to be those in use in the Boston schools—Hillard's series—which, though somewhat apt to grow declamatory in the higher numbers, certainly afford considerable scope for elocutionary effects. The series generally used in the schools of New York is Willson's—a series of the same type as that of the Irish National Society, containing a mass of matter more suitable for giving information in particular departments of knowledge than for teaching how to read with fluency and expression. Mr. Philbrick of Boston has just got out an excellent "Speaker," which promises to be a great boon to the upper classes of schools.
2. Dictionary. On almost every teacher's desk lies a quarto copy of Webster's Dictionary—a valuable book of reference, not always, however, apparently, cared for so well as it deserves.*
3. Writing-books. The series of writing-books most in use is Spencer's, and the style of writing most admired the Spencerian, giving the most elaborate directions as to the shape and formation of the different letters, and resulting in a hand as far removed from what is pleasant to the eye and from what the late Lord Palmerston considered to be the perfection of handwriting—firm, compact, distinct—as it is possible to be.
- The text books mostly American compilations. In the Philadelphia High School I observed that a few British text books—e.g., Blair's Rhetoric, Fownes's Chemistry, were used, and the employment of Liddell and Scott's abridged lexicon is nearly universal in classical schools; but as a general rule, those in use are almost exclusively compiled by American book-makers, and pushed into the market by American booksellers. I have already quoted Mr. Barnard's remark that the book-selling interest, reluctant as he was to say so, must be considered as one of the influences arrayed *against* the common school. He had in view the abduction of many of the best school teachers, and their conversion into agents by the publishers.† A still more evil result is the needless multiplication of text books, and the jobbery that is practised to get them, when made, introduced into the schools.‡ Whether anything in the shape of actual

rich and poor, and maintained at the public expense. England, consequently, has to-day, as she always had, a mass of ignorance and social degradation of which we know nothing (?), and which constitutes, to all intents and purposes, a low caste, separated by a broad gulf from the classes above, a class disfranchised and proscribed, a dead sea of moral corruption, a prolific hotbed of political discontent and social animosity." (*Massachusetts 28th Report*, p. 88.)

* "This great work," says a New York school commissioner, "was originally introduced into every school in this district; but, alas! the sad relics of departed greatness are all that remains. It is to be found in only fifty-eight at present, twenty-eight being entirely destitute. Forty of said dictionaries are shamefully mutilated, marked, and torn, and only eighteen are in good condition. Two only have been stolen! It is hoped they have received better usage.

With regard to the use the dictionary should be put to, the same writer remarks:—"Many teachers have no systematic plan of using the dictionary. They may occasionally refer to it themselves, and allow their scholars to do the same, when they find an uncommon word, but there should be some system, in order to render the book as useful as it may be in a school. Scholars of proper age and attainments should have a blank book, and while studying their lessons, transcribe every word the definition of which they do not perfectly understand, noting the book, page, &c., for future reference, and then referring to the dictionary, select the definition applicable to the word in the connection in which it is used, and copy this opposite the word. In this way, a vocabulary of common and scientific terms would be mastered and treasured up in the mind, which would be of more value to the scholar than the recitations of a whole quarter, performed in the parrot-like manner that characterizes too many of our schools." (*New York 11th Report*, p. 133.)

† See *above*, p. 16, note †.

‡ I append some expressions of opinion with regard to the multiplication of text books. "If," says the Superintendent of schools at Worcester, Mass., "with so much of the school life given to the science of numbers, our children do not become accomplished arithmeticians, a serious defect must exist somewhere. We think that the defects which we discover (and we confess them to be numerous) are not so much to be ascribed to defect in teaching as to defective books. It is far less the fault of the teacher than of the publisher and the bookmaker, who have expanded the arithmetics, of which there should never be but two—one mental and one written—into a series of five, through each of which the child must wade as through a swamp; and the wonder is, that in the attempt he does not oftener get swamped. In these prolix treatises, the principles which ought to be as simple, concisely, and clearly stated as human language can state them, are buried in a mass of words, enigmas, and puzzles, which distend to fifty pages what ought to be comprised in ten, and every principle is burdened with an array of examples which serve rather to confuse than to enlighten the mind, and, by their order, arrangement, and mode of statement, to conceal rather than to reveal what the child is seeking to learn." (*Massachusetts 28th Report*, p. 119.) The above description is true of other text books besides those in arithmetic.

The Rhode Island Commissioner, advocating the use of a uniform series of text books, authorized and required by the State (as is the rule in Canada), notices, as one advantage, that it would relieve the schools from an existing nuisance. "It would certainly do away with the somewhat annoying visits of itinerant school-book agents, which are becoming quite frequent, and under our present system are in some degree required. At one of our Institutes, a teacher who was present remarked that he had had the pleasure of receiving seven visits during a single term—two from parents, and five from book agents." (*19th Report*, p. 34.) The same writer dilates on the extent and seriousness of the evil:—"In many schools which I have visited, I have found two or three kinds of readers, as many of spellers, geographies, and arithmetics. Of the latter, in one school I found five varieties. It is easy to see that no teacher can afford to supply himself with all these from his own resources; he must take them away from his scholars. Nor can he be expected to be so thoroughly familiar with all as to possess himself of that ready preparation essential to enthusiastic and successful teaching. I know of no evil so easily remedied that is working so serious an injury to our schools." (*Ibid.*, p. 35.) One probable cause of much of this diversity is noticed by a New York Commissioner:—"One of the principal causes of this diversity (aside from agents) is, that teachers going out from our academies and high schools wish to use the same text books that they have been in the habit of using themselves, and can induce only a part of the scholars to purchase a 'better book,' while the remainder use the old one. I wish something might be done in the way of legislation to remedy this evil in text books." (*New York 11th Report*, p. 322.) In the more perfectly organized systems of the cities, the Boards of Education do adopt something like a uniform rule in this respect; but even in New York, variations exist, though kept within limits by the controlling eye of the Superintendent.

bribery of trustees or teachers is employed for that purpose I will not take upon myself to affirm, though hints that such is the case are dropped, not obscurely, in some of the reports; but a common and avowed practice is, to make a deduction of 40 to 50 per cent. on the selling price of the first lot taken for the use of the school, in order to secure the subsequent introduction of the book, and to remove any financial scruples that might resist a change.

The large city schools, especially the schools of higher grade, are supplied with apparatus of every kind, on a scale of the utmost—I had almost said of superfluous—liberality. Nothing is omitted, in the way of maps, diagrams, books of reference, cabinets of objects, appliances for illustrating the principles of natural philosophy, and so forth, that the most advanced educationist could either suggest or require. The high school at Philadelphia, in addition to very complete cabinets of philosophical apparatus, is fitted up with an observatory on the roof, containing a powerful equatorial telescope and other costly astronomical instruments, which the students are taught to use. Indeed, if one formed an opinion from the apparatus only, one would suppose that a much higher standard of mathematical and philosophical knowledge was reached than other evidence leads me to believe is actually attained in the schools.

Apparatus in cities.

In rural districts, naturally enough, the state of things is very different. Black-boards, it is true, are found in nearly all schools, but not always black-boards in very good condition, nor always chalk, without which the black-board is of little use, and very frequently nothing beyond a black-board. Even in Massachusetts, no longer ago than in 1861, the Secretary of the Board of Education regrets to "say that most of the public schools of the State are destitute of maps and apparatus suited to aid the teacher and the pupils."* But in this, as in all other points connected with the condition of the school, one district differs essentially from another, and the root of the difference lies in the extent to which liberal ideas with respect to education have penetrated the neighbourhood. It is the story of what is constantly seen in every part of England over again.

In rural districts.

And what is true of the apparatus and schoolroom appliances is true of the school buildings generally. Nothing can be finer or more suitable to the purpose (though very seldom with any pretensions to what is called "architectural character") than some of the new school-houses which have been erected within the last five or six years in all the great cities of the northern and western States of the Union. They are buildings generally of from three to four stories high, solidly constructed of brick, some of them with double-sash windows, fitted with interior venetian shutters, with elaborate, but not very successful systems of heating and ventilation,† as nearly fire-proof as possible, and always arranged

School buildings.

* *Massachusetts 24th Report*, p. 80. I confirm my statement by two instances picked up at hazard, one from New York, the other from Massachusetts. "Every school-house has a black-board, but few have globes, maps, or other apparatus." (*11th New York Report*, p. 169.) "A large black-board, outline maps, and a globe, ought to be found in every school-room. And your Committee are sorry to be obliged to report that nearly all our school-houses and their locations are just the opposite of what they should be, and would better befit criminals than scholars. Not a globe can be found in any school, and but few outline maps, or remnants of what once were outline maps. Where black-boards exist, they are generally small, and so much out of repair as to be nearly useless." (*Massachusetts 28th Report*, p. 165.) But this must represent the condition of a very backward township.

Samples of meagre apparatus.

† Though much attention has been paid in America to the best methods of heating and ventilating school-rooms, it is admitted on all hands that the plans hitherto employed have been singularly unsuccessful, and many persons are coming back to the idea that the old-fashioned "unpatented" way of opening doors and windows is the best mode of purifying the air of crowded rooms. The most recent and most approved method for heating is by the use of steam, and is thus described:—"The heating pipes are brought together in a chamber in the basement of the building. This chamber is supplied by conductors with the cold air from the outside of the building, and the heated air passes by conductors from the hot-air chamber into the different rooms, in the same manner as from an ordinary hot-air furnace. The consumption of fuel is somewhat greater than in the buildings heated by pipes which are placed in the rooms to be warmed; but this increased expenditure is mainly owing to the fact that rooms heated by pipes around the walls are of necessity poorly ventilated. The saving is made by heating the air once, and then breathing it over and over; whereas, by the improved arrangement, the air is heated, used once, and then removed by introducing a fresh supply. This may safely be pronounced one of the best methods of heating school buildings yet devised, since it secures a requisite degree of heat, furnishes a constant supply of fresh, warm air, and insures a good action of the ventiducts." (*Wells on Graded Schools*, p. 177.) This is called "heating by steam," but the more proper title would have been, as it seems to me, "heating by hot air." I do not pretend to understand the mysteries of warming and ventilating rooms, beyond knowing, in the simplest and most obvious way, when their temperature is comfortable and the air feels fresh and pure. The last sentence in the above description states what the method ought to do, rather than what it does. All the systems in use are alike pronounced not to produce the results desired. Here is a report of the state of things in New York:—"Some of the school buildings which are heated by furnaces are entirely too cold for children to remain in during school hours. The thermometer in these seldom rises above 50°, except in mild weather; and in many of the class rooms the temperature is often lower. Two years' experience of such furnaces is sufficient, and if they cannot be made to answer the purposes for which they were placed in the buildings, they should be removed to give place to better ones, if any can be found; and if not, to the old wood stove, the heat from which is undoubtedly much healthier. In some of the schools in the uptown wards, so cold have been the class-rooms that the children in severe weather have been dismissed at noon. . . . In this connexion I may add, that no system of ventilation has been adopted in the construction of new buildings which has been successful. The crowded class rooms are filled with impure air, which must engender disease if not removed. This is partially accomplished by lowering the upper sash in winter, and the opening of all the windows and doors during the usual recess. The Committee on Warming and Ventilation gave to this subject an extended investigation, obtaining the views of scientific gentlemen, and arrived at the conclusion that no perfect system could be successfully introduced into our school buildings without the aid of machinery." (*Report of Mr. Assistant-Superintendent Jones for 1865*, p. 6.)

Heating and ventilation.

Deficiency in the Plans.

Arrangement of
buildings.

with a view to facilities of escape in case of fire, with broad staircases, and doors opening outwards,—of a nearly uniform and unpretentious pattern, costing, with the lot on which they stand, from \$40,000 to \$100,000, according to their size. The general arrangement is pretty uniform also. In the basement are the heating furnaces and ventilating apparatus, coal and wood cellars, and a good deal of often unoccupied space. Above that, the ground floor is devoted to covered play-rooms. The school-rooms proper commence on the first story, and consist (in New York at least) of a large assembling hall, surrounded by smaller class-rooms, this arrangement being continued for as many stories, probably, as there are grades or departments in the school. The character of the desks and school-room fittings is well-known. The seats have all backs to them; the desks are either of polished birch or mahogany, sometimes a single desk to each scholar, sometimes, and more commonly, each desk accommodating two; and everything wears the appearance of admirable fitness for work, combined with perfect order and cleanliness. A peculiarity in the American arrangements is that the whole area of the room is generally occupied with seats and desks, and as a consequence the children look very densely packed, and as a further consequence, the air of the rooms not unfrequently becomes fetid and unwholesome. If it were not that a mass of American children are much more easily reduced to order, and are perhaps more sensible of the value of order, than the same number of English children would be, a good deal of practical inconvenience and confusion would result from the crowded condition of many of the rooms. As it was, I observed none.

Case of Phila-
delphia.

In respect of buildings, however, the city of Philadelphia is somewhat, for the moment at least, behind its neighbours. The President of the Board of Controllers has lately (September 5, 1865) made a communication to the Board, in which, in view of the possibility of the approach of cholera, he thus describes some of the school-houses:—"We know," says Mr. Shippen, "that many of our schools are kept in damp and badly-ventilated church basements, partly underground; in private dwellings, which in a neighbouring city would be called 'tenement houses'; in halls, in engine-houses; in fact, in almost every kind of structure that is covered with a roof, not even excluding the rope-walk and the stable." And the City Council have just voted an appropriation of \$800,000—about £125,000—for the express purpose of enlarging and improving the accommodating power of their schools.

Country school-
houses.

In the country, again, buildings vary infinitely. In the New England States, most of the rural school-houses, and not a few even of those in the towns, are what are called "framed" buildings, that is, timber structures, with walls of weather-boarding outside and lath and plaster inside; sometimes of two stories high, when a graded school in two departments has to be provided for; neatly painted white, standing in a sizeable plot of ground, planted with "shade trees,"—on which great store is set, as a shelter from the excessive heat of summer;—altogether forming, if not a picturesque, at any rate an unmistakeable and interesting object in the landscape. In the State of New York, the Union Free Schools, which are beginning to prevail, are mostly solid, handsome, two or three storied buildings, but, as a set-off, there are 226 "log" school-houses in the "Empire State" still.* By law of the State, not more than \$800—about £160, at the

State of things
in Massachusetts.

An echo to this description comes from Massachusetts:—"Much as has been said on ventilation," writes Mr. Northrop, "the majority of the school-houses in the State remain unventilated, or at best ill-ventilated. Any apparatus for this purpose, other than windows and doors, is still the exception. Bad air is the greatest annoyance encountered in visiting schools. In visiting eight schools at Melbury the other day, I enjoyed the luxury of breathing pure air in each. The cause of this rare phenomenon was not any superior apparatus, but the following printed regulation of the school committee, conspicuously placed in every room:—"The windows that will not directly admit the air upon the children should, during the hours of the school session, be dropped a few inches from the top, and at recess, and at the close of the school, both morning and afternoon, all the windows should be thrown wide open for a few moments, so as to change the air of the school-room and effectually remove from it all impurities." (*Massachusetts 28th Report*, p. 52.) If this simple "unpatented" method of ventilating rooms (as a New York Commissioner calls it) were oftener practised, both in America and in England, it might save State Agents and Inspectors the trouble of making recommendations, bound to succeed in theory, certain to fail in practice. Notwithstanding his regret at the absence of "apparatus for the purpose," Mr. Northrop seems to consider "fresh air through the window" the best system of ventilation after all.

Mr. Wells gives the caution that "to insure the safety of the school, the boiler should if practicable, be located outside the main building"; a caution, considering the ugly habit that American boilers have of bursting without notice, very necessary to be borne in mind, but as far as I observed, never or very rarely acted on. There is a strange inconsistency in America between the theoretic appreciation of, and the practical indifference to, the value of human life.

State of school-
houses in New
York.

* The figures for 1864 are:—Log school-houses, 226; "framed," 9,941; brick, 1,002; stone, 543; total, 11,712. (*New York 11th Report*, p. 8.) From the same report I take two illustrative pictures; one paints things, I take it, at their average, or perhaps a little above the average, the other at their worst. In the second district of Columbia County "there are 106 school-houses; 100 of them are 'frame,' and the remainder are brick. Some are in good condition, but most are in bad order. There are some which have sufficient playgrounds and yards; others have neither, but are located as near the highway as possible without interfering with the privileges of the travelling community. All the school-rooms are heated by stoves, most of them using wood. The rooms are generally well ventilated, some by lowering the upper sash of the windows. In some districts convenient and beautiful edifices have been erected, with particular reference to the health and comfort of the teacher as well as the scholar. Joint district No. 4 has a model edifice, pleasantly located near the highway, painted white, with green blinds, the inside tastefully arranged, the desks comfortable, handsomely grained, a fine table for the teacher, a good black-board, globe, maps, and all the apparatus necessary for the use of the pupils, good closets for hanging the clothes of the children, as well as shelves for the dinner baskets; and last, though not least, a suitable room for coal and other fuel—an evidence of the increasing interest felt and appreciated, as well as manifested, by the inhabitants in the glorious cause of education." (*New York 11th Report*, p. 160.)

normal value of the dollar—can be raised by taxation for the erection of a school-house, unless with the special approval of the Commissioner of the district, and not more than \$20 can be spent in a year on repairs. So that, unless the special approval of the Commissioner is pretty freely granted, it is evident that no architectural extravagances, such as have caused the waste of so much money in England, that might have been spent with more advantage on the inside of the school, can be perpetrated here.

I have already said as much as I think it necessary to say on the subject of Moral training, "discipline"; but I may be allowed to add a few remarks with respect to the "provision made for moral training," to which, in connection with the internal organization of the schools, my instructions directed me to "pay special attention."

Whatever may be thought of the provisions made for religious instruction, it cannot at least be said that the necessity of moral training as a part of education was overlooked by the framers of the American system of common schools.* It is regarded as "the duty of teachers to guard the conduct of scholars, not only in the hours of school, but at recess, and on their way to and from school, and to extend at all times a watchful care over their morals and manners, endeavouring to inculcate those virtues which lay a sure foundation for future usefulness and happiness."† It is held that "moral" as well as "intellectual qualifications" constitute the "standard of admission" into schools of the higher grade;‡ and the Courts have decided that, "in order to maintain the purity and discipline of the public schools, the school committee have power to exclude therefrom a child whom they deem to be of a licentious and immoral character, although such character is not manifested by any acts of licentiousness or immorality within the school."§ By the Boston regulations, "when the example of any pupil in the school is very injurious, and in all cases where reformation appears hopeless, it is the duty of the principal teacher, with the approbation of the committee, to suspend such pupil from the school."|| And by another regulation, it is required that "good morals being of the first importance to the pupils, and essential to their highest progress in useful knowledge, instruction therein shall be daily given in each of the schools;"¶ and the teachers themselves, "in all their intercourse with their

Provisions made for it.

And now for the gloomier view. In Essex County, it is said—"Most of the school-houses in this part of the country are framed buildings, erected as cheaply as possible, without particular reference to warmth, beauty, or convenience. Three districts have no houses at all, and some eight more would not, I think be in a worse condition if the same was true of them. Most of the school-houses are situated on the line of the highway, without other playground than the road. Only one has an enclosed yard. The out-buildings in more than half of the districts are merely temporary sheds, rudely erected with posts set in the ground for a frame, to which are nailed boards forming a shelter for the wood. Nearly all the school-houses are supplied with a black-board of some sort—a very necessary part of the apparatus, though in too many instances rendered useless for want of chalk. About three-fourths of the schools have a chair and a desk for the teacher, and in one-fifth may be found a map of some kind; most of the stoves are good, but some are old castaway cook-stoves, and others are patched up with flat stones and old shovel-blades to keep the fire from falling out. A few of the school-houses have ventilators; some, in their present condition, do not need them, the air being sufficiently pure, on account of its ready ingress and egress through cracks and broken windows; while in some, again, the air is kept in a confined, unhealthy state." (*Ibid.*, p. 177.)

Even in Massachusetts sometimes things are but little better. In one township, of 22 school-houses five are reported as creditable "to the taste and benevolence of those by whose energy and perseverance they were built and are preserved"; 12 "serve as tolerable shelter from scorching sun and pelting storms"; the other five "are wholly unworthy of the name they bear." It is asserted that there are six school-houses in the township which a committee of carpenters, appointed for the purpose, "appraised at less than \$76, about £12, each—a sum that would little more than build a hovel for a cow"; and some reflections are drawn from the lessons of "carelessness and immorality" taught by "broken doors, black ceilings, patched walls, and half-demolished seats." (*28th Report*, p. 24; see also pp. 165, 145.)

and sometimes in Massachusetts.

I may add that I was pleased to notice the attention paid in city schools to the condition of the yards and offices; they are kept sweet and wholesome, and anything like offensive scribbling or drawing is immediately detected, and would be severely punished. The masters often pointed to the irreproachable state of these places, as a sort of indirect test of the moral tone of their school. Unhappily, the habit is even more prevalent in America than it is in England of defiling the walls in places of this kind with ribald verses, coarse jokes, and obscene sketches.

Attention paid to yards and offices.

I would also notice that, though the habit of profane swearing has grown to a terrible height in the country generally, nothing of the sort struck my ear among the children attending the schools. Possibly it is repressed by the fact of the mixture of the sexes, which, whatever may be all its effects, naturally acts as a check upon coarseness.

* By the laws of Massachusetts, the teacher is required to be "of competent ability and good morals," that he may be qualified to instruct the children not only in the ordinary branches of an English education, but in "good behaviour." (*Revised Stat.*, 23. ch., s. 1.) In another section (s. 7) of the same chapter, "all instructors of youth" are enjoined "to exert their best endeavours to impress on the minds of children and youth committed to their care and instruction the principles of piety, justice, and a sacred regard to truth, love to their country, humanity, and universal benevolence, sobriety, industry, and frugality, chastity, moderation, and temperance, and those other virtues which are the ornament of human society, and the basis upon which a republican constitution is founded; and it shall be the duty of such instructors to endeavour to lead their pupils, as their age and capacities will admit, into a clear understanding of the tendency of the above-mentioned virtues to preserve and perfect a republican constitution, and secure the blessings of liberty, as well as to promote their future happiness, and also to point out to them the evil tendency of the opposite vices."

† *Acts relating to the Public Schools of Rhode Island*, p. 87.

‡ *Massachusetts 24th Report*, p. 133.

§ *Ibid.*, p. 135.

|| *Rules and Regulations*, ch. viii., s. 15.

¶ *Ibid.*, s. 6. I have no idea, however, how this requirement is complied with, nor do I believe that it is literally complied with. Such "daily instruction" in morals, if attempted, would soon become a conventional and perfunctory thing.

scholars, are to strive to impress on their minds, both by precept and example, the great importance of continued efforts for improvement in morals, in manners, in deportment, as well as in useful learning."*

Extent to which they are observed.

The extent to which these rules and requirements, than which nothing can be more admirable, are complied with, depends mainly on the personal character of, and the sense of duty entertained by, the teacher. Some teachers would be content with producing mere "deportment;"† others would aim a little higher, at "good manners"; a few would really be dissatisfied with themselves if they did not feel that the "morals" of their school were high and pure. It must be admitted that the more perfect the grading of a school, the greater difficulty is thrown in the way of moral training, from the fact that the individual boy or girl is merged and (so to speak) obliterated in the mass.‡ Different plans are adopted by different teachers to produce a healthy moral atmosphere in their schools. Some appear to be content with that fragmentary reading of a passage of Scripture which is the ordinary, though not the universal, prelude in American schools to the work of the day.§ Others think that the mere placing of a child for six hours a day under the discipline and order that are maintained in a good school must exercise a powerful, though imperceptible, moral influence.|| Others have tried the plan of self-reporting,¶ or mutual reporting.¶¶ Others resort to weekly

Different expedients.

Reading of Washington's Farewell Address.

* *Ibid.* s. 2. With a view to impress each rising generation with the principles which animated their forefathers, "on the 21st of February annually, the masters of the high and grammar schools of Boston are to assemble their pupils, each in the hall of his school-house, and read to them or cause to be read to them by one or more of their own number, extracts from Washington's Farewell Address to the people of the United States, combining therewith other patriotic exercises." (*Ibid.*, ch. viii., s. 37.)

Form of New York note to parents.

† I have before me a printed form of weekly note which is sent by the Principal of a New York grammar school to the parents of his boys. It is the highest mark of approval given. "Sir,—It becomes my pleasant duty to inform you that your son A.B. has merited the approbation of his teachers. During the past week, he has recited correctly all his lessons, has been punctual in attendance, and *gentlemanly in deportment*.—I am, &c." And the phrasing of the monthly record is similar, the heading being "*deportment during the month*"—not "*conduct*." Among some directions and suggestions contained in the Annual Report of the St. Louis Public Schools for 1864, I observe this:—"An occasional well-timed story or anecdote, embodying a lesson in morals or manners, read by the teacher, may have the happiest effect. Proper instruction should be given to children as to their *manner* of going into houses, offices, and other places on errands. The need of this instruction is frequently observable in those visiting the offices of the School Board." (p. 70.)

Extent to which individual character is known.

The Rhode Island Commissioner, as usual with him, takes higher ground:—"The standard of moral instruction needs to be carried very much higher in nearly all our schools. *Christian morality*"—(the italics are not mine)—"should be made a distinct and daily study . . . We need such an education for youth as will make it more than possible that they will do justly and love mercy—an education that will furnish them with faith in God and man, that will secure a manly frankness and boldness in establishing truth and opposing whatever is false, which will teach the mastery over passion, the patience of self-control, the generosity of forgiveness, the safety of self-reliance, the cheerfulness of a fervent spirit, reverence for what is sacred, the binding power of an oath, courtesy which is better than grace, gentleness which is more winning than beauty, and that courage which casteth out the cowardice of doing wrong; an education which shall enhance the value of everything but evil deeds, penitentiaries, and sheriff's fees." (*19th Report*, pp. 27, 28.)

Influence of Scripture-reading inadequate.

‡ Mr. Gardner, the Master of the Boston Latin School, told me that he thought he knew the character of his boys (to use his own expression) "right through." As far as a morning visitor has a right to judge, there was a healthy, honest air in that school which pleased me much. The straightforward manner of the master seemed to have transfused itself into the boys. Some New York masters whom I asked the question, said they believed they knew pretty correctly the temper and character of the majority of their boys. I seemed to gather from the general testimony which was offered me on all sides, that the prevailing vice of American school-boys is untruthfulness, in one or other of its manifold forms. The Superintendent of Schools at New Bedford, Mass., speaks of "the frequency with which the most flagrant disregard of truthfulness is brought to his notice in cases of discipline referred to him, and in various ways"; and expresses "the conviction painfully forced upon him that the cause of good morals in the youth of the city is not keeping pace with the efforts to promote their intellectual progress." (*Massachusetts 28th Report*, p. 198.)

Influence of daily discipline.

§ "The simple reading of Scripture does but little to accomplish this"—(the impression on children's minds of the moral principles required by the statutes). "Dispensing with all doctrinal teaching, which is improper and illegal, our children should be trained in each and every department of our schools, to have a proper sense of their moral obligations." (*Massachusetts 28th Report*, p. 71.)

System of self-reporting.

|| "Any close observer will perceive that, in placing a child under daily instruction and discipline in the school-room, to be governed, and drilled, and plied with motives, and taught self-control, and punished for wrong-doing, and rewarded for good behaviour, a moral force of unmeasured extent is continually and silently brought to bear. Thus the school becomes to the State a vast insurance office, to guarantee that its inmates shall be found, in the coming years, among the sober, industrial ranks of the community, and not in her almshouses and gaols." (*Ibid.*, p. 88.)

Example of its working.

¶ "The plan of making children reporters of their own misdeeds should be carefully considered. Our opinion, founded upon even a casual observation, is that the system is bad. Punishment is easily escaped by falsehood, and with younger children the tendency to such is inevitable. Unless coupled with a high sense of honor, hardly to be expected in the lower departments, teachers had better depend upon their own observation." *Ibid.*, p. 71.)

"Some years ago," says Mrs. Stone, one of the ablest of the Ohio teachers, in an essay on school government read before the Teachers' Association at Cincinnati, "I had charge of the boys in a grammar school. One day some acorns were thrown violently across the room. The room was large and the pupils numerous, and as the acorns were thrown from under the desks, I was unable to detect the author of the mischief. The next morning the offence was repeated. I inquired who did it. No one could tell. I said—'We will have no recess in this room until I have been informed who threw the acorns. The author of the mischief must be a great coward, and shews a very mean spirit, if he will keep all these boys in, rather than report himself and bear the punishment alone.' The first recess time passed off quietly. At the next, occasional threatening glances directed towards Jacob, the largest boy in the school, shewed who was the offender. At the third recess, the angry glances were attended with the quick, oblique motion of the head with which boys emphasize threats. By the time of the fourth recess the indignation of the boys

or monthly reports to parents, which they require to be brought back to them with the parent's signature, shewing that they have been received and read.* Others employ "certificates," "medals," "rolls of honor," stimulating the desire

διὲν ἀριστεύειν καὶ ὑπέροχον ἔμμεναι ἄλλων. †

Indeed, the appeal to honor, to ambition, to proper pride and a sense of shame—the "shame that bringeth glory and grace" ‡—appears to be the means most commonly employed, and these to be the motives most largely trusted, to plant in a child's mind the seeds of virtue, and quicken it to a sense of duty.§ It is felt, however, that something is wanting still. The question is raised whether morality, apart from religion, can be taught at all; or, if taught, whether it be worth the learning.|| The seeds of morality can only be expected to germinate, many are beginning to think, under the influence of the sun of gospel righteousness, without which even a Socrates can only produce an Alcibiades. But no sooner does the thought take definite shape than, looming in the distance, is beheld the terrible phantom of "sectarianism";¶ and the desire of many hearts remains an aspiration only; and the greatest of all moral motives—the sense of accountability to God,** the greatest of all moral facts—that sin need not have dominion over those who are not under the law, but under grace—are scarcely more than timidly whispered in the schools.

Ethics, in the system of Aristotle, was but the vestibule of politics; and certainly a specialty in the school system of America, and a very valuable specialty, is the connection which it is desired to establish in the schools between moral and Political element in American education.

was raised to such a height that the offender evidently thought it safest to confess before the school closed. He arose, pale and trembling, and acknowledged his guilt. The rest of the boys were excused to take recess, and no more acorns were thrown during the session." (*Ohio Monthly for Sept.*, 1865, p. 297.) It was the use of the motive that is so much relied upon at Mettray—the fear of being considered "lâche,"—perhaps a lower motive still, the fear of becoming an object of the vengeance of his school-fellows—a dangerous instrument to use, except by the very skilfullest hands.

* This is an almost universal practice in the largest and best schools. For a specimen, see above, p. 232, note 6.

† In awarding the medals and certificates annually distributed in the schools at Boston (about which see above, p. 68) it is expressly required in the regulations that "general scholarship, and more especially, good conduct, shall be taken into consideration." (*Regulations*, ch. iv., p. 17.)

‡ In New York there has been recently introduced a system of certificates, which is said to have largely improved attendance, and may have improved morality. We have seen (above, p. 75) that a "roll of merit," "including examinations and conduct," is part of the system of the Free Academy. A copy of this roll is sent to every parent or guardian.

§ Mr. Hancock of Cincinnati, in a paper read to the Teachers' Association, recommends to teachers the formation of a "legion of honor in every school; that no one's name be placed on the roll whose conduct is not exemplary, out of school as well as in; that in every place where school reports are published such pupils should receive honorable mention; and that every member be permitted to wear some modest badge indicative of his high position." The proposal was discussed, but did not carry with it the unanimous consent of the Association. (*Ohio Monthly*, Sept., 1865, pp. 321, 255.)

¶ *Eccles.* iv., 21.

§ Thus Mr. Hancock:—"Every teacher who has in himself any seeds of true nobility of character—and without this he can do nothing—if he keep this cultivation of a high sense of honor steadily in view, and bring all his resources to bear upon it, cannot fail to find the tone of his school gradually coming up to a high level. I am not to be understood as setting up this sense of honor as the end of moral education—by no means. It is but the beginning—a noble beginning, I believe, which in the end is to flower and bear fruit in a perfect obedience to law, in the restraint of the passions, and the unfolding of the beautiful characteristics of a Christian life." (*Ohio Monthly*, p. 320.)

|| "But, fellow-citizens, as you are well aware, morality not founded on Christian principle is like a baseless fabric—a castle in the air—is limited in its range of duties, and of short duration. Genuine virtue is the offspring of Deity. The code of morals found in the Bible is the unerring standard of right and wrong. A solemn reverence for Holy Scriptures, and a full acknowledgment of our obligation to be governed by them, are indispensable elements in the moral training of our youth and of all mankind." (*Massachusetts 28th Report*, p. 96.)

¶ "To avoid 'sectarianism' have we not well nigh ruled all religion out of our schools?" (*Ibid.*, p. 95.) "Should not the teacher teach the great principles of public and private virtue and morality, which are common to all religious sects? Some may object to this branch of education, and denominate it 'sectarianism.' We are no advocates for the introduction of any sectarianism into the course of instruction given in our common schools. But is it sectarian to teach children to be good and kind and affectionate, to instruct them in the principles of justice and truth and honesty, to teach them to obey their parents, to obey the laws of the land and the laws of God, to endeavour to impress upon them the importance of reverencing God's name, of loving him with all their heart, and their neighbours as themselves? We think not. But if we would have our children become virtuous and useful members of society, we think we should desire to have this kind of instruction given in our common schools." (*Ibid.*, p. 151.)

** "It is said that Mr. Webster was once asked—'What is the greatest thought that ever occupied your mind?' After a solemn pause, he replied—'The greatest thought I ever had, or can have, is the sense of my accountability to God.'" (*Ibid.*, p. 96.)

Daniel Webster's words are, as they deserve to be, weighty with his countrymen. In a speech delivered at Plymouth Landing, in 1822, he thus describes the aims and aspects of the policy of free public schools:—"We regard it as a wise and liberal system of police, by which property and life and the peace of society are secured. We seek to prevent, in some measure, the extension of the penal code, by inspiring a salutary and conservative principle of virtue and of knowledge in an early age. We hope to excite a feeling of respectability, and a sense of character, by enlarging the capacity and increasing the sphere of intellectual enjoyment. By general instruction, we seek, as far as possible, to purify the whole moral atmosphere, to keep good sentiments uppermost, and to turn the strong current of feeling and opinion, as well as the censures of the law and the denunciations of religion, against immorality and crime. We hope for a security beyond the law and above the law, in the prevalence of enlightened and well-principled moral sentiment. We hope to continue and prolong the time when, in the villages and farmhouses of New England, there may be undisturbed sleep within unbarred doors." (*Quoted in 19th Rhode Island Report*, p. 12.)

political training.* The object to be attained is the production, not so much of the good man, as of the good citizen. Every American citizen has to play a part in the great arena of public life, which in other countries is reserved for the governing class or classes.† If there had been a free-school system in the South, there would have been no secession, no civil war.‡ Hence the need and demand for a thorough political education.§ Hence the extent to which the study of the Constitution of the United States pervades the programme of all the schools.|| Hence the continual appeals to support the system, on national and patriotic, even more than on social and domestic grounds.¶ And the result certainly is very remarkable. The political intelligence of the people is extraordinary. Compare the political knowledge and the mental activity displayed on political questions of a New England farmer or mechanic with that possessed and exhibited by an Englishman of similar social position, and the contrast would be ludicrous. I was told that, in the eastern States, I might meet with farmers driving their own plough who would be delighted to stop their oxen and discuss a problem in differential calculus. I suspect, if they stopped their oxen for a discussion at all, they would prefer that it should take the direction of politics rather than of the higher mathematics, and would sooner have their mind occupied with concrete questions of domestic or foreign politics, than with algebraic formulæ and abstract magnitudes. At any rate, it is thought on all hands to be advisable that boys should be taught at school the principles of the Constitution under which they live, and what will be expected from them, not only as members of society, but as constituents of a nation.**

For "religious instruction," in the sense which we in England attach to the words, it cannot be said that any provision at all is made under the American school system. Anything like "sectarian," which, as it is interpreted, means anything like doctrinal or dogmatic teaching, anything of the nature of a creed, or which requires children to utter the phrase "I believe," is implicitly forbidden in all the schools; in some States it is forbidden in terms.†† It is true that every-

Duties of a citizen are primary.

Provisions against sectarianism.

* The prime importance of moral instruction all will admit. But this branch has heretofore been confined principally to the Sabbath-school, and other Sabbath-day and home instruction. I think, however, that it could be introduced as a study into our common schools, and pursued with as much, if not more, profit than any other study. It is not proposed to introduce the peculiar dogmas or tenets of any sect, but to educate and enlighten the conscience, and inculcate the great and universally admitted principles of justice and right. Too little attention, also, is paid to the subject of civil government, many of the teachers being deficient in a knowledge of its first principles. Would it not be well, then, to make morals and civil government prominent themes in our Teacher's Institutes? (*New York 11th Report*, p. 229.)

† "A practical education for a Hindoo sudra, an English factory operative or miner, a Russian serf, or a Mexican peon,"—the collocation is not very complimentary, but the English operative or miner will have too much sense to feel himself affronted by it—"is not that which an American citizen should receive. They have nothing to do with the affairs of Government. The State neither needs their counsel nor asks their advice. It requires them to be industrious, quiet, content. The warp and woof of our entire system of government is spun and woven by the citizen. From him all power emanates, for he is the fountain-head of sovereignty. To him all questions of right and policy must ultimately be referred, and from his decision there is no appeal. What problems are there for him to solve during the next fifty years! What blessings or curses are to be heaped down by him to all coming generations! Standing, as he does, in the front rank of progress, at this critical moment in the world's history, what hopes and fears cluster round him, and what a sacredness should surround the ballot-box, which emits his voice of destiny! Such an education as shall fit him for all the duties and responsibilities of his peculiar position can alone be called practical." (*Inaugural Address of the President to the Ohio State Teachers' Association, Ohio Monthly, Sept. 1865*, p. 255.)

‡ "It is a suggestive fact that, wherever these schools have been established and maintained, there treason against the Government has found no favour with the people." (*St. Louis Report for 1864*, p. 61.)

§ Again is quoted the counsel of Daniel Webster:—"On the diffusion of education among the people rest the preservation and perpetuation of our free institutions. I apprehend no danger to our country from a foreign foe. The prospect of a war with any powerful nation is too remote to be a matter of calculation. Besides, there is no nation on earth powerful enough to accomplish our overthrow. Our destruction, should it come at all, will be from another quarter. From the inattention of the people to the concerns of the Government, from their carelessness and negligence, I confess I do apprehend some danger. I fear that they may place too implicit confidence in their public servants, and fail properly to scrutinize their conduct; that in this way they may be the dupes of designing men, and become the instruments of their own undoing. Make them intelligent, and they will be vigilant; give them the means of detecting the wrong, and they will apply the remedy." (*Ibid.*, p. 62.)

|| "We would recommend that the Constitution of the United States, or the Declaration of Independence, be introduced into our schools and used as a reading lesson as often as once a week. It seems to us this would be a very proper exercise in these days of rebellion. It would be the means of bringing up the rising generation with proper views of republican institutions, and cause them to place a just value upon the blessings of civil and religious liberty." (*Massachusetts 28th Report*, p. 109.)

¶ "To sustain our public schools with a liberal hand, and to watch over them with an ever-wakeful vigilance, is to subserve most surely and extensively the future well-being of the country, which we are so lavishly pouring out blood and treasure to save from threatened destruction." (*Ibid.*, p. 89. See also p. 56.)

** "A man is a man, a citizen, and a member of society, before he is a farmer, a minister, or a mechanic. At the same time, therefore, that he is pursuing his calling in the effort to get a living, and add to the general prosperity in material things, let him also discharge to the extent he may be able those duties he owes to his neighbour, to the township he lives in, and the country of which he is a part. There is but one other way in which a man can do so much for his kind as by the effort to make our common schools what they should be; for, next to religion, our country depends on them for its true national greatness." (*Ibid.*, p. 144.)

†† "The school committee shall require the daily reading of some portion of the Bible in the common English version, but shall never direct any school books calculated to favour the tenets of any particular sect of Christians to be purchased or used in any of the township schools." (*Massachusetts School Law*, ch. 38, s. 27.) The Act of 1642 provided that "religious instruction should be

where, at least I *believe* everywhere under the system, provision is made for reading the Bible; and almost everywhere provision is made for opening the work of the day with prayer;* but the disjointed, inconsecutive way in which the Bible is read—to-day a psalm, to-morrow a section from a gospel, the day after, a paragraph from one of the letters of St. Paul—in all cases unaccompanied by a single word in the shape of note, explanation, or comment, cannot and does not amount to anything that can be called systematic religious instruction. Indeed, considerable anxiety is being awakened in the minds of many thoughtful men, earnest and eager supporters of the system of common schools, by the fact that a very large proportion of the rising generation are growing up and going forth into life without any methodical knowledge of the Bible at all.† In a passage in an essay which has become only too well known, in the sense of having been made the peg on which to hang much bitter controversy, it is asserted that the Bible must be interpreted like any other book. Whether the statement be true or not—and in a certain sense I consider that it is perfectly true—it is quite clear that, in a certain sense also, if the Bible is to be understood and made available for practical purposes, it must be

Anxiety felt on this subject.

The Bible needs study.

given to all children" (*Horace Mann's 10th Report*, p. 9), but this Act, if not actually repealed, has yet been emptied of all significance by the progress of events and the disintegration of religious belief. It is found to be impossible to give "religious instruction" without favouring "the tenets of some particular sect of Christians," that is, without doing a forbidden thing.

In the city of New York the provisions of law are as follows:—"No school shall be entitled to, or receive, any portion of the school moneys in which the religious doctrines or tenets of any particular Christian or other religious sect shall be taught, inculcated or practised, or in which any book or books containing compositions favourable or prejudicial to the particular doctrines or tenets of any particular Christian or other religious sect are used. But nothing herein contained shall authorize the Board of Education to exclude the Holy Scriptures, without note or comment, or any selections therefrom, from any of the schools; but it shall not be competent for the said Board of Education to decide what version (if any) of the Holy Scriptures shall be used; provided that nothing herein contained shall be so construed as to violate the rights of conscience, as secured by the constitution of this State and of the United States." (*New York Manual*, s. 18, p. 47.)

In Ohio, I was informed by the State Commissioner, there is no special enactment of law prohibiting teachers from giving what religious instruction they please, provided it be not of a "sectarian character." If it were thought to favour the tenets of any particular religious body, the Board of Education probably would interfere. But, he added, there is very little biblical teaching in the schools.

I have previously quoted the words of a Massachusetts School Committee, who, though they want something more than "simple reading of the Scriptures," admit that "all doctrinal teaching is improper and illegal," and must be "dispensed with." (*Above*, p. 86, note §)

* At Boston the rule is:—"The morning exercises of all the schools shall commence with the reading of a portion of the Scriptures by the teacher in each school; the reading to be followed by the Lord's Prayer, repeated by the teacher alone." (*Regulations*, ch. viii., s. 5.) At New York, "all the public schools of the city under the jurisdiction of the Board of Education shall be opened by the reading of a portion of the Holy Scriptures, without note or comment." (*New York Manual*, p. 93.) At Philadelphia, "at the opening of each session of the schools, at least ten verses of the Bible, without note or comment, shall be read to the pupils by the Principal, or, in his or her absence, by one of the assistants, and some suitable hymn may be sung." (*Rule xxv.*) At Chicago, "the morning exercises of each department of the several schools shall commence with reading the Scriptures, without note or comment, and that exercise may be followed by repeating the Lord's Prayer, and by appropriate singing." (*Rule*, s. 46.) At Cincinnati, "the pupils of the common schools are allowed to read such version of the Holy Scriptures as their parents or guardians may prefer; but no notes or marginal readings may be read in the school, nor comments made by the teacher on the text of any version that is or may be introduced." (*28th Report*, p. 92.)

Rules about prayer.

I heard (as already alluded to) an extempore prayer used by the Principal, devout, earnest, evangelical, at the opening of the High School at Newhaven; and the *Te Deum* chanted (more, however, as a specimen of their vocal culture than of anything else) in a coloured school at New York. A county superintendent in Pennsylvania "makes special mention, as of an important fact, that in many schools the Lord's Prayer and the Apostles' Creed are frequently and devoutly recited in concert by all the pupils. They read the Scriptures alternately." (*Report for 1864*, p. 68.) Things seem to be very unequal in Pennsylvania. As a specimen in one county, "the Scriptures are read regularly and used for the purpose of moral instruction in 401 schools, 120 are opened with reading the Scriptures and prayer, and in 17 moral instruction is given orally. There are but six schools where no moral instruction is given." (*Ibid.*, p. 55.) In another county, "in ten schools moral instruction is imparted by the reading of the Scriptures every morning, and by prayer; in seventy-two others the Scriptures are occasionally read either by teachers or pupils; and in seventy-five no moral instruction of any kind is given." (*Ibid.*, p. 51.) The "without note or comment" rule is not enforced in Pennsylvania. Occasionally "the teacher asks some simple questions, or makes some appropriate remarks, to impress the lesson read more deeply on the mind." (*Ibid.*, p. 212.) In some schools "religious lectures are given" (*ibid.*, p. 186), but as to what would be their character, or what they would amount to, I have no definite idea.

† I do not think that I have a right to mention the names of gentlemen who thus expressed their feelings to me in the confidence of private conversation, though theirs are names which, if mentioned, would carry great weight with them; but at least, I may be permitted to quote sentiments to the same effect that have already appeared in print. "The importance," says a Pennsylvania school inspector, "if not the absolute necessity, of a system of religious training in our public schools becomes every year more apparent; and there is no greater perversion of the letter and spirit of the law than to say that such is not contemplated because sectarian teaching is excluded. This is a subterfuge under which teachers and school officers often seek to hide the responsibility resting upon them, and thus secure to themselves a pretext for neglecting this important duty. The clashing of different religious creeds and the risk of sectarian dissension are far less to be feared than the absence of all religious instruction. The truth will always stand the test of discussion, and has nothing to fear from it; it is false delicacy alone which seeks to avoid this imaginary evil by encouraging one that is real. If there ever was a time when such training was imperatively demanded it is now, when the heavy hand of an afflicting Providence is on us as a nation, and when we are passing through a much-needed discipline on account of neglecting this duty. It is not only important but essential, in order to the sustaining and perpetuation of our civil and religious institutions, that the tone of manhood and standard of Christian character should be elevated, and that the generation soon to take our place should not only be strong-hearted, quick-handed, and clear-headed, but that they should be taught to love their God and their fellow men, as well as to love their country and understand its institutions, and their duty as citizens of this great and growing commonwealth." (*Pennsylvania Report for 1864*, p. 137.)

Illustration of a feeling that is widely spread.

studied like any other book. If the Bible be, as I believe it to be, in any sense a whole, with an organic structure and interdependence of parts, and a spiritual sequence and development of ideas, it cannot exhibit this character of itself, so necessary for a just estimate and interpretation of its contents, to the student who has no other knowledge of it but what he picks up piecemeal. I know that many of the warmest friends of the American public schools would gladly see imported into the system some means of communicating to the pupils more of definite religious knowledge, if only it could be done without compromising or infringing upon that principle of entire religious freedom which is one of the corner-stones of all American institutions. I am afraid till men's minds and tempers are cast in a new mould it cannot be done; and if perfect religious freedom is a blessing, which I willingly admit it to be, it must be accepted, like many other principles, with its inseparable drawbacks and disadvantages. For us in England it has produced the acknowledged inconveniences, largely qualifying the otherwise beneficial action, of the denominational system; in America the result has been what its enemies call a "godless" education, and what even its friends allow does not include within its scope the highest objects that can occupy the thoughts or touch the heart of man.

Difficulty of securing this in the public schools.

Hence alienation of many from the system.

From this circumstance, however, that the public schools, as a whole, are divested of a distinctly religious character, and practically give nothing but secular instruction to their pupils, arises a state of public feeling towards them which, if not yet predominant, is, I think, steadily growing; which in some individual minds is very strong, and even pervades whole sections of the community; and which, perhaps more than any other adverse influence, seems likely to threaten the permanence and stability of the system, or at least of the system as now administered, in the future. Hence the lukewarm support given to the system, sometimes the open opposition avowed to it, by the great, compact, and powerful Roman Catholic community, and especially by the Roman Catholic hierarchy.* Hence the attitude of indifference, if not of more than indifference, taken up towards it by nearly the whole body of the clergy of all denominations.† Hence the growing preference

Roman Catholic aims and efforts.

* The admitted aim of Roman Catholics is to have "separate schools." In some places they have been too eager, and, anticipating public opinion, have ended only in placing a serious obstacle in their own way. In Ohio, about fifteen years ago, they attempted to get a share of the school fund appropriated separately, but without success; and a law was passed in consequence, that no religious sect should ever be allowed a share in the State Fund for a separate school, and this law it would require a three-fourths vote of the whole State to repeal. In this State, I was informed that nine-tenths of the Roman Catholic children are in separate schools, under the control of their own priests, and supported, of course, out of their own resources. In Cincinnati, I was given to understand that there were 8,000 children in the Roman Catholic separate schools, as against about 16,000 in the public schools. Bishop Duggan, of Chicago—a man, I should say, without a tinge of bigotry—told me that he did not dissuade children from attending the public schools, because he had nothing better to offer them; but that, if he could see his way to the successful establishment of separate schools, he should certainly feel it his duty to throw all his influence in their favour. I was told, upon what seemed to me the best authority, that in some parts of Illinois, where the inhabitants are almost exclusively Roman Catholics, Roman Catholic trustees appoint Roman Catholic teachers to the public schools, and that definite religious instruction in the articles of the Roman Catholic faith is given by them. In Connecticut also, I was informed, upon equally reliable authority, there are certain localities—New Britain, Waterbury, and Hartford were mentioned—in which there are school buildings erected by the Roman Catholics, which they loan to the State, and which come under the control of the township school committee, as far as examining the teacher is concerned, but in which religious instruction is given to the children by the priest, the school taking its share of the general and local appropriations. In Newhaven I visited two Roman Catholic separate schools,—one for boys, taught by a single master, the other for girls, taught by Sisters. They were flourishing as far as regards number of scholars; and though the building in which they were held was not in first-rate order, the instruction given seemed to be sound and practical, and a nice (though in the case of the girls a rather sombre) tone pervaded the schools.

The following picture of the efforts and views of the Roman Catholics in America, in the matter of education, is painted by one whose opinion is that "Roman Catholicism bids fair to be the dominant faith over the whole American continent." (*Nichol's Forty Years in America*, vol. i., 337.) "In 1861," he says "there were 96 academies and colleges for young men, and 212 female seminaries, besides a vast number of primary schools established by Catholics for the education of their own children, while they are also obliged to contribute to the taxes for the support of the common schools of the country. This heavy burden will be borne, however, only until the Catholics in any State have numbers and political power sufficient to compel a division of the school fund, and the devotion of a fair proportion to their separate use; and this day, in several States, cannot be far distant, and is looked forward to with dread by many Protestant Americans." (*Ibid.*, ii., 84.) "There are Jesuit Colleges in New York, Massachusetts, Baltimore, Washington, Cincinnati, St. Louis, New Orleans, and Mobile; and the reputation of this order for thoroughness of education has caused large numbers of the Southern youth to be entrusted to its care; and whatever may be the demerits of its members, they seldom fail to gain the love and confidence of their pupils who, as the Southerners say, can read their diplomas." (*Ibid.*, ii., 86.) In illustration of this writer's expectation of the future predominance of Roman Catholicism in America, it may be remembered that De Tocqueville prophesies that the state of religious belief two generations hence—it may almost be said now, one generation hence, for it is thirty years since he wrote the words—will be "que nos neveux tendront de plus en plus à ne se diviser qu'en deux parts, les uns sortant entièrement du Christianisme, et les autres entrant dans le sein de l'église romaine." (*Democratie en Amérique*, ii., 31.)

Attitude of the clergy generally.

† The law of Massachusetts declares that it is "the duty of the resident ministers of the gospel (*inter alios*) to exert their influence and use their best endeavours that the youth of their townships shall regularly attend the schools established for their instruction"; and Mr. Boutwell's comment on the law in 1861 was, that "in nearly every township, clergymen are members of the committees and participate in the management of the schools, and that, whether so entrusted or not, they are always willing to devote their time and talents for their welfare." (*Mass. 24th Report*, pp. 95-6.)

Regrets at the absence of the clergy from the schools.

But a very different story is told elsewhere. In Connecticut there are frequent and loud complaints that "men of influence, position, and wealth"—and the description must certainly include the clergy—do not give their support to the school; and that "the great want of the schools is interest on the part of the community, particularly the more influential part." (*Report for 1865*, pp. 52, 63.) In Ohio the Commissioner regrets that "the teachers struggle on alone, cut off from all external aid and sympathy; no friendly counsel or instruction, no kind admonition or direction,

which is observed in some places for "parochial schools," that is, schools connected with particular religious congregations or societies.* Those who, with De Tocqueville, believe that the "spirit of religion" is one of the foundation stones of American institutions,† will readily believe also that a school system which appears to exclude this spirit in its attempt to educate youthful minds, *must* be unacceptable to those who are themselves penetrated by it and have faith in its potency.

There appears to be no difficulty experienced in assembling children of all denominations in the same school-room; though, here again, as before noticed in regard to social status, a sort of attraction by affinity seems to prevail, and you find in one school quite a cluster of Jews,‡ another almost possessed by Roman Catholics. This is particularly observable in New York, where some quarters of the city are almost exclusively occupied by an Irish population. The effect in some schools has been rather curious. Under the influence of Roman Catholic trustees, there has not been any introduction of Roman Catholic teaching, but there has been an exclusion of the Bible. It is strange that, with the possibilities of religious influences reduced to a *minimum*, the spirit of religious zeal (if it be zeal), or of religious intolerance (if it be intolerance), should fasten upon that *minimum*. The question is not, as with us, whether a catechism shall be taught, or whether the formularies of a particular church shall be taught, but whether the "authorized" or the "Douay" version of the Bible shall be used, and whether the verses shall be read wholly by the teacher, or one after another by the scholars, or by teacher and scholars alternately. The omission to open school with the reading of Scripture is contrary to the regulations of the Board of Education, but it is winked at, and is considered as a concession to a powerful party, which it is thought better to make than to run the risk of a disturbance. Cases of intractableness occasionally arise, in which an individual child, acting probably under the orders of his parents, refuses to take his turn in "reading Scripture round," or to conform in some other way to the pattern followed in the school; and these cases, like other instances of disobedience or indiscipline, produce momentary difficulty, and have to be delicately handled;§ but they are not numerous, nor very serious in their effects.

Mixture of denominations in the schools.

As to the results of the association of children of different religious beliefs in the same school, I do not feel justified in pronouncing a very strong or very definite opinion. With every approach so carefully barred against sectarianism, and the whole religious teaching (such as it is) being of so absolutely neutral a tint, there is no room or pretext for quarrelling, nothing that can generate *odium theologicum*. It may result, and I think it does result, in indifferentism, in a depreciation of the value of a creed and fixed forms of faith, and in a more thorough acceptance than elsewhere of the half-truth that "He can't be wrong whose life is in the right." It struck me very forcibly—I had almost said painfully—in America how little identity in religious feelings or unanimity in religious habits or opinions appears to be estimated as a constituent of domestic happiness. In no place have I ever

Results of this association.

comes to them with assistance or encouragement." (11th Report, p. 35.) In Pennsylvania, the language of the Superintendent is still more distinct:—"In days not long gone by, it was the custom for clergymen to feel a deep interest in the cause of popular education, and exhibit that interest by frequent visits to the schools where the youth of their congregations are to receive their education. Their visits did much good, afforded aid and encouragement to teachers, stimulated pupils and gave them confidence in their schools, and influenced parents to take a more lively interest in the matter. Of late, this habit has fallen into disuse, to a great extent. Ministers now seldom visit the schools; consequently, all the good they might accomplish is lost, all the influence they might exert in favour of moral culture is so much taken away from the institutions where the youth are to be prepared for their duties and responsibilities in subsequent life. . . . The influence of so large a class of educated men thus exerted in favour of the public schools would be a power for good, the value of which can hardly be estimated. It is earnestly desired that clergymen would take this matter into careful consideration, and seriously ask themselves whether there cannot be a healthful moral influence exerted over the children while in school, that shall guard them against the vices to which they are exposed, that cannot be exerted at any other time. We do not mean sectarian religious instruction, but instruction upon those plain principles of morality upon which all agree. The mere presence of these men at the schools would do good, if they did not utter a word. An educated Christian gentleman carries with him a power that will be felt by all who come within the sphere of his influence, and by none more than by the young." (Report for 1864, p. 39.) A similar indifference on the part of the clergy (as a body) towards the schools prevails in Canada, at least in Upper Canada.

* "It is claimed by many that there is a lack of moral culture in the public-school system; that the training of our children is often committed to the oversight of immoral persons. This conviction is strengthening the feeling for parochial schools wherever they can be established, and the consequent withdrawal of many children from the public schools." (Pennsylvania Report, 1864, p. 82.)

Preference for parochial schools.

† See above, p. 10, note ||.

‡ In one New York grammar school which I visited, containing about 800 boys, I was told by the principal that there were about a hundred sons of wealthy Jews, who made no objection to the reading even of the New Testament. I should not regard this fact myself as a sign of "enlightened tolerance," but merely a mechanical acquiescence in what they probably deem a harmless and prescribed conventionalism.

Jews in a New York school.

§ It is surprising how delicate the handling of parents sometimes is required to be. A teacher in a school at Providence, to stimulate his class, happened to say that they could not spell so well as the negro children in a certain primary school. A parent, whose daughter was a member of the class, demanded the dismissal of the teacher (no doubt on the *real* ground that he had insulted his scholars by such a comparison, but) on the *nominal* ground that he had spoken an untruth. The case had to be met by the teacher taking his class with him to the coloured school, and testing the spelling powers of the negro children by fifty of the hardest words he could find! . . . The spelling in the coloured schools of Providence has almost passed into a proverb for its excellence. Mr. Northrop speaks of "the unrivalled spelling of Providence" in his *Lecture on "Supervision of Schools,"* p. 5.

"Touchiness" of parents.

seen the principle of "agreeing to differ" in matters of religion so thoroughly woven into the tissue of society. It is not at all unusual to find two or three faiths in one family, and husband and wife and children separating on the Sabbath (as the Lord's day is always called), to worship with different congregations.*

Attempt to estimate the system as a whole.

I have now travelled, I hope with sufficient fulness to be complete, sufficient coherence to be understood, and sufficient accuracy to be trusted, over the wide field of phenomena which the American system of common schools exhibited to my eye. It is time to gather up the loose threads of the discourse into a few definite conclusions, briefly to state what struck me as being the system's most prominent results, and to take my leave of it with a few critical notices of a general kind.

Its correspondence with the phenomena of American life.

In endeavouring to comprehend and appreciate this system of common or public schools—for the two epithets are used indifferently—it is absolutely necessary that the European observer should throw his mind, if possible, into the conditions of American life, should take his point of departure from a few leading social principles, and keep constantly before his eye certain salient social phenomena, which have (so to speak) necessitated its form, give to it its significance, underlie its action, maintain its motive power, determine its methods, and fix its aims. The *principles* have been already referred to;† they are the principles of perfect social equality and absolute religious freedom.‡ The *phenomena* are the restlessness and activity of the American character,—without, perhaps, the culture and refinement of the old Athenian, but with all his versatility,§—the absorbing interest of political life; the constantly rising aims of each individual; the ebb and flow of commercial enterprise, and the immense development of the spirit of speculation; the intense energy of the national temperament, its rapidity of movement, its precipitancy, its impatience of standing still. Many an American in the course of an active life will have turned his hand to half a dozen different professions or ways of getting a livelihood.

"Eris tu qui modo miles
Mercator; tu consultus, modo rusticus: hinc vos,
Vos hinc, mutatis discedite partibus."||

"The one lesson we are taught all through life," a person one day humorously but truly said to me, "is to be *discontented* with our station."
